This presentation discusses results of the study of victimisation of LGBTQ+ people in Russia before and after adoption of the "gay propaganda" law in 2013. This law served as a clear sign of authoritarian tendencies which only thickened by the full-scale invasion of Ukraine and real nuclear war menace in 2022. Thus, Russia's sexuality politics serves as an indication of a more general direction from human rights and to dictatorship in the country's development. For example, Russia has a well-developed hate crime legislation and LGBTQ+ sexualities are covered by it via a higher court decision. Yet, few anti-queer violent incidents are registered in the Russian legal system and still many crimes against LGBTQ+ people are committed annually. Moreover, eventually, the "gay propaganda" law contributed to further increase of anti-queer violence. An original method of court rulings analysis was developed and utilised in order to find out a number of criminal offences against LGBTQ+ people. All court decisions that mention non-heterosexual victims were reviewed to identify whether these cases could have been considered hate crimes. In result, more than 300 first instance criminal court rulings were identified. Descriptive statistical analysis demonstrated that the number of victims grew substantially after 2013, the year of the "propaganda" law. Further research will suggest how other relevant events impact on the level of anti-queer violence as a more general tendency of departing from human rights and falling into authoritarianism.

Decentralising the Panopticon: How Neo-Disciplinary Power Relations Work

Michel Foucault's theory of disciplinary power continues to inspire sociological analysis of sexualities. Its central element is a metaphorical Panopticon, an imaginary source of control over individual behaviour that produces docile bodies through the illusion of surveillance. Within this theory, the Panopticon represents the authority of expertise. Thus, in sexuality studies, medical expertise was crucial for the production of knowledge about how sexualised bodies must look and behave. This in turn resulted in the production of sexual identities and practices. However, the centrality of any kind of expertise is currently under threat of drastically changing social conditions. If in the time of Foucault expertise was an exclusionary club for a small highly educated class, today easy access to production and spread of information makes it a much more widely shared enterprise. More and more people rather google information or watch YouTube vloggers interpreting recent discoveries than listen to a medical expert with checked credentials. The thesis of this paper is that this changing mechanism of the spread of information also considerably transforms how power operates. Without the consolidating authority of the

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Panopticon, power relations become fragmented, fluid, and decentralised. Therefore, we are entering into the era of neo-disciplinary power where older mechanisms and techniques give way to their transformed versions. The paper is based on an empirical analysis of more than 300 cases of anti-queer violence in Russia published in *Violent Affections*. The research sought an explanation of the mechanism which contributed to the rise of anti-queer violence after the introduction of the Russian "gay propaganda" law.

Royalism As Anti-Authoritarianism? Hongkonger Identities, Mourning and Colonial Nostalgia

The outpouring of grief and love for the late Queen Elizabeth II expressed by many Hongkongers can only be understood in the context of anti-China sentiment. Numerous artworks, poems and letters of condolence posted on social media claimed that the queen had built the beautiful Hong Kong that was later destroyed by the Chinese authoritarian regime. Some of these posts also suggested that the monarchy represented a form of rule superior to that of the Chinese Communist Party. Hongkonger diaspora communities in the UK also organised public mourning events, displaying their solidarity with 'the British people' in remembering the 'great monarch'. These observations during the national mourning period for Queen Elizabeth II in September 2022 offer insights into the different Hongkonger identities emerging from the Hongkonger diaspora in the UK, revealing contested understandings of localism, colonialism and Chineseness – Anti-China Hongkongers, anti-Chinese Hongkongers and Hongkonger British. In this paper, we will explore how Hongkonger identities are constructed through othering China, racializing mainland Chinese and 're-turning' to the British. By analysing online posts and community events published by Hongkongers in the UK and Hong Kong in response to the death of Elizabeth II, as well as interview data from the Hong Kong diaspora, we argue that royalism became a vehicle for expressing anti-authoritarianism. In mourning the queen, a collective sense of loss and grief for the 'old Hong Kong' was mobilized and the queen became an icon of 'law and order' and 'civilisation'; critical commentary on British colonialism was notably absent. Our analysis therefore offers a critical understanding of how the colonial legacy, Chinese authoritarianism and the rise of Hong Kong localism interact and continue to shape Hongkongers' identities as they pursue their 'Revolution of Our Times' outside of Hong Kong.

Reclaiming Democratic Citizenship Against Algocracy in the Pandemic Era

This paper tries to pay more attention to how such divisions and distrust increased among Korean citizens throughout the pandemic era with reference to privacy, hatred, and unequal social impacts, which have deepened the marginalization of social minorities. We have learned that what is the most urgent is to reclaim democratic citizenship and to reduce the unjust and unequal social impacts under the threat of algocracy. Increasing reliance on algocratic systems limit citizen's participation in and comprehension of decision-making processes. In addition, we foresee huge barriers ahead, including an infodemic such as false or misleading information, shrinking NGOs' engagement in decision making process in platform economy, and reduced advocacy for social minorities, while democratic citizenship is being revitalized. Given these, this paper proposes that Korean citizens recognize social minorities as others and protect their rights, as well as respect public sphere where they can participate creatively in rebuilding trust that has weakened under the attack of platform economy.

The Emergence of Vocational/Professional Training in Expanded Higher Education Systems in East Asia

Societies in East Asia have experienced a massive expansion of higher education in recent decades. Under the strong influence of Confucian culture, families place a high value on education and children usually have high educational goals. Once the education systems have expanded, they attracted students from different socio-economic backgrounds to enrol in postsecondary programs. The earned tertiary credentials are expected to increase the young people's employability and future income. However, the more inclusive higher education systems do not necessarily promote upward mobility or narrow the social inequalities in occupational outcomes. Students from higher socio-economic background are found to maintain social privilege in obtaining a well-recognized university degree in prestigious traditional professional fields.

Rather than examining the mechanisms of social exclusion in the increasingly stratified higher education sector, this paper focuses on the new mobility opportunities brought by the diversified tertiary curricula in the expanded

system. Using the development of accredited nursing programs in Hong Kong as a case example, this paper critically investigates the role of newly emerged professional/vocational programs in the massified higher education sector. It reveals how tertiary institutes have expanded to embrace vocational training as occupations have become more professionalized and university-based for their initial education. Unlike traditional professional degree that prepare someone to work in a prestigious field, such as medicine and law, the emerging professional programs have less restrictive admission requirements but have high market value. They are designed to provide students with a professional credential that leads them to a stable well-paid job in the increasingly competitive and precarious Asian labour market. Findings of the paper have a large theoretical implication on the life chances posed by an expansion of higher education under the challenges of increasing social inequalities in East Asian societies.

Civil-Military Politics and the New Illiberalism in Latin America

Despite formal consolidation of liberal democracy in all Latin American nations except Cuba, involvement of the military in domestic politics has not ended. In this paper we argue that new forms of military involvement no longer take the form of the institutional dictatorships known from the 1960s-1980s. Rather, after 1990 this produced hybrid civil-military politics in which various forms of military involvement (tutelary power, co-governance, extended civic action, military parties, and even veto coups) have been incorporated into electoral politics by civilians. This paper examines a number of recent scenarios of civil-military politics to argue that each of these scenarios potentially or actually drives democracy into illiberal or openly authoritarian territory.

Worldwide Changes in Unplanned Pregnancies

The majority of research on the topic of unplanned pregnancies is conducted in countries with high fertility levels. This is for good reasons, because in these countries access to modern contraceptives could still be improved, in particular for certain groups of women. Moreover, the implicit assumptions seems to be that once overall access to modern contraceptives has been achieved, unplanned pregnancies will reduce to a level that does not warrant attention from researchers or policy makers. However, the few studies that have been conducted in Europe show that even in countries like Sweden and Denmark – where the majority of adults use modern contraceptives and few restriction exist on abortions – 25% of pregnancies are unplanned. These numbers are supported by researchers who say that unplanned pregnancies are of all times. In fact, some argue that the proportion of unplanned pregnancies can be higher in low fertility countries, because the wish for a lower total number of children increases the length of time at risk for an unplanned pregnancy. In this study I answer the question: Is the reduction in number of births accompanied by a similar reduction in the proportion of unplanned births? To answer this question I combine information of the World Fertility Surveys (1970-1980), Demographic Health Surveys (1990-now), Family and Fertility Surveys (1990), and the Generations and Gender Survey (2000-now). Based on information of current pregnancy status and the level of wantedness of this pregnancy, I estimate the overall number of pregnancies per 1000 women and the proportion of these pregnancies which were unplanned. Using regression analyses, I examine if the proportion of unplanned pregnancies has reduced over the past decades and if the a reduction in the overall number of pregnancies is associated with a reduction in the number of unplanned pregnancies.

The Chosen People in the Lucky Country: Immigration Goals As Determinants of Religious Self-Identity Among Israeli Migrants and Expats in Australia

While unmarked and hence overlooked by many individuals in their daily lives, social identities are often reconsidered and transformed during an immigration process. This is particularly true for immigrants whose religious affiliations now cast them a minority in the destination country. This transition from being a religious majority to a minority challenges immigrants' religious self-identities as well as their religious practices, thereby redrawing boundaries of belonging. While Immigration studies have extensively studied identity shifts of migrants, the scholarship has yet to systematically address the effects of immigartion goals, permanent or temporary, on religious identities and practices of voluntary immigrants. Aiming to fill this gap, this study examines the relationships between immigration goals and the construction of social identities, particularly religious identities, among Jewish-Israeli immigrants in Australia. Until quite recently, immigration from Israel was frowned upon, as immigrants were often stigmatized as unpatriotic and betrayers of the Jewish religion. But, as attitudes toward global immigration improved, Australia also became a coveted immigration destination for Israelis. Based on in-depth

denotes a presenting author. Abstracts are organized by first presenting author's last name.

interviews with both Jewish-Israeli permanent immigrants and expats (N=22), varied in their socioeconomic and ethnic backgrounds and, primarily, in their immigration goals, we intersect our interviewees' religious self-perceptions with their integration process. Our findings suggest that while immigrants with different immigration goals do share some similar religious practices (such as celebrating Jewish holidays) and perspectives (e.g. aversion towards organised religion), they nevertheless tend to perceive Jewishness differently. Thus, although both Immigrant groups refrain from cultivating social contacts with the local Jewish community, expats are more likely to see Judaism as a culture and an ethnicity, whereas permanent migrants tend to consider it a religion. Consequently, expats are more reluctant to celebrate local and Christian holidays while permanent migrants tend to be more open, largely embracing new ethnic cultures and religions.

Emotions and Autonomous Health Movements: Lessons from Abortion Self-Help Collectives in Europe.

The rise of right-wing populism in Europe in the last few years resulted in a backlash against gender equality and women's rights. In Poland the main area of this backlash appears to be sexual and reproductive health. In 2015 the right-wing populist Law and Justice Party won the parliamentary election in Poland and immediately attempted to restrict abortion rights. In 2020 the Constitutional Tribunal of Poland has ruled that abortion due to foetal defects is unconstitutional. Since January 2021 abortion in Poland is allowed only in two cases: when pregnancy poses a threat to the life or health of a pregnant woman and when the pregnancy is the result of a crime.

In response to this conservative backlash against women's reproductive rights, over a dozen grassroots abortion-aid groups have been formed around Europe to support women from Poland with organising surgical and self-managed abortions. These non-profit groups provide Polish women seeking to terminate their pregnancies with financial, logistical, and emotional support. The emergence of this autonomous health movement (see Braine 2020) is an example of transnational civil disobedience against the local state repression.

Drawing on in-depth interviews with abortion activists based in Poland, Germany, Austria, the Czech Republic and the Netherlands, this paper analyses the role of emotions in forming and sustaining the autonomous health movement. The paper focuses on collective-based response to abortion restrictions in Poland. It analyses the role of emotional support in the abortion-aid groups and argues that while the activists' emotional labour empowers women and challenges the populist, right-wing narratives in Poland, this emotional labour also contributes to sustaining the status quo of gender norms promoted by these narratives.

KORBIEL, Izabela* (Vienna University, Austria)

Home Academia. Female Researchers and Their Working Conditions during the COVID-19 Pandemic.

The COVID-19 pandemic has intensified existing gender inequalities across society, also in academia. Women have constantly carried the majority of family-related commitments that consumed most of their time and energy.

The aim of this paper is to draw a picture of working conditions for women in academia during the pandemic crisis. It gives space for discussion of hopes and fears regarding female academic perspective in regard to the changed research and teaching landscape.

First analyses advocate that working from home during and around lockdowns has placed a disproportionate weight on female academics and especially mothers of young children, who reduced their work hours five times more than fathers. While mothers have taken main responsibility for childcare and home schooling at the cost of their paid time at work, it does not apply for fathers.

This paper discusses the circumstances that determined female labour in men dominated academia since the outbreak of COVID-19 based on 20 qualitative interviews with female academics conducted after two years of home office and online academic life. The main questions are:

- which strategies do female researchers develop in order to adapt to the new situation
- what are their fears about their academic future imposed by the pandemic
- did they change future plans due to the current situation
- what do they expect from politics and policy makers regarding inequalities in academic labour

In academia the effect is imposed the most on junior faculty, who are balancing professional obligations with the obligations for their families and young children. For instance female social scientists of multiple disciplines have published 14% fewer working papers than before the pandemic. It might take years, however, to see full impact of the pandemic on academic success of female researchers, given the duration of publication process or tenure track procedure.

Life on a Map. Creative Methods in Biographical Research.

This paper discusses two creative methods in biographical research: life charts and mapping as supporting tools to qualitative interviews. The aim of the project is to draw a picture of the post pandemic labour situation and work-life balance of female academics in order to show the transition caused by the COVID-19 crisis. The author approached creative methods from a constructivist point of view, as methods that give access to other dimensions of people's life stories. Participatory methods address and shift the power dynamics, they can also be used as ice-breaker and create good atmosphere during the interview. Creative methods assist interdisciplinary life narrative researchers in bringing forward other aspects of life stories than those favoured by the traditional, biographical interview.

On the one hand the mapping method was applied in order to visualise networks during the pandemic, this method supported the participants in evaluation of the role of the partner, children or colleagues. Maps produced during this process inform the data analysis afterwards as they assess and visualise social capital of the participants. Furthermore the participants could map their lives before the pandemic focusing on different settings. To reach this aim the participants were asked to draw places they were visiting every day before the pandemic such as the office, kindergarten or school. In the next step they were asked to draw the places visited mostly during the pandemic. Afterwards they compared both pictures and searched for spaces that overlap and pointed at places that vanished from their lives. On the other hand life charts supported the narrative and helped to memorize events in chronological way. With creative methods in this biographical research project the researcher believes she opened a new perspective through the dialog that visualised the past and the present.

KORNBERG, Dana* (UC-Santa Barbara, USA)

Transactional Pathways

Granovetter's agenda-setting 1985 article distinguishes "traditional" from "modern" economies and declares its interest in "modern capitalist society" (70). Economic sociology has tended to follow this pronouncement and has consequently tended to include several a priori assumptions: that economic life takes place primarily within state-regulated firms, that exchanges unfold in a quid pro quo calculative fashion, and that transactions entail little to no obligation, amongst others.

Yet, in so many contexts—and especially within informal institutions where most of the world's economic life takes place—these assumptions simply do not hold. I propose integrating the concept of "transactional pathways," coined by anthropologist Jane Guyer, because it offers an opportunity to move beyond modernist assumptions, by and large relied on by economic sociologists and political economists alike. The concept of transactional pathways builds on the "spheres of exchange," which anthropologists used to distinguish how goods were morally classified (wheat versus cows, for example). Transactional pathways bring into focus patterns of exchange—no matter the institutional form they take—in order to trace "the historical constitution of conversions and wealth creation" (Guyer 2004, 30). In other words, transactional pathways help to explain how some actors, groups, and institutions manage to cultivate power through economic relations, not only because of their "network ties" but because of their ability to access and hold on to goods of prestige in the first place.

Questions that can be asked using this concept include: How do ethnic (and other) groups coalesce via economic exchange? How are status positions generated, and how might they be transformed? The promise of this perspective is an invitation to conduct research that reveals the processes through which status distinctions (based on race/caste/class/gender/Indigeneity) are generated and upheld via economic transactions.

Typologisation of Remigrants and Analysis of Return Stories: The Case of Latvia

Considering the size of the population, which hardly reaches two million, the significant drop of population driven by the emigration during the past decade (around 10%) poses a serious challenge. To improve cooperation with Latvian emigrants, as well as to facilitate their return, more attention is being paid to remigration policy and the study of return processes. The paper analyses typical patterns of remigration to Latvia, identifying the challenges associated with return in different migrant groups (by gender, age, education, etc.).

Classical migration theories (e.g., neoclassical economics, NEML) are criticised in the context of the remigration because they ignore relevant contextual factors of both the host and home country and do not address the non-economic reasons for return. Therefore, the study adopts a structuralist approach to the theoretical underpinning of remigration, where contextual factors of both host and home country play a significant role.

The analysis uses data from the largest remigrant studies in Latvia, carried out in 2016 (project "Return to Latvia", the sample of remigrants n=3088) and 2019 (project "Exploring Well-Being and Social Integration in the Context of Liquid Migration: A Longitudinal Approach", the sample of remigrants n=1400). Five typological groups of return migrants, estimated by cluster analysis, are interpreted according to different theoretical models. To deepen understanding of the subjective interpretation of remigration factors, in-depth interviews from the Latvian National Oral History archive are analysed as well.

The analysis reveals that although emigration is mostly based on economic reasons, the main reasons for remigration are non-economic. They are related to homesickness, the desire to spend more time with family members and to raise children as Latvians, as well as difficulties of assimilating into the host society. Significant obstacles for remigrants are difficulties in reintegrating into Latvian society.

Accessible or Not That Much? Urban Mobility Conditions for People with Disabilities through the Prism of Russian Youtube Users Reactions

This research examines the mobility conditions of people with disabilities in the urban environment as a social problem. We leverage the constructionist approach towards social problems which views social problems as actions by individuals and groups insisting that a condition is a problem and demanding solutions to fix it. The research focuses on the reactions of Russian YouTube users to the problems of the urban environment accessibility for people with disabilities through their comments under the episodes of the YouTube-show "On the Wheels". We performed a quantitative and qualitative analysis of the 7 472 comments. The vast majority identifies urban environment accessibility as a social problem and express strong emotional reactions towards the mobility conditions people with disabilities face in the city. Dominant rhetorical strategies used in the comments to substantiate the problematics of the condition are the rhetorics of calamity, endangerment and entitlement as per the methodology developed by P. Ibarra and J. Kitsuse. Within the rhetoric of entitlement, users stress the importance of giving the right of unrestricted mobility to everyone, including people with disabilities. The rhetoric of calamity draws a connection between the accessibility problems and the quality of public administration in Russia. The rhetoric of endangerment views physical barriers to mobility as a threat to people's health and security. Furthermore, commentators conclude that an accessible environment will benefit everyone in the city. There are not many counterrhetorical strategies found in the studied comments, and most of such comments admit the problem of an accessible environment.

Struggling with Limitations, Creating New Possibilities – the Identity of Men in the Empty Nest Stage

The current modalities of manhood are torn between an old, classic model of the income provider (Quéniart, 2004) and a more modern trend that allows for disclosure of emotions and care practices (Schoppe-Sullivan & Fagan 2020). However, studies concerning changing manhood schemes are rarely devoted to the situation of men experiencing an empty nest. In our article, we would like to fill an existing gap in this area. It is clearly visible that the experience of an empty nest coincides with other important aspects of men's life: aging, assessment of achievements and acceptance of limitations on and in the self (Scher, 1992). We analyze how children's leaving influences the reconstruction of the identity of the man that takes place in the lives of the respondents.

The analysis of the interviews shows that the effect of the empty nest in men poses questions about passing away, as well as the need to reformulate their current life. Some respondents are confronted with the fact that the possibilities of crossing new boundaries and new achievements (e.g. in sports activities) have significantly decreased. However, some respondents see the new situation as space for the pursuit of new passions and interests (especially when they do not require a competition against others) - often those that they had to put off while raising children. The surveyed men (although it depends on their property status) are capable of implementing more advanced plans (e.g. buying real estate abroad).

Digital Resistance in Russia's War in Ukraine: Studying Social Media Disinformation Campaigns with SNA Tools

Russia's war in Ukraine since 2014 and till full-scale invasion on February 24, 2022, boosted wide scope of disinformation tools. In our paper we focus on Telegram social media platform and messenger which usage in Ukraine increased extremely in 2022. As this messenger enables getting messages even with poor Internet connection, hundreds of thousands of Ukrainians started using it. As of July 2022, KIIS polling data conducted with CATI, 79% of the adult residents in Ukraine were using Internet on daily basis, and Telegram was among TOP-3 messengers that people used (44% used it during a week before the survey). Some Telegram channels in Ukraine managed to achieve several hundred thousands of subscribers, and therefore the activity of these channels – how they evolve, their evolution, and what content they generate for the subscribers – is in focus when they are used as an instrument of disinformation.

We collected the data on new Telegram channels that were created and were operating in the territories of Ukraine temporarily occupied by Russia (e.g. Kherson, Zaporizhzhia, and till recent month Kharkiv) in February-September 2022. We depicted more than a hundred of channels, and discovered that they often repost news from each other, forming the networked structure by reposting (similarly to Twitter networks and communities). Besides, we discovered the change in the network strategy of these channels: before the de-occupation of Kyiv, Chernihiv and Sumy regions in spring 2022, the network was very synchronized posting and reposting similar messages. After May 2022 some channels changes their content strategies: they started posting local news in a way that was normalizing the occupation. Our objective in the study is not only defining disinformation messages, but also showing the structure of (hidden) cooperation between channels in forming specific discourse.

Measuring Social Capital: Applying Resource Generator in Studying Networks Mobilizing Potential

A few studies on social capital address it through the relational perspective. Putnam's approach suggests that the social capital is a key driver for interpersonal cooperation in various organizations along with the trust in these groups (Putnam, 2000). The lack of social capital as well as the low level of trust might become a threat to democracy and would lead to the loss of potential for collective action and cooperation in communities. In relational approach social capital is analysed through structural positions of individuals and groups, direct and indirect ties, and with the idea of access to the material and non-material resources through the network. Some international studies follow rather Putnam's approach providing empirical evidence on the interconnection between the interpersonal trust and participation in non-governmental organizations and associations. Other surveys trace the interconnection between the level of civic engagement and self-assessed size of the personal network.

The team of Dutch sociologists developed a tool called "resource generator" for measuring social capital in its mobilizing potential (van der Gaag & Snijders, 2005). This paper suggests the overview of its application in the nationally representative polls in Ukraine in 2019-2021 (three waves), discussing the potential of the tool application in the other contexts in turbulent societies. Since 2000s the resource generator was applied in the Netherlands, the UK, Canada, Poland, but all these polls were not systemic. The key findings for Ukraine's data from 2019-2021 illustrate the slight decline in social capital due to the pandemic with the return to or even overcome the pre-pandemic level in the access to some resources. It also reveals the difference in social capital by gender, age, and self-assessed income level. The latter is compared with the Dutch survey SSND conducted in 1999-2000.

KOSUGI, Ryoko* (Saitama University, Japan)

The Rise and Fall of Student Activism in Tokyo in the Late 20th Century: Focusing on State-Level Policy Regulating Campus Locations

This presentation aims to demonstrate how state-level policy regulating university locations impacted student activism in the metropolitan Tokyo area in the late 20th century. The Japanese student movement gradually took form after the Second World War and by the beginning of the 1960s it became very active. A great number of students all over Japan joined campus protests and the antiwar demonstrations, especially in the late 1960s. However, in the mid-1970s student activism generally started to shrink, and current numbers and amount of activeness are much smaller than those of the 1960s. Focusing on the Kanda-Ochanomizu District in central Tokyo, this presentation explores the process in which the state policy regulating university locations aggregated a number of campuses to the District by the 1950s, helped the District develop into the heartland of Japanese student activism by the late 1960s, and eventually strangled student activism in the District after the 1970s.

More specifically, by analyzing data from my interviews with ex-student activists, geographical data of the District, and data regarding higher education policy and urban planning in the Tokyo area, this presentation examines how the aggregated campuses in the District of the 1960s ingenerated the student area, which accommodated spots for students like cafés, lunch counters, bookstores, and dormitories. This presentation then explores how students became politically socialized and mobilized to the demonstrations in those spots. This presentation also shows that around 1970 the state policy started to push campuses out of the District and in to suburban Tokyo, which dismantled the student area of the District and student activism there as well. The discussion on the impact of spatial change on student activism in Tokyo will contribute to the refinement of social movement theories that have paid special attention to the role of space in the dynamics of social movements.

Gender Gap Dynamics Among Refugees and Recent Immigrants: Different Start, Different Patterns?

In the last years, the labor market integration of immigrant women has received much attention in the migration literature. We examine gender differences in labor market integration among refugees and other new immigrants who came to Germany during a similar period from a dynamic perspective. We compare their pathways throughout the early period after arrival and study a range of conditions suggested to be relevant for gendered labor market outcomes. Using two panel data sources, which include recently arrived refugees (the IAB-BAMF-SOEP Sample of Refugees) and other immigrants (the IAB-SOEP Migration Sample) in Germany, we compare the dynamics and sources of employment gender gap among refugees and other immigrants. The results uncover narrow initial gender differences among refugees that grow over time and a reversed pattern among other immigrants. However, female refugees' initial disadvantaged starting position maintains five years after arrival. Our results, therefore, reinforce the triple disadvantage female refugees face in the receiving country. Furthermore, our findings indicate that the explanations offered in the literature cannot fully explain the hurdles female refugees and other immigrants face when entering the labor market.

Proximity at Distance? Digital Family Practices through the Lens of Gender and Privilege

Transnational, mobile families have already been accustomed to and depended on digital family practices prior to the COVID-19 pandemic and research has shown the significance of digital communication technologies for 'doing family' across distance and despite mobility. Such technologies not only help to maintain familial ties and emotional closeness, but they are also crucial to circulate affect and to take on care work. Using transnational, mobile families as an example, this paper shows how digitalization in everyday life helps these families to create 'proximity at distance', discusses limitations and explores the impact of the pandemic and concomitant policies like restricted mobilities or stay-at home-orders on their (digital) family life. Based upon a long-term, on-going ethnographic study among transnational professionals and their privileged, 'elite' families in Tokyo/Japan (since 2019), this paper argues: Digital family practices are highly intertwined with digital family 'displays' (Finch 2007). Further, the COVID-19 pandemic has forced families to renegotiate, to adjust and to further develop their (digital) practices and displays – even if digitization was already a part of their everyday life. Finally, 'gender' and 'privilege' emerge as important analytical categories when studying digital family practices. This paper will show that both, practices and displays, are highly structured by gender and privilege and discuss its implications for family as a social practice.

Help-Seeking and Help-Receiving Behaviors in Long-Term Life Restoration Process of Elderly People after a Disaster

The present study, a case study of the 2011 Great East Japan Earthquake, focused on the impact of the disaster on restoring livelihoods of affected people. The objective of this study is to examine factors related to help-seeking and help-receiving behaviors, and help-seeking preferences of disaster affected elderly people.

It has been pointed out that Japan has a high aging population and that 80% of the human casualties in disasters are elderly people. It has also been pointed out that elderly households affected by disasters are in economic distress. In Japan, it is said that an earthquake in the Tokyo metropolitan area and a Nankai Trough mega earthquake will occur in the near future. There is concern that many elderly people will become victims of the disasters, making it difficult for them to restore their lives.

Previous studies showed that disaster affected people had tried hard to reconstruct their damaged livelihoods by themselves in the first few years. It was also indicated that they felt being inequitably treated and abandoned over several years after the disaster. Their former value of taking action to make changes transformed to that of abandonment. Their long-term life restoration processes are still going on in the disaster-affected areas.

In this study, interviews were conducted with elderly home-evacuated disaster victims in the Great East Japan Earthquake. Based on the textual data, their processes of restoring their lives after the disaster were visualized and analyzed. Elements in the processes were categorized as helping, help-seeking and help-receiving behaviors. Factors related to social support were also clarified, and those chronological changes were examined.

Platformization As a New Social Order

The paper aims to make sense and theoretically argue for the idea of platformization as a new social order.

This paper analyzes the growth of platforms and their controversial and growing power in society. Platforms, most often analyzed in relation to various arrangements of work, its forms and multiple consequences, extend as a new economic socio-material engine, bringing in new possible tensions that materialize in the forms and ways of regulation, for example, but also in the practices of arranging services through platforms. Platforms are thus not one single or separate category of economic functions, or indeed work, or a single mode of operation subjected to specific type of work. Platformization extends beyond the traditional categories of economic and social units, transforming the ways we use and analyze the typical categories of activities, and explain the changes and transformations brought forward by the platformization.

Focusing on the different forms of platform work and subjective experiences of the different forms of work does not enable the analysis and understanding of the interconnected nature of immaterial and material in the platformization. The governance, mediation and reorganization of work, markets and public services, the construction of new digital user subject positions with consequences in material lives, are all examples of the transformational power and tensions platformization produces. The paper elaborates the understandings of the workings of platforms and algorithms in shaping the modern society through technology. To do so, paper addresses the key aspects behind the growth of the platform economy as the foundation for the new types of societal relations, and discusses how technologies become absorbed into existing organizing, as a new social order.

Destinies of Nuclear Orthodoxy: Religious Expertise on Scientific Issues in Russia

After the collapse of the USSR, the academic field in Russia has lived important transformations. The change of funding opportunities and social conditions heavily impacted research process. As well as the abandon of Marxist materialism, opening the room for critiques of the Soviet-style Atheist epistemology. Beyond the academic field, the post-Soviet Russia has become the field of debate on secularization theory. Many social scientists pointed out growing presence of the Russian Orthodox Church and Muslim Spiritual Boards in public field, within institutions and administration. Their opponents answered by stressing on the Soviet heritage in knowledge transmission, especially in scientific field, and the low level of religious practice.

In this paper we will focus on the activity of Orthodox intellectuals and authorities within the field of nuclear energy in Russia. Indeed, the tandem Orthodoxy/Nuclear Energy is considered as the basis of spiritual and physical integrity in Russian conservative circles. This position has not been officially approved by the Russian Orthodox Church because of its openly militarists dimension, though the Church has constantly developed the cooperation with scientific institutions specialized in nuclear sphere. At the same time, on should not forget the resistance of a part of scientific community against these initiatives, since the majority of scientists of Soviet generation have a strong Atheist background.

My hypothesis is that initially presented as a support of scientific research by the Church, this Orthodox/Nuclear cooperation goes beyond epistemological interest and traces of the conservative turn in contemporary Russia with the cohesion of (armed) science and united spirit of the nation understood as a Eurasian empire. I argue that the freedom given to the religious actors in this matter by the state is can be interpreted as a pragmatic use of religious resources in managing science rather than a mark of the desecularisation process.

Post-Soviet Muslims in Europe: Recycling the National into the Religious?

This paper focuses on the adaptation strategies of the Muslim population of Europe which has immigrated from post-Soviet countries and, in particular, from the Northern Caucasus in Russia (Chechnya, Dagestan, Northern Ossetia, etc.). Many of these Muslims has been immigrating in Europe during the last 30 years for different reasons: the civil war in Chechnya, restrictions of religious freedom in Russia, violence against the LGBT-people. European countries host many post-Soviet Muslims as political refugees from Russia, though many of them do not accept being called "Russians". The paper focuses on the cases of France, Belgium and Switzerland and aims to analyse how these Muslims adapt their religious practices and the way of life to the European environment in the framework alternative to the secularisation theory.

What are the strategies of adaptation for these Muslims in the European context where they face "liberal" and "republican" approaches to secularism instead of Soviet/post-Soviet style of religious managing? My hypothesis is that these Muslims transform their national identity into the religious using local and international Muslim networks. This augmented Muslim identity will form their main resource for their adaptation to the foreign environment. In the situation of migration, these Muslims prefer to proceed through the global Muslim market networks rather than their national or ethnical references (Gauthier 2020). Thus, my theoretical assumption is in line with alternatives to the theory of secularisation that are developed by François Gauthier et his colleagues of the Fribourg University (Cornelio et al. 2020; Gauthier 2020).

KOWALSKI, Michala* (Drug Policy Modelling Program, SPRC, UNSW Sydney, Australia)

What's the Problem with the Night-Time Economy: Examining the Problematisations in New South Wales' Late-Night Alcohol and Night-Time Economy Policies

The legacy of New South Wales' (NSW) flagship night-time economy policies of the last twenty years, better known as 'lockouts', is far from clear. Supporters and detractors have constructed vying framings of the outcomes in various media outlets and government fora for nearly a decade. These policies were recently suspended, in favour of investment in the night-time economy. Here, we argue that at the heart of this debate are the deep-seated problematisations in these policies. We apply Bacchi's What's the Problem Represented to be (WPR) approach to the following policies: the first iteration of lockouts in NSW (known as the Newcastle decision), the lockout laws in Sydney's Central Business District and Kings Cross, and the renewed investment in the night-time economy known as the '24-hour economy'. This theoretical approach to

policy analysis contains a set of questions designed to assemble a systematic Foucauldian deconstruction of the problem representations the chosen policies are purporting to solve for. Using the WPR approach, we draw out the inherent problematisations, examine the knowledges they rely on, and study the effects they produce. We hope that by making the different problematisations inherent in these policies explicit, we contribute to both the discussion regarding the legacy of 'lockouts', as well as to the discussion regarding the future of alcohol and night-time policies in the state.

Social Media Influencers As Agents in Political Socialisation Processes of Their Followers: Self-Perceived Opinion Leadership and the Creation of Online Communities

Social media platforms have become an increasingly important source for politically and socially relevant content, reflected by some prominent examples such as the youth-initiated climate protests Fridays for Future and the Black Lives Matter campaign to increase awareness on racism. One group of main actors on social media platforms are social media influencers; users who are more active, more popular and, as the name suggests, more influential than others. Initially recognised for their economic potential to "shape or persuade consumer buyer intentions or opinions" (Ruiz-Gomez, 2019, p. 24), a shift towards politically and socially relevant content, also referred to as "political influencing" (p. 2), has been observed and influencers' potential impact on public discourse and opinions has been emphasised (Riedl et al., 2021). This research explores influencers' self-perceived role as political socialisation agents in relation to their followers' political views and behaviours. Drawing on semi-structured interviews conducted with social media influencers, their self-perceived authenticity, trustworthiness and potential to convey information, form opinions and shape behaviours was investigated. Exploration of these aspects was facilitated by applying a case-study approach, focusing on influencers' who actively participated in a debate on removing an abortion law in Germany, the repeal of §219a of the Criminal Code in June 2022, by sharing relevant content on their social media accounts. Analyses draw on the idea of opinion leaders (Lazarsfeld et al., 1948), non-professional communicators who informally shape other's political views and behaviours, as well as on Bennett's (2008) notions regarding online communities as spaces for self-actualising citizens and connective actions and discuss influencers' capacity to create such communities. Findings of this research help to better understand political influencers' own perception of them as political socialisation agents and offer directions for future research investigating follower's experiences when interacting with (political) influencers and their communities.

KRAFT, Carina* (The University of Adelaide, Australia)

Taming the Algorithm? a Bourdieusian Approach on Negotiating Algorithmic Visibility of Politically Relevant Content on Social Media Platforms

Social media platforms have become an increasingly important source for politically and socially relevant content, reflected by some prominent examples such as the youth-initiated climate protests Fridays for Future and the Black Lives Matter campaign to increase awareness on racism. However, platforms act as information intermediaries, or rather, information gatekeepers which afford the architecture and algorithms that determine which and how information is prominently displayed on the platform and shape how users can (inter)act in their spaces. Algorithms are thought to reproduce trends, polarisations and persistent inequalities in the offline world. While acknowledging the power of algorithms, some scholars emphasise an element of human agency in algorithmic functioning on social media platforms. To explore this interplay, I draw on semi-structured interviews conducted with social media influencers, i.e., users who are more active, more popular and, as the name suggests, more influential than others, who shared politically and socially relevant content on Instagram, one of the most widely used social media platforms. Interview topics included how influencers interpret and express their agency when sharing and navigating political content within platforms' affordances. In a conceptual approach to this idea, Lundahl (2020) argued in favour of employing Bourdieu's theorisations to investigate the social power of algorithms in the case of algorithmic visibility. The analyses draw on this framework and discuss in what ways influencers negotiate the visibility of their content to the algorithm and subsequently through the algorithm by adapting their habitus on social media platforms. The findings of this research help understand experienced power dynamics between algorithms and humans and explore how we can negotiate and balance their impact when (inter)acting on social media platforms.

KRAHMER, Alexander* (Fachhochschule Erfurt, Germany)

Urban Experience and Emotions. the Role of Social Conflicts

While urbanization finds itself spatially and historically more and more absorbed by global processes, the influence of the latter changes (and had already changed) our perception and *emotional experience* of the city (*cf.*

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Call). Follow-up diagnoses, such as a spreading "indifference" can be found in prominent and divergent thinkers as Georg Simmel ("blasé") and Henri Lefebvre ("alienation"). However, both thinkers show quite contradictory remarks in this regard. The elaboration of these contradictions will be the subject of the first part of our lecture.

Meanwhile, emotions are not only encountered as *indicators* of global influences in the urban context, but also and more directly as ,*companions'* to various phenomena, e.g. social conflicts. Due to spatial and temporal compression they stand out more clearly in the urban context, which makes their entanglement with emotions much easier to examine, too. This interrelationship will be the focus of the second part.

Finally and to support this step with some examples, we will draw on findings out of a new government-funded research project (LoKoNet, BMBF), which, since mid-2022, has been investigating the connections between urban conflicts and emotions. Case studies, that we currently proceed, show a multitude of mutual influences and dependencies between the two, but also how relations of emotions and conflicts has their impact on our general perception of the urban.

Care to Share? Investigating Determinants of Code Sharing Behavior in the Social Sciences

Transparency and peer control are cornerstones of good scientific practice and entail the replication and reproduction of findings. However, scientific accountability rests on the premise that research materials (e.g., statistical analysis code) are made publicly available, which still seems to be the exception rather than the rule among social scientists.

We conduct a field experiment requesting statistical analysis code from corresponding authors ($N = 1,206$) who have published research articles based on data from the European Social Survey (ESS) between 2015 and 2020. To investigate what factors increase or inhibit researchers' willingness to share code, we randomly varied three aspects of our e-mail's wording in a 2x4x2 factorial design, resulting in 16 unique treatment conditions with $n = 75$ per treatment combination. Building on previous literature, we hypothesize that specific appeals, positive framing, and a reduction of effort on the researchers' side will increase authors' willingness to share. Data collection started on the 6th of July 2022 and is expected to be completed by the end of October 2022. The experiment has been preregistered on OSF and is currently under embargo due to the ongoing field phase.

This experimental approach will enable us to estimate aggregate rates of code sharing in the social sciences and allow us to assess specific factors (and combinations thereof) that determine authors' willingness to share. As open code is a prerequisite for prospective replication studies and, thus, the credibility of observational social science research in general, this study makes a significant contribution to the current state of research.

Who Should Take Care of a Dependent Elderly Person? the Perspective of Representatives of Different Generations

The proposed paper will present the results of qualitative research conducted in 2022 among 64 representatives of four generations (the Traditionalist, the Baby Boomers, Generation X and Generation Y) discussing the narrators' opinions on the role of the family in the process of providing care for a dependent elderly person. In Polish society, the prevailing belief (culturally and legally entrenched) is that an elderly person in need of care should be taken care of by the immediate family. Nevertheless, the use of specialized institutions, such as Nursing Homes, is becoming more common, which still arouses extreme emotions, especially in rural areas. Surprisingly, positive opinions about such institutional solutions were expressed by seniors themselves, guided by the well-being of their relatives and the desire to take care of their own psychological comfort. The surveyed representatives of Generation Y, on the other hand, expressed ambivalent feelings toward the use of institutional support for their loved ones. In understanding the issue, the category of generation is helpful, perfectly illustrating to what extent the moment of a person's biography determines his perception of the phenomena of interest. This content will be the subject of the proposed paper.

Who Won a Million? Analysing Competition of S.S.H for Grants in Lithuania

The presentation explores trends of competitive funding of social sciences and humanities (SSH) in Lithuania since 2010 till 2021. Display of financial data helps to reconstruct symbolical hierarchy of SSH and competitive capacities of each disciplines. Despite a heavy focus on empirical data (which is very interesting and suggestive by itself), I would like also to discuss three subtopics or structural shifts: (1) a hypothesis about competitive energy of sociology as a precarious and neo-liberal practice (an ideological shift within sociology); (2) how granting schemes push sociological focus toward explorations of subjectivities and sensitivities (a methodological shift toward fragmentation of the social as an explanatory model); (3) what is an effect of funding patterns on publishing practices in sociology (a communicative shift toward an accidental and anonymous subject/audience). Discursive assumptions of my argument is based on Alvin Gouldner's sociology of sociology.

The dataset covers a period of ten years and is composed from numbers of annual reports on external funding in higher education sector (universities and national research institutes) and grants distributed by national research programs of the Research Council of Lithuania.

KRANIAUSKIENE, Sigita* (Klaipeda university, Lithuania)

Combining Life Stories and Life Course Data in Search for Structural Changes of Transition to Adulthood: The Case of Longitudinal Youth Research in Lithuania

In this presentation, I would like to share my experience using a specific longitudinal youth research format to study changes in the life course in Lithuania from the second half of the 20th century to the present day concentrating on youth as a stage of the life course. The focus is on the changes in the transition to adulthood over time - from Soviet standardisation to post-Soviet de/re-standardization and de/re-institutionalisation after Lithuania joined the EU and the Schengen area and went through economic upheavals and recession. I have examined these changes by combining life story interviews (biographical methodology) with demographic analysis of birth cohorts.

The question is how to combine quantitative and qualitative methods in this format of youth research to identify these changes. I used two data sets. Quantitative data on demographic behaviour of five-year cohorts were generated from two waves of *GGS* (2006-2009) and the *Family and Inequality Survey* (2018-2021). Qualitative data, consisting of life story interviews, was collected in different projects from 2010 until 2022. The analysis of life stories of the different birth cohorts in the search for homogeneity/heterogeneity of individual experiences of a transition to adulthood made it possible to verify and confirm the shift from standardised and institutionalised life course trajectories to de/re-standardized and de/re-institutionalised ones.

However, since life stories, collected over a decade, conclude of people of various ages, a specific "problem of retrospection" arises, as an interplay of age, cohort, and historical period effects influence interviewee reflections on the period of youth.

This presentation is part of the project "Growing up in Independent Lithuania: Life Courses of 1980-2000 Cohorts, Behavioural Strategies and their Contexts" (2021–2024).

KRASOWSKA, Agata* (University of Wroclaw, Poland)

Experiencing a Mental Crisis and Forced Loneliness in the Biographies of Workers

The aim of the presentation is to analyze the category of forced loneliness in the context of paid work as part of a biography in Poland. Enforced loneliness is when it is accompanied by a state of danger, uncertainty, lack of sleep, suffering and mental disorders. It is a kind of separation similar to imprisonment (Storr 2010). The speech will be structured around the thesis that forced loneliness is the consequence of experiencing a mental crisis. For this purpose, I will use data from biographical interviews (BNI) and CATI belonging to two projects COV-WORK (UMO-2020/37/B/HS6 00479) and IDUB (BPIDUB.4610.715.2021). The aim of the paper is to identify the area of connections between the mental crisis and the experience of paid work, which is very often precarious, temporary, flexible and unstable. A mental crisis is the experience of a loss of mental balance caused by external or internal factors, which include: loss of the meaning of life or value system, the concept of self. The crisis is a consequence of, for example, the cultural idea of self-realization. A. Honneth points out that the common idea of self-realization transforms into a form of social compulsion, and this requires from individuals daily introspection, which directly leads to a feeling of emptiness. In this situation, people either simulate authenticity or become depressed (Honneth 2004: 474).Therefore, the important questions are how the informants experience mental crises? How do they function on the labour market despite experiencing a mental crisis and how does it relate to the Covid reality? These questions are related to the reinterpretations of the existing coping strategies in professional and private life and the question how informants build relationships in the reality of forced loneliness? Where do they get resources to deal with a mental crisis?

KREKULA, Clary* (Linnaeus University, Sweden)

The Biosocial Construction of Age: On the Political Use of Age in Age Determination of Asylum Seekers and in Healthcare Prioritization during the Covid 19 Pandemic

Age is multidimensional encompassing, for example, the dimensions of chronological, social and biological age. Extensive research in several age fields has shown not only that age is a social construction, but also how this is done and the consequences for various age groups. However, there is no corresponding research on biological age. This means that social science research has contributed to maintaining the conception that social age is constructed while biological age is objective and neutral. As a consequence, biological age – unlike chronological age – is presented as non-discriminatory when serving as the basis for distribution of rights and welfare resources. Examples of this can be found in legislation on age discrimination and in how access to healthcare interventions during the Covid 19 pandemic were distributed on the basis of age in some countries. In polemic against this simplified view of biological age, my presentation will show that it is manipulable as well as socially manipulated.

This paper consists of two parts. First, I discuss the concept of biological age and point out the vagueness and contradictions in the still ongoing pursuit of reliable indicators and scales. Second, I demonstrate how the concept in spite of its unreliability is used in political rhetoric and practice. The starting point is two themes particularly notable over time in Sweden, where biological age since the 2010 decade has gained a prominent position in political decision processes: biological age in determining the age of unaccompanied young asylum seekers and biological age in prioritizing healthcare interventions during the Covid 19 pandemic, respectively. The paper concludes with a theoretical reflection and the question whether existing legislation against age discrimination is too limited.

KRETSER, Irina* (Saint-Petersburg State University, Russian Federation)

"It Is so Difficult to be a Younger Sibling All the Time": Younger / Elder Relations As a Biological Fact and Social Construction

Hierarchy based on age difference and birth order has always been a crucial issue in sibling relationships. While age difference and birth order are unchangeable throughout life, the social construction of elder/younger, which grows out of these variables, is more flexible. In my research of 30 sibling dyads aged from 20 to 40 who live in different cities in Russia or abroad, I examine what it means to be an older or younger sibling and the stability/changeability of elder/younger roles from childhood to adulthood.

I start with the examination of cultural expectations and practices that relate to elder/younger sibling roles in childhood. I analyze such patterns as responsibilities of elder siblings towards younger ones, the dominance of the elder siblings, a privileged position of younger siblings, elder siblings as an example, and younger siblings as ballast. Age difference, gender, quality of relationships, and family structure affect the predominance of a particular pattern.

While in childhood, elder/young roles more reflect such biological facts as age difference and birth order, in adulthood, elder/young roles and resulting

sibling relationships transform into more flexible social construction. Adult siblings can maintain asymmetric, unequal relationships in adulthood or gradually reduce differences until elder/younger roles become unimportant. What is most remarkable is the "pendulum" effect implying situational identification of elder/younger, which means that elder and younger siblings can change roles regardless of age. The second and third strategies can become potentially conflicting in the case when siblings disagree if elder/young roles are biological fact or social construction.

While in my research, I focus on narratives about the children and adult experiences, we can raise the question, do elder/younger roles matter for older adults?

KRICHEWSKY, Damien* (University of Bonn, Germany)

Fostering Transformative Change in Biodiversity Governance: Reflections on an Action Research in the Field of Access & Benefit-Sharing

Three decades after the adoption of the Convention on Biological Diversity in Rio, the upcoming Post-2020 Global Biodiversity Framework follows up on the landmark IPBES report of 2019 by aiming "urgent and transformative action" to achieve "a transformation in society's relationship with biodiversity". This ambitious science & policy discourse, which has gained momentum in environmental governance, is ambivalent. Confronted with the failure of prevailing approaches, but also hindered by powerful obstacles to change (e.g. ingrained onto-epistemological coordinates, institutional path-dependencies, inequalities and power relations, uncertainty avoidance), governance institutions in need of legitimacy are tempted by pseudo-transformation, including shallow visions and calls for action, abstract models, decontextualized success-stories, and modernist utopia of technological fixes (e.g. climate engineering, genetic redesign of 'nature'). However, by emphasizing the existential need for radical change in a situation where the habitability of Earth is at stake, narratives of transformation also create opportunities for more daring initiatives, in which people join hands to do substantial transformative work.

How social sciences can best help institutions identify the pitfalls of pseudo-transformation and unlock potentials for radical and substantial change is a matter of intense discussions (e.g. Lövbrand et al. 2015; Beck et al. 2021; Lidskog et al. 2022). Our talk will contribute to these discussions by reflecting on an ongoing action research conducted by University of Bonn and the German *Gesellschaft für Internationale Zusammenarbeit*. Anchored in the field of biodiversity governance, with a focus on access & benefit-sharing (ABS) for genetic resources and associated traditional knowledge under the Nagoya Protocol, this action research mobilizes critical theories of the Anthropocene (e.g. Latour; Haraway; Tsing; Escobar), empirical analysis, and concrete transformative work with key actors of ABS to identify and creatively overcome *in thoughts and practice* the flawed modernist framework underpinning the ABS regime (e.g. naturalist ontology, economic reductionism, post-colonial developmentalism).

RC09-JS-132.1

KRICHEWSKY, Damien* (University of Bonn, Germany)

Pushing Pluriversal Transformation through the Cracks of 'Sustainable Development': An Emancipatory Journey in the Worlds of Access & Benefit-Sharing

As the end of the Cold War spurred a neoliberal version of the modern project of global development, a new governance architecture was adopted in Rio to curb the destructive side-effects of this project and make it 'sustainable'. Three decades down the road, as devastating effects and apocalyptical scenarios discredit the sustainable development paradigm, institutions of environmental governance and development cooperation increasingly recast themselves as agents of a 'sustainability transformation'. This trend involves shallow calls for transformative action, abstract 'pathways', success-*stories*, and hyper-modernist utopia (e.g. the genetic redesign of 'nature'). Yet, narratives of transformation also highlight the existential need for radical change in a situation where the habitability of Earth is at stake. Can this be used to foster counter-hegemonic transformation in contexts where, behind the façade, development institutions and professionals are increasingly unsettled by the ecological destabilization of their "one-world world" (Law, 2015)?

The proposed talk will address this question by discussing opportunities, obstacles and strategies for 'pluriversal transformation' in an action research currently conducted with the German *Gesellschaft für Internationale Zusammenarbeit* (GIZ). Since over 16 years, GIZ has worked with African states, industrial actors, and Indigenous Peoples to shape and implement the Nagoya-Protocol, which governs access & benefit-sharing (ABS) to genetic resources and associated traditional knowledge under the CBD. Like many of its siblings (PES, REDD+...), the ABS regime dysfunctions. Using the swelling 'sustainability transformation' narrative as an entry point, the action research mobilizes critical theories of the Anthropocene (e.g. Latour; Haraway; Tsing; Escobar), empirical analysis, and concrete transformative work with GIZ and other actors of ABS to *identify the flawed assumptions underpinning the ABS regime* (e.g. naturalist ontology, economic reductionism, post-colonial developmentalism), and to *creatively emancipate from these epistemological and institutional shackles* to make ABS more supportive of the biocultural diversity of the more-than-human worlds it assembles.

Artificial Intelligence on "New" Working Environments in Industry: Challenges and Prospects for Sociology

In the last decades we are observing the prevalence of theoretical models in the field of labour economy to improve knowledge on AI and its impact on labour markets. In contrast, there are, limited sociological studies on this issue. Most sociological studies are driven on services and platform economy, or on the private spheres. For this reason, we present and discuss the importance of sociological studies on manufacturing environments, where there is a long theoretical debate on the industrialization process and on mechanization, which can be retrieved to the new type of HMI. Seminal sociological works (Friedmann, Touraine, Bell, Riesman) paved the way to new studies, especially about the technological change's effects on qualifications and employment. These were the cases for several US, German, British and French sociologists. But the studies on AI in work environments are less widespread. The topic became more complex, the difficulties to access firms for empirical research at the shop floors were an obstacle. Globalization trends have changed the way products can be designed and manufactured and that could imply a more generalized process of use of flexible production systems and integrated communication between organization units. The more intensive usage of automated systems enabled a shift towards a strategy of Industry 4.0 for the manufacturing sector in many developed economies, which means an advanced application of AI in work spheres. This implies a deep change as well on the HMI in those sectors. One important challenge for the sociology theoretical models is to understand the implication of those changes and to develop new qualitative approaches in a more holistic mode. Such new approaches mean that sociology can become an important tool to present complex and innovative models more focused on the human implications of such technology.

Democratic Environmental Governance, Fisherfolk Communities and the State: A Case of Vizhinjam International Seaport in Kerala

Based on the multiple narratives focusing on the Vizhinjam International Seaport Limited (VISL), this paper attempts to understand the conflicting narratives of its various stakeholders. The VISL is perceived as an initiative of national pride as it is India's first major mother port. The objective of the study is to examine the factors that have led to the resistance toward the seaport and the emergence of multiple discourses surrounding it. The data collection comprises in-depth personal interviews with the people residing along the coasts, civil society organizations and bureaucrats of the Government of Kerala. The coastal communities in Vizhinjam include traditional fish workers, trawlers, auctioneers, vendors, hotel owners, real estate agents, and clergymen of the church. Around 50 respondents have been identified and interviewed. The secondary data include newspaper articles, journal articles, the Comprehensive Environmental Impact Assessment report of the port, and the feasibility report of the same. The study was carried out in the villages around VISL which is currently under construction between the year 2011 to 2012. Since the inception of the project, there have been several groups and people being vocal against the project as well as endorsing it. The study articulates the conflicting narratives of various stakeholders as well as the events that have led to the people to protest against VISL. The protestors hold the State as well as the State–Capital nexus accountable for the damage they believe has been caused to the coastal regions of Vizhinjam and adjoining villages.

Analytical Sociology: Methodological Reflections on Theory, Methods, and Data

This talk discusses the principles of analytical sociology in the light of recent trends in sociology and neighboring disciplines. Across the social sciences, the credibility revolution emphasizes the identification of causal effects and open science practices as cornerstones of credible social research. Another development is the rise of computational social science fueled by the availability of digital footprint data and advances in computationally intensive methods. While these trends are relatively independent of each other, both prioritize new methods and kinds of data over theory development. In comparison, the agenda of analytical sociology has always been centered on the idea to uncover the underlying mechanisms of empirical regularities and to formulate generative theoretical models that allow such insights to travel across and link various areas of research. The talk will take stock of these developments and discuss their implications for the agenda, methodologies, and prospects of analytical sociology (see already Hedström 2021, Manzo 2022).

Governing Inequality: Tax Perceptions, Redistributive Preferences and Expectations Towards the State Among the Political Elite in Mexico

Contrary to what standard models suggested, higher inequality does not automatically lead to greater demand for redistribution. Many factors have been shown to divert the seemingly straightforward relationship between perceiving inequality as a problem and advocating for progressive tax systems, but few studies have focused on the narratives that those politicians and civil servants in charge of policymaking mobilize against fiscal interventions.

To help fill this gap, we interview 14 Mexican top-level politicians/civil servants in positions to shape and implement tax policy at the national, state and municipal level, about their perceptions of inequality and redistributive preferences, asking about different mechanisms that have been shown to affect demand for redistribution, such as perceptions of social mobility, meritocracy and trust in government.

We find that interviewees perceive inequality as problematic, although they don't necessarily have an accurate perception of the income distribution (nor their own position within it, which they grossly underestimate). Moreover, they feel powerless to influence inequality. Despite the capacity of taxes to pay for the social programs they favor, and curb inequality – two things interviewees agree lie in the realm of governmental responsibility – they do not spontaneously name tax policy as a solution to inequality. As most are not bound by popular vote, indicating no direct conceptual link between the two topics.

Instead, they belief in meritocracy, proposing education and conditional poverty relief as solutions to the acknowledged unequal opportunities. They consider taxes beneficial but stop short of supporting a reform of the current regressive tax regime. Despite being part of the political system themselves, they have low trust in the government's ability to use additional revenue adequately. Such perceptions constitute obstacles to any potential progressive tax reform in Mexico and countries with a similar context.

Gender and Violence in the Psychiatric Context

Background: Victimization of mental health service users is a pressing problem with severe consequences for mental health and recovery processes, and with implications for mental health treatment and services.

Method: Based on recent findings, gender specific victimization rates and similarities/ differences between men and women's violence experiences will be introduced.

Results: Women and men treated for mental health problems show comparable prevalence rates for physical vicimization. However, compared to the general population, women have significantly higher risks for physical and sexual victimization than their male counterparts. Further gender differences were found in regard with violence settings and forms, type of perpetrator, and social characteristics.

Conclusion: A gender perspective on victimization is vital for the development of effective strategies to prevent and manage victimization among women and men treated for mental health problems.

Emotions and Mobility – Changing Social Imaginaries of Study Abroad

Educational mobility used to be depicted – both by policy and by its users – as a happy space of self-development. In this presentation, I will look at study abroad as an institutionalized form of realization of aspirations and playfulness within a wider educational career. I will analyse the European programme Erasmus during the very specific time of the COVID-19 pandemic were both these pillars of mobility were put at stake: the 'future' prospects of young generation in regards to their professional careers become uncertain, but also the 'present' opportunity to enjoy the educational semester abroad. On the basis of 10 focus group interviews conducted within two projects concerning impact of COVID-19 on international student mobility (Spring 2020) and Erasmus mobility (Spring 2021) I will try to reconstruct the narratives of Erasmus higher education students facing the crisis in regards to mobility, as well as one's agenda towards the future. How young people were reconstructing the

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

meaning of the Erasmus exchange taking into account the fact that its core elements – educational experience and intercultural encounters – were limited or even blocked? Taking into account the positive image of study abroad experience and its biographical significance, I will look into emotions in relation to the experience of studying abroad during the epidemiological crisis. The crisis moment allowed also resignation, sadness or solitude to show in the discussions, something that was rare in previous studies on Erasmus mobility, but was allowed in pandemic. This possibility to complain, fail or resign is interesting to discuss in regards to the existing discourses of aspirations, which demand entrepreneurial spirit and hope for success, as well as in light of strong normative pressures to participate in geographical mobility.

Measuring Gender Equality for Gender Equality Plans. Critical Reflections over the Indicators in Policy Design and Monitoring at the Institutional Level

Gender Equality Plan (GEP) at the institutional level has become the new eligibility criterion for research funding in the EU countries. Each university or research organisation is thus required to design a strategy for gender equality with, among others, an adequate tool for progress measurement and inclusive approach. This raises questions on indicators for gender equality in research and higher education, but also requires deep reflection on intersectionality. Both problems have been addressed in Gender Equality Audit and Monitoring (GEAM) - a questionnaire framework developed within the ACT and INSPIRE (Horizon), used already by about 30 institutions. GEAM captures the experiences and perceptions of employees regarding key dimensions of gender equality, such as working conditions, work-life balance, discrimination, sexual harassment, micro-aggressions.

This presentation focuses on the analysis of indicators included in the GEAM and its usefulness for design and monitoring of GEPs. We look at the importance of both objective (institutional statistics) and subjective (survey-based) indicators, but also at indicators capturing the organisational culture as the environment for inequality.

Secondly, we assess the measurement of implicit/covered discrimination, which – contrary to overt discrimination - is harder to diagnose and target with the policies. We discuss whether the GEAM provides effective indicators to capture implicitly biased behaviours and acts.

Thirdly, we examine which indicators appear useful to design institutional solutions in regards to inclusive gender equality. We look into the potential to carry out an intersectional analysis based on the data generated with the GEAM. How feasible is the analysis of discrimination based upon intersecting categories such as gender, race, ethnicity, disability, sexual orientation or age? We carefully discuss whether – or, if yes, to what extent – focusing on the intersectionality and strengthening inclusiveness of GEP plays down the gender inequalities and risks that gender is lost in the process.

Situating Space in the Rise of Aam Aadmi Party: Tracing the Emergence of Resistance and Political Subjectivity Among Urban 'Slum' Dwellers and Rural Farmers Against Authoritarianism in India

This paper examines the recent success of Aam Aadmi Party, an urban social welfare based political party from India, in expanding its vote base from urban slum dwellers of Delhi to predominantly rural farmers of Punjab. It demonstrates the emergence of a common sensibility of economic dispossession influencing the political subjectivity of farmers as well as 'slum' dwellers against right-wing governance of the incumbent Bharatiya Janata Party, expressed through the recent success of farmers resistance strategies against state led neoliberalism, and the electoral choices of 'slum' dwellers and farmers. It argues that analyses of political contestation against the authoritarian state and its neoliberal policies of land grabs, privatization and corporatization remain unattended to, when limiting our study of politics to methodological cityism which studies the grievances, electoral demands, and solidarity of urban and rural subjects disjointedly. It shows that studying space, and its immanent politics beyond the dualities of urban and rural, allows for suturing together successful challenges to authoritarian governance in India. The paper draws on primary sources such as farmers newspapers and social media interviews during state elections, to synthesize the emergence of similar political subjectivities among both urban and rural subjects, through their experiences of economic injustices. It finds that rural/urban binaries are unproductive and hinder tracing the influence of state led urbanization processes on the political imaginaries of people, their agency for political contestation and sympathy for each other. Drawing on electoral discourses of farmers and slum dwellers, it utilizes the framework of planetary urbanization to analyze the political consequences of urbanization

in process and expands the framework's utility to demonstrate how spatial processes instigated by the authoritarian state is shaping a political subjectivity of resistance among rural and urban subjects against the economic modes of right-wing governance.

KUBICKI, Pawel* (Jagiellonian University, Poland)

Urban Social Movements in Poland

The presentation focus on the process of formation and transformation of urban movements in Poland. Conclusions are based on the data collected during the research project: "Urban Social Movements in Poland" supported by the National Science Centre. For the requirements of the project was adopted a method of qualitative research using the techniques of in-depth narrative interviews, participant observations and secondary data analysis. The author conducted 30 in-depth interviews with leaders of urban movements from sixteen cities. The presentation describes the process of structuralization and the creation of identity of the Polish urban movement and their role on the local political stage, stressing, in particular, their significant role as a creators of a new discourse in Polish cities.

KUBISA, Julia* (University of Warsaw, Poland)

Gender Equality Plans at Universities in Poland and Institutional Change between European Institutional and Local Political Pressures

In the past, European Commission encouraged universities to adopt certain equality measures. Currently, applicants in Horizon Europe need to prove that the university has or prepares a Gender Equality Plan. Those strategic documents focus on addressing gendered biases and obstacles visible in academic careers – leaking pipeline in case of women academics, glass elevators in case of men academics, uneven divisions of labour and power, lack of balance between academic work and life. The general aim is to eradicate of as much as possible of direct and indirect discrimination, which are recognized as a salient obstacle in the process of development of science. Therefore, there is a significant institutional pressure on European level on GEP implementation at universities. This presentation is focused on the case of Polish universities and the processes of preparation and adoption of GEPs in the context of conservative, right-wing and anti-gender political climate: the government and lobbyist organizations in the country. My aim is to study whether GEPs bring institutional change to Polish universities, with regard to the specific shape of GEPs that combine EU demands with local context, and the significance of local political pressures on the process of preparation and implementation. I combine perspective of participant – author of first GEP in Poland at University of Warsaw with sociological expertise to present initial findings on the specifics of the process of implementation of gender equality policies at universities in the particular political context, with the use of feminist institutionalism approach. The research is based on autoethography, critical discourse analysis and approx. dozen problem-centred interviews with equality stakeholders at Polish universities.

KUBOTA, Hiroyuki* (Nihon University, Japan)

"Friendship Marriage" between Non-Heterosexuals: Circumventing Amatonormativity in Marriage in Japan.

In the context of the increasing global tendency toward providing equal marriage rights for same-sex couples, Japan appears to be far behind the consensus in Western countries. Taiwan was the first Asian country to permit same-sex marriage in 2019, but the Japanese government has been reluctant to redefine marriage to include same-sex marriage, restricting the legal rights and protections for non-heterosexuals at the state level.

In this background, the emerging phenomenon of "friendship marriage" has drawn attention. Friendship marriage is legal matrimony without romantic or sexual activities, typically between gay men and women. This kind of marriage has gained increasing visibility in mainstream media since 2020. A marriage without love and sex is viewed as deviant and even false when compared to the norms of heteronormative romantic love, but it is still an important option to allow homosexuals to camouflage themselves under heterosexuality and access the rights that marriages provide. However, it also reflects contemporary hardships regarding love, sex, and marriage for everyone under the current conditions of late modernity (Illouz 2013).

This paper explores the implications of the growth in friendship marriage in Japan, taking a mixed approach. First, a preliminary online survey was conducted on 400 individuals (200 couples) who were married through a friendship marriage agency to collect basic information including sexual orientation and reasons for opting for friendship marriage. Second, semi-structured interviews were conducted among 20 individuals in consent in Tokyo and Nagoya, to determine the reality of their unique marriage.

From the data thus gathered, I argue that friendship marriage in Japan is utilized between non-heterosexuals including asexuals , to access the privilege

denotes a presenting author. Abstracts are organized by first presenting author's last name.

of legal matrimony and its importance in the Asian context, circumventing not only the heteronormativity but also the amatonormativity (Brake 2012) of the unequal marriage laws in effect in Japan.

KUCUK, Meryem* (Dr., Turkey)

Urban Transformation and Segregation: The Case of Zeytinburnu, Istanbul

The global and neo-liberal policies that dominate modern society cause urban people to change socio-culturally and economically, and result in spatial transformations. The issue of urban segregation that is observed with spatial transformation differentiates the impact and dimension of these socio-cultural and economic changes. Economic factors and reorganization have significant impacts on the transformation and segregation of urban space. Reorganization affects generation-based relationships and the relevant population distributions, differentiating social classes and income distribution. Ever-changing economic policies transform urban spatial organization and intensify spatial appearance and social differentiation. Furthermore, the prioritization of a capitalist economy and a competitive labor market with the approach of a socialist state and changes in the policies of a welfare state, as well as unemployment and inadequate access to income and housing, have intensified poverty and segregation. The supra-national and national movements/migrations after the 1990s brought social groups with different ethnic roots together in the same urban space, resulting in a heterogeneous social structure. Some groups with different ethnic roots, described as social minorities, were separated from one another socially and physically. It is, therefore, safe to state that the processes of spatial transformation and segregation that happen on the urban scale are based on urban settlement patterns and social classes. This study reveals "how the spatial transformation finalized urban segregation". It questions "how the social classes transformed the space and the elements determining the selection of housing", "the ever-changing relationship of ownership and its connection with urban segregation", "perceptions, distances and attitudes of different urban social classes toward whatever or whoever is different" and "how different classes were affected in the urban transformation and regeneration process". Based on the subject and problem of the present study, the field study was conducted in Zeytinburnu, Istanbul, Turkey.

KUDLA, Daniel* (Memorial University, Canada)

Examining the Local Policy-Making Process of Canada's National Homelessness Strategy across Atlantic Canada

The implementation of the federal government's homelessness strategy (called "Reaching Home: Canada's Homelessness Strategy") is executed by a governance network comprised of a diverse group of government, quasi-government, and nongovernment actors. While there is an abundance of government reports and scholarly work that evaluates the effectiveness of homeless reduction programs enacted by these governance networks, little work examines the decision-making and policy-planning process that creates the conditions for homeless reduction programs. Given that innovative and coordinated systems of programs are most effective in reducing homelessness, it is crucial to evaluate homeless governance networks' level of autonomy, flexibility, and collaboration throughout the homelessness policymaking process. To fill this research gap, we provide an Atlantic Canada context by focusing on the homeless policymaking process in four mid-sized Canadian cities (St. John's, Halifax, Saint John, and Charlottetown). This includes 30 interviews with the federal governments' professional staff and a content analysis of homeless policy documents. We draw from policy mobilities literature to understand how an assemblage of diverse social actors adopt and legitimize homeless policies in their particular locales. This project conceptualizes policymaking as horizontally distributed among an assemblage of state and civil actors rather than the central state unilaterally directing governmental programs through an all-encompassing neoliberal ideology. Seeing through "assemblages" helps us see the possibility that governance practices can have multiple and contradictory outcomes, foregrounds agency in governance processes, orients us to how situated actors negotiate tensions that emerge in these heterogeneous formations, and appreciates the contingency of particular governmental formations and how these arrangements fluctuate and change. This project is the first phase of a larger project that will include the perspectives of a larger sample of local community stakeholders across our four research sites.

KUENNEN, Tamara* (University of Denver, USA)

Institutional and Cultural "Power and Control": Excavating the History of the Power and Control Wheel

This Essay excavates the history of the "Power and Control Wheel"—an iconic image in the anti-gender violence movement. On a single vivid page, the Wheel captures multiple layers of abuse. In the wheel's hub are the words "power and control," the fundamental motivations of an abusive partner. Eight

spokes emanate from the center, each representing a tactic of abuse designed to accomplish that goal, such as "coercion" and "intimidation." The rim of the wheel identifies "physical" and "sexual" violence as the actions holding together and fortifying the tactics of an abusive partner's control.

The Wheel sprung from activists' interviews with battered women in the U.S. in the early 1980s. First printed in a modest spiral bound manual with cover art drawn by a volunteer, for thirty years the Wheel has been the predominant model of intimate gender violence in the U.S. and in many countries around the world.

What the world does not know is that the Wheel was originally accompanied by a Chart. The "Institutional and Cultural Supports for Battering Chart" focused on structures outside the relationship that increase one partner's capacity to abuse the other. Women in discussion groups would connect an intimate partner's tactics (pictured in the Wheel) to institutions, cultural values, and beliefs (listed on the Chart).

The Essay traces the disappearance of the Chart and argues that this disappearance illuminates two essential movement challenges: the masking of structural causes of gender violence when the exclusive focus is the individual relationship, and the set of problems that flows from the professionalization of the movement, whereby people experiencing abuse are viewed as clients to whom services are delivered, rather than partners with whom activists forge new paths toward social change.

RC12-182.2

KUENNEN, Tamara* (University of Denver, USA)

Institutional and Cultural "Power and Control": Uncovering the History of the Power and Control Wheel

This Essay excavates the history of the "Power and Control Wheel"—an iconic image in the anti-domestic violence movement. On a single vivid page, the Wheel captures multiple layers of intimate partner abuse. In the wheel's hub are the words "power and control," the fundamental motivations of an abusive partner. Eight spokes emanate from the center, each representing a tactic of abuse designed to accomplish that goal, such as "coercion and threats" and "intimidation." The rim of the wheel identifies "physical" and "sexual" violence as the actions holding together and fortifying the tactics of an abusive partner's control.

The Wheel sprung from activists' interviews with battered women in the U.S. in the early 1980s. First printed in a modest spiral bound manual with cover art drawn by a volunteer, for thirty years the Wheel has been the predominant model of domestic violence in the U.S. and in many countries around the world.

What the world does not know is that the Wheel was originally accompanied by a Chart. The "Institutional and Cultural Supports for Battering Chart" focused on structures outside the relationship that increase one partner's capacity to abuse the other. Women in discussion groups would connect an intimate partner's tactics (pictured in the Wheel) to institutions, cultural values, and beliefs (listed on the Chart).

After identifying factors contributing to the Chart's disappearance, the Essay argues that this disappearance illuminates two essential movement challenges, which are masked when the exclusive focus is the individual relationship. The other is the set of problems that flows from the professionalization of the movement, whereby people experiencing abuse are viewed as clients to whom services are delivered, rather than partners with whom activists forge new paths toward social change.

KUKUTAI, Tahu* (The University of Waikato, USA)
THOMPSON, Victor* (Rider University, USA)

The Rise of the Identity State: Ethnicity, Citizenship and the Census

Today more than 95 percent of the world's countries undertake a census, making it one of the few policy instruments that are truly universal (Kukutai, Thompson & Macmillan 2015). Using a unique global database of census forms and population registers over a 40 year time period, we examine how governments around the world have enumerated their populations using both ethnic-racial and civic-legal models of enumerations. The results of our project suggest 4 types of states: 1) **Super identity states** that enumerate their populations across multiple dimensions of civic-legal and ethnic-racial status; 2) **Identity states** who draw ethnic-racial and civic-legal distinctions within the population but do so using a more limited set of indicators; 3) **Citizenship states** that enumerate only on the basis of civic-legal status; and 4) **Weak identity states** that capture only one dimension of difference, most often birthplace or nationality.

Our work traces **the emergence of a new global norm of identity accounting** with a turn toward more complex forms of census enumeration that reflects internal pressures on states to recognise group-based identities as well as external pressures associated with migration flows, trade and global civil society. In making this argument, we depart from previous theories, which typically treat ethnic-racial enumeration as the unique product of a country's historical relations and contemporary conditions, by showing that the construction of identity in the census is influenced by factors that emanate both within *and* outside the state. We end with a discussion of how technological innovations are transforming the ways in which governments collect data on

their citizens, often for the purpose of monitoring and intervention, which raises new questions about the state's use of population data, individual rights to data privacy and security, and ultimately the future of the census.

RC18-JS-13.4

KULAS, Piotr* (Uniwersytet Warszawski, Poland)

Authoritarian State or Authoritarian Society? Right-Wing Struggle for Recognition in Poland.

The presentation aims to analyse the authoritarian shift in Poland in terms of the recognition theory. The recognition framework helps understand the popularity of the Polish Right in recent decades. The presentation argues that while economic redistribution is important, only recognition gives the right-wing lasting support of the electorate.

More and more groups do not accept the distribution of respect prevailing in Poland. The struggle for changing the respect distribution patterns has been part of the deliberately constructed project of the Right since the 2000s. The right-wing claims to represent groups of people and cultural values neglected, misrepresented and deprived of access to cultural circulation for years. The right-wing version of the populist recognition underlines the idea of a familiar Polishness consisting of ordinary people. According to the right-wing narration, most Poles have become "strangers in their own land", ridiculed by the big-city and paternalistic elite. However, its recognition policy generates contempt for categories of socially and politically constructed enemies: critical elites, a large part of the intelligentsia, professionals, sexual and ethnic minorities, and women. In effect, the struggle for recognition is a zero-sum game: respect can only be earned at the cost of contempt for someone else.

The presentation builds mainly on data collected in the two surveys on the representative sample of Polish society in 2020 and 2021 (n = 1000 adult respondents). It also draws on other sources like desk research and the content analysis of the press and political programmes. In conclusion, I put my findings in the perspective of the recognition and recognition gap framework to analyse how the disrespect experienced by people eases the way to authoritarianism, social dominance orientation and rise in intergroup competition, the support for populists aiming to "take back" the country and make it great again.

RC47-JS-76.6

KULAS, Piotr* (Uniwersytet Warszawski, Poland)

Recognition Gaps in East-Central European Society. Distribution of (Dis)Respect and Its Role in Struggles for Human Rights and Cultural Worth.

The struggle for recognition returned to the moral grammar of social conflict in twentieth-first-century societies. The presentation examines the role of respect distribution in Central European countries on the backdrop of their recent shift towards illiberal democracy, with Poland as a critical case study. In recent decades, people in the region have experienced new forms of recognition gaps which largely contributed to the current political polarization. A recognition gap is a form of inequality and injustice experienced by people based on class and cultural differences. It is a missing framework in the current socio-cultural analysis. The presentation shows how members of different groups and classes experience and perceive recognition in their daily interactions with others. It also shows how claims for respect/recognition ("what it means to be a worthy person") differ according to classes, social standing and group belonging. It also develops the main societal and cultural "recognition gaps" in Polish society. Based on Axel Honneth's theory of recognition and the recognition gap perspective by Michèle Lamont, the author advances the thesis that there are two main recognition gaps within Polish society. The recognition gaps concern two main groups: *minorities* and *the denigrated*. While in the first case, the lack of recognition mainly involves injustice and deprivation of rights of women and minority groups, the second misrecognition concerns people despised due to their material status and cultural worth. The presentation builds mainly on data collected in the two surveys on the representative sample of Polish society in 2020 and 2021 (n = 1000 adult respondents). It also draws on other sources like desk research and tens of in-depth interviews. In concluding remarks, the author argues that people experiencing recognition gaps are pitted against each other and used by populist politicians in a zero-sum game to split them apart.

KULCZYCKI, Andrzej* (University of Alabama at Birmingham, United States)

Drawing Light from the Covid-19 Pandemic: Advancing Vaccination Efforts, Metrics and Reporting Systems for Future Pandemic Preparedness and Ongoing Adult Vaccination Programming

The Covid-19 pandemic has caused devastating health and socio-economic consequences, exposing multiple public health system deficits. Greater cooperation and coordination are needed to deal with global health threats and immense gaps in vaccine equity. The response to Covid shows low historical consciousness among policymakers and even many scientists about lessons from recent infectious disease epidemics such as smallpox and polio, contained through worldwide vaccination efforts, and HIV/AIDS, which has required immense global collective action. Additionally, we must act now to prevent, or at least contain, the next pandemic. In 2022, a two-track pandemic has continued with booster Covid-19 vaccinations available in high-income countries while first doses have still not reached many people in low-income countries and fragile states. Vaccine hesitancy, cost and access barriers undermine response efforts in nearly all settings. This paper first surveys major institutional arrangements proposed to help manage greater global vaccine cooperation and equity to help determine a more effective and sustainable approach. It then examines the use of immunization information systems, with greater focus on the US and UK, for lessons to prepare for the next pandemic and to strengthen adult vaccination campaigns in normal times. The need for expanded provider enrollment and data reporting, long-term investments to support staffing, infrastructure and data security, and granting public access to vaccination records, as well as several major deficits, are highlighted. The pandemic response emphasizes the need to explore the status and value of vaccination data as an important glue connecting vaccine development (where it succeeded) and downstream vaccine delivery systems (where it fared less well, particularly in the US). A more universal approach is needed to uniformly collect more comprehensive, accurate data to inform development and use of reliable metrics for health systems, disease and pandemic preparedness and response, and vaccination programming.

Religion, Low Fertility and Competing Visions of Tradition in Europe and Latin America: A Comparative Analysis of Catholicism, Pronatalist Stresses, and the Natural Order in Poland and Brazil

Demography creates threats and opportunities. Religions influence cultures and societies and have sought to influence fertility and reproduction, including their ethics, consequences and policies. Politicians have concerns about current and future implications of fertility changes. The concerns of religions, politicians, and other organizations on these issues may become hotly contested. At the 1994 Cairo population conference, the Vatican stifled discussion of abortion that advocates promoted as a reproductive right and became recognized for the first time at a major global forum as a public health concern. Since then, declining fertility rates and ageing in many regions have led to the evolution of population policies related to fertility. By 2019, almost as many governments had policies to raise fertility as those that sought to promote smaller families. Autocratic and quasi-authoritarian rulers have found a significant government role in stopping declining birth rates, often backed up by religious groups. In Iran, Russia, Poland, Brazil, the USA, and elsewhere, these have become embroiled in arguments about gender equity, misogyny, illiberalism, and authoritarianism. Questions about fertility/reproductive politics remain complex and controversial, yet little scholarly attention has been paid to what Catholic leaders have had to say about low fertility. Low fertility rates are tied into the political dimension of demography and narratives of cultural identify, nationalism, and population decline, particularly in Europe and, increasingly, Latin America. This paper focuses on how demographic developments and arguments have become enmeshed and evolved with the interplay between abortion, women's reproductive health and population policies. We focus on Poland and Brazil within their respective regions. Catholic leaders and politicians have sought to restore the 'natural order' on sexuality and reproduction, yet falling birth rates indicate their strictures may be increasingly sidelined. This comparative analysis uses these case studies to examine recent changes in religious beliefs, values and choices.

KUMAR, Adarsh* (Friedrich Schiller University Jena, Germany)

Migrant Workers of Colour in Platform Economy: A Case of Uber in the United Kingdom

Researchers in platform or gig economy have assumed that every worker is the same, with same agencies and perceives employer's control uniformly. It is problematic! It emanates from the idea that labour is a commodity, although it is a 'human being' with all its worldly challenges.

Studies suggest that migrant workers dominate the platform economy, and its algorithmic management (AM) coupled with national contexts-Immigration policies- 'controls' them. Moreover, depending home and host country's contextual and social realities, different workers perceive the platform's 'control' differently.

This paper adopts a qualitative method and interviews 31 Uber drivers and 6 Unions. It conducted six months of non-participant observation of a worker's chat group comprising 23,000 members and an average of 15 posts/day. It also incorporates observations from two court hearings and three driver's protests in the UK between January 2022 to July 2022.

Findings suggest that Workers of Colour (WoC) from developing countries face relatively more challenges from Uber's AM than white workers do. In conflict with passengers and issues with the app, WoC feel marginalized,

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

discriminated, and believe treated harshly by customers, Uber, and local institutions. They claim, passengers unnecessarily blame and poorly rate them, and unreasonably nitpick issues such as car cleanliness and driver's behaviour, and intentionally provide wrong ratings and complaints to the Uber system, sometimes to get free coupons. In return, Uber's AM, often without consulting, either suspends workers from their job or sends them harsh warnings. At Greenlight hubs and during customer support, it takes more time for WoC to resolve issues; from obtaining car stickers to dealing with the issues of account deactivation.

There are multiple reasons for this. First, WoC bring insecurities from their home countries and feel like 'second-grade residents' of the host country. Second, the host country alienates them, given their strict immigration policies.

KUMAR, Anilesh* (Hong Kong Baptist University, Hong Kong)

Prime Time Hate: A Political Economy Approach to Investigate Communal Narratives on TV Debates in India

A notable change in the nature of TV journalism has been registered in India since the victory of the Bharatiya Janata Party (BJP) leader Narendra Modi in 2014 and subsequently in 2019. News organisations/journalists that have been critical of Modi have landed in legal and financial troubles while a large section of the mainstream media (and an emergent ultra right-wing digital eco-system) has been propagating BJP's ethno-nationalist politics. Media support for the BJP's ethno-nationalist ideology has reflected on a number of occasions in which minorities, particularly Muslims, have been found to be at the receiving end of an incessant media trial questioning their loyalty and projecting them as a threat to national security.

While such 'media framing' of minorities has been studied in various countries, the proposed article is the first study of Indian TV media that aims to explore the topic from a political economy perspective. Much has been written regarding how the media (re)presents Muslims elsewhere, however, there is no comprehensive study on the relationship between media ownership and the (re)presentation of Muslims in a 'certain way' in Indian media.

To explore the ownership-narrative dynamic, this study proposes to conduct a thematic discourse analysis on more than 200 episodes of News18' prime-time debates. News18 is owned by India's largest industrial conglomerate Reliance Industries Limited (RIL) and its owner Mukesh Ambani – the richest businessman in India, is known to have close ties with Modi, raising pertinent questions about the role of media in creating sympathetic narratives for the ethno-nationalist ideology of the BJP.

Preliminary findings suggest a clearly discernible trend of an overtly hostile media coverage against Muslims which can have serious social and political implications for India in particular and democracy in general.

KUMAR, Bagesh* (National Institute of Educational Planning and Administration, New Delhi, India)

Understanding Humiliation in Indian Higher Education: A Perspective from Dalit and Adivasi Students

Imbibed in the Indian social structure, 'caste' is a live force in Indian culture and politics. In recent times, caste and tribal identity in/and higher education institutions are one of the emerging fields of critical social enquiry. Gatekeeping mechanisms through institutional practices of exclusion and discrimination are reflected in the discourse on merit and reservation policy. This serves as the departure point for this paper, engaging with the idea of humiliation using the 'perspective from below'. This study captures the experiences of Dalit and Adivasi students in different social settings within the university campus, including classroom settings, academic discussions, hostel life, along with peer group formation. Consequently, it problematises the idea of 'inclusion' in higher educational institutions beyond affirmative action policies.

This study is a multi-sited ethnography conducted in two phases between 2017 to 2019. The sites of the study are located in the Northern and Southern parts of India. Both public universities are ranked among the top five higher education institutions by the Government of India. The study reflects multiple facets of the reproduction of caste inequalities through discriminatory practices on university campuses. It attempts to contextualise humiliation through the lens of everyday experiences of exclusion, discrimination and alienation in the educational trajectory of socially disadvantaged students. Additionally, it critically examines the relationship between 'identity, space and power' through the lived experiences of the first-generation Dalit and Adivasi students.

The study concludes social identity makes humiliation endemic in every social context, including higher education. Experiences of humiliation are common in the narratives of the Dalit and Adivasi students. Given the relationship between social identity and humiliation, such experiences severely affect academic life, mental health and well-being. Further, the study outlines the limitations of the inclusive policies that block socially marginalised students' participation in teaching-learning and research activities.

Embedded Dispossessions: The Gendered Self in the Classroom

In India, patriarchy invades the young minds in a very unobtrusive manner, through cultural celebrations, language discourses and the pedagogy. On the one hand, there are millions of unwanted girls and on the other, the girls who survive encounter systemic and epistemic discrimination throughout their life cycle. The socialization process commencing with the family and continuing through the educational mechanisms play a vital role in creating the dispossessed self.

This paper focuses on the multi-layered dispossessions operating in the society which makes for a 'gendered' experience. The educational apparatus and the pedagogy are governed by hetero-normative concerns; for the boy it's the amalgam of caste and class and for the girl, it's the nexus of caste, class and gender which determine their life choices. The entire process is mediated through the prism of language. The classroom is an exclusionary space for girls, where they encounter hegemonic language, behavior and mentalities. It would be interesting to explore interpersonal relationships, peer prejudices and coping mechanisms by such linguistically marginalized students? Adopting a case study method, the paper revolves around five research scholars in Delhi University, who exhibit great resilience in overcoming familial, societal and pedagogic prejudices to access higher education. Are these students able to build a network for emotional solace, to survive the inequity surrounding their life worlds? Scholarly articles as well as personal narratives will be utilized to unpack the process of alienation as well as resilience in the classroom and outside.

KUMAR, Deepak* (University of Delhi, India)

Linguicism in Indian Higher Education: A Case Study of University of Delhi

Language plays a major role in human life in the context of communication, sharing emotions, and cross-cultural notions. It has a capability of knowledge production and acquisition to contribute to the intellectual sphere. From tertiary to higher learning, language plays a very important role in the learning process. But providing "quality-education" is the entire sole reasonability of institutional preference in language. In modern times, schools are mostly divided into two groups based on their language: government-funded and private schools.

Those who come from economically-weaker sections depend on government schools for their children's schooling. There is nothing wrong with sending children to a government school, but it is a matter of "quality education" and the medium of instruction. For example, most private (so-called public) schools provide education in English, whereas government schools provide the same in regional languages. The division of language is also determined by gender, caste, and class. Most of the time, students from upper castes, classes, and boys prefer higher education, whereas economically disadvantaged sections are unable to attend. And when marginalised students enter into university spaces, they encounter discrimination and exclusion inside and outside the classroom from peer-groups, teachers, and administration as well. As a result, it has an effect on their mental health, and they feel things like inferiority-complex, humiliation, lack of confidence, psychological-pressure, being left-out, feeling depressed, or being insulted, and sometimes it even makes them think about killing themselves.

While using the case study method, this paper addressed the life-journey of five research-scholars at Delhi University who exhibit great resilience in overcoming familial, societal, and pedagogic-prejudices to access higher education. It will also address the concerns of these students who encounter challenges in bridging the gap that has been created due to language-discrimination and their emotional solace to survive the inequity surrounding their lives.

Upliftment of Displaced People: An Examination of the Role of Government and NGOs at Hydro Power Projects in Mountains of Himachal Pradesh

Since India's independence in 1947, there has been a surge of economic development activities in the form of massive infrastructure development projects such as the construction of dams for power and irrigation, the building of roads, urbanization, mining, building of thermal power plants, etc. Proponents of large dams argue that only these types of massive projects can improve India's economy and the lives of millions of people. While on the other side this sort of development has produces massive displacement of the local people. The issues related to land acquisition, compensation, resettlement as well as relief and rehabilitation for displaced and project-affected people is a serious issue of concern for the government as well as the NGOS to meet these challenge and concerns. There are

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

many NGOs actively working to proper relief and rehabilitation of the affected people. In this scenario, the focus of the present research paper is to examine the role of NGOs as well as Government for the upliftment of displaced people in the context of relief, rehabilitation and resettlement programmes in district Kinnaur, Himachal Pradesh, India. A simple random sample strategy was used to pick 300 respondents in total for interview. Likewise, 150 male respondents and 150 female respondents from the Jangi Thopan and Karchham Wangtu Hydro Power Projects were chosen for the sample.

Understanding Environmental Conservation through the Lens of Myths, Beliefs and Practices : A Case Study from the Mithila Region in Bihar.

Sustainable development has become a buzz word in contemporary times, which is a reflection of mankind's growing sensitivity towards environment and ecology. However, this was not the case a few decades earlier. Uncontrolled and unreasonable activities coupled with irresponsible exploitation of natural resources brought us to a grim reality and a bleak future. Therefore, new models of development are being tried across the globe, which gives priority to the environment and ecology and tries to establish a harmonious coexistence with the nature. Unfortunately, such discussions have failed to accommodate the lived experiences of "folk societies" whose track-record in this record has been exemplary. As an additional lens for reviving the viewpoint on the current environmental status, communities' cultural histories have recently come into focus. The folk societies' nature conservation is guided by myths, folk beliefs and cultural practices. The folk customs establish themselves as relics of the environmental consciousness that is sorely neglected in these times of environmental screams coming from all around the world.

Therefore, this present study tries to look at the latent function of myths, beliefs, cultural practices and morals towards environmental conservation and preservation. In this context, this paper seeks to explore the folk society's mythical traditions and belief systems, which are embedded in such society's every-day practices, towards protection and conservation of the environment. The rural Mithila region of Bihar has been the focal point of this study. Participant observation, informal interviews and group discussion will be used as the tools of data collection for this study. it will try to answer the relationship between Myths, beliefs, rituals, tales, social and moral practices and sustainable environmental practices of such societies. The article will aim to explore in-depth insight of myths, beliefs, practices and its relation with ecological conservation.

Existing Multiple Deprivations and Covid-19 Pandemic: An Empirical Perspective of Marginalized in-Migrants Cycle Rickshaw Pullers in Delhi

India reported the first case of positive Covid-19 on dated 30th January 2020. The GoI has taken various initiatives or necessary actions to control the spread of coronavirus and stop chain transmission at the community level through stopped human mobility or migration across states. India is also known as one of the largest countries of In-migrants population size (436 million, 2001) across states. India's nationwide lockdown to has put questions about the livelihood and survival of the millions of In-migrants population across the states or cities. Millions of migrants are getting employment in various kinds of jobs urban informal sectors jobs. They had impacted severely immediate after the closed of all the manufacturing industries, businesses, construction work, stop means of public transportation (Railway, Buses, Taxi) in terms of the mass exodus of labourers from different cities. They were engaging in Delhi as '3D' (dirty, dangerous, and demeaning) jobs. Millions of migrants are belonging various kinds of occupation are belonged the scheduled caste, minorities, social group in Indian society. The selected occupational group as Cycle rickshaw pullers have affected adversely by the Covid-19 Pandemic. Many of them are not educated due to poverty or having historical past exclusion experiences. Cycle Rickshaws provide cheap and easily accessible public transport in Indian cities, especially for the low- and middle-income group people. Cycle rickshaw pullers do not enjoy benefits from any kind of the Centre and state-led sponsored social security schemes and welfare programs in Delhi. This paper focuses to understand the nature and reasons for in-migration of Cycle rickshaw pullers, its determinants, and various level of deprivation and exclusion. How were they severely impacted by Covid-19 led Migration Crisis? Exodus migration has further exposed their question of survival and existing policy and program in respect of Internal migrants.

Understanding Dalit Diaspora and Transnational Network across Globe: A Perspectives of Dalit Diasporic Organizations.

India has the largest Diaspora in the world (32.1 million, MEA 2021). Dalit lives at are really at the center of discussion and debate of the South Asian Diaspora. Indian Diaspora consists of both Old and New Diaspora. Old Diaspora includes India's emigration through various streams of migration such as *indentured or Girmitya, Kangani, Free Passage* under British colonialism System in 19th century and was emigrated towards plantation economies. Mostly indentured labourers belonged to the agriculture caste, menial sub-caste like *Chamar, Koris, Pasis, Ravidassia* and artisan castes of lower strata of the Indian Social System. They emigrated to work as a labourer in the USA, Canada, UK, Caribbean countries (Trinidad, Jamaica, Surinam), Mauritius, Fiji etc. New Dalit Diaspora includes skilled and semi-skilled emigrated population (professionals, doctors, engineers, IITs, entrepreneurs, free labourers, domestic help etc.). They emigrated after India become an independent nation in 1947. Caste identity is strongest within the Indian diaspora which restricts the social-cultural and professional atmosphere of thousands of Dalits across the globe. Therefore, the various Dalit social groups have created their organisations (FABO, VODI, VISION, BAMCEF, DSN, ACDA etc.) to develop social solidarity, awareness and consciousness about their rights, identity, and challenges among Dalit communities in the world. This paper is the following objectives:1) to understand the historical and contemporary pattern of Dalit emigration from India, its characteristics, and reasons for emigration; 2) to understand the various Dalit transnational diasporic organisations, their formation and significant role in understanding the issues, challenges and activism of caste discrimination; 3) to understand the role of Dalit transnational network and its roles to develop awareness and caste discrimination at international level. Both primary and secondary data have been collected and analyzed with the theoretical and analytical framework related to Caste, migration, diaspora and diasporic identity and solidarity.

Digital Alienation of Dalit Students during the Pandemic: A Case Study of University of Hyderabad

Education is perceived as an instrument of both individual and community emancipation, renewing ideas through constant social interactions to gain social consciousness. Due to the Reservation policy, social diversity of Indian public universities has increased and so the diversity of the classroom. With the students from various spatial and social backgrounds, the pedagogy is expected to meet diversity of the classroom. However, the pedagogical practices raise questions regarding inclusive and exclusionary practices that function against marginalized students. Chandra B.P. Singh[1] states that the Higher education pedagogy in India is thought to have alienated and disempowered the underprivileged while educating them. The rural Dalit students face challenges to comprehend the concepts taught in the classroom due to lack of cultural capital. The outbreak of the COVID-19 pandemic enforced the closure of educational institutions to prevent the spread of the virus. As educational institutions were compelled to opt for online education, the University of Hyderabad announced Digital Access Grant to benefit students of backward communities as an aid to online education. Researchers concluded that there is a huge digital divide among various sections of Indian society which determine accessibility to education during COVID-19. Deshpande[2] observes that only 10% of Scheduled Caste households have Internet access, compared to 20% of upper caste households. Therefore, this paper aims to study the digital alienation of rural Dalits students in University of Hyderabad via online mode of education during the COVID-19 pandemic. This paper also tries to study the efficacy of this inclusive program aimed to mitigate the digital divide among university students, and as a way forward. The study is based on recording the narratives of 100 Dalit Students via closed and open-ended interview schedule.

To be a Tourist or Not : After Effects of Covid on Tourism

To be a Tourist or not : after effects of covid on tourism
Terror of covid has led in reduction of tourism around the world, it has changed the way people used to travel. Sanitizers and masks have become the most essential add-on to the luggage. Tourism is not just travelling and exploring new places, it also enables people to connect to a different culture. Tourism industry was adversely affected along with other sectors and saw a huge downfall. Post covid every country has been continuously working on improving their policies and infrastructure to reboot the tourism. Specifically considering India, several states are preparing a framework, for example

Jammu & Kashmir crowned as the "Paradise on earth" has chosen 181 villages with scenic beauty and cultural significance to become tourist destinations. This move will significantly boost the rural economy and give the young men and women more options for direct and indirect employment.

The religious places which are often visited by people travelling for leisure, were closed amidst the covid pandemic but are now open for public. Hotels, restaurants, home stays and other accommodation facilitators' businesses were severely impacted. Now post covid they have to take extra care of sanitization and hygiene measures just to attract a fraction of the pre covid inflow of tourists. In this paper we will try to analyse the effect on tourism industry post covid by collecting information from various government departments and also try to gain deeper insights into their efforts to reboot the tourism industry.

Key Words: Post Covid, Tourism, Religious Places, Safety measures

Understanding Objectification of Indians As Subjects through Dividing Practices Including Science and Religion; Democracy and Populism; And the Global North and the Global South

In pandemic, genetic testing has emerged as an authentic way to diagnose and treat a patient. The focus of this study is to understand the entanglements of science, populism and democracy are leading to a unique way of unfolding of the pandemic and a creation of a new subjectivity in India. To understand a new subjectivity, the paper uses Foucault's concept of objectification through dividing practices on the lines of religion, on the lines of religion/science and populism/democracy. The research is based on mixed methods: qualitative as well as quantitative methods by locating the problem in the secondary literature. Further, symptoms and experience of disease by an individual do not seem to play a significant role in identifying a patient. A healthy can become healthier and health can co-exist with illness. An asymptomatic individual can be also categorized as a patient.

Moreover, the dynamic interaction of democracy, populism and science is leading to a unique way of unfolding of the pandemic. The main problem is the accessibility of science to masses. Few Indian people having privileged to understand science and can change their behaviour as per its epistemic system, but the masses who behave as per cultural and religious meanings will be unaffected. This appears to be a case in a democratic country like India. For example, many people still believe covid 19 is a hoax. Since, fatality due to covid 19 doesn't seem a direct outcome of the disease. The explanation by media given for the fatalities is not only related to covid 19. But, most covid-19 deaths are reported by providing other information including they are already suffering from chronic diseases such as tuberculosis, diabetes and so on. This fact doesn't scare the masses as they don't understand the explicit role of covid 19 in these deaths.

Parental and Organizational Support to Employees in Call Centres

The paper aims to present the supportive role played by parents and call centre organization to women employees working at Indian call centres. Despite challenging working conditions in the form of daily night shifts, monotonous work routine, the employees worked smoothly at call centres with the support mechanism given by their families and call centre authorities. The first part of the paper discusses the supportive role of families for their unmarried, married daughters and wives working in call centres. Married women employees received the support of their family members in the Management of their family and working life. They also had social support of their in-laws. Unmarried women received social support from their families to work during night shifts at call centres. The second part of the paper presents the role of call centre organization in maintenance of work-life balance. The study uses the work-family balance model to discuss the form of organizational time demands, perceived career consequences and managerial support to prove that the call centres through their flexible leave policies, medical aids, safe and secure transportation have helped women employees in managing their personal and family life. The data was collected upon 150 women employees working at six different call centres in the city of Gurgaon, India. Thus silencing the critiques for calling call centres as electronic sweatshops and unsafe for women, the paper highlights the brighter aspects of call centre life

Future of Refugee Children in the World

Every year due to war, violence, conflict, and human rights violations millions of people are bound to leave their country. As per the UNHCR report, in 2021 around 89.3 million people are forcibly displaced from their country, of which 36.5 million are children, 41 percent of the global refugee population. However, due to a lack of funds, neither UNHCR nor the host countries can provide food, shelter, health, education, and other social security to the children. The long-term future of refugee children is still neglected or not receiving attention at the global level. The future of refugee children is one of the most significant humanitarian challenges at the global level today. In many host countries, children are facing issues such as child labour, illegal organ transplant, prostitution, trafficking, selling and purchasing for domestic help, etc. This paper will analyse the discriminatory practices by the international actors to provide asylum to particular countries (Ukraine) and neglect others (Myanmar, Syria, and Afghanistan). The finding of this paper is also noticed that the dual standard of practice by the international actor to provide asylum to the refugees is based on their priority or political reason. The purpose of this paper is to discuss the issues and challenges and to raise the question about the future of refugee children in the world.

Issues and Challenges of Migrant Worker's Social Security in Unorganised Sector in India

In India, around 93 percent of India's workforce are working in the unorganised sector, in which most of them are migrant workers. As per the government Census 2011, out of the 1.21 billion Indian population, 454 million, or 37 percent are internal migrants. All the workers who work in unorganised sector are mostly daily wage workers their survival is dependent on daily earnings. The fact is that they are contributing a lot to the growth of the Indian economy. However, even after 75 years of Indian Independence, the Indian government is unable to cover their social security, welfare, health, etc. Migrant worker in India is deprived of all social and economic security. This paper will cover all the aspects of social security related to migrant workers in unorganised sector in India. Including, the purpose of this paper is to critically analyse the attitude of the government and the need for policy reform that can benefit the migrant worker but is neglected by the Indian government.

Labour Regulation in Global Apparel Supply Chains: Collective Voice in the Place of Collective Bargaining?

Concentrated corporate power and failures to appropriately manage the risks for workers mean that they bear the heaviest toll in globalised apparel supply chains. Law and associated normative frameworks seek to strengthen worker voice and other worker rights to tip the scales of unequal bargaining power to benefit the workers. However, some of the traditional tools of labour law such as unionising and collective bargaining have significantly weakened over the past three decades, and was most felt during the Covid-19 pandemic. Such erosions of worker rights leave women workers particularly vulnerable in the labour-intensive apparel industry, where they are a majority and deemed docile contributors.

This paper adopts a socio-legal approach to examine how women workers in Sri Lanka's apparel industry action non-conventional forms of collective voice, and legitimise their expression in resisting and re-shaping labour regulation in the industry and across its associated supply chain. The research is executed as a qualitative study examining three multi-level case studies over the pandemic and post pandemic times in Sri Lanka, in the context of an economic crisis and an authoritarian political overlay.

I use networked governance to understand a) worker experience in expressing collective voice and instances that impact women workers; b) how worker networks strengthen their 'bargaining' power, empower workers as regulators, and act as a check on employer accountability for worker rights, among other accountability mechanisms, across the supply chain.

The project demonstrates modes of activism and how workers legitimise such interventions in actioning 'collective voice'. Understanding workers' role as regulators helps us to reconceptualise governance in globalised supply

chains. This research will have implications for how we think about women as industrial workers and identify normative frameworks that enable women workers to gain the maximum leverage to influence labour regulation.

RC12-188.5

KUMARAGE, Achalie* (School of Regulation and Global Governance, Australian National University, Australia)

Re-Thinking Collective Bargaining: Legal and Normative Pluralism As an Instrument in Labour Rights Negotiations

Weakening of autonomous forms of worker voice was acutely felt during the pandemic times in the global south apparel manufacturing countries. Not having the right channels, such as collective bargaining, to voice such violations, often meant that the workers absorbed the shocks to the system that they were a part of. But did the absence of effective formal voice mechanisms mean the absence of worker voice?

This paper examines how worker voice is actioned and is amplified in systems where the legal right to collective bargaining is ineffective. Although emanating from the law, collective bargaining and other worker voice mechanisms are often embedded in the social realm and the translation of these legal rights are impacted by non-legal norms and practices in complex globalised supply chains. This paper further explores how normative plurality within a social field, ranging from legal and rights norms, industry and institutional norms and social norms, is utilised by women workers, and how they employ different normative framings to maximise their power and leverage in negotiating work rights.

Drawing from a case study on workplace health and safety in Sri Lanka's apparel industry during the pandemic, I observe the ability of women workers to engage with different normative frameworks to draw attention and seek remedies. Using a legal pluralism lens, I argue that the normative plurality in apparel supply chain regulation, can be an empowering force for women workers to legitimise their claims. Through 'regulation by the social sphere', I further demonstrate how the normative plurality enables workers to recruit support from a globalised apparel supply chain, transnational worker collectives and other institutions to express voice and check the behaviour of other powerful actors such as the employers and international buyers. This research invites to re-imagine labour governance in global supply chains, considering workers as regulators.

Linkages of Intimate Partner Violence (IPV), Coercive Control, Alcoholism and Mental Well-Being: A Community-Based Study in Delhi

Purpose: Violence against women can be conceptualized as an issue relating to the exertion of power and social control over women. Intimate partner violence not only damages the victim physically but also psychologically resulting in long-term consequences. Thus, the study aimed to understand the community level scenario on IPV and alcoholism and how coercive control mediates this linkage, and impact on mental well-being was observed.

Methods: Based on the urban slum setting of Delhi, the study adopted a mixed method approach. The quantitative analysis included univariate and bivariate analysis. Also, a generalized structural equation model was built to carry out the mediation analysis and effect of IPV on mental well-being. The narratives from the qualitative data were used to supplement the quantitative results.

Results: Around 76% women reported to experience physical IPV among those whose husbands drink alcohol. The coercive control, emerged to be an important factor that amplified the tendency towards IPV. The results show that with increasing number of coercive control acts, the physical, emotional and sexual IPVs increased. Most women were of the opinion on banning alcohol and closure of alcohol shops. Among women who sought help did not receive required urgent support legally.

Conclusion: There is a need for community based organisation to create awareness on alcoholism and its adverse effects such as violence; engage with grassroots level workers and women in community to make them aware and the need to fight against it without tolerating via songs, women's legal counselling and by raising community slogans.

Social Representation of Pandemic:Collocational Network and Keyword Analysis of Media Reports and Public Discussion on COVID-19

COVID-19 has been labeled as the black plague of the 21st century which triggers enormous challenges to public health globally. Most countries have been stepping into a phase of co-existing with the pandemic. However, seeing how the pandemic is represented by different social mechanisms is still significant. This study uses social representation theory to analyze the epidemic discourses from the preliminary outbreak of the pandemic in 2020 to the time of wildly spread in 2021. The purpose is to investigate how COVID-19, as an emerging and unfamiliar pandemic to human society, is represented by media reports and social media discussions. More than 169,000 media reports on COVID-19 and 260,000 online discussions are collected as empirical data for analysis. Two research techniques that have been prevalently adopted by corpus linguistics in the digital age, collocational network analysis, and keyness keyword, are adopted as the major methods. Two concepts, anchoring and objectification, from the social representation theory are adopted to investigate how the covid-19 'reality' and discourses are constructed. The study found that the media and social discourses about COVID-19 are often anchored to diseases that have been familiar and occurred in the past as the reference, such as SARS and influenza. Vaccination is also connected to those vaccines that most people take annually to reduce the uncertainty and anxiety about the novelty COVID-19 vaccine. Different mechanisms of objectification, including the official statistical number of confirmed cases and the concrete anti-epidemic materials such as masks and sanitizer are represented as the pandemic reality or convinced guidelines of pandemic prevention practices. We argue that via the serial processes of anchoring and objectification, COVID-19 is understood by the public and society. However, we should be careful that certain processes of social representation might simplify the complexity and misinterpret the situation of COVID-19.

Verbal Communications in Teaching and Learning Holistic Thoughts: Insights from Practice of Yoga Teachers in Kuala Lumpur, Malaysia

This study considers approaches to teaching and learning holistic thoughts, based on a case study of yoga classes in Malaysia. From the latter half of the 20th century, researchers began to recognize the importance of holistic approaches to human beings and the world, because environmental problems and limitations of the modern medicines have triggered increased criticisms of the modern science. Teaching and practicing techniques that originate from religious and spiritual philosophy and practices, such as yoga, are often mentioned as examples of the embodied holistic epistemology. However, the previous studies have mainly focused on their philosophical dimensions, and hardly paid attention to the practical process of teaching and learning holistic ways of thinking. Hence, this presentation discusses approaches to teaching and learning holistic thoughts embodied in yoga, by analyzing teachers' verbal communications in yoga classes. An examination of verbal explanations of the physical practices captures the linkages between body and mind that constitute an important element of holistic epistemology. I conducted interviews with yoga teachers and action researches in yoga classes intermittently from 2017 to 2022 in Kuala Lumpur, Malaysia. Discourses on yoga in Malaysia as a multi-religious society differ from those in modern Western societies. Since yoga teachers in Malaysia tend to distinguish religion and spirituality, it offers insights on connections between religion, spirituality, health and well-being of individuals in greater detail. Yoga teachers use two types of verbal instruction in their classes, i.e., instructions on physical movements and explanations of philosophical reasons for those movements and their anticipated effects on one's body. These two types of verbal communications together facilitate students to become conscious of their own body, thereby helping them connect their mind and body by themselves. In other words, students do not memorize movements and thoughts separately but experience the connections between their body and mind.

Youth and Environmental Change in India: A Theoretical Perspective

Modern societies have engaged in increasingly disruptive modes of interaction with the biophysical environment, and this is widely perceived as not simply a side effect, but a characterizing trait of modern societies. The

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

environmental issues in India and around the world have been receiving today has never been seen before. The drivers of global environmental change such as fossil fuel consumption, urban and coastal development, industrialization, deforestation, and other land use changes are inequitable and can be disproportionately attributed to regions, and social groups in India. Youth as a group is facing a number of environmental risks and hazards, who have to live for an extended period with the deteriorating environment bequeathed to them by earlier generations. Youth have used multiple ways to express their political agency against social, economic, and environmental policies that contribute to climate change and environmental degradation. A singular trajectory for the environmental movements is difficult to imagine for mitigating all these challenges. There is a study of societal transformation in response to environmental change has become needed, yet little consensus exists regarding the conceptual basis of transformation. Young people will be compelled to engage in new forms of action and activism that will generate effective responses to ecological challenges in India. The main objective of the research paper is to examine the factors responsible for emerging challenges of environmental change in India and further it analyses the role of youth in environmental movements by applying New social movements theory.

Working from Home and Change in Fertility Intentions during Covid-19 Pandemic in Two Contrasting Gender Cultures: The Comparison of Sweden and Poland

The Covid-19 pandemic and related massive spread of home based work led to substantial changes in the conditions for combining work and childbearing. On the one hand, working from home (WFH) helped parents to accommodate increased childcare needs during the pandemic. On the other hand, it led to acute experiences of blurred boundaries between work and family life during childcare and school closures or quarantines. Therefore, the direction of the impact of WFH on fertility intentions (hereafter FI) during the pandemic is not unequivocal. In this paper, we investigate how WFH was related to change in FI of mothers and fathers during the pandemic in two countries with contrasting gender role cultures and discuss the complex mechanisms behind these relationships. With the use of unique Familydemic Harmonized Dataset from representative samples of parents in both countries, we estimate multinomial logit regressions by gender and consider a set of potential moderators derived from theoretical expectations, including the role of change in financial well-being of the family during the pandemic as well as gendered division of labor in the family before the pandemic. We find evidence for an overall negative relationship between WFH and FI in both countries. This relationship is positively moderated by the worsened financial situation in Poland only, suggesting that WFH brings important savings to families whose financial situation has deteriorated and who live in a country with lower income level and poorer social support than in Sweden. Interestingly, in both countries the negative relationship between WFH and FI is not observed among mothers who adopted traditional division of labor between partners prior to the pandemic. This finding indicates that increased unpaid workload observed in both countries during the pandemic was easier to handle by mothers who used to carry the majority of unpaid burden already before the pandemic.

Working from Home and Perception of Change in Work-Life Balance Among Parents with Dependent Children in Six Countries during the Covid-19 Pandemic

Better access to working from home (WFH) during covid-19 pandemic offered parents the possibility to accommodate increasing childcare needs but at the same time, it led to an unprecedented scale of workers performing simultaneous paid and care work/homeschooling. The overall effects of WFH on work-life balance (WLB) during the pandemic are thus not clear. In our study we argue that three important moderators alter the positive impact of WFH on WLB during the pandemic: i) time that children spend at home, ii) the division of unpaid labor between working mothers and fathers and iii) change in parent's working hours during the pandemic. We use data from the Familydemic Survey, conducted between June and September 2021, on representative samples of mothers and fathers living with at least one child aged less than 11 in six countries (Canada, Italy, Germany, Poland, Sweden and the US). We find evidence showing that WFH was positively related to change in WLB among mothers and fathers. However, the positive effect was weaker among those mothers whose child(ren) stayed at home due to childcare closures for longer than a month. The positive effect among mothers disappeared if women increased their working hours during the pandemic. We also found a negative relationship between HBW and WLB among fathers, who increased their working hours during the pandemic. Interestingly, working from home was positively related to change in WLB among men who were the ones (mainly) responsible for childcare. We also show that mothers (compared

to fathers), parents whose children were out of childcare for six months or more (compared to other parents) and parents who increased their working hours during the pandemic (compared to other parents) had higher predicted probabilities to report worsened work-life balance during the pandemic.

Reading Democracy in Turkey through Political Approaches to Music

Based on Simmel's ideas on the forms of artistic expression and the type of government ruling a society, the proposed paper focuses on the parallel developments in politics and musical activities under the Justice and Development Party government since 2001. The COVID-19 pandemic has been a test case of democracy for governments all over the World. Agamben (2005) argues that the state of exception is not a pause to, but a construct of the normal/system. Governments imposed a number of bans during the pandemic and removed them before the declaration of the end of the pandemic at the global scale. One of the striking rules enforced during the pandemic in Turkey was to the ban on all artistic activities. While all other bans have been removed since the spring of 2022, the ban on music after midnight remained intact. Over the summer 2022, many music festivals were cancelled allegedly due to security reasons. Moreover, there has been increased attacks on popular musicians known as oppositional.

The paper consists of three parts. The first part presents a brief account of a history of music and democracy in Turkey. The second part analyses past two decades that we mark it by two events: the Gezi Park movement, an occupy movement emerged 2013, and the so-called Turkish type of presidential system, broking down the separation of powers and was enforced in 2017. The paper argues that former created both a fear on the part of the government for freedom of expression, creativity and gathering as well as music performances as there was a festival in the beginning of the movement. The final part discusses the parallel between concentration of power in one hand and the concentration of spaces and styles of music.

KURZ, Julia* (Technical University of Dortmund, Germany)

Disempowering for Participation.

This reflection about ethnographic inspired qualitative research as a means of disempowerment for enabling participation stems from a transdisciplinary visualisation project between computer graphics scientists, neurosurgeons, and sociologists. To transform high-dimensional, qualitative medical patient data into a visualised digital form, the expertise of all three disciplines had to be considered. But the neurosurgeons and computer graphics scientists first had to learn – most probably due to their social affiliation to high-status professional groups – to listen to each other on eye level. They all had to be disempowered first.

I will argue that qualitative research (observations, interviews, expert rounds) turned out to be a means for unveiling underlying relevance structures of the disciplines as well as a means for creating transposition experiences and thereby became a form of action research. The qualitative methods were adapted to this situation through embedding especially computer graphics scientists into conceptualizing and conducting the joint research and thereby empowering them for participation.

During this project, I, the sociologist, took on different roles. I was not only a moderator of the negotiation processes, but sometimes also a contentious member of them – because I want to bring in my original sociological expertise about supporting cooperation on the ward through the visualizations. The critical reflection on these non-researcher roles is an important point, because I became powerful through disempowering the other and at the same time followed my own interests.

Beyond that, I was always a researching sociologist with my own interest in producing knowledge about hospital information ecologies. But all my collected data are biased through the lens of visualisation development. To reflect critically on the meaningfulness and validity of these data for my own research questions shall open the discussion about possible research outputs beyond the "pure" results of action research itself.

Indigenous Historical Writings and Decolonial Futures of Education

For centuries, Indigenous peoples have engaged with alphabetic literacy to express, maintain, and reconceptualise cultural identities.[1] This paper explores how written historical sources by Māori, Aboriginal, and Torres Strait Islander authors might be critically incorporated in contemporary education. These sources can platform Indigenous voices in a way that connects with

the alphabetic literacy of contemporary students themselves, providing an opportunity to critically recognise colonial and historical complexities of identity.[2] Indigenous writers frequently emerged from schools shaped by Western, Christian, and imperial understandings. Consequently, Linda Tuhiwai Smith identifies that many Indigenous communities remain ambivalent about the influence of these discourses.[3] Does this support Audre Lorde's notion that 'the master's tools will never dismantle the master's house'?[4] This paper evaluates this question, arguing that a 'static' 'traditional' idealisation of Indigeneity can be misleading and that there is decolonial and pedagogical value in evaluating written tensions and interplay between 'traditional' and Western cultures of education. This conceptualisation encourages students to evaluate literacies as divergent, subjective, and heterogenous cultural practices shaped by situated contexts of power relations.[5]

Appropriation and Resistance in Vienna's Graffiti and Street Art Scene

The past decade has given rise to a new trend in arts-led urban revitalization, leading decision-makers away from building expensive, architecturally stunning arts palaces in cultural districts. Instead, across cities of varying size, we see a proliferation of temporally, spatially, and economically flexible cultural festivals seeking to celebrate "authentic" local expressions while attracting visitors and filling hotel rooms. In particular, we note the growing popularity and institutionalization of (legal) street art, a clean-cut cousin of graffiti which once has been—and, in some places, still is—viewed as an indicator of disorder and crime. This development trend is amplified by the growing significance of social media, especially Instagram, in branding cities and their artists. Street art initiatives and festivals, we maintain, draw attention to different parts of the city and create new geographies of culture, investment, and tourism—giving rise to new actors, alliances, and conflicts.

In this paper, we explore these emerging urban dynamics for the Austrian capital of Vienna, a reputable arts city, as an interesting "deviant" case in which graffiti writers, street artists, and other cultural actors have, thus far, largely managed to resist efforts of appropriation and instrumentalization of their craft through state and private actors. We also discuss the roles Vienna's particular history, location, and governance may have played in this process. The paper builds on ethnographic observation, interviews, internet and social media research undertaken in 2021. In our comparative case study, Vienna is one of four metro areas whose urban art scenes we are examining, next to Montreal (CA), Tampa/St. Petersburg (USA), and Bristol (UK). Our larger goals are to understand what drives arts and culture-based community and urban development strategies, which factors determine similarities and differences in outcomes and, ultimately, what academic scholars can contribute toward building fair, sustainable, and creative urban havens.

Multicultural Education As a Social Movement

Indonesian sociologists and educational pedagogues have been discussing the idea of multicultural education since the 1990s. This discourse continues to this day, as evidenced by the many articles on multicultural education published in scientific journals. Despite the various challenges, most researchers and academics at least argue that the mainstreaming of multicultural education in Indonesian society is very important. Unfortunately, until now, government pay less attention to multicultural education. However, initiatives from the ground for multicultural education are evident. From a sociological perspective, this situation shows a close relationship between multicultural education and social movements. This paper aims to present an analysis of multicultural education as a social movement in Indonesia. The research was conducted in formal and non-formal schools that have practiced multicultural education in several areas in Indonesia with qualitative research methods through in-depth interviews and observations.

KUTSENKO, Olga* (National Taras Shevchenko University, Ukraine)

Power of Freedom and Activism: Ukrainian Alternative to Militant Authoritarianism

The Russia's war against Ukraine was an expected event for the military, and an unexpected one for many civilians. Ukraine's successful resistance in this war is also a surprise. The war become not only the embodiment of the neo-imperial Russia's ambitions using militant authoritarianism, but it has also manifested the clash of Russian-Orthodox and European civilizations. Ukraine made its historical rational choice in favor of the latter. Is this choice of development path accidental under the pressure of circumstances? Or is it rooted in the society's unique features? What features of society give it the strength to resist military invasion?

For a deeper understanding of the strength and weakness of society in wartime, we apply the civilizational paradigm based on the analytical tradition of Nelson, Febvre, Eisenstadt, Arnason etc. The paradigm is grounded on the articulation of the long-term structures and basic values that determine the 'frames' of possible choices by society in its development paths. The *structural-cultural frame,* rooted in history, as a corridor of historical opportunities make certain types of social activism and social order possible.

Using the WVS and EVS database, the paper will provide the empirical evidence of the basic cultural and structural differences of Ukrainian and Russian societies at the eve of the 2020s. The cultural and agency shift in Ukrainian society happened during the last decade(-s) within the corridor of opportunities; it is associated with the strengthening of freedom and democracy values, social activism and national identity, as well as with formation of a new middle class as a driving social force mobilizing society against the military aggression obtruding the Russian civilizational bondage. This qualitative societal shift in Ukraine has provided the alternative to the wave of advancing militant authoritarianism in the 21st century.

RADZINSKA, Jowita (SWPS University, Poland)

GOLINSKA, Agnieszka (SWPS University, Poland)

Settling in Uncertainty and Risk: Polish Responses to the COVID-19 Pandemic and the War in Ukraine

The COVID-19 pandemic and the war in Ukraine have become a multi-crisis that has caused a state of emergency, particularly in Central Eastern European and Baltic countries. Accelerated by combination with the threats of economic recession, democratic backsliding and climate collapse, these crises have created an unprecedented emanation of Beck's risk society (1992). The global nature of these risks, their encompassing of all areas of life, and the cumulative effect of their co-occurrence has been theorized in a concept of a 'crisis society', in which the conditions of crisis are becoming part of people's daily lives (Moralli&Allegrini 2021).

In this article, the global pandemic and the 2022 war in Ukraine are conceptualized not as isolated events, but as overlapping and mutually reinforcing 'unsettling events' (Kilkey&Ryan 2021), which denotes that these macro-level changes cause unanticipated disruptions at the individual level. Combining the theories of risk society and unsettling events, we tracked how young Polish adults and their parents had reacted to a multitude of unsettling events, which contributes to current sociological knowledge on how individuals thrive in a 'catastrophic society' that is marked by omnipresent risk, tangible hazards and anxiety.

This theory is built on data from the ULTRAGEN project, employing a mixed-methods and longitudinal lens to explore the relational, material and subjective dimensions in the narratives on the pandemic and war. The data comprises 70 in-depth interviews with Polish young adults (18-36) and their parents (44-66) collected in 2021, responses from an asynchronous exchange conducted with the same participants in reaction to the 2022 military aggression in Ukraine, and a representative survey covering young people's views and strategies regarding multiple threats. As a result of the analysis, individual reactions to uncertainty and risk have been analysed within the framework of material, relational, and subjective aspects of unsettling events.

Adolescents' Self-Efficacy and Life Satisfaction: The Importance of Cultural Orientations

Self-efficacy, people's beliefs about their abilities to take effortful action toward goals, has been documented as improving mental health and subjective well-being. It could be more significant for the subjective well-being of adolescents who are in the developmental stage where they actively engage in interactions with the world and the development of their own perspectives. Yet, the current understanding of adolescent self-efficacy is less conclusive, partly because

prior empirical studies have largely focused on a single country (mostly the United States) or Western societies. Given that culture shapes the conditions determining adolescent subjective well-being, it is rather unfortunate that we have little empirical evidence on whether adolescent self-efficacy is beneficial across cultures. How is self-efficacy conditioned by the *cultural orientations* of the country in which adolescents reside? To answer this important yet under-examined question, this paper examines the relationship between adolescent self-efficacy and life satisfaction that potentially varies across countries.

We analyzed the 2018 Programme for International Student Assessment (PISA) data drawn from a sample of 15-year-old students across 67 countries. The findings show that holding a higher level of self-efficacy is linked to better life satisfaction among adolescents in all countries included, as expected. More interestingly, we found that this beneficial effect of self-efficacy varies across cultures. The positive effect of self-efficacy is greater in *individualistic* countries (where autonomy and personal achievement are prioritized over social harmony and integration) than in collectivistic countries. This finding suggests that cultural environment is important to understand adolescent social-emotional development as well as psychological well-being.

Cultural Nuances of Agency-Well-Being Relationship: Testing Person-Culture Match and Cultural Heterogeneity Hypotheses with World Values Survey

The well-being benefits of agentic beliefs—beliefs about one's own power/control in shaping their life outcomes- are well-documented (e.g., Bandura 2006; Mirowsky and Ross 2013). Previous studies demonstrated that the positive relationship between the feeling of agency and subjective well-being is moderated by cultural context such as aggregate, national value orientations (e.g., Inglehart et al. 2008), paying little attention to both the fit of the person to cultural context (person-culture fit) and the dispersion of cultural factors such as the heterogeneity of beliefs in a society. Our study aims to address this gap by investigating two novel mechanisms through which agency contributes to well-being: (a) the person-culture match of agentic beliefs (the interactions between individual and national level agentic beliefs) and (b) the heterogeneity/dispersion of agentic beliefs in a country. Prior research focused on the level of agentic beliefs at the individual or aggregate national level, regardless of the differences between the person and the culture, or persons within society. We expected that the person-culture match of agentic beliefs (e.g., agentic people living in agentic societies) would be positively correlated with life satisfaction (Hypothesis 1). Additionally, we also expected that the more homogenously agentic (less dispersed) a nation is, the greater the well-being benefits individuals get from their feelings of agency would be (Hypothesis 2). Analyzing the World Values Survey Wave 6 data from 49 countries using multilevel modeling (N = 66,226), we did not find any support for Hypothesis 1 but found support for Hypothesis 2. Individuals benefited from living in agentic nations, independent of their person-culture fit. Individuals living in more homogenous agentic cultures reported higher levels of life satisfaction than those in more heterogeneous agentic cultures. Findings suggest the importance of cultural heterogeneity, rather than a pure person-culture match, in understanding the relationship between agency and well-being.

KWON, Sohee* (University of Melbourne, Australia)

A Decolonial Feminist Analysis of Institutionalised Australian Sociology

Hegemonic, Western-dominated forces underpin the formal academic discipline of sociology, with Ali Meghji (2021) arguing that sociology did not become colonised, but rather its very foundations are colonial. Sociology today embodies a colonial episteme that it continues to be shaped by and reproduce. Within the global academic field of sociology, sociology in Australia is itself marginal. Raewyn Connell (2018) shows that the perspectives, histories, and traditions of the metropoles (the imperial centers of colonisation) are prioritised over those of the periphery. Sociological thought that is predominantly Eurocentric is applied in various periphery settings; however, in an Australian settler-colonial context, Indigenous and other non-Western knowledges are marginalised even further. This paper presents a decolonial feminist analysis of the persistence of colonial legacies in sociology in Australia, especially with an understanding that coloniality is intermeshed with other mutually constitutive oppressions, including ableism, capitalism, heteronormativity, patriarchy, racism, and xenophobia. Here, decolonisation refers to the processes of opposing what Aníbal Quijano identifies as the "coloniality of power" (2007, p. 171) through resisting colonial, modern assumptions that celebrate Western knowledges while marginalising non-Western ones. María Lugones's "coloniality of gender" (2008, p. 1) and Vrushali Patil's "coloniality of sexuality" (2022, p. 410) extend the decolonial thought initially elaborated by Quijano (1992), illuminating how racial, gender, and sexual hierarchies, among others, are co-implicated. What can a decolonial feminist approach reveal about the extent to which the sociology of gender and sexualities in Australia is shaped by Western (colonial) knowledges? What are the identifiable traces of coloniality

in sociology at the University of Melbourne in particular? And can sociology in Australia even function as a site of resistance against coloniality, let alone move towards decolonisation as a discipline?

Young Political Consumers between the Individual and the Collective: Evidence from the UK and Greece

Abstract:
The perceived surge of young people's interest and engagement in politics as a result of their pro-environmental attitudes and cosmopolitan orientation has been recently well-documented. However, one form of youth political participation which remains particularly understudied is political consumerism. Consequently, we still know relatively little about what motivates young people to engage in it, or the extent to which these motivations vary across countries. Although previous literature perceives political consumerism as a primarily *individualistic* form of political participation, we argue that such conceptualizations underestimate the growth of political communities of citizens-consumers. Using a unique survey of 634 young people aged 18–29, we examine the diversity of personal motivations and the personality outreach of young political consumers in a country of the European north (the United Kingdom), and one of the European south (Greece). The data reveal that young political consumers are operating less from an exclusively individualist position and more from a 'connected' one. Indeed, their personality orientation outlook reaches beyond their immediate local communities, to an ever-expanding global imagined community. In turn, their motivations seem to expand even further, involving also the animal kingdom and the wider environment.

Atmospheres of Distance. a Comparative Ethnography of Social Distancing between the Public Transport Systems of Milan and Amsterdam

Since the first months of 2020, the transport systems of most cities have had to face transformations of public spaces due to Covid-19. Despite social distancing practices became a primary tool to face the pandemic, there is more than a doubt about what social distancing is. The unremitting flourishing of mainstream narratives that discuss social distancing, unknowingly referring to physical distancing, triggered the indignation of most sociologists. Indeed, many scholars distinguish between mere physical distancing and what Simmel defines as a more structural social separation among individuals or groups. However, this last theorisation did not consider any form of materialistic thinking, minimising the power of the body, the senses, and the emotions in the space of micro-interactions and offering a non-comprehensive overview of the phenomena. This project explores Milan and Amsterdam's urban public transport systems beyond the pandemic, suggesting a definition for social distancing driven by a phenomenological ontology and an interactionist approach. Social distancing can be intended as the normative outcome of a negotiation practice immersed in the affective atmosphere of the jurisdictional environment. Affective atmospheres may be interpreted as a way for individuals to subjectively perceive and collectively build their experiences in everyday life interaction rituals, leveraging the power of senses and emotions. Atmospheres are, ethnomethodologically speaking, the social air in the ecological context where norms and meanings are negotiated. This research aims to study how social distancing practices emerge from face-to-face interaction rituals through an ethnographic approach. This methodological frame offers an in-depth view of the infra-ordinary, shedding light on the hidden practices of reproduction of social structure that involve the Simmelian stranger and make the invisible visible. Moreover, the comparative nature of this project enables the investigation of the diverse choreographies of distance and how they take shape, isolating peculiarities tied to specific cases.

Addressing Masculinities to Stop Intimate Partner Violence: How Are Social Innovations Being Created in Different Types of Organizations in Spain and Sweden?

Within the literature on non-profit organizations, two theoretical perspectives exist. The first sees the non-profit sector as fundamentally different from the public sector. The second sees all organizations of the same field as the same, i.e. isomorphism. Understanding these two perspectives is especially relevant for public health activism because it tends to engage people working across both sectors and often in collaboration. In this paper, we explore these two perspectives among organizations in the field that incorporating masculinities in efforts to address intimate partner violence (IPV).

Working with men/masculinities to address IPV is a social innovation that currently being created in non-profit and public organizations alike. Different forces explain this development: to avoid recidivism and guarantee rehabilitation in the judicial system; for prevention from the educational system's point of view; as a goal of coeducation among feminist groups; and because of a demand from men's organizations.

Our paper explores how these social innovations are being created within different organizations, and the similarities and differences between them. Our paper is based on qualitative interviews conducted with professionals representing organizations from both non-profit and government sectors in Spain and Sweden. Purposive sample was applied in both countries to obtain a heterogenous sample of organizations from both sectors, including at the local and national level, and working on feminism, social inclusion and men's issues. The interview guide contained questions about the goal of the organization, its work in the field of intimate partner violence, the actions and services addressing young men, and the respondents' professional experiences and perceptions about these actions. A total of 32 interviews were conducted, 19 in Spain and 12 in Sweden, between September 2019 to February 2020. Using constructivist Grounded Theory method, we analysed how these different professionals understand the process of working with men/masculinity in their organizations.

Minimal Secularism: A Defense

In this talk, I articulate a political theory of secularism that can be defended against common, legitimate criticisms of existing forms of secularism. What I call minimal secularism is not vulnerable to the claim that secularism is hostile to religion, marked by an ethnocentric legacy of church-state separation, or committed to a Christian, and specifically Protestant, conception of religion. In addition, it is more structured and precise than liberal philosophies advocating state 'neutrality' towards the plurality of conceptions of the good life. Minimal secularism is a thin, yet attractive, transnational ideal for progressive politics.

Re-Accessing Participants: Doing Qualitative Longitudinal Research with Young Fathers

This presentation explores the challenges and affordances of qualitative longitudinal youth research with young fathers. Insights are presented from the Following Young Fathers programme of research in the UK. Funded by the Economic and Social Research Council, Following Young Fathers (2010-2015) was the first major study of young fatherhood in the UK, examining the lived experiences and support needs of young fathers (aged 25 and under). Following Young Fathers Further (2020-2024) is a multi-strand, qualitative longitudinal and participatory research study, funded by UK Research and Innovation Future Leaders fellowship (Tarrant, 2020-24). In this paper we present our innovative methodological approach to working with participants across projects and over a timeframe of ten years. We discuss the challenges of conducting qualitative longitudinal research with young fathers, the ethics involved in establishing and maintaining relationships with young participants over time and our approach to analysing large amounts of data across connected, yet distinct, projects. Qualitative longitudinal data will be presented, offering temporal insights into the lived experiences and support needs of young fathers in the UK over the period of a decade. The presentation concludes by reflecting upon the value of conducting qualitative longitudinal research with young fathers over the past ten years.

The Struggle Is Real: School, Work and Life in Lockdown

When COVID-19 was declared a pandemic in March of 2020, students in the Philippines were in the last few weeks of classes. The sudden closure of schools and government measures such as lockdowns, physical distancing, and limited mobility disrupted young people's lives. For more than two years since the pandemic started, young Filipinos continued to learn through remote learning modality, which has important implications for students' learning outcomes. Even before the pandemic, the country has been facing challenges in achieving quality and inclusive education. A study by the WorldBank in 2022 showed that the country has the highest rates of learning poverty in the East Asia and Pacific region.

This paper describes the experiences of the youth (age 15-24) in terms of schooling, work, and their activities during the pandemic. The data is based on the 2021 Young Adult Fertility and Sexuality Study (YAFS5), the fifth in a series of nationally representative surveys on Filipino youth.

Initial results show that among students who are yet complete high school level, 12% did not enroll in the Academic Year 2020-21 while 10% among those who completed high school did not go to college. An overwhelming majority of students were under modular distance learning. Common problems they experienced were: internet access, difficulty in understanding lessons, finding time to study because of household chores, finding a quiet place to study, and motivating themselves to do school work.

Of the 17% of Filipinos with college degrees, only 66% are currently employed, 21% have worked in the past but are not currently working, and 13% have never worked. There is also a regional disparity in the level of youth employment.

These findings have important implications on how the country can achieve its ideal of a demographic dividend.

Art Biennials with Multiple Mobile Affordances Emerging in the Global Artistic Field: A Biennial Case Study of Taiwan's Military Archipelago Matsu

Art biennials are not only events in the art world, but also become creative tools for many cities appealing to tourism attractions in the global competition. Currently the biennials no longer stay in large cities--from Venice to Sydney, but also appropriated by islands, borders and rural areas--from Setouchi, Manifesta to Matsu-- for social engagement with alternative art.

This paper focuses on Matsu Biennial of Taiwan, firstly held in 2022 spring during Covid-19 period. Matsu was a group of military frontier islands of Taiwan during Cold War between Taiwan and China, and also border islands with different migrant and religious histories. Bathed with special weather and geographical conditions, military heritage and fishing food culture, Matsu provide special 'affordances' historically, geographically and culturally, for artistic engagement. Themed as *Island's brew,* Matsu biennial emphasis on the food and wine culture, linking nature with culture, bringing out the natural affordances many biennales in cities neglect.

Drawing upon Bourdieu's field and Latour's STS theories, this paper considers Matsu biennial appropriating military island background as new strategies to compete in the global artistic biennale field. It examines four dimensions of *mobile affordances:* migration religious memories, military historic heritage, weather and transportation, geology of rocky archipelagos on the sea. These affordances provide the creativity bases for on-site installation and socially engaging art.

By examining the curating strategies, responses of residents, visitors and artists collected by interviews, fieldwork and media representation, this research finds that the unfamiliar military past based on mobile affordances have surprised the engaging artists and participants. However, people haunted with the military past and residents preferring religious past identify less with contemporary artistic engagements. The military islands suddenly turning into art tourist destinations, seem not ready for touristic services from transportation to hospitality. It concludes with creativity and community-making debates.

Aiding Repression: The Effects of Chinese Communication Aid on Media Freedom

As China has become a major foreign aid donor to developing and underdeveloped countries, it differs from other international donors. It has followed the principle of non-interference and does not impose aid conditionalities on recipient countries. In this paper, we argue that Chinese aid, particularly communication aid, has increased the level of digital capacity and digital repression in recipient countries. Specifically, since the Arab Spring and the Jasmine Revolution, regime elites have recognized the role of communication technology in anti-government protests. Accordingly, their motivation to intervene in the digital realm has increased. With the technical support of Chinese communication aid projects, recipient countries have been able to monitor and censor people's behavior in the digital realm. To test our argument, we analyze data for 111 countries from 2002 to 2017. We find that Chinese communication aid increases digital capacity and repression levels in recipient countries. Our findings are robust to alternative model specifications and contribute to the ongoing research agenda on the perils of Chinese foreign aid.

Deliberative Harmony?:Negotiating Family Conflicts during High-Risk Social Movements

Political polarization not only threatens democracy but also disrupts family lives, causing rifts between family members with contrasting political orientations. This article examines how individuals negotiate politically driven family conflicts in a severely polarized and risk-laden context by focusing on the 2019 Anti-Extradition Bill Protest in Hong Kong—a high-risk protest that led to the hostile division of the pro- and anti-government factions, merging political identity with social identity, and dividing the territory along a single political cleavage. Based on the data collected through in-depth interviews conducted between 2020 and 2021 with self-identified protest participants, this article illustrates the impact of the protest movement on family relationships and identifies the strategies deployed by the participants and their family members to resolve political discordance. The findings demonstrate that the pernicious effect of political polarization and the protest penetrated the domestic realm and influenced everyday family life to a varying degree, depending on the family lifecycle, relationship quality, and the political biography of family members. Individuals employed a repertoire of practices, such as creating relational

buffers, building self-disclosing dialogues, and establishing reflexive consensus to deescalate confrontations, restore intimacy, and contain political risk. This article unravels the influence of social movement on personal and familial biography by illustrating how individuals rearticulated family relationships and reinvented relational practices that consolidated and redefined the prevailing family culture in times of political crisis. It also provides a nuanced analysis of the ways in which individuals alleviate intense antagonism and overcome polarization in the domestic arena, and highlights how structural and relational constraints, such as changing socio-political circumstances and familial power dynamics, may obstruct deliberative communication and reconciliation on the interpersonal and societal levels.

Intersectional Marginalization and Family Strategies: Family Lives in Cubicle Homes Under Covid-19

The impact of COVID-19 on family life is widely documented, but more effort is needed to investigate how it has varied across social groups regarding their structural positions. This study focuses on the low-income families living in cubicle apartments in Hong Kong – an informal housing unit subdivided from a larger domestic quarter – to examine how the pandemic has exacerbated structural marginalization, which is manifested in everyday family life. Data was collected through ethnographic observation and in-depth interviews conducted with tenants living in cubicle apartments concentrated in two low-to-middle-income neighbourhoods in Hong Kong since January 2021. The author interviewed 41 families, which included 41 caretakers and 22 children. The findings reflect how COVID-19 has disrupted the fragile equilibrium barely sustained through the tenants' daily household maintenances before the pandemic, causing health risks, immobility, financial strain, and family conflicts, all of which severely threatened their well-being. In particular, the study examines the role of home space to illustrate how the access to and the lack of space might alleviate or aggravate the impacts brought about by COVID-19 respectively. Based on the data, this article identifies the spatial, virtual, and collective strategies employed by the families in coping with the adversities caused by COVID-19. The study shows that while the pandemic has separated these families from their extended or immediate families in Mainland China and increased the burden of caretakers, especially women's, it nonetheless motivated them to expand and utilize their social networks and participate in community-based collective actions. This study contributes to a multi-faceted understanding of the impact of COVID-19 on family life in conjunction with housing inequalities and spatial injustice, revealing how structural inequalities, such as those rooted in class, gender, and migration status, are operated, reinforced, and contested in everyday practices.

Digital Miracle and Reality Undercurrents: The Globalization of Original Streaming Films and Series for Regional Industries

Globalized streaming platforms are making it easier for subscribers to watch foreign films and series and also enable local content to access cross-culture communication opportunities. Still, it is impact on the regional brick-and-mortar film industry remains to be determined. By analysis of texts based on financial reports of Netflix, the US and Korean newspapers, and Commentary information by users,   this study reveals that Netflix's digital capitalism logic decision-making and industry draw-in are underlying risks for the local film and series industry. Through the empowerment of creators and incorporating Korean culture into original streamings throughout the creative process, Netflix creates a new digital monopoly on Korean film. And the local brick-and-mortar film industry is caught up In the logic of the decision to continuously provide original cultural and creative products for Netflix. Numerous investments and the potential for mega global viewing are soft power that local companies and filmmakers cannot resist, even if it conceals the risk of being abandoned by Netflix due to shifting subscriber preferences, underperforming revenue, or lack of effective regulation. Combined with the closure of local cinemas due to COVID-19, Netflix may become the new Korean cultural gatekeeper.

Young People's Leisure Time in Urban Environments during Covid-19 Pandemic

During the years 2020 to 2022 around 10 youth researchers conducted team ethnographic study in metropolitan Finland and in Tampere, located more central Finland. This ethnographic team did ethnographic observation on young people's leisure time activities on urban and semi-urban spaces of these cities together with street youth workers and outreach youth work. At the same time the study gathered relevant data on these specific youth work activities during covid-19 restrictions. In addition, the study conducted interviews and group interviews with young people, young people were co-researchers and their multiple experiences were also gathered through artistic competition. In addition, media news were used and analyzed as part of the study.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The presentation will explain the most important finding of this extensive study, published as a book in Finnish in early 2023. The study analyzed multiple of intertwined themes including "hanging out", safety and harassment, security and security guards, use of drugs and alcohol, youth groups and gangs, use of public and semi-public spaces. The study concludes with long list of recommendations, what should be developed on city and/or societal level in order to support young people's sustainable well-being better in the future.

Imams' Role in Muslim Communities in Sydney

Post-migration religious groups, like other immigration groups, are changing the environment for residing, and in a constructive process, their interactions and processes of identity-building affect the social conditions in which they seek to satisfy their religious and cultural needs. Muslims may feel insecure, with a sense of spiritual segregation, and struggle to adapt to the new environment, including being able to accept the differences between western culture, religion, and their own new field. My research indicates that this shift can manifest itself in various ways (habitus, capitals), including the adaptation of symbolic gestures, religious fads, and social mobility, to co-exist in society, seeking shared values and mutual understanding. In terms of contextualizing my research, this paper presents part of the research findings from the empirical data gathered together with discussion, through multiple lenses and mediated through contexts.

The findings demonstrate the impact of imams on Muslim communities through their leadership in Sydney. The findings reveals that how guardian leaders protect the Islamic identity of Muslim congregations as well as transmit a traditional understanding of Islam for congregants, including the next generation. Therefore, most of the leaders as the traditional imams' support weekend faith-based schools to shape the identities of young members of the community and ensure that the next generation is versed in Islamic tradition. The analysis of traditional leaders shows that they create bonds between the members of their congregations through programs and a variety of social events within the community. They revolve effectively around matters of faith, and thriving mosques offer a place for prayer, as well as for communal gatherings and activities. Seemingly, some of the data shows that a number of traditional imams in their communities in Sydney do not see their role as aiding the integration of the members of their communities into Australian society.

The Dead-End of Construct Variance and How to Work Around It with Geometric Data Analysis

Testing for construct invariance has become standard practice in cross-cultural research. However, the criteria involved (configural, metric and scalar invariance) are so stringent that a lot of comparative studies stop at identifying structural effects because the latter preclude the bulk of the inquiry that the researcher would like to conduct (e.g., studying country positions on a latent scale). This paper proposes a workaround this impasse by sidestepping the congruence criteria stemming from the general linear model (GLM). The illustration is from a study of partly racialized press coverage, produced more than a century apart of two outgroups: Jews and Muslims. Multiple factor analysis (MFA), an extension of geometric data analysis (GDA) reveals that none of the latent constructs (discourse frames) structuring the data in one group has an at least configurally invariant counterpart in the other. This is especially an issue for measuring *overall* racism since one of the questions the study addresses concerns the difference in the degree to which these two groups are racialized in the press. By locating units of observation (the articles) on the one hand and topics clustered into discourse frames on the other in a joint space, MFA offers avenues for comparison that are not available in a GLM framework. In MFA, the fact that racialized discourse involves different ideas depending on the group covered (Jews v. Muslims) becomes a facility for, rather than an impediment to comparison. This is because while there does not exist an overall racialized frame that would be invariant for both groups, the groups' respective distances from their own (i.e., group-specific) frames are calculated in the joint space. The discussion also includes an argument for a less conventional approach to measuring distance between sets based on the Hausdorff metric.

Climate, Employability and Labour Marginalisation in India: A Case Study

Climate change has resulted in low farm productivity in today's globalised world. Where, climate change are responses either to increasing industrialisation or for several other developmental agendas of the socio-political conditions. The present situations of Sri Lanka or Ukraine give alarming indications to other nations. Geo-political conditions, or simply one disastrous flood, typhoon or hurricane as witnessed in different nations in recent times can lower down the nation's economy drastically. If this is the question that has shaken the powerful nations and has put them in distress about survival and sustainability today; it is not new to discuss how the lower-income sections of Indian society have been migrating for decent working conditions and income as their rural fields are subject to victims of low productivity both in terms of agriculture and livestock. Based on case study and narrative case analysis of labourers in these contexts, this study will try to address the migrating patterns among the labourers of the Indian subcontinent. Also, it will look at how climate change has affected them severely, be it in terms of poor economic conditions or forcing them to mental social isolation. The study also tried to look at how labour became victim of the climate change and at the same time faces serious socio-political imbalances. Especially the study also unfolds the painful life and hazardous journey of labour from rural to semi-urban peripheries due to climate change. In conclusion, the study sees climate change as a process that affects the social, educational and employment of poor and marginalised labour to access even the bare minimum needs in their life.

Learning Critical Consciousness: Higher Education Student Activists in Yogyakarta

Indonesian higher education student activists have always been at the forefront of resisting Indonesia's anti-democratic politics. Yet, little is understood of the educational processes that shapes their activism. Utilising Paulo Freire's concept of critical consciousness, or the skills required to understand and act on oppressive social, political and economic phenomena, this research explores how Indonesian student activists developed their critical consciousness while under the backdrop of a growing authoritarian regime and a neoliberal education system. This study draws on ethnographic fieldwork of 12 higher education student activists from the city of Yogyakarta involved in the *Aliansi Rakyat Bergerak* student movement and protests. Findings suggest that while the Indonesian state does have a stronghold over tertiary education institutions, there exists opportunities for a degree of agency to interact and gain counter narratives. This includes from within these institutions such as from the teaching staff and the students themselves but especially from outside these institutions. Particularly, learning through the student's direct involvement in political activism, such as social movements and protests. Through this investigation this research further argues that while direct involvement in political activism can constructively and critically shape the student's critical consciousness, yet for some, being involved in political activism can also be contradicting, constraining and fatiguing. Resulting in some of the student's desire to limit or retract themselves from engaging in socio-political issues and at times even encouraging them to engage in anti-democratic politics. A focus on the lived experiences of the student's activism provides a deeper account of learning through activism and highlights the importance recognising that in their process of learning politics and activism it cannot be separated from their lived experience of being a student activist.

Men without Gender? Theorizing Social Reproduction, the Coloniality of Class, and the Gender of Working-Class Men

After decades of poststructuralist informed feminist theorizing on difference and privilege, it seems unnecessary to note that men are not unmarked by gender, despite being privileged by it. And feminist intersectional analysis alerts us to the fact that, although some men may be oppressed as the working poor, they are nonetheless not solely marked by their class. This paper is an extended response to comments by a male colleague who, while summarizing a series of papers at a conference on labor in India at which the only two papers on women workers had been sequestered into a panel on gender, proclaimed "we are talking about class and not gender" as a rationale for not addressing the content raised in those two papers. In this paper, I theorize this analytic of working (class) "men without gender" as a feature of the 'Colonial/Modern Gender System' theorized by Maria Lugones. Transnational labor sociology of the global South maintains the masculinist heteropatriarchal framework of a dualism between private and public spheres of labor, and the corollary binary of home and work, that originated in conceptualizations of the working class as blue-collar and male in the global North. I extend Lugones' rereading of modern capitalist colonial modernity—the colonial imposition of gender, race, and sexuality on the colonized—to the coloniality of class. I propose a decolonial feminist approach that foregrounds the labor of social reproduction to gender the male worker and class the woman worker in the global South. Drawing on Delhi-based male workers' narratives of their lived experiences of migration, work, and displaced homemaking illuminates the dispersed and shared labor of social reproduction, which enables me to ask what is hidden from our understanding of gender in (post)colonial contexts and how we might push further to decolonize class alongside gender and sexuality.

Co-Producing Knowledge in Action: Reflecting from the Main Bhi Dilli Campaign for Equitable Planning in Delhi

There is a need to recognize plural knowledge and lived experiences for equitable urban planning. Much has been written about the potential of coproduction of services and knowledge in recent literature. How does this coproduction of knowledge take shape at the scale of the city and what is the role of academic actors here? Positioning academia within a constellation of urban actors, this paper reflects on the process of coproduction within a campaign for equitable urban planning in Delhi – *Main Bhi Dilli* (I too, am Delhi) Campaign. The campaign brings together urban actors with diverse positionalities, differing theories of change across academic actors, social movements, and civil society actors, across sectors and lived experiences in the city. This paper draws from the archival material of the campaign produced through prolonged dialogue and practice-based research. It focusses on one particular knowledge product that the campaign has produced called the Factsheets. Factsheets are 4-page documents that simply provide an overview of the theme (informal -livelihood, housing, gender, etc.) and what the Master Plan can do to address the gaps in planning that exist. The paper uses the 'factsheets' as an artefact of coproduction, as a site that holds the processes of coproduction together. It argues that while the factsheet itself is one of several outcomes of the campaign, it is the processes of holding, contesting and channeling multiple positionalities towards a common aim and vocabulary that is technical, timely and strategic, that are of real value. While the exact format and material may not be translatable in contexts with different social and political realities, we argue that the principles of accessibility, legibility, holding diverse streams of knowledge and contestations and synthesizing them in a propositional mode while in a diverse coalition are useful across contexts.

Intergenerational Relations and Reimaginations of 'Active Ageing': Observations of Higher Education Students' Understandings of 'Old Age' Under the Covid-19 Pandemic in Hong Kong

Based on the findings of an exploratory study on higher education students' understandings of 'old age' in Hong Kong, this paper considers the relevance of issues of intergenerational relations to meaningful reimaginations of 'active ageing'. The 'active agieng' paradigm emphasizes providing support for older adults' social engagement to achieve health and well-being in old age and is widely adopted in policy and practice in ageing societies. Nevertheless, with older adults identified as a higher-risk group under the pandemic and their morbidity and mortality widely reported, biomedical conceptualizations of old age as a 'problem' of decline and dependence have reemerged in media (e.g., when older adults were singled out for not wearing facemasks or social-distancing in public) and even at the policy level (e.g., when self-isolation measures were targeted at the population at or above a fixed age).

This paper presents the findings of a focus group study on how higher education students in Hong Kong understand 'old age' and the way older adults are treated by the wider society under Covid-19. It illuminates the importance for researchers in ageism to attend to the prevailing normative expectations that 'responsibilize' individuals to negotiate individualized risks for planning and providing for an increasingly contingent lifecourse. In a neoliberal flexible economy, the weight of expectations to be 'self-enterprising citizens' can be felt as much by younger adults as in the case of older adults who are encouraged to embrace 'active ageing'. Yet, debates centring around public investments in social welfare, especially social care and healthcare, appear to have fueled ageism. The sentiments are crystallized in the intergenerational tensions manifested under Covid-19, at the same time when intergenerational solidarity is seen to be essential to active ageing. Implications are drawn for rejuvenated engagements with 'active ageing' and for higher education teaching and learning.

Problematising the Global North/ South Binaries: A Critical Review of the Sociological Literature of Education of Ethnic Minority Students in Hong Kong

This paper reviews literature on education of ethnic minorities in post-1997 Hong Kong and reflects on the underlying politics of knowledge production. Scholarly interests in education of ethnic minorities have centred around language education and curriculum development, the impact of education reform, and what these mean for equality and equity in Hong Kong society. Problematic assumptions in education policy and practice have been identified; the persistent educational disadvantage of ethnic minority students despite institutional changes is made clear. Qualitative and participatory methodologies have contributed invaluable insights into the perspectives of ethnic minority students, their families, and teachers as they experience the said changes and debates.

Situating the relevant literature in mainland China-Hong Kong relations in the post-1997 period, the paper proposes how postcolonial perspectives can both potentially expand and limit sociological imaginations about education of ethnic minorities in Hong Kong. The paper foregrounds the need to attend to the mediation of so-called 'Global North' concepts or frameworks in a context where the SAR government and local citizens continue to negotiate their position vis-à-vis the national agenda of a globalising China while seeking to realize the visions of a global city. Attention is drawn to the inequalities in how locals mobilize 'multicultural' resources and identities in education, and to the uneasiness for education of ethnic minority groups to be made relevant to ongoing identity politics. With this, the paper sheds light on the difficulties for producing understandings of 'multiculturalism' that can resist appropriation by neoliberal doctrines while at the same time relate to local cultural and political sensibilities. What it means for researchers to go beyond 'West/non-West' or 'Global North/South' binaries in researching education of ethnic minorities in the current Hong Kong context is explored.

Pilot Scheme on Community Care Service Voucher for the Elderly in Hong Kong: Implications for Long-Term Care Policy

As community care services are publicly funded in Hong Kong, an introduction of the Pilot Scheme on Community Care Service Voucher for the Elderly (CCSV) from 2013 onward aims at empowering the users with autonomy in choosing service and service providers, enhancing financial sustainability and encouraging participation of different types of service providers. This article first analyses the effectiveness of CCSV in terms of utilization rate, attrition rate and reasons of withdrawal, and provides sound short-term, medium-term and long-term recommendations. Secondary data covering the annual survey conducted by the Social Welfare Department with all voucher holders in the first (2013-2017) and the second phases (2016-2020) was used.

The utilization rate of CCSV in the first phase was satisfactory but the second phase is constrained by a low utilization rate, in which 17%–35% of CCSV holders who did not use their vouchers to purchase CCS. Moreover, a high attrition rate of CCSV holders in both phases warrants special attention. It is demonstrated by an increase in the percentage of CCSV holders who have left the scheme from 9% to 64% in the first phase. It is followed by an increase in the attrition rate from 9% to 44% in the second phase. The Pilot Scheme on CCSV represents a new trial in Hong Kong since 2013 because long-term care is financed based on a publicly funded model. It exerts far-reaching policy implications on the future development of the Pilot Scheme, which is characterized as a co-payment and money-follows-user approach.

Becoming Parent: The Impact of Nonstandard Work Schedules on Childbearing in France

The relationship between work schedules and fertility has become important because of the declining fertility among European countries with a significant rise in women working in nonstandard schedules (NSWS). Our study investigates the effect of different types of NSWS (early morning, late evening, night and/or weekends) on women's fertility in France in a longitudinal framework while controlling for hours of work. We use the *Conditions de Travail*

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

(CT) panel dataset covering 4,178 women of childbearing age in 2013, 2016, and 2019. Using lagged regression models, we found that working NSWS contemporaneously decreases the propensity of a woman to have a new child, while the lagged effect is positive. In addition, the result is primarily attributable to NSWS that are worked on an involuntary basis as opposed to voluntary NSWS. When assessing the different types of NSWS, we find that the effect is the strongest for night schedule.

Mental Health Among Nonstandard Schedule Employees: The Gendered Role of Family and Work Resources

While employees engaged in nonstandard working schedule (NSWS) face major issues regarding family cohesion and partnership, the mechanisms through which NSWS can impact individual mental health are not much explored. In this paper, we first examine whether NSWS is associated with poorer mental health, contrasting by type of schedules and gender. Second, we investigate whether job and family resources contribute to mitigating the relation between NSWS and mental health for both male and female employees. Finally, we explore whether the role of both resources vary by social class among men and women. We use data from the 2016- French CT-RPS survey on working conditions that provides detailed information on psychological risks and working schedule for a sample of 15,474 employees living in metropolitan France and with partner.

We find that women report significantly poorer mental health than men in all schedule and this gender gap increases among employees working in nonstandard schedules, especially when they work on weekends. For both men and women, the lack of family and job resources is associated with higher risks of poor mental health. However, for women, family resources appear to be more important than work resources, especially women in lower social classes. On the contrary, work resource is a more important factor than family resource among upper and middle classes.

LAMBERT, Simon* (NEIHR- National Coordinating Centre, New Zealand)

Inland and Ocean: Indigenous Relocations Forced and Voluntary – Gulf of Mexico and Canadian Prairies

In the histories of Indigenous Peoples, we see mobility in response to environmental and societal changes or pressures. This paper compares the experiences of Indigenous communities across two broad spaces on the Americas, the Canadian Prairies and the Gulf of Mexico Coast, in framing their responses to the present climate crisis. We see commonalities and cultural risks caused by colonization and globalization- a disaster colonial concept that maybe countered through Indigenous knowledges, lifeways and place endurance.

We take these Indigenous historical experiences and contemporary responses to project three future scenarios. The first sees the status quo of Indigenous marginalization enforced; the second with Indigenous Peoples even more oppressed through neocolonial confiscation and extraction as non-Indigenous societies seek their own survival; and a third scenario where Indigenous sovereignties are acknowledged and new approaches to development modeled and expanded to environmental and societal wellbeings.

Seeing Others: Redefining Worth in our Divided World

Growing inequality and the decline of the American dream are marked by a mental health crisis across all social classes in the United States. I consider what alternative hopes are taking shape based on interviews with 80 Gen Zs and 185 agents of change who are producing new narratives in entertainment, comedy, advocacy, art, impact investing, and other fields of activity. They are offering alternatives to neoliberal scripts of self by producing narratives that emphasize inclusion, authenticity, and sustainability. They contribute to social movements that aim to extend recognition to the largest numbers, even in a context where political backlashes are multiplying. These transformations point to how to broaden cultural citizenship, not only in the United States but in other societies.

LAMOTHE, Carmen* (University of Toronto, Canada)

Public Stalls, Private Walls: Toilet Graffiti As Political Participation

In an increasingly online world, graffiti can offer us a glimpse of local, "offline", and anonymous forms of written messaging. Graffiti, studied in sociology, mostly focuses on public urban pieces, tagging, gang graffiti or murals. But how might we theorize graffiti differently? I argue that toilet graffiti can offer a case in which to newly examine larger social issues around political discourse. Pictures of toilet graffiti (n=300) were collected between 2014-2017 at Concordia University's Sir George Williams Campus, located in the downtown core of Montreal. Using toilet graffiti as a case study, this research explores notions of private and public, gendered political participation as well as their intersection with space, place, boundaries, privacy and anonymity. It explores a method of studying liminal space which adds to Goffman's notion of frontstage/backstage as well as expanding the scholarship around the public/private divide. Findings highlight the importance of the liminal space in facilitating access to public political discourse.

Reparation Ecology and Climate Risk in Latin-America: Experiences from Four Countries

Published in Frontiers in Climate (October 2022), this paper is based on original comparative research carried out in four Latin-American countries on the ecology of reparation, understood as a non-dooming and scantly explored frontiers to re-deploy contemporary strategies of adaptation to climate risk. The IPCC's Sixth Assessment is a landmark in recognising social justice and local knowledge as imperative for successful climate adaptation; however, taking this new scientific consensus seriously has profound implications. While narratives of fossil fuel companies and closing climate windows often dominate climate politics, there is an urgent need for new thinking frames, especially given that everyday adaptations by the most vulnerable are often hindered by incumbent actors at more local scales. In response, this paper tackles the issue of Climate Risk and Human Well-Being in Latin America from an emerging and innovative perspective: Reparation Ecologies. Reparation is a heuristic category by means of which we systematise converging evidence about the responses of local Latin-American communities to severe socio-environmental crises closely connected to climate risks and to long-lasting threats to the well-being of human societies as well as ecosystems. The results focus on a comparative analysis of five case studies on nature-based urban adaptation in two low-income settlements in Brazil; local ecological governance led by actors from the organised civil society in Colombia; agroecological and just innovative food production systems in Ecuador and sustainable urban-rural food markets in Guatemala. Assuming the complexity of climate change from a culturally and geographically located perspective, the paper unveils the non-doomed, ecologically reparative character of these initiatives. It therefore contributes to the recent turn in the debate on climate risk, claiming that diverse groups of people and communities around the world are contributing to radical change, tuning their behaviours and social arrangements in what an emerging scholarship defines as Reparation Ecologies.

The Normalization of Precarity: An Ethnography of Energy Spaces and Life at Risk in Vila Nova Esperança (São Paulo, Brazil)

Published in Portuguese and English in *Desenvolvimento e Meio Ambiente* (Development and Environment) in October 2022, this paper aims to explore the intersections between the spatial configurations of disaster risk and its political, social, and cultural consequences. The article presents the results of the first phase of the field research, carried out between September 2021 and March 2022 in Vila Nova Esperança, a low-income community in the western periphery of São Paulo. The research originated from the ethnographic analysis of the access to energy infrastructure and services, defined as the object of study through the notion of *energy space*, ensuing from Setha Low's work on ethnography of space and culture. The precarity marking the energy space

extends to other dimensions of the inhabited space and its social relations, encompassing other fragilities related to disaster risk and the impacts of climate change. Emerging from the systematization of the histories of people and place is the permanent and intertemporal character of precarity, which despite the achievements of the community and the residents, presents itself as a political fact. The results combine the analysis carried out with data on urbanization in the periphery of São Paulo, being the ethnographic work based on the narratives of community members, together with the study of the spatial configurations of energy access. From this triangulation emerges the combination of the social construction of biophysical and social risk as a transversal element that shapes the main result of the article: the multiplication of forms and dynamics of the social production of risk as a process that goes beyond disaster risk and the impacts of climate change. In this sense, the phrase "normalization of precarity" in the title is a provocation, an invitation to look into the intertemporal permanence of precarity in the periphery of São Paulo.

Transnacionalización De La Violencia y Mujeres Solicitantes De Asilo En México

Las solicitudes para obtener el reconocimiento de la condición de persona refugiada en México incrementaron significativamente como resultado del contexto violento, las crisis políticas y económicas, la proliferación de grupos delictivos y la violación masiva de derechos humanos que se registra en países de América Latina y del Caribe. La Comisión Mexicana de Ayuda a Refugiados (Comar) reportó que, hasta septiembre de 2021, sus números rebasaron las 90 000 solicitudes (Comar, 2021), con la particularidad de que se trata principalmente de personas sobrevivientes de violencia y/o perseguidas por pandillas y grupos delictivos. Es preciso puntualizar que este aumento ha sido constante y sumamente rápido. Es así como en un corto período, las solicitudes de asilo ante la Comar presentaron un máximo histórico que asciende a 100,000 hasta octubre de 2021 (Castañeda, 2021), cifra que representa un incremento de 119% (Aritsa, 2021). En ese sentido, el objetivo de esta ponencia es analizar cómo las manifestaciones y los efectos generados por la violencia no finalizan en el momento en el que las mujeres abandonan el lugar de origen, sino que les persiguen durante el tránsito y estancia en el destino (Landeros et al., 2022; Landeros y Mass, 2022; Landeros, 2022, Landeros, 2021). Utilizando un diseño metodológico cualitativo, se analizan testimonios recabados a partir de entrevistas realizadas tanto a mujeres solicitantes de asilo como a abogadas de organizaciones de la sociedad civil (OSC). Los hallazgos indican que, aunque las solicitantes de asilo salieron de su lugar de origen huyendo de la violencia, en México han encontrado un contexto ocasionalmente más violento donde intervienen actores tanto gubernamentales como de la delincuencia organizada, propiciando la transnacionalización de la violencia. Lo anterior, implica ver la violencia como un ciclo que obliga a las autoridades a generar mecanismos de protección integral para las mujeres en movilidad.

From Preschool to Adulthood – Challenges and Possibilities of the Swedish SOFIA-Study

We aim to discuss opportunities and challenges in constructing knowledge about youth based on a longitudinal study initially designed within a more individualistically oriented field of research. The Swedish SOFIA-study (Social and Physical Development, Interventions and Adaptation), is an ongoing prospective longitudinal study designed and undertaken in collaboration with schools. It includes six waves of data on children from ages 3 – 5 years in 2010 (n=2 121) to youth aged 14 – 16 years in 2021 (n= approx 1 800) in a mid-sized Swedish city. Data include surveys with teachers, parents, school principals and children/youth. Another five waves are planned for years 2027, 2032, 2042, 2052 and 2062. The study is framed within a psychological context and a considerable part of included survey questions focuses on antisocial behaviour and other aspects relating to risks of criminality. Despite this behavioural and risk focus, the SOFIA study provides opportunities to explore the lives of youth from a generational youth sociology perspective: the study

has high retention rates, covers both childhood and youth and is planned to follow the participants until their mid-50s; SOFIA is well anchored in schools and supported by the local school administration, which facilitates current and future co-production of research; multiple-source information enables disentanglement of complexities of several domains of young people's lives, for example, peer-, parent- and teacher relationships, school belonging, experiences of violence and health; data from six waves makes it possible to apply analytical strategies to capture complex patterns across time as opposed to typical linear paths. It is possible to expand the study through linkages to register data on neighbourhood characteristics, educational attainment, employment, welfare and health care usage, etc. We propose that a pragmatic solution focused approach to interdisciplinary longitudinal research on youth represents a contribution to the field of youth sociology.

LANGAT KORIR, Nancy* (Kenyatta University, Kenya)

Handshake or Hand-Cheque: An Analysis of the Discursive Construction of the Kenyan 2017 Post- Election Political Pact in the Daily Nation Newspaper.

The 2017 post-election period in Kenya was characterised by violent protests that led to loss of lives, injuries and destruction of property. These ended on the 9th of March 2017, when President Uhuru Kenyatta, and the opposition leader, Raila Odinga, shook hands in what came to be known as the 'Golden Handshake'. The symbolic handshake was intended to unify the country that had then been divided along ethnic and political grounds. The symbolic value of the handshake was however interpreted variously in discourses expressed through various platforms such as the social media and the traditional media. This study sought to establish the representation of the handshake in the Kenyan print media. This study is informed by the belief that the media is influenced by social, political and economic contexts. Previous studies have proved that language can be manipulated by powerful institutions such as the media to advance their ideological stance on an event or situation. The media use of language becomes a basis through which actors make sense of, frame and interpret situations. This study therefore aimed to analyse the linguistic strategies used in the Kenyan' *Daily Nation* newspaper to report on the handshake and attempt to theorise possible mental schemas of interpreting reality that such schemas formed in the readers. The study adopted the Socio-Cognitive model of Critical Discourse Analysis Theory as a framework. Data is drawn from the Daily *Nation* Newspaper published between the 10th of March 2018 and 10th of March 2021. Data was analysed using the tools of corpus linguistics .The findings indicated that the handshake was represented as a key campaign issue for the 2022 elections. Apart from Uhuru Kenyatta endorsement of Raila Odinga as his preferred presidential candidate, state resources were used to foster Raila Odinga's campaigns.

LANGMAN, Lauren* (Loyola University of Chicago, United States)

Neoliberal Globalization Alienation and Dialectic of Social Change

For Marx, alienation needed to be understood in terms of material conditions—the bourgeoisie owned the means of production that made possible their appropriation of the "surplus value" produced by workers. Under these conditions of alienated labor, there was a major distortion of selfhood, the objectification/dehumanization of the person, erosion of bonds of solidarity, and the demise of traditional values. Today, neoliberal globalization has led to enormous wealth, but at large human cost given economic inequality, precarity, and rapid socio-cultural changes that have impacted the collective identities of many groups. Although tied to class, the major conflicts today are between collective identities—between those few who face enormous benefits from current conditions, and the majority who have been adversely impacted by growing inequality, precarity, and dehumanization. These multiple legitimation crises at the system level migrate to the subjective realms of the "life world"—identity, motivations, and feelings—triggering a great deal of fear, uncertainty, anxiety, anger and, in many cases, a sense of shame (Habermas). Almost a century ago, given the failures of the capitalist system, major segments of the population embraced right wing parties, ultimately the Nazis, rather than progressive parties, based on the impact of authoritarianism in political behavior. More specifically, the authoritarian character structure that sought domination over others—accompanied by subordination and obedience to authorities and aggression to the outgroup—led many, but not all, to fascism. Contemporary research has suggested that while social class is less salient today, the specific forms of alienation and the grievances of economic hardship have been coupled with challenges to heretofore privileged essentialist collective identities and values, such as race, gender, and nation. Recent studies have suggested reactionaries are motivated by ressentiment, ontological anxiety, and necrophilia, while progressives seek freedom and dignity.

Star Trek or Matrix: Wither Humanity?

This talk discusses the spread of right-wing authoritarian mobilisations and governments worldwide, weaving a dialogue between critical theory and social movements studies. Science fiction, especially imaginaries of what a future society might look like, provides the author with a greater realm of freedom to offer both a critique of present society and, at the same time, imagine the future in ways that might avoid an explicitly political stance. For that, our crucial historical juncture is analysed by considering the dialectic of contemporary mobilisations and the multiple representations of the future.

LANGSTON, Jessica* (University of Sheffield, United Kingdom)

Why Good Social Workers Do Bad Things: An Institutional Ethnography of Social Work Practice with Children and Families in the UK.

Drawing on the findings from an Institutional Ethnography of social work practice with children and families in the UK this paper explores the actualities of everyday practice and traces the textually mediated social relations that come to coordinated them.

As with many other countries across the world the United Kingdom has seen significant economic and social changes, resulting in a punitive and neglectful state (Featherstone et al, 2018). An investigation into extreme poverty, completed by the United Nations in 2018, highlighted that these changes were targeting the poorest in the country at a time when the welfare state has been purposefully dismantled and the social safety net of local public services has been eliminated through the deliberate underfunding of local authorities (Alston, 2018).

Despite those entering the profession identifying with the regulatory duties to uphold human rights, challenge discrimination, and promote social justice (SWE, 2022) studies have identified that families living in deprived areas in the UK are significantly more likely to receive social work intervention than those living in least deprived areas (CWIP, 2020).

This study found that social work, as social workers, the public, and politicians understand it bore little resemblance to the everyday activities social workers undertook. Whilst participants verbally articulated activities grounded in the profession's ethical and legislative duties, the day-to-day tasks undertaken by social workers were process driven and punitive echoing the dominant ideology or personal responsibility transmitted through a raft of legislative and policy changes.

The paper will explore the mechanisms of control and compliance that were constructed by the department to restrict the space in which social workers had to exercise professional discretion and perform social work in line with their values and regulatory duties.

LANZA, Simone* (University of Milano-Bicocca, Italy)

Green Time, Human Time or Screen Time?

The family environment in Western societies has changed in three generations: from 0 device (1950) and 1 device (1980) to 10 devices (2010) per family. Screens have changed the human perception of space and time. The managing access to screen, and regulation of screen time becomes more and more difficult for families. Back and forescreen constitute the new environment for child. The guidelines of paediatricians of various nations (US, Italy, Canada, etc...) have pedagogical implications for parents but seem not to be effective possibilities. On the other hand, school systems and even pedagogists give conflicting guidelines. It seems useful to clarify from a pedagogical point the alternatives to screen-time highlighted by many scientific studies, those that empathize favourable psychological outcomes of the green time and human time. Objects have always had an educational power in pedagogical literature. Although time is socially scarce, all along pedagogical literature many critics suggest the idea that human relational time and green time are nourishment that cannot be replaced by machine mediation (as screens). Some studies suggest that the combination of high screen time and low green time may affect mental health and well-being. Which idea of world can develop screen time? Which are the effects of infant screen time – in comparison with green time and human time - on multiple domains of child development including language, cognition, attentional, social and emotional capacities? In a pedagogical perspective family have always to face alternatives, but when families see alternatives and when families are in group, they can make better decisions.

Hegemonic Ideologies of Motherhood As a Barrier to Fertility Among Women with Disabilities

While feminist and disability movements have made significant progress related to involvement and activities in the public sphere, the domains of motherhood and reproduction remain contentious. Motherhood is a normative expectation in society and the role of mother remains central to the identities of many women. Yet, women with disabilities are often considered unworthy of motherhood and even criticized if they pursue it.

Drawing on focus group data from a random sample of 22 women with disabilities (including chronic physical and mental illnesses and physical disabilities), this paper uses an Intracategorical Intersectional Critical Disability Framework to examine the experiences of women with disabilities contemplating decisions about reproduction and motherhood.

Inductive data analysis revealed a variety of decisions to mother, or opt out of motherhood, based on dominant ideologies about the demands of motherhood and beliefs about the nature of specific disabilities. Assessments of the potential risks, rewards, and demands of motherhood were shaped by hegemonic ideologies of motherhood and mediated by significant others, health care authorities, and material resources. A key finding based on the experiences of the women in this study was the appropriation of oppression via hegemonic ideologies of modern motherhood that varied based on intersectional social locations and intracategorical differences in impairment.

Grounded in the individual experiences of women with disability at multiple social locations, this research draws attention to the structural level and demonstrates how ideologies of motherhood are complicit in 'stratified reproduction' by empowering some women to reproduce and disempowering others. This finding broadens our understanding of fertility barriers to include oppressive hegemonic ideologies of motherhood.

Study findings also provide broader insight into the ways in which women with disabilities are subjugated and the social processes underlying internalized oppression, which are critical to understand and address in order achieve progress towards full inclusion and equality.

Politicization of COVID-19 and Experiences of Care and Disability in the United States: The Case of Home Care in Kansas

The Home and Community Based Services (HCBS) program in the United States provides in-home support to low-income individuals with disabilities. Regulatory policies regarding safety practices in long-term care are focused on those living in congregate living facilities, leaving in-home care less regulated and lacking a clear chain of responsibility. During the COVID-19 pandemic, the HCBS system was forced to react in real time to unprecedented conditions, impacting practices of care and the experiences of persons with disabilities and those that support them.

In the US, partisan political messaging about COVID-19 contributed to opposing beliefs about COVID-19 risks and appropriate public health behaviors to minimize risk. This paper examines the role of COVID-19 politicization in determining care and safety practices and shaping the experience of disability during the pandemic.

Data come from 63 in-depth interviews with 69 HCBS stakeholders in Kansas between March 2021 and April 2022. Respondents included HCBS consumers, direct service workers, family caregivers, and representatives of home care agencies and other service providers. All interviews were transcribed verbatim and qualitatively analyzed using an inductive, team-based, iterative, consensus-based process, facilitated by Dedoose software.

Our findings implicate the politicization of COVID-19 as a mechanism through which care and safety was compromised, and persons with disabilities further marginalized in an already ableist society. Respondents describe how State and local politics directly contributed to disparities in access to COVID-19 testing, vaccines, and other resources for HCBS consumers and workers, as well as community backlash over public health safety measures. HCBS consumers and workers, who largely identify as being at increased risk of adverse COVID-19 outcomes, felt devalued and excluded by a society that dismissed the need for public health precautions.

Study findings will be discussed in relation to the social construction of illness and emerging discourses on politics of the body.

Language Knowledge, Linguistic Acculturation Profiles and Occupational Aspirations: The Case of the Second Generation in Catalonia

One of the most important predictors of future access to the labour market is occupational aspiration which is known to be decisively influenced by issues connected to the family's socioeconomic and sociocultural level, academic performance and knowledge of languages.

However, in the case of bilingual contexts, the role of linguistic factors can be ambivalent. In Catalonia, this issue leads to questions of great theoretical and contextual importance including: What is the role of language knowledge of Catalan and Spanish in the occupational aspirations of descendants of migrants?, Are both equal predictors of higher aspirations?, How do young people behave depending on the different profiles of linguistic acculturation they develop?, and deriving from the foregoing, Can the symbolic value granted to languages mediate its exchange value in the labour market?

this communication aims to analyse the influence and predictive power of these variables on occupational aspirations, using a questionnaire completed by 205 young people of African, European and Latin American origin in Catalonia.

The findings indicate that better knowledge of Catalan and a profile of linguistic acculturation which emphasizes this language predict above-mean occupational aspirations. Knowledge of Spanish has an unclear role and a profile prioritising Spanish is a negative predictor.

We conclude that language knowledge becomes a resource 'through' its symbolic value, questioning theories postulating that multilingualism allows access to better occupations.

Walking with Water: A Relational and Respectful Design to Water Planning in the City.

Melbourne's geomorphology and urban history have shown the changing landscape conditions that have displaced water through different design and colonial planning interventions in the city; and more recently through the contemporary planning approaches that have gained momentum globally, such as water-sensitive urban design, urban greening, and rewilding. Despite these approaches in Melbourne, water memory keeps surfacing, inviting us to reconsider our human and more-than-human relations.

There is a growing concern in Australian planning (Matunga, 2013) about the lack of involvement of Indigenous People (Jackson, Porter, and Johnson, 2018). As such, there is a need to propose methodologies to deal with the spatial and environmental management that can include Indigenous people and Knowledge. Focusing on water as an element that overlaps human activity and natural underground landscape (Gandy, 2014), this project explores Indigenous and non-Indigenous collaborations developing a respectful and relational design. The Respectful Design framework developed by Sheehan (2011), looks at "natural systems by thinking more deeply, divergently, and connectively through design." This framework is based on Indigenous Knowledge as pillar of the research and privileging Indigenous voices to respect their cultural ownership.

This study centres on the Indigenous paradigm of relationality as a holistic and expansive alternative to understanding human and more-than-human relationships to propose new methodologies for underground water management. In particular, the research analyses drained, displaced, and piped waterways to show how these design disciplines could develop their relational methods and contribute to planning studies and urban data.

Rural Indonesian Youths' Conceptions of Success

Pierre Bourdieu is a preeminent Northern theorist whose concepts and ideas have been applied extensively in global youth studies. Yet Bourdieu has been critiqued for his assumptions of cultural homogeneity and failure to include local voices in his theory making. Therefore, the question arises: Are Bourdieu's concepts still useful for research in the Global South? Drawing on ethnographic fieldwork in a remote Indonesian village (Ngadas), this essay interrogates Bourdieu's concepts of cultural capitals in explaining young people's conceptions of 'success.' In contrast to acquisition of capital for individual distinction and competitive advantage, Ngadas youth accumulate capital in order to maintain collective harmony and sustain a gift-giving cycle (*guyub rukun*). This study presents an expanded understanding of capital as a collective endeavor which challenges narrow interpretations of Bourdieu in the context of Southern youth studies and suggests the need for more contextually nuanced usage of his theories. It is central to the merging theory of navigational capacities which draws on Bourdieu's notion of capitals but places emphasis on the collective nature of these capitals.

LARENZA, Ornella* (University of Applied Sciences and Arts of Southern Switzerland - SUPSI, Switzerland)

Coping with No Access to Social Assistance: A Qualitative Longitudinal Study on Single Parents' Life Course in Switzerland

Single parents (SPs) are among the main beneficiaries of social assistance in Switzerland. Most studies associate their vulnerability with negative outcomes that would be the product of their non-normative family structure, disregarding how the social policy context can impinge on their life course. Indeed, as a risk-management policy, social assistance can redress SP's life course when facing critical transitions. Conversely, when support is not available or SPs experience a clash with eligibility rules or non-take-up, it may turn into a stressor and affect their life course in many domains. Despite its relevance, the link between no access to social assistance and SP's vulnerability is mostly overlooked. This paper investigates how such problem can shape SPs' life course in Switzerland and sheds light on the unintended consequences of social assistance conditionality. Two waves of semi-structured interviews were conducted with a group of fourteen SPs with full custody of their children, facing economic hardship and problems with receiving social assistance, in the French-speaking Switzerland. A three-step analytical strategy involving thematic, categorical, and chronological analyses of qualitative data was run. SPs can try to supersede the unreceived resources by mobilizing their families, some third parties or making extra money; fight against the providing institutions to seek to obtain the benefits; adapt their life course to the benefit eligibility requirements or accept the status quo and forgo the benefits. Problematic access to social assistance does not just affect SPs financially but entails a more complex set of undesirable changes in many life domains such as: delaying the professional career; reducing time for the children or adapting to an unsatisfying quality of relationship with them; delaying new couple relationships and living in an unpleasant environment. Matthew effects allow the most audacious and better-informed SPs to overcome problems of access and contribute to inequalities among them.

The Digital Care Promissory: Unresolved Contemporary Care Problems and Imagined Techno-Futures

For nearly two decades, long-term and social care systems globally have faced crises due to austerity, workforce shortages and demographic shifts emerging from ageing societies. To resolve these contemporary and ongoing challenges for care, members of industry and government have increasingly championed the role of technology to instil better care, notably contributing to increased organisational efficiencies, workforce productivity, and quality of care for individuals and families. Leaders of care systems increasingly seek to harness artificial intelligence in its myriad forms, such as predictive analytics and robotics, to secure these outcomes for sustainable care arrangements and systems. However, these technologically-enabled care outcomes have yet to be fully realised.

This paper critically explores discourses focused on contemporary and future roles of technology in care. It identifies the emergence of a 'digital care promissory' which exposes tensions between a burgeoning evidence base of negative trial results on the effectiveness of care technologies with the temporal flows of the promised potential of technologies to transform care in consistently unrealised and re-imagined futures within care policy and practice.

From Television to Netflix: Overcoming Political Authoritarianism

Since the beginning of the 2000s, the production and export of Turkish soap operas abroad has been steadily expanding, accrediting to the Turkish serial industry a leading role within the international media scene.

Turkey aims to become a model of a Muslim but democratic and modern country in the region especially for other Muslim countries. Even if the leading political party (AKP) is not an explicitly religious one, the statements effectuated from times to times by its representants indicate an important convergence

between the religious values and the party's political and social priorities. Furthermore, the audiovisual sector in Turkey is subjected to censorship. Within this context, cultural products produced in Turkey – and particularly television series - seem to function not only as tools of the country's soft power outside Turkey's borders and of promotion of its neo-Ottoman political orientation but also as tools for the promotion and the perpetuation of the government's world view inside the country.

The taboo of the sexuality and the importance of motherhood, the underrepresentation of LGBTQ community members, of ethnic or of religious minorities, the "sin" and the attribution of justice are some of the elements that characterize Turkish television series. Nevertheless, online streaming services seem to have offered to the producers of serial fictions a certain autonomy overcoming this way the restrictions imposed by the government. The results presented through this paper are based on an empirical research in Istanbul concerning the production process of Turkish series as well as on the analysis of gender representations projected by several series diffused through Turkish channels as well as online.

RC37-546.2

LAROCHELLE, Laurence* (Université Sorbonne Nouvelle - Paris 3, France)

Transnational TV Series and Cultural Diplomacy : A Case Study

Since the beginning of the 2000s, the production and export of Turkish soap operas abroad has been steadily expanding, accrediting to the Turkish serial industry a leading role within the international media scene.

For many specialists on the subject, Turkish soap operas seem to be considered by the Turkish government as tools in order to enhance a positive image of Turkey and thus, augment its "soft power" particularly in countries that belonged to the ancient Ottoman Empire. Within this context, many strategies have been established by the Turkish government in order to assist the production of Turkish soap operas and their diffusion outside the county's borders.

The Greek-Turkish antagonism is one of the few conflicts between neighbors to persist over time. The rivalry between the two countries is based not only on objective and tangible elements (e.g., minority issues, the Cyprus question, different interests in the Aegean, etc.) but also on emotional ones. However, since the economic crisis, Greece is one of the countries that systematically import Turkish soap operas. Through this paper the author aims to present the results of her empirical research concerning the reception of Turkish soap operas by Greek audiences.

This research revealed that Turkish soap operas attract Greek audiences due to the cultural proximity between Greece and Turkey. However, this attraction should not be confounded with the desire to overcome long-enduring rivalries and negative feelings towards the neighboring country as soft power theory suggests. More specifically, this study confirms the role of several factors as third-party mediators in the reception of these serial fictions, such as the audience's predisposition, current diplomatic relations between two countries and collective, family and/or personal memory. The results presented through this paper are based on 50 in-depth interviews with individuals residing in different geographical areas in Greece.

Innovate to Win: Is That Easy ?

Face aux avancées technologiques et à l'intensification des guerres hybrides et asymétriques, l'innovation est de plus en plus présentée comme une condition *sine qua non* à la victoire militaire. Cette communication analysera comment cette injonction, devenue un véritable mot d'ordre avec l'arrivée au pouvoir d'Emmanuel Macron, impacte le travail des forces armées au quotidien. En d'autres termes, nous nous intéresserons à l'innovation *par* et *pour* les militaires, à travers une recherche menée au sein des forces spéciales françaises. Basé sur des entretiens, de l'observation participante et l'analyse de la littérature grise, notre travail mettra en lumière l'innovation « au quotidien » développée par les militaires afin d'améliorer leur outil de travail. Nous verrons ainsi qu'innover ne va pas de soi, et notre communication s'emploiera à en analyser les raisons. Nous montrerons que la « logique d'innovation » prônée par les acteurs politiques rentre parfois en conflit avec la « logique d'organisation » de l'institution militaire qui, malgré la création de nouvelles structures, reste soumise à un certain nombre de *patterns* retardant l'innovation. De plus, l'institutionnalisation progressive de cette dernière au sein de la défense n'a fait que renforcer une multiplication des échelons et une lourdeur administrative rendant d'autant plus difficile pour les militaires de mener à bien un projet. On assiste alors à une reconfiguration de l'*ethos* militaire, où le « combattant » devient aussi un « entrepreneur », dans la lignée de la mise en œuvre d'un modèle de « start-up Nation » où se développe au sein des régiments des modèles néo-managériaux issus du secteur privé (*labs*). Pour autant, le travail d'innovation prend la forme d'une « perruque inversée », où le militaire donne de son temps et de son argent personnels au profit de l'institution sans aucune contrepartie, si ce n'est l'amélioration de son outil de travail.

Health Capital: Patient's Investments in Their Bodies and the Reception in the Healthcare Field

Health has become synonymous with happiness and the possibility of living a perfect life. Almost everyone in the modern society invest in the body (from surgery to fitness and yoga). These investments are socially differentiated and differentiating. Dominant groups define the healthy game and habitually they know bodily what is the distinctive, what is desirable and what is vulgar. The specific health investment gives access to privileges. Based on Bourdieu's relational sociology, in this paper we investigate how hospitalized patients invest in their body and if and how they relate their investments to their diagnosis/illness trajectory. We draw on Health Capital (HC) (Larsen et al. as a typology of five ways of investing in the surgical body, the chemical body, the nutritional body, the physical body, and the mental body – and the socially differentiated combination of these. HC – including the five bodies – is built on concepts such as position, disposition/habitus, capital, social space, and social fields, and individual social practice. Our interest is in the socially differentiated investment strategies that are applied among a heterogeneous group of patients with different diagnosis and health conditions. We will examine how different investment styles are perceived and handled among healthcare professions in a Danish context. Do they compensate for patients with a low amount and composition of Health Capital, and what are the consequences for the treatment process?

Our study involves a sample of 600 patients across medical specialties and diagnoses (acute/chronical, cure-able/non-curable patients). They will be asked to complete a survey in which questions and variables are constructed using the theory of HC and its five types of investment. Data analysis involves Multiple Correspondence Analysis (MCA). Further 30 individual interviews with patients and 20 healthcare professions will supplement the MCA.

WITOSZEK, Nina (University of Oslo, Norway)

An Evolutionary Model for Prosocial Well-Being

This paper is inspired by the third wave of evolutionary thought that focuses on the role of cooperation and altruism in forging complex societies. We posit that people's subjective assessment of their own quality of life is the sum their happiness, which is related to individual selection, and their sense of having a meaningful life, which is related to group selection. Conceptualizing life quality from this perspective of multilevel selection, as "Happiness + Meaning = Well-being," offers insights into how the human well-being system helps people navigate between individual and group needs. Happiness is defined as the cluster of affects that reward individuals for solving adaptively relevant problems. Meaning rewards individuals for contributing to their community. While people derive happiness from cooperation and competition, meaning originates from prosocial (cooperative/altruistic) behavior. Since increased within-group competition often reduces societal well-being, public policy should aim at cooperative means for good living. Our model brings attention to these dynamics. The Nordic countries, which score highest on quality of life, facilitate multilevel well-being, that is, individual prosperity and altruistic opportunity. To investigate how meaning contributes to group selection—and individual flourishing—we conducted in-depth interviews of Nordic and Slavonic helpers of Ukrainian refugees in Norway (*n* = 32). In line with Randolph Nesse's view on happiness not as an affect meant to be maximized, but an evolutionary signal, we use a qualitative approach that allows for a deeper understanding of how individuals adapt to these signals. Our findings suggest that happiness is transient so that the well-being system's signal sensitivity can be preserved. Meaning is enduring since it assesses and reinforces social belonging. These insights are relevant for our era's turn toward more holistic development policies. Compared to often materialistic, competition-driven happiness pursuits, meaning-driven well-being is a more sustainable alternative for individuals, communities, and the planet.

LARSEN, Mads* (University of Oslo, Norway)
WITOSZEK, Nina (University of Oslo, Norway)

Mechanisms of Prosociality: A Comparative Analysis of Nordic and Slavonic Altruism Toward Ukrainian Refugees

Nordic high-trust societies are underpinned by *prosociality*, a term denoting cooperation and working for the good of others. State-funded voluntarism provides opportunities for altruism that appears to contribute to the Nordics' exceptional level of well-being. Altruists are rewarded by a warm, lasting affect that enhances personal well-being, thus motivating further prosociality. Humanity's evolutionary past coded into us a desire to strengthen our community by helping those in need—a biocultural drive that is corrupted when

authoritarian regimes impose unselfish behavior on disillusioned populations. Such *coercive altruism* has a line of adverse long-term consequences for development. Our paper examines how cultural history and memory influence people's prosocial mechanisms, and how sharing insights and practices from democratic and authoritarian traditions can lead to new, revitalized forms of altruism. Our in-depth interviews (*n* = 32) of Nordic and Slavonic helpers of Ukrainian refugees in Norway (1) illuminate the impact of culture and memory on altruistic practices, (2) define points of tension between systemic and anti-systemic modes of prosociality, and (3) identify cross-cultural interactions that generate trust, well-being, and social innovation. The post-communist experience of the Slavonic informants motivated *subversive altruism*, which highlights spontaneity, improvisation, and occasional rule breaking. Norwegian *bureaucratized volunteerism* is based on trust, efficacy, and rule-following. Our evolutionary approach substantiates how important it is for development and immigration policies to align our knowledge of human nature with insights into the workings of cultural legacies. A better understanding of the biocultural mainsprings of altruism could be of crucial importance in our era of reemerging authoritarianism and increasing migration.

Out-of-Home Care of Young People with 'Complex Needs'. a Parental Perspective on Risk Management

In recent years, there has been an increase in out-of-home care of young people in Sweden. The social services decision to place a child in out-of-home care is preceded by an assessment of different risks in the young person's environment. Being placed in out-of-home care may however also produce new types of risks which may affect the young person negatively. This paper is based on interviews with parents or guardians (n= 12) to children placed in out-of-home care (voluntary or involuntary) by the social services. The aim is to examine the process leading to the placement of a child from a parental perspective. How can different actions taken by different actors (parents, social services, and youth psychiatric care) before, during and after the child was placed in out-of-home care be understood in terms of management of risks? Have new types of risks emerged as a consequence of the out-of-home care placement? If so, how have these risks been handled? The data collection was undertaken in 2021 and participants have been recruited in various parts of Sweden. Preliminary results indicate that parents have experiences of; not having received appropriate early support to the family, a lack of knowledge concerning children with psychiatric and neuro psychiatric conditions, having to struggle to receive support for the whole family, breakdowns of care leading to the child being moved between different foster and residential homes, with a large variation in quality of the treatment provided. Further, parents experienced a lack of communication from staff in residential care. Having your child placed far away from the birth parents, increases the risk of less contact between parent and child. Having your child placed in out-of-home care is perceived of as a crisis, and more support to the entire family is requested.

Staying Online: Experience of Cyber Childhood in Transnational Families, the Case of Moldavian and Ukrainian Left-behind Children

Labour migration among citizens from Eastern Europe to the European Union has steadily increased over the past decade. Economic hardships and the search for higher living standards have led numerous Moldovan and Ukrainian citizens to seek employment on a permanent or seasonal basis in the European Union. While certain families migrate as a unit, many children remain left behind by one or both of their parents/caregivers, resulting in the growing phenomenon of transnational families. Cheap communication technologies and the internet allow children to develop coping strategies to overcome their challenging circumstances. This research is based on CASTLE project in which we address the stay-behind children's situation in the context of migration. Empirical data was collected through 102 semi-structured interviews and 10 focus groups with adult and child transnational family members and caregivers, and 24 interviews with experts from relevant organizations. The results analyzed how the children living in these families can develop a hybrid identity through using technology in daily family life. Even if they grow up in Ukraine or Moldova, through the transnational relationship mediated by ITC, their identity also contains elements from their parent's countries of migration. Most of the LBC project themselves into a future outside their country, transnationality being interpreted through educational opportunities. Being part of the digital native generation, for left-behind children by parents' labour migration, the use of ICT makes a more personal and introspective meaning, being an active part of family life. By living a lot part of their family life through digital technology, they have a childhood with a greater cyber component.

Digital Labour Platforms, Resistance and Labour Protection in Bangladesh

Digital labour platforms are the newest technological wave that is reshaping and reconfiguring the economic and labour landscape. Digital platforms often known as the gig economy are increasingly adopting app-based models to connect consumers with workers to complete their on-demand tasks. Existing research on the gig economy and its regulation are mostly Global North facing whereas little is known about the emergence of the gig economy in the Global South. In particular, there is a gap in the literature about how the gig economy is regulated in the Global South and gig workers' working conditions and resistance opportunities. Within this context, based on Twitter data, content analysis and in-depth interviews with 15 gig workers and their association leaders, this paper explores the nature of gig work and gig workers' associations in Bangladesh as well as the implications of the digital labour platforms for labour regulation in Bangladesh and the potential applicability of existing laws and regulations to platform work.

Drivers of Disillusionment and Exit Among White Supremacists: A Gendered Analysis

Building on our earlier research on why women leave and stay in white supremacist groups in the United States (Latif et al 2020), in this paper, we compare the unique trajectories of men and women and consider the factors and processes that contribute to their respective disillusionment and exit. In our previous analysis, we discover that the processes of disillusionment for women are asynchronous. For some, disillusionment came before exit, but the reverse was also true. Others exited but never became disillusioned. In this paper, we matched men and women by age at the time of their involvement and by group, two variables that allow us to identify comparable experiences in white supremacy. We examine the complex interplay between belief and action to identify the myriad factors that shape the processes of disillusionment and exit. We draw on life history interviews with 47 men and women who were former members of white supremacy groups in the United States and assess the impact of individual-level factors, such as responsibilities for their families and economic opportunities, and how such factors interact with group-level influences to shape the processes of disillusionment and exit. This gendered comparison fills a critical gap in the literature on extremist movements and contributes more broadly to our understanding about what membership in the white supremacy movement entails for men and women, its impact on their sense of self, and the mechanisms that can strengthen or disrupt their affiliations.

An Intersectional Perspective in Gender Roles in Sexuality and Care of Women with Functional Diversity

This research is framed within the project "Sustainability of care for people in a situation of dependency: experiences and dilemmas in the design of techno-care. PT18-2624; PAIDI2020)".

This research is focused on acknowledging how women with functional diversity deal with self-care and receiving the care of others, as well as what spaces and social meanings are being attributed to them when they express their sexuality.

Their sexuality is going to be closely related with the ruling beauty standards, which imply that non-normative bodies are going to be understood as something distant from the eroticism and less predisposed to pleasure, thus infantilising or even making their pleasures and desires invisible.

This reality could be appreciated more strongly in terms of female sexuality, as beauty has traditionally been associated with the female identity, whose sexuality has been subordinated to the male desires.

Regarding this topic, García-Santesmases (2014) highlights the poor attention that has been paid to the intersectionality of functional diversity and the inequalities between men and women, even though there has been many researches focused on gender violence committed against women with functional diversity (Wu et al. 2017).

This research analyses through secondary sources and interviews with key people the existing data and information about sexuality, pleasure and

functional diversity. However, this research has faced some severe difficulties due to the fact that, as Shakespeare (1998, p. 205) mentioned, in the case of people with functional diversity "sexuality is not an issue as it is not a topic, or it is a topic as it is seen as an issue". At the same time, it implies questioning the sexual relations between men and women, as well as the sexual encounters as we traditionally know them: coitocentric and centered on the erection, the orgasm and the ejaculation.

Social Equality Versus Equality of Opportunities and Their Impact on Social Policy. the Years after the Chilean Estallido Social.

Almost two years have passed since the occurrence of the Chilean "Estallido Social" in October 2019. The central consequences of the protests can be summed up in a deep crisis of legitimacy of the economic development model and any political institution associated with it and constant criticism of the levels of inequality in the country. The presentation aims to analyse the events and developments of the "Estallido Social" using International Social Survey Programme data from 2009 and 2019 to explore the role of perceptions of economic inequality in the emergence, consolidation and later outcomes of the Chilean protests. The analyses are based on a theoretical approach from relative deprivation and social justice theory.

The results of the analyses indicate that the "Estallido Social" was a group of social protests born from an individualistic distributive preference based on the idea that each person should get what they deserve according to their own merit. Thus, the crisis of legitimacy derived after the protests results from the imbalance between what people perceive and what defined as a just level of economic inequality. Chileans did not look for a model based on social equality where the state, or another institution, decides each person's success. The afterwards events of the protests showed that the solution to this criticism was never to change the system but rather to provide greater justice to its functioning while maintaining its distributive principles.

The presentation concludes that social policies based on creating an egalitarian society should be avoided, even if one of the principal causes of the "Estallido Social" was a direct criticism of the inequalities produced by neoliberalism. Social policies that ensure equal opportunities from targeted access to sectors with fewer resources seem to be a way out of the crisis of legitimacy faced by the Chilean development model.

"Chileans' Anger at Inequality Boils over": The "Estallido Social" and the Role of Perceptions and the Legitimacy of Economic Inequality in Social Protests

In October 2019, the "Estallido Social" demonstrations began in Chile. The protests originated from a growing critique of the government economic development model and the levels of inequality in the country. The social demands were varied and included several areas of Chilean society, from writing a new constitution to improving gender disparities. As a result, these Chilean demands for a more equalitarian country led to a 2020 referendum and the later creation of the Constitutional Assembly. Using International Social Survey Programme data from 2009 and 2019, and a theoretical framework based on Social Justice and Relative Deprivation Theory, I argue that the protests that started in 2019 were a consequence of a process that began years ago. Initial analysis pointed out that the 2019 demonstrations stemmed from earlier public discontent based on a perception that inequality was increasing, generating a more socially segregated society. Thus, the "Estallido Social" is based on the perception of an unequal country and a lack of trust in the institutions that should prevent it. However, my research also shows that the Estallido has a counter-intuitive origin, namely from a criticism of the perceived levels of economic inequality at a time when Chileans perceived less inequality than in the past. Thus, why did the Estallido begin in 2019 and not before when perceived inequality was greater? The research concludes that at the base of the demonstrations was an imbalance between what Chileans perceived and what they tolerated as a fair level of economic inequality. Perceptions of actual and just economic inequality relate to each other in order to explain deprivation feelings. Deprivation has increased in the last years among Chileans, and it is another variable that must be included to explicate the massiveness of the Chileans' protests.

Rational Choice and Unintended Consequences Under Restrictions during a Pandemic: Theoretical Reflection

Quarantines, lockdowns, a mask regime and travel restrictions during the COVID-19 pandemic created a number of barriers to the normal functioning of society. The most rational choice in such a situation was to move a lot of activities into an online. So many employees began to work remotely, students switched to Zoom, various documents and services became available only online. There are already many studies that show that this measure has contributed to many unintended consequences, primarily for the education system. Firstly, the transition to online has reduced the concentration, significance and effectiveness of learning. Secondly, online communication is significantly different from face-to-face communication. Many teachers complained that it was harder for them to hold an audience without even seeing the students' faces. Third, going online creates a lot of inequality. More crowded residential areas and houses created many risks for the spread of the coronavirus, while others could afford to distance themselves. The given examples of unintended consequences of restrictions associated with the spread of coronavirus theoretically make it possible to analyze their causes and effects.

Firstly, one of the main reasons is the shortsightedness of some actions. Rational choice in one situation could lead to many unintended consequences. Secondly, unintended consequences included effects of various kinds and different spheres of activity. These include: physical consequences (harm to a person's physical condition), psychosocial consequences (harm to psychological and social aspects linking social conditions and mental health), economic and cultural consequences. Thus, in order to avoid such consequences, a comprehensive strategy was needed. Of course, such actions were virtually impossible at the beginning of the pandemic, but in the future the development of theories that would be aimed at predicting and earlier identifying unintended consequences is needed.

Healing through Social Media: Experiences of Ethnic Minority Cancer Patients and Survivors in Hong Kong

Abstract

A sizable number of literatures have suggested that cancer patients can be empowered by social media in two ways. First, social media promotes eHealth literacy by enhancing the circulation and exchange of medical information among patients and thus enables cancer patient education (Attai *et al*., 2016; Braun *et al*., 2019). Second, it leads to social support from other patients and medical professionals and in turn accumulates one's social capital which can be mobilized to cope with challenges aroused from cancer (Bloom *et al*., 2019).

This presentation provides an alternative perspective to discuss the relationship between social media, healthcare and the emotional outcomes of cancer patients/ survivors, i.e. the construction of self-image in cancer treatment and its implications. I argue that with the aid of social media such as Facebook and Instagram, the process of identity construction of cancer patients can be understood via Erving Goffman's (1956) narratives on the presentation of self in which individuals manage their impression to others during social interaction in order to define who they are. Drawing on interviews with twenty non-Chinese cancer patients and survivors including Filipinos, Indonesians and Indians in Hong Kong during April and August 2022 through snowball sampling, I find that social media helps to shape their self-image through presenting their ideal self as a fighter/ survivor rather than a victim/ patient of cancer. Although eighteen out of twenty interviewees were young and middle-aged female (between 28 and 60) who were reluctant to be diagnosed of cancer at the very beginning, a substantial number of them felt extraordinarily proud of showing pictures of their bald head and the process of chemotherapy on social media – the topics which can be considered as taboo in their homeland, and eventually overcame their emotional distress and pain over cancer treatment.

Right-Wing Mobilizations and Feminist Resistance in Contemporary Poland : The Struggle over Abortion As a Case Study

Linked with critiques of (neo)liberalism and globalisation, anti-feminism (and more generally anti-genderism) has become a key element in the rise of conservative/right-wing movements, parties and organisations over the past decade in Poland (Korolczuk and Graff 2022). The return of the Law and Justice party to power in 2015 intensified this dynamic by legitimising hate campaigns and demonisation of feminist and LGBTQ activists as enemies of the nation and curtailing women's rights. At the same time, these attacks have led to the emergence of a new wave of radical and intersectional feminism fighting not only for gender equality but also against church interference in politics, national-populism and authoritarianism in the country. Based on ongoing ethnographic research, this paper proposes to examine the rival responses of conservative/right-wing and feminist organisations to the abortion struggle in Poland today. Indeed, the massive mobilisation around the near-total ban on abortion (in force since 2020) testifies to the polarisation of society and is central to Polish politics. From a dialectical perspective, I will first analyse the discourses, practices and strategies of both groups, focusing on how they address women and feminism (within their organisations and in

general). Assuming that struggles over gender are struggles over the definition of democracy, I will then attempt to question women's leadership and the relationship between patriarchy and democracy in contemporary Poland.

Educational Expansion and the Family: How Do Family Generational Mobility Patterns Effect Children's Success in Middle Adulthood?

In this presentation, we examine the relationship between educational expansion in the 1980[ties] in Germany and the generations within a family. Up to now it is not well understood whether children, who benefit from school expansion by acquiring a significantly higher level of school qualification than their parents are also able to translate their school-leaving qualifications into success in the labour market. We ask whether children who benefit from educational expansion in this regard succeed in earning a high income or achieving a high occupational status in early and middle adulthood.

To answer this question we employ data from the *German Pathways from Late Childhood to Adulthood (LifE)* project which nospan over 33 years. Data include a cohort of juveniles, born in 1967 and their parents born between 1935 and 1945. The juveniles were first interviewed in 1979 at the age of 12 years, then 5 times each year up to 1984 at the age of 16 years. They were interviewed again in 2002 and 2012 at the age of 35 and 45 years. In total we examine 1359 women and men, for whom we have information on the parental home, youth and the further life course.

We use regression models differently for gender and the two dependent variables representing success: status and income. We run the analysis for young and middle adulthood (age 35 and 45) to see how mobility patterns between parents and children are still influential in middle adulthood.

We find mobility patterns related to school qualification between parents and their children which relate to educational expansion. These mobility patterns influence success in early adulthood. But the influence is different for men and women. Women succeed in school, but are not able to translate this success into the labor market.

What Drives Socio-Economic Success in Middle Adulthood in Germany and the USA? an International Comparison of Long-Lasting Impacts of Family Background and Individual Resources in Youth When Controlling for Education

We examine whether social background and individual characteristics from adolescence influence success in middle adulthood in Germany and the United States. Research has shown that educational and occupational attainments have a significant impact on success in middle adulthood. However, little is known about whether parental home or individual performance in school, aspirations, or even intelligence still influence success in middle adulthood.

We use data from the Pathways from Late Childhood to Adulthood (LifE) study for Germany and the High School and Beyond (HS&B) Midlife Follow-up for the USA. LifE is a longitudinal panel study of juveniles (1359), who were first interviewed in 1979 at the age of 12, then 5 times each year up to 1984. They were interviewed again in 2002 and 2012 at the age of 35 and 45. For the USA we use the HS&B Midlife Follow-up data, where 27,000 participants were first interviewed in 1980 and followed up in 1982, 1984, 1986, 1992, and 2014-2015. The early surveys collected information about school experiences and opportunities, family and demographic backgrounds, education, career, and family outcomes. The 2014-2015 survey then collected information about midlife work, family, and health. We use regression models for women and men differently for the two dependent variables representing success: status and income for each country.

We can show that at age 35 and even still at age 45, individual school performance still affects success as measured by income and status. However, the findings differ strongly by gender country and the two success criteria. Men report higher income than women even when childhood factors and education were controlled. In general education was the strongest predictor of both later adult occupational status and later adult income, but mediated not all of the effects of childhood intelligence and parental socioeconomic background.

Spirit and Defiance: Three Case Studies of Informal Groups in Santiago De Cuba.

This paper reports the findings of 3 years of ethnographic research with 3 informal collectives in the city of Santiago de Cuba: Rastafari, a youth urban dance group and rockers of three generations. A panoramic analysis of the Cuban socio-political context of recent times opens the door for each of

these groups. The examination essentially focuses on how they manage their identities, how they have developed their conflictive or close relationships with social structures/agents and the implicit imaginaries in each community. At the same time, the gender and racial perspective is transversal in the analysis.

Racism, Clinical Psychosis and Subclinical Psychosis Symptomatology: The Role of Ascribed Migrant Status and Post-Migration Stress

The majority of post-migration stress research focuses on refugees. Far less research explores post-migration stress in non-refugee migrants. Even less attention is paid to this issue in people who, due to attributes such as physical appearance and names that supposedly do not belong to Western industrialized societies, are perpetually perceived as migrants despite never having had their own migration experiences. We theorize that the region of the world that racialized people are perceived as being 'really from' - and the potential level of prejudice or othering in contrast to the desirability of that world region in the Western imagination - serves as the basis for a restaging of colonial logics. Resulting in a cumulative stress burden that can theoretically contribute to high morbidity in psychoses. We conducted an umbrella review of the literature and supplemented our quantitative analysis with qualitative interviews. In our umbrella review of meta-analyses that report the incidence of psychotic disorder diagnoses among migrants by region of origin, we found that migration from so-called developing countries and migration from the Caribbean and Africa carries the most significant risk of psychosis. In our qualitative interviews with a non-clinical sample of individuals who self-identified as Black people or People of Colour, we found that being reduced to the status of 'migrant Other' is a traumatic reality that can cause a sense of differentness, negative self-awareness, paranoid ideation regarding general persecution and self-questioning with self-esteem instability. In this presentation, the relationship between the attribution of migrant status and the global spatiality of racism, and the associated inequalities in diagnostic, care, referral and treatment duties will be discussed. As well as the interaction between Western mental health science and wider societal spheres such as in stigmatizing media reports and the cultivation of moral panics that shape structures of institutional racism.

Racist Stacking in the German Football Bundesliga: A Disruption to the Sports As Social Cohesion Narrative at the Institutional Analysis Level

Sports and culture tend to be revered for their ability to promote a sense of social cohesion at local, national and even international levels. Especially the reverence for diversity in sports teams is widely recognized as foundational proof of social inclusion and cohesion. However, sheer numbers about the composition of sports teams might not be a sufficient indicator for social inclusion. Even more so, they do not necessarily point to the absence of racism or marginalization. Research on racist stacking in sports is a critical lens that can make the existence of marginalization and racism within the diversity in sports teams visible. Suppose Black players are stacked into playing positions that are associated with speed, physique and aggressiveness, whereas they are underrepresented in positions that require tactical and intellectual skills (like game overview, game organization, leadership and build-up play). In that case, this pattern closely relates to racist stereotypes and their embeddedness in sports institutions. We discovered evidence of racist stacking in our examination of the first and second divisions of the men's German Football Bundesliga, specifically in the over-representation of Black players as wingers and the over-representation of white players as goalkeepers. In this presentation, we

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

focus on the discussion of these results; namely on the subtle naturalization of biological forms of racist beliefs about Black people and People of Colour in societal imagination, which, despite the supposed scientific turn towards social constructionism, still leads to tangible forms of racialized exclusion and boundary-making processes within paradoxical forms of inclusion. As these imaginations are maintained and reproduced by language, we deliberately (re)label the unequal distributions of playing positions as racist stacking (instead of racial stacking) and thus clearly distance ourselves from a latent belief that human races exist.

Advantageous Comparison: Using Twitter Responses to Understand Similarities between Cybercriminals ("Yahoo Boys") and Politicians ("Yahoo men")

This article is about the manifestations of similarities between two seemingly distinct groups of Nigerians: cybercriminals and politicians. Which linguistic strategies do Twitter users use to express their opinions on cybercriminals and politicians? The study undertakes a qualitative analysis of 'engaged' tweets of an elite Nigerian law enforcement agency. We analyzed and coded over 100,000 'engaged' tweets based on a component of mechanisms of moral disengagement (i.e., advantageous comparison), a linguistic device. The results reveal how respondents defend the actions of online fraudsters ("the powerless group") by strategically comparing them to the wrongful acts of corrupt politicians ("the powerful group"). Similarly, the results show how respondents positioned this linguistic strategy to compare "the powerless group" (online fraudsters) and "the powerful group" (politicians) in society. Indeed, tweet responses suggest that the Economic and Financial Crimes Commission (EFCC) generally looks downwards for culprits (i.e., online fraudsters) while ignoring fraudulent politicians. We conclude that the process by which some actions are interpreted as a crime compared to others is a moral enterprise.

Working from Home, COVID-19 and Job Satisfaction Among Parents: Evidence from Australian Panel Data

In light of the massive increase in the incidence of working from home (WFH) in many countries during the COVID-19 pandemic, the question of whether WFH is good or bad for worker well-being has received much attention. On one hand, WFH may reduce commuting time and increase control over working schedules. On the other hand, WFH may facilitate work during "unsocial hours", such as nights and weekends, and lead to feelings of loneliness and isolation. During the lockdown periods, parents WFH experienced additional challenges when simultaneously having to supervise and homeschool their children. Yet longitudinal and representative studies on the effects of WFH on workers', and particularly parents', job satisfaction are rare.

Against this background, we apply fixed-effects regression analysis to data from the Household, Income and Labour Dynamics in Australia (HILDA) Survey for the years 2015 to 2021 to gauge the effect of WFH on job satisfaction. The HILDA Survey is unique in that a) it provides information on the extent of WFH and job satisfaction before and during the pandemic for a nationally representative sample, and b) data collection in 2021 coincided with strict lockdowns in two Australian states (only), allowing investigation of whether effects differed by the strictness of COVID-19 regulations. We analyse several job satisfaction dimensions, e.g. satisfaction with the flexibility to balance work and non-work commitments, with working hours, and overall job satisfaction. Furthermore, we analyse whether the impact of WFH varies between parents and non-parents as well as by children's ages.

Preliminary results show positive associations between the extent of WFH and the job satisfaction dimensions for the pre-COVID-period, with parents and non-parents benefitting to similar degrees. For the COVID-period, we expect a decline in these positive associations, which should be particularly strong for parents of young children in regions with strict lockdown regulations.

Including Diversity and Daily-Life Experiences in Science: Some Evidence from the "Allinteract" European Research Project

Despite the efforts to involve citizens in science, the participation of "vulnerable" people (i.e. people with low socio-economic status, ethnic and religious minorities, young/women and LGBTIQ+ people) is still low. Studies show that citizens who participate to science engagement activities have often the same characteristics in terms of gender, ethnicity and education, namely white, middle-upper class, well-educated and male. In order to increase the recruitment of new talent, the ongoing "ALLINTERACT project" (https://allinteract.eu/about/) team is analyzing the relationship between science and society, with the aim of generating new knowledge about how to foster engagement in science, adopting a mixed-method approach (a social media analysis, twelve focus groups and a survey involving 7507 respondents conducted in different European countries). In particular, the Italian team's analysis shows that barriers to participation in science are still present, especially cultural ones. However, awareness-raising initiatives are numerous (even if targeted especially at women), but the participation of "vulnerable" people and their use of the scientific evidence is limited. According to research results, although they do not fully participate, they positively value scientific research and recognize its benefits, even those (such as people with low socio-economic status and religious minorities) who, according to common sense, would be uninterested in science. General results suggest that awareness-raising actions could be designed for different targets and in a more inclusive way. Therefore, the new challenge is to use different conceptual frameworks and approaches, settings, languages and technologies and to refer more to citizens' daily life issues, since there is more engagement and learning activation when actions are related to everyday life. In fact, the relationship between science and daily life emerged as relevant during the pandemic, which has really brought science into citizens' life both in positive and negative sense.

LECCARDI, Carmen* (University of Milano-Bicocca, Italy)

The Challenge of Longitudinal Research in the "Suspended Transition"

In this age, longitudinal research is gradually spreading throughout the world of social sciences. The reasons for this are many, and they all relate to the possibility of using such research to examine social change processes and their impact on specific population samples. For those who study the life experiences of young men and women, this type of research has additional value, as it sheds a light on the "suspended transition" to adulthood young people have been experiencing in recent decades in the Global North. Young subjectivities, influenced by the highly individualized social landscape, which is also crossed by ever more rapid and fragmented processes of change, gradually develop new action strategies. These forms of agency, directed at the growing uncertainty that surrounds both present and future, are still only partly known. Longitudinal research, thanks to its diachronic character, seems to be especially suitable for capturing the distinctive traits of these reflexive and creative forms of action.

One qualitative longitudinal research, developed as a three-year project and set to conclude in December 2022 by the Department of Sociology and Social Research of the University of Milan-Bicocca, has moved in this direction, centering around the life courses of young people and their transformations in our age. The three waves of interviews conducted throughout Italy clashed with the various waves of the Covid-19 pandemic. Thus, this research was able to observe whether and in what ways the young people involved in the program were able to turn the disadvantage of "suspended time" created by the pandemic into a biographical opportunity. In this regard, we spoke of a new form of psycho-social moratorium that has made a real breakthrough in the dominant paradigms of action in the 'high-speed society'.

How Distance to University Impacts Academic Aspirations?

While past research on inequalities in higher education enrollment has investigated the role of various individual-level characteristics, spatial determinants have been relatively disregarded. Yet, university decentralization has been seen by occidental democracies as great leverage towards equality of opportunity and has been implemented in many countries, specifically in

Sweden. One of the most adopted reasoning is that geographical distance hinders individuals from attending university. Indeed, proximity to university can foster educational attainment in at least two ways: (1) geographical proximity reduces the cost of going to university, mainly because the transportation and time costs are lesser (cost hypothesis); (2) universities bring about spillovers to the surrounding community that can lead youths to see higher education as a natural goal which they would otherwise not (spillover hypothesis).

This article investigates the link between distance to universities and educational aspirations. Particular attention is also paid to heterogeneous effects by parents' education and income, as students from low-educated or low-income families are more likely to be affected by distance. We use data from the Swedish administrative registers (n = 411,109) to compare educational aspirations of 9th grade students (15-16 years old) by examining their upper secondary education program choice. In Sweden, students from the 9th grade must choose between academic and vocational programs for upper secondary school. If one aspires to go to university, one should choose an academic track. We use this variable as a proxy for educational aspirations.

We suggest two hypotheses. First, as both the "economic cost" and "spillover" mechanisms would suggest, we expect that the propensity to apply for an academic track is lower for individuals living further away from a higher education institution (H1). Second, we expect larger effects for children from low-educated or low-income households (H2).

MCAVAY, Haley (Sciences Po Paris, France)

The Enduring Influence of Residential Disadvantage on Educational Attainment: Towards a Longitudinal Machine Learning Approach

Prior research has shown that deprived neighborhoods negatively impact educational attainment, irrespective of individual and family characteristics, but still remains unclear on the determinants of this effect. Using administrative data from Sweden over 20 years, and drawing on bespoke neighbourhood, this article explores the temporal dimensions of neighborhood effects.

We answer three questions on the relationship between residential context and high school graduation: 1) Does sustained exposure to disadvantaged neighborhoods matter? 2) When does it matter most? And 3) for whom does it matter most?

We use inverse probability weighting to estimate a marginal structural model. Our approach differs by relying on a machine learning algorithm to estimate propensity scores, proving to be significantly more performant than logistic regression.

All findings conclude that the negative effect of living in a deprived neighborhood is larger when exposure is longer, during late adolescence, and among women and Swedes without a foreign background.

(Re)Claiming Place for a Future: Examining Transnational Mobility As an Enabling Factor in Young Asian Australians' Reconstructions and Reclamations of Future Possible Selves (and societies)

Based on emerging findings from my PhD study, this paper examines the experiences of young Asian Australian women, to explore how transnational mobility might enable them to reimagine of the kinds of futures and future selves that they might hope for or aspire to, beyond the marginalised portrayals of their selves and their futures they had been surrounded by growing up in Australia. Through qualitative interview data, the paper unpacks how senses of place can be interconnected with senses of temporality (Prince 2014), with place-based exclusion experienced as a closing off of their futures in Australia, or even an inability to imagine them. Moving beyond exclusion- or deficit-based framings, however, the paper focuses on the role of the transnational or 'overseas' as a space these women creatively employ to build their sense futurity and ultimately hope (Cook and Cuervo 2019). It examines how mobility through different environments enables them to access different frameworks for understanding their experiences (Fricker 2007), and constituting alternative their (future) possible selves. It examines how relational everyday practices of friendship might offer strategies for envisioning and working towards future possible selves; and further, towards societies that might support them. Finally, it examines how some women employ these practices to facilitate a return to Australia and reignite aspirations for a future here.

Suriname's Bauxite Industrialization: How a Specialized Commodity Exporter Reconstructed Global Aluminum Production Chains By Asserting Local Priorities

In 1958, the small, bauxite exporting country of Suriname signed a surprising industrialization agreement with US multinational Alcoa. The company would develop an integrated aluminum industry in Suriname in exchange for heavily discounted hydroelectricity from a specially constructed dam. Suriname thus became the only major bauxite producer outside Europe and the US with integrated aluminum production facilities (Holloway 1988).

This little known Brokopondo agreement is in many ways a classic instance of reconstructing global connectivity by rebalancing local priorities. Spatially reorganizing the aluminum production chain in this way had dramatic macroeconomic consequences in Suriname. Alumina and aluminum exports replaced exports of unprocessed bauxite. National income and income per capita grew rapidly (Dijck 2001).

This paper embeds the Brokopondo agreement world-historically to explain Suriname's successful rebalancing of local priorities with global connectivity. I argue that such a deal was possible because of Alcoa's new exposure to competition in American aluminum markets, and because of the way that Dutch colonial control, and its associated racial discourses, were institutionalized in Suriname's politics of national autonomy.

Suriname's experience shows how opportunities to assert local priorities are produced by local politics and by new entanglements of global political and economic power.

The Immersive and the Outside: Visitor Photography and the Art Experience in Taiwan

The experience of art in museums and galleries is an interactive process between the artwork, the exhibitionary space, and the visitor. In our time, it often involves another participant: photograph-taking. Encouraged by mobile devices and social media, seeing art through photographic act has become a global phenomenon. Yet this paper argues that its consequences differ between societies, depending on the particular position each occupies in the international artworld. In the case of Taiwan, on the one hand, original artworks significant in shaping art histories rarely travel to Taiwan; on the other, artworks made in Taiwan mainly stay here and remain peripheral in the global art field. From an audience's perspective, this paper explores how picture-taking mediates the visitor experience of artworks in Taiwan and its implications when taken into account of this society's marginal position. Discussions are based on ethnographic observation took place in art museums, galleries, and exhibitions in Taipei between 2021 and 2022, as a comparative study following my doctoral study of photographic seeing conducted in London from 2015 to 2020. Paying attention to the now popular claim of immersive experience by exhibition providers, analysis draws on the dialectical relationship between the inside and the outside, found on spatial, institutional, and experiential levels. The findings show complex relations between the visitor and the artwork when intervened by photography. It reveals how visitor photography can both facilitate the audience's immersion in the artwork and turn the audience outside of possible connections with art. Consequently, audience in Taiwan can both enjoy agency in creating artistic association not necessarily dictated by the dominant art narratives and, however, be pushed further away from the core of the global artworld. This research is of interest to scholars and art practitioners mindful of more inclusive, subversive and de-colonised relations between art and its public.

Cost of Taiwan's 'Silicon Shield': The Human Implication of 'Made in Taiwan'

Semiconductors (commonly referred to as 'chips') are components that enable electronic devices to function and have both civilian and military applications. While American designers are leaders in semiconductor R&D and hold core intellectual property rights, the US does not actually produce semiconductors. The main reason US design firms outsource semiconductor production is that it is more cost-effective, and shortens production time. Leading high-end chips producers (foundries) are all in East Asia. Taiwan Semiconductor Manufacturing Co. (TSMC) and South Korea's Samsung together account for 70% of global semiconductor manufacturing.

TSMC has close connections with California's Silicon Valley and a well-developed supply chain knowledge and transfer networks. Despite its dominant position as the lead manufacturer of the global semiconductor market, the turnover rate of high-talented engineers at the TSMC has remained a constant

challenge. If TSMC creates a 'silicon shield' for Taiwan's security in geopolitics, making it less likely for the international community to accept a scenario of a Chinese invasion that would threaten the stability of the global semiconductor supply chain, then the recruiting and retaining talent for TSMC is not only a firm-level issue, but also a broader national security challenge for Taiwan.

Our work starts from small and medium innovative companies' support to the TSMC and then examines the main challenges facing talent recruitment and retention for the TSMC. Our paper argues that there are inherent factors in TSMC corporate culture, such as but not limited to expectation of excessive overtime, that makes it difficult for it to successfully meet this challenge in a growing competitive market for talent in the tech sector. Nevertheless, it must change its employment culture in order recruit, retain and ultimately to foster the talent it needs to remain a leading manufacturer in the global semiconductor industry.

From Ideologists to Programmers: Activists' Roles in Contemporary South Korean Social Movements

This paper proposes an empirical analysis of the strategies taken by South Korean activists to sustain social movements. Results from qualitative analyses of interviews with activists who played a central role in social movements in the 2000s and quantitative analyses of documents such as press releases and statements show that activists are recently emphasizing a different role than before in social movements. Considering the role of activists in social movements is to propose ideological or institutional alternatives and to organize collective actions, the center of gravity is shifting to the latter.

During the 2016-2017 candlelight vigil, which unfolded in the exposure of various corruptions related to the then government, activist groups formed solidarity and organized rallies as "experts" in social movements to effectively flocculate the anger of citizens. As a result, it led to the impeachment of a president for the first time in Korean history.

The fact that activists acted as social movement programmers emerged in the fact that they did not present a common proposal for the "post-impeachment". Although the limitations of the South Korean representative system were revealed, the coalition of organizations could not propose an alternative and ideology beyond the impeachment of the president.

In this regard, institutional democratization in 1987 had a huge impact on the role of activists. As a result of democratization as the ideological alternative, which can be agreed upon despite each other's different ideological positions, only a sharp ideological gap between organizations remained that could not be narrowed.

This tendency has both advantages and disadvantages. As the initiative of citizens is strengthened, the legitimacy of the movement can be increased. On the other hand, the imagination of the future resonates only in individual units, and the possibility of spreading to society gradually decreases.

Top Wealth Households in China and the U.S.

This study compares top wealth households between China and the U.S. and explores the role of social and economic context in the creation of an elite class in these countries. We study these topics using data from the Survey of Consumer Finances (SCF) and the China Household Finance Survey (CHFS). The result reveals three important findings. First, wealth is more unequally distributed and more concentrated at the top of the distribution in the U.S. than in China. Second, top wealth households have more diversified asset portfolios in the U.S. than in China. Third, the two countries' demographic characteristics of top wealth households are similar, but top wealth households in China are led by much younger people than those in the U.S. These findings shed light on the importance of institutional arrangements in shaping opportunities to generate larger wealth.

Differences in the Disaster Mitigation Behaviors of the General Public and of People in Hard-Hit Areas

This research used the risk analysis framework to compare between determinants of disaster mitigation behaviors of the general people and of people in hard-hit areas by a disaster. The data of Taiwan Social Change Survey (2019) and of Social Impacts and Recovery Survey of Typhoon Morakot (2019) and multiple hierarchical regression analysis were used. The risk analysis framework included vulnerability (psychological, demographic and socio-economic factors, family structure, social network, and social media) as well as hazard and exposure. The results showed that for the issues of vulnerability, (1) the psychological factor and mitigation behaviors had a positive relationship for the general public, but not for people in hard-hit area. (2) Demographically and socio-economically, people with higher the education level or those in indigenous families engaged more mitigation behaviors. For people in hard-hit areas, older respondents and those in permanent houses engaged less in disaster mitigation. When there was more than one person with access and functional needs in the family, both groups had more mitigation behaviors. (3) As for family structure, people in hard-hit families living alone engaged in less mitigation behaviors. (4) Social networks had significant influence on the hard-hit households, but not on the general public in disaster mitigation. (5) People with higher frequency of internet use were more likely to engage in mitigation behaviors. For the issues of hazard and exposure, (1) those with disaster experiences were more likely to carry out mitigation behaviors than their counterparts. (2) In the area where the hard-hit people were located, the higher the percentage of the population affected by the potential of landslides, the more mitigation behaviors the people were taking. The results suggested that different countermeasures should be applied when promoting disaster mitigation behaviors to the general public and to people in disaster-hit areas.

LIN, Mei-Chun (National Science and Technology Center for Disaster Reduction, Taiwan)

Including Social Vulnerability in Disaster Management Plans of the Local Government

There is a major problem in the disaster management plans of the local governments in Taiwan: the issues covered in the plans are similar in different cities, districts, or counties, and cannot reflect local social characteristics. In other words, the plans usually cover the ideas of hazard and exposure but not social vulnerability. In order to solve the problem, we reviewed social vulnerability literature, identified indicators of social vulnerability, collected related data from the government, and establish an online social vulnerability assessment system for the local governments to check their social vulnerability. The system includes data of 33 indicators collected for all 33 cities and of 25 indicators for all 368 districts or counties in Taiwan from 2002 to 2020. For instance, according to the system, Nangang District in Taipei is more vulnerable than other districts in Taipei in emergency medicine because its service area of each medical institution is relatively large, and its number of medical workers per 10,000 people as well as number of hospital beds per 10,000 people are relatively small. According to the historical trend, the number of businesses is increasing rapidly in Nangang District. The results suggest emergency medicine and disaster management for business should be two important issues for the disaster management plan of Nangang District. The evaluation mechanism of the central government on local governments in Taiwan will begin to include the issue of social vulnerability in the end of 2022. There are already several cities (New Taipei City, Taoyuan, Chiayi, etc.) requested trainings of the social vulnerability assessment system we develop. We hope the system can turn the aforementioned problem of the local disaster management plan to be a thing of the past soon.

The Paradox of Women Supervisors: Men and Women Managers' Use of Work-Family Policy during the COVID-19 Pandemic

While corporations have adopted and recommended work-life policies to accommodate work and family issues, many workers hesitate to use those programs. Using a representative sample of 1,908 managers employed about 300 Korean companies during the COVID-19 Pandemic, this study examines whether the access to work-family initiatives is affected by the gender of supervisors. We find that both men and women managers feel more difficulty in using the flexible work programs and family support programs when their supervisors are women. Paradoxically, female managers report that they feel uneasy to use childbirth and childcare programs when they work with women boss. We discuss possible underlying mechanisms leading to the paradox of women supervisor effect as well as the conditions under which we can avoid the effect to occur.

What the Netflix-Korean Wave Nexus Teaches Us about Global Cultural Value Chains

This paper examines the global value chains (GVCs) of Netflix and the ways the leading global streaming platform interacts with regional and local producers, focusing on its expanding linkage to Korean producers. Although GVCs have emerged as a defining feature of the contemporary global economy, reshaping the way the South and the North meet and the global and the local interact, the attempt to apply GVCs to cultural and creative industries is still nascent. In this regard, the rapidly expanding role of Netflix in the latest stage of the Korean Wave provides an interesting opportunity to understand the new phase of the global digital media industry from a GVC perspective. The paper examines the Netflix-Korea nexus based on the insights from the GVC perspective. Buyers, e.g., streaming platforms, can play a different role in shaping suppliers' upgrading, a movement to higher value-added activities, by distinctively organizing and governing their GVCs. In response, suppliers, e.g., Korean content producers, adapt to buyer strategies and can exercise their own strategies for internationalization and upgrading. While firm actors in GVCs, both buyers and suppliers, are not equal in power, with distinctive resources and capabilities, they can co-evolve and adapt to each other in various ways. Building upon such insights, the paper first reviews transnational cultural flows from a GVC perspective, and analyzes Netflix's evolving relationships with local suppliers, focusing on how the lead firm governs its GVCs and the strategies affect the Korean content producers' strategic choices and responses. By so doing, the paper strives to understand the rise of the Korean content in Netflix in a broader theoretical and empirical context of the contemporary global economy and draw its implications to the future of GVC governance and supplier upgrading in the fast-evolving global cultural economy.

Ambivalence of Screens: Appropriation of Screens By Korean Young Adults with Problematic Internet Use

Since the early 2000s, problematic Internet use has been recognized as a public health concern in South Korea. It is characterized by excessive, compulsive, and hasty use, and is associated with harm to an individual's social, psychological, and physical wellbeing. Among other digital health topics, the issue of problematic Internet use occupies a unique position, particularly when it comes to regulating screen usage and ensuring that a person maintains control over how it is used. In this particular instance, the screen serves as both a source of the problem and a solution.

An in-depth interview with twenty-two Korean young adults ages 18 to 25, who claim to be having problems related to their Internet use (online games, social media, online forums, etc.), indicates that interviewees employ a variety of strategies to reduce their Internet use. As we identified in the study, individuals practice three different ways of coping with their problematic use, particularly through the use of screens, through which they practice coping strategies: (1) They quantify the use of screens through diverse tracking functionalities, (2) they voluntarily block their use through applications that limit access, or (3) they symbolically transform the meaning of their use in a more conceptual manner.

By focusing on the specificity of the screen and the relationship between users and their screens, this research sheds light on the specific way in which users' health is governed. The interviewees' strategies for reducing screen time reveal a sense of ambivalence with regards to screens, since they are both causes of and solutions to overuse of screens. Therefore, the use of screens by users for extremely diverse and even contradictory purposes leads to the development of original digital practices. More importantly, this points to the potential and capacity of users to arbitrate between their needs and constraints.

From Flea to Shining Flea: Pandemics in the Modern World-System, 1600-2022

There exist many rich datasets and excellent analyses, investigating the drivers of individual pandemics (or of epidemic disease more generally since the 20th century). However, we can also learn a great deal by analyzing pandemics from the purview of a macro-historical timescale and a global scope. The sociopolitical parameters of a virus can change over time. For instance, while HIV/AIDs were discussed in the 1980s largely as a developed world health crisis, the virus spread rapidly in Africa. Many important historical processes – such as hegemony, globalization, inequality, social resistance, and medical science – evolve slowly, yet play an important role in limiting or expanding the scope of possible responses. This paper uses both quantitative data and historical evidence to describe and explain global pandemic severity in Afro-Eurasia (and globally after the 19th century) since 1600. Examining the relationship between global processes and pandemic severity, the paper presents evidence

that hegemonic decline, war, and growing inequality intensify pandemic severity. Pandemics, in turn, tend to accelerate hegemonic decline and reduce globalization.

Hayao Miyazaki on Mimesis: Structural Asymmetry in Storytelling and Its Meaning of Social Critique

Many academic studies have been conducted on the world of world-famous animation master Hayao Miyazaki. In this study, I would like to show that the motifs of anti-war pacifism, feminism, ecology, and anti-capitalism, which have been pointed out as the core of Miyazaki's world of works, can be integrated from the perspective of Frankfurt School theorists Adorno and Benjamin. This can be summarized as the *asymmetry* of the overestimation of problem setting and the underestimation of problem-solving, the narrative structure that penetrates the entire world of Miyazaki's work. In other words, Miyazaki is basically over-setting the problems of the contemporary actual world through the concept of an '*Ausnahmezustand*' that means every day's collapsing, and asking for the restoration of *mimesis* memories as a very weak alternative. This asymmetry tends to intensify, especially as his early works move to later works. I will outline the development process of Miyazaki's world and show how he uses asymmetrical apparatus as the core narrative structure inside the works, and it has become more and more intensified. Through this, we will be able to see that he is urging us to reflect on the totality of modernity, just like critical theorists.

Suicidal Thought As a Gendered Ontological Anxiety Caused By Postmodernity: Focused on Korean Women Born after 1990

Recently in Korea, the suicide rate of young women has increased to a level similar to that of the war generation in Europe or the generation in transition countries, and suicide among young women is emerging as a social problem. In order to find an answer to why young Korean women commit suicide, this study attempted a holistic analysis of suicide by collecting the life stories of twenty-one women born after 1990 who were constantly experiencing suicidal thoughts. As a result of the investigation, suicidal thoughts of young women can be interpreted as ontological anxiety caused by postmodernity in South Korea, not simply because of economic difficulties or job instability. In the social structure that still maintains patriarchy despite the compressed modernization and personalization of Korean society and the recognition of gender equality according to the achievements of the feminist movement, young women experience existential anxiety due to frequent failures or mannerisms. Through this pressure, persistent suicidal thoughts were found in young Korean women. From a feminist perspective, this study should be interpreted as a result of gendered ontological anxiety in maintaining the patriarchal Korean social structure.

Do You See What I See? Explaining (gendered) Perceptions of Gender Inequality in the Australian Legal Profession

The legal profession is a crucial force shaping our social, political, and economic environments. Yet within the profession, gender inequalities pose persistent barriers to justice for key 'insiders', women lawyers. Scholars, policymakers, and professional associations have long detailed women's underrepresentation in leadership roles, and overrepresentation in less lucrative areas of the law (Bolton and Muzio, 2007; Tomlinson et al., 2019). Extreme examples of gender inequality include high-profile revelations of workplace sexual harassment in Australia's High Court (Maley, 2022). Analysing interviews with 30 leaders in the Australian legal profession and a survey of solicitors in New South Wales (n=766), this paper examines lawyers' perceptions of gender inequality in the profession. Although gender inequality was a major concern for the stakeholders interviewed, among surveyed solicitors, the existence of inequality was contested along gender lines. Men were significantly less likely than women to perceive inequality in the profession, characterised by equal treatment, the capacity to progress in careers, and experiences of disrespect. Drawing on scholarship into how professional practise and privilege (Foley et al., 2022) and constructions of masculinity (Flood, 2019) shape meaning, we seek to conceptualise why perceptions of gender inequality in the law diverge.

International Migration, Acculturation, and Care Work: Unpacking the Experiences of Korean Grandparent Caregivers in the USA

This qualitative study interrogates the complexities of grandparent caregiving work within immigrant families by asking the following questions: What are the circumstances that lead to grandparents taking care of grandchildren? What are grandparents' experiences of performing family care work outside of their country of origin? The study answers these questions by analyzing interview and observation data collected on eight Korean grandparent caregivers residing in Central New York (USA). The study finds that grandparent caregivers buttress their family's middle-class lifestyle, while also keeping them rooted in Korean traditions. Grandparent caregivers' work enables their children to focus on academic and professional pursuits that may maximize current and future earnings. Meanwhile, they transmit elements of Korean culture to their grandchildren – laying the groundwork for them to become *Korean* American citizens. These findings prompt us to reconsider the connections between immigrant family life and integration, and grandparents' role within popular parenting paradigms like concerted cultivation.

It Takes a Village to Raise a Child Free from Gender Stereotypes: A Qualitative Study of Leave-Taking Fathers' Gendered Parenting Experiences in South Korea

Existing studies suggest that children raised by parents in gender egalitarian or non-conventional arrangements tend to demonstrate more gender egalitarian views and attitudes (Halpern and Perry-Jenkins, 2015; Risman and Myers, 1997). A recent study found that father involvement in childcare and housework during childhood and adolescence play a critical role in shaping children's gender-egalitarian attitudes (Cano and Hofmeister, 2022). However, less attention has been paid to the role that fathers' uptake of parental leave has on children's gender socialisation. This paper draws on 51 qualitative interviews with and web materials (including blog posts) of households where South Korean fathers took parental leave to explore fathers' ideas and experiences of gendered parenting and their children's gender socialisation. South Korea offers an apt context because of its particularly long and flexible leave for parents; a parent can take leave up to one year when children are as old as eight years, and leave-taking fathers often use the maximum period and when their child is six to eight years old. I identify three typologies of fathers: 'subversive' fathers who make explicit effort to practice gender-free parenting, 'conservative' fathers who prefer their children to follow conventional gender behaviours, and 'ambivalent' fathers who had mixed, indifferent, or contradictory attitudes toward gendered parenting. Fathers do report instances of their child's gender subversion. However, more prominent were stories detailing challenges to raising children without gender stereotypes, despite the parents' best intentions, due to influences from the children's teachers, peers and their parents, and popular culture and media. I argue that raising a child free from gender stereotypes is challenging and takes much more than a shift in parental gender roles at the home; it takes a whole village. I also suggest that the links between fathers' uptake of leave and gender-equal parenting is not so straightforward.

The Contested Making of Gig Workers: A Comparative Study of Global Capital and Organized Labour in the Gig Economy in Seoul and Toronto

The gig economy refers to an online platform-mediated economy where individuals work on a piecemeal basis and are (mis)classified as "independent contractors." The main literature on gig work heavily relies on a single-country focus, primarily on North America and Europe. There is a significant lack of transnational research on gig workers' collective action, although it is increasing. Therefore, a comparative study is of utmost importance to situate the gig economy in a transnational context, highlighting commonalities and specificities in different localities where the negotiation in the gig economy takes place.

My transnational comparative study focuses on how gig worker ideals are negotiated among the actors involved in the gig economy in Seoul, South Korea and Toronto, Canada. I suggest gig workers' unions as focal field sites of my comparison since unions have been a significant locus of exclusion and inclusion, making worker subjectivity by shaping or challenging the worker ideal. My research involves two groups of delivery gig work and unions in Seoul, a leading market in Asia, and Toronto, one of the big markets in North America. Both cities display increasing numbers of gig workers and workers' grassroots resistance. Seoul and Toronto present distinct characteristics, including the labour history and social security system, but share the growing precarization of labour, the erosion of unions, and exclusionary mainstream unionism. Among other platforms, food delivery workers of both cities have organized successfully in a similar period in 2019. By using two years of ethnography in these two unions and in-depth interviews with over 80 gig workers and stakeholders, I investigate how gig workers are constructed, but also their construction is contested by multi-levels and multi-actors.

RATH, Saroj (University of Delhi, India)

The Inroad of Retail Investors into the Indian Equity Markets: Tapping the so Far Untapped Potential

The devastating Covid19 propelled pandemic unleashed an unforeseen financial withdrawal syndrome whereby Foreign Institutional Investors (FIIs) withdrew their capitals from Indian Stock Markets with surprising speed. More surprises were in stores when financial analysts noticed near no impact of FIIs withdrawal from Indian stock markets. What exactly happened? Despite such ominous withdrawal by the FIIs why the Indian stock market refused to crash or did not face financial crisis? The answer lies in understanding the potential of retail investors in Indian stock market. A retail investor in equity markets is understood as long-term investor investing a small corpus in the big pool. A recent trend in Indian stock markets witnessed a major shift in the age-old phenomena with increasing retail participation in direct equity. The retail investors turned themselves into net buyers in Indian equity markets during the post COVID-19 era by investing a sum totalling Rs. 1,917 billion in 2020 and 2021. As of March 2022, the retail investors alone own 9.7% stake in National Stock Exchange's Capital Market Segment, the highest in the last 14 years. A sharp growth in participation of retail investors is seen after the market crash of April 2020. The rising trend can be attributed to the presence of discount online brokers and increasing interest of retail investors staying home during COVID-19. The investment by retail investors offsets the withdrawal of funds by Foreign Portfolio Investors. In this background, there is a need to study the implications of increasing participation of retail investors in Indian equity markets. We assess the potential role of retail investors in Indian equity markets vis-à-vis risks faced by them. The finding are relevant to policy makers for much needed regulatory reforms to protect retail investors in volatile markets, and shape their behaviour to the greatest interest of the economy.

The Promise of Small Nuclear Reactors: Constructing and Deconstructing a Nuclear Renaissance in Canada and Finland

In the context of the aggravating climate and energy security crises, the global nuclear energy community views the future with great hope of a new renaissance, with Small Modular Reactors (SMRs) as the latest in the long series of nuclear technology promises. This paper combines the concepts and methodologies of sociology of expectations and institutional theory, to analyse the construction, contestation, and controversies over SMR promises in Finland and Canada – two high-trust countries with advanced plans for the deployment of the technology. Debates in the main national newspapers, in 2000-2022, were taken as the starting point for 1) identifying the key actants, actors and actor networks that seek to construct and deconstruct promises concerning SMRs, and 2) analysing the form and content of the argumentation used to either defend or criticise the promises. Applying the principle of "follow the actors", the most central actors were first identified in the media material, and their activities (argumentation and networking) then analysed in other arenas, as manifested in parliamentary and governmental documentation, press releases, industry conferences, and social media.

The study contributes to the scholarship on promise-building and promissory communities by elucidating how historically formed institutional path-dependencies, ideologies, and identities shape promise-building as the nuclear energy industry, born in the era of high modernism and its faith in overarching solutions brought by the techno-sciences, seeks to adjust to the new era of presentism and decentralised socio-technical energy systems. Historical contextualisation helps to provide explanations to seeming anomalies, such

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

as the contrast between the centrality of the "rationalist-environmentalist" ecomodernist movement in the Finnish SMR-promise-building networks, as opposed to its relative marginality in the Canadian networks. Further interview-based, ethnographic research, complemented by more systematic exploitation of social media analysis, will be needed to explore the dynamics of promise-building in non-public expert and professional spheres.

Against Revelation: Hubert and Mauss' Shaping of Durkheim's Late Sociology of Religion

Although Roberston Smith's influence on Durkheim's sociology of religion is undoubtedly the most examined issue, its evidence still relies upon a single letter from 1907, in which Durkheim attributes his "revelation" due to the reading of Robertson Smith 12 years earlier. Against Durkheim's alleged revelation, this paper addresses Hubert and Mauss' contributions to the *sociologie religieuse* section of the *Année sociologique* first series (1898-1913) to shed light on the theoretical matrix behind Durkheim's *Les formes élémentaires de la vie religieuse* (1912). To this end, a set of Hubert and Mauss' studies between 1898 and 1906 on religious phenomena is examined in order to unveil how their approach understands religious rituals as *sacred dramas*. Their approach emphasizes crowds' creative power in generating new ideas and practices through aesthetic and rhythmic performances – such as music, dance, and drama. In doing so, such an analysis may allow us to comprehend not only how Hubert and Mauss' *sociologie religieuse* approach has shaped Durkheim's late sociology of religion but, ultimately, the history of the Durkheimian sociology of religion as an inherently collective enterprise.

Energy Citizenship and the Social Acceptability of Large Wind Energy Projects

The drive toward clean electricity relies for a substantial part on the growth of the wind energy sector. Wind farms often viewed in a favourable way by the general public, once implemented can generate resentment and conflicts within local communities. Energy projects driven by citizens are emerging as a way to increase social support to energy transition.

Relying on the survey of case studies, this paper attempts to synthetise the factors which explain the differences in the social acceptability of wind farms. Are more inclusive processes or collectively led projects effectively leading to better outcomes in terms of acceptability of wind farms than purely private developers led projects? Or is the level of opposition to wind farms linked to a broader cultural and political context which would explain the intensity of conflicts generated by wind farms implementation?

This paper provides finally an inventory of contrasted approaches in the implementation of wind farm projects and what they mean for the acceleration of energy decarbonization.

When the Narrative of State Power Meets the Narrative of a National Minority. the Case of the German Minority in Poland.

The author will present partial results of the latest research on Polish-German marriages (2019-2022) on the perception of the linguistic rights of the German minority in Poland. A discourse analysis will be presented concerning the legal and linguistic situation of a minority that has been deprived of statutory rights by the state authorities since 2021. It met with a social and political resonance on both sides of the Polish-German border, marked by strong emotions. This presentation is an attempt to approach the discourse analysis from the perspective of the researcher and participant of the studied processes.

We Haven't Got You COVID: Including Lgbtiqa+ People in Disaster Planning, Response and Recovery

This paper presents the findings of an unpublished literature review on the impacts of COVID-19 restrictions on sex and gender diverse minorities (LGBTIQA+ people). The review was commissioned by Respect Victoria and led by Gender and Disaster Australia (GADAus). The review focused on emerging Australian and International data. The findings highlighted the different ways in which state and nation-wide restrictions reflected as they magnified structural inequalities against LGBTIQA+ people. At best, measures aimed at reducing the spread of COVID-19 blind-sided LGBTIQA+ people's specific needs. At worst, they led to increasing discrimination and marginalisation of LGBTIQA+ people, communities and infrastructure.

The review's findings are consistent with a growing body of research on how heterosexist assumptions continue to inform emergency management and service delivery. While COVID-19 has presented its own unique challenges, measures aimed at reducing its impact have drawn on – as they have reinforced – the same deeply embedded heterosexist and gendered assumptions that inform disaster and emergency planning, policy, and service delivery more broadly. The paper concludes with recommendations for developing diverse, inclusive disaster and emergency policy and practice. The recommendations are aimed at transforming our approaches to disaster management and service delivery, including pandemics, to ensure that they consider the needs and lives of the different groups that make up the diversity of the Australian population, including LGBTIQA+ people.

'Disaster Drag': An Intersectional, Queer Critique of Hypermasculinity in the Age of COVID

COVID-19 posed a challenge to male leaders whose authority in times of disaster has often rested on public displays of what Aolain (2010) callsl 'hypermasculinity'. Unlike other more dramatic types of disasters, including fire and flood, COVID-19 didn't easily lend itself to portrayals of male heroics. It did not lend itself to images of male leaders in hard hats and protective clothing, alongside emergency service or army personnel. Instead, the response to COVID-19 was led by health bureaucrats and medical experts and involved testing, social distancing and individuals taking responsibility for monitoring their own health. It involved forms or leadership and collective interventions that might be labelled 'feminine'.

This paper develops the notion of 'disaster drag' to unpick how the authority of male leaders relies on the public performance of heroic or hypermasculinity. The differing gendered responses of male and female leaders during COVID-19 brought into focus not only the limitations of masculine forms of leadership but also the degree to which male leaders rely on 'disaster drag' for their legitimacy. However, 'disaster drag' also hints at what is less obvious but nonetheless vital to masculine displays of leadership, an assumed heterosexuality. Hypermasculinity is better described as *hetero*gendered, a ramping up of men's displays of their gendered sexuality in times of national crisis and disaster. It involves the marginalisation of women and all things coded feminine and the marginalisation of non-heteronormative forms of sexual and gender expression. The paper argues for an expanded, intersectional model of gender and gender inequality and how the pressures to conform to binary, gender stereotypes impact women and LGBTIQA+ people. The model proposes that these pressures interact with other types of structural identity-based discrimination, leading to increased risk during and following disaster for women and LGBTIQA+ people who are part of other minority groups.

Educational Disobedience As Innovative Educational Practice. Insights from a Mediterranean Case Study

The most recent data by the Italian Ministry of Education (2021) highlight a significant growth over the last three years of the different forms of parental education in Italy as one of the most controversial but innovative educational trends. Indeed, this complex phenomenology received constant attention in the Italian public debate as a form of alternative action fueled by the 'reaction' fallout from critical implementation of distance learning in public schools during the COVID-19 pandemic. Almost sixteen thousand Italian students and their families claim to choose a non-standard organizational and didactic model. These phenomena express a declination of "disobedience for innovation" both concerning the public education system and a mainstream cultural model. The main aim of this paper is to discuss the main highlights and theoretical implications coming from a qualitative case study focused on the participation of the Italian homeschooling groups in the protests against the COVID-19 restrictions. Collected data show that the members of these communities present some oppositional elements (which therefore explain their support for the protest) unveiling unexpected alternative trajectories for educational programmes and practices that challenge Italian public education system. Our research combines two issues: 1) an up-to-date description of the symbolic elements that surround alternative educational practices related to protests against COVID-19 health pass (and any kind of mandatory vaccination policy) in 2020-2021 in Italy; 2) the critical engagement to the public education *weltanschauung* from the alternative education phenomenology (eg. unschooling, outdoor education, homeschooling and so on) offering a creative/communitarian response: being disobedient is being innovative.

The Role of Smartphones in Maintaining Contact with the World Left behind. the Case of Young Ukrainian Refugees in Poland

From the first days of the war in Ukraine, 6 million forced migrants crossed the Polish-Ukrainian border to the West. This is the largest migration movement since World War II. Due to universal mobilization of males in Ukraine, the vast majority of those coming to Poland are women and underage children.

Majority of Ukrainians who left their homes due to the war or the risk of direct attack brought to Poland their personal mobile devices – smartphones, a multifunctional tools for managing the journey. These portable tools are used at every stage of migration – from searching the destination point, crossing the border as safe as possible, finding accommodation and making home. The paper attempts to map the affordances of smartphones that allowed young Ukrainians to stay in touch with Ukrainian world, whilst building their new lives in Poland – for some only temporary. Based on in-depth interviews with young refugees from Ukraine, their parents and Polish hosts, I raise the questions on a phenomenon of a digital third space for those who came to Poland and those who stayed in Ukraine.

The analysys of empirical findings will be based on the data on the use of the smartphones by refugees, especially in the context of the studies on transnational migratory habitus / digital migration studies. This study attempts to answer the following questions: 1) For what purposes the Ukrainian young refugees in Poland are using their smartphones? 2) To what extent the access to the virtual transnational spaces facilitate the homemaking process in the host society and the virtual communication with their own national/ethnic habitus in the situation of ongoing state of war? 3) What are the perceived effects of using the smartphone during the migration journey?

Campus Hate Crimes during the Trump Era: University Responses to Violent White Supremacist Movements in the US

Given that a key aim of academe is to facilitate open intellectual exchange and debate, it is not surprising that universities can become fulcrums of protest and extremist agendas. Although recent scholarly literature on campus hate crimes is limited, such research tends to highlight news coverage and institutional responses. Robust data on campus hate crimes, however, have emerged in the past ten years, with the United States Federal Bureau of Investigation utilizing location-based reporting systems to improve incident tracking. We have analyzed national data on the rise of hate crimes at colleges and universities over the past decade. In addition to the quantitative analysis, we offer an in-depth discourse analysis of the University of Virginia's (USA) response to the "Unite the Right" rally of white supremacists in Charlottesville on August 11 and 12, 2017, an event that resulted in multiple deaths and injuries. The analysis focuses on conflict escalation, as well as university strategies for de-escalation, dispute settlement and post-conflict peacebuilding.

Slaves of Passion? Work of Journalists in Cognitive Capitalism

"It is hard to defend democracy without a permanent contract. It is hard to defend democracy when the pay rise comes with the increase in the minimum wage," said Paweł Figurski, a young journalist from Gazeta Wyborcza, the largest opinion-forming newspaper in Poland, when he received an award for investigative journalism.

Similar public complaints by Polish journalists about overwork, precariousness, and low salaries are repeated remarkably often. They have a basis in research (Dobek-Ostrowska et al. 2013; Głowacki 2013; Nygren, Dobek-Ostrowska 2015). However, this is not a Polish peculiarity. Comparative studies indicate that the position of media workers across Europe is similar, as it also stems from the same structural transformations of the media (Witschge, Nygren 2009; Deuze, Prenger 2019).

The next phase of the free-market "Great Transformation" described by Polanyi (1944) has made information another fictitious commodity after land, work, and capital (Jessop 2007). Cognitive capitalism (Berardi 2005) changed the nature of mental labour, which is particularly visible in creative industries (Deuze 2007). Therefore, I consider journalists to be representatives of wider social groups: creative workers and even a large part of the middle class.

I intend to show how journalists experience changes in the media industry (mainly market pressure), how these changes influence broader quality of life (see Cummins 1996; 2000), and how journalists react to these changes. I rely on the analysis (Miles, Huberman 1994; Charmaz 2006) of 43 in-depth, semistructured interviews conducted in 2022 with Polish journalists.

In this contribution, I want to focus on the issue of passion in journalistic work from the perspective of governmentality studies (see Foucault 1979; Miller, Rose 1990; Rose 1999). The passion in the my respondents' narratives appears both as a tool of neoliberal subjugation and a strategy for resisting market pressures.

LETOURNEAU, Angeline* (University of Alberta, Canada)

Out of the Pot and into the Fire: The Limitations of Renewable Technologies for a Just Transition

Advocates for a just transition argue that decarbonization of the economy will maintain or even improve quality of life for most people: better jobs will be available, a healthier environment will be possible, and greater equality will be achieved without the extraction of fossil fuels. While scholars and activists alike have begun to envision what a society run on alternative, renewable energy sources could look like, what is frequently overlooked are the upstream systems required to realize a transition on such a scale. The global market of raw materials, particularly rare Earth minerals necessary for renewable energy technologies and infrastructure is deeply entangled with human rights infractions and catastrophic environmental harms by mining companies. Simply replacing existing infrastructure with renewable technologies is insufficient for a just transition. To ensure that a transition is truly "just", we must reconcile the need for a significant reduction in greenhouse gas emissions with the very real impacts that the extraction of raw materials will have for the land and its people.

Using an anticolonial lens, this paper explores how a just transition may be achieved not just for urban communities in the Global North, but for rural and Indigenous peoples in the Global South and beyond. I begin by examining the dominance of just transition literature by Global North voices, demonstrating how this has resulted in fixations on socio-economic changes in Global North countries and inadequate attention to global supply chains of raw resources. I then provide a brief overview of the political-economic dimensions of rare earth mineral mining and conclude with interventions that could align extraction systems with the values associated with just transitions.

Domestic Military Deployments: Canada

Canada's defence policy provides for domestic employment of the Canadian Armed Forces, but organization and force structure tilt heavily towards foreign deployment. As set out in the current White Paper, *Strong, Secure, Engaged*, there are eight core missions for the Canadian Armed Forces (CAF). The first five missions listed revolve around the provision of conventional forces to NATO, NORAD, the UN. These missions underpin the basic force structure and fundamental orientation of the CAF. Of the other three missions only search and rescue has a significant dedicated force structure. Assistance to civil authorities for law enforcement and the provision of assistance to civil authorities and non-governmental partners in responding to international and domestic disasters or major emergencies are largely dependent on re-tasking forces designed for combat or combat support.

The Demographics of Force Generation: Recruitment, Attrition and Retention of Citizen Soldiers

The prevailing model of civil–military relations in democracies is that of the citizen soldier.[1] If soldiers are citizens first, then the armed forces as a whole should be broadly representative of the society they serve, modelling equality of opportunity, especially in democracies that champion freedom, equality and justice. How representative is a matter of controversy beyond the scope of this chapter. However, from the premise of the citizen soldier one might normatively infer that, at a minimum, the armed forces should be on a trajectory of becoming more representative of society.

Reversing Apartheid Under Racial Capitalism: Notes from Land Occupations in Cape Town

Scholars of racial capitalism typically examine how racist policies augment profitability in a given context. But how should we understand these policies when they emanate from a state intent upon *counteracting* racist histories of residential segregation, job reservation, and land distribution? South Africa's postapartheid government has staked its very legitimacy on just such a reversal, yet it continues to evict land occupations on a regular basis – occupations which are nearly exclusively Black. Why? Drawing on my newly

published book *Delivery as Dispossession*, rooted in a decade of ethnographic fieldwork in South African land occupations, I examine the limits of remedial housing delivery in Cape Town. Centuries of racial capitalist dispossession have produced a situation in which the distribution of free, formal housing – an attempt to reverse apartheid – cannot possibly keep pace with the scale of need. Residents are entered onto a waiting list, which now takes over 60 years. In the meantime, they must provide for themselves, and they do: by occupying land. But the state, wary of incursions on private property, then works to clear these new occupations – often by bumping new occupiers to the top of the waiting list and vilifying them as "queue jumpers." Paradoxically then, in the name of reversing apartheid, the postapartheid state dispossesses Black residents. I conclude with reflections on what this means for the study of racial capitalism, considering how antiracist policy is limited in a capitalist context.

The Diffusion of Certifications and Gender Equality Plans in Science: Activism and Institutional Change

Gender equality has become an increasingly important issue in the scientific space and has been the subject of several initiatives implemented by universities, research funding agencies, professional associations, etc. Certifications, award schemes, and Gender Equality Plans are being produced and disseminated in different parts of the world. How to explain this development? This presentation advances partial results of research that mobilizes the sociology of activism to study the involvement of professionals in these processes. Working in governmental and non-governmental organizations, they lead the formulation and dissemination of incentive and control mechanisms to advance the goals of gender equality by defining discourses, norms, and procedures aimed at correcting gender biases in institutions. A chronology of the design and implementation of gender equality certifications and plans in different countries makes it possible to identify these individuals and study their social and professional trajectories.

Based on the analysis of documents (reports, CVs, websites), the study examines concepts, objectives, and justifications mobilized in the schemes and plans, including the strategies formulated to achieve gender equality. The analysis of the CVs of the protagonists of the processes of formulation and dissemination of these initiatives allows us to identify training spaces and professional trajectories. The interviews help us better understand the processes that led to the involvement of individuals with this cause and the networks and resources they mobilized to advance the initiatives in focus.

We identify the emergence of a new field of professional practice, where experts - in general, women researchers turned activists - work as knowledge producers, consultants, and mediators between different spheres - science, media, politics, law, etc. Finally, we show how the international circulation of ideas and justice models and the activism of experts have contributed to the cause of gender equality in science.

LEVITIN, Maor* (York University, Canada)

Authoritarianism, Alienation, and the Question of Left Leadership

Authoritarianisms on the Right have gained momentum across the globe in recent years. This phenomenon can, at least in part, be understood as a reaction to the ubiquity of alienation in contemporary society. It is manifest that alienation makes people susceptible to manipulation by authoritarian leaders who are adept at generating illusions of comfort, security, purpose, and community. Checking the influence of right-wing demagoguery might require that the Left offer an alternative form of leadership, one that could provide a vision of a qualitatively different, non-alienated way of life and is ethical in character. This new style of leadership on the Left would eschew domination and be inherently antiauthoritarian. In other words, rather than simply replicating the manipulative and controlling qualities of right-wing populists, an authentically progressive leadership ought to be thoroughly humanistic. A theory of ethical Left leadership is called for, then. The distinction first-generation Frankfurt School critical theorists (and Erich Fromm in particular) draw between rational and irrational authority can help lay the groundwork for articulating the difference between domination-laden styles of leadership and those that are transformative and emancipatory. Since the Frankfurt School and Fromm's engagement with this distinction is only cursory, however, it needs to be fleshed out before its theoretical and normative import can come into view. In addition to providing us with the means to combat the growing influence of authoritarian leaders, a theory of ethical Left leadership promises to challenge the radical Left's reliance on horizontal forms of organization.

LEVITT, Peggy* (Wellesley College, USA)

Transnational Social Protection: Changing Social Welfare in a World on the Move

How do individuals protect and provide for themselves in a neoliberal world where so many people live, work, study, and retire outside their countries of citizenship and where many states are reneging on their contract to provide basic social welfare to their citizens? The conventional wisdom is that access to social protections is limited by membership in the nation-state of residence via citizenship, geographic proximity to the distribution of services, or embeddedness in local family or social networks. This conventional wisdom is sorely out of date. There are increasing numbers of long-term *residents without membership* who live for extended periods in a host country without full rights or representation. There are also more and more long-term *members without residence* who live outside the countries where they are citizens but continue to participate in the economic and political life of their homelands. Professional-class migrants who carry two passports may know how to make claims and raise their voices, but there are many poor, low-skilled, and undocumented migrants who are marginalized in both their home and host countries.

In response, a new set of social welfare arrangements has emerged which sometimes complements and sometimes substitutes for traditional modes of social welfare provision. Migrants and their families unevenly and unequally piece together *resource environments* across borders from multiple sources, including the state, market, nongovernmental organizations and their social networks. Local, subnational, national, and supranational actors are all potential providers of some level of care. Four logics upon which rights are based: the logic of citizenship, the logic of personhood/humanity, the logic of the market, and the logic of community. The conflicts between these different logics are at the core of controversies and conflicts over what we *can* and what we *should* do to protect dispersed individuals and families from risk, danger, and precarity.

Introspecting Food Movements in Canada: Unpacking Tensions Towards Justice and Sustainability

Over the past decades there has been a notable growth in community-based food systems projects and successes. Despite these advancements, food insecurity, precarious food work, ecological degradation, and corporate conglomeration in the food sector all continue to increase, compounded by the ongoing impacts of white supremacy, patriarchy, settler colonialism. Recognizing these growing inequities, critical scholars have noted that too many food systems initiatives are overly concerned with influencing individual behaviours and a focus on narrow objectives. Furthermore, many approaches tend to overlook ways that food systems are embedded within political and economic structures that constrain their goals of social and environmental justice. These multiple challenges suggest that food movements are at a crossroads. This presentation reflects on this pivotal moment through an analysis of key food movement actor's perspectives on the progress and promises as well as emerging tensions for food movements in Canada. Through a series of interviews with individuals most prominent in food movement spaces, we explore key perspectives on the state of food movements and possibilities for future directions. Our findings paint a complex and nuanced portrait of what food movements have accomplished, teas out internal tensions, and identify questions facing their future prospects. The perspectives presented through our findings offer a path to transcend the critiques that position short-term strategic gains in opposition to longer-term systemic change. We suggest that food movements can overcome these challenges by embracing a more radical and expansive vision of social and environmental justice that is deeply embedded within food systems while also looking beyond them.

LEVY-GUILLAIN, Rebecca* (Centre for Research on social InequalitieS. Sciences Po Paris, France)

The Production of Gender Inequalities in the Experience and Management of Emotions before Sex

Norms regulating access to sexuality remain deeply gendered. Men tend to be encouraged to accumulate sexual conquests and are required to obtain their partners' consent (Kimmel, 2008). Women, on the other hand, must ensure that their sexuality is embedded in a romantic or marital relationship and that their desires are respected (Hamilton & Armstrong, 2009). In this context, women and men experience the period leading up to sex differently. What emotions do they feel before engaging in a sexual intercourse? What forms of emotional labor do they deploy (Hochschild, 1983)? And what inequalities arise as a result?

The results outlined in this paper are based on the analysis of 130 biographical interviews conducted with women and men between the ages of

18 and 65 from different social backgrounds. In these interviews, respondents were asked to recount some of their sexual experiences and to describe their emotions before, during and after sex.

First, we show that women and men do not have the same mental life before sexuality. Women analyze, sort and transform their emotions which are multiple and contradictory; whereas men often focus on their feelings of sexual desire and let themselves be guided by them. In a second time, we show that these differences of relation to the emotions produce two types of inequalities. On the one hand, women have less leeway to act than men. On the other hand, the sense of self-agency they experience is more precarious.

Endogamy As an Anchor: Exploring Australian Jews' Attitudes Towards and Experiences of Inter-Cultural Partnering

The Australian Jewish community is comprised of immigrants and their descendants from various locations and waves of migration, coming with their own unique histories, values, and institutions. Each wave of migration has aimed to continue their form of Jewish life in Australia, inspiring the establishment and strengthening of Jewish synagogues, day schools, youth movements, and other institutions. The practice of endogamy (within community partnering) has been a key strategy among many to ensure the continuity of Jewish values, beliefs, and practices across generations. Despite this, intermarriage rates have gradually increased over the last 50 years. This indicates that Australian Jews' relationships with traditional Jewish institutions and with broader Australian society has also been changing. Aiming to understand these changes, we interviewed 40 young Jewish Australians from a range of Jewish upbringings about their attitudes towards and experiences of inter-cultural partnering. Focusing on the participants' experiences within contexts such as family, schooling, and social networks, this paper explores how their Jewish identities shape partnering choices. In particular, the paper examines how inter-cultural partnering choices differ across streams of Judaism (e.g. orthodox vs progressive) and change over the life course, as interviewees attempt to anchor their Jewish identities and obtain a sense of belonging while negotiating their place in Australian society.

Sense of Place, Space and Loneliness for People Living with Chronic Conditions

The negative effects of loneliness on health and wellbeing are known, yet effective solutions are not. This paper responds to calls for understandings of, and responses to, loneliness that consider spatial and material factors that create and sustain (dis)connectedness. Inspired by Bourdieu's concepts of collective habitus and habitus clivé, and drawing on data from a combination of indepth and walking interviews and photo elicitation with 40 people who were living with chronic conditions and experiencing loneliness, we explored how place is implicated in the experience of loneliness. Our findings draw attention to the complexity of the relationship between sense of place and feelings of loneliness, including the interconnectedness between self, other people and the natural and built environment. Among participants who lived in social and/or transient housing, a discourse of fear was prominent. Poverty, insecure housing, transient living and unsafe neighbourhoods dovetailed to create feelings of isolation and distrust of others. While these participants exhibited a strong sense of belonging to neighbourhood, these spaces hindered their engagement in activities that ameliorated their loneliness. In contrast, other participants described the importance of green space in lessening their experience of loneliness and supporting social wellbeing. A deep connection with the natural environment, being known in the community and regular visits to green spaces fostered a sense of connectedness, even in the absence of interpersonal relationships. These findings highlight the critical importance of creating places that support ways for people vulnerable to loneliness, especially those who are economically and socially marginalised, to not only meaningfully connect with others, but also to meaningfully connect with themselves, with nature, and with the built environment.

Social Media Use, Prosocialness, Life Satisfaction and Political Participation of Hong Kong Young People

Although the literature consistently reveals a positive relationship between social media use and political participation, the mechanisms connecting them are still unclear. Recent studies in the western context have revealed that prosocialness and life satisfaction may be considered as two mediating factors on the relationship between social media use and young people's political participation. Contrary to some of the western findings, however, one recent study reveals that individuals in Hong Kong who are more dissatisfied with their lives are more likely, instead of less likely, to engage in radicalized actions. In light of these inconclusive findings, this paper explores how the direct and indirect effects of social media use on political participation among post-secondary students in the context of Hong Kong. In particular, it will examine the roles of life satisfaction and prosocialness as mediators between social media use and political participation. The empirical data comes from the first wave survey of a 4-wave longitudinal study of identity status among the young population in Hong Kong. The sample consists of 882 post-secondary students between 18 and 24 years of age. Structural equation modelling was used to test specific pathways outlined in the hypothesised model. The results have demonstrated that the relationship between social media use and political participation is mediated by prosocialness and life satisfaction for young people in Hong Kong. However, our findings indicate that radical political participation is not directly influenced by young people's life satisfaction. Young people who were more dissatisfied with their lives would first participate in conventional political activities. The experience in the conventional forms of protest then increased their likelihood of joining the more radical forms of political action.

Strategic Interaction and Tactical Shift in the Hong Kong Pro-Democracy Movement

Existing scholarship usually examines how structural constraints shape tactics. By bringing the framework of strategic interaction into the study of tactical shift, this article examines how activists resolve different strategic dilemmas on the basis of what they have learned from the ongoing interactions with other activists and their targets in the strategic arena. As interactions unfold, activists revisit their readings of the political context and revise the tactical plans accordingly. This paper presents a case study of the Hong Kong pro-democracy movement which evolves from a movement relied mainly on institutional politics to a transgressive contention forbidden by the state. The use of disruptive tactics has gained traction as intra-movement conflicts unfold from the 2003's July First demonstration to the 2019's Anti-Extradition Law Amendment Bill Movement. By tracing the interaction sequences over time, my findings demonstrate that factional battles within the Hong Kong pro-democracy movement have opened and foreclosed different strategic possibilities in each round of interaction with the government, thereby shaping the trajectory of tactical shift. Alongside the consecutive defeats in advancing democratization, the young radical groups have gradually gathered steam by downplaying the moderate strategies employed by the traditional democrats. In face of these challenges, the traditional democrats have also revisited their optimism toward institutionalized politics and adjusted their tactics along the radical path. The dynamics of strategic interactions and interpretive change thereby shape the choices of tactics over time. My analysis reveals that perceived opportunities shape strategy, but they are not unchanging and is contingent on strategic interaction among actors. The current analysis moves beyond the classic model of protest cycle by highlighting the interactive dimensions of contentious dynamics.

Maternal Non-Standard Work Schedules and Children's Socio-Emotional Development: Evidence from the UK

Non-standard work schedule (NSWS) of mothers has been linked to negative outcome of children, yet few studies have examined the mechanisms behind such association. Our study uses the Millennium Cohort Study (MCS) to capture the changes in the social and emotional wellbeing measured in SDQ of children

aged three to seven by mother's work hours. We consider household structure, family income, and parental characteristics, and focus on two mechanisms: stability of children's daily life and quality of time parents spent with children. The former is operationalized by regularity of mealtime and bedtime each day, and the latter by the frequency of parental engagement in stimulating activities such as reading, writing, visiting the library with children. Among those whose mothers work at least one hour a week (standard or NSWS) we use pooled OLS, random effects, and fixed effects models to capture the impact of mother's NSWS on five domains of SDQ (emotional, conduct, peer problems, hyperactivity, and pro-social behavior). Next, we conduct mediation analyses by type of NSWS to estimate the direct and indirect effects of maternal NSWS on child total SDQ scores via the above-mentioned two mechanisms. We found that mother's NSWS is associated with increases in children's social and emotional problems, compared to those who work standard schedules. Children whose mother works at night (10pm to 7am) and weekends are particularly more negative impacted than those whose mother works evening hours (6pm to 10pm). The quality of time spent with children only mediates the effect of NSWS to a small degree and is less important than the stability of children's daily schedules. We contribute to the literature by testing important mechanisms behind the linkage of mothers' NSWS to children's socio-emotional development from the UK context.

Unequal Electoral Participation: The Negative Effects of Long Work Hours and Unsociable Work Schedules in Europe

Situated within gender inequality in time as a resource for political participation, this study examined 1) the relationship between long working hours and unsociable work schedules and participation in national elections in Europe before or in 2010; 2) factors that may mediate this association; 3) gender differences in this relationship and occupation-specific patterns, using wave 5 of the European Social Survey data on 24 European countries. The findings show that working > 45 hours per week and working in evenings, nights or weekends is associated with lower national electoral participation in women with both high and low occupational status. Among men with the lowest occupational status, working long hours is also linked to lower participation. These findings are robust against controlling for important confounders. Political interest seems to partially mediate the negative effect of unsociable work schedulers on voting in women. Neither health nor social engagement played a mediation role.

Metro-Induced Housing Gentrification in Guangzhou, China: A Spatial-Temporal Analysis

More and more Chinese cities have built rail systems and implemented transit-oriented-developments (TOD) in order to meet the increasing transport demand associated with the rapid urban growth (Huadao, 2019). It is believed that TOD development can not only reduce urban traffic congestion, but also promote real estate development and generate large revenue growth for local governments (Zhang et al., 2005; Zhao and Li, 2018). By improving the surrounding environment and accessibility, areas around the rail stations would experience an increase in job opportunities and regional amenities, which in turn attract population from upper socio-economic classes to live near the rail stations, drive up housing price, and push the economically disadvantageous out of their neighborhoods around rail stations (Pollack et al., 2010; TCRP, 2004; TCRP, 2008; Tiebout, 1956). Scholars label these phenomena TOD-induced or transit/metro-induced gentrification (Bardaka et al., 2018; Kahn, 2007; Lees et al., 2008; Pollack et al., 2010).

The travel and economic benefits of rail development are well researched, but the social effects of rail are largely understudied, especially in China (Dong, 2017). We analyze the housing supply and social groups associated with urban rail development using the 2000 and 2010 census data from Guangzhou, China and a linear mixed-effects modeling approach. Our results indicate that although low price rental housing units have generally increased over time, the increase in rail neighborhoods has lagged behind that in non-rail neighborhoods and that the rail/metro-induced effect on affordable housing supply and thus the population is evidenced. This research contributes to the existing literature by investigating an important but previously overlooked issue and providing empirical evidence of social changes in a city that has experienced rapid economic growth and pioneered rail development in China — a developing country. Limitations and implications of the findings are discussed.

From the First Step to the Development: The Sustainable Development of Equestrian Policy in China

The horse industry has been one of the most significant industries in China's history, and it is still undergoing transformation in the modern era. This presentation provides an overview of the sports policy documents of Equestrians in China. This qualitative research methodology includes documents analysis of normative and policy documents. The presentation shows the equestrian structure of China, the conclusion obtained is that the growth strategy for equestrian sports in China has followed three phases: Trying phase before 2008; Preparation phase:2008-2015; Incipient phase:2015-2021. In a time when the horse business is undergoing a shift from traditional to modern, there are several issues with the policies that govern it. Relevance is the most significant aspect of a policy. In general, policy objectives are vague and imprecise, and there is only limited interaction between the sectors to which they pertain. Second, the policy is inconsistent and unstable. Third, there is a deficiency in terms of professional evaluation and relevancy. In addition, the process chain is missing, which means that pre-development preparation is not done. The complex causes of these issues include the sports management system, the government's policy ideals, and the competition of interests among policy stakeholders. As a result, this study makes suggestions for China's equestrian-related sports sector policies. First, the government collaborates in multiple sectors. Second, to encourage the establishment of national and local equestrian-related sports facilities soon. Third, the government promotes and governs professional equestrian sports. Fourth, establishing tournaments for allied equestrian activities on a progressive basis.

Public Attitudes As the Macro-System of the Parents Who Lost Their Only Child: Ethical Imputation, Predicament Awareness, and Help Willingness

In China, the population of older parents who lost their only child (PLOCs) is increasing and will keep growing for about 30 years. The PLOCs are thought to undertake the ethical imputation that they have not taken good care of the child, for the tradition emphasizes children as the center/fate to a family. This study aims to investigate public ethical imputation concerning PLOCs and its relationships to the awareness of predicament of the PLOCs and the willingness to help PLOCs. A nation-wide sample of 2029 (M_{age} = 36.62 years; SD = 10.06; 50.1% males) adults aged from 18 to 71 years was included in this questionnaire-based survey. The results indicated that ethical imputation negatively predicted public predicament awareness toward PLOCs. More importantly, this effect was stronger when the public had lower levels of social trust than was that among the public with higher levels of social trust. In addition, ethical imputation had impacts on help willingness in specific condition. Specifically, ethical imputation negatively predicted help willingness among the public with higher levels of social trust; in contrast, this effect was not significant among the public with lower levels of social trust. Interestingly, the results also indicated that more predicament awareness toward PLOCs did not necessarily lead to more willingness to help PLOCs. These findings promote an understanding of the public' s predicament awareness toward PLOCs and provide an alternative perspective from the macro-system to help PLOCs.

Japan's Disaster Medical System and Response to the Covid-19

Disasters affect millions of people and cause collective social distress in Japan. In recent years, the most memorable catastrophes are the Great Hanshin-Awaji Earthquake in 1995, followed by the Great East Japan Earthquake in 2011 and the Kumamoto Earthquakes in 2016. Based on the lessons learned from these disasters, Japan has reviewed and greatly improved the disaster medical system by establishing disaster base hospitals, the Disaster Medical Assistance Team (DMAT), and introducing a medical information system named EMIS (Emergency Medical Information System) throughout Japan. The purpose of this paper is to introduce the National Disaster Medical System (NDMS) in Japan by focusing on these three systems. Moreover, this paper will also briefly discuss how these systems operate in times of disaster. Because the coronavirus is still affecting people's lives, the NDMS is adapting to deal with the current pandemic. This paper will also discuss how these systems are

responding to the pandemic. However, it is predicted that within the next 30 years, a highly destructive Nankai Trough megathrust earthquake will hit the southwestern area of Japan. How to prepare to respond to earthquakes of such a scale and other disasters while dealing with the pandemic is a present challenge for Japan's disaster medical system in the future.

Digital Diplomacy As Authoritarian Practices: A Case-Study of China's Wolf Warrior Diplomacy

Diplomacy is an age-old art of state craft, while social media was newly born in the latest wave of technological revolution. When classical meets modern, it could start to transform the traditional art of diplomacy, as demonstrated by Ukrainian President Volodymyr Zelenskyy's wartime videos under Russia's invasion; it could just put old wine in new bottles, as many international organizations do when migrating generic statements into a social media account; or it could fall somewhere in between. For those studying diplomacy and/or digital media, a key question remains to be answered is what social media could bring to diplomacy and diplomatic communication.

The existing literature of digital diplomacy adopts a liberal-triumphalist approach to this question. In this article, however, we studied a case of China's wolf-warrior diplomacy to understand how diplomatic actors may utilize preexisting cleavages in the digital world to promote polarizing narratives.

We collected posts by a representative wolf-warrior diplomat, Zhao Lijian, on the international (i.e., Twitter) and the domestic (i.e., Chinese Weibo) social media platforms. For analysis, we first applied the method of computer-assisted content analysis to examine the content of Zhao's social media posts and identify his wolf-warrior narrative. Then, we used quantitative methods to gauge the effects of several socio-political and economic factors on his wolf-warrior narratives on the international and the domestic platforms, respectively.

Our study found that Zhao strategically utilized social media platforms to deliver differential messages to international and domestic audiences and responded to diverse goals of wolf warrior diplomacy. Other than providing an open and public space for diplomatic communication, social media may also introduce pitfalls of its own to public diplomacy. This study suggests that we should develop contextualized counterstrategies to offset the effects of these pitfalls.

Challenging Authoritarian Regimes: Political Grievance and the Perceived Consequences of Political Action

In authoritarian states, characterized by closed political opportunity structures and human rights abuses, the conditions for political grievances to arise are plentiful. Theoretically, non-electoral political participation (NEP) such as attending public demonstrations and working for political organizations is possible and could turn back authoritarian development, yet citizens rarely engage in political action and the regime continues on its authoritarian path. Research tends to theorize about differences between democratic and non-democratic systems, losing sight of the variation of crucial features between them - the practice of human rights violations, and specifically, state repressions. Authoritarian regimes abrogate human rights to quell dissent. I theorize that state attacks on the physical integrity of individuals to punish resistance moderates the relationship between individual level grievance and political action. I address the question: *In authoritarian and democratic regimes, what are the relationships between political grievance, political action, and human rights violations?* I expect that, in democratic and authoritarian states, the greater the level of political grievance, the stronger the probability that individuals engage in non-electoral political participation; however, in authoritarian regimes, the high level of human rights abuses chills participation, and thus reduces the effect of grievance on political participation. I test the relationship between political grievance, human rights violations, and non-electoral participation using harmonized Survey Data Recycling 2.0 dataset combined with CIRIRIGHTS Human Rights dataset (N respondents ca. 2,6 million across ca. 130 countries).

Global Youth Climate Activism and Planetary Citizenship in Times of Crisis: A Global North and South Comparative Perspective

In the current times of global crises, such as climate change and the Covid-19 pandemic, how young people navigate these emergencies and catastrophes demands special attention, particularly as the generations that will inherit these issues. This paper highlights the need to consider young people as capable actors and to obtain insights from their crisis engagement. Specifically, it investigates the global youth climate activism that peaked in 2019 and has remained active, primarily online, during the pandemic. In 2019, young people who were deeply concerned about the global climate crisis teamed up to lead protests against climate inaction in over 150 countries. This occurrence of

youth-led global climate activism has demonstrated some young people have sought to take climate emergencies into their own hands and address the issue collectively as a globalised citizenry.

Drawing on in-depth interviews conducted in 2019 and 2020 with young climate activists in two global cities, Hong Kong and Melbourne, together with online observation during the pandemic, this paper discusses how these young people perceive, communicate about and engage with climate change as a planetary crisis. Results show that these young climate activists have envisioned themselves as citizens of the planet and that a sense of crisis has driven them to take individualised yet collective actions on climate change and sustainable living. By comparing climate perceptions and communication experiences of young climate activists in Hong Kong and Melbourne, this paper offers a preliminary comparative approach to understanding similarities and differences in how young people relate the local to the global in Global North and South. It also articulates how collective self-identification and manifested agency among these globalised climate-concerned young individuals contribute to the formation of a 'planetary citizenship'. Overall, this comparative approach and the emerging concept of planetary citizenship contribute to the development of planetary youth research.

Integration Along the Class Lines? the Everyday Interactions and Boundary Making/Unmaking between Mainland Skilled Professionals and Locals in Hong Kong

Scholars and the Hong Kong government have been concerned about the social, economic, and cultural integration of new mainland Chinese immigrants (NMCIs) into local society. Research on NMCIs' integration difficulties in Hong Kong has focused on one-way permit holder migrants from China—who are less skilled and face discrimination and problems with integration based on differences in human capital—while overlooking internal variation among NMCIs. Mainland skilled professionals (MSPs) may have different integration experiences and receive different treatment from locals. Drawing on interviews with 48 MSPs and local Hong Kongers, this article investigates three sets of questions: (1) what do interaction experiences between MSPs and locals look like in the workplace and other social settings? (2) how are specific stereotypes of the other group changed or reproduced through boundary making/unmaking processes? (3) which kinds of integration are MSPs pursuing and do they face barriers during their integration process similar to those faced by one-way permit holders, and how do they react to the barriers? The findings suggest that for MSPs, although class-based discrimination is mediated in the workplace after interaction, the boundaries of 'us' vs. 'others' are still prevalent between them and locals due to language, cultural difference, and identity.

Ambivalent Resistance: Indie Music, Mobilization and Hong Kong's Localist Movement

Hong Kong's nascent localist movement is viewed as an identity movement and triggered heated discussion, but little research explores the relationship and combination between politics and local musical cultures. This paper examines how the performances and texts of local indie music bands symbolize and form identity and local-based mobilization between youth. the consequence of this form of ambivalent resistance. With in-depth interviews and cyber-ethnographic studies, this research primarily examines *My little airport*, a Hong Kong-based music ensemble, we find the tension and interaction between artists' aesthetic freedom and political involvement. Music's enduring capacity to mobilize individuals and encourage their participation in contentious action, equipping young people with guiding strategies for their engagement and practices of local identity in an ambivalent way. The ensemble, which thrives upon local culture, has propagated a strategic discourse of emotion, local and identity-based awakening and resistance. Such discourse, in turn, supplies emotional, cultural, and legitimizing content for the participants undergoing their framing process. Through the interweaving of local, metropolis, and identity repertoires, individuals perceive, participate in, and imagine the experience of place, thus forming a sense of place for both the individuals and the group, which subsequently enables them to engage in with broader identity movements.

Multidirectional Residential Integration: Residential Trajectories of Chinese Immigrants in the Tokyo Metropolis, Japan

Residential mobility is one of the most critical indicators for immigrant integration. Studies have commonly used two main directions as indicators for residential integration, which I refer to as static immobility and linear mobility from ethnic neighborhoods (ENs) to wealthier majority neighborhoods (non-ENs). However, the paradigmatic view of residential integration does not fully

explain immigrants' residential integration due to 1) within-immigrant group heterogeneity in sociodemographic composition, 2) the emergence of global new immigrant destinations, and 3) the development of wealthier ENs at immigrant gateways. Based on these three points, this paper showcases the *multidirectionality* of immigrant residential integration focusing on the within-immigrant group diversity at a new immigrant destination. Using an original online retrospective survey on Chinese immigrants' residential histories upon arriving at the Tokyo Metropolis (n = 1482), I first link residential mobility with immigrant integration using sequence analysis to analyze the longitudinal patterns of residential mobility. A follow-up penalized multinomial logit (PML) model confirms the relationship between residential mobility patterns and integration.

The sequence analysis results show at least four distinct patterns of residential mobility: *Mobilizing to non-ENs* (spatial assimilation), *Remaining in ENs* (place stratification), *Remaining in non-ENs*, and *Mobilizing to ENs*. Each of the four patterns accounts for a significant share of Chinese immigrants' residential mobility. The PML model, using indicators derived from spatial assimilation, place stratification, and coethnic preference, confirms the correlation between *Mobilizing to non-ENs* and spatial assimilation. Furthermore, it also demonstrates the *Mobilizing to ENs* as integrating residential mobility due to the interaction of upward socioeconomic mobility with a high level of coethnic preferences. The pattern of *Mobilizing to ENs* indicates a counterintuitive and reserved pattern of residential integration, which requires reevaluation of residential integration and the formation of desired ENs as a residential destination in both new and traditional host societies.

LIANG, Yingjian* (Indiana University, USA)

Job Search As Cultural Adaptation: How Organizations Make People before Hiring Them

Existing literature shows how organizational socialization shapes members' thoughts and behaviors but has neglected how organizations make people even before hiring them. This is an important neglect because how well job seekers adapt to these organizational pressures may affect hiring, a critical point of stratification on the labor market. To address this limitation, my research examines cultural adaptation during job search, or how job seekers adapt their expressed values and self-presentation styles to fit organizational expectations. My project focuses on graduate student job seekers in computer science and engineering (CSE) programs in the United States as a theoretically critical case. This case provides a unique opportunity to observe how job seekers respond to pressures of organizational socialization and with what consequences, given their job search process unfolds over several months, leading to drastically different employment outcomes (e.g., salary and organizational status).

Drawing from three waves of longitudinal qualitative interviews with 63 respondents (175 interviews in total), my paper reveals that job seekers engaged in two types of cultural adaptations – cognitive and behavioral – in response to employers' expectations to fit into organizational culture before hiring. Through cognitive adaptation, job seekers revised their biographical stories to fit employers' organizational values; through behavioral adaptation, job seekers refashioned their self-presentation styles from a technological examinee to a professional interlocutor. Furthermore, I identify resources respondents used to accomplish these adaptations, including public information, school resources, and personal networks. While respondents who used a wide range of resources achieved faster cognitive adaptation, those who selectively mobilized strong ties in their networks achieved behavioral adaptation mostly effectively. Respondents who accomplished both cognitive and behavioral adaptations appeared to enjoy better job search outcomes. These results expand our analysis of organizational socialization outside of the boundary of formal organizations and highlight their implications for social stratification.

Return Migration of International Students during COVID-19 Pandemic in China

The global pandemic (COVID) has affected the lives of people across the globe. This paper examines how the global pandemic has affected the lives of international students in China. Due to language and cultural differences, we argue that international students in China are especially vulnerable during the early stages of the pandemic as much information on the pandemic was unknown at the time.

Using an online survey of international students carried out in August 2020 in a major research university in China, we aim to study the return migration decision of international students. Our results show that students with fellowships and major in natural sciences are less likely to return to their countries. Consistent with migration theory, students with longer time of duration in China are less likely to retune home. They are more likely to understand and take advantage

of China's unique COVID prevention procedures put in place in 2020. The most striking finding is that inequality between countries plays a very important role in the process of return migration.

The paper is significant and innovative in several aspects. First, it will advance new knowledge of how an unprecedented health crisis has affected international students' learning experiences and well-being. This is a unique opportunity to examine in a systematic way trajectories of lives of international students in the on-going global pandemic and unfolding cross-international boundaries. Second, the paper is timely to study how students' coping process during on-going crisis is driven not only by inequality of students' social economic origins, but also inequality between students' countries of origin. Third, the paper employs an innovative survey method of social media platform. Finally, insights from the paper have the potential to inform universities and policy makers to deal with any future international health crisis for the well-being of international students.

Women's Protection or Patriarchal Control? an I.E. Journey in the Domestic Violence Prevention Network

Two decades after the Domestic Violence Prevention Act was enacted in Taiwan, a domestic violence prevention network (DVPN) has been established that involves social workers in the first sector and the third sector, the police force, the judicial system, and the healthcare sector. Domestic violence is not criminalised in Taiwan, so the social welfare sector leads and is accountable for processing domestic violence cases. This I.E. journey begins with the standpoint of social workers in the third sector whose service programmes were outsourced from the first sector. The researcher did participant observations for two months in 2018 and, in 2021, conducted 15 one-to-one interviews with social workers in a national organisation that provides various gender-based violence services outsourced from local governments.

The IE journey begins with a problematic—how did social workers organise knowledge of intimate partner violence (IPV) under the ideology of women's protections prevailing in the DVPN? The research reveals that the computerised technology used to monitor and shape social workers' processings of domestic violence cases reflects a governmental control over the third sector under the name of 'protecting IPV victims.' The textual technology utilised in the DVPN reflects a strong focus on reassuring the victim's physical safety. In contrast, the practical knowledge generated through service provisions reflects contrary experiences of domestic violence. The frontline workers struggle between experiential knowledge of IPV formed through everyday work practices and the text-based ideological regulations that implicitly reflect patriarchal controls from the government to the IPV victims and workers from the third sector.

A Comparison of Cross-National Surveys from the TSE Perspective Using the Relationship between Religion and Happiness As an Example.

Secondary data are a good source for cross-national comparison. However, researchers often encounter the issue of identifying a good quality survey project in order to obtain reliable findings. As each of the cross-national survey projects has specific research purposes and approaches, results that are measured by the same latent construct in different cross-national surveys may vary for the same country. From the perspective of Total Survey Errors, survey aspects, such as mode of data collection and survey agency, may have impact on data quality. While the results of the same latent construct may differ, it is possible that findings of multi-variate analysis on the latent construct are similar.

This study aims to report a within-country comparison across different cross-national survey projects. Data for this research are drawn from the International Social Survey Programme (ISSP) 2018 and the European Values Study (EVS) 2017. The ISSP 2018 Religion Module focused on attitudes towards religion and religious practice. The EVS 2017, as previous waves, focuses on morale, religious, societal, political, work, and family values of Europeans. Among the participated countries in both of the survey projects, 21 European countries are selected for analysis. Common question items in both ISSP 2018 and EVS 2017 will be used, including religious attitudes and practices, general happiness, self-rated health, and social-demographic characteristics. Preliminary findings on the relationship between religion and happiness will be reported and discussed.

Deglobalization: Conceptual Issues and Long-Term Global Social Change

Globalization as a theoretical concept has been debated and operationalized for decades but the idea of deglobalization has received much less attention. What could it mean vis-a-vis the various kinds of globalization proposed and defended in the social science literature? Is it an important phenomenon and how might it be measured? This paper discusses how sociologists, economic historians, archaeologists, and political scientist have understood deglobalization and the possible relevance of this concept for grasping the changes that are happening in the contemporary world-system and how the current period can usefully be compared with earlier periods of structural deglobalization. Structural globalization has been both a cycle and an upward trend as periods of greater global integration have been followed by periods of deglobalization on a long-term stair-step toward the greater connectedness of humanity. In the current period the world-system may once again be entering another phase of structural deglobalization as the contradictions of capitalist neoliberalism, environmental degradation and uneven development have provoked different kinds of anti-globalization populism, rivalry among contending powers, trade wars and movements for mitigating the effects of climate change. This plateauing and possible downturn in economic, political and cultural connectedness is occurring in the context of U.S. hegemonic decline and the emergence of a more multipolar configuration of economic and political power among states. the world-system is indeed once again entering another period of economic deglobalization and compares the current period with what happened in the 19th and 20th centuries to specify the similarities and the differences. We also examine different kinds of recent connectedness to see which kinds are deglobalizing and which kinds are not. And we discuss several theoretical and measurement issues that have emerged from the study of trends of structural globalization and deglobalization. And we evaluate the usefulness of competing ways of conceptualizing deglobalization.

Medical Mistrust and COVID-19 Among African Americans in the US Deep South

This presentation discusses the results of an ethnographic study on attitudes toward COVID-related vaccination in the rural Black Belt of Alabama, where the Tuskegee Syphilis study (a traumatic event for many families) was conducted over 40 years from 1932 to 1972. The Black men in this study were denied life-saving treatment and many died from syphilis. We conducted IRB-approved Zoom interviews with community leaders, health providers, public health officials, and long-term residents of five counties in the Black Belt. Study methods included health diaries, photographic and data visualization, advisory board consultation, direct observation, and collation of demographic, health and economic data for analysis. We found that community leaders (pastors, mayors, and elders) played a pivotal role in promoting vaccination in a "we have to take care of ourselves" response to higher rates of COVID-19 mortality among African Americans. The Tuskegee effect was observed in these terms: mistrust of Department of Health efforts to engage with African Americans in a meaningful way, eagerness to be vaccinated against a backdrop of medical neglect for minority health, and framing vaccination uptake as a social justice project to compensate for historical wrongs. Where vaccine refusal occurred, typically among younger residents, there was frequent mention of social media, family and friends, and other "influencers" who stated that vaccines are dangerous or a Big Pharma conspiracy. Reasons for hesitation (rather than refusal) included lack of transport to testing sites, time poverty, and a mistaken belief that the vaccine was not free. We found that community efforts to promote COVID-19 vaccination turned historical trauma into positive action for health equity during the pandemic, which in turn, helped to increase vaccine uptake in this vulnerable population.

Towards a Mega-Expertise? the IPCC, Transformative Change and the Future of Expertise

What kinds of expertise is needed to facilitate and guide the work for transformative change? The context is the growing severity of the current environmental situation, which implies a need for social transformation. This also implies a need for a new form of environmental expertise, with a radical new, broader, and more complex task which challenges disciplinary and institutional boundaries and raises fundamental epistemic and normative questions.

This paper explores the interdisciplinary and epistemic challenges faced by experts involved in the IPCC. The empirical material consists of semi-structured interviews (N=17) with experts involved in the IPCC, mainly in AR5 and AR6. Data from the interviews were analyzed thematically using NVivo.

First it analyzes what challenges – problems as well as opportunities – the experts face when conducting global environmental assessments. Thereafter it turns attention to what kind of expertise they believe will be important for IPCC's future work. Of particular interest is analyzing the role they assign to social scientific expertise. Based on this analysis, the paper reconstructs the kind of expert position they believe IPCC should take, and by linking to findings from Science and Technology Studies (STS), it critically discusses risks and opportunities of this position.

By focusing the experts' own experiences of as well as beliefs about how science should collaborate and act to develop policy-relevant knowledge, this paper contributes to the discussion on the IPCC's future development, but also to the discussion on the role of science in the work for transformative change.

Limitations of Parsons on Norms

Limitations of Parsons' Treatment of Norms

Talcott Parsons developed an influential treatment of norms - rules of conduct - as structural elements of society. His model of a system of norms was essentially an inverted tree structure. Generalized norms regulate conduct in all social relationships, e.g., rules of honesty and respect for others. The structure then branches such that specialized norms apply to various specialized settings - economic exchanges, political competition, status acknowledgement in social stratification, parents' relations with children or childrens' with parents, which vary by ages of the participants. A limitation of the tree-structre model emerges when we consider our roles in presenting sociological ideas. We do so in different ways if we discuss them informally with a close colleague, defend them against a critical colleague, present them at a profssional conference, or teach them to beginning undergraduates or to advanced graduate students. In each situation, rules of logic, thoroughness of demonstration, etc. apply, but our conduct is quite different. To analyse the differences effectively, we need a transformational theory of norms, like Chomskyean transformational grammars, a theory in which rules are flexibly combined to create situationally new normative understandings. Norms of intellectual demonstration may be combined with rules of informal or more formal relationships, with collegiality or with teacher-student relations. This is a simple set of examples, but almost all conduct exists in multi-dimensional relationships where new normative understandings are created and used for a situation, then recreated for other practical settings.

LIDZ, Victor* (Drexel University College of Medicine, USA)

The Development of Four Function Macrosociology

The Development of Four-Function Macrosociology

A major development in mid-20th century macrosociology was Talcott Parsons' four-function analysis of societies into four primary subsystems, the economy, the polity, the societal community, and the fiduciary system. Each of the four systems was treated as structured by institutions functionally differentiated from the other three systems, yet engaged in active processes of "interchange" with them. The origins of this analysis began with Economy and Society, which Parsons published in 1956 with Neil J. Smelser. It treated the economy as a subsystem serving the adaptive function but engaged in interchanges with the other three systems. However, generalizing that model to the other three subsystems was challenging, an effort barely finished at Parsons' death in 1979. In recent years, Victor Lidz and Helmut Staubmann have published two volumes of previously unpublished manuscripts from the late 1950s and early 1960s that show the early efforts of Parsons and his colleague, Winston White, to generalize the model to the non-economic subsystems of society as the conceptual basis of a planned book on American Society. Values of American Society (LIT Verlag, 2016) addresses the core structures of the fiduciary system and the pattern-maintenance components of the economy, polity, and societal community. Subsystems of Society (LIT Verlag, 2022) restates the economy's status as subsystem, presents the polity as goal-attainment subsystem, and treats community, but with a local, not societal emphasis, as the integrative subsystem. The presentation will discuss the insights and shortcomings of the early formulations..

Precarity of Race: The in/Formality Nexus and Translocal Histories of Thai and Roma Workers in Sweden

The paper enquires into the entanglement of precarious living and working conditions in the Swedish berry industry with processes of racialization. The authors argue that the precarity can only be understood if temporary seasonal migrant workers are positioned within the dynamic of the political economy of informalization and ethnic racialization of local, national and transnational labour market segmentation,

The Swedish berry industry today relies on two categories of seasonal workers, namely "third country national" Thai workers who are designated as circular migrants in EU-parlance; and Bulgarian Roma, arriving on the basis of intra-European mobility as EU citizens. While the first category is granted work permits by the Swedish migration authority when formal minimum wage contracts have been countersigned by a Swedish trade union, the other category is mostly informally recruited by countrymen and completely detached from industry responsibility for their working conditions, demonstrating the aporias of EU citizenship. The paper compares formal and informal aspects determining the conditions of the Thai and Roma berry pickers' arrival and work in Sweden and how race is articulated in these different situations. This illustrates the problematic aspects in analytical approaches that strictly separate the concepts of 'formality' and 'informality' and shows how such distinctions relate to histories of race that affect current relationships at the local labour markets and in surrounding communities. Thus, the study illustrates how ethnic racialization and labour market segmentation processes, linked to culture, class, gender and legal status, affect how political ambitions of formalization play out.

Accelerationism: Capitalism Beyond the Great Reset

The onset of a global pandemic, worldwide economic recession, and continental kinetic war has prompted international organizations like the World Economic Forum to articulate a "Great Reset" of the world political and economic order. Core to this project is a planetary coordination of governments and corporations to redirect global capitalism towards ecological and social sustainability objectives. Sociological theory has not kept pace with these rapid changes, defaulting to the view of a new capitalism reigned in within more humane and ecological parameters. This paper discusses the work of Nick Land, focusing on his theory of capitalism as accelerationism. In Land's accelerationism, capitalism's core logic is not wealth accumulation per se but positive feedback through which capitalism, technology, and artificial intelligence become increasingly indistinguishable. From this perspective, I discuss how social and ecological inputs into capitalism will not only not moderate its neoliberal extremes but accelerate its planetary expansion. I introduce the object-oriented view of "capitalism as actor" into this discussion, clarifying how capitalism functions as critique, subsuming attempts at state or organizational control.

Northeast Asia International Order and Governance Tasks after COVID-19

After the outbreak of COVID 19, Korea, China and Japan controlled strictly border entry and exit like other countries. The relationship between the tree Northeast Asian countries has also been relatively tense along with groundless rumors about the cause of Covid 19 and spread of the impression. Of course, in the tension between the three countries, in addition to Covid 19, various issues such as North Korea Issue, THAAD missile deployment issue due to US-China military conflict, post history issues, and US-China competition for economic hegemony are included. The conflict between the tree countries in the process of coping with COVID 19 amid various issues and contexts of international order is a clear example of the difficulty of establishing governance in Northeast Asia. I would like to analyze how the spread of Corona 19 is affecting the cooperative relationship between the three countries and changes in the perceptions of civil society, and to what extent to bring about changes in the establishment of international order and governance in Northeast Asia in future.

Legal Professions and Anti-Corruption Operations: The Case of Lava Jato

Lava Jato was a Brazilian anti-corruption operation that began in 2014 and garnered support and displeasure both inside and outside the legal body. This proposal aims to analyze the perceptions about the operation within the legal body based on interviews with judges working in the city of São Paulo and their adherence or disagreement with a professional identity that has as its motto the fight against corruption, promoted by Lava Jato operators. The theoretical bases of the proposal are the legitimation strategies of legal professions and the analysis of professional ideology in the Court of Justice of São Paulo. As partial conclusions, the study of the 19 interviews conducted between 2016 and 2019 confirms that Lava Jato was a relevant event to the legal body. Nine talked directly about Lava Jato; another spoke about the Italian operation Clean Hands, and yet another about the uses of corruption for conservative political purposes. Most of the answers involving the operation referred to what is valued by the Judiciary Branch and what it is to be a judge. In the answers, the judge in charge of the operation, Sergio Moro, was brought as an example, and the interviewees either adhered to or criticized him. In the adherence, there is the defense that Moro acted technically. When criticizing, some interviewees said that what should be valued in the Judiciary was an "average judge" who did not appear in the press, accomplished his goals, and did not create problems. On the definition of what it is to be a judge, even the interviewees who criticized Moro brought the judge's duty closer to politics. However, they understood politics as part of their profession, distant from political parties. In this way, we hope to contribute to understanding how political crises give rise to discussions of legal professions.

The Politics of Knowledge Production - Translocal Learning in Housing Struggles

This article examines housing movements in the context of knowledge sharing and production within social movements. Drawing from a perspective that describes activism as a social practice that produces knowledge, this paper analyses how social movements activists produce and transmit social movement knowledge. Based on fieldwork research in Dublin (Ireland), I identify the ways contemporary housing movements develop new local knowledge and promote this knowledge within and outside their movement communities. This research finds that knowledge transmission, critical thinking and innovation was indispensable for the viability of dialogue among groups carrying out strategic housing action. These findings highlight that housing movements promote new cognitive and epistemic solutions through their practical and discursive action with other non-housing social movements. These results contribute to housing studies by focusing on the political and social dynamic that generates new knowledge and innovative housing practices.

A Phenomenology of Injustice: Iris Marion Young on the Experiential Grounds of Critique

Iris Marion Young´s philosophical archive tends to be divided into two different axes: on the one hand, there are texts dedicated to the theories of justice and democracy, and, on the other, texts on feminist phenomenology. Although such a division is reasonably appropriate, as it roughly reflects Young's editorial options, I argue it engenders a limitation on scholars´ engagement with her theoretical legacy. Depending on their interests and institutional affiliations, readers tend to privilege one or another axis, ignoring the contributions from the other without further explanation. Going in the opposite direction to this trend, I argue in this paper that a better appreciation of the works bequeathed by Young depends on the recognition that her Critical Theory was developed in an integrated way: the phenomenological dimension is inseparable from her normative proposals, while the question of justice always serves as a guiding principle to her exercises on phenomenology. In advancing this thesis, I focus my attention on a central element of Young´s reflections on justice: the idea of social groups, in their relationship with the categories of identity and difference. I suggest that more than trying to establish an increasingly precise ontology of social groups, Young´s many reformulations on the concept of social collectivities are best interpreted as coexistent approaches that sometimes highlight groups' socio-structural elements and, at other times, their phenomenological-experiential dimensions. To this end, the author's phenomenological texts must be analyzed in line with her sociological analysis, in an exercise that allows us to apprehend Young's Critical Theory as an eclectic and original enterprise that seeks to unite the critical heritage of Adorno, Marcuse, and Habermas with the phenomenological legacy of Sartre, Beauvoir, and Fanon.

Will the Real Victim Please Stand up? International Organizations, Businesses, and the Framing of Labor Exploitation in the UN Global Compact

Businesses have become central players in the contemporary movement against "modern slavery," focusing on forced labor, child labor, and human trafficking for labor exploitation, and incorporating these issues into corporate social responsibility efforts. Intergovernmental organizations have encouraged this trend, seeking to bring businesses into partnership and to cooperate with them in addressing these problems. Relying especially on voluntary multi-stakeholder initiatives, the goal has been to create social change through the dissemination of global norms that businesses will adopt and follow. In this paper, I critically analyze the "modern slavery" documents, website text, and webinar proceedings of one such major initiative: the United Nations Global Compact. With a board comprised of business leaders, along with civil society and labor representatives (including ITUC) and the ILO as a "key stakeholder," the United Nations Global Compact asks that businesses pledge to uphold the elimination of all forms of forced and compulsory labor and the abolition of child labor. How is labor exploitation being framed in this initiative and with what implications for the solutions proposed and for the workers themselves? I find that the materials emphasize a criminalization perspective, one that largely absolves businesses from their role in the persistence of these problems. Moreover, the framings move the focus from worker exploitation to western businesses as the "real" victims of forced labor, child labor, and labor trafficking, with suppliers in the global south and consumers blamed for the problems and workers themselves largely overlooked. These framings decenter workers and the role of labor groups and they do little to challenge existing processes of labor exploitation in global supply chains.

Does It Matter or Is It Necessary and Possible to Talk about Social Class with Middle School Students?

This study aims to shed some light on a long-debated issue: does it matter to talk about social class with middle school students? Those who say no think social class is irrelevant or too big a question for students to handle, and even if it isn't, learning about it would not change anything. There is nothing the teachers can do, not to mention students. In some cases, it even causes doubt and anger, if not hostility. Most of the teachers mean well, but their insensitive 'lectures on meritocracy', acting as symbolic violence, hurt a lot of students, those from high SES family included. To make thing worse, the teachers do it without knowing that they are doing it. On the basis of two-year classroom observation in a junior high school and fifteen- year follow-up biannual interviews with 6 male students, from when they were twelve years of age till their late twenties, the author proposes that not only does it matter to talk about social class, it is also necessary and possible to do it in a gentler way. Teachers do not have to use the c-word to make it clear to the students that agents are always classed and so is their agency. Compromise happens, especially for students from disadvantaged backgrounds. Stop making students believe 'they got what they deserved; they deserved what they got'. This is the first step toward social justice in educational setting.

"Cyberyaos" in Contemporary China's Pearl River Delta

My paper aims to explore "cyberyaos" in contemporary China's Pearl River Delta, a key economic zone of advanced manufacturing and modern service industries. The local term "yao" (妖) refers to people who make a living by male-to-female cross-dressing prostitution. In this sense, the compound word "cyberyaos" signify yaos who make use of cybertechnologies so as to solicit and/or provide paid erotic performances in cyberspace/time. This paper looks into the complicated socio-cultural contexts from and within which the cyberyao phenomena arose and into the hierarchy yaos have constituted in cyberspace/time. It also tries to provide critical accounts of how and why yaos negotiate their gendered/sexualized bodies through plastic/cosmetic technologies, of how and why yaos overcome their shortage of cybertechnological knowledge so that they become able to solicit in cyberspace/time and of how and why yaos and their clients through their online interactions produce a variety of erotic film clips which may deepen our understanding of pornography. Yaos are very often criticized by their opponents as "shanzhai" (山寨; copycat) due to "female impersonation". However, the local feminist/queer theorist Josephine Ho reminds us that shanzhai is not merely copycat, but, rather, a near-inexhaustible source of productive energy. Given that cyberyaos are always negotiating and, I would argue, modularizing their diverse, ever-changing genders and sexualities under various circumstances and that "transgender" is merely one of the gender/sexual modules they manage in their daily lives, I suggest that we may turn to Ho's notion of "shanzhai

gender/sexual modularization" in discussing contemporary Chinese cyberyao phenomena. Through their shanzhai gender/sexual modularization practices, cyberyaos have challenged local heteronormative norms characterized by and imbued with gender/sexual "authenticity" and "originality". My paper employs a qualitative research approach with a combination of online in-depth interview, online participant observation and online text analysis.

Slaughter for Living: A Study on Massive Family-Based Butcher Migrants' Welfare Conditions in Beijing

The fruits of China's development has not been divided equally among its citizens. The new and invisible great wall known as Hukou system had separated the urban dwellers and the rural citizens, presenting different recipients with great disparities in welfare. Currently in China, if a person wishes to migrate and settle in a different city across the provincial boundaries, she or he would have to work in the designated city for about five years, pay adequate tax, and purchase local houses, similar to the requirements of investment migration to foreign nations. To combat the poor welfare conditions of the non-local citizenship and to cope with the fact that the dominant social connection of these outsiders' are strong ties instead of weak ties, migrant workers tend to utilize the family linkage. They either join the relatives in the big cities, displaying a similarity in occupational selection, condense collectively into retail jobs or labor, or migrate in units of families directly. As China enters the "new normal" with aging population, the new need of building a society of common prosperity and the status quo of the dismissal of land speculation as the fuel for local government's financial development, major cities start to lower the standard of granting citizenship, opening the discussion of welfare reform. Providing more welfare to the great amount of aging migrant workers who are in urgent need of welfare distribution is urgently needed. This essay will conduct field works in Changping District, Haidian District, and Chaoyang District, focusing on the butchers who migrated from the small town of Maqiu in Jiangxi to Beijing based on family connections. By detailed portrayal of their living condition and data analysis, this essay would not only shine light on the pressing matter of China's welfare reform, but also offer possible solutions.

Bringing Firm Back in the Developmental Skill Formation Model: The Case of Taiwan (1966-1983)

In the literature on skill formation in the newly industrialized countries in East Asia, scholars were highly influenced by the concept of the developmental state. They emphasized that to provide manpower for economic development, the skill formation regime is established by the state. This argument was called the "developmental skill formation model". In this article, I tried to fix this argument by bringing the firm back in the development skill formation model. I called this viewpoint "embedded developmental skill formation regime", which suggests that the skill formation regime in newly industrialized countries was not only built by the state. The firm also played an important role. The firms were not only incorporated into the skill formation regime by the state but also had the capacities to respond state's policy and to shape the skill formation regime.

In this article, I will show how firms shape the skill formation regime in Taiwan. In the 1970s, firms in Taiwan were embedded with two different institutions of skill formation. One is the Vocational Training Fund Statute (VTFS) in the training sector. It is represented as firm-based training. The other one is cooperative education in the educational sector, which represented as school-based training. Firms in Taiwan had responded to these institutions differently. Because small and medium enterprises in Taiwan resisted paying levy training, the VTFS failed. But the cooperative education was welcome for companies to invest in human capital. These different reactions from firms caused schools to become the main skill provider in Taiwan's skill formation regime.

LIN, Lefeng* (Xi'an Jiaotong-Liverpool University, China)

Social Mobilization: A Pragmatic Logic of Chinese Trade Union Reform

This article explores the pragmatic logic of China's state-run trade union reform through a case study in Shenzhen. Based on participant observation, archive, and interviews, the author finds that the Shenzhen union federation carried out three major reform programs since 2007: implementing wage collective bargaining, democratizing union elections, and building community unions. The author argues that a new operational logic, "social mobilization", emerged from the official union reform. Social mobilization means that the official unions actively engage society actors in building union legitimacy and organizational capacity at the grassroots level, aiming to resolve conflicts in

the first place and channel workers' demands into the state-led organizations, thus pre-empting independent labor movement from taking place outside the All-China Federation of Trade Unions. While the new reform logic and strategy are effective for the Chinese state to suppress independent labor activism in communities, new reform also creates an organizational dilemma which inhibits itself to be emulated in large scale. As the community union reform helps workers build leadership and organizing capacity in neighborhoods, the state also felt potential "threat" as the worker power cultivated through the community union reform may be used against its authoritarian rules.

Effects of Covid 19 on Digital Transformation. Evolving Education Technologies in a Post-Pandemic Context

The COVID-19 pandemic has disrupted the status quo in many areas of society, including education. The educational institutions are forced to adopt virtual learning and digital transformation is a necessity. Online learning turns out to be almost as effective as learning that is the "New Common". The introduction of lockdowns and social distancing measures makes people sometimes resentful of the new normal. Although crises tend to reshape society, it is still uncertain how the global COVID-19 pandemic will transform our lives, and the global pandemic is encouraging and accelerating innovation and advancement, especially in the digital sphere. This paper aims to explore the challenges, opportunities and implications of COVID-19 pandemic in the education context of the local communities. It uses the qualitative study approach to enrich the aims and results of the study. This paper after introduction is divided into following sections. Section 2 introduces the objectives of the study. Section 3 shows the significant of the study to the literature. Section 4 discusses the literature review about COVID-19 influence and education field. Finally, the last section provides the study conclusions and main recommendations for future research. The paper has been organized under the follows: (1) Effects of Covid 19 on Economy, Society, and Environment, (2) Covid 19 and Educational Problems, (3) Covid 19 and Online Teaching & Learning, (4) Digital Transformation & Expansion of Educational Technologies, (5) Educational Inequality by Digital Divide, (6) Solutions for Education in a Crisis Context, (7) Opportunities for Education Technologies. The research method is literature review.

Globalisation and Implications for Education: Local Pedagogies

In a world coming up with uncertainties and crises, such as the global financial crisis and the Covid-19 pandemic, the local communities must get prepared and be adaptive to rapidly changing circumstances. Taiwan has been making comprehensive education reforms since the 1980s, aimed at upgrading skills of manpower, creating rooms for upward social mobility, and enhancing economic competitiveness, and has benefited with new opportunities of economic development. The paper discusses the issues of education reforms in Taiwan, namely the pursuit of standards and excellence globally, equality of access and quality of education for all. There are four sections in this paper. The first section focuses on the politico-socio-economic contexts facing the education reforms. The second section examines the prominent policy issues arising from the education reforms. The third section turns to discuss the policy lessons that can be drawn from the education reforms. The final section concludes the discussion. The author discusses the educational reform in the age of globalization, with reference to the commodification of higher education, the decentralization of education, choice in education, the privatization of education, and multiculturalism and education. In particular, the author hopes the study of how education systems take on an ambitious set of goals, intended to make education more responsive to the demands of a changing external environment, will illuminate the dynamics of educational reform and increase the understanding of educational institutions. The research method is literature review.

Precarious Work in Early Adulthood: The Case of Taiwan

This study seeks to investigate the young adults' propensity of work precarity in Taiwan. The significant advancement in technology and fast economic growth in past decades on this island country has increased the average income to a level as high as certain countries in EU. However, the government's commitment to market openness, deregulation of financial capital and investment across the straits onto China, and low minimum wage, along with weakened unions both in firms and across industries, have engendered a labor market unfriendly to young adults in their pursuit of careers. Low unemployment rates have been long compromised by merger pay for most young workers, despite their high proportion of finishing college degree owing to the expansion of higher education. These conditions combine to make Taiwan a unique case

for examining how young adults have experienced instability and insecurity in the labor market. In studying this case of Taiwan, this study uses a longitudinal survey dataset (the Taiwan Youth Project) which allows observation of young adults' work conditions before they reach age 30. The techniques of latent profile analysis is applied to differentiate young workers hired in both public and private sectors on the basis of six indicators capturing instability and insecurity of job: temporary work, no benefit, hour rate, working on a second job, worry of being replaced, and worry of losing job. The analysis results in three categories for both the period in 2104 (age 28) and 2017 (age 31). The category of having precarious jobs at age 28 constitutes 25.9% of all young respondents, while it decreased to 10.8%. Regression modeling is performed to determine what factors are important in predicting the probability of young workers to be placed in the category of having precarious job. Policy implications are discussed in the conclusion.

Metamorphosis of Power Governmentality : a Demolition Process at the Heart of Peking

About 2.6 kilometers from Tienanmen square, sits one of the most ancient hutongs of Beijing. But now, it's empty. The once crowded neighborhood, after demolition, has been replaced by empty mansions and private club, sealed off from the rest of Beijing, hiding behind gray walls. Here, is where the shift of traditional Authoritarian model of urban development in China took place. This paper use this example to discuss the shifting governmentalities of authoritarianism, to shine light on the rich tapestries of authoritarianism.

Today, the urban entrepreneurialism that underpins China's speculative urban development has been replaced by the logic of cultural preservation and political loyalty performance. Political power is no longer mutually in collusion with economic power, but disembedds from the coalition, shaping of landscapes with sheer political power and even violence. The grabby hand of the state empties local spaces and the life worlds of the inhabitants, and the inhabitants themselves are transformed into infrastructures and landscapes, creating a new political theatre.

Firstly, the sovereign, by suppressing news reports and lock down the access of housing purchase and citizenship, disembedded this neighbourhood with the public sphere. Secondly, by letting neighbourhood committees and state enterprises who have no power to make decisions and influence policies to negotiate with the residents, the true responsible power can hide behind grassroots state apparatus, depriving the state of the flexibility to make concessions. The residents are de facto disembedded from the decision-making power of the state. Thirdly, by making negotiations with the residents mono-v-mono and publicize the agreement reached, the state disembedded the residents with each other, allowing for a break in unity between residents.

Through this, the local powers fail to resist. The power of the state is communalised, and hard-line struggle is waged against the dislocated population. Authoritarianism shines with its new forms.

LIN-JANUSZEWSKI, Liang-Wen* (Paderborn University, Germany)

First-Year University Transition Experiences of German Students in the Global Pandemic

The first-year transition experiences play a key role in undergraduate study life in the following life trajectories. In the meantime, how social factors unevenly influence individuals' meaning-making during the transitional process in the context of post-pandemic cannot be overlooked.

The purpose of this university-funded research is to examine the first-year transition experiences of German undergraduate students regarding their academic and social aspects of university life in the context of the pandemic. This study applies qualitative methods including content analysis of 60 written reflexive narratives and 40 semi-structured interviews of university transition experiences of students entered in 2021 at a German university. Bourdieu's concepts of capital, habitus, and field are applied as the main theoretical framework in this study.

Based on the preliminary results of content analysis, faced by all students, the main challenge of social aspects during their university transition is establishing supportive relationships with instructors and peer groups. I suggest that the main challenge is caused by interactions between the institutional regulation, cultural context of German higher education, and changing signifiers of 'being a university student,' which are against the measurements of the pandemic. How students from different social backgrounds, especially first-generation college students, perceive and respond to the challenges and consequently result in what educational inequalities will be analyzed via the interview data, which will be collected through the coming winter semester of 2022/2023.

International Students' First-Semester Transition Experiences after the Pandemic in Germany

While studies on transition experiences of international students have caught attention on different topics across English-speaking countries, research on how international students experienced their study life in Germany has still been relatively few. In the UK, the US, and Australia, for example, there have been studies looking into the transition experiences of international students regarding friendship networks, social media usage, cultural socialization, university-based support, and institutional support. In Germany, the concerns about the international student transition focus on the influence of cultural capital and Chinese students' cross-cultural adaption.

The first-semester transition experiences play a key role in international student study life in the following years. Understanding their voices also contributes to a sustainable higher education campus. With the ease of the pandemic measurements and re-normalize campus life, international students are expected to be back on campus. Meanwhile, how social factors unevenly influence individuals' trajectories during the transitional process in the context of post-pandemic cannot be overlooked. Therefore, it is high time to examine transition experiences of international students in Germany.

The purpose of this university-funded research is to understand international students' first-semester transition experiences regarding their academic and social dimensions of university life. Research questions cover 1) their expectation, aspiration, and perception of German higher education; 2) their challenges and strategies during the first semester; 3) their meaning-making of the transitional process; 4) and the mechanism resulting from structural factors. Two rounds of semi-structured interviews will be conducted on 20 international students at the beginning and the end of the winter semester2022/2023 at a German university. The life course perspective and Bourdieu's habitus will be applied as the main theoretical framework.

The results will engage in the debates on the concept of habitus and empirically provide insights to consider what environment and ongoing support may better reflect international students' experiences.

International Collaborative to Identify and Improve Food Insecurity Risk Factors Among Low-Income Young Families in Melbourne and Omaha

In 2017-19, 13.5% of households in Australia and 8.5% of households in the U.S., were impacted by food insecurity. The prevalence is estimated to have doubled during the COVID-19 pandemic. Our international collaborative conducted mixed methods studies in 2020-22, to gain an understanding of differences and similarities between the US and Australia in terms of food systems, food assistance, and food insecurity in families with children aged 0-5 years. A policy and program review established the dominant solutions and research-foci in both nations, and a scoping review investigated constructs of food insecurity pertinent to young families. Semi-structured interviews with pregnant women and mothers were conducted in Omaha, U.S. (n=19) and Melbourne, Australia (n=22), during periods of stay-at-home public health orders to investigate the dimensions of food security. Results indicate both countries have inconsistent and limited assessment of food insecurity and related factors that low-income families experience, which hampers effective programmatic and policy responses. Of particular concern is the impact of food insecurity on young children: infants have greater odds of having poor health, being nutrient deficient, experiencing developmental challenges, and being hospitalized. Food insecure pregnant women may have increased risk of greater weight gain, disordered eating, and pregnancy complications. Lived experience of this phenomena suggests particularly for the access, availability, utilization and agency dimensions of food security, the pandemic had substantial impacts. Whilst localized measures, including less austere social safety nets and community initiatives were mobilized during the crisis, these were not sufficient to overcome the barriers to food security experienced. Historically, food insecurity has been addressed by countries individually, with limited cross-country collaboration. Our collaboration has attempted to spotlight the need for joined up efforts and future studies can build upon this foundational work, examining the constructs identified across food insecure populations in high-income countries.

Regional Innovation: An Cross-Industry Exploration of Innovation Practices in the Cradle Coast Region of Tasmania

This presentation will discuss the results of a recent field study on innovation practices in the Cradle Coast Region of Tasmania. It contributes to a knowledge shift away from the over-proportioned focus given to big cities by investigating how the social, cultural, and political context of a particular Australian region influences innovation endeavors.

A large amount of research on innovation explores the social and cultural attributes of innovative environments. This research typically assumes an urban setting, as it reports on factors such as density, diversity, and cultural amenities as central to the creation of innovative 'hotspots' (Florida et al., 2008; Van Boom, 2017; Wood & Landry, 2008). A key problem with the over-representation of research on urban innovation is, that it has led to the assumption that, either there are no innovations in regional areas, or that regional areas need to adapt to an urban setting to become innovative (Eder, 2019; Shearmur, 2012; Van Heur, 2011).

The findings that will be presented are based on a qualitative investigation of innovative businesses in various industries, as well as the local supporting infrastructure. By investigating the process of innovation (from idea to launch or implementation) across a range of industries we will be able to present a nuanced and complex picture of regional innovation practices, collaboration and partnership practices, as well as the place-based economic rationales that form the possibilities for innovation.

The findings presented will contribute towards a regional sociology of innovation, and give voice to regional agency and creativity which is often overlooked.

Research Circles and Swedish Folk Bildung As Approach to Democratized Research and Learning in Revitalizing the Ideas and Practices of Its Own Tradition

Sweden has a deep tradition of popular education rooted in social movements and the praxis of self-education in study circle groups as core innovation in the tradition. It aims to be democratic forms of citizen education through collective self-education and empowerment in smaller groups (Larsson & Nordvall, 2010). It also inspired the innovation of research circles as a PAR approach where researchers are included to support participatory research done in accordance with study circle norms and practices (Holmstrand & Härnsten, 2014). The grounds in values, institutions and practices have been eroding in recent years challenged by demands for more instrumental views on education as well as critique of its too lax forms of control and evaluation of its free forms of starting and managing study circles. This is the background for an ongoing research circle in the context of ABF, Workers' Educational Association, the largest study association in Sweden. The focus of research is to consolidate and reinvent Folk *Bildung* through study circles appropriate for the organization. It is as well an effort to introduce research circles in a study circle organization supported by SPARC, a Swedish PAR community. The purpose of the paper is to describe and reflect on emergent processes and outcomes of the research circle. The research questions are: How can Folk *Bildung* in a study association be reformulated and reinvented to be attractive for internal and external stakeholders? How can research circles be done and integrated in an organization focused on Folk *Bildung* through study circles? The result of both practical and academic value relates both to the process, the experience of introducing and running a research circle in a study circle organization, and outcome, a future oriented manifesto of Folk *Bildung* as an attractive and distinct profile for the organization and its stakeholders.

Neoliberalism, Global Capitalism, Extractivism and the Politics of Resistance in the Philippine Context

Neoliberalism's constant search for new spheres for global capitalist expansion and extractivism go hand in hand. This is seen in the global expansion of corporate mining that results in the expulsions of indigenous people from their land and disrespect of their basic social, economic, political, environmental, and cultural rights necessary for their survival. Indigenous ancestral lands are the last frontiers of capitalist modern imperialism that destroys remaining elements of communalism in indigenous concept of land, production, and environment. In such process, we see the alliance of transnational capital and neoliberal nation-states. The process of extractivism in the periphery and the flow of extracted resources to the core reinforce the resilience of the global capitalist system that breeds global inequality and human rights violations. This is illustrated in the Philippine case. The Philippine Mining Act of 1995 that liberalized corporate mining for transnational corporations embodies neoliberal policies that serve the extractivist expansion of transnational capital for profit while it plunders the environment, usurp the Filipino people's sovereignty, and dispossess the indigenous people of their rights. This context has become a site of resistance of indigenous people and other human rights defenders who challenge transnational corporate power, state violence in defense of capital, and bureaucrat capitalists. This dialectic of oppression and resistance provides insights about post-extractivist development anchored on an integrated framing of human rights and sustainability in policy. Made possible by a Fulbright Research Scholar Award, I gathered data for this research by conducting fieldwork in the Philippines in 2017, visited a mining site and interviewed indigenous people affected by corporate mining and their forms of resistance, guided by some principles of grassroots-oriented research that begins from the marginalized's experience. A book-length manuscript has been completed from which this paper presentation is prepared.

Something Old, Something New and Something Borrowed: A New Perspective on Low-Waste Consumption Practices

Transitioning toward zero waste cities and a circular economy is an urgent global challenge. Many affluent cities around the world are experiencing an urban waste crisis and there is a need to change norms and practices at the household level alongside structural change away from the high-waste system we currently inhabit.

To achieve low waste cities, it is useful to identify and understand existing dynamics of low waste consumption that can be extended and built upon. Research on 'green' consumption has expanded over the last two decades and there is a growing body of knowledge on various forms of sustainable purchasing of new products and the dynamics of the second-hand market. However, existing research is highly fragmented and siloed; usually focussing on a single type of product (such as clothing or food) or a single mode of acquisition.

In this paper, we offer a novel integrated perspective and explore patterns of low waste consumption across three material domains: 1) clothing and accessories, 2) appliances and whitegoods and 3) furniture and homewares. To do this we draw on findings from a national survey (n=2717) conducted in Australia conducted in 2022. We identify the low waste consumers: those who are careful about new purchases, those who purchase second hand, those who borrow and share items and those that do all three. We outline the significant relationships between low waste consumption patterns and gender, class, ethnicity and household/dwelling type.

And Yet, They Persisted: Urban Inequalities, Community Change and the Resilience of Historically Black Neighborhoods in the US Capital Region.

Arlington County, Virginia, is an inner-core suburb in the U.S. Capital region and a central node in the government-contracting sector concentrated around the Pentagon. Contemporary urbanization processes privileging specific spaces, residents, and economic sectors continue a historical legacy of racial exclusion and exploitation in the region. Despite this history, a handful of African-American neighborhoods took root in Arlington beginning as early as the mid-nineteenth century and have managed to survive into the present. Our research explores the social and cultural factors accounting for the persistence of historically Black neighborhoods in otherwise hostile social and political geographies. Taking the neighborhood of Green Valley in Arlington County as our case study, we reconceptualize the notion of "community fabric" as a primary facilitator of the survival of communities like Green Valley that find themselves both historically isolated (through processes of structural racism) and geographically constrained (through the legacy of restrictive racial

covenants and de jure residential segregation). This paper frames community fabric as a set of collective practices that give rise to community resilience and effective modes of community resistance. Our examination of community fabric in Green Valley focuses on four elements: (1) construction and practice of mutual aid; (2) recognition of collective memory and shared trauma; (3) practices of trans-local citizenship among former or displaced community residents; (4) preservation of community institutions, shared spaces, collective symbols, and public rituals. We explore how these four elements converge in the space of John Robinson Park, which has been the heart of the Green Valley community and served variously as a space of leisure, symbol of community identity, and a site of contestation. We suggest that this conceptualization of community fabric as a foundation for community resilience and resistance may have broad applicability in contexts of historical exclusion and exploitation across the globe.

LINK, Felipe* (Pontificia Univ Catolica Chile, Chile)

Scales of Sociability: Towards New Forms of Segregation of Social Ties in Urban Space

The relationship between space and sociability has revolved around two different considerations. On the one hand, the loss of relevance of the neighborhood scale as a space for significant encounters (Wellman, 1979; Bridges, 2002; Piselli, 2007). Moreover, other authors emphasize the dispersion of social networks throughout the city, where the neighborhood´s boundaries would no longer fulfill any significant role as a space for sociability (Webber, 1964; Wellman, 1979; Ascher, 2004). On the other hand, the importance of the neighborhood as a provider of social ties (Gans, 1962; Suttles, 1972; Guest, 1999), even if they are weak (Pinkster, 2007; Volker, 2007).

However, within this discussion, the consideration of space is usually reduced to the gross geographical distance (Dagaranova, 2012; Preciado, 2012; Mok, 2007; Viry, 2012) or the distinction between links located inside or outside the neighborhood. (Wellman, 1979; Campbell, 1992; Guest, 1999a; Mesch, 2003; Carrasco, 2008). The paper aims to contribute to this field, inquiring about the location patterns and scales of different social ties in the urban space. Based on a qualitative analysis of personal networks, we analyzed the concentration of social ties throughout the city. This pattern does not occur randomly.

We analyzed the case of Santiago de Chile, understood as an example of urban inequalities in Latinamerican cities. We found very different locations considering the types of social ties. Consequently, we propose an intermediate scale between the neighborhood and the city, referring to the location of different social ties and where the inhabitants maintain a certain familiarity. The scales between the local and the urban and beyond are essential to understand personal networks and discussing the relationship between scale, sociability, and biographies in big cities.

LINKE, Vera* (Helmut-Schmidt University Hamburg, Germany)

The Organizational Imaginary of Insurance

Insurance is a pervasive financial infrastructure, and several explanations exist for how its ubiquity came about in the nineteenth century: a) market institutions were established so that insurance services could more easily be bought and sold; b) collective bargaining transformed previous solutions for administering unemployment and poverty into national insurance arrangements; and c) the implementation of mathematical techniques made insurance calculable and thus helped to expand it over the course of the nineteenth century. While the literature thus accounts for developments in different spheres, it does not address how these parallel dynamics of expansion connect across spheres. Did the development of insurance markets affect political aspirations for general insurance schemes? Did political tensions around social problems affect market dynamics? And did the diffusion of insurance mathematics impact the marketization and political nationalization of insurance in similar ways?

I suggest that these disjointed explanations in the historical sociology of insurance can be synthesized by shifting attention to the emergent organizational form of insurance. Based on a discourse analysis of nineteenth century British insurance, I show that a heterogeneous range of experts and practitioners (actuaries, statisticians, mathematicians, philosophers, social reformers, legal scholars) though disagreeing on many topics, began to understand insurance in terms of an organizational imaginary: They resolved debates about issues such as security, solvency and insurance populations by declaring and promoting organizational structures as appropriate solutions. The organizational imaginary helped to specify and generalize a new common understanding of insurance, thereby fostering its expansion. By reconstructing how organizations appeared as an orienting device that bridged different societal spheres in nineteenth-century insurance discourse, this contribution demonstrates the relevance of organizations for societal processes.

Covid-19 in Chile:Psychological and Societal Outcomes

This presentation is a comprehensive description and in-depth analysis of the current Covid pandemic and political crisis in Chile. It provides a structural analysis of the Chilean economy and discusses how Chileans in different social strata are coping with both Covid-19 and the social revolution. This is a historical case study of Chilean society and its experience with a simultaneous pandemic and transformative social change. With Covid-19,Chile is experiencing its worst pandemic in 100 years. The first case of Covid-19 was reported in March of 2020 in the midst of a profound social revolution that was ongoing from October of the previous year. The rapid social,economic.and political changes that have occurred with both the social revolution(estallido) and the Covid-19 pandemic have resulted in disproportionalely experienced unemployment,isolation,illness and death and have produced in many middle and lower class Chileans an anomic crises that includes anxiety and depression because of the uncertainty of the future.This analysis provides insights for interpreting the outcomes of the recent presidential election and the referendum on the new Chilean constitution.

Financializing Professionals: Experiences of Urban Planners in Publicly-Traded Firms

While urban planning has traditionally been a public sector practice, the field is arguably in the midst of significant re-structuring with the increasing privatization of planning services (Clifford, 2013, Slade, 2021). Despite recent attention to the experiences of private sector planners (Parker et al., 2018; Wargent et al., 2020), there has been little differentiation between types of private sector planning firms, and how organizational contexts may impact professional planners. The rise of publicly-traded planning and engineering 'mega-firms' – created through aggressive strategies of mergers and acquisitions – raises questions about the relationship between the financial imperatives of listed firms and professional practice (Raco, 2018). Although there has been broad interest in the financialization of urban processes (French et al., 2011), the planning firm as a site of financialization, and the impacts for professionals and the profession, has received little critical attention. This work draws on in-depth interviews with 30 planners working in publicly-traded firms to (1) understand the impact of financialization on the day-to-day work of professional planners, and (2) examine the implications of this model of practice for the planning profession more broadly. I find that while publicly-traded firms offer the potential for more resources and opportunities to work on complex projects, most planners described their work as stifled by organizational structures oriented towards market pressures and fine-grained financial indicators. Concerns about the amount of time required for financial reporting and focus on utilization rates were found to impact staff morale, and also have potential consequences for projects, clients, and the public interest. Critically, in firms where planning is a small business line and subordinate to more profitable services, there may be emerging ethical issues - such as how firms bid on and staff projects – which have not received attention in professional codes.

Involuntary Migrants: Intimate Relationships and Life Choices of Hong Kong Young People in Taiwan

The failed protests for universal suffrage in Hong Kong and the subsequent arrest of political activists have pushed many young people to flee the city. One popular destination is Taiwan due to its physical and cultural proximity. Entering and residing in Taiwan is relatively easy for these young people but many of them struggle to obtain citizenship. For these Hong Kong young people, getting the citizenship of Taiwan is more than just securing the right of residence because if they cannot do so, they will be left with the option of moving to another country when their Hong Kong passports expire as they cannot return to Hong Kong to renew them. To become a citizen of Taiwan, they are required to either return to Hong Kong after college graduation to work for two years and come back to Taiwan or they have to work in Taiwan for five consecutive years and get an income double of the minimum salary. The former option is simply too risky for these young migrants, and the latter option is difficult to achieve, even for the locally-born fresh college graduates. The absence of a refugee law and that Taiwan is not a signatory of the Conventions Relating to the Status of Refugees add to the pressing problem that these young people are facing. The current paper discusses the effects of these uncertainties on their life goals and intimate relations. It analyses the narratives of 20 Hong Kong young people who came to Taiwan after 2019 to examine the issues of citizenship, migrant status, social positioning, and intimate lives in the midst of the current immigration law and socio-political milieu, and to reveal how these young people interpret and negotiate their life choices and relationships in the migration process.

Experiencias Visuales, Sensibilidades y Sociedad: Aportes Desde Una Sociología De Los Cuerpos/Emociones

La trayectoria de la sociología visual propone un campo de reflexión específica que enfatiza la potencia de lo visual en la investigación social (Harper 1986, 1998; Becker, 1974; Wagner, 1979; Collier, 1967, entre otros). Retomando tales discusiones en esta ponencia se propone recuperar algunas perspectivas desde una sociología de los cuerpos/emociones(Scribano, 2019) en función de hacer reflexiva un conjunto de experiencias visuales surgidas en investigaciones situadas en Córdoba, Argentina. Se busca reconfigurar interrogantes que marcan la relación entre fotografía y sociedad en la actualidad, resaltando el lugar de la imagen en los procesos de estructuración social de las sensibilidades sociales. En otros lugares hemos explorado la potencialidad de las imágenes-fotografías como modos expresivos que posibilitan establecer un punto de análisis entre el conocimientos de las sensibilidades sociales y los procesos de estructuración (Lisdero, 2017; Scribano, 2008). Aquí, recuperamos los puntos de partida teórico-epistémicos (en torno a las "experiencias visuales") y presentamos algunos elementos de diferentes investigaciones situadas. Si bien las mismas tienen objetivos particulares, todas se encuentran atravesadas por presupuestos que pueden reconstruirse a partir de las tensiones entre sensibilidades sociales, expresividad y el uso de las imágenes-fotografías en los diseños metodológicos. Como estrategia expositiva, se presentarán una serie de imágenes/fotografías, utilizadas como estrategia expresivas de los sujetos - tanto en entrevistas en profundidad como en el contexto de trabajos etnográficos específicos-, y se reflexionará acerca de la potencialidad del uso de estas imágenes en los procesos de investigación social cualitativa, y particularmente en la comprensión de las "políticas de las miradas" (Scribano y Lisdero, 2019) en tanto eslabón central de los regímenes de sensibilidad en las sociedades contemporáneas del Sur Global.

Trabajo Digital, Emociones y Género: Sentidos Del Trabajo, Procesos De Re-Mercantilización y Construcción De Subjetividades a Partir De Las Experiencias De Mujeres Trabajadores De "Delivery Por Plataforma" En Argentina

A comienzos del siglo XXI parece evidente que la digitalización del mundo convive con la emocionalización de los procesos de trabajo en la vida cotidiana. Estamos ante un sistema social que se globaliza produciendo/comprando/vendiendo emociones en y a través de "mediaciones" digitales. En este sentido, es posible entender lo que se puede llamar la emergencia de "sensibilidades de plataforma" (Scribano y Lisdero, 2019), particulares formas de ser-estar y sentirse en las múltiples formas "laborales" que son propuestas para una pléyade de sujetos-que-viven-del-trabajo (Antunes, 2005). Los debates que las sociedades del Siglo XX produjeron en torno a la comprensión de las transformaciones del "mundo del trabajo" parecen resultar, por momentos, insuficientes a la hora de comprender la complejidad que las experiencias laborales y los procesos de sujeción asociados a los mismos. Particularmente, resulta imprescindible interrogarse acerca de las múltiples y específicas desigualdades de género que se estructuraron en torno a las experiencias laborales digitalizadas, y cómo estas se vinculan a los procesos de configuración de emociones sociales y construcción de subjetividades (como sustrato de las identidades políticas).

En este contexto, aquí se propone incluirnos en este debate recuperando algunos elementos de una particular sociología de los cuerpos y las emociones para comprender los sentidos del trabajo (Antunes, 2005), las reconfiguraciones del cuerpo-de-las-mujeres-como-mercancía, y los procesos de construcción de subjetividades (Scribano, 2015) a partir de las experiencias de mujeres trabajadoras de "delivery por plataformas" en tres ciudades de Argentina (Córdoba, Villa María y Rafaela). Estas dimensiones nos informa acerca de las "políticas de las sensibilidades" como elemento significativo para entender los procesos de estructuración social en curso. En función de este objetivo, se analizaran registros etnográficos y entrevistas en profundidad realizadas entre 2018 y 2022.

The Emergence of the Third Space in Teachers' Professional Practices

In P. Bourdieu's theory of sociology of education, the teacher is seen as a social agent of dominant power fields. From Bourdieu's point of view, the teacher arbitrarily imposes the culture of the dominant classes on the pupils using the pedagogic authority granted to him by external structures, thereby reproducing existing power relations. According to Bourdieu, pedagogical authority is provided not on a person but a position in advance and is a necessary precondition for pedagogical work. Pedagogical authority elevates the teacher to a superior status over the pupil, confirming that what he does is legitimate, valuable and in the pupil's interest. However, various studies on teachers' professional performance reveal that the authority teachers are given is no longer enough. Teachers describe themselves as unpowered, vulnerable social agents in their relationships with pupils, parents, and educational experts. This situation reduces teachers' job satisfaction and is one of the causes of professional burnout. Teachers choose different behavioural strategies in this new situation. We have used postcolonialism as a theoretical and methodological approach to analyse this situation. The thesis is that teachers, compensating for the lack of pedagogical authority, create a Third Space in their interactions with pupils. A qualitative study conducted with teachers in Lithuanian schools revealed that teachers confine the reproduction of the dominant class's culture and exercise various collaboration strategies with the pupils' cultures. In these cultural interactions, a new, hybrid culture is emerging. Within this culture, teachers are rethinking and reinterpreting their professional identities while at the same time shaping new educational practices. The discussion question is: what do these changes mean? Do they interrupt the reproduction process, thereby causing the transformation of the whole social structure, or show that the dominant power fields have found new social agents to reproduce the existing society?

The Identitive Labor of Chinese Immigrants in COVID-19: The Good, the Bad and the Ugly

This paper argues that understanding COVID-19 as solely a public health crisis disguises an identity crisis that contains confused logics of belonging. Where Chinese immigrants use and dispense with their symbolic boundaries under conditions of marginalization during their time overseas, any meaningful analysis of their projects of enfranchisement must be advanced by dovetailing the rhetoric of "victimhood" with that of "agency". Meanwhile, however, the transient identities they cultivate through the mediations of their boundary work, or what we call "identitive labor", are not necessarily up to speed with the ever-emerging structures of exclusion they strive to delegitimize. The incoherence of the multi-identitive subjectivities that result obfuscates questions of belonging that underpin the metrics of global interconnectedness, by which nations as well as the flow of identities between them are organized. In the result, the field of identitive action and the symbolic boundaries in which it is embedded present our Chinese interlocutors during COVID-19 with as much a source of hope and empowerment as one of precarity and dispossession.

Early Childhood Health, Home Environments, and Educational Achievements

This paper aims to evaluate how home environments contribute to the production of health-related inequality in socioeconomic status attainment. Using prospective data from the National Longitudinal Survey of Youth 1979 – Children and Young Adults Project, I test whether home environments exacerbate or alleviate the impacts of early childhood health on education in a mediation framework. Results indicate that the role of home environments changes with the timing and nature of health adversities. Low birth weight is associated with decreased cognitive stimulation and emotional support at home, and these disadvantaged home environments can exacerbate the negative impact of low birth weight. However, for illnesses and behavior problems that appear later in childhood, parents tend to take a compensatory strategy by providing more stimulation and support at home. These parenting strategies can offset the impacts of health problems and ultimately increase children's scores on standardized tests. These findings highlight family resources and parenting strategies as important mechanisms linking early life health to socioeconomic achievements later in the life course.

Thinking through Race & Settler Colonialism with Asian Australian Studies

Within settler colonies, Asians have long been racialized as alien invaders. As Ross (2006) argues, stories of Australia's vulnerability to the "Asian menace" – and their "unnatural" presence in the Australian landscape - have long preoccupied the Australian imaginary and continue to do so. How do we understand this racialization and how do we respond to it? While Asianness has often been theorized separate to settler colonialism in Anglo settler colonies, scholars in Asian American & Asian Australian studies have increasingly begun to grapple with how the interplay of settler colonialism and capitalism shapes Asian racialisation. Such works have begun from the foundational premise that settler colonialism relationally produces racial scripts of Indigeneity & Asianness. Authors for example have highlighted that simultaneous to the genocidal dispossession of First Nations, Asian labour was being imported into Australia by white settlers to work the stolen land, thereby highlighting the interconnectedness of Asian migration and the colonial process. Significantly, authors have further highlighted how these material structures & processes participated in the production & categorization of race in Australia. These and similar insights raise two important questions, which this talk hopes to explore: (1) how has settler colonial history shaped and contributed to the racialized 'alienness' of Asian subjects; and (2), what do these new disciplinary efforts contribute to the broader racial scholarship on the relationship between race, settler colonialism, and non-White settlers?

Divergence in Chinese Sexual Attitudes: An Age-Period-Cohort Analysis

The evolution of sexual attitudes is an important incision in our understanding of social change. The social transition in China is quite dramatic and typical, which forms a natural quasi-experimental design and provides rich empirical materials for observing the temporal changes of sexual attitudes. However, existing studies fail to fully investigate the developing tendency of Chinese sexual attitudes from the perspective of time. This paper uses the age-period-cohort analysis framework and combines two unique elements of Chinese society, political identity and urban-rural dual structure, to empirically explore the changes of public sexual attitudes. Using the data of six national social surveys from 2010 to 2018, it examines the influential factors and underlying mechanisms of Chinese sexual attitudes evolution. The findings indicate that older people tend to be more conservative in their sexual attitudes. The period effect shows a fluctuating upward trend, and the public's tolerance of sexual attitude is generally improved. There are significant differences in public attitudes toward sex among generations. Political identity and urban-rural dual structure have a significant impact on the differentiation of public sexual attitudes, and the frequency of Internet use further strengthens it. The robustness test of the APC model also verifies the main results. The results of this study underscore the necessity to actively deal with divergent and even potentially conflicting sexual attitudes.

Cosmopolitan Imaginary and Temporal Liminality: --a Comparative Study on Chinese Youth Mobility in Australia and North America

Australia and China began the working holiday agreement in 2015, with 5000 visas for each year. Between then and the outbreak of COVID-19, China was consistently the country with the second most Work and Holiday visas granted among all nations. Based on one year of fieldwork in Australia from 2017 to 2018, I recognized that the working holiday program has been framed as a "culture policy" that inspires Chinese youth's "cosmopolitan imaginary." An official discourse focusing on cultural exchange connects working holiday makers with Western ideas such as "gap year," "overseas experience," "individualism," and "global citizens." This discourse leads the public to barely perceive working holiday as labor migration. In reality, the design of the working holiday program is actually a cross-economy temporary labor import policy, which both matches the goal of the Chinese national modernity project and fits Australia's shift in immigration policy. My research contributes to the current discussion on transnational youth mobilities by centering home country's contexts, such as the trend of "rùn" (searching for a way out), the

"involution" and "lying flat" phenomenon in China. I want to elaborate on how individual migration choices interact with macro-social structures and social changes. Aspiring to be "cosmopolitan," these Chinese youths end up in constraint, precarity, immobility, and exploitation based on race, gender and nationality in Australia. I argue that their status of vulnerability, caused by being temporary, is an extension of the liminality they had suffered in China. To demonstrate my argument, I conduct a comparative study to contrast Chinese working holiday makers with Chinese youth mobility in the United States and Canada through other approaches. In this case, my study further explains how class/stratification operates transnationally. A comparison of mobility options/life experiences before and after the outbreak of the global pandemic will also be included.

Walking on the Road of Educational Discontinuous: A Study on the Cross-Cultural Growth of Young Chinese Students Abroad

1.Background
With the increasing internationalization of the current society, a group of young Chinese students who go abroad to study without completing their primary, middle and high school education in China. They are based on Chinese education, while foreign education culture makes them suffer from the influence of living habits, cultural customs and other aspects, but they have gone through lots of efforts to get into famous universities. This relatively marginalized groups' conducting self-regulation in the cross-cultural environment is worth pondering.

2.Inquiry
In this study, five young Chinese students study in Australia, the United States and the United Kingdom were selected by snowball sampling and coded. The research method of individual autobiography and interview is used to explore the individual growth process of them from China to overseas and towards academic success. The cross-cultural influence is discontinuous significance. The great leap in cultural customs and educational system makes the influence of educational discontinuous gradually expand, and the requirements for its coping ability are also gradually increased.

3.Conclusion
In summary, by virtue of their own cultural logic, the young Chinese students have formed the foundation of leap-forward cultural integration, rooted educational continuation, compensatory moral feedback and latent cultural implication, and lead to independent personality growth and conscious life growth, finally form cross-cultural growth on the road of education. Cross-cultural growth is a manifestation of educational discontinuity. With the ability of cross-cultural growth, such a group of people not only obtain academic achievements, but also educational achievements on the road of cross-cultural development. It can be expected that the way of education under the cross-cultural background must be the way that enables students to get individual extension, stimulate their potential and eventually grow up in life, which is also the power brought by discontinuous education.

LIU, Ruoxi* (Department of Sociology, University of Cambridge, United Kingdom)

Alternative-Seeking of the Self-Employed Cultural Workers in China: Decentralisation, Decentralised Cultural Production, Communal Spaces, Daily Practices, and Mobility

I began my eight-month ethnography among Chinese self-employed cultural workers by examining how they negotiated both the market economy and an increasingly rigid authoritarian state. I conducted participant observations, in-depth interviews, and diary methods and found that the current generation of self-employed cultural workers has developed new and alternative practices and tactics for their cultural production, work, and lifestyles. I explain how these emergent practices are non-subversive, are passively resistant, and transcend traditional conceptions of social and cultural activism. In particular, I describe how their cultural work, communal spaces and daily practices, and mobility-seeking practices are decentralised. I highlight the alternative-seeking of these practices and argue that it is different from cultural activism for being implicit and subtle. I argue that their alternative-seeking is a response to increasing state censorship and the precarities of a Chinese labour market that has neoliberal characteristics. By developing alternatives throughout their self-employment practices, independent cultural workers in Chinese cities have devised alternative work- and lifestyles that emphasize decentralisation, everydayness, and mobility. Specifically, the implicit activism and mobility-seeking embedded in their alternative-seeking is passively resistant to the new Chinese social normality – neo-liberalism in state-dominated narratives. The everydayness and non-productivity of their alternative-seeking contributes to the long-term (re)empowering of self-employed cultural workers and revitalising of their communities.

Life Coach Online? the Rise of the Life Advice Influencer and the Self-Branding Practice in (post)Feminist Culture

Nowadays, more and more influencers have provided suggestions about relationships, careers, beauty and dieting on Chinese social media. Their video posts are titled: the ice-breaking techniques; social phobia, anxiety, inferiority, how to have a strong heart? 3 habits that will change your life; the ways to improve your learning and work efficiency. As a new type of influencer, which has not grabbed much attention in celebrity studies, and considering their attempt to guide followers' in all spheres of life, the term "life advice influencer" is created to conceptualise them. It is worth noting that their media content is proportionately targeted to female audiences. It manifests unique postfeminist femininity, which assists their self-branding building process. Life advice influencers express specific emotions, including confidence, boldness and happiness, showing themselves as beautiful and powerful. By adopting an affective-discursive approach, this article analyses 300 video posts of different life advice influencers on the Chinese social media platform Xiaohongshu from an affective perspective. In particular, inquiry about how life advice influencers mobilise specific emotions to construct self-branding online, and how their self-branding practice is associated with postfeminist affective life. It argues that the emotional logic of postfeminism has permeated into digital culture, and life advice influencers introduce a suit of feeling disciplines to the public, this is a subtle way of neoliberal governmentality, which form constraints for both female influencers and female audiences.

Crisis As Opportunity: Professional Career Paths at Two Historical Turning Points in Hong Kong

This study uses the case of Hong Kong lawyers to investigate how professionals change career trajectories at historical turning points. Theoretically, it develops a theory of professional flows and focuses on two spatial processes that structure professional careers: relocation and rerouting. During the 1997 Handover and the 2019-2021 anti-ELAB protests and coronavirus pandemic, hundreds of lawyers quit practice in Hong Kong to pursue other career options, such as business and finance, government and politics, or relocation to other countries. Drawing on the career mobility records of law firm partners reported in 336 monthly issues of the *Hong Kong Lawyer* journal from 1994 to 2021 and other archival sources, the study examines how and why lawyers left their high-status jobs to pursue other career paths during the two major historical turning points in Hong Kong.

Whistleblowing in Social Organizations: Insights into Governance Absorption on Durability

Background: Nonprofits play an increasingly important role in social services. Based on neo-institutionalism, government-nonprofits relations have critical influences on nonprofits, and the profession can trigger changes. Currently, government-nonprofits relations are largely characterized of governance absorption, by extracting from nonprofits to achieve collaborative governance. Whether governance absorption is beneficial to the durability and what role the profession plays still need to be explored. This study constructs a conceptual framework of governance absorption, the professionals, and the durability from collaborative governance perspective.

Design/methodology/approach: Using the China Social Work Dynamics Survey (CSWLS2019) data, this study selects 746 nonprofits nested in 56 cities. The multilevel regression analysis incorporates both institutional- and city-level factors to examine the impact of governance absorption on the durability and the moderating effect of professionals.

Findings: The result shows that nonprofits mostly accept governance absorption, but the durability and professionals are in the low level. The analysis indicates that firstly, all three dimensions of governance absorption, ideological absorption(β=0.459***), administrative absorption(β=0.517***), and strategic resource absorption(β=0.526**), have significantly positive effects on the durability; secondly, for five dimensions of the durability, professionals significantly strengthen or weaken the effects of governance absorption. Therefore, (1) governance absorption can promote the durability of nonprofits. (2) Professionals can moderate the relationship and play a whistleblowing role.

Implications: The theoretical implications are that governance absorption demonstrates the imbalance in interacting subjects and the profession can play a key moderating role in imbalanced collaborative relationships. Furthermore, this study reveals that governance is a more appropriate framework for analyzing government-nonprofits relations. For practical implications, it suggests that government and nonprofits should keep governance absorption

to promote collaboration. The study highlights the importance of professionals in the relationships between governance absorption and nonprofits, suggesting that they can use the profession to play a whistleblowing role.

Cyber Utopia: Birth and Death——the Spatiotemporal Utopianism of Cyberspace

David Harvey's "spatiotemporal utopia" concept is a subversive reconstruction of past utopian ideas and a cautious description of future digital society. Cyberspace, as a new public sphere, has the potential to become the concrete form of a "spatiotemporal utopia" in the new era. Starting with the revival of the public sphere in cyberspace, the study further argued that cyberspace could and will become a new "spatiotemporal utopia", citing examples to prove it. Innovative nodes in cyber society tend to be digitalized, such as transforming office spaces from cafés to online meetings. Spaces with emotional value are also becoming online, i.e., with social media, cemetery mourning spaces transformed into extended affective spaces. The study then discussed the heterogeneous character of cyberspace as a "spatiotemporal utopia" and afterward identified the lack of spatiality and sense of place in cyberspace. Finally, the study judged whether real-IP-address, which removes anonymity from cyberspace, will lead to the death of the cyber utopia. The study argues that creating an equal platform for all to express their views makes cyberspace a cyber utopia. The focus is on "equality" of "de-structuring", so that "anonymity" is not necessary for a cyber utopia.

Tourism and the Alleviation of Poverty: A Study on Rural Community Development in Fujian, China

"To end poverty in all its forms everywhere by 2030" was set as the first sustainable development goal by the United Nations in 2017. In line with this, tourism has often been used as a mechanism or a tool for poverty alleviation. This study was contextualized in the pro-poor tourism and community development literature. The ethnographic research reviewed the evolution of Shuiji Village, a rural community in China's Fujian Province, from 1979 to 2020, in terms of production means, economic structure, lifestyle, social structure, and ecological environment. Driven by endogenous self-motivations of the rural community for development, along with government interventions, a dual-track collaborative development model was inductively developed. It was found that elite groups remain the dominant driving force for, as well as the main obstacle to, rural community development. Government interventions were found to maintain the stability of the rural community, to balance tangible and intangible resources within the community, to ease structural differentiations, and to guarantee benefits for disadvantaged groups. Tourism development has positive impacts on villagers' material, lifestyle, capability, and attachment to the land. Different generations have different perceptions of their lives in the village. Young people tend to leave their village due to growing disparities of power and lack of opportunity for personal development. This rural community is characteristic of relative poverty, marked by the differences amongst the disadvantaged and the advantaged groups. While tourism has successfully lifted the village out of poverty, its development could not stop the village from getting "hollow" with largely aging/aged villagers staying behind.

A Renewed Experience of Sense De/Synchronization: Inspiration from Digital Art

This paper explores a phenomenon of desynchronization of senses provided by an assemblage of human and technology. Scientifically, synchronization of senses makes all senses work together. The possibility of synchronization depends on the working of brain, or consciousness, by which means our brain can automatically make sense of the experiences of the world and render them reasonable and unified. The isolation of senses may testify the idea of sense synchronization. In rethinking the relationship between human and technology, what technology does or its effects upon human is gradually separating our senses experiences. Make it isolated to some extent also assists some ideologies such as capitalism and rationality become dominant and inevitable for our daily life. Cognitively, the operation of head canon unites our senses of the world. It helps piece things together since they were isolated by technology. In desynchronization, we find how our brain is capable of "make up" a new synchronization of senses which can be virtual or what Baudrillard called "simulacra". Technology makes the isolation and the reunification of senses possible. The introduction of technology into human world offers a possibility to provide alternative experiences of our senses, in which the unity

or the synchronization of senses can be broken up into pieces and reassembled intentionally or arbitrarily in a virtual+ world. The experience of the separation of senses becomes possible, or even inevitable. Following McLuhan, it is not just the change of "sense ratio", but also a transformation of the way the organs assemble themselves with technology. In doing so, it also contributes to the logic of any kind of capitalist ideologies. The separation of senses and re-assemblage of them become the prerequisite for the work of capitalism. These renewed experiences deserve more researches if we would like to know deeper how technology influences human beings.

The Quantification of Humanity and Its Discontents: Cases from Self-Driving Technologies

The aim of artificial intelligence is quantifying human intelligence and the ways it operates, in every aspect. Comparing with what Sigmund Freud discussed in his famous book, *Civilization and its Discontents*, the paradoxical relation of human instincts to civilization, the oppression of the former contributes to the development of the latter, and in doing so, the emancipation of the former becomes an unavoidable fate for human beings to maintain, voluntarily or not, the idea of civilization. It can be observed that similarly, there is a paradoxical or dialectic relation between the idea of quantification and humanity. Although it is not clear if we can accept a future of everything that can be quantified, or re-/presented with algorithms, it happens now and seems to have tremendous effects upon the human world. This paper examines the idea of the quantification of humanity and its discontents with the cases from self-driving technologies. The author argues that the debate about the uniqueness of humanity founds itself on the idea of "double contingency", in terms of Luhmann, and the idea of artificial intelligence, which is a core technology of self-driving vehicles, aims to eliminate double contingency, by which means to make communications between human and machine from ABOUT to WITH, in the ways of pushing humans to the side of machines, instead of vice versa. In the cases of self-driving technologies, it may lead to a future of less humanity than increasing more of it. Following viewpoints of STS, especially Latour's humans and technical objects co-constituting social facts, and Katherine Hayles' "cognitive assemblages", and with perspectives from ethnomethodology and its potential contributions to the development of artificial intelligence, the author will provide an analysis of the quantification of humanity and its implications to a world of human-machines.

Living the Gender Gap within the Classroom: Students´ Experiences from Two Chilean Schools

The problem of educational inequality is a widely recognised issue across developing and developed countries. Literature have offered theoretical and empirical insights to understand the scope of the problem of educational inequality and its effects on individuals and society. However, the problem of inequalities under both a multidimensional and intersectional perspective has been comparatively less explored.

This paper is based on qualitative data that I have collected for a study that explores how multidimensional and intersectional inequalities are lived within the school. This paper draws on the cultural reproduction theory (Bourdieu & Passeron, 1990), particularly the links between different forms of capitals and schooling (Lareau, 1987; Reay, 2004; Davey, 2009; Forbes & Lingard, 2015). With a feminist and postructural framework, this paper also takes the concept of everyday schooling to understand shows how teachers and students deal with routine barriers in the formal and informal school (Gordon, et al., 2000; Gordon, 1996). Methodologically, it is based on data collected, following an ethnographic approach, through participant observations within the school, focus groups and interviews with students.

This presentation shows how the gender gap is not only problem of access to education and it is not only a problem of dissimilar outcomes between girls and boys. The central argument here locates gender inequalities – in intersection with other social divisions- as an experience that emerges and can be well-maintained in everyday school. Such experiences are observed in multiple ways, for example, how teaching is done, the interactions between teachers with boys and girls and peer interactions (between students) too. Moreover, I argue that although the gender gap can emerge within the classroom, it also can be resisted by those who are part of the schooling system.

Facing Today's Challenges with Lessons from the Past: The Evolution of Wealth Inequality in Canada and the United States in the Aftermath of the 2008 Financial Crisis

The current crash and volatility observed in the financial markets provide an opportunity to re-examine the 2008 financial crisis as a way of better

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

understanding the present. As the saying goes, those who do not examine the past are condemned to repeat it. Accordingly, in this paper, I propose to perform an in-depth analysis of the 2008 financial crisis and its aftermath in both Canada and the United States to highlight the ways that financial volatility and wealth inequality are highly contingent on economic, financial, and political regulation and structure. This analysis will be performed using data from the Luxembourg Wealth Study (LWS) for a period covering approximately two decades up to the present. Financial volatility is not akin to the weather. Like any economic phenomena, it is a condition that emerges from certain forms of political and legal regulations. It strives from a given set of institutional, political, and social norms and practices. While geographic neighbours, wealth inequality in these two countries has profoundly diverged since the 2008 financial crisis and its aftermath. Our interpretation of the divergent wealth inequality scenarios in these two countries will draw on social policy, politics and ideology in a comparative approach. While the empirical analysis will involve a return to the past, the discussion will be focused on understanding the current situation, political cleavages and possible options. The presentation will end by raising a series of questions as to the proper place of finance in the organization of society, in terms of balancing responsibility between the individual, the family, the market and the state.

Mongolian's Imagination of Subjective Well Being

Mongolian's imagination of subjective wellbeing has differed other nation's imagination of subjective wellbeing. Mongolia is less developed country however, its people's subjective wellbeing evaluation is similarly Japan's and South Korean subjective wellbeing evaluation. These similarities has raised following questions that "is it rooted from imagination of subjective wellbeing" and "is economic development not direct influencing factor for subjective wellbeing". Post-socialist conditions have influenced that evaluation. Other hand Mongolian hybrid life style that, is nomadic and urban cultural heritage, has generated different evaluation results from similarly less developing countries such as Vietnam and other Asian countries.

Building a Political Perspective. Human Rights Standards and Indicators in the Field of Children's Rights in Argentina

Building a system of indicators that permits monitoring public policy implies different challenges since it requires great methodological caution, as well as to ponder institutional cultures in order to avoid bias in the evaluation of the different local realities under examination. At the same time, when those indicators are evaluating the fulfillment of human rights on the part of the states, the challenges are even more complex. In this paper, we reflect on the decisions and methodological precautions we adopted in the process of creating a national system of indicators to evaluate the System of Integral Protection of Children's Rights in Argentina, an evaluation that would be performed by a new institution, the Ombudsman of Children's Rights.

Both the extension and heterogeneity of the System of Protection, as well as the different perspectives with respect to the agencies and practices to focus on in the examination, were key points in the process of defining the focus of evaluation. The definition of what to evaluate and how to do so is not only a methodological problem but a political one. Defining a national system of indicators that beholds the ethical and political children's rights standards presents the challenge of dealing with an inadequate homogenization and the universal assignation of meanings to practices and institutional realities that vary locally. The process also required the definition of the institutional and political perspective of evaluation for the new agency.

Movilidad Urbana Sostenible Y Género

La movilidad sostenible constituye uno de los objetivos prioritarios en las Agendas Urbanas locales que tratan de llevar a la práctica los ODS de la Agenda 2030. Nos encontramos ante un modelo de transporte público pendular, urbano y metropolitano, cuyo diseño está orientado a la realización de viajes de casa al trabajo y del trabajo a casa, manteniendo un modelo masculinizado de transporte, que deja fuera de su planteamiento la perspectiva de género. Las mujeres, que son las mayores usuarias de transporte público, no realizan de forma mayoritaria este tipo de trayectos. Los cuidados y acompañamientos a niños y mayores requieren de la realización de rutas intermedias que no se contemplan en este modelo. No obstante, pese a las evidencias, el transporte se sigue concibiendo como neutral con respecto al género. Aunque los impactos del crecimiento urbano están profusamente analizados, existe una brecha de conocimiento sobre estos impactos de forma diferenciada sobre hombres y mujeres. Se detecta una falta de líneas de base sobre las que construir diagnósticos y evaluaciones, que permitan una incorporación sistemática de las necesidades de las mujeres en las planificaciones que aborden la movilidad y el transporte en el ámbito urbano. El trabajo que se presenta es fruto de una investigación en curso que se realiza para el Instituto de Estudios sobre la Hacienda Pública de Andalucía (IEPHA) y cuyo objeto es el análisis de propuestas que mejoren la integración de la igualdad de género en las políticas de movilidad urbana y transportes sostenibles. La investigación se basa en un exhaustivo análisis documental de las principales experiencias que, en nuestros contextos, se han desarrollado en torno a la incorporación de género en la movilidad urbana sostenible y en entrevistas a expertos de la administración responsables en estas materias.

"Why Can't We?" Disinformation and Right to Self-Determination. the Catalan Conflict on Twitter

Disinformation does not always take the form of a fake news item, it also appears in much less evident formats which are subtly filtered into public opinion, thus making its detection more difficult. A method is proposed in this paper to address the study of "widespread" disinformation by combining social science methods with artificial intelligence and text mining. The case study chosen was the expression "right of self-determination" as a generator of disinformation within the context of the Catalan independence process. The main work hypothesis was that the (intentional or unintentional) confusion around the meaning and scope of this right has become widely extended within the population, generating negative emotions which favour social polarisation. The method utilised had three stages: (1) Description of the disinformation elements surrounding the term with the help of experts; (2) Detection of these elements within a corpus of tweets; (3) Identification of the emotions expressed in the corpus. The results show that the disinformation described by experts clearly dominates the conversation about "self-determination" on Twitter and is associated with a highly negative emotional load in which contempt, hatred, and frustration prevail.

Older Adults, Gender, and Emotions: COVID-19 in Buenos Aires, Argentina

Mortality worldwide caused by the COVID19 pandemic mainly affected older age groups and the male population. The city of Buenos Aires, Argentina, was no stranger to this general trend: 87% of the deceased were over 60 years old and 55% were men. Although the risk was disproportionately higher for men, research conducted in different locations shows that the emotional impact of the pandemic context had a more strongly negative record among women. In our paper we deal with this apparent paradox. Our purpose is to explore, through a longitudinal fixed panel design, a sample of 322 men and women aged 65 and over living in the city of Buenos Aires, during the long period of government-mandated social isolation measures. We conducted a qualitative thematic analysis of fears of contracting the disease, feelings of loss, emotions and worries, that respondents manifested over three waves of data collection (June – August, 2020). Our focus is the understanding of how the chain of change and / or continuity of emotions takes place according to a temporal sequence as well as to the gender of the respondent, which exposes the "importance that an event in the natural or social world has for a subject" (Bericat, 2016).

From 'Flood Stories' to 'Flood Actors': Children As Change Agents in Disaster Risk Education

The 2022 Intergovernmental Panel on Climate Change Report emphasises the urgent threat of climate change and the need for societies to adapt. In England, 1 in 6 households are at risk of flooding and this is set to increase. It is vital that communities, including youth, learn how to live with flood risk.

Our research with flood-affected children in England revealed how young people can be 'actors' during and after a flood and also how their insights can influence the way societies manage flood risk (Mort et al., 2018). Through sharing and reflecting on their own flood stories, the children produced manifestos that called for change in flood policy and practice, including the introduction of flood education for all children.

Our latest work has responded to this call by drawing on the voices of those flood-affected children to engage the next generation of children as 'flood actors'. Our animated 360 'flood story' videos draw on data from the original research to immerse the viewer in the experience of flooding from a child's point of view. We have worked with new groups of young people to evaluate these videos and co-create educational resources which support children to further their understanding of flooding and identify ways of taking action in their local community.

This work has demonstrated the power of peer-to-peer education about disasters, whereby children learn about flooding directly from other children who have experienced it. We argue that the empathic approach of the flood story videos motivates children to want to know more about the issues, while inspiring a sense of solidarity and agency. We are just starting to explore how these 'flood stories' can translate across different cultural and geographical contexts to create new forms of global solidarity and action among children on the frontline of climate change.

Who Trusts Science? a Scoping Review

The coronavirus pandemic has highlighted the issue of trust in science. The relationship between science and society in the context of the pandemic crisis has been ambivalent, oscillating between trust and mistrust in science, scientists and institutions. In this work, a scoping review is carried out with the aim of analyzing the academic production about trust in science in the current context of global crisis. On the one hand, data related to the socio-spatial and disciplinary characteristics of the research have been collected. On the other hand, special attention has been paid to how trust in science is measured when considered as an independent and dependent variable, as well as to the main variables that explain trust in science and the variables that are explained by it.

Non-Resident Not Absent: The Caregiving Role Non-Resident Fathers Play in Raising Their Children

Many studies, particularly in western countries, have made assumptions that fatherhood can only be exercised in the context of a nuclear family. However, in a South African context, the understanding of a family from a homogenous, dual-income, and co-resident lens disregards the emergence and prominence of the so-called non-traditional families. Studies in South Africa have also shown that co-residence is not always plausible or realistic. This paper contributes to the growing understanding of the manifold caregiving roles that non-resident biological fathers play in the raising of their children over the life course. In-depth interviews were conducted with 23 black South African non-resident fathers aged 25 to 64 in Tshwane Municipality. The study found that non-resident fathers play a significant role in raising their children. This study makes an important contribution to dispelling two myths that have dominated fatherhood literature in the last few decades. Firstly, dispels the myth that Black South African fathers' especially non-resident fathers are irresponsible and are deadbeat. Secondly, the study showed that residence is a poor predictor of paternal involvement. Men in the study, make sustained efforts to remain active in the lives of children. However, the findings also show that non-resident fathers frequently struggle to strike a balance between their many responsibilities and the societal expectations that their role as fathers must meet. Furthermore, non-resident fathers found it difficult to simultaneously adapt to their manifold roles of provider, nurturer, and moral guide.

Sex Work and PTSD : On the Emergency of a Public Health Controversy

L'étude s'interroge, à partir du cas de la France, sur la manière dont l'exercice d'une sexualité tarifée est associé à des risques psychosociaux. Plus précisément, comment le travail du sexe a été progressivement interprété sous un cadre psycho pathologique autour de la catégorie du traumatisme et comment ce cadrage psychiatrique a pu influer sur les prises de décision politiques autour de la prostitution.

Les discours institutionnels sur la prostitution en France connaissent depuis les deux dernières décennies une médicalisation progressive, cristallisée dans des textes de loi et des rapports d'expertise. Dans ce contexte, une partie importante de la littérature médicale sur les personnes exerçant le travail du sexe associe l'exercice de la prostitution à des vécus traumatiques et ses conséquences psychiques. Plus particulièrement, ce schéma interprétatif met en avant une corrélation entre la prostitution et une prévalence des personnes atteintes du syndrome du Stress post-traumatique (PTSD) chez les travailleur. se.s du sexe. À partir d'une analyse d'archives et d'entretiens semi-directifs, je m'intéresse à la socio genèse de cette controverse et de son impact sur l'encadrement public des pratiques sexuelles.

The RISE of Pentecostalism in Areas of Agrarian Reform: The Social Construction of Forgetting the Fight for the LAND

This is a study about a rural community in the Rio de Janeiro state, in an agrarian reform area, which specificity refers to the remove from the organized social movement and the rise of Pentecostal churches. The community of Sebastião Lan II is the result of a land occupation and has remained so for 24 years. In the research carried out (2002-2018), we identified the social construction of forgetfulness about the "struggle" for land. The absence of the State and the emptying of community public spaces, which appear as contradictions that must be seen in the light of neoliberal and authoritarian practices and ideologies. The work is divided into three parts: the contextualization of the field and the first clues, in which we will present the emergence of a tension between the organized social movement and the new religious leaders. Then, we develop some considerations about the "signs" of conservatism and a need for the denaturalization of religion as an expression of political setback. Finally, we describe what we classify as evidence of the rise of Pentecostal churches as hidden subjects and social mediators parallel to the territorial ordering of the settlement project. It is about the ambiguity of social processes that culminate in an unpredictable agrarian reform experience, "resignifying" social conflicts as moral.

LOCKIE, Stewart* (James Cook University, Australia)

From Conservation to Assisted Ecosystem Adaptation: The Social and Political Implications

The last decade has seen dramatic escalation of climate adaptation research and policy, the overwhelming focus of both being vulnerability and resilience in relation to agriculture, urban planning and disaster risk reduction. This paper will consider the still nascent field of assisted ecosystem adaptation; that is, the deliberate acceleration of evolutionary responses to climate pressure through techniques such as assisted species migration, selective breeding and enhanced ecosystem restoration. Debates over the merits of assisted ecosystem adaptation focus on: (1) the complexity of global environmental change; (2) the temporally unbound character of intervention and its (potentially unforeseeable) consequences; (3) the challenge of developing effective governance regimes for the implementation of adaptation interventions; (4) the ethics of intervention in ecosystems managed to conserve 'natural' values; and (5) the moral risk of intervention to support ecosystem adaptation being used to justify inattention to the root causes of environmental change. Debate emphasises less the facts of assisted adaptation, therefore, than it does the epistemic, ontological, political and ethical implications of shifting from conservation to pre-emptive, resilience-based ecosystem management. These implications will be explored with a particular focus on the need for sociologies that are productive of just socio-ecological futures.

LOCKYER, Orin* (BRANZ, New Zealand)

Transitioning to Sustainable Practices in the Development of Apprentices in the Construction Sector in a Time of Emergency.

Aotearoa New Zealand is facing housing and climate emergencies. The demand for construction is currently high, due to an under supply of housing. Despite this strong housing need, if Aotearoa New Zealand is going to meet the 1.5 degree celsius global climate target for its residential building stock, it needs to reduce its carbon footprint by 72%. To add to these emergencies, most construction trade workers do not have the knowledge, skills, and competencies to address climate change in their current practices. As the predominant training mechanism within the Aotearoa New Zealand construction trades sector depends on the apprenticeship model which emphasises on-the-job training and mentoring, this makes the teaching and learning of sustainable practices even more challenging as mentors are already over-stretched to meet the current housing demand. Utilising a practice-based approach influenced by Kemmis & Schatzki, this paper analyses the current and future practice of construction apprentices at the frontlines of these dual emergencies. I explore how these emergencies influence the practice architectures of training and work for apprentices and their mentors. By examining these 'communities of practice', we can gain insight on how more sustainable training practices could be introduced that can equip the future generations of the construction workforce with the skills and competencies required to address the impact of climate change.

LOCONTO, Allison* (Université Gustave Eiffel, France)

Sustainability Standards As Spaces for (Bio)Diversity

Recent studies in the sociology of standards have demonstrated that rather than homogenizing practices, standards can also open up spaces for diversity to emerge. Specifically, four spaces have been identified: standards in the making, standards in action, standards in circulation and standards in interaction. The majority of studies to date have focused on the making and action spaces, where they have shown that standards are often at the center of power plays and diversity emerges from gaps between principles and implementation. These studies have typically focused on the creation of economic value and the values of participation and inclusiveness. The study of circulation focuses analytical attention to the movement of standards from one socio-technical context to another and explore the diversity that emerges through this movement. Recent studies have begun to highlight how both resistance and innovation can become valued actors who are tasked with the circulation of standards. The fourth space of interaction is an emerging object of research and centers on the commensuration activities that are carried out by organizations who seek to standardize diversity through meta-standards. This fourth space is the object of the research presented in this paper as I explore the valuation of (bio)diversity as it is included in trade-offs analysis by meta-organizations who are seeking to develop standards for sustainable food systems. Based on participant observations (2020-2022) in the One Planet Network Sustainable Food Systems Program, I analyse working group activities that identified the interlinkages, gaps and trade-offs for sustainability of local food systems. I differentiate between the valorisation of (bio)diversity and its evaluation by meta-organizations. I argue that the commensuration work carried out by meta-organizations opens up new ways of valuing bio(diversity), but these are more focused on the value of diversity and not on the valuing of biodiversity.

LOEZA REYES, Laura* (Universidad Nacional Autónoma de México, Mexico)

Las Estrategias De Las Organizaciones Civiles Mexicanas Para Defender Los Derechos Humanos En Un Contexto De Autocratización: 2018 - 2023

Históricamente las organizaciones de la sociedad civil (OSC) en México han desempeñado un papel central en los procesos de democratización del régimen y han orientado sus actividades principales al diseño de políticas públicas dirigidas a la inclusión de los sectores de la sociedad excluidos. Con sus diversas estrategias de incidencia, entre las que destacan la incidencia legislativa han buscado poner límites a los excesos en el ejercicio del poder por parte de agentes estatales y vigilar las acciones de gobierno. De esta manera lograron avances importantes en la democratización del régimen en décadas pasadas. Estos están relacionados con el reconocimiento y la ampliación de derechos humanos, no sin tensiones con el Estado. Sin embargo, a partir de 2018, cuando tomó posesión el actual gobierno federal, asistimos a retrocesos importantes en los logros obtenidos por las OSC y movimientos sociales durante más de cuatro décadas.

Estos cambios corresponden a lo que los especialistas han caracterizado como procesos de autocratización (Applebaum, 2021; Cassani y Tomini, 2018; Lührmann y Lindberg, 2019; Wenzell y Wilfahrt, 2018) y consisten principalmente en: 1) la subordinación de los poderes legislativo y judicial; 2) el debilitamiento de los organismos autónomos con función de contrapesos;

3) ataques públicos a la prensa independiente; 4) el desmantelamiento de instituciones que operaban políticas públicas de atención a poblaciones vulnerables; 5) el ataque a organizaciones de la sociedad civil (recurriendo incluso a reformas legales) y 6) el aumento creciente de las facultades y el presupuesto a las fuerzas armadas.

Mi ponencia se centraría en tratar de dar cuenta del impacto negativo de estos proceso en la labor de las organizaciones de la sociedad civil y el periodismo independiente, actores relevantes en un régimen democrático y en sus estrategias para enfrentar estos cambios. El referente empírico provendrá de entrevistas a profesionales de ambos gremios.

What Prevents Better Animal Welfare?

'Good-enough' animal welfare seems to have achieved momentum in Norwegian industrial food production. However, in the grocery trade, we find meat products that are labelled as having better animal welfare. What is the difference between good and better animal welfare? Why cannot all products achieve better animal welfare? In this paper, we ask what obstacles stand in the way of better animal welfare? Farmers report that they financially and structurally have no opportunity to produce in a different way than what they do today. They are somewhat locked in a system that limits the possibility of operating differently. This runs alongside confidence that 'the great silent mass' is happy with the way food is produced and 'have nothing to hide'. This paper departs on mainstream farmers' perceptions of animal welfare and their reasoning for continued industrial production. These perceptions are negotiated with perceptions of what good animal welfare in industrial production, with systems offering 'better animal welfare' and with perceptions of risk and sustainability in sustaining or changing production.

Youth Work, School Bullying and 'Public Executions' – Preparing Young People to Accept Authoritarianism

The 'second paradigm' (Schott & Søndergaard) of school bullying draws attention to the authoritarian context (Yoneyama and Naito 2003) of schools and bullying as 'institutionalised violence' (Yoneyama 2015, 129). Yet, Olweus' (1991) individualising approach to school bullying (victim, perpetrator, bystander) continues to dominate policy and practice globally, and particularly in Australia. Anti-bullying messages in schools that fail to account for the authoritarian context may prepare young people to passively accept 'inequalities embedded in larger social structures' (Pascoe 2013, 95). Drawing on insights from extended listening (through interviews and focus groups) to 11 young people in secondary education in South Australia, this presentation considers the implications for youth work practice in schools as a site that contributes to young people's acceptance of authoritarianism. As one participant in this study articulated, the result of getting caught bullying in his alternative education program (run by youth workers and teachers) is 'like a public execution'.

While youth work research is ideally reflexively aware of the profession's role within the 'carceral network' (Foucault 1979), spatiotemporal analysis reveals new complexities in the creation of 'tyrannical spaces' (Percy-Smith & Matthews 2001) both under and outside the adult gaze. Youth workers in schools can be entangled in the 'hierarchical, power-dominant management structure' (Yoneyama and Naito 2003, 318) and become institutional representatives for the keeping of order. Furthermore, long-established youth work practices, such as employing humour to navigate conflict (Sapin 2013), are being reanalysed as an invisible and affective form of violence (Threadgold 2020) employed by adept students and co-opted by adults to maintain established social hierarchies (Yoneyama 2015). This presentation raises for discussion opportunities and difficulties for youth work practice to challenge the social dynamics of school bullying and institutional violence that prepare young people to accept authoritarianism.

MAUNAYE, Emmanuelle* (Université Rennes1, France)

Young People and Shared Housing: Between Free Choice and Constraints

Many young people in Western countries are increasingly experimenting with forms of shared housing, for hybrid reasons, mixing constraints and choice. Their decision is of course based on economic imperatives and the need to overcome the complexity of access to independent housing (relative closure of the housing market, cost of housing in urban centres and economic precariousness) (Heath et al., 2017). Some arrangements appear to be the result of different forms of constraints (mobility difficulties for rural young people or those with disabilities, restrictive administrative situations for young

migrants, etc.). However, the choices in favour of shared housing cannot be reduced to these imperatives. Many young people opt for this solution for reasons resembling political convictions: a desire not to conform to expected trajectories and to experiment with other forms of transition to adulthood; aspirations for more collective and supportive forms of life; commitments to more environmentally friendly lifestyles (Loncle & Maunaye, 2021).

In this context, and based on two current research projects that have resulted in some forty interviews, one on the sharing practices of young people in a medium-sized town in France and the other studying access to housing for exiled people in Europe (Merging, H2020), we propose in this paper to analyse, through a qualitative approach, the ways in which the young people concerned share their living space, defining their home where intimate life and collective life confront each other. We will also try to approach the impact of the installation of shared habitats in the local environment and the neighbourhood.

Green Jobs for Young People: Policies and Controversies

In the context of debates around the economy-ecology link and transition, this abstract describes the diversity of meanings attributed to the notion of green jobs. We will come back to the need for State intervention to promoting and regulating these jobs, particularly for young people, constituting a target of both debate and public action. We will illustrate these questions by the example programs targeting young people at the intersection of environment and employment in Canada, showing several controversies around gender, diversity and North-South inequalities.

The Aftermath of the Pandemic: Exacerbated Advantages and Disadvantages in the Labour Market

In addition to health issues, the COVID pandemic had short-term social impacts of an unprecedented magnitude and nature on employment, education, future plans and family and social activities. The evident short-term effects of these shocks have been amply documented but repercussions in the long-term are much less well understood. However, the latter could have the potential to exacerbate pre-existing job insecurities and social inequalities of pathways. This abstract will present results of a mixed methods project analysing the impacts of disruptions especially of work and employment resulting from the pandemic and discussing the nature and subjective experience of uncertainty and longer-term consequences on workers choices and pathways. It focuses on these effects in different aspects of the social and personal life of workers of various occupations from the initial shocks observed in March-June 2020 and for two years. Data here come from seven focus groups through 50 participants focusing on social categories more brutally affected by pandemic social and labour consequences (young people, females, the less qualified). Results presents both foreseeable objective workplace changes (especially loss and termination of employment and for essential jobs turnover and change, increase of worked hours, reorganisation of shift schedules, etc.) ; and unexpected and subjective consequences, highlighting tendencies towards the exacerbation of advantages and disadvantages in the labour market concerning qualification and gender : career and income opportunities for the more qualified (engineers and nurses) ; violence and worse workplace conditions for less qualified and exposed workers (cashiers and delivery workers) ; intensification, emotional stress, burnout and overwork for female workers (nurses and cashiers) ; every day agency and schedules autonomy thanks to virtualisation for male workers (engineers and delivery workers) ; change-of-life priorities and personal projections and reversibility on choice of occupation depending on occupations.

Resiliencia Comunitaria En Zonas Despobladas: Aproximación Desde Profesionales De La Acción Social

La despoblación y la baja densidad de habitantes son frecuentes internacional y localmente, sobre todo en zonas rurales. Suceden gradualmente, *"a cámara lenta",* pero alcanzan a poner en riesgo estos entornos y colocar en situación de vulnerabilidad a los grupos humanos que en ellos residen. Sus consecuencias económicas, sociales, políticas y medioambientales se ven cada vez con mayor frecuencia y crudeza. Así, la despoblación y sus efectos, producen necesidades específicas en quienes habitan estos espacios. Estas se relacionan con la sostenibilidad, con dificultades de acceso a servicios, con el bienestar social percibido, la calidad de vida y los derechos humanos, entre otras. De aquí que las disciplinas de la acción social se vean comprometidas a favorecer procesos de cambio positivo en estos espacios. El enfoque de la resiliencia

comunitaria, que implica respuestas colectivas de resistencia, recuperación, empoderamiento y transformación social, es una alternativa idónea para la acción social en estas áreas. Para esto, es necesario conocer cómo aprecian sus profesionales los procesos resilientes en estas comunidades. Con este objetivo, esta investigación presenta los resultados preliminares de un análisis de la percepción de resiliencia comunitaria en zonas despobladas o con baja densidad poblacional, por parte de los y las profesionales de la acción social. Se ha utilizado el instrumento de Ruíz-Pérez (2015) de 16 ítems, escala Likert de 1 a 4. Esta Escala de Resiliencia Comunitaria evalúa las dimensiones de afrontamiento comunal y autoestima colectiva, partiendo del modelo de Suárez-Ojeda (2001). Se ha suministrado a profesionales de la acción social de municipios españoles con una densidad inferior a los 12.5 hab/km². Se espera que los resultados permitan conocer la percepción que de la resiliencia comunitaria tienen los y las profesionales, para facilitar el diseño e implementación de intervenciones sociales que favorezcan procesos resilientes en estos contextos.

Composite Indicators of Social Stratification to Compare Inequalities Among Countries: The Case of Spain and Argentina

This paper formulates a proposal for the construction of composite indicators of social inequality intended for the comparative analysis of the social stratification among countries. We consider the cases of Spain and Argentina as a result of various comparative research advances carried out in different projects over the last few years. The intention is to expand these results to countries of very different varieties of development. We use a multidimensional theoretical perspective on social stratification and an analysis model for comparative study between the two countries, which incorporates the gender dimension, which reduces coverage bias selecting the entire society and which takes into account household as an analysis unit, thus avoiding population dismemberment. We hypothesize that both countries maintain similar general patterns in terms of social stratification that structure the social inequalities of households. Although structuring patterns are common, the levels of inequality they entail are accentuated in the case of Argentina. To account for the hypothesis, the article presents two strategies that seek to obtain two measures of social stratification as composite indicators. In this paper, Spain and Argentina are compared with 2018 sectional data. On the one hand, following the typological construction methodology, where we seek to obtain a qualitative measure through a Typology of Social Stratification (TSS). On the other hand, and in the context of this methodology, we propose to generate an alternative composite indicator that measures inequalities with a quantitative variable through a Social Stratification Index (SSI). In both cases, the ultimate objective is to use these measures in the comparative study of social stratification over time and through space. Our proposal for the future is that there is the possibility that these indicators can be used universally, transcending the type of countries analyzed, and thus encompassing different countries with different levels of development.

Building Wealth through a Stratified and High-End Inclusion: The New Social Ladder of Internal Migrants in Urban China: The Case of Zhuhai (Guangdong)

Since the launching of reforms and opening-up, the link between internal migration and urban dynamics has undeniably been evolving in China. In the early stages of the economic reforms, internal migrants have mainly been the low-cost workforce that fuelled the urban economic growth. In parallel, they have been seen as a heavy financial burden for local governments to shake off. More recently, and in line with the intention to reorient economic growth through innovation and domestic consumption, internal migrants' role has been renewed. In 2014, the central government has announced a "new-type" urbanization strategy. The new model called for a readjustment between the "land-based urbanization" and the "demographic urbanization", meaning to strictly control the production of built-up areas while improving the mechanisms to integrate migrants in urban areas.

After four decades of economic transition and a soaring number of internal migrants flocking to urban centres – 288 million in 2018 (NBSC 2019) – to what extent has the role of internal migration changed in relation to urban development? How do migrants participate in the socio-spatial reconfiguration of urban spaces, in this phase of the Chinese urbanization, which switched attention to "*people*" (以人为本) and "*quality*" (质量)? What are the policy instruments to implement the plan?

Based on more than 140 interviews and on an extensive ethnographic fieldwork (2016-2018) carried out in Zhuhai (Guangdong) as part of my PhD, this paper sheds light on a selective and highly competitive model of migrants' urban integration. Moulding a new social ladder of internal migrants, this model handpicks the youngest, the best educated and the most qualified migrants, as a valuable resource for local development. While reinforcing

the socio-spatial differentiation of urban space, the new strategy produces interstices of informality for those who can't prove one's claim to being a talent or a qualified migrant-worker.

LOUGHNAN, Claire* (University of Melbourne, Australia)

'The unlawful': the power to name

What we say about others, how we speak, is ethically significant, and it is a source of power. Despite a general tendency to think of violence as exemplified by direct, physical interactions, we know that discursive violence is also a source of harm. As Zygmunt Bauman has shown in his significant study of the holocaust, the social exclusion of others begins with naming practices and ends with the justification and normalisation of human suffering. In this paper, I explore the power of criminalising narratives, and their effects upon those seeking refugee protection, by bringing sociological perspectives into conversation with critical criminological analyses. Such narratives, I propose, are also mirrored in the categories used in Australian migration law to refer to those seeking asylum, as well as to temporary visa holders. They reflect the incremental yet insistent normalisation of these narratives over almost three decades in Australia. And although the application of such categories ('the unlawful' etc) might suggest the dispassionate exercise of authority in that the definitions are merely mechanistic – violence does not disappear; it simply emerges in a new form which renders it much more difficult to detect and to counter.

Accountability in Green Hydrogen Standards and Certification

An emerging response to climate change is the development of so-called 'green' or 'sustainable' hydrogen. This is hydrogen gas that has been produced using renewable or other low carbon forms of energy, and thus has the potential to mitigate climate change. Hydrogen can be used to provide energy in hard-to-electrify sectors, and has hence been promoted as a key part of the global transition towards sustainable energy. In this paper we report on findings from our Australian Research Council project 'Sustainable Hydrogen Certification: a multistakeholder governance approach'. We first examine how the climate problem has been defined by those promoting green hydrogen. Through discourse analysis of standards and certification we show how the problem of climate change has been reduced to a narrow techno-economic framing. In other words, the tools and instruments central to the certification of green hydrogen are focused on precise technical accounts of how much carbon is emitted per megajoule of hydrogen gas, at the point of production. Wider sociopolitical and ecological issues such as transport emissions, significant water usage in production, community consultation and indigenous rights have been acknowledged, but thus far all largely excluded from consideration in certification discussions. It is considered that these issues are best addressed through other governance processes. In the second part of the paper we analyse and map the types of institutions and authoritative knowledge active in developing green hydrogen standards. There is a complex mix of public and private sector organisations involved, from the European Union to the multinational corporations Shell and Fortescue, to Australian state governments. We analyse how the expertise and institutional capacity of these diverse organisations helps explain the trajectory of green hydrogen certification to date. In conclusion, we look at the possibility of the emergence of different voices and accounts of green hydrogen.

Race, Racism, and Wellbeing Impacts on Aboriginal and Torres Strait Islander Peoples in Australia

Introduction: Race has been (re)constructed over time by those in power to oppress and regulate the lives of Indigenous Peoples and people of colour. In settler-colonial states like Australia, race is weaponised to justify settler-colonial violence and to control Indigenous lives. Aboriginal and Torres Strait Islander Peoples, the Indigenous Peoples of Australia, have been radicalised since first contact, which has resulted in racism and oppression, with present-day implications for health and wellbeing.

Methods: Mayi Kuwayu: the National Study of Aboriginal and Torres Strait Islander Wellbeing, is an Indigenous designed, led, and governed Australian cohort study. Self-reported exposure to interpersonal racism and health,

wellbeing and cultural data from the Mayi Kuwayu Study is used to examine the impacts of interpersonal racism exposure on health, wellbeing, and cultural participation.

Results: Almost sixty percent of Mayi Kuwayu Study participants report experiencing interpersonal racism across their lifetime. Participants exposed to any level of interpersonal racism have significantly poorer general health, mental health and wellbeing compared to those reporting no exposure. Experiencing any level of interpersonal racism was also linked to significantly lower levels of cultural participation. These poor health, wellbeing and cultural outcomes worsen with an increase in exposure to interpersonal racism.

Conclusions: Experiencing interpersonal racism has a range of significant negative consequences on health, wellbeing and cultural outcomes for Aboriginal and Torres Strait Islander Peoples. Understanding the history of race and the impacts of interpersonal racism is necessary to improve the lives of Aboriginal and Torres Strait Islander Peoples.

The Contours of Sensory Jurisprudence and Urban Sanitation

The paper contends that sensory realms of urbanity are imbued with power relations. When examined alongside sensory legislation, the senses are gateways of knowledge as well as instruments of power. Regardless of whether sense modalities like sound and smell remain formless, immaterial, fluid and are expansive in their mobility and permeability, social actors continue to come up with ways to manage these modalities and to contain them. By using cases of sensory transgression across a range of Asian cities in the 1800s and 1900s, I show how senses such as smell and sound constitute public nuisance. Public sanitation is threatened by sensory excess permeating from pungent odours and loud noises in combination. Laws are therefore deployed so as to safeguard particular spaces in urbanity such as residential zones from sensory excess. That said however, spatial delineations enacted through laws are not merely about putting in place measures to curtail sense permeations that are a threat to public health. These demarcations concomitantly cordon off sensory practices of one group that are pit against another, thereby shoring up issues connected to sensory rights and citizenship in dense urbanity. Sensory restraint in the form of discourse and legal intervention serves to protect the interests of particular social groups. These are determined by various groups of social actors who are in pursuit of correcting sensory inequities. Smell and noise governance are therefore intimately entangled with the cultural and the political.

LOYI, Terbi* (Savitribai Phule Pune University, India)

Music and Everyday Life Perspective

The paper looks at music as a site of production of space where identity(ies) are not only formed and asserted but also contested and reclaimed. Music is not only seen as a commodity of consumption but also as a site of meaning-making where one can explore, engage, negotiate, re-negotiate and express one's identity.

Using everyday life perspective and life-world, the paper explores the role of music i) as a pedagogy in the construction of national identity, especially in geopolitical conflict zones, ii) as a site of asserting dominant cultural traits to the minority communities, and iii) as a site for reclaiming the identity.

Everyday perspective is used to understand and explore the everyday taken-for-granted consumption of dominant cultures in the contemporary global world through music, which influences and shapes the production and circulation of music by the minority community. The paper, however, also explores music as a site which provides a platform to perform and reclaim one's identity.

LU, Anya* (Sam Houston State University, United States)

Self-Expressions of Loneliness By LGBTQ+ Members on Social Media during COVID-19 Lockdowns

Loneliness has been acknowledged to be an ongoing epidemic in the US, and it has been linked to a myriad of health concerns, including high blood pressure, impaired cognitive performance, as well as suicidal ideation. Further, sexual minorities face higher levels of stress, and are at higher risk of poorer mental and physical health compared to heterosexual population. During the COVID-19 physical distancing measures, in addition to the isolation felt by those affected, sexual minorities may also deal with stigma, prejudice, and discrimination that create a hostile and stressful social environment. In the present study, the authors examine the self-expressions of loneliness by Twitter users identifying themselves as LGBTQ+, during the COVID-19 lockdown measures. Analyzing tweets nospanning from 2019 to 2021, the author examines the change in the context in which loneliness is mentioned, the emotions accompanying such disclosures, and the quality of potential responses by other users. This study finds that the self-disclosures rise in volume during the lockdowns, abate during the summer of 2020, but subsequently rise even higher in 2021. Findings show an increased attention to the online platform as a social space. This paper explores the changes in emotional context around loneliness from

before to during COVID-19, and compares this to Twitter users who do not self-identify as LGBTQ+. Throughout, the author highlights the advantages and limitations of using social media data for the study of emotional expression. On one hand, the self-disclosures are unsolicited, diverse in their expression (often using additional media in complement to text), and sometimes reciprocated by the Twitter community. On the other hand, major privacy concerns, as well as selection biases and language ambiguities limit the generalizability of findings and reproducibility of the study.

The Struggle between Pro and Anti-Immigration Sentiment in the U.S. during the 2020 U.S. Election

Public attitude toward immigration in the United States has fluctuated dramatically in the last 10 years with division between republican and democrats priorities in immigration policy. A lot of discourse can be seen in online discussions of U.S. immigration policies. According to Menshikova and Frank van Tubergen (2022) this is a key question for sociological research on interethnic attitudes and it is imperative to see if existing theories are applicable to online disclosure of intergroup sentiments. This study examines the sentiment of Twitter users towards foreigners and immigrants in the U. S. during the period of six months before and after the U.S. presidential election. Over 50 million tweets were collected, in that period, containing words related to "immigrant" and "foreigner". Implementing mixed methodology we analyze the data using: interrupted time series analysis, sentiment analysis and qualitative methods of constant comparative analysis on a selected sample. Using the group threat theory examining the anti-immigrant sentiment and its connection to the political affiliation of the users by coding more than 3500 tweets. To provide the context of the tweets before and after the election, conduct a sentiment analysis and look at the emotion words which are most often used before and after the election. This paper examines how the 2020 election and the January 6 United States Capitol attack are related to the expression of pro and anti-immigration sentiment on Twitter.

Social, Cultural, and Livelihood Reconnections after Relocation: Recovery of Relocated Aboriginal Communities after Typhoon Morakot in Taiwan

After a devastating disaster, residents with enormous housing damage or livelihood impact have to plan their future lives under environmental and social constraints and utilize the available resources to make their recovery decisions. For those relocating to new communities after the disaster, the assistance policies from governments and NGOs may facilitate them "building back better" through re-establishing their social, cultural, and livelihood linkages. It is necessary to evaluate the social, cultural, and livelihood recovery of the relocated households and communities, especially the vulnerable aboriginal communities, to verify the effectiveness of the post-disaster assistance policies from governments and NGOs.

Typhoon Morakot struck Taiwan in 2009, leaving over 6 thousand households damaged or unsafe. Most of the devastated communities were aboriginal. However, there was a limited solution to acquiring safe land for housing and livelihood recovery within the communities after the disaster. On the other hand, due to hazard mitigation, cost and administrative expediency, and achievement display concerns, governments collaborated with NGOs offering "free-permanent housing" as incentives to relocate the households and communities to newly developed sites distant from their original communities. Now, it is over twelve years since the event, and it is appropriate timing to evaluate the recovery progress of the relocated aboriginal communities.

This study selects three types of relocated neighborhoods as the cases, including that composed of households from multi-community, from multi-community but conglomerated by origin, and from single-community. This study applies the site survey, in-depth interviews, and survey data collected in the tenth year after the event to evaluate the relocated aboriginal communities' social, cultural, and livelihood recovery. The results show that the neighborhoods from a single community have stronger connections to their original tribes and more sound and safe recovery than other relocated aboriginal neighborhoods.

"Camera on, Please, Let'be Together": A Case Study of High School Students' Experience Towards Online Class in China during the COVID-19 Pandemic

The COVID-19 pandemic has made online learning a new routine for many students in China. Drawing on 15 in-depth interviews and fieldwork in a high school in southwest China, this paper highlights how students construct their memories of the pandemic in terms of individual experience and collective identity. It explores two aspects of the process of making and remaking

memories, including self-presentation and national identity. By using theories of collective memories as an analytical framework, this paper argues that the individual and collective memories are interweaved together through schooling on the cloud and discourse practice on the ground. Rather than memories about the past, the 'lived experiences' during the pandemic have constructed a shared event at present for these teenagers in China.

Climate Migration in Euro-Med Region - What Can We Learn from National Characteristics in the Fields of Environment, Culture and Economic Development in Relating to Outlining of Climate Migration Policy in Regional Scale?

The article presents a framework for a discussion on climatic migration against the background of social, economic and inter-cultural aspects as a global phenomenon, its macro-regional expression in geographical defined region of Euro-Med, and examines state-level affinities in the above wide contexts.

The article has four parts: the first, framing climate migration on the backdrop of risk societies and the multiplier threats posed by climate change. With expansive reference to climatic migration against the background of cause and effect and the visibility of climate change in the Mediterranean and the Middle East, and South Mediterranean with continental continuity with Africa on the Egyptian border, and in the Eastern Mediterranean basin.

The second, raising key questions that arise against the background of the introduction, with an emphasis on the nexus between social, economic and intercultural factors. the third, focusing on the characteristics of the participating countries in Climate and Migration policy in the light of multiculturalism and socio-economic aspects. The methodology is based on review of international indices, acceptable by international institutions, in the field of environment, the level of climate risk for the country and more. The fourth part summarizes the findings and illuminates the continuation of research work, the promotion of policies and collaborations in the Euro-Med space in order to design a climate migration policy that can be implemented for the benefit of the environment, the receiving countries and the migrants.

Paradigm Shift from IPCC to IPCCRC- Mediterranean as Model 'Cradle of Partnership' (COP) for Climate Regionality

2030 is the target year where be possible examining in practice the worth of commitments made 15 years ago at the COP21 Paris Conference, were aimed to reducing the GHG emissions, on state level. Yet, although it is still early to evaluate the results 8 year ahead, it is already fair to determine that the doubt whether states would meet these COP21 committed values, is not negligible.

When examining the limited published data so far in Mediterranean region, only few countries referred to the manmade trap whether their targeted fossil fuel production is compatible with the Paris agreement goals. That is, focusing on reducing GHG emissions per se, makes it possible not determined governments to ignore their responsibility for the source of emissions, and therefore does not accelerate the transition to renewable energies, surely low-income South Mediterranean countries that have lack of skilled climate. Recent years in the Mediterranean proved that the model for global forecasts based on IPCC as literally defined "Intergovernmental Panel on Climate Change" is probably outdated and Mediterranean region should adopt the IPCCRC "International Platform for Climate Change Regional Collaborations".

The article outlines new framework that adoption it will greatly assist stabilize the climatic state in the Mediterranean region. The 3 points are:

1. The internalization of **climate inequality** as part of state-level and as part of defined regional collaborations, such as the Mediterranean geo-political zones.

2. Outlining a long-term climate policy, based on principles of reducing gaps in regional scale in implementation of low carbon economy policy, focusing on renewable sources. This policy should be applied to geographical circles of **climate induced migration**.

3. The need to create Agenda for **climate democracy**, which focus on educational learning programs both for shaping awareness and for building climate resilience of community and civic engagement in climate governance.

LUCAS, Patrick* (UNSW, Australia)

Re-Thinking Biodiversity Conservation Work on Agricultural Land

Australian farmers increasingly face the twin pressures of demonstrating environmental stewardship while also operating in a productivist agricultural system. Regulations, policies and programs are being developed to restore on-farm biodiversity. One aspect of effectively implementing these interventions is to understand farmers, farming and how the work of on-farm biodiversity conservation fits in. This research uncovers and scrutinises farmers' biodiversity conservation decision making and work, addressing a critical gap between private land conservation (PLC) program intention and successful implementation. To do so, it takes a processual and relational approach to understand biodiversity conservation on agricultural land in Australian rural landscapes. Instead of assuming conservation decisions occur in isolation, such as relative to an incentive program, this research assembles the political, economic, social, biophysical and cultural relationships vital to farmers' conservation decisions and labour. These assemblages include, amongst others, human and non-human actants and changing consumer-producer relations. Persistent loss of biodiversity has major implications for human and non-human wellbeing. Land use change for agriculture, in response to rapid urban development and population growth, is the primary driver of biodiversity loss. Considerable efforts are underway to engage primary producers in conservation on their properties. Research and policy for private land conservation generally focuses on discrete economic and ecological factors to understand land management decisions bounded in short-term and stable environments. But limitations exist when accounting for the complexity primary producers face, particularly over longer planning horizons. Progress in conservation on agricultural land will stall if programs and research are not equipped to account for this complexity.

MARZULLI, Michele* (Ca' Foscari University of Venice, Italy)

The Debate on Covid-19 Vaccines and the Image of Science: A New Political Cleavage in Europe?

From the very beginning of the Covid-19 pandemic, it was clear throughout Europe that public opinion and policymakers would put their trust in science and particularly scientists (Safford et al., 2021). However, bitter and widespread disagreements soon arose over different visions of how to contain the pandemic, conflicts exacerbated by the onset of vaccination campaigns.

Interesting aspects of the Covid-19 vaccine controversies are, on the one hand, the renewed reflection on science as knowledge in the making, contextual, critical and, on the other, the connections of such disputes to the new political cleavage that seems to be emerging in Europe, with the split between pro-Europeans (European Union) and anti-Europeans, overlapping and perhaps replacing the traditional one between left and right, progressives and conservatives (Ford, Jennings, 2020). This rift is becoming evident in recent years in the debate on a variety of economic and social issues, and among them, in the polarization between pro-vax and anti-vax arguments.

Therefore, with comparative intent and through a qualitative analysis of the online interactions generated by some Italian and UK Twitter profiles (science communicators, medical doctors, researchers and politicians), the study aims to answer what appear to be relevant research questions: *What image of medical science as an expert system emerges in the debate on Covid-19 vaccines? How are the controversies on Covid-19 vaccines issue related to the emergence of a new political cleavage in Europe?*

Transition to Adulthood in Italy in the Last Century. an Empirical Analysis Using Data Coming from Italian Lives (ITA.LI)

This paper investigates the life trajectories of young people in Italy in order to understand if gender, generation, parental socio-economic background, and life course characteristics affect the timing and the ways of transition to adulthood – i.e., when people complete education, find a job, leave parents' home, start a cohabitation or get married and have children. Data comes from ITA.LI - Italian Lives, an important longitudinal survey based on a multi-stage stratified sampling design. ITA.LI comprises 4900 families and almost 9000 individuals aged 16 or over living in Italy. The questionnaires allowed the reconstruction of each subject's life course, starting from his/her birth until the time of the survey (retrospective questionnaire), and a wider analysis of some aspects concerning the current situation of individuals and families (prospective questionnaire). Overall, the analysis suggests a noticeable delay in the transition to the first job due to the longer time spent in education and a pattern of leaving home and having children that appears more complex in the more recent cohorts. More precisely, ages on leaving school and at the first job entrance displayed a linear increase across cohorts, while ages at the first union and the first child varied over time, following U-shaped trends. Moreover, a converging trend in the trajectories across gender has been found despite inequalities are still present in the labor market outcomes. Finally, piecewise constant exponential models and optimal matching analyses have shown that a chronological order in the steps towards adulthood still exists, although the life courses are becoming less standardized and predictable in the more recent cohorts.

Artisanal Making, Cultural Inclusion, and the Limits of Media Representation

Research has consistently shown that producers and consumers perceive artisanal products to be more trustworthy, environmentally sustainable, and as facilitating greater 'personal' or 'associative' relationships than goods produced at a larger scale. While such attributes can reveal the progressive potential of the artisanal, they can also potentially limit the types of making careers and identities that made are possible or desirable. Focusing on artisanal food and craft, this paper identifies the production sectors and identities that have been most visible in Australian news and lifestyle media in the past two years. Our analysis highlights an over-representation of normative white, middle-class identities that do not reflect the diversity of Australian artisanal making, as well as persistent affective discourses in which making is presented as a 'labour of love' and its associated challenges and hardships downplayed. We argue that media interest in the artisanal can assist in promoting personalised commercial relationships between producers and consumers, but the limited ways in which makers are represented raises questions about the kinds of making that is presented as most valuable and successful. Given that similar representational strategies are often adopted by makers themselves, it is essential to consider the role of these representations in limiting the visibility and sustainability of artisanal making, and hence the wider progressive possibilities of small-scale production.

LUCZAJ, Kamil* (University of Lodz, Poland)

LEONOWICZ-BUKALA, Iwona (University of Information Technology and Management, Poland)

The Well-Being of a Host, Wellbeing of a Guest. the Micro-Dynamics of Host-Guest Relations in Polish Homes after 24.02.2022

The Russian invasion of Ukraine resulted in an unprecedented influx of female Ukrainian migrants to Poland. Currently, we are all observing a very rare sociological phenomenon, when the refugees can count not only on systemic support but are hosted, in large numbers, in private homes and apartments, what was dubbed a "refugee miracle" by the Western press. The empirical base of this presentation is a collection of in-depth interviews conducted in Polish-Ukrainian collaboration with Polish hosts who invited refugees to their houses and Ukrainian refugees who stayed under one roof with the hosts.

The core objective of the project is to determine basic problems triggered by this novel situation and to identify policies that may support the hosts and guests in the future. The thematic analysis of the interview transcripts enables us to answer the main research questions, including: How does hosting a refugee at home impact interpersonal relations between household members?; What kinds of problems have occurred, and how were they sorted out from the point of view of the host and the guest?; What kind of state support is crucial in such a situation?

Our interviews with Polish hosts suggest multiple difficulties, including not-so-simple adaptation to everyday routines (e.g., eating habits, division of household duties) but also complex psychological processes such as too strong emotional attachment to the guests. The problems of the guests usually fall under the category of intercultural communication, street-level bureaucracy, and emotional reactions to uncertainty.

Working-Class Academics As Agents of Social Change. Les Miraculés Versus Institutional Doxa

Pierre Bourdieu famously stated that school "manages to exclude in those it excludes the very idea of contesting the principle of exclusion." Thus, school systems all over the world tend to reproduce themselves in terms of accepted dispositions, values, interests, and points of view. More recently, the new working-class studies (e.g., Jack Metzgar) have suggested that one of the reasons why the truth is lost within a middle-class perspective, which "doesn't know it is just a perspective". Against this backdrop, based on a qualitative analysis of 26 biographical cases of upwardly mobile academics from Poland (autobiographical narrative interviews and follow-up repeated in-depth interviews), their family members, and colleagues, totaling 75 qualitative interviews, I argue that working-class scientific habitus is indispensable for questioning the institutional doxa. By focusing on the lived experiences and problems of the members of the marginalized community of working-class academics, this study combines clinical sociology with biographical research.

What is striking in the interview transcripts is the lack of devotion to academia characteristic of Bourdieu's "oblates" or "les miraculés." Instead, the upwardly-mobile interviewees criticize class privilege of the inheritors, question the work ethics of privileged students (by contrasting their myopia and sense of entitlement with own willingness to work hard, seen as a result of their unprivileged upbringing), fight unfair academic norms (double standards), or undermine the entire academic game by rejecting the stakes of the current state of the academic field (neoliberal academic order and procedures of knowledge production). The unwillingness to comply with the norms makes some upwardly-mobile academics suffer but can also be an asset at the level of the entire higher education system, a particular institution, or an individual academic (e.g., being better prepared for trauma-informed teaching).

Enhancing Social Inclusion of Culturally and Linguistically Diverse Communities in Sport: Generating Ripple Effects?

Culturally and linguistically diverse (CALD) communities and individuals are still consistently disadvantaged, under-represented, and discriminated against in sport. The action research that we analyse in this paper, called Change Makers Melbourne's West (CMMW), brings together local coalitions of sports club leaders, facilitators, researchers, and community partners. This study explores the co-creation of inclusive climates in sports clubs in Melbourne, Australia, and the ripple effects this process may stimulate. The CMMW project was conducted over a two-year period, consisting of four guided collaborative sessions with three cohorts of club leaders. Participants included four researchers, nine undergraduate and postgraduate students (so-called 'facilitators') and 67 club leaders from 37 community sports clubs across a range of sports. Multiple sources of data were collected and analysed, including audio recordings of the sessions, all artefacts produced in the sessions, a survey administered at the end of each cohort, interviews with club leaders, interviews and focus groups with facilitators, and field visit observations and reflections. Applying ripple effect mapping techniques, we discuss three sets of outcomes: instrumental (changes to policies, plans, decisions, behaviours, and practices); conceptual (i.e. changes to knowledge, awareness, attitudes, emotions); and capacity building (changes to skills and expertise). The findings also indicate some of the contextual and intervening conditions that influence these changes (or lack thereof). We reflect on the implications and limitations of the CMMW project aimed at promoting equitable social inclusion for CALD migrants in community sport.

Are Children Still Important for Asian Families? a Comparative Study of the Lowest-Low Fertility Societies

Have the advanced economies in Asia fallen into the fertility trap, where individual ideals fall to a level that corresponds with the actual fertility level? Are there contextual differences within Asia that explain fertility decisions? Using a multifactorial vignette design with hypothetical scenarios of policies and norms, we collected survey data from young adults in Taiwan, Hong Kong, and Singapore (N=2,000 in each society), and analyze their fertility intentions and decisions on the number of children. We found that there is still a huge gap between people's fertility preference and reality in all three contexts. While economic reasons, family-friendly policy provisions, and gender norms for equality are important factors for increasing fertility intention and for higher order births, fertility intention among Taiwan people are more responsive to parental leaves and affordable childcare facilities than those in Hong Kong and

Singapore. Having lower parental involvement in children's school education increases the intended number of children for respondents in Hong Kong and Singapore, but not in Taiwan. Finally, people's perceived governmental efficacy positively increases fertility intentions and higher order births in Hong Kong and Taiwan, but not in Singapore. Our results illuminate the continued value of children in these Asian contexts, but whether people's ideal number of children can be fulfilled depends on both individual-level and policy-level condition as well as the cultures that pertain to parenting/childcare responsibilities and gender norms. We also encourage policymakers to consider contextual differences with a multi-level perspective when designing fertility policies.

Its Not Sociology! Restraints and Possibilities for the History of Sociology in India

This paper looks at some of the difficulties encountered by those attempting to study the history of sociology in India, starting from the suspect nature of the sub-discipline itself. While there is much work in the *sociology* of sociology in India, historical works on the discipline are not as common. The author reflects on various restraints on studying the history of sociology, as well as the ways in which these were overcome in the course of doctoral work that traced the history of sociology in Kerala, the southwestern state of India.

This paper will also discuss the various methods employed in analysing the history of sociology in Kerala including the review of relevant literature, interviews of significant stakeholders, analysis of a sociological association and its fifty-year old journal, and comparative analysis. The dilemmas of the 'participant-as-observer' and the issue of 'meta-objectivity' are touched upon. The pursuit of 'scientific reflexivity' by the author and the attempt to overcome subjectivities to gain macro perspectives on sociology in Kerala are also sketched out.

RC08-134.4

LUIZ, Linda* (St. Teresa's College, Ernakulam, India)

Sociology and Its Siblings: The Case of Kerala from the 1930s

In Kerala, the southwestern state of India, sociology has been taught as a minor subject from the 1930s onwards to those pursuing economics as their major. Sociology has also been related to departments of English, philosophy, political science, history and social work in this manner. Full departments of sociology came to be established in the 1960s, after India gained independence and the state of Kerala was formed. Programmes in social work at colleges run by Christian congregations provided a base for starting sociology departments. Not all the initial appointees in sociology at this time had masters or research degrees in sociology, though they were from related social sciences.

Sociology has been taught to students at Christian seminaries in Kerala from the late twentieth century. Priests and nuns were also sent to study sociology in the United States, and some returned to establish or work at sociology departments in Kerala. Sociology had a negligible presence at government-run higher education institutions until the end of the twentieth century. However, at the turn of the century, sociology was ushered in at the school level in Kerala on a mass scale. In some cases, the establishment of posts in sociology was a matter of practicality, as it 'came in the combination' or was required to balance the workload of faculty in other departments. The institutional and disciplinary reasons for the genesis of sociology at these various fields and the relation of sociology to its sibling disciplines at these spaces will be examined in this paper.

Eurocentrism, Decoloniality, and Potential Alternatives: Addressing Western Traditions in the Study of Sanctuary, Solidarity, and Hospitality

The study of urban sanctuary, migrant solidarity, and hospitality has been generally informed by the initiatives of cities in Europe and North America aiming to provide essential services to precarious migrants under the assumption that such efforts will foster their social and civic inclusion. The concepts of urban sanctuary, migrant solidarity, and hospitality are thus indicative of Western normative assumptions and of the concrete efforts of municipal governments and local civil society organizations in the global north. The purpose of this study is twofold: (1) explore the Eurocentric ideas embedded in the notions of urban sanctuary, solidarity and hospitality; and (2) explore alternative framings of urban sanctuary, solidarity and hospitality in the Global South. The paper addresses this purpose through three sections. First, we explore the western ethical and political traditions that shape current understandings of the concepts of hospitality, solidarity and sanctuary. Second, the paper considers decolonial approaches to avoid eurocentrism in the study of hospitality, solidarity and sanctuary in the Global South from Latin America and Africa. Finally, we introduce potential non-Western philosophies

for promoting sanctuary, solidarity, and hospitality in the Global South in the form of Buen Vivir and Ubuntu. This paper aims to make both a practical and theoretical contribution for facilitating comparative studies of urban sanctuary, migrant solidarity, and hospitality policies and practices between cities in the global north and the global south.

The Role of Local Self-Government Reform in Strengthening Local Democracy

The reform of local self-government contributed to bringing services as close as possible to people in the community. It is the territorial community that is the main bearer of local self-government functions.

The participation of citizens in the development and decision-making is an important component of participatory democracy. The instruments of participation are established by law, that is, clear procedures for involvement are defined, which have both legal and practical consequences. In addition to being enshrined in laws, forms of participation can be regulated in statutes and regulations of communities.

This text analyzes the forms of local democracy that are available to residents of Ukrainian communities. In the Ukrainian legislative field, there is no single law that would regulate the procedures of all forms of public participation. The norms determine the opportunities for community residents:

- The Constitution of Ukraine regulates the right of territorial communities to participate in management and decision-making.

- Law "On Local Self-Government in Ukraine" - clear legal opportunities for citizens' participation are established.

- Law "On citizens' appeals" - the regulated procedure for appeals, the procedure for review and the responsibility of officials for limiting this form for citizens

- Law "On the status of deputies of local councils" - recalling a deputy on the people's initiative and assigning voters to their deputy of the local council

For the effective development of local democracy, only legislative regulation is not enough, the following are also important:

- training for communities about engagement tools. In this case, it is necessary to explain to deputies, officials, and residents about the possibilities and their influence on decision-making.

- conducting information campaigns for citizens. To spread positive practices taking into account the territory, needs, and characteristics of the community.

Algorithms in Social Welfare: Healthcare Fundraising Disparities on Gofundme

This paper identifies digital philanthropy as an important case of the intersection of algorithmic decision-making and the politics of social welfare. Crowdfunding, the practice of asking for money from others using dedicated commercial Internet platforms, is a significant means by which individuals and families in low, middle, and high-income countries fund various welfare needs, most notably healthcare. While proponents describe it as a democratic practice, occurring on platforms that act as neutral arbiters of deservingness, scholars draw attention to the low success rates and highly unequal outcomes associated with crowdfunding. This paper discusses algorithms' role in shaping crowdfunding outcomes and, by extension, access to social welfare resources in areas neglected by the welfare state. First, based on analyses of cross-national data on crowdfunding campaigns from the platform GoFundMe, we find evidence that crowdfunding use is shaped by social policy contexts, suggesting that crowdfunding is used to fill gaps in contemporary social safety nets. Second, based on analyses of GoFundMe healthcare crowdfunding campaigns in the U.S. and Canada, and in-depth interviews with campaign organizers, we find evidence of disparities in fundraising outcomes based on age and race and ethnicity that are in part attributable to the platform's algorithmic selection of featured campaigns. This research underscores the pitfalls of market-based solutions to welfare needs in the context of digital capitalism, acute population health crises, and welfare state retrenchment in industrialized countries.

White Gold, Black Debt: Racial Capitalism and Agricultural Modernization in Burkina Faso

This talk focuses on the theoretical contributions of a forthcoming book project. This book interrogates the process and consequences of agricultural modernization in the cotton sector of southwestern Burkina Faso, where farmers have expanded their use of agricultural technologies such as pesticides and genetically modified seeds while exporting cotton to the global market. Through ethnographic data, I show how this process reproduces both global and local inequalities and unravels ecological and social webs of interconnection. Yet I also found that this process was not simply one of top-down exploitation, but embraced in multiple (and at times ambivalent) ways by a range of actors seeking to better their lives, often reflexively aware of the symbolic and material standing of rural Black Africa in a global racialized hierarchy. I build upon longstanding contributions in African agrarian change that honor a political economic analysis that foregrounds colonial history and processes of capitalism, while also making space for the fluid role of culture and the agentic capacity of rural Africans. However, to both the "popular" debates over agricultural modernization and the academic literatures on agrarian change, I offer a new angle of analysis. I situate agricultural modernization within the economic and ideological history of racial capitalism, arguing that racial hierarchies and imaginaries – and the myriad ways that differently situated people navigate or resist them – play an under-examined role in shaping agricultural modernization in contemporary Africa.

The Affective Economy of Professorship Qualifications: Ruling, Emotions and Resistance

This paper explores what counts as a legitimate career in contemporary Norwegian academia. Drawing on conceptual tools and insights from Institutional ethnography, theories of affect/emotion and resistance studies it explores how women postdocs and associate professors encounter neoliberal ruling in academia in the work of qualifying for a full professorship. The paper is focused on the work of writing up a CV, and more specifically encountering the Norwegian Research Council's CV-template for "Established Researchers". The CV template tells us something about the activities and practices that count. Through sharing experiences related to filling in the CV template 10 colleagues and I were enabled to point towards (what might be called) an affective economy connected to the neoliberalisation of Norwegian academia. We explore together how our emotions reproduce what counts, as well as how they produce resistance towards dominant notions of (use)value in academia. Methodologically the process of discovery drew on the "Search Conference" method, involving three stages of democratic conversation. First stage focuses on identifying problems in the current organisation, policies, or institutions, somehow shaping everyday life and working life. The second stage focuses on developing a vision for the future. The third stage focuses on what practical steps can enable our getting closer to that ideal. This paper is based on material from such a Search Conference involving 11 women academics. While zooming in on the first of the three stages, which took its point of departure in the work of CV-writing, the paper also links in to the shared visions and practical organization for doing academic careers and academic social relations differently.

LUNE, Howard* (Hunter College, CUNY, USA)

The Message Is the Medium

Democracy is a process. It is a set of rules, principles, and norms that describe how things should operate, for everyone. Authoritarianism is an endpoint. Ongoing event framing is less important than the master frame that the desired system of authority must be put into place, for some. The claim itself, not the reasons for it, is the point.

Therefore, democratically-based movements address what ought to be and why. Authoritarian framing is about what must be prevented and how. It expresses fear of loss of control. It identifies "the enemy" and demonizes and dehumanizes them. Support for democratic processes and the expansion of democratic rights lean heavily on moral arguments about things that are actually happening. Autocratic movements rely much more on the fear of uncontrolled enemies. Data is less important than the feeling of uncertainty.

This distinction has many implications. In this paper I focus on the use of implied threats in the public discourse in support of Donald Trump's MAGA movement. Specifically, I examine two rhetorical strategies. The first is the simultaneous use of multiple, contradictory narratives, such as the idea that the FBI could have planted classified documents at Mar-a-Lago and that the documents were declassified before Trump took them. This apparent lack of concern with consistency can be shown to be a strategic framing device in which the reality of the situation does not have to be evaluated at all. The important communication goal is to imagine fearful scenarios.

The second strategy involves supporters of the movement favoring communication by "dog whistles" – claims that are not to be taken as literally true but which reflect a shared belief in the inferiority of their targets. These "jokes" endorse the master frame implicitly without providing real arguments. Distinguishing "us" from "them" is sufficient.

Understanding Leisure Constraints of Chinese College Students: A Comparison of Participants and Non-Participants

Campus recreational sports play an important role in improving college students' health, well-being, and quality of life. However, college students are often faced with constraints that prevent them from participating. To date, research focusing on Chinese college students' leisure constraints is limited. To address this gap, the purpose of this study was to explore how perceived constraints on intrapersonal, interpersonal, and structural levels influenced the participation of Chinese college students in recreational sports activities among both participants and non-participants. Data were collected using a questionnaire from students (N =160) at a college in Beijing, China. Analysis of data confirmed the previously established hierarchical model of leisure constraints. Both multi-group invariance test and independent t-test were performed on the two samples. The results indicated that the most important constraints were the lack of time and the lack of adequate training. Non-participants face higher levels of leisure constraints on most of the items compared to participants. Significant differences were identified between the two samples, particularly at the interpersonal and structural levels.

Adapting the Conceptual Tool to the Digital Future: A Two-Dimensional Framework of Censorship

As authoritarianism adapts to the digital age, we are witnessing waves of authoritarian resurgence worldwide. These waves challenge our conventional conceptualization of censorship, which mainly regards it as a state-centered, top-down measure to restrict public expression. This view, however, is questioned in the era of digital media when private actors such as social media platforms and individual users play an active role in "censoring" and surveilling online public expressions. Indeed, as we dig into the literature on censorship, its conceptualizations are plural rather than singular regarding 1) who censor, 2) who/what is censored, and 3) what power is exerted in the practice of censorship.

In this study, we propose a new theoretical framework to categorize the plural conceptualizations of censorship in scholarly work. Borrowing from Michael Mann's theory of power, we develop a two-dimensional framework to categorize power exerted in censorship. The first dimension captures the feature of the power center: is it diffused/decentralized or authoritarian/centralized? The second dimension characterizes the way in which power impacts its subjects: is it restrictive power, or constitutive power? This framework demonstrates the limitations of the mainstream conceptualization of censorship in North American social sciences. It also could be applied to showcase the plural usages of the term in today's digital world.

In a case study, we collected posts and comments containing the word, censorship, from Reddit in 2021. By integrating computer-assisted content analysis (e.g., word embedding) with quantitative methods, we show different social contexts in which the word censorship becomes a metaphor for various forms of power relationships.

This study sheds light on a growing dystopia sentiment of an authoritarian future brought up by digital technology. It also helps us to adapt and expand our conceptual tool to understand digitalized social practices.

SYDNOR, Sandra (Purdue University Hospitality and Tourism Management, USA)

Understanding Tourist Motivations in Visiting Current and Former Conflict Zones

Locations recovering from conflict have a difficult time rebuilding their tourism sectors due to several major factors, including that the perception of danger persists long after the actual conflict has ended, creating a hesitancy for potential visitors. As limited literature exists on tourist motivation in these environments, the research asks if understanding the characteristics and motivations of these early travelers might allow recovering locations to speed tourism sector recovery. Would knowing whom to target for emergent post-war tourism recovery and early marketing speed economic rebuilding, and perhaps also lead to a faster shift in outside perceptions of whether a location remains dangerous after a war has ended and helping to connect it to the outside world during the peace-building process? Using a mixed methods approach with a primary emphasis on qualitative analysis, the researcher will conduct approximately 10 or more qualitative interviews with recent travelers to areas considered current or recently former conflicts, with Iraq a primary consideration. Questions would seek to understand visit motivations, before and after visit perceptions of a location, media research, family, friend, regional ties, ethnic influences, and travel sophistication before such visits. In addition, the researcher will collect data on personality characteristics such as Risk-Taking Behavior and Resilience using already available scales. In addition, the research offers a comparative analysis of both traditional data analysis and analysis software (e.g., NVivo). This may be presented as a poster or as a paper.

Between Hope and Despair: The Bootstrap Worker As a New Professional Figure

By following a professional group for eLearning specialists for 22 months, I analyze the problems faced by digital freelancers in their attempts to navigate the tumultuous waters of independent and contingent labor. To describe freelancers' self-representation of their working conditions, I advance the concept of the bootstrap worker.

The bootstrap worker builds on previous conceptualizations of the entrepreneurial-self, such as the no-collar worker, the digerati, and the venture laborer. By repurposing managerial practices of startup entrepreneurship as instruments for self-management, this professional figure normalizes precarity and instability and frames them as preconditions for self-actualization and economic success. The result is a professional figure trapped in a state of perpetual becoming, where self-actualization seems always one project away, but is never fully achieved.

Throughout my research I then observed the tactics bootstrap workers rely on to grapple with the uncertainty characterizing their working conditions. In this respect, I found informal professional events such as social gatherings, tech meetings, and networking events to play an essential role for bootstrap workers.

My experience shows how these informal gatherings, while helping individuals to cope with the consequences of a project-based organization of labor, repurpose some of its central tenets as solutions to problems this organization of labor creates. A case in point is how participants approached issues of skills obsolescence and portfolio building as opportunities for iterative experimentation and business development. Indeed, this approach helped them to address their need to stay at the forefront of technological developments. But, on the other hand, it normalized expectations about bootstrap workers' willingness to engage in free, immaterial, and speculative labor which is selectively (if ever) retributed by clients.

The Impact of Remote Work on U.S. Rural Regions and Second-Tier Cities during the COVID-19 Pandemic

This paper analyses how the COVID-19 pandemic, and the normalization of remote work, have offered U.S. secondary cities and rural regions the opportunity to reshape their public images in the attempt to lure high-income, skilled remote workers. The study investigates how Remote Work Attraction Incentive Programs (RWAIPs) are constructing a new imaginary around second-tier cities and rural regions as ideal places for remote workers. It then discusses how RWAIPs compare with previous models for talent attraction and local economic development.

The analysis reveals how RWAIPs counter established talent attraction models by framing their respective locations as places for production or, better, remote production, rather than as places for consumption. The narrative RWAIPs websites build around remote work is one of work life balance, of professionally fulfilling lives spent within connected (to high-speed Internet, to major infrastructures, to local business communities) and affordable locations. In addition to promoting their destinations by emphasizing the quality of the built and natural environments, what Richard Florida identified as "territorial assets" or "quality of place", RWAIPs websites focus in large measure on themes about the life quality that remote workers can achieve in less dense, inclusive, and more affordable locations.

The lifestyle RWAIP websites portray and promote, however, is at odds with the programs' own definitions of remote work. Despite calls for inclusion and attention toward representation of minorities, the programs go a great length do define what makes remote work and who is a remote worker. In doing so, RWAIPs further forms of socioeconomic discrimination, already evident and well known in urban contexts, beyond the confines of major metropolitan hubs.

The Future of Israel-Palestine: Solutionism and the One-State Reality

A solution to a protracted political conflict, such as that between Jews and Arabs in Israel/Palestine, is not just a pretty picture of the future. Such pictures are easy to come by. But when one claims to advance a "solution," one is not just describing an arrangement that would satisfy a set of necessary moral or existential requirements. One must also provide a politically plausible and morally acceptable route to the achievement and implementation of the imagined arrangement. The reality is that between the Jordan River and the Mediterranean Sea there is one single state. Its name is Israel. In this one-state reality, talk of a two-state solution protects circumstances of silent apartheid by distracting attention from, and deflecting efforts to address, long and decisive struggles over how the one, non- democratic, state that exists will evolve. Solutionism, peddled with vocabularies associated with two- states, cantons, confederation, or one-state—whether Islamic, binational, or democratic--directs attention and endows importance to tasks of designing intricate legal and administrative blueprints for what might be accomplished in a perfect, or at least politically cooperative, world. But politics and political interests are not residual categories. They are key drivers of the conflict. Pouring effort into drawing politically unattainable pictures of what could be, or should be, is at best a waste of time and at worst an obstacle to those caught in the conflict or committed to its peaceful transformation, who must contend with immediate questions of life, political equality, access to resources, and security that really matter for shaping what the country will be in fifty to one hundred years. The sad truth is that deep political problems do not turn into solutions. They turn into other problems, often worse, but sometimes, eventually, better.

LYALL, Ben* (Monash University, Australia)

Self-Tracking and Cyberattacking: Social Media Reactions to Garmin's Ransom

In July 2020, the technology company Garmin was the victim of a corporate ransomware attack. For end-users of Garmin's popular range of self-tracking devices, services were taken offline for a period of around four days while the company rallied to respond (allegedly paying up). This paper presents user reactions to the cyberattack, via a content analysis of 2,198 English-language tweets from this four-day period (with additional acknowledgement of content in other languages), interaction data on Facebook (via CrowdTangle), and immersion in the social media conversations in-situ.

For Garmin users who took to Twitter to comment on the outage – using hashtags like #garmindown – the discussion flowed through stages confusion, anger and empathy directed at Garmin. This was interspersed with in-group advice on technological workarounds for keen runners, and outsiders sharing sardonic memes about self-tracking culture. This cyberattack and ensuing media event is significant in two ways. First, it presented to social media users and users of wearables – perhaps for the first time – an example of how their personal self-tracking is reliant on global infrastructures: their data become suddenly, and very publicly, entangled with larger corporate interests. Secondly, it connected disparate (usually geographically tied) activity-tracking communities into a shared global community of Garmin users.

Largely absent in social media rhetoric were considerations of the (bio)value of personal activity data, and the significant role Garmin play in the wider sensor society (for example, through the provision of GPS services). Instead, primacy of concern was granted first to personal details and second, to payment information. Ultimately however, the event was seen as a brand-based drama, rather than an opportunity for communities to reflect of corporate datafication practices, data sovereignty, and their own data literacy.

'Find Your Pandemic Flow': Corporate Blogs in the Liminal Space between Health and Wellness

During the COVID-19 pandemic, corporations have variously attempted to acknowledge, address, harness, and co-opt the emerging health and social issues raised by the 'new normal' of pandemic living. Among many such examples is the official Fitbit blog (https://blog.fitbit.com/) which, since March 2020, has published over 80 posts related to the pandemic. Courtesy of the company's mixed business interest's technology, health, science, fashion, and wellness, Fitbit is uniquely situated to offer data and commentary. While always footnoted with the disclaimer *'this information is* [...] *not intended as a substitute for medical diagnosis or treatment',* Fitbit's sector-leading position provides it a powerful platform on pandemic matters.

The blog speaks to a privileged 'working-from-home' audience whose health is often unaffected by the pandemic, the wellness messages in Fitbit's COVID-19 blog posts pivot the pandemic to a private issue, suggesting ways of coping and controlling the impacts. Across its posts, the blog gives explicit advice on face masks, social distancing, isolation and quarantine, symptom monitoring, and even vaccines. Significantly, it also rearticulates generalised health topics through a pandemic lens: matters including stress, rest, physical activity, and immunity. While occasionally linking to public health sources (such as the CDC), the primary goal of the blog is not public health. Rather, its goal during the pandemic has been to demonstrate the continued utility of Fitbit products, and to demonstrate the power of Fitbit's global datasets.

The paper unpacks how the blog's broad approach to discussing the pandemic – under a guise of their products, services, and marketing being neutral commercial agents – risk trivialising the wider health and societal impacts, while also allowing space for alternative narratives about COVID-19 and SARS-CoV2. While never engaging with misinformation, the company's prioritisation of corporate self-interest sees it invest in the maintenance of the liminal distinction between health and wellness.

LYCHKOVSKA-NEBOT, Oksana* (Odessa I.I. Mechnikov National University, Ukraine)

Les Stratégies De La Guerre Informationnelle Comme Les Éléments Cruciaux De La Guerre Contemporaine : Le Cas De La Guerre En Ukraine

Notre contribution porte sur le caractère spécifique des stratégies et des pratiques communicationnelles de Russie dans la guerre en Ukraine. Le récit politique et propagandiste russe englobe toutes les composantes cruciales de l'idéologie totalitaire en sphère publique : la relativité de la vérité, la réalité se transforme en fiction, la vérification des faits dans les nouvelles est absente et sa nécessité est discutable. Les nouveaux mécanismes de guerre informationnelle sont présents partout - dans les médias traditionnels, numériques et dans les réseaux sociaux.

Nous envisageons, ainsi, d'analyser les composantes de la guerre d'information menée par la Russie contre l'Ukraine et contre le monde « occidental » comme le système de la propagande complexe et à plusieurs niveaux. Il est possible d'évoquer **des éléments institutionnels de guerre** : l'interdiction de toutes les ressources d'information opposantes, la création de médias spéciaux contrôlés qui effectuent des manipulations ciblées, en partant du "soft power" de la propagande et en terminant par la création soit « le blocus informationnel », soit de fausses nouvelles, la désinformation et la manipulation. A cet égard nous proposons de distinguer des concepts apparentés, en particulier, la « désinformation », la « fausse information », la « manipulation », la « propagande » ; **la création et la diffusion des éléments narratifs de guerre** : de « récits de haine » ou de « récits de guerre » en utilisant les techniques spéciales psychologiques comme, entre autres, les effets d'assimilation et de contraste dans la persuasion, la création de « croyances spontanées », la manipulation des « valeurs fondamentales », les effets de halo et de résonance émotionnelle, les mécanismes de « spirale du silence », les principes de transfert de responsabilité, etc., **la création des mèmes et de la « sphère des trolls »**.

Religion, Art, and the Crisis of Grand Narratives: Post-Secular Challenges and European Contexts

This paper will analyse the relationship between religion and art in the context of modernism in Europe and the impact of postmodern contentions about grand narratives, and their in/ability to inform contemporary understandings of culture and religion. The use of art to promote ideologies of power and capital is well known, as is art's promotion of religion throughout history. Conversely, art is a major form of critical engagement with both sacred and secular institutions and movements. But with the questioning of grand narratives in times of multiple secularities, key questions can be asked about the complex ways that religion and art interact, especially in nations with increasing levels of social and religious diversity.

In this paper examples of modern art will be discussed to underscore the emblematic interplay between religion and art in modern society, and how their interaction highlights the complexities inherent in the association between religious aesthetics and the forces of secular modernism in the cultural sphere. Specifically, the works of European artists who identify as Catholic will be examined, including the writer Graham Greene, and the painter Gwen John.

The paper will then assess the problematic encounters highlighted by the postmodern turn that has led to a questioning of the credibility of grand narratives in modern discourse, artistic works, and religious belief, and what this situation means for religion and art in Europe and other parts of the world. At issue here will be the uncertainties posed to religions as they seek to represent traditions and values that are increasingly being disputed by social movements and individuals seeking greater social recognition, and how such concerns are illustrated in contemporary religiously themed art. The work of a range of sociologists, including Habermas, Bauman, and José Casanova, will be utilised to examine the broader implications of these issues.

Linguistic Diversity and Inclusive Multiple Choice Assessment: Implications for Teaching First Year Sociology Courses

Multiple choice questions (MCQs) are widely used in large, introductory sociology courses. Recent research focuses on MCQ reliability and validity and overlooks questions of accessibility. Yet, access to the norms of academic discourse embedded in MCQs differs between groups of first year students. We theorize these norms as part of the institutionalized cultural symbols that reproduce social and cultural exclusion for linguistically diverse students. A sociological focus on linguistic diversity is necessary as the percentage of students in Canada who use English as an additional language (EAL) rather than English as a native language (ENL), has grown. Drawing on sociology as pedagogy, we problematize MCQs as a medium shaping linguistically diverse students' ability to demonstrate disciplinary knowledge. Our multimethod research uses two stage randomized exams and focus groups with EAL and ENL students to assess the effects of a modification in instructors' MCQ writing practices in sociology and psychology courses. Findings show that students are more likely to answer a modified MCQ correctly, with greater improvement for EAL students.

Carbon Offset Markets and the Contested Space of Human Rights

Carbon offset now represents a central strategy for state and private sector actors in seeking to uphold legal and moral responsibilities to reduce greenhouse gas emissions. Commonly linking the so-called global north with the global south, carbon offset initiatives rely upon activities that sequester carbon dioxide and other greenhouse gases in one part of the world to offset, or compensate, for polluting activities elsewhere. Such schemes are a central part of countries' Nationally Determined Contributions (NDCs) for meeting emissions reductions targets and for corporations claiming 'zero carbon' emissions. Despite their allure, many carbon offset programs – including industrial forestry and 'climate smart' agriculture – are exploitative and unjust, raising questions about human rights as well as their effectiveness in supporting timely decarbonisation.

The expansion of carbon offset as a response to the climate crisis sits within – and is enabled by – the infrastructures of global climate governance. At COP 26, for example, a new agreement for market mechanisms was formalised (via Article 6), further institutionalising market responses to climate crisis. In this paper, I show how global climate governance deploys colonial capitalist and extractivist imperatives that commodify nature, in this case, carbon stores, to institutionalise market-based climate solutions. Informed by a sociology of human rights, I then explore how global climate governance grapples with the human rights implications of carbon offset. Global climate governance frequently frames rights via concepts that are readily measurable and enforceable, including 'benefit sharing' and 'forest rights'. Yet the violence of this rights translation frequently fails to align with local understandings and priorities. I thus conclude by reflecting on the potential of *local rights translation* to widen understandings of human rights in global climate governance and, inter alia, carbon offset markets.

Spate of Mergers and Acquisitions in Indian Edtech Industry: Waves of Predatory Consolidation

This paper seeks to analyze the trends observed in the Indian Edtech industry during pandemic and post-pandemic period. Even though COVID-19 devastated the world, posing diverse challenges for countries world over and every sector of economy, Indian Edtech industry was growing at an exponential rate as the key beneficiary of "covid economy" and the closure of educational institutions and offline coaching facilities. As of June 2022, India has a total of seven Edtech unicorns. With clearance for 100 percent FDI in education the valuation of Indian Edtech industry is estimated to reach US$ 30 billion shortly, attracting new players. Of the total funding raised, Byju's leads with 57%, followed by Unacademy (10.5%) and Vedantu (9.5%). The apparent advantage and benefit of Edtech is that it provides education at the fraction of the cost one has to pay for attending a college or a university as they are not required to invest in infrastructure and personnel, rendering an attractive business model. With pandemic having subsided and the educational institutions reopened, Edtechs are experiencing a major crisis requiring them to modify their business model and approach and as a result, Edtechs embarking on consolidation strategy through acquisitions and mergers. Recently, Byju's, the world's most valuable startup completed 16 big acquisitions. Unacademy, the second most valuable Edtech made 11 acquisitions. UpGrad, which became a unicorn last year, completed 9 acquisitions to consolidate its position in the sector. Further, sensing distress post-Covid, Edtechs have been looking to adopt a hybrid approach resulting in further consolidation through acquisition of off-line education establishments. There are key societal drivers that have provided impetus to this industry and far reaching implications of the ongoing monopolistic consolidation that could be dwelt with in the full-length paper

Taming the Soft Despotism: The Regulation of Big Tech Industry in India

In our information age dominated by Big Techs that offer instantaneous access to unlimited information, all our decisions and choices ought to have been most rational and effective. But if the intent of the these Big Techs is to influence and control our decisions and choices through surveillance and monitoring to serve the profit interests of market forces, the information turns out to be dysfunctional and counterproductive. In the so called "networked democracies" that make extensive use of ICT, the constant objectification, profiling, surveillance and monitoring of citizens' movements, financial affairs, and conversations by the BIG Techs, phrased as 'soft despotism', is viewed as routine and normal, posing a serious threat to individual liberty, privacy and freedom of choice. Several governments, civil societies and agencies world over have raised serious concern over these despotic practices by social media and e-commerce platforms dominated by Big Tech agencies resulting in fresh policy initiatives and establishment of regulatory authorities and agencies. With global norms having shifted dramatically toward greater government regulation of the digital sphere, variety of approaches on how to structure regulation are being evolved. As a result, every country today has its own ICT policy and regulatory authorities to deal with data privacy, antitrust, cyber security and financial transaction issues. The paper seeks to focus on functioning of BIG Tech agencies in social media and other services and the operational constraints and limitations being encountered by the regulatory agencies in India based on the policy documents, research reports and case studies The findings indicate that these regulatory agencies appear to be wrought with conceptual and jurisdictional ambiguities leading to enforcement limitations. In India the scuffle between the Big Tech and regulators appears to be growing brusque with different sections of society subscribing to divergent views and stands.

Internationalization at Home in Taiwan's Higher Education: Domestic Students' Perspectives

Since the early 2000s, the call for internationalization at home has begun to focus on how internationalization would impact domestic students. Despite a growing body of research on this topic, little is known about the experiences of domestic students in a non-Western context. Based on focus-group interviews with 53 students at four universities in Taiwan, this paper examines how domestic students perceive and experience the changes on campus and in student life brought by university policies and practices of internationalization. "English as a medium of instruction" and "(lack of) intercultural contacts with international students" are two major themes emerged from the analysis. First, students are concerns about how the adoption of English as a medium of instruction affects the quality of learning and classroom interaction patterns.

   * denotes a presenting author.   Abstracts are organized by first presenting author's last name.

When English is a second language for both instructors and students, limitations in speech register and linguistic repertoire often generate detrimental impacts on the quality, efficiency, and experience of learning; including the depth of content in training, student comprehension, and classroom dynamics. It is also noted that whether English is perceived as a proper medium of instruction is related to respective disciplines' characters. Second, domestic students often do not initiate contacts with international students, and intercultural contacts are often casual and short-lived. Reasons for domestic students' lack of contacts with international students can be categorized into cultural, social, pedagogical, and institutional factors. The ensuing influence of domestic students' "internationalization at home" experiences on their perspectives toward the internationalization of higher education is discussed, and suggestions are made to enhance domestic students' quality of campus life in universities' pursuit for internationalization.

One-on-One Pairing Mechanism Under China's Targeted Poverty Alleviation Scheme and Its Implications for Poverty Governance: Evidence from a County in Western China

Chinese government has proposed the "Targeted Poverty Alleviation" (TPA) program since 2013. Under this scheme, a large number of grass-root cadres were mobilised to rural villages to eradicate poverty, which is a frequently-utilised policy tool by the Chinese Communist Party throughout its history. By the end of 2020, every identified household was lifted above the national poverty line. The innovation of this scheme lies in that impoverished households were paired with individual government officials, who were the main stakeholders responsible for implementing the TPA program at the local level. Nevertheless, the organisation and mobilisation mechanism behind this sizable anti-poverty campaign were rarely examined quantitatively, especially the one-on-one pairing mechanism at the core of the TPA program. Based on an empirical case study of a rural county in Shaanxi Province, China, this study delves into the mechanism of this political mobilisation campaign, in order to better understand how "precise identification, precise assistance and precise management" were materialised. This study is among the first attempts to quantitatively examine the relationship between cadres' ranks and workloads in the TPA and the social and financial resources of the sending sectors using empirical data from diverse sources, including government documents, media reports, detailed field studies and in-depth interviews. In addition, this study also explores the identification method of impoverished households and the specific role of cadres under the TPA program. The results show the necessity of mobilising broader government sectors and cadres under a very tight timeline. The one-on-one pairing mechanism took advantage of the existing Chinese bureaucracy while enabling an impersonal allocation of tasks for local cadres. Through transferring the specific tasks to smaller-scale units of the government bureaucracy, this innovative mobilisation mode improved the efficiency and efficacy of the TPA program to eradicate China's extreme poverty.

The Cross-Genre Dissemination of Platformized Cultural Contents:Computing How Algorithm Erode Cultural Boundaries in China

The present study intends to illustrate how algorithmic recommender system contributes to the erosion of cultural categorical boundaries on Bilibili.com, a prominent user-generated content platform in China. With an exploratory study of the network of associations among 229,849 music videos, the study aims to a) reconstructs how musical contents of different cultural categories are related together by both the platform's recommender algorithm and user aggregated contents; and b) investigate role of algorithmic systems in "de-classifying" cultural goods and assembling users of distinct social circles.

According to Bourdieu's theory of cultural distinction, in China, "French musical" is normally classified as a sort of "fine art" that is appreciated mostly by "highbrow" consumers or at least French speakers. Whereas, with the global diffusion of digital media platforms, many masterworks of French musical were uploaded online and gained their reputation especially among users of Bilibili.com. The starting point of our data collection was 891 videos which are searching results of the keyword "French musical". By applying network analysis and content analysis, we found 11 tightly connected clusters of different cultural categories, with overlap between group of French musical amateurs to fans of Japanese ACG (animation, comics and games), E-sport game, K-pop culture, Chinese pop idol, etc.

This study intends to shed some light on the critical understanding of the role of algorithmic systems in the digital culture era. Contrary to classic cultural consumption theory, algorithmic systems did not relate music contents according to their intrinsic features such as artistic style or aesthetic form, nor online users' aesthetic perceptions of these contents. Interestingly, a semantic network was reconstructed based on literal similarities of those videos' tags. Further investigation and data analyses will be validated.

"Being Red but Not Professional": Professional Autonomy and the Construction of State Hegemony.

China is building a new governance model, including the reconstruction of professions. China's emerging social work profession plays an important role in building a harmonious socialist society. But during the development, under the "localization discourse", its ideology has been reconstructed and restricted. ideological proletarianization theory believed that the compromise of ideology could bring professional autonomy at the technical level. However, although China's social work profession tries to actively integrate into the state-dominating ideology, it may not gain professional space for developing knowledge and techniques autonomously and is questioned as "red but not professional". Therefore, this article attempted to further analyze this state-profession relationship by integrating ideological proletarianization and hegemony.

Using the Chinese social work profession as the case, we studied 754 rural social workers. We built a structural equation model including four core latent variables: *Professional social values, Individual work meaning (Representing the transformed ideology), technical autonomy, and service impact.* The results showed that individual work meaning and professional values were each significantly and positively associated with service impact while the technical autonomy of social workers only played a limited mediating role.

These findings show that for the social work profession, ideological proletarianization does not bring higher technical autonomy, which was against Derber's point and re-proved experiences of "not professional". Even if professionals lack professional autonomy, however, the state can still use the construction of pedagogical hegemony to prompt professionals to carry out services, so that they can better serve the improvement of the legitimacy of governance. If the loss of ideological autonomy cannot be exchanged for technical autonomy, and if pedagogical hegemony can prompt semiprofessionals or paraprofessionals to achieve a service effect, then being red but not professional may not be a transitional state but instead may have begun to be gradually finalized.

Tastes and Complex Tastes.

Taste is central to the sociology of culture and a frequently-invoked explanans in the discipline at large. Yet, it remains a semantically ambiguous polyseme that has been understood and operationalized in often divergent ways by generations of sociologists. In this essay, we survey contemporary empirical research on cultural tastes and use abductive reasoning from measurements of taste to clarify the semantic ambiguity surrounding taste. We argue that taste should be conceptualized as a person's thick subjectivity in a cultural field, expressed through multiple modalities of action whether it be their *preferences*, *consumption*, or *competence* with respect to culture.We show how such a pluralist conceptualization of taste is useful and intuitive by using it to articulate the analytical form of complex tastes, a class of tastes that are both mundane yet under-appreciated by sociologists of culture. Some tastes, like guilty pleasures and ironic consumption, can be said to be complex because they contain inherent antinomies across the modalities of taste.

Modernization and Career Mobility: A Study of the Netherlands between 1813 and 1922

According to modernization theory processes such as educational expansion, industrialization, urbanization, and improvement of means of transport and communication lead to a shift from ascription to achievement. This hypothesis has mainly been tested for intergenerational mobility and

marriage mobility. This paper will present new results on changes in career mobility during modernization. The empirical example will be the Netherlands during the 19th century. Hypotheses will be tested using the Genlias digitized index of marriage records for 5 out of 11 Dutch provinces (1813-1922). We link the marriage data to the Historical International Standardized Community Indicators-Netherlands (HISCI-NL) dataset (Knigge, Schulz & Zijdeman 2012). This dataset includes yearly measures for a number of modernization processes for all municipalities in the Netherlands. First results suggest that with modernization the effect of ascribed characteristics (father's occupational status) on career mobility decreased and the effect of achieved characteristics (status of son's first occupation) increased.

Grassroots Activism, Gender Justice and Emerging Solidarities in Post-Coup Myanmar

Drawing on ongoing research collaborations with Emraan Azad (Liberation War Museum, Bangladesh) and Ei Thin Zar (University of Wisconsin-Madison, US, & University of Chiang Mai, Thailand), this paper explores the ambiguous position that 'justice', and especially 'gender justice', occupies for diverse communities from Myanmar in response to continued ethnic armed conflict and the military coup of 2021. The work is influenced by Deleuzian understandings of space, transitions and mediations (Deleuze & Guattari 2013) in offering an exploration of the particularities of conflict settings that offer opportunities for social transformation (Maber 2016; Maber 2018). Situations of conflict create both social and physical upheaval which can produce diverging reactions, understood through mediations between smooth and striated space. This upheaval and the migrations it engenders through displacement and exile gives rise to an increased nomadism in the periphery accentuating points of contact and avenues for contestation, resistance and solidarities (Maber 2016; Braidotti 2011). These varied lines of flight create a distinctive landscape for social activism, navigating competing agendas, assumptions and expectations. Community understandings of justice therefore may differ significantly from the expectations of justice amongst international agencies, INGOs or judiciary mechanisms such as the ICC and ICJ. We explore how justice, and in particular gender justice, is navigated and worked towards amongst grassroots activism, including women's led community groups, within Myanmar and beyond its borders, in Bangladesh and in Thailand, revealing transnational solidarities as well as points of tension. The work is attentive to Serene Khader's observation that "Western feminists wrongly assume the need for an ideal vision of gender justice" (Khader 2017, 3). The goal therefore is not to define a static notion of what gender justice would be, but rather to explore the ways in which this concept may be worked towards within different spaces.

MABIN, Alan* (University of the Witwatersrand, South Africa)

Citizens in a World of Recomposition: The Popular and New Social Movements in Capital City Regions

Swedish sociologist Göran Therborn's *Cities of Power* addressed capital cities, where political power and its expressions are concentrated. He concluded with an optimistic view on prospects for popular mobilisations: 'Ordinary people are not going away ... [F]or urban social change, capital cities of power turned into cities of transformation are likely to be decisive' (Therborn 2017 p. 357).

The paper explores propositions advanced by Therborn that 'the growth of a large, volatile middle class – overcompensating for the decline or stalling of the working class, very different from the sedate European bourgeoisie and the traditionalist bazaar traders, often linked to a large student milieu and currently hooked in the virtual community of social media' appear 'on some crucial occasions capable of rallying sectors of the precariat and the unemployed', that 'constitute a potential for democratic urban street protest and are on some crucial occasions capable of rallying sectors of the precariat and the unemployed' (2017 pp. 205-206). New forms of citizenship and political contestation are evident in cities of different scales. Are urban mobilisations across emerging forms of social solidarities offering transformations in the lives of 'ordinary people'? – as socio-economic and political recompositions impose new oppressions but also open new opportunities for social movements, whether or not formal 'participatory' procedures exist.

The 'cities of power' from which cases are drawn here are Brasília, Delhi, Paris, Pretoria, Stockholm; each set in national and continental contexts in which urbanization affects entire societies. Empirical sources include participant observation, documents, secondary materials and voices of actors (drawn from work by Mabin and Harrison 2022). The study employs 'experimental comparison' (Layoun 2009; Domínguez and Dziub 2021; Detienne 2008).

The paper supports Therborn's views on potentials for new configurations of mobilisation; but there may be limits where building solidarities diverts movements from more transformative intentions.

One's Place in Times of Crisis: Social Position According to Class or Other Attributes

We present the results of a study conducted during Chile's ongoing socio-political crisis sparked by the 2019 social uprising and the COVID-19 pandemic. Our aim was to understand how people define their social position during a period of rapid and profound change that has exposed the precarious situation of many individuals and households. Specifically, we analyse how individuals label their social position according to a notion of social class or in reference to other attributes associated with factors such as the labour market, work relations, income and occupational distribution, as well as the link between their position and crucial subjective processes.

In 2021 we applied a survey to a sample of 1,620 individuals. Respondents were from the Chilean capital, Santiago – where we distinguished between those from the wealthier sectors and the rest – and from Puerto Montt, an intermediate city in the south of the country.

The indirect vignette-based methodology applied is both quantitative and qualitative and enables us to establish the proportion of individuals who, in a crisis situation, identify their subjective social position in terms of social class rather than other attributes. We then assess how that subjective position is influenced by existing social and economic inequalities, particularly falling income, reduced access to goods, and lower consumption. Subsequently, we estimate the extent to which the type of subjective position depends on respondents' socio-economic conditions and is related to subjective factors. Finally, we discuss the results in relation to comparative studies of countries based on scales of subjective social status and subjective social class.

MACALUSO, Marilena* (Palermo University, Italy)

The Political Participation of Migrants: The Council of Cultures in Palermo

A relevant field for the participation of migrants and second-generation people, who are often excluded from voting rights and other forms of formal political participation, concerns unconventional political participation. Daily processes of 'citizenship from below' take place informally in the course of migrants' interactions. Forms of unconventional political participation include: a) trade union membership; b) ethnic, national, cultural or religious associations; c) participation in pressure groups and movements. Among the experiments in opening participation for all residents in local governance there are advisory bodies that formally include migrants.

The Council of Cultures of the Municipality of Palermo (created in 2013) is an elective body that has consultative and mediating function with the different town communities. It represents who have a nationality other than Italian nationality or who have acquired Italian citizenship and is a consultative and advisory body for governmental choices of the local administration. This paper reflects on the process of institutionalisation of the Council of Cultures in Palermo and on its ongoing transformations during 10 years.

The Council of Cultures is made up of 21 members and is the fourth institutional body after the Town Council, the Municipal Executive Committee, and the districts. It represents seven geographical areas: Central Asia, East and West Asia, West Africa, North Africa, East Africa and Central Africa, Council of Europe member countries, and the Americas and Oceania.

The new generations, although in some cases criticising what had been achieved in the past, recognise the institution of the Council of Cultures and decide to get involved in it. Through interviews with privileged witnesses (candidates and Council of Cultures members), the paper explores the opportunities and limits of this form of political participation.

Signals of Belonging: Emergence of Signalling Norms As Facilitators of Parochial Cooperation

Mechanisms of social control at times reinforce norms that appear individually, or even collectively, harmful or "wasteful", such as mutilation practices or extensive body tattoos. This project explores the argumentation that such norms arise to help distinguish between ingroup "friends" who have aligned interests and outgroup "foes" who do not, facilitating parochial cooperation. We build an agent-based model based on the trust game with

signalling and analyse the dynamics of signalling norm emergence within groups of different relative sizes in the population and under different costs of sending signals of group identity.

In line with the literature on tag-based cooperation, we find that norms that prescribe sending costless group identity signals can easily emerge from random individual acts of signalling. Yet, this norm emergence is often at the expense of minority group members who now fail to obtain benefits from interacting with majority group members. We further show how norms of sending costly signals can emerge from individual acts of random signalling if there are sufficiently many individuals who know how to interpret these signals and the group makes up a sufficiently large share of the total population to benefit from parochial cooperation. If signals are very costly to send, small minorities can rather benefit from "blending in" with the majority group, and thus fail to develop signalling norms and parochial cooperation.

These results help us further understand the dynamics of norm emergence in contexts where different groups have conflicting interests and identify groups that benefit the most from developing signalling norms. Our findings provide a theoretical insight into real-life contexts such as those where groups develop ethnic markers in response to environmental changes that put their interests at odds with the interests of other groups.

MACCARINI, Andrea* (University of Padova, Italy)

The Clash within Civilizations? a Cultural Sociology of Populism

"Populism" plays a significant role in contemporary conflicts, which resemble Huntington's famous scenario of a clash of civilizations. This paper argues that its sociological understanding is fundamentally flawed, proposes a conceptual alternative and introduces a related research agenda. Mainstream views of populism are criticized for being *one-sided* – e.g. reducing it to economic discontents –, or developing a *subtraction story* – i.e. the idea that non-populist attitudes would spontaneously triumph, once constraints had been removed –, and often dismissing their *explanandum* as sheer pathological irrationalism.

Then a fresh conceptual framework is articulated. First, in line with Jeffrey Alexander's basic assumptions, it is claimed that (i) populism is not a deviation from democracy, but a naturally occurring dimension of contemporary democracies, and (ii) is a *continuum* stretching from the political left to the right, fatal to democracy only on the extremes. In addition, Shmuel Eisenstadt's seminal reflections on barbarism and modernity are deployed to gain a richer understanding of the phenomenon in terms of cultural sociology. His analysis revolved around the social construction of symbolic boundaries, based on three major codes identified as *primordiality*, *civility*, and *sacredness*. The crucial distinction runs between the absolutization of one code vs. a pluralistic interweaving of the three. Such an absolutization results in violence, social and political exclusion.

This perspective allows a deeper understanding of the cultural programs of populist leaders and parties, and their possible effects on the social order. One corollary is that the boundary between civil and barbarous is conceived as running not *between* civilizations, but between factions, elites and counter-elites *within* them. Such a clash *within* civilizations will play a decisive role about the hopes of a peaceful arrangement of newly emergent inter-civilizational conflicts, and the possible emergence of post-colonial forms of universalism and human rights, drawing on indigenous cultural traditions.

Children and Young People As Agents of Change in Disasters: Flipping the Risk and Vulnerability Discourse to Enable a Capability Narrative

When given the opportunity, children and young people are highly capable, agentic thinkers with creative ideas around disaster issues. However, their lifestage has positioned them under a vulnerability and risk discourse. They are not simply passive recipients in disasters, and as the frequency and intensity of disasters increase, so have demands for children and young people to be acknowledged as 'agents of change' (UN Sendai Framework for Disaster Risk Reduction 2015-2030).

Disaster preparedness and recovery has taken a child and youth-centred approach in the past 10-15 years and research reveals that children and young peoples' experiences of disasters are not only different from adults but diverse and complex. This is particularly evident in the aftermath of disasters as family and daily lives are unsettled and connections with friends and communities disrupted, alongside the environmental impact and loss of familiar local spaces. It is evident that one of the greatest challenges to overcoming traditional emergency management, disaster response and regularity requirements is building trust and to flip the script on the dominant risk/protection framework

that sits around children and young people in disasters. Sociological models of acts of citizenship offer a unique opportunity to interrogate the notion of risk and introduce a strengths-based, agentic role for children and young people in disaster preparedness, response and community resilience.

In this presentation we share the experiences of young people leading bushfire recovery from Australia's devastating 2019–20 Black Summer Bushfires. As part of a Collective Impact Project across the Australian state of Victoria, they demonstrate how children and young people are leading disaster recovery, (re)building communities and preparing for future events. We overlay their experiences with sociological models of citizenship to demonstrate how a capability narrative can sit alongside a vulnerability and risk discourse for children and young people in disaster risk reduction.

Democracy and Youth Participation in the Brazilian Semiarid: The Experiences of the Youth Consortium of Bahia

Just as Brazilian re-democratization in the 80s opened the space for greater popular participation in political life, three decades later, the Youth Statute brings light to a new paradigm of the role of youth in claiming rights and in society itself. The recognition of the youth as agents of change opens the way for young people to connect their demands to real perspectives of dialogue with public power and to have political influence.

This work narrates the experiences of the young people who compose the Youth Consortium of Bahia, in Brazil, during the pre-election process in 2020, which produced a campaign for political advocacy in municipal elections. Based on three axes: identity, interaction with the institutional sphere, and spaces and instruments for participation, the Consortium develops training courses aimed at improving the political training of young participants based on familiarization and analysis of the current legal framework and consolidating issues related to youth rights, especially rural youth.

The results of the activities demonstrate that the training stimulates reflection on the social participation of youth and the construction of possibilities of political influence based on their demands. The interactions with political institutions, in turn, strengthen democratic practices and the dialogue with the institutional sphere, which is crucial for ensuring a long-term impact of the Consortium's actions.

New Paradigms of Labour Regulation in Brazil´s Post-Pandemic Period

The text explores the new legal configurations constructed by and within the pandemic context in Brazil, derived from institutional reforms and the political experiences of resistance, as well as the forms through which they interact with labour law. The Covid-19 crisis in Brazil served as a catalyst for necessary structural ruptures with a number of neoliberal austerity policies. At the same time, the pandemic opened up a terrain which proved to be fruitful in the rampant deepening of the offensive of neoliberal policies on workers' rights, with erosive institutional reforms of basic rights being operated and the weakening of workers´ collective-driven action. In this scenario of emergence and aggravating legal instability, the analysis uses as reference the experience of labour disputes in digital work platforms in Brazil, one of the most vulnerable sectors. The axis of the reflection are the arenas of disputes for rights and regulation, intertwined by asymmetric power relations produced by exclusion and violence in this subordinate sector. The analysis contemplates the perspectives of the State, the Judiciary, the platform companies, and of the organized workers. The arguments are supported by data provided by empirical research conducted in Brazil during the pandemic. The results presented reveal new paradigmatic configurations in labour relations in Brazil. The reflection includes, as a conclusion, a critical analysis of the protection and rights for the sector of platform work in Brazil in the post-pandemic period.

Political Repression and Human Rights Mobilization in Brazil: Competitive Diffusion of Protest Control Repertoires

This paper documents and analyzes the trajectory of contention between law and order and human rights coalitions for the regulation of protest politics during the Brazilian cycle of contention from 2013 to 2016.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The global diffusion of repressive protest control models is one dimension of the crisis of democracy: ostensible policing, digital surveillance and restrictive laws. Since the 2000s, social movements scholars have been dedicated to explaining repression-mobilization nexus as a relational process. But, although new legislation is part of recent changes, the role of law as an contention arena has been under-theorized, whether for legitimizing the actions of state agents, or for containing the coercive power of the state by advocacy groups.

The literature on legal mobilization, in turn, emphasized law as a cognitive, symbolic and political resource for actors in conflict situations. However, it has disregarded, first, the arena of criminal law as a space for contention social movements-State; second, the broad repertoire mobilized in human rights campaigns beyond litigation, such as public denunciations, monitoring of State agentes, etc.

We build an analytical model considering the strengths and weaknesses of these two sociological traditions. We produce a synthesis of the conceptual debate (*cycles of contention, political/legal opportunities, contention arenas, contentious and institutional repertoires, transnational diffusion*). Our data result from a variety of methodologies: protest event analysis, network analysis, and socio-legal analysis of strategic litigation in criminal/civil arenas.

The paper aims to answer three questions. First: What changes did the Brazilian cycle drive in the repertoires of street protest, state control and human rights activism? Second: How the Brazilian state is responding to protests and how human rights networks are responding to repressive strategies combining political and legal strategies? Third: What social processes and mechanisms have drove the global diffusion and local adaptation/innovation of repression and human rights repertoires.

MACLEAN, Sarah* (La Trobe University, Australia)

A Socio-Material Exploration of Alcohol and Drug Service Provision for Young People

Recent sociological theorisations of addiction propose that alcohol and drug (AoD) use and problems emerge through contingent networks of forces, rather than pathologies in sovereign individuals. Similarly, changes that people make to drug use may be regarded as occurring through entangled relationships with people, places, objects, identities and meanings. This conceptualisation offers a productive way out of the dichotomy between individual self-control and addiction that characterises mainstream understandings of AoD use.

Our paper draws on thematic analysis of a longitudinal qualitative study. Participants were aged 16 to 23 and were engaged in Australian residential AoD services or day programs in Victoria, NSW and the ACT at the time of first interview. We conducted three successive waves of interviews over 12 months with a total of 38 young people, exploring their service experiences and trajectories.

We look closely here at young people's reflections on what services could do to enable them to better manage drug use and its effects on their lives. Critical to this was temporarily providing a safe and secure place to live; an environment which facilitated, for example, regularising of sleep patterns and an orientation to the future through removing the need to focus on day-to-day survival and drug acquisition. Young people were also linked with resources such as mental health support and housing services. On exit, ongoing 'check ins' from a range of staff knitted them into connections with stable and caring adults.

While participants also spoke of learning life skills such as relapse prevention, these were hard to implement in the absence of other resources. We conclude by recommending that policy approaches to mitigating AoD use problems encountered by young people attend to the importance of bolstering and maintaining material and social resources their lives.

MACLEAN, Sarah* (La Trobe University, Australia)

Drinking Alcohol at Home Feels Different to Drinking in Public Places

One of the properties that makes alcohol such an appealing drug is its versatility – the capacity users observe of generating different emotional and sensory experiences when it is used in different settings. Here, we provide a thematic analysis of in-depth interviews conducted with 40 midlife Australians who drank at home at least weekly. Using new materialist thinking and theories of affect, we show how the emotional states and bodily sensations afforded by drinking alcohol vary according to whether a person is situated at home or in a public setting, and also whether other people are present. In our participants' accounts, drinking at home was characterised by a sense of relaxation and deceleration, improved mood, reward and validation and enhanced forbearance, particularly when they were alone or with a partner. In contrast, they felt enlivened on drinking outside the house and more capable of social engagement. This was accompanied by alertness and a sense of need for some level of self-surveillance to ensure they did not encounter harm or embarrass themselves. For some, drinking outside the house also felt more volitional and less habitual than drinking at home did. We conclude that alcohol's effects must be understood as arising as part of dynamic configurations of factors. These are both human: such as bodies and meanings, and non-human; including

alcoholic substances and places. Grasping this, people consume alcohol to achieve affective states that are functional and pleasurable in the contexts where they find themselves.

Environmental Anxieties and Coping Strategies - Comparative Study of Poland, Ukraine and Hungary

Our contemporary society is confronted with new types of risks related to threats associated with technological progress and environmental damage. Environmental threats generate various types of anxieties that influence the decision-making process. They affect not only attitudes in social life but also the decisions and actions of public authorities.

Although many sociological theories are latently building on anxiety/fear, anxiety/fear is seldom the focus of theoretical analysis. Instead, it is considered to be a self-evident component of social phenomena. The focus on fear and anxiety also leads to many preventive actions to provide security, limiting peoples' freedom.

This research aims to assess what environmental anxieties and coping strategies can be identified concerning other perceived anxieties in Poland, Ukraine, and Hungary (PUH).

To prepare the preliminary list (to be used in the representative survey) of anxieties, including environmental ones, a review of surveys related to environmental anxieties that included PUH will be employed to create a preliminary list of environmental anxieties. We will conduct a qualitative content analysis on survey questions to identify the types of concerns, issues, problems, etc., about which respondents were asked. We will include international and national surveys conducted within five years (between 2016-2021), including the European Social Survey, e.g., Public Attitudes to Climate Change ESS8 2016; the Eurobarometer, e.g., Special Eurobarometer 513. Climate change etc.

Moreover, a representative survey using a Computer-Assisted Web Interview (CAWI) will be conducted. The CAWI survey will be based on the following: 1) a free-listing approach and 2) a structured interview. After answering the free-listing question, respondents will be asked about their anxiety toward particular threats identified in the qualitative-content analysis of earlier international and national surveys and their biographical context, professional background, and environmental perception.

Q-Deliberation As a Method to Study and Consult Environmental Issues

The natural environment can be studied concerning its physical characteristics or by referring to its social perception. However, they require norms and regulations that allow for their protection and efficient management due to the multiplicity of societal attitudes and views, including environmental resources use.

An efficient way to reconcile the interests of different social groups representing radically different views may be participatory methods, but although they seem promising as a means of facilitating the management of such issues, they are associated with a number of limitations discussed in the literature.

The purpose of this poster is to present and discuss the Q-deliberation method as a new approach to public research and consultation used to analyze residents' opinions on environmental issues.

Q-deliberation is a combination of the Q methodology, used to study narratives, discourses, and mental models, and deliberative polling, in which subjects are surveyed twice, between which they participate in thematic discussions under the guidance of trained moderators.

The Q-deliberation method is discussed according to the criteria of: 1) inclusiveness, 2) exchange of information, 3) influence on public decisions, which makes it possible to show its advantages as well as its limitations and thus further identify applications of the method to the study of environmental issues.

Senses of/in the City: A Speculative and Conceptual Exploration of Sensory Spaces of Play in the Digital City

The digital city is a space of sensory play that contains the visceral embodiment of digital pleasures (Smith et al 2019), extended or mixed-reality environments (Heemsbergen 2021) and aesthetic encounters (Maddox et al 2022). We observe the shift from only the platform economy to the mediated experience of a city, and articulate the ways in which that can be achieved (via the big platforms and otherwise) in social digital-physical connections. An embodied sense of the social in these spaces can be derived through unpacking conceptual work on social effervescence (Olaveson 2001), sensory playfulness, and digitally-mediated intimacies. We characterise these social moments of interaction, engagement and participation through intensities and immediacies of experience that involve intention and symbolic focus. Focusing on the sensory, playful, and digitally intimate cities space can also be understood as a way of inscribing desire lines in urban environments that can often be hostile to pleasurable and non-commercial forms of engagement (Smith and Walters 2018). Our approach creates a vector between the urban geography of a city, its digital architectures and a playful and pleasure-ful built environment that speaks, plays and resonates with residents in an experiential way (cf Sassen 2014). We argue that these vibrant moments of encounter in the digital city can drive creativity, place-making and a sense of belonging that manifest in localised ways.

MADHAVAN SARASAMMA, Jayakumar* (University of Kerala, India)

Back to Square One: Livelihood of Elderly Return Emigrants in Kerala, India

Kerala is known for the migration of the manual labourers to the GCC countries of the Middle East. Since it is a non-settlement migration, they have to return either on attaining certain age or on completion of employment contract. The size of elderly population in Kerala stands high (12.6 percent) compared to the national average (8.6 percent). The number of return emigrants reached 1.8 million in 2018, adding to the already burgeoning elderly. In this situation, the present study looks into the livelihood situation of elderly return emigrants using both quantitative and qualitative data. They migrated at their younger age and returned after long years of toiling in the host country supporting their family and contributing to the local economy. But they became a vulnerable and dependent social group after return. In Kerala, old age dependency ratio constitutes 19.6 percent and is higher than the other states in India. The returnees from the GCC countries added to the dependent elderly population. Thus, their livelihood raises serious questions as they are not adequately covered by specific social security measures. Since they spent most of their income for day-to-day maintenance of their family and for basic necessities like housing, education and healthcare, they did not have any savings. Since, they lost their income and are unable to work due to their physical inability or disease, their life after return is a great concern. Only very few were in a comfortable position so that they did not have to work. This situation demands pertinent policy and intervention from the government for their welfare.

ICT Mediated Intimacy: Virtual Co-Presence of Long-Distance Couples in Kerala, India

Interpersonal communication is the cornerstone of every social relationship, especially marital relations. Even if situated far away from each other, long-distance couples make all possible efforts to stay in touch with each other. Information and Communication Technology (ICT) contributed significantly to maintaining transnational social ties, especially between the long-distance couples. Kerala, the southern state of India, is well known for transnational migration, especially the migrants in the GCC countries who left their spouses behind. ICT mediated communication made revolutionary changes in their relationships through smart phones and other such devices. Consequently, both the migrants and left behind enjoy virtual co-presence and intimacy. Kerala tops in smartphone penetration in India (65 percent). The present paper captures the virtual co-presence and intimacy of the transnational partners facilitated by ICT mediated communication, using mixed methods. Phone calls, instant messaging, and video calling are the most popular modes of communication among long-distance couples. Video call acts as an alternative to direct face-to-face interaction and provide a sense of connectedness. It helps them see each other and understand each other's feelings and emotions from their facial expressions, gestures, and posture, and thus create a sense of co-presence among them. Frequent video calling helps maintain close relationship between the long-distance couples. It provides intimacy and fill the absence of partner and create emotional bond between them. Seeing the living conditions of each other presents the reality of the other side. Youngsters use video calls more frequently than the elders. Technical issues, location of partner, difference in time zone, mobility, audio and video quality and lack of privacy are the major limitations of video calls. Despite all these, regular video calls create virtual co-presence and intimacy and help fill the absence of partners.

Emerging Professionalization in Social Innovation. the Case of Early Childhood Education and Care in Barcelona

Professionalization is a long-standing heuristic concept in the sociology of professions, which has been extensively debated during the phase of the consolidation of the discipline. However, since the seminal contribution of Wilesky (1964), this concept has slipped away from the centre of the debate, as it was assumed that all the emerging professions would have followed the steps idealtypically represented by Wilesky on the basis of the experience set by the liberal professions.

However, the post-industrial transformation has impacted strongly on the domain of professions. Especially in welfare services, the increasing diversity of the users have determined a consequent need for new specializations and competences which goes beyond the traditional education offered within the established professional communities. Among others, the labour market participation of young mothers and the needs for reconciling work and family have given impulse to a strong growth in the offer for childcare under 3 years old. But not all the services follow an approach based on the school integration of the first childhood: socially innovative projects – as *madres de día*, *grupos de crianza compartidos* and *espacios de crianza* – claim for an approach based on a home-like environment of care, inspired by Montessori, Pickler and Waldorf. These professionals do not usually train in formal institutions, but they become professional in informal communities and training promoted by activists and engaged parents.

In this communication, we will contribute to the debate on professionalization by focusing on the case of social innovation in childcare 0-3 in Barcelona (2019-2021). Thanks to interviews with association representatives, policy makers, activists, educators and parents (tot=47), we will discuss what does *being a professional* mean in these projects and how their professionalization is occurring at the margins of the traditional system of professions.

Inte-21.3

MAESTRIPIERI, Lara* (DASTU/Politecnico di Milano, Italy)

Prosumption in the Early Childhood Education and Care

Prosumption is a concept that refers to those situations in which there is a blurring of consumers' and producers' work. Although marginally employed by the mainstream welfare debate, prosumption has been gaining ground in the analysis of local welfare provisions in which users are the more and more called to participate in service provisions and management by the progressive subsidiarization of services. However, the current scientific debate on the sociology of professional groups have underestimated the impact that the current prosumption trends might have on the professionalism of welfare professionals. The esoteric and detached position of professionals is now increasingly put in question by practitioners and amateurs that might have acquired the same expertise through practice and involvement.

This speech will stem from an empirical investigation of projects of social innovation in the Early Childhood Education and Care in Barcelona (2019-2021). Stemming from the over 50 interviews collected with activists, representatives, policy makers, educators, and mothers, I will show the potentiality of applying an analytical framework based on prosumption for the analysis of the communities of care that lie behind the ECEC socially innovative projects in Barcelona

Knowledge Management and Division of Labor in the Global Automotive Industry: Considerations on the Brazilian Case

This paper seeks to contribute to discussions on the role played by emerging economies of the Global South in the international division of labor based on the case study of the Brazilian automotive industry. After all, how is Brazil inserted in the global production network (GPN) of automotive vehicles? The study used a quantitative methodology based on official data on the Brazilian labor market, covering the period between 2006 and 2020. These data were analyzed through categories of types of occupation and types of economic activity, segregating automakers and auto parts suppliers. In result, the study identified that, in 2020, Brazil concentrated almost half a million jobs in that

industry, with 63.5% of these jobs in occupations directly linked to production and only 5.6% of "professionals in the sciences and the arts". The calculation of an occupational concentration quotient shows that the automakers concentrate proportionately more jobs related to research and development (R&D) activities than the suppliers. The results reinforce the perception that Brazil occupies an intermediate position in the automotive GPN, being responsible mostly, but not exclusively, for production activities. At the same time, the study reinforces the hypothesis that the need to adapt products to local markets puts pressure on multinational enterprises (MNE) to decentralize part of their R&D processes, transferring knowledge to subsidiaries and to local companies. There is, therefore, in global knowledge management, a tension between, on the one hand, the pressure for upgrading of actors and local institutional arrangements and, on the other hand, the effort of MNE matrices to centralize technology and decision-making processes. Finally, the study also points to the usefulness of indicators on the labor market and on types of occupation for the analysis of GPNs.

STAMM, Camila (Universidade Federal do Estado do Rio de Janeiro, Brazil)

The "Social Revolution of Maricá": Social Policy, Basic Income and Development of a Brazilian City

Maricá is a city located in the metropolitan area of Rio de Janeiro, Brazil. According to official data, its population has been growing at a fast pace: it increased by 109% in the last 20 years, reaching 167 thousand inhabitants in 2021. After the beginning of oil extraction in the pre-salt layer of the Brazilian coast, Maricá became the city which receives the largest amount of royalties in the country (more than 529 million dollars last year). Despite this, the city is characterized by having a poor population. According to the latest available data, 17.5% of families lived on less than half a minimum wage per capita per month in 2010. The city hall has implemented social policies such as free and universal public transport and one of the largest sub-national basic income programs in the world. Currently, a quarter of the population is beneficiary of the program and receives 200 reais (the equivalent of 39 dollars) paid in a local currency called Mumbuca, which can only be used in the city's commerce. In addition to income transfer, the program is a development policy, as the money transferred is spent entirely on the local economy, providing a virtuous cycle of growth. The objective of this study is to analyze the impacts of the social policies, especially the basic income program, on health, education and the economy of the municipality. The methodology used is quantitative, based on the use of official statistical data to calculate indicators such as: growth rate of the formal labor market, evolution of public revenue, infant mortality rate and school approval and dropout rates. This work concludes that investments in social policies cannot be seen as mere public spending, because, in addition to improving the population's quality of life, it provides regional economic development.

Growing Links between Digital Ag and Finance Capital in Canada: Examining the Cases of Veripath and Farmersedge

Scholars have recognized Digital Ag technologies and financialization as important vectors of agri-food transformation, yet little research has examined how these trends mutually influence one another. In this paper, I present case studies of two Canadian firms blending Digital Ag and finance capital in novel ways. Veripath is an established farmland investment company, with significant holdings in Western and Central Canada. It relies on Digital Ag technologies and platforms to monitor the performance of its properties, contributing to the 'assetization' of farmland and making farmland legible to prospective investors. FarmersEdge is a Digital Ag platform and service provider founded in Canada in 2005. Today, its operations nospan North America, Brazil, and Australia. The firm has received significant backing from finance capital, including the Fairfax group. Through document analysis and a systematic review of the financial and agriculture press, I analyze how these firms represent an evolving nexus between finance capital and Digital Ag, with significant implications for agri-food restructuring.

MAGNUSSEN, May-Linda* (University of Agder, Norway)

Emotions and Ruling Relations in Academia

I am involved in a research project in which colleagues and I explore the everyday work of associate professors at the University of Agder in Norway (UiA), including our own work. A lot of the work we make visible is emotional. Many research participants, including ourselves, for instance tell that we feel ashamed when we are not able to live up to objectified understandings of what a good academic is. Many of us also do work to hide that we are not living up to such ideals. Looking into central texts produced by the EU, the Norwegian

Research Council, the University of Agder etc., we find that knowledge development is reduced to a resource for primarily economic, but also social, development. Academics, on the other hand, are reduced to carriers of this resource. We are reduced to "brains", disconnected from bodies, from social relations to people outside of academia and to specific places. Ideal academics are described as free-floating, flexible and detached. Our attention right now is directed towards if and how this objectification shapes what happens at UiA, including the mentioned emotional work, and how we can resist it. The project is ongoing, and what I want is to think aloud, together with others, about questions concerning feelings and ruling relations.

MAHAJAN, Tarang* (Jawaharlal Nehru University, India)

Foregrounding Trauma and Embodiment in Ethical Feminist Research Modality

This paper attempts to explore the notion of research ethics and how that may set up several dichotomies, necessarily generating limited and hierarchical modes of knowledge production and a framework of research that alienates parts of both researcher as well as the identified participants experiencing different forms of violence. The paper does this, firstly, through personal reflections over the process of conducting interviews, the prescribed behaviour and attitude toward a participant, the skepticism regarding building a relationship and the confounding challenges of distressing and violent conditions in which the participant may be embedded; most of all the possible re-traumatizing of a participant and the consequences on the researcher in encountering such situations and listening as individuals with their own specific histories of trauma.

Secondly, informed by Walter Mignolo's and Maria Lugones' work on the decolonial option, the paper explores the insights surfacing through non-dual philosophies. As part of the author's ongoing doctoral research, a cross-cultural philosophical approach has provided a germane ground of conceptual rethinking of feminist thought and provoked questions regarding the need and mode of integrating trauma and embodiment in feminist research and activism, if even possible in the current institutional formation of social sciences.

This is an attempt to understand why such work sits uneasily in the terrain of methodology and requires as yet unexplored and unnamed ways of communicating and engaging. Two such approaches are explored; uncovering a relationship between the self and other by cultivating a radical 'no-self' subjectivity which is etched with responsibility, and that of trauma informed body work. Both are oriented as non-violent responses to violence and aggression, integrating individual comportment and community support, embedded in traditions of thought not easily available or visible in academic training and engender a caring and ethical relationship of knowledge sharing and building.

"I Just Want to Die": Reflections on Mental Health from a Cohort of Young African Graduates at the Intersection of Pandemic

From 2020, the global COVID-19 pandemic has resulted in estimated excess mortality in Africa. Lockdowns instituted in 2020 and 2021 impacted greatly on critical social determinants of health (SDOH), such as education, employment, housing, and food security. Studies conducted globally during the pandemic have suggested that population mental health has been adversely impacted by COVID-19 and that lockdowns may be attributable, at least in part, to changes in SDOH. However, there are major limitations to much of the extant literature on the mental health impacts of COVID-19. The majority of studies have been conducted in high income countries despite considerable differences in SDOH between high income and low-and-middle-income countries among other factors (e.g., in Africa the ongoing HIV epidemic, social unrest, gender based violence, climate disasters etc.). This paper reports on a 5-year longitudinal cohort study initiated in 2019 that focuses on youth outcomes as beneficiaries of a prestigious and holistic scholarship programme for young Africans. The study focuses on six countries (Ethiopia, Ghana, Kenya, Rwanda, South Africa, Uganda), providing a rare opportunity to investigate changes in mental health before, during, and after COVID-19 in low and middle-income African countries. Where the pandemic has created a state of precarity on the one hand, on the other, the pandemic has also helped people speak more openly about their mental health. This paper proposes to leverage the existing cohort to investigate the impact of COVID-19-related changes to SDOH on mental health and functioning among young graduates in Africa. Underpinned by intersectional theory, this contribution will help us understand how young African people navigate mental health at the intersections of race, gender, age, ethnicity, class and now - pandemic.

MAHROUSE, Gada* (Concordia University, Canada)

The Paradoxical Privileged Mobilities of Post-COVID-19 'Digital Nomads'

It goes without saying that tourism industries have suffered because of the global COVID-19 pandemic. The lockdown measures that ensued have also challenged the need for distinct workplaces and led us to see that many can work far away from where they live. The juncture of these two recent changes has prompted a few countries to issue special remote-work visas for "digital nomads" to bolster their economies (Gershman 2021). For example, in July 2020, Barbados started offering a "Work from Paradise" visa allowing remote workers to relocate there for one year (Robson 2020).

The idea of "digital nomads" whose lifestyles blur the distinctions between work, leisure, home, and travel is not new. However, as Hermann & Paris observe, the COVID-19 pandemic has significantly boosted the phenomenon and they predict it will continue to grow long after the pandemic ends. Moreover, focusing on digital nomads who relocate in the current context of travel restrictions and regulations offers new insights into governmental structures and social expectations regarding geographic mobility, entitlement, risk, and will also glean compelling insights on neoliberal lifestyles.

This paper considers these social and political contradictions brought about through these new visa regimes. Focusing on this new figure of mobility: *the post-Covid-19 digital nomad*, the article draws on interviews of those who have lived and worked abroad as digital nomads between 2020 and 2022. Moreover, in keeping with the session thematic of 'Paradoxes, Contradictions, & Controversies' and through a mobility justice perspective (Sheller 2018) I will consider how the geographic mobility for some is reinforced at a time when borders and travel are restricted for most.

RC50-691.4

MAHROUSE, Gada* (Concordia University, Canada)

The Tourist and the Refugee As Racialized Figures of Mobility

In recent years, artists and activists have provocatively juxtaposed the refugee "crisis" with the world of leisure and tourism. Examples include political artist Banksy's exhibition called "Dismaland" that included a coin-operated game where visitors could steer boats filled with refugees around a pond, or the graffiti inscriptions "Tourist go home/refuges welcome" that started appearing in popular tourist destinations in Europe (Peter 2017). However, with a few notable exceptions, academic research has yet to examine the conceptual and material links between tourists and refugees in the contemporary moment. Indeed, tourism is not an area of focus in the field of migration studies and similarly the refugee crisis is rarely addressed in tourism studies. This paper attempts to bridge that gap by focusing on the "two absolutely dichotomous figures – the wealthy tourist from the global north and the utterly disenfranchised refugee from the Global South (Pugliese 2009) the juncture of two mobile figures: "the tourist" and "the refugee" to also consider the mutability between them. That is, recalling Zygmunt Bauman's (1998) description of the figure of the tourist and the figure of the refugee (what he termed 'vagrant') as "two sides of the same coin," this paper to contribute to literature in the interdisciplinary study of "mobilities," or specifically "mobility justice" (Sheller 2018).

Specifically, I will make three related arguments: 1) that the figure of the tourist and the figure of the refugee are constituted by each other ; 2) that these two figures are racialized whereby the tourist is the mobile white subject/figure and the refugee is the Other whose mobility is suspect and must be restricted; and 3) that these taken-for-granted understandings organize and reproduce significant injustices in the contemporary world.

MAI, Yen* (Uppsala University, Sweden)

Youth Civic Actions in an Authoritarian State: The Case of Vietnam

This conference presentation examines the formation of youth civic identity with a specific focus on youth training programs organized by different Vietnamese civil society actors, such as local NGOs, social enterprises, and grassroots networks. These programs provide training and materials to aid different forms of youth activism such as youth participation in the LGBTQ movement, youth actions towards climate change, and youth projects aiming at education equality. Combining cultural sociology with the sociology of emotion, this micro investigation illuminates the backstage of social change, addressing how youth participants are able to find pathways for social transformation and identity development even in a social setting where actions that overtly challenge the state's authority are deemed problematic and highly repressed. Utilizing data collected from participant observation at two training programs and in-depth interviews with 31 young adults who engage in these programs, I show how participation provides Vietnamese youth a critical venue to access alternative feeling rules, cultural toolkits, and activist networks, through which they develop a sense of civic responsibility and the desire to contribute to the collective. This study constructs youth as main actors of social change, recognizing that activism in an authoritarian society can take on subtle forms

beyond protests and demonstrations. I argue that activism can be observed through training that provides youth participants with critical understanding of human rights, the laws, and different paths to development. This, accordingly, brings about a profound transformation in youth civic identity. The findings contribute to empirical understanding of youth civic participation in the Global South, advancing our understanding on the processes of social transformation within the limits of an authoritarian regime. It emphasizes that youth should not be regarded as passive recipients of participatory development; rather, they are active meaning-makers who intimately shape how social transformation unfolds.

It Takes a Farm to Destroy a Woman: The Violence of Trolling in the Philippines

Disinformation, fake news, and online attacks pervaded the 2022 Philippine elections. Leni Robredo, the former Vice President, and the lone woman Presidential candidate became the target of internet trolling. Compared to her nine male co-aspirants, trolls came after her - berated her intelligence, minimized her accomplishments, and tagged her as a communist sympathizer. The website Troll Exposer identified 102 trolls who shared the same propaganda against Robredo and many of these accounts were linked endorsing Marcos-related pages. Consequently, manipulated information changed voters' perception of their candidates.

Drawing from the content of selected troll accounts utilizing the Slovenian critical theorist Slavoj Žižek's notion of violence, this article analyzes how trolling leads to symbolic violence through online harassment and discrimination. Žižek (2008) begins his analysis of violence by characterizing systemic violence as the violence inherent in a system, not only referring to direct physical violence but to "forms of coercion that sustain relations of domination and exploitation, including the threat of violence". He details systemic violence into three modes: subjective (crime, terror) objective (racism, hate-speech, discrimination), and symbolic (embedded in the language itself). Robredo's election loss implies that Filipinos' naivete in authenticating and verifying information was preyed upon by trolls. Moreover, factors such as culturalism and sexism played a significant role in why Filipino netizens have the propensity to believe dubious sources.

Measuring Contextual Variation in Older Adults' Quality-of-Life Cross-Nationally: Challenges and Opportunities

Demographically, the globe has experienced a (likely) irreversible transition wherein for the first time in human history, older adults outnumber children. This transition has already slowly occurred Europe and the United States, is happening rapidly in Latin America, Asia, and is likely to eventually occur in Africa. Although individual-level characteristics are crucial to understanding quality of life among expanding aging populations cross-nationally, scholars are increasingly exploring the role of context in shaping well-being. This trend is fueled by wider availability of data and linkage options, particularly cross-nationally. A majority of prior and existing work in this area includes comparisons by continent (e.g., Asia, Europe), within continent (e.g., Southern versus Northern Europe), across countries (within or across continents), within a single country (e.g., rural versus urban), or within a metropolitan area (e.g., neighborhoods within a city). Although these types of comparisons allow for a greater understanding of a multitude of cultural, economic, policy-related, and other factors, empirical work remains methodologically limited by a lack of standardized within-country, regional identifiers. In this paper, I first provide an overview of existing work on contextual influences of quality of life among aging populations cross-nationally and outline current barriers to measuring "context." Second, I argue for a workable, methodological operationalization of "context" that incorporates geographic, cultural, political, economic, and other forms of available data from a multidisciplinary perspective. Specifically, I propose avenues for the creation of standardized within-country regional identifiers based on meaningful cultural-geographic distinctions that draw on available data sources. Although only a conceptual proposal at this point, the creation of this type of standardized identifier would be a revolutionary tool in measuring "context" and identifying nuance in individual-level, cross-national datasets of aging populations, especially enhancing the utility of the harmonized sister-studies in the Gateway to Global Aging Data database.

An Approach to Digital Sensibilities from Theoretical Contributions of Norbert Elias

Norbert Elias, from his notion of civilizing process, delves into the ways in which social transformations have modified the emotional behavior and experience of human beings, the regulation of emotions and the structure of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

human manifestations. In his work "The process of civilization, sociogenetic and psychogenetic research", he problematizes the relationship between the direction of changes in the emotional and control structures of human beings and the structural changes of society as a whole, stressing the individual-society dichotomy.

In this line, in the face of the process of social change that is happening to us at a planetary level, based on transformations 4.0, it becomes essential to ask ourselves about the process of structuring emotions in social networks. The so-called revolution or society 4.0 alludes to a new paradigm of production, characterized by a process of digital transformation and technological progress that caused mutations in the social relations between subjects and therefore in the forms of social structuring. This new alternative form of the previous industrial dynamics takes place from the emergence of microelectronics, computer science, biotechnology, the Internet of Things, Internet of Services, advanced robotics, artificial intelligence, additive manufacturing, simulations, Big Data, cloud manufacturing, nanotechnology, cybersecurity, smart drones and augmented reality (Nagao Menezes, 2020).

It is at the intersection/convergence between industry 4.0 and the globalization of digital consumption where new properties of the politics of current sensibilities are elaborated (Scribano, 2019; 2021) and assuming that the logics of the structuring of sensibilities vary according to to the space-time logics, the proposal of this paper consists in problematizing the current digitalization context, specifically the social dynamics that is expressed in Instagram, from the emotions´s theoretical contributions of Norbert Elias.

Social Justice and the Subject-Based Curriculum: Socio-Academic Distribution and Status Hierarchy in the Making of Curriculum Inequality

Curricular justice is a critical element of social justice in education. Across education systems, its realisation faces various obstacles, the nature of which varies across curriculum types and levels of education. In the schooling years, universal access to socially significant knowledge is generally considered as a leading principle of curricular justice. In the subject-based curriculum, this principle is translated into aspirations for equal access to the bodies of knowledge deemed central to young people's learning. In this paper, I explore the usefulness of theories of distribution and recognition to understand the role of the curriculum in educational inequality. The study draws on empirical data from the senior high school curriculum in Australia, where students select a collection of subjects to complete their high school certificate. The analysis reveals that participation levels are unequal across curriculum areas: whereas most student study English, mathematics and science, only a small proportion learn technology, a non-English language, industry or information technology subjects. Statistical modelling indicates that these patterns are constituted at the intersection of social differences between students—in gender, social class and academic competence—and the structures of the school system—including schools' sector and geographical location. Theories of distribution and recognition are called on to explain these findings. I argue that the role of curriculum in educational inequality arises from status hierarchies between subjects and curriculum areas, on one hand, and socio-academic inequalities in opportunities to succeed through these subjects and curriculum areas. The unequal recognition of different subjects and curriculum areas in university selection underpins their unequal value in the senior high school curriculum. Meanwhile, curriculum contributes to inequalities through distributional inequalities in social access to academic competence across the curriculum. I contend that theories of recognition and distribution are both needed to understand how the curriculum contributes to educational inequalities.

The Unfulfilled Promise of Education: A Longitudinal Analysis of Young Australians' Education and Work Experiences across Two Generations

Longitudinal research is a powerful tool for analysing youth as a dynamic life stage. When conducted with chronologically successive groups of young people, it also allows researchers to analyse change in objective and subjective social experiences, as young people navigate shifting opportunity structures and make and remake aspirations and relations. The use of longitudinal methods across youth cohorts is thus uniquely positioned to make sense of social differences in youth experiences both within and between cohorts. In this paper, we explore social differences in the education-work nexus for two cohorts of young people. We draw on Life Patterns, a mixed-method and multi-cohort longitudinal study of young Australians who are followed from school through their transition to adulthood. We examine how these successive cohorts relate to their own education and work journeys through an analysis of satisfaction with educational outcomes and labour market trajectories. This two-cohort research design helps us examine between-generation differences in youth experiences of education and work, amid a decoupling

of the education-work nexus for young people over the last thirty years. It also allows us to explore within-cohort differences in experiences of education and work, especially as these experiences as stratified based on gender and educational qualifications. We find that young people who finished school in the late 2000s and those without university qualifications are less satisfied with their education and work outcomes at age 30 compared to young people who left school in the early 1990s and university graduates. Since the expansion in young women's educational participation has driven Gen Y's higher level of qualification compared to earlier generations, we argue that gender inequalities and the enduring deterioration of the youth labour market have belied the promise of personal fulfilment through education for young women.

Pandemic and Online Chess Boom: Creation of a New Digital Community in Indian Sports

The COVID-19 pandemic and the near global lockdown that followed, meant that most sporting activities including over the board chess tournaments, were cancelled. However, online chess across different digital platforms thrived as new players, streamers and audiences started taking to the game. In India, the coming together of comedian-streamers and chess players who began live-streaming casual games and major tournaments in an entertaining fashion attracted a newer, younger fan base to the sport, which had been till then largely considered an intellectual affair. The massive digital transformation meant new formats and concerns, as well as new opportunities.

The growing Indian fan-base meant a larger market for the sport in the country, greater interest in the Indian players from international tournament organizers, and ultimately, led to the organization of the Chess Olympiad 2022 by the International Chess Federation (FIDE) in Chennai, India. More interestingly, it brought about a digital fan community which in often extended beyond just the sport. With social media, the fans could not only interact with players and content creators, but also with each other, coming together as a community – channelizing anxieties and uncertainties of the pandemic, forging new friendships, organizing charity events.

Using interview methods and cyber-ethnographic tools, this paper will try to understand the experiences of new chess fans who started following the sport during the pandemic. I will also look at the perspective of the chess players and streamers, and what they feel is the impact of this on the sport itself. In doing so, the attempt will be to understand the dynamics of such a digital fandom. The wider aim of the research is to look at the coming together of sports and digital media, and the new complexities and processes arising out of it.

The Internet, Storytelling and a Sociological Exploration of the Digital

Telling stories is a basic human activity and sociologists have always been interested in the storytelling as a tool to understand the lives of the people they are studying. With the development of new technology, be it radio, cinema or television, new forms of storytelling emerge which leads to new sociological research. Different scholars have studied various kinds of stories and storytelling practices – myths and folklores; readership patterns; audience reactions; trends and fashion inspired by cinema; and several other themes.

With the advent of digital media, not only have our modes of communication changed, but storytelling has also found new forms and platforms. The internet, today, is a thriving platform for telling different kinds of stories, and a sociological study of digital storytelling becomes much needed. It allows not only to explore storytelling itself, but can help understand better the present society in which the internet has become ubiquitous. It opens up new areas of sociological sociological enquiry – about the social actors involved in the process, the storytellers and listeners; their social positions; method and medium; access and barriers; context and impact.

This paper draws from various scholars of digital sociology (such as Manuel Castells, Robert Latham, Saskia Sassen), scholars who have studied storytelling (like Walter Benjamin, Claude Levi-Strauss, Veena Das, Roma Chatterjee) as well as my as well as my own doctoral research on transmedia webseries. The attempt is to understand the relationship between society, technology and storytelling in the present era of the Internet – a digitized, global world, where most social processes, including consumptions, production, communication, have some element of the digital embedded in it. In such a scenario, it becomes all the more important for sociology to study the digital if it has to be a true study of the society.

union membership, the information economy, and the role of technology. The 'convenient and efficient' model of doing business the smartphone-based app companies indulge in results in precarious working conditions. In India, the precariat is reconfigured from the pre-existing social inequality, primarily thriving on the caste system. Workers may now have more access to technology than ever before, which they use to upskill and get hired into the labour market. However, the work arrangements done by algorithms nudge them to work beyond their limits mainly at a significantly low cost with a high risk of physical and mental injury. This article thus further identifies the knowledge gaps on the patterns of workers' organising in the past and present.

MAKHETHA, Trevor* (University of the Western Cape, South Africa)

Reimagining Sociology of Education in South Africa: Toward a Radical Praxis

"There is no Sociology of Education in South Africa!" remarked a participant at a recent meeting of the South African Sociological Association. This assertion emerged during a discussion which considered a new working group dedicated to sociological research on schooling. This statement was both startling and telling of the apparent state and status of this sub-discipline within Sociology in South Africa. While the statement could not be more incorrect, such a notion is indicative of broader narratives concerning education in South Africa. For example, Amnesty International recently declared the educational system in South Africa to be 'broken and unequal.' Yet, South Africa is home to some of the most vibrant and internationally recognized scholars, practitioners, and journals. Moreover, some of the most cutting-edge innovations in education have been produced in the country. Perhaps this disconnect between what is produced at our universities and research institutes and the larger educational system – specifically, public sector/ state-funded schooling – is the aftershock of centuries of segregated education. Reimagining the Sociology of Education in South Africa and Africa is therefore not only timely but necessary. In response, I propose a reconfiguration of what a reimaged Sociology of Education might look like. More specifically, these propositions will answer the following questions: (i) How might we leverage sociological insights to reimagine education in South Africa? (ii) How sociologists might develop research agenda(s) to deepen and extend scholarship of education (iii) How we might use sociology as a discipline to inspire/cultivate a new generation of scholars/activists/practitioners. This contribution endeavours to extend current debates about the role and position of the Sociology of Education globally.

The Price of Care: A Reflection on Work in Childcare and Elderly Care in France

The aim of this paper is to argue how care work can be decently remunerated by examining the case of domestic work in childcare and elderly care in France. There exists abundant research on the question of care and the working conditions of care workers. Many point out the difficult and underpaid conditions of this work, which is mainly performed by women. Some consider this problematic because care is frequently associated with women and domesticity.

A close study conducted of care work in France through a field survey reveals, however, a different configuration with respect to care work: Decent working conditions and rewards are possible in a specific circumstance wherein i) the government intervenes with the public policy through labour laws and subventions; ii) there is more demand than supply, and demand consists of a population wealthy enough to buy the services; and iii) the care requires a full-time worker due to its nature entailing constant attention.

Because of this specific condition, many registered childminders in Paris are able to work at home with working hours adapted to their family life, while also earning a relatively good salary, regardless of their poor educational background. On the other hand, elderly care workers are often compelled to work fragmented working hours, divided between one user's home and another. Most of the time, their salary hovers around the minimum wage fixed by law.

The Formation of Localities in the Practices of Deurbanization Mobility: Analysis of Sociocultural Transformations of Rural Areas Cases 2020 – 2022

Over the past years, we have designated a trend: external epidemiological, political, socio-cultural and technological events allow the city dweller to stay away from the physical city space and create their own ecosystem of actions and experiences around them, but outside the city.

For example, 2020 COVID-19 pandemic had a significant impact on migration flows in the Russian space: the factors attracting the population to megacities have reduced their impact, giving rise to centrifugal factors, which in turn led to an increase in atypical migration processes, primarily to massive the outflow of citizens to out-of-town spaces. We underline the special issues of so-called "crisis deurbanization" and the study illustrates the specific conditions and circumstances of migration process in several waves of the pandemic in 2020 – 2022.

The so-called "second homes" of the townspeople from now on fully began to combine recreational, "quarantine" and work functions, which allows them to be used for long-term residence during the crises and after the end of it. This clearly indicates the prospects for the formation of settlement clusters of immigrants from megacities in the future.

The purpose of the work is to unlock the potential of locality production as an alternative approach to conceptualizing the phenomenon of deurbanization mobility. We focus on moving from urban to non-urban spaces, professional activities of the settlers, and their interaction with social environment and examine the "production of locality" concept — the transfer of the meanings of urban life to the out-of-city space and the emergence of a new life world.

Socio-cultural transformations occur and capture the material environment, which resource and ideologically determine the new format of life of both: immigrants and spaces around them.

Mutual Learning Is Possible? Practical Evidence of a More Equal International Development Cooperation

In recent decades, global society has oriented international development cooperation toward a paradigm shift; pursuing less hierarchical cooperation, moving beyond donor-beneficiary logic and assuming that of partnership, is one of the goals of this transformation. Several interventions promoted by the United Nations and the OECD have pushed in this direction, encouraging a kind of cooperation aimed at promoting human development and protecting the fundamental rights of human beings. With this framework in mind, this study seeks to analyze an emerging concept in the literature on cooperation: mutual learning. Since sociological studies on this concept are still very limited, a qualitative research was conducted with the objective of exploring the concept of mutual learning and verifying its presence in the practice of cooperation. The research project was implemented in two stages: firstly, 21 semi-structured interviews were administered to key informants working in different sectors of cooperation (public-government, private for-profit and non-profit, academic) with the purpose of producing a theoretical-empirical definition of mutual learning. Secondly, a documentary analysis of three types of documents (project proposal, concluding report, and evaluation report) was carried out on rationally selected cooperation projects, promoted by Italian NGOs in different developing countries. Therefore, the study intends to present two sets of results: (i) the indicators of mutual learning derived from the first research phase, useful for identifying its presence in the empirical reality; (ii) the innovative aspects that emerged from an initial verification of these indicators in the practice of cooperation, on the basis of which a new definition of mutual learning and additional indicators were produced. Analyzing the concept of mutual learning from a theoretical and empirical perspective in North-South relations – which by their nature asymmetrical – makes it possible to enhance the equal perspective of cooperation promoted since 2000 by different international development actors.

Tipping Hats, Riding Coattails: Intertextual Reference Networks in American Country Music

This paper analyzes reference networks within the lyrics of American country music. References to icons, heroes, and ancestors provide rich material for narrative construction of self and one's imagined community. Popular culture provides a potent distribution network for these narratives, while simultaneously developing its own internal mythology. But while the content of these retroactive constructions is often examined, it is rarely possible to provide a longitudinal, structural analysis of the dialogic processes that converge into shared meanings and icons. This paper examines this phenomena, using a dataset of 61,000 American country music songs from the past 60 years to investigate artists' use of lyrical citation of peers and predecessors, as part of a complex process of meaning-making at the individual and cultural levels. A network analysis of these references reveals the emergence of reference clusters corresponding with cultural and political positions, iconic focalization on certain artists, and the key actors in driving this process. Textual analysis of the lyrics that constitute the connections reveals the way in which some artists – especially those marginalized within the field – use these references to construct claims to legitimacy, while others use them to police the current state of music or society with reference to the imagined judgment of iconic forebears. These findings are discussed in relation to the rightward political shift of American country music's presumed audience.

MALAINA, Alvaro* (University Complutense of Madrid, Spain)

A Constructive Criticism of Social Complex Systems Modelling from Gilles Deleuze's Rhizome Theory and Bruno Latour's Actor-Network Theory

A complex social system (Gilbert and Troitzsch 2005, Epstein 2007) is generally defined as a self-organized system of reflexive and intentional human actors (individuals, groups, organizations, among others) that, in their nonlinear local interaction, elicit the emergence of global properties that are not reducible to these individual actors: structures such as the State, language, the market, cities or social phenomena such as urban segregation or cooperation.

In our paper we elaborate a constructive criticism of the anthropocentric common theorization of social complexity that serves as the basis for the multi-agent modeling of Complex Adaptive Systems science, as well as of its systemic closure that serves to run its simulations and models.

We base our critique on Gilles Deleuze's rhizome theory and Bruno Latour's actor-network theory.

From the Deleuze conceptual framework of the rhizome, we propose that the social complex system should not be closed in a coherent holistic unification but should be apprehended instead as an expansive multiplicity characterised by a subtraction of unity from the system (n -1), which at the same time does neither reduce it to its parts, overcoming the dilemma between the One and the Multiple.

From Latour's actor-network theory, we posit that the non-holistically unified social system must emerge from an acentric and expansive network of heterogeneities that is not reduced to self-reflexive human agents but also incorporates, on an immanent level, of ontological equality, non-human agents (actants), thus amplifying horizontally the system's own internal complexity and its internal network of interaction and agency, always open to new connections.

The complex social system understood from this perspective would therefore not be reduced to computational modeling and simulation and should thus resemble more an "image of thought" like Deleuze's rhizome, as a map of non-unified and expansive multiplicities, within a social theory open to complexity.

MALAINA, Alvaro* (University Complutense of Madrid, Spain)

The Implications of the Ontological Turn in Sociological Theory: A Necessary Debate

The so-called "ontological turn" (Holbraad and Pedersen 2017) has recently opened an important debate in anthropology, based on the work, among others, of authors such as Descola (2013), Latour (2007) and Viveiros de Castro (2014). It could be understood as a radicalization of decolonial theory, in the sense of proposing that Western modernity based on the ontological separation between nature and culture would not be a representation of the world or culture imposed on others through processes of colonization and later modernization and globalization, but a world or ontology that would have been imposed on other worlds or ontologies based on a non-distinction between nature and culture, the human and the non-human, such as the Amerindian and Southeast Asian animist ontology.

We understand that its implications in social theory have not yet been sufficiently explored in sociology beyond the debate in the anthropological discipline. In the current context of ecological crisis we understand that opening the reflection on the ontological turn in sociology is an urgent need. Sociological theory arises with Western modernity itself and would have incorporated as an unquestioned epistemic a priori that particular ontological root that Latour calls the "modern constitution", based on the separation between culture and nature. The difficult self-reflective debate in sociological theory about the ontological turn would instead be crucial today, since urgent problems such as climate change and its anthropogenic root could derive from that modern ontological premise that understands human society as separated from nature. Contemporary sociological theory should also take very seriously the question of ontology already opened and posed in anthropology, opening up to new critical theoretical configurations of the relations between the human and the non-human, beyond the usual conceptual frameworks of culture or epistemology, as an awareness of a "pluriverse" (Escobar 2018) of different enacted worlds.

MALALLA, Sahr* (University of Victoria, Canada)

Settler Colonial Surveillance in Canada's Federal Prisons: Engendering Erasures through the Use of Actuarial Instruments in the Security Classification Procedure

In Canada's federal prisons, security classifications (minimum, medium, or maximum) are used by Correctional Service Canada (CSC) to determine a prisoner's penitentiary placement and "correctional plan", based on an identification of "criminogenic needs" that are targeted for intervention (Andrews, 2000). Classification decisions are reached, in part, using an actuarial risk assessment tool, the Custody Rating Scale (CRS), an "objective" instrument comprised of 12 items that are scored by an assessor and calculates a prisoner's recommended security classification level. This practice is characteristic of the "new penology" in which prisons operate; a framework that espouses an actuarial discourse that prioritizes probability, risk, and managerialism to achieve efficiency and standardization within a system (Feeley & Simon, 1992). Critics of the CRS caution its use, having demonstrated that Indigenous female prisoners are being overclassified (Webster & Doob, 2004). CSC has undertaken revalidation studies of the CRS to determine its predictive ability for Indigenous prisoners, consistently concluding the CRS is valid and reliable (see e.g. Barnum & Gobeil, 2012; Gobeil, 2011).

I argue that CSC legitimates the continued use of the CRS by appealing to justifications grounded in an actuarial rationality that simultaneously engenders colonial erasures, consistent with a "logic of elimination" inherent in settler colonial societies (Wolfe, 2006). Through an exploration of the myriad of ways in which CSC occludes Canada's settler colonial history through its revalidation studies of the CRS, how CSC supports the cultivation of Indigenous subjectivities into specific forms (Klein, 2020) and how CSC exhibits "settler moves to innocence" (Tuck & Yang, 2012) are rendered intelligible. Taken together, CSC's utilization of actuarial instruments as a surveillance mechanism to classify and locate "undesirable" behaviour evinces the State's reach in its attempt to "transform" Indigenous prisoners to align with the responsibilized, neoliberal actor and, in turn, maintain settler dominion (Klein, 2020).

Social Innovation in Education

This article presents different perspectives of social innovation in education, focusing on formal education and problematizing the lack of concepts, recognition, integration and acceptance of social innovation in education. A definition of social innovation in education introduces three different dimensions: level of innovation, type of education where the innovation emerges and types of social innovation in education. This paper recognizes that an open question in social innovation in education is how to analyze educational innovation with a systemic approach. More empirical research on social innovation in education is crucial to better understand how innovation in education occurs, how actors co-create new models of education, how innovation networks in education are constructed and what new forms of governance in education are being implemented in different countries. This paper highlights the role of civil society in educational innovation as a means to modernize the education system through new social practices.

Alienation and Authoritarianism Today: A New Phase of the Neoliberal Counterrevolution

This paper engages Herbert Marcuse's work of the early 1970s (*Counterrevolution and Revolt* and the 'Historical Fate of Bourgeois Democracy'), putting them into dialogue with current commentators who have reflected on how systemic forms of extreme alienation under neoliberalism have enabled the rise of populist authoritarianism within existing liberal-democracies today. Specifically, I want to look at how Marcuse's work of the early 1970s maps reactions to these more extreme forms of alienation (both from above and below), including what he termed a counterrevolutionary 'proto-fascist syndrome', within western liberal-democracies as the New Left waned. The paper will discuss how a number of journalists and theorists have implicitly or explicitly taken up, in a kind of debate with Marcuse's 'ghost', aspects of Marcuse's analysis in their own critiques of neoliberalism today. I argue that, with Marcuse's analysis as a backdrop, we are witnessing a shift to a new phase of the neoliberal counterrevolt – advanced neoliberalism. Revisiting how Marcuse saw the relationship between forms of alienation and authoritarianism can illuminate recent discussions of how liberal-democracies globally are turning into an illiberal 'New Despotism" today.

Impact of Migration on Mountains with Special Reference to Uttarakhand Himalayas in India

Migration is an age-old phenomenon but these days it has become an integral part of life of the people across the globe as an immediate alternative to get rid of scarcity of resources. Out- migration is acute in mountainous

region as the area is not conducive for living. An example of out-migration and its impact on the mountains is cited in this paper from the state of Uttarakhand in the sub- continent of India.

The bald mountain and infertile soil without irrigation facility in the sloppy land no way support the growing population in the mountainous regions Moreover, there is hardly any employment opportunities in non-farming sectors. Uttarakhand is called an abode of natural resource, the abundance of beauties, the hill stations and the famous pilgrimage centers are the prime tourist destinations of India. However, there are regional disparities and inequalities.

The studies show that migration ensures sustainable development in the mountainous regions not only reducing people's sufferings but also contributes towards a sustainable environment as reduces human pressure on land water and other resources. The positive outcome of migration is manifested as the migrants bring prosperity like improved living standards, education and after all money the migrants no more bear the unprofitability of agriculture as a result of the destruction made by the wild animals and natural calamities. Tejam village study show the people with wealth, ideas, talents and exposure prefer to leave the village for better opportunities and the non-migrants are the poor and incapables.

The paper is an attempt to highlight issues related to the migration such as; overburden of the women, deterioration in agricultural activities, migration reminds how the migrants walked thousand miles during COVID-19 period in 2020.

MALLICK, Sambit* (Indian Institute of Technology Guwahati, India)

Gene Editing of Livestock: Implications for Science, Technology, Innovation and Development Policies in India

This paper focuses on India's stand on the global controversies over genetic engineering in agriculture and allied fields in the context of the dichotomous positions of the US and the EU, and thereby investigates India's national experience vis-à-vis the influence of transnational forces. India's biosafety regime – the regulatory apparatus in place tasked with policy decisions including matters pertaining to the application of genetic engineering and agricultural biotechnology, in general, and its role as an independent provider to science, technology, innovation and development policies assumes greater significance. In this context, it is important to question the science dictated by the State-Capital nexus, which lies in its cognitive, ethical, economic and political manifestations. The GMOs have been accompanied with the promise of a more productive agriculture. With that promise comes ethical dilemmas, environmental issues and the emergence of risks that remind us of the dangers ahead. We examine the economic, cultural and political implications of increased corporatisation of seed production and the contending interests, norms, meanings and values associated with different stakeholders in the product patent regime in India. The purpose is to examine the myriad practices through which farming communities are attempting to reclaim the "commons" through acts of repossession by holding aloft the spirit of equity, diversity and inclusion.

KEHROLOGOU, Katigo* (Dept of Geography, Harokopio University, Greece)

Housing and School Choice in a Lower Middle-Class Neighbourhood of Athens

Households with limited resources in West European or US cities often prioritize access to better quality schools at the expense of housing standards. This trade-off is not relevant in Athens, where the housing market is rather inflexible, residential mobility among the lowest in Europe, and no evidence relating residential location to school quality. Residential location in Athens is usually the outcome of inherited housing property and family self-help networks. Therefore, school choice is usually based on an existing and non-negotiable residential location.

Residential location and school choice are not the same for different social groups. The more affluent usually live in areas where the quality of schools is high. When they don't, they usually choose schools, even at a long distance. Households with limited resources, usually make choices within their neighbourhood, and those with more cultural capital try to choose better options among local school units.

The case we will present is about school choice within a lower middle-class neighbourhood of Athens, close to the city centre. Our data originate from an ethnographic research including participation for a year in a class of 16-year-old pupils at a professional education school, and from interviews with pupils of the same age at the local General Lyceum. Findings up to now show that the professional option is exclusively adopted by immigrants' children, while native Greek clearly avoid it. The professional option is in a mood of stagnation and entrapment in an educational impasse, worsened by limited language skills, disincentivized teaching staff and frequent dropouts. We assume that school segregation can coexist with social and ethnic mix, even though the latter should not be taken for granted due to micro-segregation issues which are often neglected.

Community Experiences of Extractivism in Tripura, Northeast India

Like many other tribal regions in India, attempts to search and extract natural resources within Northeast India are intruding into the ancestral land of Indigenous tribal people. Moreover, the extractive industries and the corporations such as oil, gas and mining are poorly managed. Therefore, the Indigenous tribal communities began to experience environmental hazards, local economic collapse, community land loss, and displacement. Such experiences are often related as 'resource curse' by primarily distinguishing it as the economy-centric model of modernity by adhering to capitalistic/neoliberal agenda. This model has possibilities to reduce state responsibilities towards its society and people, while on the contrary, privileging the space for corporations to further extract resources from the forest-adjacent land of Indigenous tribal communities. By observing the changing reality in the region, in this paper, we examine the recent practices of natural resource extraction on the ancestral land of Indigenous tribes of Tripura. The paper dwells on the following questions: what adversity has the politics of extractivism brought into Indigenous community's life? How did the community continue resisting for their own survival? What are the emerging complex relations between the state and the local Indigenous tribes vis-à-vis the extractivist politics? Pondering on the above questions, we make an attempt to unravel the everyday stories of dissent and negotiation against extractivism by the Indigenous tribal villagers of Tripura. By using ethnography fieldwork, we based our reflection on their lived experiences of extractivism, such as before and after the operation of resource extraction in their territory.

Work-Family Conflict (WFC) and Working From Home (WFH) during the COVID-19 pandemic: Information Technology (IT) managers in the Sri Lankan IT industry

Although Work-Family Conflict (WFC) has been widely explored in various research contexts, I have yet to form a precise understanding of WFC during the COVID-19 pandemic, especially in the Sri Lankan Information Technology (IT) industry. Boundary theory posits that individuals create physical, temporal, emotional, cognitive, and/or relational boundaries to separate work and family domains. Work-family border theory also posits that an employee crosses the border between work and family domains routinely. However, some portions of the theoretical explanations of boundary theory and work-family border theory were no longer relevant when organisations introduced WFH as a result of the COVID-19 pandemic. Some of the reasons for this were the disappearance of the physical boundary between work and family domains as there was no border for them to cross between work and family life. The WFC experienced by IT managers during the COVID-19 in the context of boundary theory and work-family border theory is a novel area of research. Thus, the study aims to understand the WFC of IT managers during WFH induced by the COVID-19 pandemic. Data were collected online in three stages from 25 IT managers who worked at home during the pandemic: primary interviews; audio diaries; follow-up interviews. The sample consisted of seven female IT

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

managers and 18 male IT managers. Thematic analysis technique was used in analysing the data. It was seen that IT managers experienced WFC caused by time-based, strain-based, and behavioural-based factors when they were WFH during the pandemic. Findings also indicated that culturally defined gender roles in Sri Lanka created a difference between WFC experienced by female and male IT managers. The findings contribute to boundary and work-family border theory by revealing that even though there is no physical border to cross daily between work and family domains, WFC can be experienced strongly.

A Rapid Review on the State of Medical Sociology Literature in the Philippines

Medical sociology aims to understand the social conditions as fundamental in producing, maintaining, and alleviating health inequalities and inequities in an identified community. As a subfield of and within sociology, medical sociology as a formal discipline in the Philippines is relatively nascent yet ubiquitous in the literature – tackling issues such as social capital and health, education, gender, race, stigma, and life-course approaches, all within the greater sphere of public and physical health. While the field is highly institutionalized in Western societies, local literature has only been emerging. This research aims to discuss the state of medical sociology literature in the Philippines, its importance in the social construction and experience of illness, and its effect on healthcare professions and the healthcare system itself. Through this rapid literature review, I identify the importance of highlighting the qualitative experiences of patients as a tool to explore phenomena at the intersection of the social and the clinical. Ultimately, I argue that this rapid review shows great possibilities for the growth of medical sociology as an established field of study in the Philippines – bourgeoning in the marriage of medicine and public health with the social sciences.

Challenges and Advances in Universal Health Care Implementation: A Case Study of Selected Healthcare Practitioners in a Tertiary Hospital in the Philippines

Since the Universal Health Care (UHC) Act was signed into law in 2019, the Philippine government has aimed to ensure quality health care for all Filipinos by automatically enrolling every citizen into the National Health Insurance Program. This current health sector strategy builds upon decades of reforms that hoped to solve the issues of a broken service-delivery mechanism - where inequity persists in access to essential health services and health outcomes across regions and provinces. Three years since, everyday Filipinos have yet to fully avail the effects of this landmark legislation, putting an undue burden on government-funded hospitals that aim for sustainability, especially amid a global pandemic. Examining a tertiary hospital in the Philippines through the lived experiences of its personnel, this paper will discuss the challenges in implementing population and service coverage amid an apparent lack of government support and its prospects toward full coverage for every Filipino. Analysis of transcripts of key informant interviews conducted during the research would reveal that while the Philippine government has provided the backbone for universal coverage, bureaucratic structures and lack of government prioritization have led healthcare workers to be stuck in an agentic gridlock between macro-level government processes and microlevel everyday experiences with patients.

"the People Who Care ... Are Vaccinated": An Intersectional Analysis of Inequalities in Responsibility to Prevent COVID-19

The arrival of COVID-19 vaccines in Canada marked the first time in recent decades that *adult* vaccination became central in public health discourse. COVID-19 vaccines were promoted as a way to reduce infection and end pandemic restrictions, evoking feelings of hope and responsibility to get vaccinated. Canadian public health institutions made efforts to ensure vaccines were accessible and various local organizations worked to fill gaps in accessibility (e.g., vaccine clinics for various oppressed communities). However, public and health discourses prioritized individual objection as the main barrier to high vaccine uptake.

This study explored how oppressed individuals, including Racialized minority and Indigenous Peoples, perceived their personal responsibility to access vaccines in contrast to the Canadian state's responsibility to make COVID-19

vaccines accessible. We gathered perspectives in qualitative interviews (N=27) at a time when vaccines were initially becoming available to adults living in Canada (May-June 2021). Critical discourse analysis and research about moral responsibility, health, and risk informed our analysis and coding in NVivo.

Findings suggest that individuals took up public health discourses about getting vaccinated, thereby engaging in government of oneself and others towards getting vaccinated. For example, in stating that "the people who care ... are vaccinated," a participant implied that those who are not vaccinated do not care about minimizing personal health risks, contagion, or social disruption from the pandemic. In this statement, "care" is a signifier of informing decisions in a morally responsible way. However, participants also critiqued discourses that hold individuals responsible to access vaccines. They identified substantial barriers to accessing vaccines that may prevent individuals with less resources from accessing vaccines (e.g., travel time, missing work, accessing childcare). We argue that the focus on vaccine hesitancy without attention to systemic barriers deflected responsibility for making vaccines accessible from centralized institutions and onto individuals.

MANCA, Terra* (University of Alberta, Canada)

"They Weren't Really Sure What to Do with Pregnant Clients:" a Qualitative Investigation of Discourses about Disease Risks and Uncertainties about Vaccination

Many women and healthcare providers have uncertainties about influenza, whooping cough, and COVID-19 vaccines during pregnancy. Each of these vaccines are intended to prevent severe disease among pregnant women, fetuses, and infants. Yet, information about these vaccines can be inconsistent due to gaps in data, especially in early 2021 for COVID-19 vaccines. Although information has about COVID-19 vaccines improved, limitations remain in information about all recommended vaccines that are intended to inform decisions pregnant women and healthcare providers' decisions.

In this paper, I present results from a discourse analysis of online texts (N=438) and qualitative interviews (N=39). Online texts included publicly available discourses from Canadian health authorities, professional organizations, and vaccine manufacturers. Interview participants included 31 pregnant women and 12 healthcare providers practicing in Canada. Most participants completed two interviews, the first targeted understandings of vaccination in pregnancy and the second gathered their responses to online texts. Data analysis applied a feminist discourse analysis approach, with attention to discourses about risk, motherhood, and responsibility for fetal health.

Results suggest that texts responsibilized individual women towards making personalized decisions about vaccination during pregnancy for COVID-19 vaccination, but towards vaccine acceptance for influenza and whooping cough. Although most pregnant participants were accepting of all vaccines, they were most confident about influenza and whooping vaccines, which were clearly recommended by their healthcare providers. They were less confident about COVID-19 and felt responsible to balance risks from the disease and the vaccine based on incomplete information. One explained, healthcare providers "weren't really sure what to do with pregnant clients" who asked about COVID-19 vaccination. Combining governmentality and cultural approaches to risk theory, I argue that vaccine discourses govern women towards vaccine acceptance (not choice) when there is stronger evidence, but towards individual choice (not acceptance) when there is uncertainty surrounding a pharmaceutical product.

VIDEGAIN, Karina (UNAM, Mexico)

"Counting" Emotions: Socio-Emotional Well-Being and Class Inequalities in Mexico.

El objetivo de la presentación es analizar el vínculo entre emociones y desigualdad social en México con el fin de identificar estructuras emocionales diferenciadas por clase social. Dicho objetivo comprende el propósito heurístico de realizar una reflexión metodológica en torno al uso de abordajes cuantitativos para analizar la relación entre emociones, estructuras macrosociales y desigualdades contemporáneas. Para ello partimos del supuesto de que tanto el contexto como las estructuras sociales condicionan las percepciones emocionales de los individuos y, a su vez, ello incide en la capacidad/posibilidad de acción, tanto individual como colectiva. Es decir, la esfera emocional no sólo se constituye en el campo de las desigualdades sociales, sino que también ayuda a su reproducción.

Bajo estas premisas generales, las preguntas de investigación que guían el trabajo son: ¿Cómo se distribuyen socialmente ciertas emociones? y ¿hasta qué punto las desigualdades de clase se expresan y reproducen en desigualdades emocionales?

Para responderlas hemos optado por una estrategia metodológica multidimensional basada en la observación retrospectiva de estados emocionales diversos (26), registrados a partir de lo que los sujetos indican de su propia experiencia en la Encuesta sobre Bienestar Auto-reportado de México (ENBIARE 2021).

Los hallazgos de investigación muestran cuatro tendencias generalizadas: 1. El bienestar subjetivo y los estados emocionales que lo conforman se distribuye de manera desigual en función de las clases sociales; 2. Las clases más bajas disfrutan de menos emociones positivas y padecen más emociones negativas que el resto de la población; 3. El impacto de la clase sobre los estados emocionales es más fuerte en las emociones negativas que positivas y; 4. El impacto de la clase es más importante en las clases bajas que en el resto para condicionar los niveles de bienestar subjetivo.

Democratists or Nationalists? the Identity of Anglophone Secessionism in Cameroon

Back in the 1960s, Cameroon, a small state located in Sub-Saharan Africa, engaged in the nation-building process after gaining its political independence from France and the United Kingdom (UK). However, this process has turned into an identity crisis since the 1990s. Anglophone citizens, who inherited a British culture from colonization, have protested for an independent and autonomous identity within a postcolonial context characterized by authoritarian rule (the period between 1960 and 1990) and democratized political life (the post-1990 period). Anglophone mobilizations have been associated with nationalism and secessionism. At the same time, Anglophone movements have put forward a set of critical discourses against the state's administration and cultural heritage management. Unlike mobilization theory that distinguishes nationalism from governance's activities, this paper implements an interactive approach to state and society to analyze Anglophone policy discourses in Cameroon as a governance crisis. The analysis develops a post-structural perspective based on systems modeling and classical social contract theory. The relational practices embedded in the Cameroonian state's postcolonial authoritarianism and Anglophone nationalism show solid cultural, technological, and political interactions between nationalism, new democracies, and postcolonial authoritarianism. It is specifically found that the historical context of democratization associated with the postcolonial state's power and control over national culture and political resources unintendingly created windows of opportunity for Anglophone social mobilizations for an independent identity.

From Coal to Renewables: A Study of the Perspectives of Indian Coal Industry's Labour Unions

The discourse around the role of labour unions in energy transition has been well discussed among policymakers and academics in contemporary times. Studies have stressed labour unions as a stakeholder in just energy transition. However, labour unions' perceptions of renewable energy sectors have been less explored, especially in the global south. Our study explores how labour unions in the Indian coal industry perceive the upcoming renewable energy sector. The analyses are based on 25 semi structured qualitative interviews with the coal industry labour union leaders using snowball sampling at three level-macro, meso and micro. We find differences in opinions regarding the renewable sector, given the diversity in the labour unions' ideologies and political affiliations. Nevertheless, all of them agreed that increasing renewable capacity in India's energy mix is necessary to tackle carbon emissions while doubting if it will meet India's energy needs and security. They want the transition from coal to renewables to be a gradual process. The unions with left political leanings are pessimistic about bringing in private companies. They firmly believe that the transition should be handled by the government and public sector undertakings to ensure livelihoods and social security. However, the right-wing unions believe that private players are essential for the industries to survive, hoping that employment opportunities will increase. Further, the study reveals that left-wing unions are apprehensive regarding the unionisation of workers in the renewable sectors, though they think unionism will not be completely wiped out. Finally, we conclude that consultation with unions through various institutional mechanisms is imperative during the transition process to ensure a transition that is 'just' for the workers and their communities. The unions need to revisit their collective bargaining strategies to sustain themselves in the renewable sector.

Is Empowerment Varies in Cross-Region and Local Brides of Haryana? a Study of Jind District

In India, Haryana has a strong preference for the male child and the consequent abortion of female foetuses. This leads to unusually high numbers of men unable to find brides locally. Therefore, men of marriageable age are facing a crisis in finding brides for marriage. Now, these men are seeking marriage partners from less prosperous states like Bihar, UP, West Bengal, Assam, Tripura, Jharkhand.The primary objective of this research is to explore the empowerment among cross-regional brides and local brides. Fieldwork was conducted in 12 village of Haryana during June to august 2022 for getting first-hand information on the research problem. 10 key informant and 15 In-Depth interviews were conducted to get a nuanced understanding of the issues at hand.Haryana has a patriarchal society which leads to overall less empowerment of the women in the state. Beyond this cross-regional bride enjoy less empowerment. Families does not allow the movement of these brides in fear that they may run away from the house. They get some kind of mobility only after having children. On the other side, local brides are financially and socially independent. It is also found that the level of empowerment increased with the age among both types of brides. Among both the category of women, Older women have more freedom than younger ones.There should be a need for an awareness program about the attitude of society towards females in general and cross-region brides in particular.

I Eat What I Desire: Modern Foods and Benefits within the Mankon Community, North West Region, Cameroon

There is a global shift in nutrition patterns, with people moving towards more affluent foods. This study focuses on the benefits of modern foods and consumption trends within African communities, with particular reference to the Mankon community, North West Region, Cameroon. A qualitative approach was adopted in the study and in-depth interviews used to collect data. Twenty-eight participants of the community were sampled, classified into different age groups, the youth, middle aged and the elderly. A qualitative research method for the study enabled the researcher to have an in-depth understanding on the benefits of modern foods and consumption trends within the Mankon community. Contrary to the widely held view that modern foods cause health-related complications, such as cancer, diabetes, obesity and hypertension, the findings revealed contrary views from participants. The study revealed that modern food provides a balanced and healthy diet, improves taste, appearance, and presentation of food. Modern food also provides consumers with increased varieties, accessibility, and availability of foods to carter for the growing population. There is need to incorporate modern foods in food consumption patterns, maintaining a moderate consumption and provide greater access to the wider population in the Mankon community, North West Region, Cameroon.

Experiencing the Body in the Process of Non-Binary Gender Identities Development in Polish Cultural Context.

Human identity, its variability and multidimensionality have been a source of interest for researchers for centuries. My research focuses on the origins, development and process of constructing non-binary gender identities. The project is based on the grounded theory methodology and includes 30 in-depth interviews with biographical elements conducted with non-binary people. One of the aima of the study was to learn how non-binary gender identities develop throughout lifetime, what external factors influence this development, and what actions does non-binary people take to feel closer to their identity. Body and expression practices and the role of body emotions in influencing the perception of one's identity have proven to be crucial. The body, its changes during maturation, as well as conscious modifications, were the most important in the stories related to the construction of non-binary identities. It was significant both in situations of perceived dysphoria, when it did not correspond to the perceived gender, but also could be a source of euphoria, changing in the desired direction. The body and the expression related to it are elements of constant control and conscious construction in the stories of non-binary people. They become tools in the process of developing an identity. This paper aims to bring closer the importance of the body in the process of developing non-binary gender identities, as well as the multiplicity and role of body-related practices undertaken by non-binary people in order to get closer to their gender identity. The specific Polish cultural and linguistic context is also significant, as it is a conservative country that has pursued a homo- and transphobic policy in recent years.

A Pessimistic Exploration of the Links between Exploitation and Commodification in Latin America.

The conversation on the relationship between trade unionism and nature has gained continuous global relevance,as evidenced by the recent special issue of the JIR and the publication of a "Handbook of Environmental Labour Studies". However,there is still a gap between research on "green transitions" (mostly focused on industrialized countries) and studies on the "environmentalism of the poor" (especially rural workers in the Global South).In this context,much

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of the sociological discussion on the labor movement has primarily focused on Europe or the US,leaving aside questions on how industrial workers in poorer,non-industrialized regions mobilize (or not) around environmental issues.

On this regard,the absence of systematic discussions or reviews on Latin America is particularly striking.The region has become a critical space for mining and agroindustry over the last twenty years,with countries taking the lead in the production of copper,silver,soy or blueberries.There,production occurs in places marked by deep inequalities,with modern technologies affecting the livelihoods of poor local communities and employing workers who enjoy working conditions that are above the national average.

This presentation examines two cases in Peru where environmental and labor issues have emerged in the last five years.On the one hand,I trace the case of the Las Bambas mining company,managed by the Chinese MMG.On the other hand,I focus on the mobilizations regarding water and better working conditions in the region of Ica.Though they did not march together,unions and environmental collectives organised protests against international companies in both cases.I am interested in exploring why these actors did not work together,as well as the tensions that emerged around their activities. By engaging with studies on environmental labour,I hope to contribute to the global discussion on the complex relationship between trade unions and environment by looking at the challenges arising in the Latin American context,instead of at success stories.

MANKY, Omar* (Universidad del Pacífico, Peru)

Trabajo y Medio Ambiente: Mapeando La Discusión En América Latina

Uno de los cambios más relevantes de las últimas dos décadas en las ciencias sociales ha sido el creciente interés por la naturaleza. La actual crisis ecológica ha abierto preguntas cruciales que rebasan a la sociología del ambiente, influenciando sobre las agendas de los estudios sobre movimientos sociales, sociología urbana y de la cultura. En este contexto, los estudios del trabajo han sido también afectados por la creciente importancia del tema, como muestra un reciente volumen al respecto (Räthzel, Stevis, Uzzell, 2021). El interés por cómo los trabajadores interactúan con el medio ambiente se vincula, además, a otros giros recientes en sociología, como los vinculados a discusiones sobre la geografía humana y el postdesarrollo.

A pesar de la relevancia de estos debates, es llamativo que en las más de 900 páginas del *Handbook* citado aparezcan apenas tres capítulos centrados en países latinoamericanos. Esto es todavía más llamativo dada la capacidad de acción de movimientos ambientalistas en la región, así como la riqueza de teóricos interesados en visibilizar la relación entre capitalismo y naturaleza (Escobar, Quijano, Segato). En este contexto, mi presentación ofrecerá una reflexión sobre lo que los actuales estudios del trabajo en América Latina dicen sobre el medio ambiente (cómo es conceptualizado) y sobre la relación que encuentran entre movimientos ambientales y laborales. Sobre esta base me interesa pensar su potencial para iluminar problemas globales: un mapa que trace rutas a futuro. Sobre la base de una revisión sistemática de estudios sobre minería y agroexportación (dos industrias con enormes efectos sobre trabajadores precarios y medio ambiente) me interesa notar vacíos y abrir preguntas a futuras investigaciones.

Evaluating Community-Based Food System Action in Tasmania

The success of interventions or programs designed to tackle complex problems like food security are themselves complex, with multiple interconnected components delivered individually or targeted at communities or populations. Underlying changes in the reasoning and behaviour of people are triggered in particular contexts. These intersect social, economic, and political factors with participant identities, cultures, geographies and histories. This paper presents the early stages of a 'realist evaluation' of an Eat Well Tasmania healthy eating campaign as a means of engaging with the particularities of context in Australia's smallest and least prosperous state, Tasmania. Agriculture is a vital driver of Tasmania's economic growth, but the social, ecological, and economic sustainability of its food supply is at risk and rates of food insecurity are high. Up to 30 per cent of Tasmanians do not have sufficient access to healthy, affordable, and culturally appropriate food, and where you live matters - those in rural and low socio-economic areas are more likely to be food insecure.

The Eat Well 'What's In Season' campaign communicates the value of seasonal eating for as a way to improve health, look after the environment, and support local producers. How to effectively target and communicate with those most vulnerable to food insecurity has been identified as a major challenge. To respond to this challenge the researchers supplement traditional theory of change (ToC) methodology with a realist evaluation approach. This recognises that changing peoples' values, beliefs, and attitudes about food depends not only on appealing to an individual's reasoning but also on the resources available to them. In the paper we will present data collected on

program impacts and processes of implementation as well as specific aspects of program context that might impact on outcomes, telling us about the specific mechanisms that create change.

Bound By Patriarchy: Women's Experience of Internal Migration in Bangladesh

Millions of Bangladeshis move from low-income agrarian villages to the country's urban landscape with the hope to gain from the rapidly-growing middle-income urban, industrial future. However, the economic gains are mostly offset by new forms of extreme depravity, indignity, and inequality. Nonetheless, many scholars report unique gendered gains through migration – the rupture of traditional, entrenched inequalities by gender, providing women not just reliable incomes but also the opportunity to re-negotiate gendered roles, responsibilities, and identities. In this study, we present the reflections of ten long-term urban migrant women in Dhaka city: of their gains, their losses as well as their aspirations for the future. Our findings show the incredibly high costs of a migration that is induced by a desperate rural poverty. Further we find that patriarchy persists – within the often "kutcha" walls of urban low income homes to the nature of so-called economic opportunities – in the constant intertwining of capitalism, globalization and patriarchy. Caught in between, women have little choice but to cope with these new vulnerabilities by relying on the very norms and boundaries established by patriarchy and by recreating patriarchy to celebrate the (if) gains from displacement and migration.

Does Education Really Empower Women? Revisiting the Role of NGOs in Bangladesh

A famous Chinese proverb claims, "if you want to plan for a year, plant wheat, if you wish to plan for ten years grow trees, but if you want to plan for 100 years educate your women."

Education is one of the most important determinants of social development. Feminist discourse has long believed that education brings empowerment for poor women. In Bangladesh, NGOs have worked with the government for decades, especially in the development sector, since the state's inception in 1971. In fact, the role of NGOs in successfully furthering female education in Bangladesh demands praise and recognition, particularly in rural areas. In recent years, there has been an impressive increase in girls' enrolment in primary and secondary level education in Bangladesh, making the country a leader in female education in South Asia. However, the gender parity clearly visible in primary and secondary education reverses its trend abruptly in higher secondary education with high dropout rates associated with their early marriage and early entry into labour market due to economic compulsion. This limits the opportunities for higher and technical education for women in Bangladeshi society. In light of the above, in this paper, the author revisits the same five villages that she studied two decades ago to observe and document socio-economic changes, and changes in the attitude of the people towards traditional gender roles and education. The author uses in-depth interviews, KIIs and FGDs to understand the socio-economic dynamics in these villages. This qualitative research also the role of NGOs in terms of their relationship to gender and development, within the specific context of women's education in Bangladesh.

Hindu Nationalism, Authoritarianism and Post-Truth: A Consideration of the Liberal Social Media Response

There has been a growing scholarship on the emergence of right-wing nationalism, populism, as well as social media in the global arena. The same is true, on a lesser scale, with regards to the phenomenon of post-truth, although this is largely restricted to the Western world. The present paper will explore the dynamics of Hindu nationalism (Hindutva), authoritarianism and post-truth in India, a novel area of research, but from the other end. It will, by relying on qualitative data from Twitter, examine the strategy adopted by liberal critics on social media to counter Hindu nationalism's post-truth. It will specifically look at two themes: fact-checking of propaganda and fake news, and the counterposing of liberal democratic values to Hindutva. After a consideration of the prospects and the need for such an approach, the paper will outline why the liberal approach is unlikely to stop the juggernaut of Hindu nationalist populism or authoritarianism. The paper seeks to make an original contribution to the scholarship on right-wing nationalism, authoritarian populism and post-truth and the liberal response to it.

Beyond Angry White Men: Progressive Sociological Imagination As an Alternative to Aggrieved Entitlement

Michael Kimmel (2017) argues that a sense of aggrieved entitlement is central to the experiences of white American men drawn to the far-right. The concept captures both a sense of relative deprivation and rage at having something snatched away. Rather than viewing wealth inequality, chronic insecure work, or being locked out of the housing market as outcomes set in train by neoliberalism and political elites, aggrieved entitlement misdirects rage to typical scapegoats – women and minority groups, who are understood to be advancing at one's own expense. An aggrieved sense of entitlement was present amongst some participants who took part in our qualitative study of white Australian men's political attitudes and experiences. Feelings of aggrieved entitlement featured for men who held right-wing political views, including those from middle-class backgrounds with middle-class trajectories. Significantly, our research also revealed a counter to aggrieved entitlement, described here as a progressive sociological imagination. Despite significant experiences of relative deprivation, some participants did not develop aggrieved entitlement or blame others, but instead cultivated an awareness of their own privilege and systemic critiques of neoliberal capitalism. Fostering progressive sociological imaginations, particularly amongst younger white men, may be an important part of undermining the appeal of far-right politics.

Embedding Socio-Political Barriers in Ecological Restoration Praxis with the Support of Collaborative Causal Maps

Ecological restoration is a process that contributes to combating climate change by mitigating ecosystem degradation. However, the European Commission's (2020) report on the biodiversity strategy warned that efforts in the fight against climate change had been largely insufficient and lacking in ambition. Among the reasons for non-compliance, an incorrect incorporation of the socio-political dimension into ecological restoration stands out. Ecological restoration is a sociopolitical and economic process in which different interpretations, interests and forms of affectation collide. Recognizing that ecological restoration is part of this social entanglement, a systemic perspective encompassing both technical and socio-political aspects becomes necessary. Once the research problem has been established, the objective of this work is twofold, first, to identify the socio-political barriers that are part of the praxis of ecological restoration, and second, to interrelate and analyse the hierarchical structure of these barriers.

In order to meet these objectives, we used a qualitative methodology to collect the perceptions of the main actors representing the decision-making chain of ecological restoration in the Valencian Community. We conducted 30 semi-structured interviews, based on the use of Collaborative Causal Maps, with the main actors participating in the decision-making processes of ecological restoration in the region. The informants indicated the most relevant barriers to ecological restoration and established cause-effect relationships for the different elements. For the data analysis, first, we coded, homogenized and unified the content of the different causal maps with Atlas.ti. Then, we applied a Network Analysis to the unified map with Gephi Software.

This process made it possible to identify, relate and hierarchize the socio-political barriers that take place in the ecological restoration decision-making processes, as well as reveal strategic windows for action that improve their effectiveness in the fight against climate change.

Self-Management As a Tool of Local Movements to Fight Corruption and Loss of Social Welfare in the Paraná Region (Brazil)

In the case of the city of Rolândia (Paraná, Brazil), political instability and short-term management have led to institutional vulnerability that has resulted in the stagnation of economic development, an increase in inequality and a loss of social well-being. Faced with this problem, some segments of the population have initiated alternative paths of self-management. The constructivist diagnosis presented in the following is part of the first phase of self-management initiated by the local population. This diagnosis will make it possible to identify the déficits of the municipality and support the local development modelo of Rolândia. Based on the identification of the main local problems and their causes, this diagnosis has allowed us to structure the demands and strategic lines of local development according to the needs of the population and the local socio-economic context.

The diagnosis was built upon a participatory and iterative methodology grounded in endogenous knowledge. A total of 92 stakeholders took part in the participatory process, representing neighborhood associations, the administration and public services, and the economic and political sectors. Semi-structured interviews and participatory workshops were the two main sources for data collection. The participants indicated the most relevant problems of the city and established cause-effect relationships that linked the different problems. These causal relationships were articulated into Collaborative Causal Attribution Maps and analysed with Multicausal Network Analysis, supported by Atlas.ti and Gephi software. The reflective process of participants made it possible to identify and make visible the main problems and conflicts in Rolândia, to point out Windows for action and to design strategic lines for local development.

Africanising Educational Curriculum through Indigenous Knowledges – Challenges, Constraints and Possibilities.

A widely held view that education is part of culture, and that culture is transmitted through education serves as a point of departure for this paper. This adage calls for all world cultures to find expression in their respective educational systems. This need is accentuated in the historically colonised world where education systems were largely shaped by the colonising powers' cultures. In Africa, colonial powers subdivided the continent into Francophone Africa, Anglophone Africa, and Lusophone Africa. The European education systems served to suppress and marginalise African cultures and ways of life. They also created Africa's dependent development. This situation, which prevails even after political independence, is however not sustainable in an increasingly globalised world wherein cultural diversity is a source of comparative and competitive advantage, creativity, and innovation. It is therefore necessary for historically colonised world to rid itself of dependency. This requires a radical shift including within the education landscape. South Africa too needs such a shift which can partly be achieved through the Africanisation of educational curriculum using indigenous knowledges. The latter are defined by the World Bank as knowledges specific and unique to a given culture and which encompass 'the skills, experiences, and insights of people, applied to maintain or improve their lives.' Their sustenance is dependent on collective recognition and appreciation by community members. This paper therefore examines the possibilities for the incorporation of indigenous knowledges into the educational curriculum in South Africa as a strategy for Africanisation of education and therefore decolonisation. In doing so, the challenges and constraints are considered with the view to proposing the requisite intervention measures for such incorporation to succeed. The methodological approach of this paper is that of evidence review wherein scholarly publications, policy documents and other secondary sources are subjected to critical review.

MAPADIMENG, Mokong Simon* (University of Limpopo, South Africa)

Social Cohesion in South Africa in the Aftermath of Apartheid – Advocating for the Indigenous Afro-Sensed and Ubuntu/Botho Anchored Approach.

For the last decade and half, the South African government made concerted efforts aimed at promoting and fostering social cohesion to heal the historical racial divisions and their attendant social inequalities. These efforts, evident in national events on social cohesion such as the 2012 summit; came against the background of the evident persistence of racial divisions and

new forms of inequalities, that are seen as a threat to democracy attained in 1994. The persistence of inequalities and divisions point to the failure of the reconstruction and development programmes that sought to promote unity in diversity, which the novel peace-prize laureate, Archbishop Desmond Tutu, called the 'rainbow nation'. Questions of interest to this paper are: what could be the main obstacle/s to achieving the objective of socially cohesive society? Could it be that the present discourse underlying the understanding and approach to social cohesion is irrelevant? Could the indigenous Afro-sensed approach to social cohesion, anchored in the culture of Ubuntu/Botho serve as an appropriate alternative with the likelihood of success where the present approach has failed? To what extent is the present official discourse on social cohesion anchored in the culture of Ubuntu/Botho? These and related questions receive attention in this paper. A critical review of the current strategies used by government to promote and achieve a socially cohesive society, which have failed, leads to my argument for the need to shift towards adoption of an indigenous Afro-sensed approach informed by the culture of Ubuntu/Botho.

Using the Cry Freedom to Undermine Local Governments in the United States—the COVID-19 Pandemic.

Sidney Hook, the philosopher, noted that freedom is a paradox. To give one freedom you need to take freedom away from another, perhaps the ultimate paradox of the power paradigm. To give me the freedom to have no tobacco smoke in my lungs you must take away the freedom from others to smoke in public areas. Public health measures often result in restrictions on behavior. This is usually done to prevent or mitigate harm. In the US during the Pandemic, the cry of freedom (i.e., you are limiting my personal freedom) was used against local authorities to undermine public health mandates (e.g., mask mandates, restriction on the size of public meetings, etc.) at the local level. This resulted in threats of violence at the local level and the undermining of public health measures. In the US, the cry freedom is used by citizens groups as a justification for actions that are militant and could support authoritarianism. There are reasons for this reaction in the US. They include myths about the founding of the US, the role of certain religious sects, anti-science attitudes, poor science education, and erosion of faith in political and other institutions. Social media, social influencers, and others support and amplify these factors. There are actions that clinical sociologists can do to combat this trend. These include research and evaluation on public health measures, working with grassroots organizations on health promotion, and helping to craft better public health measures.

Vaccine Hesitancy—the Hydra of Public Health?

The Hydra was a sea monster of Greek mythology. It had many heads—if you cut off one, two new ones grow in its place. For this discussion we are combining the antivax movement or movements with vaccine hesitancy. Vaccine hesitancy seems like the Hydra. If you defeat one excuse another replaces it. We are looking at both reasonable fears and those fears that have no evidence to support them. First, we review the history of vaccine hesitancy and the rationales used to justify the position from the beginning vaccinations to the present. We will highlight issues in vaccine development, e.g., the use of mercury as preservative and the introduction of the new RNA technology, and the use of stem cells. We will briefly look at the factors that support vaccine hesitancy such as pseudoscience, alternative medicine, certain faith communities, social media, broadcast media, conspiracy theories, poor science education, and general decline in the faith of institutions. We will provide sociological and psychological insights into this diverse phenomenon. Our discussion will concentrate on the US experience.

Feminists Speak Binary: Role of Digital Technology in Feminist Advocacy Work

Feminist advocates continue to address the issue of violence against women. Their efforts are evolving in response to the changing paradigm of a rapidly digitising world. Easy access to smart phones and other digital tools are facilitating the rise of new interventions that leverage the strengths of quantitative data and new techniques of data management historically not used in feminist research and advocacy work. While these tools offer promising new techniques for knowledge production and representation

that are aligned with the growing interest in digital governance within the last decade; the influence of the patriarchal-capitalist system on digital technology creates an unavoidable tension with the feminist advocacy movement. This paper explores that tension through the examination of feminist advocacy work addressing violence against women within the city. Viewed through a rights-based approach, namely women's right to the city, this paper presents a single case study of a feminist social enterprise called Safetipin, which offers a range of digital data collection tools focused on women's experiences within the city with the goal of supporting inclusive planning practices and improving freedom of mobility for women. The paper presents the limits of using of digital technology in feminist advocacy within complex contexts; and it theorises how digital technology will continue to change feminist advocacy within cities.

HARRIS, Anita* (Deakin University, Australia)

Youth Transnational Im/Mobility, Transitions to Adulthood and Pandemic Time

Drawing on the concept of 'mobile transitions', our paper explores how the COVID-19 pandemic has impacted youth transnational mobility in relation to transitions to adulthood. Transnational mobility is an important *marker* and *maker* of transitions for youth in many contexts globally. The current generation of young people, more than any other, is expected to incorporate mobility options, both temporary and long-term, into their life plans and mobility is a symbolic and material resource to facilitate their transition to adulthood in changing times. Transnational mobility has become a way for young people from both the Global North and Global South to accelerate, delay, suspend, and modify transitions and to create new and alternative pathways to adulthood. When COVID19 broke out, transnational mobility was at its peak and mobility was critical to giving young people new opportunities and imaginaries for adult life. In this paper we consider how the pandemic has affected mobile young people's relationship to time, adulthood and the life course. We share the findings of the YMAP (Youth Mobilities, Aspirations and Pathways) research project (2018-2023), co-led with Loretta Baldassar and Shanthi Robertson, which is a mixed-method longitudinal research addressing the lived experiences of over 800 young movers to and from Australia originating from Italy, the UK, India, China and Australia. The sudden interruption of mobility has meant a profound rethinking of priorities and aspirations. For this generation on the move, a sudden and imposed immobility also became a disruptor in their journey to adulthood. The pandemic interrupted but also transformed their sense of biographical and generational time, their life planning, and the ways they imagine the future.

MARCHETTI, Sabrina* (Ca' Foscari University of Venice, Italy)

Ukrainian Migrant Caregivers in Italy at the Convergence of Pandemic, War and Populist Crisis

When looking at the current situation of Ukrainian care-workers in Italy a complex scenario comes into sight, which is in many ways emblematic of the critical times we are living in and of the conflicting forces affecting the realms of care, gender and migration.

We all know that the breakout of the Covid-19 pandemic has exposed our society to realize its increasing dependency on health and personal care which, in countries like Italy, the personal care of ill, disable and elderly people has been traditionally sustained through the private employment of home-based caregivers - 70% of whom of migrant origin, the pandemic thus provided a further confirmation of the necessity of foreign recruitment in this sector. Based on this awareness, in the summer 2020 the Italian government launched a regularization program for undocumented home-based caregivers, with 177.000 applications, including about 18.000 applications by Ukrainians.

After this moment, however, several forces have converged towards the vulnerabilization of migrant caregivers, Ukrainians in particular: the administrative obstacles which blocked the outcome of their applications; the war in the origin country which created a further an economic and psychological burden for them; the increasing unemployment of Italian women which made the competition in paid and unpaid care provision harsher; and finally the racist and familist attitudes of the rising Italian far-right. As a landmark of such strained scenario, the 2022 annual allocation of quotas for foreign recruitment did not include any provision for care and domestic work.

In conclusion, in my presentation I will discuss how if we wanted to a positive side-effect of the pandemic in a step towards a valorization of migrant carework, the past two years have cast a dark shadow on this picture.

MARCUELLO SERVOS, Chaime* (Universidad de Zaragoza, Spain)

Public Health, Citizen Participation and Individual Responsibility: A Socio-Cybernetic Approach.

The pandemic caused by the Wuhan virus has been a challenge for all public health systems in all countries. In each case, different public policies, more or less authoritarian, have been applied on the basis of scientific and health arguments. This paper proposes a critical reflection based on the 'local experience' of Spanish society with respect to the role of citizen participation processes as they affect public decisions regarding the best management of public health systems. This is approached from a socio-cybernetic perspective in the context of contemporary Spanish society, emphasizing that individual health is a personal and non-transferable responsibility. For this reason, decision making regarding the health system cannot be only a management of experts who impose policies based on arguments supposedly validated by scientific processes. However, the logic of the Spanish system has been the opposite since the 1980s.

This paper presents an exploratory analysis of some key points in the management of covid19, its variants and evolution in Spain. This is connected with the paradigm shift that took place in the Spanish public health system in the 1980s. At that time, there was a shift from a model in which, quickly said, everyone was responsible for their own health to one in which the State guaranteed the necessary benefits for individual health. This aspect, central to the fragile Spanish welfare state, has generated social inertias that have systemic political effects. Individual decisions have public effects and vice versa.

A mapping of the elements that make it possible to describe the system and its relationships is proposed. The relationship between the subsystem of experts and scientists and policy makers is sketched. In addition, some of the decision-making models applied, the forms of information/propaganda used, the economic interests at stake and the citizen intelligence brought into play are described.

Critical Interpreters. Language Interpreting and the Instruction of Asylum Claims in France

As the concept of governmental xenophobia highlights, policies and politics about foreigners are tightly intertwined. Thus, the myth of the lying refugee has been both the result and the ideological justification of political alterisation through exclusionary policies produced by the French asylum administration – namely, at first instance, OFPRA (Office Français de Protection des Réfugiés et Apatrides, administrative body) and CNDA (Cour Nationale du Droit d'Asile, the appeal court). Therefore, the production of otherness is to be seized at the institutional level, where policies and politics of exclusion meet.

Many studies have tackled the discursive stakes inherent to asylum procedure and recent works have focused on non-official intermediaries it involves. But while language interpreting in asylum settings has become a subfield within Interpreting studies, research in the French context has – with a few exceptions – overlooked a central actor: the interpreter.

My point is to show how the institutions assign to the interpreter a function that is part of their work of political alterisation and rejection of asylum seekers on the basis of epistemic asymmetry in evaluating their narratives. I conduct both a sociohistorical analysis of administrative archives from OFPRA and CNDA and an ethnography of interpreting in these institutions. The former shows how interpreting activity has been subjected to quantitative efficiency, which has become the administrative and political goal. Ethnography highlights the ambiguous place of interpreters within asylum institutions, not being official agents but employed by interpreting services providers that have won public markets, thus revealing how they are objects of institutional alterisation themselves and at the same time at the heart of the administrative work, and how they cope with the process of the alterisation of asylum seekers : through participation or resistance.

Digital Transformations of HIV Care: A Sociomaterial Inquiry

Healthcare services are increasingly utilising digital technologies to facilitate remote forms of doctor-patient interactions and to support monitoring of health conditions. This paper follows a sociomaterial approach to explore the relationship between novel technologies and practices of HIV care, investigated across five clinical sites (Antwerp, Barcelona, Brighton, Lisbon and Zagreb). As part of a comprehensive sociotechnical evaluation of a newly introduced digital health platform, 26 codesign workshops and 72 interviews were conducted with health professionals and patients to understand how the new technology reconfigured practices of care. Our findings elaborate how processes of digitalisation afford health practices to handle opportunities and challenges regarding quantification (handling data and new forms of visualisation), connectivity (creating meaningful encounters from distance), and instantaneous feedback (attentive responses to alerts from digital devices). The sociomaterial approach enables inquiries regarding the new forms of knowledge (technological inscriptions of HIV), the kind of therapeutic relationships (new assumptions about providing 'good care'), and the unprecedented modes of control (when the medical gaze escapes the walls of the hospital) that are produced within digitised HIV care. Through this sociomaterial analysis we aim to provide insights that can guide the orchestration of beneficial and responsible forms of digital health care.

A Multi-Families Album: Politics of Visibility of an Argentinean LGBTQ+ Family Association

Despite Argentina passing the gay marriage law in 2010, LGBTIQ+ people continue to face juridical obstacles to becoming parents. Some who surpassed them created the Argentinean Diverse Families association (FAD as its Spanish acronym). FAD has three main goals: to promote modification of the legislation to facilitate LGBTQ+ parenting, to develop a supportive network to accompany families in the same situation across the country, and to make these families visible.

This communication describes and analyzes one of the politics of visibility developed by this association: the creation of an Instagram multi-families album. FAD's Instagram profile is full of pictures of different families, with gay, lesbian, trans, and non-binary parents and their children. Besides, FAD periodically posts stories on the same content and includes Instagram Lives of a program "aired" in 2021 and 2022. When creating this interactive multi-families album, FAD approaches its goal of visibilization. However, the politics of visibility involves not only posting photos of FAD families, but also reposting other LGBTIQ+ families, both from Argentina and abroad.

I scrutinize three aspects of the politics of visibility FAD develops when creating this multi-families album. First, I describe the types of families this album portrays: age and social-class backgrounds, how many parents and their gender and sexual orientation, how many children, etc. Second, I reconstruct the logic of reposting to identify the original users' posts: FAD members, other LGBTIQ+ ordinary families, and famous parents with their children. Third, I examine the comments and reactions of these publications to observe interactions.

Based on the preliminary results of an ongoing research project, I conclude on the need of considering seriously the politics of virtual visibility to analyze both experiences of family-based politicization and how, by doing the family work of displaying their memories, LGBTIQ+ families are co-produced.

MARENTES, Maximiliano* (Universidad Nacional de San Martín (UNSAM), Argentina)

The Love Stories Approach. Theoretical and Methodological Concerns about Studying Actually Existing Love Among Argentinean Gay Men

Even when love is a widespread complex emotion in our Western societies, as social scientists we face several *issues* to study it. In this communication, I introduce the approach I followed for my doctoral dissertation about love specificities among Argentinean gay men. As the research project's goal was to study how love was experienced, the empirical-oriented perspective pushed me to reconstruct these gay men's love stories.

The communication is organized into five stages. The first describes how the love stories approach contributes to embracing a situational insight of this feeling. Because people fall in love with someone, focusing on the narrative that frames that love is necessary. The second stage explains how analyzing love stories enables incorporating other people and things that are taking part in the love relationship. Thus, rather than being taken for granted, the couple may emerge as a result of the couple-assembling process. The third stage draws on methodological concerns about how to work with love stories when conducting interviews: not disregarding plural experiences and being open to other empirical tools. The fourth stage reflects on the process of re-constructing stories and participants of the research and the researcher co-producers of those narratives. Being an active agent in re-constructing love stories implies making decisions about connections with biographical approaches, when do stories start and end, and other considerations about temporalities. The fifth stage focuses on love stories' principle of reversibility which unfolds the limitations of some ways of inquiring about love: heteronormative concerns, power balance within couples, and open and closed relationships. The love stories approach examines those issues from a more productive insight. In the conclusions, I argue about this approach's theoretical, methodological, political, and ethical assets.

MARHANKOVA, Jaroslava* (Charles University, Smetanovo nabr. 6, 110 01 Praha 1, Czech Republic)

Older Adults' Representations of Dementia: A Qualitative Exploration

Studies focusing on the perception of dementia among older adults point to the negative emotion and anxieties that dementia arouses. Dementia became an important framework for the construction of anxieties regarding advanced old age and a symbolic reference point for the representation of the third and fourth age – "successful" and "less successful" ageing. How dementia as a condition is conceptualised may influence not only the level of anxieties it evokes but also access to early diagnosis, timely treatment and social inclusion of people living with dementia and their caregivers. We use data from focus groups (N=15) and in-depth interviews (N=30) with older adults age 65+ living in the Czech Republic to explore how older adults understand the meaning of living with dementia and what language they use to describe and capture the nature of symptoms associated with dementia. The paper points out precisely three distinct features that framed the lay older adult's representations of dementia: 1) blurring the lines between dementia as a specific health condition and representation of „dreaded" old age, 2) constructing hierarchies between different conditions associated with dementia ("good" and "bad" dementia) reflecting their impact on social relations and 3) transmission of suffering. Dementia was depicted as "contagious" in its effect on the family members who were, in a sense, depicted as the primary sufferers of the disease. The paper discusses the implication of such representations on the perception of individuals living with dementia and the construction of their subjectivities.

MARIANTA, Yohanes* (STFT Widya Sasana, Indonesia)

Rowing between Two Reefs: A Study of Indonesia's Hedging Strategy in the Face of US-China Rivalry

The US-China rivalry will continue to shape the geopolitical theater of the Indo-Pacific in the foreseeable future. If not properly managed, this rivalry might lead to a catastrophic war due to the so-called Thucydides trap. As Southeast Asia evidently becoming the epicenter of this great power politics, more studies are needed to understand how countries in this region have been positioning themselves. Drawing on interviews with experts and foreign policy makers, the research seeks to shed light on how Indonesia perceives this great power rivalry and how it positions itself. The research reveals that Indonesia is now facing a challenging situation in developing its foreign policies to advance its strategic national interests without being dangerously trapped in this great power politics. Despite the growing pressure to pick a side, Indonesia has been consistent in upholding its "free and active" doctrine which leads to a firm non-alignment stance and constant refusal of forging formal alliances. The research also shows that Indonesia has been crafting its own hedging strategy by fostering strategic partnerships with the two great powers. This hedging strategy is shaped by its self-understanding as a middle power and a developing country. Given Indonesia's limited capacity and highly valued autonomy, the "balancing" and "band-wagoning" strategies are not favorable for the country. In the absence of existential threats, Indonesia will continue to pursue its hedging strategy with economic considerations at the front seat. The author posits that by maintaining good relationships with the two great powers, Indonesia actually contributes to the global interest in building bridges in the midst of the US-China growing rivalry.

MARJORIBANKS, Timothy* (Swinburne University of Technology, Australia)

Contested Power: Strategically Managing Digital Innovation in the Production of Newspapers

The question of how digital innovations emerge and are managed, and with what objectives and effects, has been central to the organisational strategies and practices of media companies throughout the twenty first century. This paper engages with these issues by focusing on strategies for innovation in production processes in the newspaper industry, and by asking two central questions: What digital innovation strategies related to newspaper production have been developed? What do these digital innovation strategies and the related organisational processes reveal about power relations in newspaper companies? The central theoretical proposition of this paper is that digital innovation in organisations is an ongoing relational process involving contests around power, where such contests involve actors within and external to the organisation. To explore the explanatory value of this proposition, this paper analyses strategies for digital innovation in the production processes of major newspaper companies in Australia and the UK. The primary data source is documents, including newspaper company documents; key stakeholder documents, including industry publications; media coverage of digital innovation in newspapers; and industry trend documents. Key findings are: (1) digital innovation in newspaper production processes has been strategically managed to reorganise power relations in newspaper companies; (2) digital innovation strategies are enabled and constrained by the history of previous

innovation processes within the company; and (3) digital innovation strategies in newspaper companies are increasingly influenced by the strategies of big tech companies. Overall, in seeking to contribute to understandings of digital innovation strategy, this paper highlights the importance of analysing power relations across time in organisational contexts and the influence those relations have on the strategic management of digital innovation.

MARKE, Verena* (Leuphana University Lüneburg, Germany)

Child Participation and the Right to be Heard – Community Rights in Progressive School Education in the US, Hawai'i

The U.S. can be considered the only member state of the UN that did not ratify the Convention on the Rights of the Child. Despite the fact, the U.S. did not ratify the UN-CRC, pioneers like Dewey or Lipman formed a movement of progressive education at various model schools combined in the approach of p4c Hawai'i – Philosophy for Children. This became the occasion for ethnographical research at the University of Hawai'i at Mānoa where western and eastern philosophy are combined. Differently oriented notions and philosophies of child-centeredness are contrasted within this research project: Does a progressive approach in a non-progressive system help to overcome discrimination?

Community-based eastern lenses lead to a concept of progressive education regarding a shared, safe, and responsibly interrelated space of teachers and students thinking and learning together. A mature community is the empowerment of students and teachers through building up an intellectual safe community and shared thinking practice. The rights of the individual are related to the rights of the community and vice versa. Critical western lenses on educational settings with children consider generational order, achievement-centeredness, and compliance and its critical consequences in educational settings regarding power imbalances: Children are constructed as becoming future citizens and human resources for building up nations and societies disregarding their subject status or their life in the present moment as beings with dignity, iterative agency, and rights. This study will completely unfold a field-grounded theory of children's empowerment through participation in progressive educational settings: What are the teachers' concepts of the voice of children and its consequences for the school practice? To which extent are the rights of individuals and groups interrelated regarding the fulfillment of participation rights regardless of their age or social position? What kind of limits are produced through dividing human rights into children's rights?

RC53-729.11

MARKE, Verena* (Leuphana University Lüneburg, Germany)

The Right of the Child to be Heard (Art. 12, UN-CRC) and a Philosophy of Children's Voices

Western and eastern philosophy are combined at the University of Hawai'i at Mānoa at the Department of Philosophy. Pioneers like Dewey or Lipman formed a movement of progressive education at various model schools combined in the approach of p4c Hawai'i – Philosophy for Children.

This study presents an ethnographical empirical research on the U.S.-State Hawai'i on the island of O'ahu regarding the research question: What are teacher's concepts of the voice of children in progressive education and its consequences for the school practice? Differently oriented notions of child-centeredness are contrasted within this research. Community-based eastern lenses lead to a concept of progressive education regarding a shared, safe, and responsibly interrelated space of teachers and students thinking and learning together. A mature community is the empowerment of students and teachers through building up an intellectual safe community and shared thinking practice. The rights of the individual are related to the rights of the community and vice versa. Critical western lenses on educational settings with children consider generational order, achievement-centeredness, and compliance and its critical consequences. A field-grounded theory of children's voices in educational settings will be completely unfolded within this study.

The main findings include the construction of children's voice from the teacher's perspective regarding three stages: I. before voice, II. present voice, III. after voice and the effectiveness of voice-driven empowerment of the child.

Before voice includes the construction of voices even before speaking and different perceptions of children's voices related to power and generational order. Present voice shows voice as an embodied event and shared body experience in a community and its phenomenological consequences. After voice includes a critical view on direct and indirect influences through emphasizing the right to speaking up instead of being oppressed or silenced.

PLICKERT, Gabriele (California State Polytechnic University Pomona, USA)

Prosecutorial Moonlighting

Prosecutors are often described as criminal justice systems' most powerful actors. Yet, the reality of prosecution is far different in many jurisdictions. A substantial number of prosecutors' offices are staffed not by career prosecutors but by part-time attorneys who need to maintain side practices in their communities. The understandable focus on the lack of equality of arms between prosecution and defense has obscured that prosecutors are not monolithic and may regard prosecution as merely part of their professional lives.

This Article sheds light on the use of part-time prosecutors in the United States using survey data from the Department of Justice's Bureau of Statistics. Approximately 15% of prosecutors' offices are led by part-time chief prosecutors, and many more prosecutors' offices feature part-time assistant prosecutors, who handle the majority of cases. We find that rural, racially homogeneous areas are more likely to employ part-time prosecutors and that these prosecutors' side practices can cause entanglements that undermine the performance of their official duties.

Research with a Sensitive Group in a Sensitive Context - Participatory Approaches and Counter-Narratives of Young People in Poland

In many places and spaces young people are still often treated in an adultistic, tokenistic way, deprived of their voices and their own perspectives in narratives about them as a heterogeneous group and in research about them. The lockdown period in Poland has become a special time in which youth voices have been even more heavily masked. This presentation will focus on a methodology sensitive to the voices (voices from the frontline of a pandemic) of young people during COVID-19. We will present the dilemmas and challenges of implementing two studies with young people (including one youth-initiated) in the sensitive context of the pandemic. We will introduce the process of implementing the research in a participatory approach, based on the counter-narratives of young people embedded in the humanizing research methodology, related to the sensitive context of their daily life during the COVID-19 pandemic and the sensitive topics that affect them as young people (which they chose to explore and which they wanted to share as counter-narratives to the narratives present in the majority discourse). While these issues require further exploration oriented towards the next stage of adapting to the difficult, unprecedented and unpredictable situation, our research methodology and research process can be helpful in understanding the situation of young people in the era of the pandemic.

Divorce between a 'problem' and a 'solution'! Economic, Social and Cultural Consequences of Divorce for Women's Lives, in the Kurdistan Region-Iraq

In recent years, a certain "moral" panic has been installed in the Kurdistan Region of Iraq (KRI), due to an increase on the divorce rates. Public debate is being held on the changing values of marriage and the possible "normalization" of divorce. The "modernization of society" and "modern technologies of communication" are perceived (at least partially) as being the reasons behind this increase on divorce rates. What is more, women's increased participation in higher education and their (even if limited) presence in the labour market can, arguably, be said to give them a bigger sense of autonomy. Still, marriage continues to be considered as important, while divorce is often understood as damaging the reputation of women and their families. In a context of rapid social change, where "new" values and practices associated with family and personal lives coexist with more "traditional" ones, we want to gain an in-depth understanding of the economic, social and cultural consequences of divorce for women's lives in the KRI. Our data is based on 17 in-depth interviews with divorced women living in the KRI; 10 unstructured interviews with "experts" that deal with divorce cases; and secondary and documental analysis of regional legislation, newspaper articles, and statistics on gender, marriage and divorce. We argue that the consequences of divorce tend to be different according to women's position in the labour market, their parenthood "status", and/or the (lack of) support of their immediate families. Some women clearly state what they perceive to be the economic and emotional gains of divorce, in what would have otherwise been "failed" and/or potentially violent marriages. Still, many women continue to face attacks to their reputation and "losses" in their social networks. Further, the agentic ways that divorced women redo their lives shows the dynamism of family structures in the KRI.

Conceptualizing Deservingness Amongst Street-Level Bureaucrats: Gatekeepers or Facilitators?

Abstract: My research explores how street-level bureaucrats engage in a variety of activist strategies and practices to increase access to health care for precarious status persons within Ontario, Canada. To investigate these strategies and practices, I draw from Lipsky's (2010) work 'street-level bureaucrats'. However, I define 'street-level bureaucrats' broadly to encompass not only paid service providers work, but also those who work adjacent to providers, who are unpaid, such as those who advocate and volunteer to ensure services. While institutional constraints, such as working in a hospital, health centre, or organization are certainly limiting in terms of how individuals help precarious status persons navigate healthcare, these institutions are not isolated from broader institutional constraints such as Canada's immigration system. People working to help precarious status persons navigate healthcare systems work within a complex matrix of institutions, actors, discourses and policies, and whether they are attached to an institutional setting or not, they still have to contend with bureaucratic challenges. As such, I have taken on this broad understanding of what it means to be a street-level bureaucrat.

My research seeks to explore the role of street-level bureaucrats who work as advocates to increase access to healthcare for and with precarious status persons. In doing this research, I aim to understand how health care advocates understand ideas of health care "deservingness", (as it relates to those with precarious status), and how their service delivery, advocacy and service seeking practices impacted by these ideas.

My presentation will focus on a preliminary analysis of 1) institutional healthcare documents from Ontario hospitals and community health centres and 2) interviews with providers, community organizers, and activists with lived experience of holding precarious immigration status in Ontario.

Community Health Workers Addressing the Unmet COVID-19 Needs of Communities

The COVID-19 pandemic brought regional, racial, and ethnic health disparities into focus, spurring unprecedented efforts to overcome multifaceted barriers to testing and vaccination for vulnerable populations. This presentation highlights the role of Community Health Workers (CHWs, *promatoras*) in a cross-sectoral collaboration of university researchers, community health organizations, a testing lab, local community health centers and community leaders. The project engaged the CHWs' expertise to address social determinants of health (SDoH) that contribute to COVID-19 disparities. Guided by two theoretical approaches (i.e., the cross-sector alignment theory and the WHO model of SDoH, the collaborative addressed COVID-19 disparities among historically underserved communities in Arizona, in southwestern USA. The project, named R.A.P.I.D. (Respectful, Action-oriented, Proactive, Inclusive, and Direct-resources), designed and implemented a culturally grounded intervention to improve access to testing and vaccination. It aimed at increasing access to COVID-19 testing through the engagement of community trusted CHWs. A transdisciplinary team gathered and analyzed data via multi-pronged approaches including secondary analysis of publicly available epidemiological and socioeconomic data, longitudinal surveys, and focus groups. CHWs with strong and long-lasting community embeddedness implemented the intervention and effectively reached out and engaged underserved residents. The presentation will highlight the critical role of CHWs in addressing underlying SDoH. CHWs generated a culturally welcoming climate, addressed linguistic, cultural, and structural barriers to testing, and provided follow-up and referrals. They made subsequent contacts to facilitate access to COVID-19 testing results and address unmet medical, psychosocial, and economic needs. The CHWs became bridges between the formal public health care system and the most underserved and vulnerable communities of Arizona. The CHWs, however, are underpaid and not fully recognized by the medical establishment. The presentation will discuss the practice, policy and research implications of the model and its potential for sustainability and replication with vulnerable and underserved communities.

Social Policy and Just Transitions: The Need to Go Beyond Jobs and Retraining

The transition to a low carbon economy is underway in Australia and many other advanced economies with significant social, economic and employment challenges anticipated for carbon-exposed states and regions. For a transition to succeed it must, of course, reduce emissions. However, what it must also do is ensure that the benefits and burdens of any transition – its financial cost, its lifestyle sacrifices, monetary benefits, employment opportunities – are fairly shared. A social justice dimension is crucial to ensuring that vulnerable individuals and regional communities are not made worse off by any transition strategies. In this paper I outline some of the guiding principles and frameworks for assessing an inclusive transition and pathway to net-zero emissions, frameworks that centre collective wellbeing and which go beyond a narrow focus on jobs and training. Adopting social policies that tackle both climate change and other community priorities can bolster support from local stakeholders, increasing the likelihood that the policy will be approved, which in turn accelerates climate action. Placed-based solutions, that incorporate diverse voices and perspectives in transition planning, and which meet the aspirations and expectations of local communities are considered vital to successfully managing transitions associated with the shift to non-carbon intensive energy forms. What I argue in this paper is that policy development requires a more integrated approach so that social dimensions can be brought into the examination of the consequences of a carbon intensive economy, along with a more considered approach to incorporating the role of social institutions in developing ecologically and socially sustainable transitions to a low-carbon future.

The Nation As Habitus: Theorizing Exclusionary Perceptions of National Belonging

Press discourse on immigration is often (inadvertently) underpinned by exclusionary perceptions of national belonging, embedded in ethnonationalist beliefs that prove extremely difficult to dislodge. Billig, in his work on *banal* forms of nationalism has noted how "thoughts, reactions and symbols become turned into routine habits and, thus, they become *enhabited*" (1995, p.42). This suggest that nationalist thinking is part of habitus, both as structuring structure, engendering particular perceptions of what the nation *is/means*, and as a structured structure, with the principle of nations as a form of social division, internalized as one of the fundamental structures by which we make sense of the world.

Drawing on an understanding of the nation as *enhabited*, I am interested in national belonging as embodied through habitus. I argue that national belonging, that is the extent to which different groups of people are understood as being part of the nation, is an elaboration of nationalist thinking which (alongside race with which it is so often imbricated) can itself be understood as one of the fundamental structuring principles of the habitus. That is, both as a set of embodied dispositions that are inculcated, partly through the *banal* structuring of immigrants and the nation, to recognise the symbolic value of specific forms of national capital within Australia, while the very principle that there are people who do or do not *belong* to the Australian nation, stems from the internalization of the nation as an intrinsic social division. As such, drawing on an analysis of Australian press reports on immigration, I argue that the nation as habitus can explain how *banal* everyday constructions of immigrants and the nation engender perceptions of national belonging anchored in older ethnonationalist understandings of the nation, and how these divisions can be internalized and perpetuated even by those excluded by such beliefs.

White with 'Native' Blood: The Formative Role of Anglo-Indians' in the Colonial Creation of the White Race

Critical historical studies on Whiteness have primarily focused on interactions with non-White Others when theorising the formation of the White race, with Whiteness understood as being constituted in relation to a racialised, exoticized Other, which it is not. Studies of marginal or subaltern 'white' groups have concentrated on the ways such groups have chosen to align with Whiteness. What is missing, however, is an examination of the formative role phenotypically 'white' but racially Other groups played in the colonial construction of Whiteness as the dominant mode of personal and political identification, structuring an imagined transnational community of Whiteness. Within British India, the 'half-caste' Anglo-Indian was ridiculed by the British, both politically and within popular culture, as embodying a parody of Britishness. In the post-colonial period, these discourses have been contextualised through concepts of hybridity and mimicry. The hybrid population is understood through its destabilising potential for the coloniser race, with their presence

challenging dominant understandings of what the coloniser race represented. However, such discourses run the risk of perpetuating rather unsettling the normative power of Whiteness, by assuming a permanence and fixedness of Whiteness that did (does) not exist.

I argue that more than destabilising understandings of race and Whiteness, it was through the existence of 'half-caste' white populations, that Whiteness itself was constructed, with the presence of the white Anglo-Indian Other shaping the particular contours and configurations of Whiteness that came to predominate within the colonial context and beyond. By examining colonial discourses around Anglo-Indians, I argue that the presence of a 'white' Other was essential for ways in which the White race came to be constituted, beyond phenotypical markers, as an exclusionary complex of hereditary characteristics, aptitudes, behaviours, and moral dispositions rooted in notions of 'blood'.

Beyond multiple modernities and secularization as normativity: how to (sociologically) deal with charismatic leaders in times of resurgent authoritarianism.

For over 50 years, sociologists around the world have tried to deal with the empirical constatation that the sacred, in multiple forms, is a key part of the modern world. Even when secularization is considered an irreversible process, its pace and extension seem to put into question at what extent the concept is useful to describe the "religious" dynamics in contemporary societies. Indeed, the continuous appearance of what Weber would classify as charismatic leaders, in all types of the multiple modernities, jeopardize the normative and universalizable character of secularization.

Far from being a surmounted form of authority, charismatic leadership have been ubiquitous, and the appeal to their extraordinary character has been jeopardizing not just democratic processes in single countries, but peace in the entire world.

This presentation will discuss these contemporary leaders in terms of extraordinay beings. Beyond the dimension of authority/obedience, I will argue that extraordinary leaders are followed but, most specifically, defined by their followers. In these act that definition, both leaders and followers are consecrated as two inseparable parts whose existences are mutually constitutive.

The Affordances of Musical Participation and Improvisation for Conflict Transformation

Music and conflict are two seemingly universal social phenomena. This supposed universality raises the question, could music be an effective tool for transforming conflict into less harmful forms? Growing research suggests it can, though this is always contingent on the actual social processes animated by the musicking within a specific context. This paper explores the first two factors: social processes and musicking. Specifically, it argues that moderate to high levels of musical participation and improvisation effectively afford *unity across diversity*, *enhanced agency*, *safe and direct experience*, and *novelty and adaptation*. Exactly how these affordances contribute to conflict transformation will vary in each case, particularly depending on the scale of the social conflict. Nevertheless, understanding the social processes afforded by moderately and highly participatory and improvisatory musicking is essential for successfully designing and executing future instances of arts-based diplomacy.

MARTIN, Ryan* (University of New South Wales, Australia)

Two Mechanisms for Musical Improvisation's Political Impacts: Disruption and the Expression of Public Opinion

In democratic societies, social movements are often key actors in political change. Such movements often effect change through public protest, which frequently involves music. Much research has examined what *musical properties* are likely to cause which *mechanisms* to successfully contribute to change via protest. This paper furthers that work by investigating how musical improvisation may enhance public protest through two fundamental mechanisms, *disruption* and *the expression of public opinion*. I argue that moderately and highly improvisatory musicking is more likely to garner high levels of participation from diverse groups of citizens and result in the simultaneous sounding of clashing musical material. As a result, it is also more likely to produce sounds that are loud, noisy, and stretch across space and time. Such sonic properties tend to cause widespread disruption and communicate to the target of the protest a negative public opinion. Further, the participation of diverse peoples afforded by highly improvisatory musicking makes perceiving the opinion as genuinely *public* more likely. I demonstrate these ideas through a case study of *cacerolazo* during the 2001-2002 Argentine Financial Crisis. Importantly, whether these potentials are realised in any

specific case will always vary based on the particular combination of factors. Nevertheless, understanding how musical improvisation may afford certain mechanisms is useful for understanding music's role in politics more broadly.

Representations of Youth Unemployment in a Pre- and Post-Pandemic Context: A Critical Examination of Two Key Periods in Australian Social Policy

In the last few decades, major labour market changes caused by increased use of labour-saving technologies, further casualisation, outsourcing of work and adaptation of neoliberal policies, have led to the exacerbation of youth unemployment such that it is recognised as a significant social policy problem and topic for youth studies. In popular media and policy discourses young unemployed people are often represented as lazy, job-shy and undeserving of welfare payments. Most proximately, the impacts of COVID19 have exacerbated unemployment in sectors like retail, hospitality and tourism that previously offered casual and often precarious employment to large numbers of young people. The Australian government's COVID19 policy response, including the JobKeeper scheme that helped businesses to continue to pay their employees, offers insight into how young people at this time were represented through the lens of 'deservingness' and 'un-deservingness'.

Building on earlier empirical work into the youth underclass phenomenon (Martin, 2009), this point in time (COVID19 2020-2022) is counterposed with an earlier era (1999-2004) to examine policy representations of young people. The earlier period, when welfare-to-work measures were introduced, is used to establish how pejorative constructions of youth unemployment were used, and then compared to a second period, during COVID (2020-2022). The analysis reveals particular representations of young people that assists in explaining why JobKeeper took the shape that it did. Apart from highlighting the normative assumptions that categories like 'youth unemployment' rely on, the analysis draws attention to the active and constitutive role played by representations in creating collective social and political life (Bessant, 2021). The findings raise important questions about the ways in which welfare policies shape the identities and experiences of young people as they transition through adulthood.

Visualizing the Datasphere: Representations of Old Bodies and Their Data in Promotional Images of Smart Sensor Technologies for Ageing at Home

Technologies for people ageing at home are increasingly prevalent and include ambient monitoring devices that work together with wearables to remotely track and monitor older adults' biometric data and activities of daily living. There is however little research into the promotional and speculative images of technology-in-use. Our paper examines the ways in which the datafication of ageing is offered up visually by technology companies to promote their products. Specifically, we ask: how is data visualized in promotional images of smart sensor technologies for ageing at home? And in these visualizations, what happens to the ageing body and relations of care? We include in our definition of smart sensor technologies both wearable and ambient monitoring devices, so long as they are used for the in-home passive monitoring of the inhabitant by a caregiver, excluding those devices targeted for institutional settings or those used for self-monitoring purposes. Our sample consists of 221 images collected between January and July of 2021 from the websites of 14 English-language companies that offer smart sensor technology for ageing at home. Following a thematic and semiotic analysis we present 3 themes on the visual representation of old bodies and their data: (1) Captured Data, (2) Spatialized Data, and (3) Networked Data. Each, we argue, contribute to a broader visualization of the 'datasphere'. We conclude by highlighting the underlying assumptions of ageing bodies in the co-constitution of ageing and technologies in which the materiality of bodies is more often lost, reduced to data points and automated care scenarios, and further disentangled from other bodies, contexts and things.

Regulating Hypnosis in France in an Interprofessional Competition Context : Relationships between Professional Groups and the State

In France, clinical hypnosis is used by different groups, which form two distinct « worlds » (Becker, 2010 ; Strauss, 1992). The first world is composed of regulated professions : physicians, psychologists and nurses working together in multi-scale cooperative networks (Becker, 2010). The second world is composed of workers proposing psychotherapy services based on hypnosis without having diploma validated by the state. We will analyse the way the state represents, for these two concurrent worlds, a hope to regulate a market characterized by a strong intra and inter-professional competition (Abbott, 1988), but also a threat for the autonomy of groups, in a context where no legislation about hypnosis exists.

First, we will analyse the failure of a professional union from the second world to obtain a certification recognized by the administration. The veto put to the certification by the department of Health is an indicator of the difficulty for these workers freshly arrived on a service market to construct a juridiction on the « personal problems » ecology (Abbott, 1988) where the threat for an illegal practice of medicine is real. However, the failure of these certification allowed professional unions to clarify a « mandate » (Hughes, 1996).

Second, we will report on the fact that regulated professions are more invested in developing training activities than in lobbying activities aiming at regulating practices. The ambivalence of a state regulation appears from these professions. Indeed, because of a growing scientific validation of hypnosis regarding the Evidence-Based Medicine model (Marks, 1999), some segments of the State tend to define hypnosis as being dependent of the territory of physicians. However, some professionals from the first world refuse to define hypnosis in a medical way, because this definition would exclude non medical professions - and above all psychologists - from training in hypnosis.

Prácticas De Cuidado y Descuidos En Un Mundo Vulnerable: Emociones, Afectos y Dilemas En Los Tecnocuidados

Las situaciones de crisis en las formas de organizar la provisión de cuidado, que impactan sobre los grupos sociales más vulnerabilizados, son numerosas. La recientemente provocada por la pandemia del SARS-CoV-2 invita a reflexionar acerca de cómo se distribuyen las responsabilidades entre los diferentes actores sociales, y qué emociones y afectos se movilizan hacia los cuidados en su relación con las tecnologías, en la era postpandemia. Los escenarios de múltiples cambios en el orden cotidiano ocasionados por esta crisis sanitaria global incluyeron una amplia generalización del uso de las tecnologías como mediaciones en el acceso a la salud y a los cuidados. Este contexto generó variadas maneras de identificar e interpretar los cuidados, de identificar y de dar respuesta a las necesidades detectadas (o no hacerlo), de interpelar a los diferentes agentes, así como nuevas formas de descuido, asociadas muchas de ellas a las brechas digitales (de acceso, uso y diseño-programación), que hunden sus raíces en desigualdades estructurales y que dibujan nuevas cartografías de la desigualdad. Esta comunicación analiza las prácticas de cuidados, las emociones, los dilemas y las tensiones que se movilizan en los tecnocuidados, comparando España y Argentina, a partir de un abordaje empírico cualitativo.

Institutionalization of Western Management Education in India: A Tale of Three Histories

This is a discussion of the three histories of management in India: Colonial, under English Direction, Post-Independence with the wish to finally Indianize Industrial Management, and Today's 21st Century conditions, with the American MBA-Model dominating managerial training. Is this historical progress or merely a subtle shift in Western Control? Given the tension about this as revealed by our recently gathered data, the issue remains open.

The situation today, was imagined to be different. Indeed, in 1964, a major conference of Indian scholars was held to develop an Indianized Model of Management Education. In the resultant *Mussoorie Report*, a list of 100 specific recommendations on how this might be achieved was developed, then relegated to planning-purgatory...

Subsequently, the national approach implemented, was institutionally supervised by American Universities and Foundations, but funded by Indian Government. The new Management Institutes were established outside

the reach of the National Educational System, with English as teaching language, thus stripping access of millions of students to needed exposure to management standards. However, the choice to offer the equivalent of the American MBA diploma quickly caught on. With now more than 6,000 of such programs, but only about 20 legitimately praised and certified.

Is national resistance to US Model Management reasonable for Indian Multinational entwined in the global context? Is a cultural priority to domestic affairs justified?

We address these issues **by relating history to practices**. Using secondary data drawn from research articles and agency documents [Mussoorie Report and others], we shed light on the historical context to explain the political and ideological origins of Management and Business education in India. Next, with original data collected during interviews with Indian engineer-managers who had taken an MBA diploma in India, we describe contemporary responses, in Industrial settings, to these historical-cultural challenges.

What Young People Say about Meeting New Friends during 2021 Pandemic

This is a report from an exploratory qualitative research about university student's personal experience on wearing masks and how to develop new personal relationships during Covid time. More precisely, to understand how (if) young people have changed the way they interact and perceive others with face covering mask.

For the purpose, twenty-four respondents (age 18-24) were interviewed face to face -and tape recorded- during the period of March-April 2021. An interview guide was used for thematic coherence since there were four interviewers; also Picture probes of mask/ unmask individual were submitted to respondents. Thematic data analysis was done manually and cross checked by the group. Respondent Verbatim are highlighted to illustrate the social scene (for dating purpose) as reported by young people themselves.

First preliminary findings are :1. communication issues due to limited nonverbal communication seen as a constraint to go towards a new person, causing inability to make an 'informed decision'; 2. Positive effects of mask wearing reported: for shy people or hiding some of the least attractive features 3.A gender effect seems to emerge: with increased female confidence in taking the first step, while the opposite happened for young men ; 4.Mask wearing affected the perception of attractiveness of the other, and most of the time when the mask was removed, interest into the other individual was affected negatively".

Though this is a small sample, it is an original collection of covid testimonies of young peoples, and it gives real-time information about young people social life during Covid. We discuss further research of investigation possible.

Por Qué Los Movimientos Contra Los Proyectos Mineros En México Emplean Estrategias De Movilización Legal

Comunidades marginadas e indígenas, así como organizaciones civiles provenientes del ambientalismo y/o la defensa de los derechos humanos buscan por medio de diferentes estrategias contener los efectos degradantes del extractivismo que tienen sumergidos a la región latinoamericana desde hace décadas. En las sociedades latinoamericanas se reconoce cada vez más una mayor intervención de las cortes ante la violación de derechos (Sieder, 2020). En años recientes se ha vuelto más recurrente que los movimientos empleen tácticas institucionales a partir de lo que se ha denominado movilización legal. De acuerdo con Paul Burnstein (1991) esta se entiende la activación de procedimientos legales y/o jurídicos como principal pauta o estrategia de acción para el alcance de objetivos. Esta ponencia busca responder a las siguientes preguntas ¿Qué factores influyen en la definición de estrategias legales de los movimientos que se oponen a los proyectos mineros en México? ¿Cuáles son aquellos factores que conducen a tomar estrategias legales como principal estrategia? Al respecto la literatura de la movilización legal ha discutido tres referentes conceptuales importantes: enmarcamiento legal (Pedriana, 2006) estructura de oportunidades legales (Hilson, 2002; Vanhala, 2012), y estructura de soporte legal (Epp, 1998). Por medio de un análisis cualitativo comparado de 12 movimientos sociales que buscan evitar la instauración y continuidad de los proyectos mineros en diferentes latitudes de México se busca identificar como es que estas nociones se articulan para hacer de la estrategia legal su principal estrategia. Esta es una investigación que busca ofrecer resultados preliminares en los primeros meses de 2023. Los resultados de investigación además de proveer información de interés acerca del seguimiento de las contiendas permitirán discutir con la literatura de la movilización legal.

MARTINEZ, Dulce* (UAM-Xochimilco, Mexico)

Música, Cuerpo y Emociones: Una Reflexión Sobre El Perreo Como Estrategia De Lucha y Resistencia

Durante los últimos años se han incrementado diferentes tipos de violencias, y en el caso de México durante la pandemia y pos pandemia, la violencia de género y los feminicidios son otros virus que se acrecentaron y no se han logrado erradicar. La injusticia, la indiferencia e impunidad ante dichos sucesos, ha provocado el surgimiento de diferentes grupos y colectivos organizados por mujeres quienes han realizado acciones colectivas para manifestar su dolor, su ira, su malestar y pedir justicia.

El propósito de esta ponencia es compartir un avance de investigación sobre el *perreo*, la música y el cuerpo como estrategias de lucha y resistencia; con la finalidad de dialogar y reflexionar sobre el *artivismo* como otra forma de lucha proveniente del *sentir* (Perniola:2016), del dolor (Ocaña:1997), del cansancio, de un *estrés colectivo crónico* (Sloterdijk:2017), donde las emociones (Didi-Huberman:2017) han fungido como potencia de su acción colectiva. El baile y el cuerpo como una forma de acción subversiva que busca trastocar las estructuras culturales, sociales y políticas en la segunda década del siglo XXI, donde el *perreo* ha sido la forma de expresar sus emociones y su estrategia de lucha, que se contrapone a la cultura (Freud:1992), la cultura como malestar.

En ese sentido se puede situar una disyuntiva al momento de hablar de cultura y arte (música y baile), es decir, la cultura es lo opuesto al arte. Mientras la cultura es el reino del valor, las costumbres y normas, el arte (música y baile) es una forma de la cultura que desde ella misma cuestionan o permiten escapar al individuo de la propia. El *perreo* como una acción reaccionaria que busca generar micropolíticas (la cultura como acciones reaccionarias) que buscan contrarrestar el poder absolutista (Guattari y Rolnik; 2006).

"My Life Hasn't Changed Much": Change and Continuity in Catholic Apostates' Lives

Defection from one's religious group is often understood as a turning point in peoples' lives. Particularly in closed religious groups that provide a complete life framework, leaving the religious community has vast family, social, work and economic consequences (Davidman, 2015; Brooks, 2018). However, when belonging to a religious institution does not imply living in a close religious environment, institutional disaffiliation might not necessarily lead to such life-changing consequences. In this presentation, I discuss the implications that apostasy from the Catholic Church has or does not have for former formal Church members in Argentina and Spain. Drawing on narrative interviews with apostates in both countries, I argue that disaffiliation might not necessarily lead to changing life conditions and worldviews. Rather, apostasy, in this case, may be understood as an act of political protest rather than a significant shift in peoples' (non)religious beliefs, practices and sense of belonging. As such, thus, their becoming non-affiliated does not necessarily mean a religious transformation. The presentation will dig into the factors or triggers that precipitate institutional disaffiliation and the consequences of this decision or lack thereof for peoples' lives. Moreover, it will highlight how apostates frame their disaffiliation as expressing continuity rather than disruption, a narrative that research on conversion processes has also shown (Johnston, 2013).

MARTINGO, Angelo* (University of Minho, Portugal)

Theorising the Language of Emotions: Arguments for a Neurosociology of Music:

The contribution of music to social cohesion through empathy, hinted at already by Rousseau and Herbert Spencer, re-emerged in late 20th century in anthropological, sociological and evolutionary perspectives, although the mechanism of such emotional communication remains unclear.

Drawing on a study on the production and reception of expressive deviations in the initial 8 measures of the 2nd movement of Beethoven's Waldstein Sonata, in which it was found that both naïve and expert listeners rated higher the recordings in which expressive deviations correlated with the cognitive representation developed by Lerdahl (2001) in Tonal Pitch Space, it is suggested that the communication of music expression implies a shared cognitive representation of music structure on which the potential role of music on social cohesion is played.

Based on such findings, as well as on the introduction of neurosociology in general sociology, and current results on music cognition and neuroscience, the pertinence of integrating Neurosociology of Music as a subfield Sociology of Music is discussed, as a means of theoretically grounding empirical results, and embodying critical theory.

Using Geospatial Technologies in Urban Ethnography

This presentation demonstrates what may be gained from combining the walk-along method (a hybrid between ethnographic interviewing and observation) with the global positioning system (GPS) and geographical information system (GIS) when exploring the social and physical aspects of locally situated urban lives. It focuses on the premise and application of the spatial transcript technique, which allows for an integration of qualitative and GPS data generated while walking, and its subsequent visualization and analysis within GIS. It suggests that incorporating geospatial technologies into the walk-along method might serve as means to operationalize particular spatial sensitivity afforded by this mode of inquiry and effectively advance its utility for yielding spatially sensitive insights.

MARTINKENE, Ginte* (Klaipeda university, Lithuania)

Bridging Transnational Life Experiences: From Childhood to Adulthood

This paper aims to examine how transnational life experiences in the childhood creates transnational background for adulthood. It is assumed that children from transnational families become adults earlier and take on family responsibilities to take care of themselves and their younger siblings if have them. This experience shapes a unique life course scenario in adulthood.

The qualitative research uses a dynamic and individualized life course paradigm, which allows revealing the impact of the transnational family life experience in four aspects: (1) individual choices and decisions; (2) the timing of significant life events; (3) the impact of the close social environment; (4) in terms of historical context and geographical location. The visual qualitative research consist of two parts: 15 qualitative interviews with children (5-17 years old) and 15 qualitative interviews with adult children (18-29 years old). The research methodology is based on *My Family* mapping method, the *Time Lining* method and *Vignette Sketch* method. The research raises the question of whether and how life at a distance in childhood affects the adulthood of children from Lithuanian transnational families. Transnational life experience creates unique social construction of age. Children living at a distance with their parents become adults earlier in their social life. Moreover, transnational life experience in childhood depends on whether it was the mother, the father, or both parents who were living at a distance from their child, and who is taking care of the child during the period of departure of one or both parents.

Class and Queer Struggles: The Critique of Capitalism in Contemporary Latin American Queer Politics

In the first years of Latin American sexual liberation movements in the 1960s and 1970s, the connections between the working class struggles and sexual and gender mobilizations were central to the transformative discourses and practices of those activists. After decades of hegemonic one-dimension queer politics, the last years have seen a rise on class issues on contemporary queer movements, especially in Argentina, Colombia, and Chile, where redistributive demands came to the first role. Are the emergence of class and redistributive claims in queer social movements connected to contemporary political and economic crisis? What are the empirical and theoretical intersections of sex and gender oppression and class exploitation produced by their discourses? To which extent do these queer politics update and transform the diagnosis from Marxist queers and feminists from the first decades of queer liberation struggles? By focusing on a sociological analysis of discourses of queer and trans leaders from Argentina, Colombia and Chile, this paper frames them as an emerging travesti and queer theory produced in Latin America that constitues a critique of both cis-heteronormativity and capitalist relations. It argues that the non-accomplished promises of capitalist sexual freedoms and the continuity of marginalized living conditions for great sectors of queer and trans populations have been central to the radicalization of sections of queer politics in recent years. On a theoretical dialogue with the tradition of queer Marxism and social reproduction theory, this paper argues that the claims towards economic redistribution, material reparation and abolition of violent institutions enacted by those social movements move beyond three classical analytical separations between working class and queer movements; redistribution and recognition struggles; transformative and adaptative tactics.

MARTINS, Alexandre* (Freie Universität Berlin, Germany)

Dynamics of Social Imagination and Political Strategies: Sexual and Gender Dissidents' Politics in Contemporary Argentina and Colombia

After the passing of Marriage Law and Gender Identity Law in Argentina and Supreme Court decisions expanding sexual and gender rights in Colombia in the 2010s, queer demands for reparation from the State became central in the political horizons of queer movements in both Latin American countries. How are these new social imaginations and political strategies enacted in those social movements? What are the continuities and ruptures of these campaigns in relation to previous ones framed on neoliberal terms based on individual sexual rights? "Recognizing is repairing" and Labor Quota for Trans People in Public Administration have been main campaigns in Argentina since 2015, whereas in Colombia the reparation for the victims of the armed conflict has been a main goal on debates around peace agreements. This paper aims to understand the different political strategies put in place by those social movements and which futures have been envisioned by their leaders. It analyzes how those claims emerged and became central to hegemonic sectors of those activisms and how the campaigns for reparation navigated through different political structures of opportunity with diverse collective actions and communicative praxis. The paper is based on sociological discourse analysis of written texts, images and videos of reparation campaigns produced by trans and queer movements in both countries, bills and judicial decisions; and in-depth interview with trans and queer leaders from Buenos Aires and Bogotá. On a theoretical level this paper argues that the campaigns for collective reparation from the State could be apprehended as new chapters of redistributive claims in queer and trans movements. They do not only expand the horizons of expectations of the hegemonic neoliberal claims from queer movements of past decades but also actualize on contemporary grounds discourses and strategies from sexual liberation movements from the 1960s and 1970s.

MARTINS, Carlos Eduardo* (Federal University of Rio de Janeiro, Brazil)

The Structural Crisis of Capitalism, US Imperialism and Alternatives for the XXI Century

The structural crisis of contemporary capitalism is linked to the decline of its capacity to dominate the development of the productive forces, to the end of the period of long expansive growth initiated in 1994, to the disorganization of American hegemony, to the growing vulnerability of its global power opening a period of intense geopolitical disputes and class struggles for the redefinition of the world system in the next decades. The resurgence of Eurasia through China and Russia, articulating, respectively, the most populous and technologically dynamic on the one hand, and the most extensive and main military atomic power of the world, on the other, through political power systems with strong capacity to control and interfere in the dynamics of capital, creates a new axis of gravitation that projects itself over Europe and the Global South threatening US imperialism, strongly associated with financialization and productive delocalization. Faced with the inability to promote its interests through consensus, the United States dedicates itself to destabilization processes, coups d'état, military interventions, trade wars and diplomatic, technological and financial sieges. Unable to maintain its economic attractiveness over Europe, it seeks to subjugate it politically and militarily, expanding NATO to the East in order to block its articulation with the East. Due to the immense difficulties in incorporating Russia to establish the northern siege over China, which could threaten its military leadership and strengthen European sovereignty, it is forced to harass, balkanize and submit it, but ends up reinforcing the great geopolitical bifurcation in progress. In this scenario of the decline of global liberalism and wars, fascism and socialism compete for control and the reestablishment of the world order still led by decadent liberalism

MARTINS ALBUQUERQUE, Paulo Henrique* (Federal University of Pernambuco, Brazil)

Hope and the Right to Dream As Political Practice in the Transition from Capitalism

In The principle of hope, E. Bloch proposes daydreaming as a program for rethinking the future, not as mere fantasy but as potential reality. It is an awake dream that needs no interpretation, no excavation, and certainly presupposes a mood that facilitates liberation and not depression. Daydreaming requires relaxation, but, as Bloch points out, "it does not seek sleepiness but the journey" (v.1, p.107). It is a particular way of drawing free choices, of planning and pondering ideas that do not ask for interpretation, but simply creative elaboration with elements already created and not simply invented. In this sense, the daydream differs from the nightdream of psychoanalysis that has a more regressive character and leads us to become dispersed in the obscurity of the lived instant. On the contrary, the daydream points to the

awakening of utopias. According K. Manheim in Ideology and utopia,utopias can be historically realized in the measure in which the present ideologies no longer serve to explain the structures of domination in force. Hope as utopia must be lived as a dream implied in political action in order to serve as a resource for criticizing dystopias, states of mind in which enthusiasm gives way to pessimism. In this sense, the debate on subjectivities emerging from oneiric symbolization is fundamental for liberating new spheres of collective action that promote emancipation from an expanded rational understanding, which includes affective intelligence alongside cognitive intelligence in the organization of experience in the world. This expanded understanding of consciousness can lead to another political practice that pierces ideologies to rescue the direct experience that takes place in the body and through bodies. Certainly, this experience implies a certain death of the pleasure of the present to free space for our sense in the future desired as a goal.

A Digital Future of Resilience. What Can We Learn from Ecological Thinking?

Due to the nomadic character of digital technology, digitalization easily crosses modernistic boundaries of nation, organization, industry, lifeworld, mind, and body, increasingly interconnecting everything with everything. However, such hyper-connectivity makes it difficult to trace and explain the broader dynamics of digitalization; important relationships and their systemic effects may therefore go unnoticed and, as we are all too aware from climate studies, will turn runaway and eventually come back to haunt us in the future with potentially catastrophic intensity, making it ever more difficult to course correct. A myriad of examples already give testimony to the possibility of such a dire digital future, ranging from the polarization of political discourse through Facebook to the colonization of urban neighbourhoods through Airbnb.

In response, I draw on ecological thinking and principles to expand upon possibilities for tracing and explaining the wide reaching, boundary crossing effects of digitalization and the runaway dynamics they may lead to. As ecological thinking is based on a radically, anti-modern philosophy that promotes connection over division, heterogeneity over homogeneity, and participation over exclusion, it has the potential to increase the responsiveness of our sociological conceptualizations towards the overarching, systemic effects of digitalization. However, while such thinking lends itself to critiquing technological attitudes of quick-fixes and exploitation, it has yet to demonstrate its potential for guiding alternative practices towards a better digital future. Hence, I will focus on possible avenues for developing such practices by discussing the notion of "resilience" as a guiding principle of digitalization. In more detail, I will elaborate on notions of diversity, hyperconnectivity, slow feedback, and participation as central categories for a more desirable digital future that is more responsive to a world increasingly marked by precarity and crisis.

Women's Participation in Defending Ukraine in Russia's War: Gender Sociology Perspective

Multitudinous forms of resistance exercised by Ukrainian women during the current war will be analyzed. Women's involvement in war could be discussed from two major perspectives – victimhood and agency. The Western gender scholarship describes women as the main victims of the situation, those who suffer from war and belong to vulnerable groups. At the same time, women are also actors of resistance, those who have agency and participate actively in different activities. In response to Russia's full-scale military invasion of Ukraine, women remain active: results of a public opinion survey demonstrate that most Ukrainian women are willing to resist with arms. Resistance is interrogated as a complex gendered practice that involves negotiating gender roles and norms. Analyzing women's resistance in this war provides a fuller picture of how Ukraine continues to fend off Russian aggression valiantly.

Promoting Education, Solidarity and Engagement through International Fieldwork: Facilitating Emotional Responses to Enhance Transformative Learning.

International fieldwork offers significant opportunities for experiential learning and forming "global" citizens, however, there are physical and socio-psychological challenges as well. Students are confronted with unfamiliar environments, mild culture shock, challenging physical and climatic conditions, the stresses of group work, intensity of field presentations, and fatigue during field trips, which can influence their affective domain. This results in differing individual behaviours, perceptions and performances of students. By placing students in unfamiliar locations, they demonstrate solidarity, through being

challenged by "others". This presentation examines how students' emotional intelligence can be utilised through innovative pedagogies to make sense of the encounters experienced by students (and staff) during international fieldwork. Using a case-study of undergraduate fieldwork in Barcelona, Spain, we examine how the use of student-led peer teaching and learning, facilitated by tutors, and supported by self-reflectivity exercises, can be harnessed to facilitate students' altruistic learning. This approach also helps students' resilience to cope with the challenges as well as the opportunities. The use of reflective field diaries is a powerful tool not only for enabling students to observe and record what they encounter but also to reflect on the meanings and positionality before, during and after being immersed in "place". Our studies show how the effective integration of peer learning with self-reflectivity enhances students' emotional intelligence and resilience, a deeper understanding of a sense of place, with the potential to achieve transformative learning.

The Poietic Potentialities of Indigenous Creative Practices in Decolonizing the Concept(s) of Indigeneity

Indigeneity is a disputed concept lacking a clear legal definition under international law. The Indigenous Declaration (UNDRIP) and the International Labour Organization's Convention (ILO169) leave Indigenous peoples and individuals the right to self-determine their own identity bound to the fulfillment of specific criteria. In particular, the Cobo description of indigeneity (1986) considers the criterion of historical continuity on the ancestral lands, which implies their preservation and transmission to future generations. According to this conceptualization, however, indigeneity does not follow the Indigenous body and presence when moving to an urban area, thus leaving behind many Indigenous people who do not live in ancestral lands.

This study draws on decolonial thinking and *pluriversality* to illustrate the role of Indigenous creativity and aesthetics in expressing the performativity of the relationship with the land. Enclosed by colonial narratives and policies, the conceptualization of indigeneity is constructed around a Western conception of the land and property that does not always correspond to the way Indigenous peoples experience it. Therefore, the dynamic nature of indigeneity should be emphasized to close the gap between legal and sociocultural definitions and experiences of indigeneity and avoid Indigenous people being excluded from the protection such legal frameworks are supposed to provide them.

By multiplying the possibilities of different spaces and times and dismissing the linear and singular project of modernity/coloniality, the poietic potentiality of artistic practices can help expand the concept of indigeneity to one that encompasses multiple *spatialities* and temporalities that do not fix nor limit Indigenous individual and collective identities.

Keywords: Indigeneity, Indigenous peoples, pluriversality, Indigenous rights, Indigenous art, creativity

MASEK, Vaclav* (Center for Advanced Genocide Research, United States)

Temporal Imaginations: Collective Memory and Collective Action in Post-Peace Guatemala

How do Indigenous movements draw on the most painful past as a source of inspiration to persist in their organizing, even in the face of systematic exclusion? Two sites of anti-mining resistance in post-Peace Guatemala reveal that the collective memory of triumphs over adversity motivates collective action that fashions counter-hegemonic struggles. Fifteen months of participant observation with Maya Q'eqchi and Xinka civil society groups show how grassroots social movements contribute to national memory cultures. By drawing on narratives of resistance against settler colonialism, Indigenous activists mobilize unified antagonistic fronts against the State and Capital. The project also relies on twenty in-depth interviews with on-the-ground stakeholders in both sites of struggle and twenty recorded testimonies of survivors of the Guatemalan genocide obtained at the Visual History Archive at the USC Shoah Foundation. Data shows how, following colonialism and the genocide, Indigenous Guatemalans understand extractivism as the third and latest iteration of dispossession launched against their territories. In the wake of mass violence, the mechanism of collective memory becomes instrumental in encouraging political action through the deployment of *temporal imaginations* —self-reflecting and retrospective mnemonic frames that position social movements in history and time. Temporal imaginations provide a channel to articulate past injustices and present grievances, cement loyalties, establish future-oriented goals, and aid in evaluating new challenging events civil society groups may face.

Sanitised Workplace Order: A Glimpse into the Character of Two New Mining Operations in South Africa

Labour studies in South African have often focused on old gold, coal, and platinum mines to understand the relationship between labour, capital, and work organisation. Research on the old gold, platinum and some coal mines has been on labour disputes often expressed through protected and unprotected strikes. South Africa's mining industry was shaped by colonial and apartheid regimes together with capital. What emerged was what Carl van Holdt terms apartheid workplace regime. However, the attainment of democracy in 1994 was meant to usher constitutional democracy and democratisation of the workplace. New mines in this case an open pit iron ore and a colliery (both surface and underground mines have come up with innovative ways of workplace relations and work organisation in comparison to older mines. Sanitised workplace order captures this phenomenon and describes the consistent application of rules and regulations and innovations that are negotiated and re-negotiated, contested, and manipulated by capital and labour in order to control space to fulfil their respective interests in the workplace. Sanitised workplace order is characterised by deliberate recruitment of young, educated, and diverse workforce, introduction of new technologies and automation in pursuit of smart mines, inculcation of company's operating model onto the entry level workforce, provision of transport and housing arrangements including allowances as well as health and safety innovations. It is in this context that capital and labour contest with each for the control of this space and the ability to do so demonstrates power.

MASLEN, Sarah* (University of Canberra, Australia)

"Listening" As a Metaphor for Synesthetic Attention

Most of the time, we disattend our perceptual processes. We orient our attention outward, rather than to the process of attending itself. The progression of social life depends on such an orientation, for if we pay too much attention to our sensation we draw focus from the object of our ongoing interactions, a point that Polanyi made in relation to speech and the playing of an instrument. Yet, there are contexts in which there is space to turn our orientation to how we are doing sensing—where we pause and take stock of those ways of knowing and being in the world that we often take for granted and yet we rely on and can actively transform. This paper addresses the sensory practices of outdoor adventurers who work on fostering an orientation to their bodies and place characterized by heightened sensory focus disconnected from the devices and data that dominate urban life. They adopt the term "listening" metaphorically to express how they are organizing their bodies always in relation to that which is happening beyond them. It is about a "quiet" humility, and taking in of cues that others may miss, towards environments that do not care if you are there. This sensory orientation and way of being in nature is cultivated via explicit "rules", moving off the bodies of "listening" others, and through a strategy of naming-cum-pointing which serves to direct the attentions of novices.

Greta Thunberg's Climate Activism: Challenging Generational and Economic Power

As the totemic leader of the *Fridays for the Future (FFF)* Movement Greta Thunberg challenges two aspects of the social order, those of intergenerational relations and neo-liberal capitalism. In this presentation we discuss how Thunberg's rhetoric, as political and participatory strategies, incorporates and subverts two key binary discourses - the adult-child and the normal-deviant binaries. These discourses have been used by some leaders as strategies to control Thunberg, by othering her as a 'child' and as a deviant, female child. Thunberg in her speeches, as acts of resistance, incorporates/subverts these discourses. This strategy deflects criticisms aimed at Thunberg and challenges hegemonic, patriarchal discourses regarding generational responsibility, and ableism. In our concluding remarks we draw attention to the relevance of our analysis for implementing policies on children and young people's participation.

Affectivity and Embodied Knowledge in Biographical Research on Mediterranean Migration

The investigation of changing migration and refuge realities in times of anti-migrant politics increasingly requires accurate concepts, tools and strategies that might adequately capture contemporary dynamics. Moreover, it also involves a further epistemological and ethical step that, while illustrating complex social dynamics, is not afraid to address and question the politics of knowledge production that informs research in this field and to illuminate emerging domains of social responsibility and political action.

In this framework, affects, emotions and embodied experiences have growingly become timely research topics (Gray 2008). Emotions, however, cannot be seen only as psychological states, but also as (relational) social and cultural practices which are destined to shape our object of study (Ahmed 2014 [2004]: 9) and enhance a further self-reflexivity from the side of researchers. Reference is here made to the feelings of pain, sadness - at one side - or discomfort, shame and rage, at the other, that biographical accounts of and encounters with migrants and refugees often touch or evoke. Thus, attending to emotions and the work of emotions itself is destined to become a crucial aspect of our method.

Based on the outcomes of an ongoing European project on migration narratives of people on the move between the two shores of the Mediterranean, this paper addresses the *affective* dimension of the relationship between the researcher and research participants, focussing on embodied forms of knowledge produced in the framework of biographical research which also involved participatory and art-based methods.

MASSICARD, Elise* (Sciences Po CERI, France)

The Political Effects of the Involvement of Non-State Actors in Governing

Authoritarianism as a regime type is a broad category, and in the last years several political scientists have suggested new, often "hybrid" types, of regime. This contribution does not aim to investigate general definitions or criteria of regime types. Rather, it starts from the assumption that regimes may not be coherent (Massardier et al.) and that more or less democratic or authoritarian spaces may coexist in one country. The contribution also starts from the assumption that the distribution of power may best be understood not by focusing solely on the "top" of the political hierarchy, but by taking in account a plurality of actors taking part in political processes. More specifically, it pays attention to the role of non-state actors and their concrete practices. Indeed, contemporary states increasingly find relays in non-state actors, among others for the implementation of policy – including control. This is also the case in Turkey (Massicard and Visier 2019). Drawing on recent individual and collective research on vigilante groups (Massicard 2019), on the role of pro-government NGOs (Massicard 2021), and on neighborhood headmen (Massicard 2022), this contribution sets out to question the involvement of these civic actors in the deployment of authoritarian practices, and examine their effects on power configurations. It shows that the effects of non state actors' involvement may indeed contribute to the limitation of pluralism and the control of potential opposition, but also empower social groups otherwise deprived of participation – and that the control by state hierarchy of these relays remains as an important research question.

MASSIDDA, Luca* (Tuscia University, Italy)

Marginalized & Stereotyped. the Political Representation of Gender-Based Violence in the 2022 Italian Election Campaign.

The paper analyzes the representation of male violence against women (MVAW) offered by the political communication of the main candidates engaged in the Italian election campaign of September 2022. Through the analysis of the contents posted on the main social networks – Facebook, Twitter, Instagram and TikTok – by 34 protagonists of the electoral campaign during the 4 weeks preceding the vote the paper wants to investigate the following topics:

- The relevance of MVAW's issues in the campaign as a whole, in the different political parties and in the individual political actors.

- The modalities, forms and logics present in the political representation of MVAW proposed by the different candidates.

- The recurrent presence of distortions in the political representation of MVAW attributable to gender stereotypes and prejudices.

- The "contribution" offered by the representation of MVAW to the construction and consolidation of the populism/anti-populism cleavage.

Data presented here were collected as part of the national research project «The Transformations of Democracy: Actors, Strategies and Outcomes in Opposing Populism in Political, Juridical and Social Arenas» (principal Investigator: prof. Carlo Ruzza; local unit coordinator: prof. Flaminia Saccà).

Trails & Bias. Stereotypes and Gender Discrimination in the Legal Representation of Male Violence Against Women

Ten years after the signing of the Istanbul Convention (2011), the Italian legislative framework on violence against women has greatly evolved. The timing of the writing of laws and those of the rewriting of social norms, however, do not always coincide and the legal system, with its language and its practices, is still partly conditioned by socially widespread gender bias. The STEP research project – coordinated for the University of Tuscia by Prof. Flaminia Saccà – analyzed 283 sentences, issued by the Italian criminal courts, to identify stereotypes and prejudices that recur in the legal and social representation of gender-based violence. This paper analyzes how the presence of criticality in the legal representation of violence against women is organized along two main categories of gender bias: *role prejudices*, which intervene in the representation of the victim and *frame prejudices*, which condition the modalities of representation of violence.

MATCZAK, Piotr* (Adam Mickiewicz University, Poland)

The Potential of Cultural Ecosystem Services in Local Urban Planning

The concept of ecosystem services is widely acknowledged in research and there are attempts to its application to policies. However, there is little research how the cultural ecosystem services could be used in the local urban planning. The research carried out in the city of Poznań (Poland) concerned planning potential related the cultural ecosystem services.

The research consisted of identifying the most important cultural ecosystem services in Poznań from the planners perspective (a workshop, the qualitative part), checking which services are most important for city residents in the immediate vicinity of their place of residence (Discrete Choice Experiment, the quantitative part) and mapping selected parameters of the housing surroundings important for the delivery of CES (the spatial analysis).

Practitioners at the workshop attached the greatest importance to the use of nature for rest and relaxation, preserving nature for future generations, and the aesthetic importance. They emphasized essential role of information on the residents' needs for their work. In the DCE study, the importance of landscape attributes were measured in units of distance to a parking lot or stop. The openness of the landscape appeared the most valued feature, while the type of greenery is the second most important one. Tall vegetation is preferred over low vegetation. The type of housing does not differentiate preferences. The differentiating factor is the use of a means of transport - a car or public transport.

The most important feature of urban landscape, i.e. openness of landscape, is difficult for planning operationalization and can be shaped primarily in the case of new investments. At the same time the results suggest residents' readiness to extend public transport in exchange for openness of landscape.

Two attributes of urban landscape, i.e., openness and the presence of trees are possible to map basing on the exiting data.

RC48-JS-67.2

MATEBESI, Sethulego* (University of the Free State, South Africa)

Transactional Activism and the Demise of Grassroots Organinisation

Community protests have become a longstanding feature of the socio-political milieu of democratic South Africa. However, the dramatic increase in the incidence of community protests points to the need for alternative perspectives beyond the current focus on the causes of protests in individual sites and locations. This paper focuses on the role of community leaders in invented spaces and their interaction with external actors to understand the effects of leadership engagement practices on community protests. Utilizing the concept of 'transactional activism', the study draws on various approaches, including the literature on community leadership, clientelism, and the dynamics of informal representation in South Africa. The empirical findings are based on six qualitative case studies across four provinces of South Africa. These cases suggest that the perverse incentives offered to community leaders organizing protests negatively affect how these leaders advance the needs of residents. Consequently, transactional activism impedes efforts to address communities' fundamental problems, opening new spaces and opportunities for protests

because of unresolved grievances. The paper concludes that the transactional activities of community leaders pose threats to community organizing and informal representation.

Do Organizations Supporting Migrant People Suffering from Mental Illness Overlap or Cooperate? Insights from a Vignette Study on Cultural Mediation between Organizations.

Through the perspective of a sociology of hospitality, and the contributions from other fields of studies as migration and mental health and the sociology of mental health, my research explores the possibility of making room to migrant persons suffering from mental illness through a coordinated network of community mental health care and asylum support services. Do these organizations use a common or a complementary set of categories in their daily work? Are these services collaborating or overlapping? Do they select their users or are they able to take care of their subjective suffering in a coordinated way? As a newcomer arriving in an urban context where a form of community health service is present along with an asylum support service, will these services reinforce her/his stigma? Or will the stigma associated with mental illness fade because of the demedicalization process entailed by the coordination of the two services? Will this process facilitate social inclusion?

The presentation addresses these questions drawing on the results of a comparative vignette study carried out in Greece and Italy. The research has involved street-level professionals from organizations operating in the field of psychosocial support and supported housing, as well as from local institutions, as social and healthcare services. The aim of the experiment was to observe the relationship between procedures adopted by street-level professionals in the categorization of migrant people and the different affiliations of each professional.

MATERA, Giovanni* (Harvard University, Weatherhead Center for International Affairs, United States)

The Role of Mental Health Care in the Mitigation of Recognition Gaps Affecting Elderly Forcibly Displaced Ukrainian Migrants.

The significant presence of elderly people in Ukraine requires special attention vis-à-vis these people among migrants. Elderly people currently represent a minority of Ukrainian forcibly displaced migrants who have mostly fled to neighboring countries or have followed their family members in other European countries. After the beginning of the armed conflict, their stay and transit through European countries has been facilitated by the rapid recognition of their social rights. One of the well-documented effects of forced displacements is the significant spread of psycho-trauma, which also depends on the pre-migration experience. My ongoing research retraces elderly Ukrainian migrants' subjective experiences and their reception in France through a threefold inquiry. More precisely, I am currently comparing different sites where elderly Ukrainian migrants suffering from psycho-trauma can be treated, via (1)semi structured interviews with caregivers and recipients, (2)a vignette study and (3)a short ethnography.

The main objective of my research is to explain the lack of recognition of elderly migrants' needs. According to my first hypothesis, this recognition gap depends on the way in which suffering is evaluated within the host community. Thus, independence derived from easier access to rights and unclaimed benefits could explain the invisibility of these migrants. A second objective is to study the ability of an asylum support service to make room for the heterogeneity of the subjectivity of migrants. My research aims at understanding whether the lack of recognition depends on the limits imposed by the normative repertoire of asylum support. On the other hand, taking care of elderly migrants by alleviating their psychological suffering could remedy the lack of recognition. Social services can make room for the vulnerability of older people through the treatment of psycho-trauma. According to recent developments in the field of community mental health, indeed, mental health care can promote de-stigmatization and social inclusion.

Tell Me It Visually. Infographic Contents for Healthcare Digital Communication during the Covid-19 Emergency

Among the forms and languages that health communication assumes, visual narration is gaining a new centrality and a strategic importance. Capable of accelerating cognitive and relational processes between institutions and citizens, images (graphics, pictures, icons, etc.) find proliferation in the digital environment. If this concerns the daily information production of health institutions, even more evident is the usefulness of visual communication

on emergency and crisis situations (Coombs, 2019), when the contents must quickly dictate behaviors, be seen, remembered and fully satisfy the needs of all audiences (Kelidou, Siountri, 2019).

This contribution addresses the issue of infographics produced by the health institutions during the Covid-19 crisis in Italy, albeit settled in the broader scenario of change that has been characterizing health communication and public sector communication in recent years (Ducci, Materassi, Solito, 2020; Authors, 2021).

In a reshaped communicative space, institutions have to manage the abundance of information, actors and relationships, in a tiring and difficult work of building their visibility and gaining reputation. Thus, our interest in institutional (info)graphics concerns not so much the technical-operational or creative level of the digital contents, but the role that these tools and languages play in achieving strategic goals and new relational attitudes with citizens. Starting from the pandemic lesson, we aim at exploring how these narratives and visual languages could redefine the health communication strategies.

In the research we present, the graphics produced by the Ministry of Health and by 10 Italian Regions during the emergency were selected. The infographics collected were created and published on the institutional website and/or on social media, such as Facebook, Twitter, Instagram. The results will be presented and discussed, putting in evidence which meanings the visual representations assume in the health communication's language development and which needs are emerging in a context of information overload.

Sensations, Subjectivity, and Science : Exploring the Fraught Metrics of Pain

In the history of pain medicine, several techniques of measuring pain have been experimented upon, from the dolorimeter to the pain scale — in order to facilitate diagnosis and treatment. The metrification of pain which involves translating felt pain into measurable categories has been oft-criticized by medical practitioners, biostatisticians, and even social science scholars for several reasons and on several registers. However, it is interesting to note how all strands of criticism coalesce around the same theme — how the metrification is not accurate enough — in doing this, they effectively do not offer criticism of metrification itself, rather suggestions on how it could be done in a more exact, clinical manner. The usage of various pain scales and suggestions for making them more accurate are made claiming that these instruments need to be invariably resorted to as long as any better or alternate ways of measuring pain come about. Such claims are in ignorance of the fact that qualitative modes of collecting information on pain could be developed and sophisticated in order to be deployed in a clinical context. For instance, both public health and medical practice stand to benefit greatly from the ethnographic method.

I intend to trace a genealogy of pain assessment over the years, and intend to argue, that tendencies of metrification might be understood as an indication of how metrics, in having penetrated and gained preponderance even in the realm of a phenomenon as complex as pain, have subsumed most other ways of apprehending the world.

MATLON, Jordanna* (American University, United States)

The Crisis of Black Masculinity in Racial Capitalism

Jordanna Matlon will draw from her recent book, *A Man among Other Men: The Crisis of Black Masculinity in Racial Capitalism*, examining competing constructions of modern manhood in the West African metropolis of Abidjan, Côte d'Ivoire. Engaging the histories, representational repertoires, and performative identities of men in Abidjan and across the Black Atlantic, *A Man among Other Men* shows how French colonial legacies and media tropes of Blackness act as powerful axes, rooting masculine identity and value within labor, consumerism, and commodification. Foregrounded by a broad chronological and transatlantic theorization of Black masculinity, Matlon's ethnography of the livelihoods and lifestyles of men in Abidjan's informal economy demonstrates how men's subjectivities are formed in dialectical tension by and through hegemonic ideologies of race and patriarchy. Her account illuminates the sustained power of imaginaries even as capitalism affords a deficit of material opportunities, thus revealing a story of Black abjection set against the anticipation of male privilege – a story of the long crisis of Black masculinity in racial capitalism.

Anti-Gender Politics in Brazil: A Comparison with Latin America Neoconservative Experiences

Anti-gender politics is not a single phenomenon, a solid organic something. It comprises an accumulation of events, with different trajectories that generate resonances and connections but also imply sequential processes of excitement and rest. At least since 2013, Latin America, and especially Brazil, entered a vertigo of democratic deconstruction with the coming to power of new right

representatives and the election of an extreme right-wing government: gender and race were at the center of this phenomenon. This paper will focus on two major axes of this anti-democratic advance in Brazil: public policies (guiding underfunding and the shift to the right-wing ideologies) and the escalation of political violence against women (elected and candidates). We discuss the role of anti-gender politics and policies in the recent authoritarian turn in Brazil and describes the rise of extreme right-wing movements and parties, focusing on the centrality of opposition to race and gender equity and LGBTQI+ rights. President Bolsonaro is notorious for his rudeness, disrespect and vulgarity when addressing his critics or opponents, be them journalists, artists, or scholars. His virulence is especially harsh when his targets are women. We can say that we have during his government an anti-gender offensive as state policy and we can also say that gender and race political violence was used in Brazil as a strategy to prevent greater access by women, especially black and indigenous women, to the Brazilian parliament.

Violence Against Women and the Layers of Racist and Cissexist Patriarchal Junction: A Decolonial Reading

The Center for Studies and Research on Women at the Federal University of Minas Gerais has been working with teaching, research and community intervention focusing on violence against women in Brazil since 2004. We started with the collaboration in the Belo Horizonte Victimization Survey, and the two last research projects was about the risks, impacts and gender responses in an international and regional comparative perspective during the covid19 pandemic and another on representation, and political violence in Brazilian elections.

In the Latin American context, we are living an escalation in multiple ways of violence. We discuss three layers of cispatriarchal and racist experience: the first is articulated with what Julieta Paredes (2011) defined by "patriarchal junction". She means that in the region there is the historical presence of different modes of patriarchy: a type already included in non-modern communities during pre-colonial intrusion, and another one associated with the present moment.

A second layer refers to intersectionality arising from ethnic racial oppression, which combined with gender, sexuality, and class, in a decolonial reading, highlights colonial structural forms of intersectional oppression. A third layer, more recent, is an experience of what Marcia Tiburi (2020) has called "turbotecnomachonazifascism". This type of current, advertising, and hysterical patriarchy would delimit the contemporary, updated expression of patriarchy with authoritarian content.

From the analysis of emblematic cases of violence perpetrated against women, especially political violence against three of the main presidents to govern in the Latin American southern cone, namely: Michele Bachelet (Chile), Cristina Kirschner (Argentina) and Dilma Rousseff (Brazil), it is intended to build a connected system of concepts and action tools, this time circumscribed and originating from Latin American decolonial feminist theories and practices.

From Marienthal to Digital Methods: Audio Diaries By Using Whatsapp in Social Research

The Diaries Method has been used since the so-called Golden Age in studies like the one of Marienthal (Jahoda, Lazarsfeld & Zeisel, 1933), but today, thanks to the help of digital technologies, this method has evolved into a tool that can make it possible to overcome lots of limitations relating to social research, including the well-known problem of intrusiveness. In a society completely immersed in the digital world (Lupton, 2015), where the distinction between online and offline social life has become increasingly porous (Pink, 2009), using in research strategies tools of daily use in people's lives can both contribute to get respondents closer to the world of research and to give social researchers new tools to study important facets that would otherwise be difficult to reach. Furthermore, it is possible to summarize the evolution, or "revolution", of this method in a greater involvement of the interviewees in the object of research and in the reduction of social desirability. Specifically, in this study has emerged that social desirability can decrease thanks to the proximity of respondents to the tool used. Moreover, using instant messaging Apps, such as WhatsApp, it is possible to re-think the relationship between researcher and interviewee and to consider new possibilities for integrated research strategies. By analyzing both the audio diaries and the meta-interviews of a study on workers' life domains relationship, it has also emerged that one of the greatest strengths of the use of the instant messaging service is that it makes possible to record moods and facets that most traditional research methods wouldn't been able to detect: allowing the interviewee to decide when and how to record an audio-diary ensures that the instrument is camouflaged with the usage of WhatsApp for other aspects of daily life.

Japanese Americans' Return Home and the War: Senses of "Home" and "Homelessness"

This presentation discusses the two ways that second-generation immigrants conceived of returning home, both to their parents' homeland and to their own homeland, and examines their senses of "home" and "homelessness" when the two countries became enemies during the Second World War. Second-generation Japanese Americans, who were born in the US to Japanese parents who had immigrated there, experienced back-and-forth movement between Japan and the US before and after the Second World War. Japanese Americans suffered great difficulties in both countries when the war between Japan and the US broke out in 1941.

Second-generation Japanese Americans are often said to have two homelands: the US and Japan. So, what feelings did returning to Japan or the US provoke in them? Some of them suffered identity crises because they were often seen as "too American" in Japan and "too Japanese" in the US, and were treated as either "enemy aliens" or "enemy citizens" during the years of the war. Their language skills had both positive and negative impacts. When Japanese Americans served in the US Army to fight against Japan, their knowledge of Japan and the Japanese language were regarded as being useful for knowing the enemy. On the other hand, people who served in the Japanese Imperial Army and could speak English were regarded suspiciously, as their language skills showed that they had ties to the enemy. Therefore, they had to hide their language skills to try to be more trustworthy "Japanese Imperial subjects". This presentation uses autobiographies, archived interviews, and works of non-fiction to focus on the life stories of second-generation Japanese American individuals, especially those who returned to their parents' homeland Japan to receive an education before the war, but were subsequently involved in the war against the US and eventually returned to the US after the war.

Impact of Typhoon-Induced Power Outages on Property Crime in Japan

One of the main factors that make research on crime and crime prevention in the affected areas difficult is the history of crime statistics data that have not been publicly available. Studies have shown that the number of crimes is expected to increase after the disaster. Research on crime in disaster-affected areas in Japan has focused on surveys of crime victimization among survivors, but this has its limitations. In Japan, open data on seven types of theft crimes have been conducted by each metropolitan and prefectural police department on a pilot basis since 2018. This study attempts to elucidate the actual crime occurrence in the affected areas in Japan in a triangulation manner. The analysis was conducted using three types of data: power outage data from Typhoon No.15 in 2019, open data on property crime by the police, and data from an online survey asking about crime victimization experiences during and after the typhoon. Crimes that occur in disaster-affected areas can be broadly classified into the following three categories:

1. Impoverished-type crimes occur due to a lack of relief supplies.

2. Phoretic-type crimes, such as fraud and illegal payments, take advantage of the chaos.

3. Stress-type crimes are accelerated by drug addiction, alcohol and other substances, and domestic violence due to the stress of evacuation life.

Although only seven types of property crimes are currently available in the open data, some of them can be categorized as convenience-type crimes, such as burglary and breaking, or stress-type crimes, such as damage to property. This study will examine the impact of social change, such as disasters, on offense.

Why Do Freelance Animators Belong to a Firm?: Manufacturing Consent with "Schedule Gifts" and Its Ambivalence in the Japanese Animation Industry

The labor market in Japan has been characterized by standard workers' long-term employment security, but nonstandard workers, such as freelancers who usually work short contracts, have been suffering from precarious labor conditions (Mouer and Kawanishi, 2005). This paper focuses on the labor process of animators, a unique occupation within the Japanese labor market because most animators are freelance workers. The paper particularly analyzes how freelance animators accept their belonging to production firms and management control through their workplace's ethnographic data.

Recent labor process theory research has confirmed that nonstandard workers have difficulty maintaining their desired work schedule and revealed that the managerial granting of additional work or schedule adjustments, even rare, results in workers' consent to work under precarious conditions. The novel concept of "schedule gifts" (Wood, 2020) indicates that managerial granting obscures the organizational control to coerce workers to work in unstable temporal order because workers recognize their personal indebtedness to their managers.

Although schedule gifts have been observed in Japan's animation industry, this paper discusses variations in the interactions between managers and animators. In particular, animators did not always express indebtedness to their managers, even if the managers adjusted the animators' schedules or assigned easy-to-manage tasks. Animators enjoyed flexible scheduling to some extent but did not recognize it as the outcome of managers' personal contributions. Instead, they saw it as the function of organizational support for animators. Although this understanding derives from the idea that an organization is necessary for animators to manage their job insecurity in freelance work, it gives a foundation to their consent to belonging to firms and accepting management control.

Ethnographic insight indicates that belonging to a firm contributes to workers' protection in precarious working conditions. However, there is an ambiguity in that accepting managerial control might affect freelance workers' freedom.

Challenging Gendered Norms of Skilled Migrants in Transnational Companies: Case Study of Japanese Professionals in Germany

This paper aims to examine how the intersectionality of gender, ethnicity and skills forms the working practices of high-skilled migrant workers in Japanese transnational companies located in Germany and how the migrant workers react to that. Japanese transnational companies introduced the new transnational employment system in 1990s, in which Japanese workers were employed directly by overseas branches. These migrant workers are positioned relatively lower in the hierarchy than assigned expatriates and are called "locally employed migrant workers." The gendered composition of the workforce, which consisted of male assigned expatriates and female locally employed migrant workers, has determined their working practices and career trajectories. The gendered norms were transplanted from Japan and applied to two types of Japanese workers, which means they were not applied to German or other ethnic groups. After several Japanese male workers began to be hired as locally employed migrant workers, however, the gendered norms and practices in workplace were confused and affected differently to female and male locally employed migrant workers. Based on ethnographic research on Japanese locally employed workers in Dusseldorf since 2019, this paper shows how gender and ethnicity intersect in Japanese transnational companies and how Japanese female and male migrant workers negotiate with the gendered norms by modifying behavior, utilizing professional skills and building/modifying career strategies.

Professional Migrants in the Enclaved Labor Market: Japanese Migrant Workers in Transnational Corporations

This paper aims to examine the role of enclaved labor market in the process of migration based on the empirical research since 2009 on Japanese professional migrants hired by Japanese transnational corporations located in China and in Germany. Professional Migrants often face the problems with transferring their human capital when they move across national boundaries. This paper introduces an alternative strategy by migrant workers employed by transnational corporations. Recently Japanese transnational corporations not only assign expatriates but also hire directly Japanese workers in each overseas branch. They build the enclaved labor market and entice professionals who prefer career building in abroad but with scarce degrees, certificates or language skills in the destination country. The enclaved labor market offers professional migrants the safety zone in the destination country, in which they avoid entering directly foreign labor markets so as to utilize their cultural capital and maximize their human capital. This paper shows how human capital and cultural capital are interwoven in the enclaved labor market and discusses the possibilities/limitations of the migration strategy dependent on transnational corporations.

Media Sports Events As a Stage for Digital Activism and Social Movements

Today, sports and sporting events are among the most popular media phenomena. While television continues to play a primary role for major traditional sporting events (Hutchins & Sanderson 2017), social networking services extend the sports narrative and experience, making sport one of the most discussed topics on social networking platforms. It is interesting at this point to examine how sporting events, though often constituting festive and ritualized expressions of imagined communities with shared values (Dayan, Katz 1992), are increasingly used as vehicles of "soft power" (Nye 2004) in the geopolitical arena, and are emerging as a stage for public discussions and expressions of current political and social issues, including human rights and environmental and social sustainability. This paper presents an analysis of sporting events with a focus on the role of the media and platforms in event production processes and/or related fan strategies and practices - including discussions on global and local interests surrounding sporting events, and fan activist movements that use sporting events to promote debate on specific issues. The investigation employs a quantitative-qualitative methodology, with inductive and deductive analysis that constructs and uses a matrix of categories of cultural content on the themes of climate and environmental and social sustainability that accompany media sporting events, proceeding with interviews with activist fans operating individually or within social movements. The findings of the research show that sporting events in the digital environment must be understood as a diverse range of events, in which the public engages in unprecedented social activism and new converging practices, such as protests against hegemonic ideologies and structures. Such activism and practices can be defined as a "participatory liveness" (Frandsen, Jerslev & Mortensen 2022), sparking political debate and social engagement for change.

Why We Don't Build Back Better: Coherence, Complexity and Control

The idea of "Building Back Better" has assumed the status of orthodoxy within post-disaster reconstruction. Yet despite widespread desires to do so, cities routinely fall short of this aim. At the Canterbury Earthquakes Symposium one expert declared: "No one builds back better". Ōtautahi Christchurch is instructive here, as the claim is frequently made that it is a paradigmatic case in how not to do it. The Canterbury Earthquake Sequence (2010, 2011) created the biggest urban renewal project in Aotearoa New Zealand's history. Local government undertook an epic consultation exercise to determine the future form of the city. But the resulting "People's Plan" (*Share an Idea*) was quickly usurped by central government's own blueprint, the *Christchurch Central Recovery Plan*. This centralised top-down command and control recovery model was castigated as an exemplar of global worst practice.

I propose a theoretical framing to illustrate the failure to build back better here. Alliteratively, the issues cluster around questions of coherence, complexity and control. For the government's blueprint for the city illuminates several fantasies of control associated with the technocratic mindset: that a central authority can dictate local interests, that community can be proscribed from the top down, and that a fixed recovery plan can deal with emergent complexities.

Yet there are resources for hope. Any authority will face constraints and contestations. Here communities rightfully insisted on being party to their own recovery. And while the city was roundly regarded as one of the most quintessentially English settlements in the colonial project pre-earthquakes, the principal Māori iwi of the South Island, Ngāi Tahu, made history afterwards, becoming the first Indigenous group to be an official partner to recovery following major disaster. They are now making their presence felt in the very fabric of the city, helping transition it into a post-colonial place.

MATUS, Claudia* (Pontificia Universidad Católica de Chile, Chile)
RIBERI, Valentina (Center for Educational Justice, Chile)

The Vitaly of the Gender Norm in Research

In this presentation, we problematize the gender norm and its agency to become gender again.

We state that the binary gender norm, understood as those natural, complementary, recognizable, and desired differences between men and women, IS the product of thinking about the world into the binary men/women and NOT the cause. This is deeply political when thinking about research and data production because, if not problematized, research becomes a particular site for discrimination. How does the ideology of natural differences is embedded in research? How does the gender norm is reproduced over and over in research?

In this presentation, we share the experience of designing and implementing workshops for academics and professionals belonging to higher education institutions in which we problematize the production and reproduction of the gender norm in research. We state that research becomes an active gendering practice that requires attention, particularly in the contemporary capitalist university. In this presentation we will discuss:

(1) how do contemporary politics of "using evidence" serve to neutralize the political aspects of gender?

(2) how is it that gender has become the "bias problem" when addressing practices of discrimination in institutions?

(3) how does the gender gap literature reduce the phenomenon of gender discrimination into men and women binary?

We state that "bias" and "evidence" play an important role in the continuity of the common sense of gender in research. We will present different examples of how binary thinking about gender DOES continue to be a powerful force that spreads its operations without being noticed. Our main assumption is that the gender norm, as a vital concept plays tricks on us, thus we have to find other ways of noticing.

MAUERER, Gerlinde* (Department of Sociology, University of Vienna, Austria, Austria)

Parental Leave Policies and Gender Inequalities in the Uptake of Parental Leave. Empirical Evidence from Austria.

In recent decades, family and gender research have identified social and gender inequalities in the uptake of parental leave (i.e. Marynissen, Wood & Neels 2021; O'Brien & Wall 2017; Connolly, Aldrich, O'Brien, Speight & Poole, 2016). The research presentation provides insights in dual parental childcare benefits claims in Austria, focusing on details in parents' daily family life with an infant or more children.

The research presentation focuses on gender inequalities in parents' daily interactions with one another and with their child/-ren. On a wider scale, these inequalities result from parents' different time-frame in the uptake of parental leave. While mothers in Austria mostly take 8 weeks of maternity leave and parental leave directly after giving birth to a child, fathers tend to take the "later" part, when the opportunity of profiting from childcare facilities and getting further (informal) support in child care tasks is much greater.

The presented empirical results derive from couple interviews with parents in Austria (2021-2022). In parallel to focusing on gender inequalities in the private sphere and in parents' employment, – as women in Austria are still predominantly expected not to return to the workplace for one, two or even more years after the childbirth –, the presentation will also include an examination of the (Austrian) welfare state construction basing on patriarchal structures (Neyer 1997, Chow & Berheide, 1994).

Finally, these results will be discussed asking for further pathways in developing gender equality policies going beyond the promotion of parents' dual uptake of parental leave. Moreover, the gained empirical data point to the need of further research on social inequalities in the uptake of parental leave and childcare allowance claims. As our findings (2021-2022) included parents working from home due to the pandemic, the "nuclearization" of small families with infants was an additional research result.

RC06-103.7

MAUERER, Gerlinde* (University of Vienna, Austria)

Social Inequalities in Claiming Parental Leave and Childcare Benefits. Empirical Evidence from Austria.

The research presentation provides insights in the dual parental childcare benefits claims in Austria, focusing on details in parents' daily life with an infant or more children. In recent decades, family and gender research have identified social and gender inequalities in the uptake of parental leave (i.e. Marynissen, Wood & Neels 2021; O'Brien/Wall 2017; Connolly, Aldrich, O'Brien, Speight & Poole, 2016).

The presented empirical results derive from couple interviews with parents in Austria (2021-2022) showing social inequalities in claiming childcare allowances in Austria. The presented qualitative sociological research (2021-2025) investigates parents' individual workplace conditions as well as their agreements with employers and with one another during the transition to parenthood (including working from home due to the Covid-19-pandemic). In parallel to focusing on gender inequalities in the labor market, prior analyses examining the construction of the welfare state basing on patriarchal structures will be included (Neyer 1997, Chow & Berheide, 1994), revealing its wide impact on gender segregation in the labor market and the (de)valuation of (private) care work.

Overall, the research findings point to the necessity of backing up and promoting gender equality (policies) in the workplace in parallel to promoting and enhancing childcare allowance models addressing parents' dual reconciliation of employment and childcare. Moreover, the presented Austrian data point to a demand of continuing research on social inequalities in the uptake of parental leave and childcare allowance claims, as the qualitative

results reveal that the provision of gender-neutral childcare allowances has not succeeded yet in realizing the dual reconciliation of work and family going beyond exceptional couple arrangements in rather well-off families.

Back in the Nest: How Family Recohabitation Questions Forms of Child Support and Family Solidarity

In a recent qualitative study on the phenomena of young people moving back in with their parents in France, we highlighted how the parental home appeared to be a resource, an essential safety net, to deal with the insecurity of the transition to adulthood (Maunaye, Muniglia, Potin, Rothé, 2018 and 2019).

In this paper, we wish to show how these phenomena of intergenerational recohabitation question the way in which parents envisage the support they must provide to their children while they are also constructing new social places and conjugal relationships as a result of the empty nest experience. The interviews conducted as part of this research reveal a form of normalisation of parents' prolonged support for their children, which makes the possibility of recohabitation evident. On the one hand, the extension of family solidarity is naturalised by the parents who, beyond the obligation to provide maintenance, see it as an expression of their parental love

On the other hand, the need for prolonged material support is also justified by an awareness of intergenerational inequalities. Parents often emphasise that they have experienced more favourable conditions of integration into the labour market and access to economic and residential independence than their children (access to employment, prospect of sustainable employment and wage growth, possibility of owning their own home). Some of the speeches thus almost evoke a debt towards the next generation, linked to the fact that they lived in a privileged context from the point of view of employment. Our communication will also attempt to analyse these representations of family support through the prism of the quality of parent/child relationships. Thus, even though relational conflict may prevent the re-housing of children, it does not cancel family solidarity but reconfigures it.

MAVICA, Giorgia* (University of Catania, Italy)

NICOLOSI, Davide* (University of Catania, Italy)

SCIERI, Alessandra (University of Catania, Italy)

Violent Extremism and New Collective Actors in Pandemic Times

In the last years, the economic, social, and even psychological impact of the various measures implemented to contain the spread of the virus contributed to creating the conditions for the advance of extremism and the adhesion of an ever-increasing number of supporters and militants to various causes, including conspiracy theories, of a political, identity, anti-technological nature (Caniglia 2021). In particular, a series of protests driven by a strongly anti-lockdown and anti-vaccine agenda often rooted in conspiracy theories, have been infiltrated by right-wing extremism elements which have contributed to increasing the violent potential of these manifestations: the presence of No-Vax who have made extensive use of social networks to sow doubts and create beliefs anti-scientific and conspiratorial (Abers *et al.*, 2021) and have embraced a radical ideology or belief that accepts, uses or condones violence to achieve a specific political or ideological purpose (Davies *et al*. 2021).

Under this light, starting from the construction of a rich theoretical background on the factors of radicalization, polarization and extremism, which enabled the acquisition of a solid and in-depth conceptual overview, this contribution aims to open a discussion on the understanding of the No-Vax protests and of the profiles related to the factors of radicalization and polarization. The results of a descriptive-interpretative analysis (review of newspaper reports), aiming at offering an extended investigative perspective on the types of protests of the No-Vax groups, and a comprehensive-interpretative analysis, focused instead on an in-depth analysis of non-directive interviews with key witnesses of these groups, move in the direction of achieving conclusions, take advantage of a circular approach that simultaneously considers action (micro) and structure (macro) in their mutual interactions and externalities (meso) and finally put the focus on issues of collective action and social movements.

MAWATARI, Reo* (Nagoya City University, Japan)

How Does the Process of Extended Urbanization Incorporate a Remote Island?: The Case Study of Naoshima Island, Japan

From the perspective of planetary urbanization, this study focuses on how urban mining and copper smelting have become productive forces, and have been incorporated into the process of "extended urbanization" that has spread on a global scale. The study explores how the enterprises of copper smelting and urban mining have caused capital accumulation both, theoretically and empirically, in a remote island region. The study investigates the island of Naoshima in Kagawa Prefecture, Japan, which has been the "business castle town" of the Mitsubishi Materials smelter and refinery since 1917. In the 2000s, Naoshima was commissioned to dispose of industrial waste that was dumped illegally on the neighboring island of Teshima. This industrial waste treatment business can be regarded as "industrial technology in harmony with nature," combining ecology and modernization. On the other hand, Naoshima island has been harmed by smoke pollution from copper smelting in the process of Japan's modernization and industrialization. In recent years, with the emergence of "urban mines," it has also become a space for recycling rare metals from electronic devices. Although Naoshima itself is not a mine, it can be regarded as a "planetary mine," incorporated into planetary-scale urbanization (Arboleda, 2020). Therefore, from the perspective of planetary urbanization, this study clarifies the process by which not only the smelter, as a means of production, but also its location, as well as the international logistics and networks that support copper production, all become productive forces themselves. Reference: Arboleda, Martin, 2020, *Planetary Mine: TERRITORIES OF EXTRACTION UNDER LATE CAPITALISM*, Verso.

Mainstream Sports Clubs Celebrating Cultural Diversity and the Social Inclusion They Promote: An Exploratory Case-Study.

Sport has received increasing sociological scrutiny in recent decades as governments and non-government organisations mobilise sport to 'integrate' people from culturally diverse backgrounds. Words like 'integration', 'equity', and 'inclusion' are common parlance, yet their definitions are often lacking, overlapping, or inconsistent, even in research. Thus, they are entangled. To complicate matters, the value of these concepts is often contested. How do mainstream sports clubs understand and value these concepts? And how does that relate to political, organisational, and sociological discourse? Historically, mainstream sports clubs have been especially exclusionary sporting environments for people from culturally diverse backgrounds. To address these exclusionary forces, several sports clubs, in Melbourne, Australia, have identified a need to celebrate the various cultures of the diverse communities participating in their clubs. Such celebrations have provided recognition and resources to disadvantaged cultural groups in other settings, but their effect in sports clubs is relatively unknown. This paper presents the findings of research that followed this case study. As a case study, the clubs (and their members) were observed as they designed, delivered, and evaluated their celebrations. Interviews were conducted with participants about their experiences. This paper critically considers the outcomes of these celebrations and how those in mainstream sports clubs advance, reproduce, or resist the entangled definitions of equity and inclusion as they seek to promote them. What kind of equity and social inclusion is promoted? Who is in control? Who benefits? How are the outcomes valued by members from different positions and cultural backgrounds? Finally, recommendations for understanding and navigating these entanglements in mainstream sports clubs will be provided. There are few case studies of this nature in mainstream sports clubs that provide such depth into a specific context.

MAYER, Elisabeth* (University of Vienna, Austria)

Don´t Look Too Closely into It – the Emotional Challenge in Visual Biographical Research

Biographical construction takes place not only verbally, but also through images. New forms of biographical research include visual methods that show how visual self-presentation is biographically embedded. Research with biographies can confront researchers with challenging emotions for which there is guidance in form of a specific methodology of interviewing that involves active and attentive listening. But how to manage strong emotions during the research process that are not caused primarily by verbal-narratives, but by the pictures shown, which when observing them touch you emotionally and pull you into someone else's life story?

Based on a case from a project funded by the Austrian Science Fund (FWF), I would like to explore and reflect on how emotions are dealt with in visual biographical research. Therefore, I focus on the visual practice of an interviewee who uses WhatsApp pictures to create a 'visual diary of end-of-life care' and thus visually finds a way of dealing with her grief.

The aim of this presentation is to provide insights into the images of a 'visual diary' and thereby showing how the emotional dynamics have developed in the interview and continued throughout the later stages of the research process. I want to illustrate how it is possible to 'look closely into it', but at the same time – through methodological procedure, reflecting and theorizing – returning to the sociological role of the researcher and thus making an outstanding practice of visual communication scientifically accessible.

RC38-553.2

MAYER, Elisabeth* (University of Vienna, Austria)

Visual Biographies – Looking at the Images of a Lifetime As a Way to Do Biographical Research

We encounter life stories in diverse media and multiple places. Accordingly, biographical expressions include not only verbal-narratives, but also analogue photo albums or digital image compilations in social media. But to what extent can images that emerge within a lifetime can be understood as biographically embedded? Or do images from different life spheres and life periods remain only visual fragments of one's own life?

Based on a case study from my dissertation, I would like to address the question of how one's own biography is visually constructed in different media. The research is based on an innovative multi-method approach that combines biographical-narrative interviews and visual analysis. I would like this specific way to do biographical research, in which image analysis is crucial, to be visible in the way it is presented. What life story does emerge when you only know its images? In this session I focus on the reconstruction of the visual life story of a mid-30-year-old and visually take the audience through his life similar to a photo presentation. I show analogue photos from his childhood and youth as well as pictures from his social media accounts with the aim to show the development of the way photos are taken in different biographical phases and their respective biographical relevance. I then compare the visual results with his verbal-narrative in order to illustrate how they simultaneously relate to each other.

Starting from the reconstruction of a visual biography, the aim of this presentation is to demonstrate how the repertoire of biographical expressions and thus also the field of biographical research is expanded by focusing on the images of a lifetime.

MAYERCHYK, Maria* (University of Greifswald temporary, Ukraine)

Welcomed and Othered: Ukrainian War Refugees Seeking Jobs in Western Europe

Until 2014, Ukrainian scholars, including pro-nationalist diasporic academics, systematically denied that the nature of the Ukrainian-Russian relationships is colonial. They argue that colonialism involves racialization as a basis for radical distinction for exploitation, while Russian imperialism towards Ukraine was based on a declaration of sameness. In the Russian imperial narratives, the Ukrainian language and culture do not exist because they are forms of Russian dialect and culture, and so on. Today, the colonial nature of the Russian war on Ukraine is commonly recognized in academic and public discourse. While Russia practices imperialism of assimilation/extinction, my research focuses on Western colonial politics towards Ukraine to shed light on forms of othering grounded in the discourse of dissimilation/subordination.

The entry point of my study is the insight of decolonial thinking extended toward Ukraine via the concept of buffer periphery. It situates Ukraine between two competing geopolitical centers and uncovers major epistemological challenges of this position. Drawing on a series of case studies illuminating the experiences of Ukrainian war refugees looking for jobs in Western Europe, I analyze how one of the most propitious politics developed in favor of refugee seekers acts as the mechanism of their othering. How did forced migration of women of different classes and educational backgrounds challenge or reinforce the previously established perception of Ukrainians as low-qualified workers? How do gender and ethnicity/ nationality intersect in the situation of predominantly female forced migration? If both modes of politics of othering – i.e., assimilation/extinction and dissimilation/subordination - are exercised toward Ukrainian war refugees, how are they intertwined, and what their political effects might be? The ultimate aim of my research is to develop a conceptual framework capable of grasping the politics of othering which are racist in essence but not based on skin color.

Co-Researching Young People's Multiple Climate Justice Activisms: Ethical, Methodological and Political Questions

In recent years, the inequitably distributed effects of climate change have fuelled school-aged students' political action across the world. Climate change 'amplifies, compounds, and creates new forms of injustices' which are 'interlinked and interconnected' (Sultana, 2021, p. 448); in settler colonial societies, these injustices are intimately entwined with colonial logics and extractive capitalism (Birch, 2018; Whyte, 2020). In the sociology of childhood and youth, scholars have analysed the representational injustices of researchers extracting 'voices' from children and young people, speaking *for* children and young people, as well as considering the methodological, ethical and political possibilities and perplexities of co-researching *with* young people.

This paper is a conversation between five members of a research team, which includes four paid research assistants who are 18-21 years old and active climate justice organisers. This team is working together on a project co-constructing accounts of school-aged students' climate justice activism(s); the five members of the team have been part of the project's design, consultation, preparation of institutional ethics application, research interviewing, analysis, co-authoring and co-presenting processes. Whilst the team is differentially positioned across identity markers and embodied experiences, we are interested in co-creating stories that compel attention to the textures and nuances of diverse young people's multi-modal activism(s), and to the political differences between and among young people involved in climate justice activism(s). In this paper, we discuss some of the ethical, methodological and political challenges we are grappling with as we work together. The challenges we discuss include acknowledging and not glossing over uneven power relations, negotiating informed and ongoing consent within the team, beneficence and capacity-building, honouring the time and energy that reciprocal co-research relationships within multi-aged and intersectional research teams demand, and seeking to avoid reproducing extractive research practices.

The Gig Economy, Academic Work and Resigned Hope in Early Career Sociologists

This paper explores the experiences of early career academics (ECAs) in Australian sociology. The short-term nature of many employment arrangements has a particular impact on ECAs and their career progression due to workload pressures, restricted access to research funding schemes and a lack of support and mentoring. The managerial agenda has contributed to a division of the academic profession into a secure core and an insecure periphery with poor pay and conditions (Kimber 2003). The participants in our study reflected that early on they accepted the precarious working conditions to establish themselves within the department. Kuehn and Corrigan (2013) refer to this as 'hope labour' where individuals accept unpaid or underpayment on the basis that this 'experience or exposure' will establish future job prospects. This paper is based on interviews with nearly 200 Australian Social Scientists about their careers and their views on the discipline. This research discovered that while ECAs have always experienced difficulties in establishing their place in the academy, this has increased in recent years. This paper interrogates the structure of inequality and its resultant impact on career aspirations of the next generation. It asks will sociology lose a generation of ECAs to resigned hope?

Transitional Justice and Forensic Exhumations: Reconciling Post Conflict Violence in Spain

Forensic exhumations are more generally associated with criminal prosecutions seeking to attribute individualised or collective guilt for the sequestration, torture and killing of civilians. Spain is distinct as often there is no criminal investigation associated with the location of the disappeared. The exhumation of clandestine graves serves wider humanitarian goals after more than 80 years since the original crime was committed. The social movement to exhume the dead began as a grass-roots initiative by families of the victims in 2000 and has culminated in the formation of numerous associations recuperating historical memory in Spain. This inevitably has had legal and political consequences because exhuming bodies cannot remain a personal matter. Due to a policy of impunity and the statute of limitations for murder expired criminal investigations are not possible, despite the continuous nature of enforced disappearance. However, the privatised exhumations offer the relatives a therapeutic form of transitional justice. It has allowed for public and open exhumation sites whereby the families can collaborate as they see fit in the recuperation of their dead. The open nature of exhumations permits communities to come together and contribute to the revision of collective memory in the recognition of the atrocities committed in the recent past. This offers those present access to truth as forensic specialists corroborate scientific findings with testimony and information of what happened to these victims of enforced disappearance.

MAZA, Octavio* (Universidad Autónoma de Aguascalientes, Mexico)

Amateur Sport and Work, a Relationship to Increases Productivity

In the presentation I am going to discuss the sport practice, used as way to be a better worker. In nowadays labor world, demands more productivity, a slender body and a pleasant attitude, in order to achieve that people, need to work harder in their labor capabilities and in their body.

This research is based on the data obtained in a survey applied to marathon runners in the City of Aguascalientes, Mexico, in which we detected a strong tendency to link sports practice with efficiency at work. For this reason, we have assumed that some sports activities are part of the configuration of the world of work, causing a kind of colonization of the world of leisure. For this paper, the proposals of Elias and Bourdieu are taken to achieve a better understanding of the way in which the subjects assume their relationship with work and with different physical activities. From Elias, we consider useful the rescue of the proposal of the process of civilization, as a tendency to control the emotions as anger or frustration, and from Bourdieu the link between sports practice as forms of distinction, to subsequently rescue Wacquant and his analysis of the meanings of the body in sports, especially the way in which sport allows the constitution of bodies fit for work.

We present a review of the reasons that the subjects give for their sports practice, as well as the meanings that sport has for them, this allows us to make an analysis that considers class and gender as part of the configuration of this relationship between work and sports practice.

Voluntary Supplementary Education and Academic Performance of Underprivileged Children: 'Hstu Mojar Ischool' Model

The level and quality of education provided to the population is a key differentiating factor between underdeveloped, developing, and developed countries. Equal access to affordable technical, vocational, and higher education and elimination of all discrimination in education are two of the outcome-oriented targets of SDG4(Quality Education). However, the need for private supplementary tutoring is hampering the quality of education by creating inequality of opportunities in south Asian countries like Bangladesh. Supplementary education has become essential for better academic performance. HSTU Mojar Ischool (HSTU FUN SCHOOL), a school with fun for children, is a free extra tuition center. This study aims to find out the role of HSTU 'Mojar Ischool' on the academic performance of the underprivileged children aging 06-15 years of Basherhat, Dinajpur. This study is inherently qualitative and case study method is used through in-depth interviews, conducted with students, guardians, and KII form teachers of 'Mojar Ischool' in the form of *testimonio* and, data were analyzed thematically. The study found that 'Mojar Ischool' attempts to complete the gaps in the academic syllabus so that students can be promoted to the next grade with adequate education rather than the minimum requirement. 'Mojar Ischool' teachers focuses on realization of a topic, not just memorizing. More than 100 students along with many dropped out students regularly attend 'Mojar Ischool', most are found improving their academic results. This study found that 'Mojar Ischool' has successfully provided free Supplementary extra tuition for the underprivileged children of the Basherhat area. 'Mojar Ischool' brought back many dropped-out students by creating awareness among the parents through regular village visits. This study found 'Mojar Ischool' as a successful non-formal education sector whose mechanism can be applied to ensure quality education for underprivileged children of Dinajpur, Bangladesh.

Reputational Capital and Vintage Fashion: A Cross-Platform Analysis on Instagram and Tiktok

Digitalization has revolutionised most aspects of social life, from personal interactions to public and political communication. The actors in the resulting digital society are "prosumers" (Toffler, 1980) who, in capitalism and industrious digital ethics, are led to produce content to accumulate reputational status. In this context, platforms play a crucial role and constitute different relationships in affordances-based environments: algorithms shape experiences on platforms, creating visible and figured affordances which outline technicalities and guide users' and users-platforms relationships. This paper investigates reputational capital distribution on platforms, understanding how it is reproduced among users and between users and affordances. The first step is to operationalise the concept of reputational capital through a

model that we define as "3(+1)ity". According to our 3(+1)ity model, reputational capital operates through credibility, celebrity and reciprocity - whose actions converge towards virality. Virality, indeed, regulates the impact of the three dimensions on the production and distribution of content. Secondly, we need to outline the platforms to be analysed. In our opinion, Instagram and TikTok could be good study environments: both visual, the two platforms offer the opportunity of a cross-platform analysis affordances comparison-based. From the considerations of Abidin (2020), which - through an ethnographic analysis - identifies principles of "person-based fame virality" on Instagram and "post-based virality" on TikTok, it is necessary to look at common affordances in order to make a comparison using Digital Methods: the hashtags of the posts. Ultimately, to analyse the distribution differences of reputation capital on the two platforms, after extracting the data through API scraping techniques, it will be necessary to analyse the number of likes, comments and views for each author.

Artificial Intelligence and Text Mining: Challenges in Social and Evaluative Research

The social issues that plague postmodern and globalized society are complex and affect various dimensions of people's lives. In the past two years, moreover, the spread of the COVID-19 pandemic has not only changed the social reality we were used to but also confirmed how data is one of the most valuable resources, challenging the tools and techniques that social scientists, in general, and evaluators have used to conduct their studies. This calls for reflection not only on the tools and techniques used to predict and evaluate the effects and impacts of interventions but also on the skills and, more generally, on the working practices that have so far characterized the evaluator's role and profession.

In this context, this paper aims to highlight the value such technologies can add to the analysis and evaluation of complex social phenomena. In particular, we investigate the potential of using ML and Text analysis tools by presenting a study on the Ukraine conflict that is changing political scenarios globally, one that policymakers need to consider when developing policies and programs. Through the case, we also explore how such technologies enable us to understand people's reactions to the sanctions against Russia, focusing on 1) perceptions of the Ukraine conflict in the digital context and 2) emotional response to the application of sanctions against Russia following the invasion of Ukraine.

Daily Lives of Young Children in Foster Care: Spatial Context and the Influence of the Intergenerational Order

This paper will report on the early findings of a new study with young children in foster care in Wales. The eighteen-month study was funded by Health and Social Care Wales. A qualitative study co-designed with young children in foster care and using creative methods, it extends the work of the cross-national Children's Understanding of Subjective Well-Being (CUWB) project with children in the general population. For example, see McAuley (2019) for an English general population study. The current study turns attention to the well-being of children living in foster care. For the purposes of interviewing these young vulnerable children, the approach has been modified to increase sensitivity. Social scientists, and in particular social geographers, have shown increasing research interest in the spaces children experience in their daily lives and how they contribute to their well-being (see Adams and Savahl 2017 and Freeman 2019 for useful overviews). This paper moves beyond that in two important ways. Firstly, it considers the impact of the inter-generational order on children's use of space. Secondly, it does so, importantly, from the perspective of the child participants. Consideration will be given to the research, policy and practice implications of the findings for the well-being of children living in foster care, both nationally and globally.

The Social Lives of Older People Living in Mexico and Scotland during the COVID-19 Pandemic: Reflections on Rights, Resources and Technology

During the pandemic older people saw transformations in their social lives due to lockdowns and other restrictions as well as their own fears and perceptions of the COVID-19 virus. These changes impacted on their human rights including access to their usual family, community and cultural connections. Technology provided one potential mechanism for people to stay connected with others, but technology may not be accessible or desirable to everyone. Gender, socioeconomic status, ethnicity, age and other factors may enhance or limit engagement with technology. This project explored experiences of older people in Mexico and Scotland during the pandemic and examined the potential of everyday technology to help maintain social connectedness and support human rights. Online semi-structured interviews were carried out with 36 older people in Mexico and 23 older people in Scotland. Sampling was purposeful creating a diverse sample across age, gender, ethnicity and socioeconomic status. The findings demonstrate that older people have a broad range of resources, within themselves, their families and communities; that enabled them to cope during the pandemic and utilise technology to maintain social connections. However, advantages and disadvantages accumulated in the life course were found to impact on people's ability to live well during the pandemic and their access to and use of technologies. Stereotypes about older age and technology use are obstacles to the use of technology, as they affect the perception of self-efficacy by older people as well as the expectations of others. Findings suggested differences between the countries in terms of access to technology but also highlighted similarities in the ways in which older people utilised resources accumulated across the life course to support social connectedness during the pandemic. We conclude with recommendations about using technology in a manner that recognises and responds to inequalities and that supports older people's human rights.

Wellbeing through tourism in a post-covid world or how tourism failed to build back better: new times, new entanglements, but the same injustices remain.

Despite promises to 'rethink' tourism, build back better, for tourism to have a reset that would yield more sustainable futures for destinations and emphasis sustainability and a more inclusive and just system tourism system, this has failed to materialise. One of the most striking features of the post-pandemic rush for 'revenge travel' was the absence of any sense of wellbeing or inclusion in policy, industry or advocacy around tourism, particularly for under-represented and underprivileged members of society. Often, the poorest and most disadvantaged were more affected by the health effects of covid, yet they were also squeezed out of participation by rising costs for domestic holidays, increased pressure on domestic resort resources and infrastructure and the consequences of government lockdown measures. This presentation discusses how tourism debates and power is concentrated in elites (Mills 1956) and that notions of social inclusion and wellbeing are radically de-emphasised in times of crisis when the power of the elites is challenged and under threat. I argue that we can learn a lot about how power in tourism operates when looking carefully at how the pandemic erased notions of equality of access to participation.

Law, Justice and Indigenous Intergenerational Trauma - a History of the Present in Australia

Australian Aboriginal peoples' engagement with policing and the justice and welfare systems has been long-standing problems in public policy and practices. Law, policing and human rights in relation to Australian Aboriginal men, women and children, including policing, arrest, charging and incarceration remain continuing problems. In the case of the State of Victoria the functioning of legal systems has been described as 'ever-increasing rates of Aboriginal incarceration and draconian bail laws' (Victorian Aboriginal Legal Service 2022).

This paper presents an analysis of the history of present-day incarceration of Aboriginal peoples and the importance of addressing the reproduction of historical concepts of justice and welfare.

An Injury to All: Essential Workers and Public Health during the Pandemic

This paper examines the ways that labor unions in the US mitigate the spread of Covid-19 in hospitals, schools, nursing homes, and meatpacking plants. Through qualitative interviews and analysis of proprietary union data, I show that the union difference was life and death in some key essential industries. Strikes, walkouts, and other labor protests, as well as simply new organizing drives, were important determinants of Covid's spread during the peak of the pandemic, especially for Black workers. Ultimately, this paper paints a picture of Covid as an occupational disease, one made less severe by the existence and persistence of strong unions.

Show Me How You Feel: Using Visual Research Methods to Explore Men's Experiences of Gender Politics and Social Change in Australia

In this paper, I reflect on the use of participatory visual methods to capture the messy and affective dynamics of negotiating normative and subjecting processes in social life. I further consider what a feminist ethic of care can look like in the context of research with men that examines power, privilege, and gendered experience. These reflections are drawn from a qualitative project with 33 men aged 18-49 in Australia, which involved video interviews using photo elicitation to explore lived experiences of masculinity, gender relations, and social change. There can be noted challenges for women studying men and masculinity in terms of relationality, power, and positionality (e.g., Egeberg-Holmgren 2013; Pini, 2005). An intersectional framing of research relationships in this space recognises there will always be a complex web of power dynamics that go beyond gender (Elliott & Roberts 2020). Reflexivity is therefore a central concern in feminist research with men to ensure ethically-sound practices that are attentive and accountable to the agency of all involved (Lefkowich 2019). For this reason, photo elicitation offered a meaningful and participatory strategy for engaging men in this study with self-reflection on complex and abstract processes. Men were supplied with reflective prompts before their interview and were asked to bring different (pre-existing) photos to share and discuss. The prompts focused on moments where gender normativity might be more affectively felt, such as periods of change, memories of connection, and representations of self. Given the broader context of the COVID-19 pandemic, photo elicitation further enabled men to draw on experiences and social interactions from "normal" life. I argue that participatory visual methods are well placed to facilitate reflexive discussions with men around how they have come to understand themselves—or not—as masculine subjects at a time characterised by polarised debate on feminism, gendered violence, and men's power.

WG08-801.1

MCCOOK, Sarah* (RMIT University, Australia)

"You Have to Make a Choice": Affective Tensions in Australian Men's Negotiation of Normative Masculinity and Social Change

Gender politics continue to shape global society in ways that reveal the deeply affective nature of social inequality and social change. Feminist theory has drawn our attention to the political work of emotions in connecting subjectivities with society, understood as the felt experience of social processes like gender, race/ism, and cisheteronormativity (Ahmed 2014; Keddie 2022). Agency emerges here as fundamentally relational, unfolding through emotional reflexivity within the spaces between selves, norms, and structures (Holmes 2010). In this paper, I develop this conceptual lens to analyse qualitative interviews with 33 men in Australia as they navigate personal attachments to masculine subject positions within changing social worlds. Recent studies from Australia and elsewhere have indicated that men are increasingly aware of shifting normative expectations and are reflecting on their own positioning within transforming social landscapes (e.g., Bach, 2019; Waling, 2020). Men in this study were reflexively negotiating the conflicting pressures of normative masculinity and awareness of feminist politics, though in different ways and to different extents. Privilege can function here to conceal the normative histories through which some men comfortably assume independence from the norm, while others might find space for resistance in their affective discomfort (see Hemmings 2012). I argue that attention to these feelings of emotion, agency and (dis)comfort can provide insight into how men experience and negotiate the subjecting work of gender, alongside Whiteness and heterosexism. Their experiences illustrate how feeling outside the norm is one pathway through which established social and political forms can be challenged and transformed in everyday life. These findings have implications for developing gender transformative approaches in ways that are supportive of non-violence

and affective solidarity (Hemmings 2012). Grounding our understandings of gender, power and normativity in men's lived experiences will ultimately support broader efforts to catalyse socially just futures.

The Hybrid Learning Dilemma: Exploring the Learning Choices of Disadvantaged Students during the COVID-19 Era

The 'digital divide' accelerated by the COVID-19 pandemic and transition to online learning in higher education is reasonably well documented (Azionya & Nhedzi, 2021; Coleman, 2021; Soomro *et al*., 2020). This divide implies an inequality between students with and without skills, motivation and access to digital tools and Internet resources. However, our understanding of the factors which influence how disadvantaged students *choose* to engage with increasingly diverse pedagogic modes is less understood (Barbour *et al*., 2020). In this paper, we will address the following question: how are disadvantaged young people engaging with an increasingly hybridised approach to learning and interaction in higher education?

Reporting on in-depth interview data from a longitudinal study conducted since 2019, this paper explores the experience of undergraduate students in receipt of a financial bursary from a research-intensive university in the United Kingdom. Qualitative interview data from 48 participants provides a unique window into the impact of the pandemic on disadvantaged students' learning choices. Whilst on the one hand these students benefitted from having the choice to attend remote lectures in personal home spaces – thereby saving money and time on their commute to campus – they also reported challenges with study motivation and forming social connections. The paper explores the tension between greater flexibility and financial freedom, and the development of social connections/capital with peers that disadvantaged students experienced during the shift to online and hybrid learning during the COVID-19 pandemic. Our data highlights the factors that empowered students to manage this tension to get the best out of their social and academic experience.

Risk-Shifting in the Time of COVID-19: The Australian Federal Government Response and Support for Family Day Care Providers

COVID-19 has raised questions about the efficacy of a neo-liberal approach to policy and regulation. In Australia, the pandemic revealed that a neo-liberal approach to early childhood care policy can exacerbate economic and health risks faced by childcare providers. Much research into how childcare providers managed these risks focuses on formal centre-based childcare with less attention given to how family day care providers (FDC) dealt with the health and economic risks of COVID-19. The objective was to learn how FDC providers, who are registered carers providing care in their family home, balanced compliance with safety measures with the economic and health risks of COVID-19. This research applies the concept of 'risk-shifting' to consider the impact on FDC providers of the Australian federal governments' childcare response to the initial wave of COVID-19. Data were collected using a qualitative, mixed methods approach of semi-structured interviews with FDC and formal centre-based childcare providers, and a content analysis of publicly available government policies and ministerial announcements. Grounded theory and inductive thematic analysis were used to identify themes. There is general agreement that the Australian government sought to implement a robust policy response to the pandemic. However, formal childcare providers struggled to remain open and navigate complex regulations to manage risks to the health and safety of staff and families. These pressures were heightened for FDC providers, as workers on the frontline of the crisis, as they balanced economic imperatives against required, but costly, safety measures to prevent health risks not only to families accessing paid care, but also to their own families and homes. This research broadens the understanding of the way in which workers are increasingly responsible for the costs associated with their own safety and, in the context of a global health pandemic, the safety of the public, due to their work.

MCGARRY, Kathryn* (Maynooth University, Ireland)

KONDRATAITE, Irma (Vilnius University, Lithuania)

Resisting Silence and Stigma: Mothering and Sex Work

This paper will explore differing representations of sex work and motherhood linked to competing ideological perspectives on sex work; from the perspective which frames it as the definitive transgression of gendered norms, to that which calls out the lack of necessary supports and protections to sex workers. Central to this will be the foregrounding of evidence from sex workers' own management of subjective identities and their narratives of working and mothering which resist stigma and shame.

Drawing on conceptual frameworks around stigma, this paper will bring together a review of the literature on sex work and motherhood in order to present key questions and new avenues of inquiry for gender, work and subjectivities. How do framings of motherhood implicate our understandings of sex work? How do framings of sex work colour our understandings of sex working mothers? And how do the perspectives of sex working mothers challenge dominant ideas of mothering and working?

This paper will interrogate these questions through a critical feminist analytic lens to understand how structures of stigma and shame operate to shape the experiences of sex working mothers, and how sex working mothers employ various strategies to resist stigma. Key to the resistance of stigma are the voices of sex working mothers themselves and our paper will consider, that though existing evidence is limited, the 'unsilencing' of such experience and resistance is crucial for advancing knowledge on gender and work and the socio-political environment which mediate subjectivities and work.

MCGLADE, Katriona* (University of East Anglia, United Kingdom)

Challenging Expertise: Knowledge-Ing in Scottish Climate Change Adaptation

Increased consensus around the geophysical science of climate change has been essential to building momentum and political ambition on mitigation and adaptation. However, it has led to policy discussions being dominated by a notion that climate adaptation is primarily a 'problem of the environment' to be solved with technical and economic solutions (Hulme 2011; O'Brien 2012; Nightingale 2016; Leichenko and O'Brien 2019; Bulkeley 2019). Framing adaptation as an apolitical and rational intervention can reduce citizens' agency to raise questions or voice alternative knowledges and experiences (Eriksen et al. 2015; Ottinger 2017; Bradbury et al. 2019). Yet a burgeoning movement in environmental social sciences and humanities has been pushing back on this neutral image of climate adaptation, firstly by highlighting its often political and exclusionary dimensions (Sovacool et al. 2015; Eriksen et al. 2015, 2021; Glover and Granberg 2021) and secondly by advocating for incorporation of a greater range of perspectives in knowledge production and decision making (Olazabal 2021; Ziervogel et al. 2021; Byskov and Hyams 2022). This wave of scholarly activity has championed transformational and transdisciplinary processes to open up and challenge narrow conceptualisations of ecological crises and their solutions (Ziervogel et al. 2016, 2021; Few et al. 2017; Fazey et al. 2018; Bradbury et al. 2019). At the same time, these processes of knowledge pluralisation and co-production are not a panacea; there is a need to remain attentive to matters of power, recognition, responsibility and epistemic justice (Santos 2007; Whyte 2013; Klenk et al. 2017; Oels 2019). Drawing on these critical debates, this paper outlines normative and instrumental arguments for ontological plurality in climate adaptation as well as participatory, deliberative and creative methodologies for knowledge-ing (Taylor, 2020) with non-scientific perspectives. Empirical examples from Scotland are presented to consider the successes and challenges of implementing these approaches in practice.

Examining 'Soft' Authoritarianism in Third Sector Organisations in the Context of Youth Mentoring within Neoliberal Outsourcing of Government Services

Third sector organisations (TSOs), in particular Faith Based Organisations (FBOs), have a long history in the justice system (Murphy 2006) and the international youth work sector more broadly (Cooper 2018). Historically their contributions have run with a degree of informality by small-congregation groups who had a commitment to those less fortunate than themselves. The outsourcing of government services through neoliberal funding arrangements in Australia, and across the developed world, is impacting the aims and practices of TSOs. This has meant that TSOs are now tendering to provide services and subject to stringent monitoring regimes producing an alignment with dominant political agendas. In this paper, we will examine the impact of these changes on TSO's as a form of 'soft' authoritarianism, and pay particular attention to the impacts of short-term nature of funding arrangements on youth work organisations. We focus on youth mentoring as an intervention that ideally involves a longer-term relationship with extended periods of contact between the mentor and mentee, yet due to marketised funding arrangements, is instead routinely employed as a short-term intervention.

The pressures of competition for funding in a marketised youth sector have required TSOs to become more bureaucratic and efficiency focussed to contend for funding to operate their organisations. This has seen a change in the nature, types and format of the services they provide. Analysis of the violating impacts neoliberal funding arrangements and bureaucratisation on TSOs, youth work practice and community sector values are not new (Lohmeyer & McGregor, 2021; Lohmeyer & Taylor 2021). In this paper, we explore how an

understanding of these effects as a form of 'soft' authoritarianism crushing the historical aspirations of TSOs and FBOs is overlooked in existing analyses, and how this is exemplified in the misapplication of youth mentoring.

Involving Families in Integrating Embodied and Objective Community Language Capital in Reading Resources for Preschool Aged Children Entering Monolingual Education Systems

Early childhood (0-8 years) is a key period for children developing habitus as the literate people they are and are becoming. Children living in households using community languages other than English can face challenges in acquiring dominant language literacies, particularly in monolingual education systems developed during colonisation. This paper reports research in Fiji involving families using community languages to co-construct multilingual reading resources with and for young children. Empowering families to draw on their embodied and objective cultural capital and collaborate with their children in bilingual book creation provided a pathway to the children's engagement with the dominant language of formal schooling and the achievement of objective reading capital. Development of the books as family-based pre-school resources reinforced families' embodied capital, sustained children's community identity, and demonstrated the families' presence and contribution to Fiji's multicultural and multilingual society. The study's participants comprised families with three-to-five year old children living in three communities in Fiji - an iTaukei (Indigenous) village, a rural Indo-Fijian community and a mixed urban community. Children participated with their families and wider communities in making multilingual books about their family household practices (shopping, gardening, cooking, religious rituals), career aspirations, play activities and popular stories, generating photographic illustrations using locally accessible props, family members and settings. Multiple generations engaged with making the books, from grandparents through to siblings and peers, capturing their embodied and objective capital contributions, fostering identities as authors, editors and readers of their literary productions. The research process resulted in the collective development of new objective community capital in the form of books, book libraries, locally illustrated alphabet charts and digital social media records of community enactment of religious observations. Through families' and communities' participation in the book creation activities, they affirmed and grew their efficacy in supporting young children's literacy.

MCKELVIE, Rhonda* (Midland Cancer Network, New Zealand)

A Self-Fulfilling Institutional Circle: How Nurse Staffing Strategies Take up New Public Management Priorities

Using Institutional Ethnography (IE) I sought to interrogate *how* nurse staffing strategies had yet to resolve short staffed shifts and compromised patient safety. I imagined, at the start of the research, I would uncover that people 'just weren't doing it right' when it came to using the staffing strategies I was part of designing and implementing across the entire country. This is because I was 'captured' by the idea that these strategies were an appropriate and effective 'solution' to the short staffing problem. It was only once I had outstanding methodological supervision, and an IE lens in front of my researcher eye, that I began to see and hear hegemonic priorities in frontline nurses descriptions of their staffing and patient safety work in everyday practice. This perplexing discovery led to the project problematic that shaped the remainder of the study and the intent to uncover *how the best efforts of an exciting initiative, by nurses, to support nurses to provide care, has resulted in practices that systematically substitute and dispute nurses' contextual knowledge about short-staffing and patient safety and do not consistently activate the staffing responses nurses know are needed.*

In this session I identify the discoveries of the IE investigation that led to an extensive mapping of how frontline nursing work, with 'safe staffing project' tools, is organised to occur as it does. That despite our best intentions, we as nurses have been organised to take up the master's discourse and tools to communicate our own *situated intelligence* in forms that are not our own. I plot some of the pins on this map and the terrain in between to bring forward how a self-fulfilling institutional circle constructed by nurses has colonised what nurses think, know, speak and do in their everyday work on nurse staffing and patient safety.

A Sociology of the Future?

The aim of this presentation is to examine the conditions of a sociology of the future. While there is an established field of research in the social sciences on the future, its impact on mainstream sociology is limited. The purpose of this article is to outline what a sociology of the future could look like beyond the field of future studies. The future is a slippery concept in sociology. To speculate is deemed risky or even irresponsible, and yet, we are in a time when the task of thinking sociologically about the future can no longer be delayed. This presentation sets out three essential criteria for a useful and grounded sociology of the future: 1) It must be more than a study of utopia and dystopia, 2) It must be able to think of the future as something rather than nothing, 3) It requires an accessible understanding of the time-based interrelations between emotion, imagination and reason. The sociological impact of the future functions in the present and to unpack the everyday consequences of this, we must incorporate existing ideas about the sociology of time into perceptions of possible and inevitable futures. Together, these conditions are necessary to transcend speculative futurism and tech-based idealism. While Fisher has described the slow cancellation of the future, and Adam and Groves have described a commodification and colonisation of the future, this presentation will explore the theme of alienation as a means to ground the future in the everyday.

Visions of Digital Labour: How the Motivation for Accumulation Informs the Nature of the Platformed Labour Relationship.

Platform mediated labour relationships are increasingly becoming part of modern working life. These platforms have existed since the early 2000s, triangulating the labour relationship to include themselves as the profit-driven intermediatory. This paper argues that the platform, in its ability to create labour relationships within its own private digital environment takes ownership over the relationship and sells access to prospective buyers and sellers of labour. Furthermore, it is the commercial logics of the platform that drives diverse arrangements of the labour relationship, as the platform attempts to differentiate its product in the market. These relationship structures include fragmented micro-tasks, design competitions, pre-packaged labour marketplaces and freelance project work. However, their vision of the labour relationship goes beyond these broad contractual structures to consider on the how users interact, trust, and value each other. The manifestation of this vision is made possible by the infrastructures built into the platform including methods of acquiring labour contracts, communication tools, surveillance features and metrics of valuation. This paper draws on comparative auto-ethnographic fieldwork of buying and selling labour on three labour platforms that each present a unique vision of the labour relationship – freelancing on Upwork, crowdsourced human intelligence on Amazon Mechanical Turk and creative competitions on Squadhelp. By interrogating the manifestation of these platform's commercial strategies within the platform interface, I argue that the labour relationship is altered, adjusted, and reinvented based on the platform's drive to present a 'new' and 'disruptive' version of the labour relationship designed to fulfil their strategies of accumulation.

Laughing at Them or with Them? Analyzing Sexual Harassment in Workplace Comedy Television Series

Prior research finds that sexual harassment is a regular occurrence in fictionalized TV workplaces, although it is rarely treated as a serious issue (Grauerholz and King 1997; Lampman et al. 2002; Montemurro 2003). Instead, sitcom characters exhibit a high tolerance for sexualized workplace interactions and typically ignore or enjoy such interactions (Taylor, Alexopoulos, and Ghaznavi 2016). Through a content analysis of randomly selected episodes from 52 contemporary workplace comedies, I similarly find that harassment is trivialized and normalized on American television screens. Harassing scenarios are characterized as good-natured ribbing between friends who perpetrate as often as they are targeted. When characters momentarily take offense, all is forgiven by the next episode, next scene, or even the next line. However, when analyzing episodes that intentionally address workplace sexual harassment using purposive sampling, more complex patterns emerge. In this sample, women were much more likely to be depicted as sexual harassers as compared to characters in randomly selected episodes. Women harass as a tool to get what they want (e.g., *30 Rock*, *Great News*) or due to a "stupid misunderstanding" that spirals out of control (e.g., *Better off Ted*). Moreover, sexual harassment seminars are depicted as a waste of time designed to protect employers from liability (e.g., *Frasier*). While in many ways these episodes make light of sexual harassment, they also include social commentary that complicates popular narratives (e.g., *Always Sunny in Philadelphia*). In the words of one harasser on *Better Off Ted* who receives a taste of his own medicine, "Harassment is

supposed to be sexy. You're not even doing it right." Findings will be discussed with an eye toward the difficulty of analyzing satirical television shows and the struggle to determine whether audiences laugh *at* or *with* problematic characters.

Attending to the Particular to Enact Decolonial Theory in Teaching Practice

This presentation explores the specificity of place as a vital dimension in bringing decolonial perspectives to pedagogical approaches and teaching practice. It reflects on a peer-collaboration process undertaken by a team of teachers to interrogate and transform how Eurocentrism underpins educational practice. We 'walked with' the decolonial concept of the pluriverse (a sense of multiple coexisting differences) during collaborative reflections about our teaching of culturally safe healthcare in Australia. Employing the pluriverse concept as a companion to our reflective process enabled us to ask critical questions about Eurocentrism in our teaching practice and content. Our questioning, in turn, generated principles for embedding the pluriverse in the curriculum, pedagogical approaches, and teacher dispositions. However, to what extent did drawing on the pluriverse concept create affordances towards decolonisation in our teaching spaces? The enduring challenges remained: finding ways to invite students to examine their relatedness to difference; reflect, deconstruct, and build relationships; and attend to plural affective perspectives. The presentation discusses how attending to the particular has the potential to support enacting decolonial theory in teaching practice: 1. Understand learning and teaching spaces as affective assemblages to account for the specificity of the historical and political context and how coloniality inscribes on bodies in that context. 2. Consider how decolonial concepts and associated pedagogies are co-composed in the specificity of learning and teaching encounters. 3. Allow mutual constructive generation between decolonial theory and educational practice in specific settings. 4. Think decolonial theory with other educational approaches shaped by practice and from related settings.

Australian Climate Movement Strategy

A range of scholars have observed that despite decades of activity, the transnational climate movement's impact on policymaking has been limited. In this context, questions of movement strategy and capacity have become crucial. This paper utilises a Gramscian framework, and in particular his notion of hegemony, to investigate the strategies and capacities of key social forces fighting for climate action in Australia: environmental groups, trade unions and The Greens. Initial findings based on in-depth semi-structured interviews and document analysis will be presented to illuminate movement strategic choices and the ability to carry these out.

China's Challenge - Managing Cross-Strait Connectivity

The coincidence of the pandemic & aggravated political divisions have eroded earlier supply-chains. Crises provide a unique window on the concept of **"connectivity,"** capturing how strong and weak ties unfold in a defined space and time. Taiwan-funded ICT networks in China provide a window on the global crisis in supply chain management. Retaining and advancing foreign investment in the "nodes" or local clusters of GVCs has been one key to China's growth. This paper draws on two areas of my recent research: the evolution of Party-state policy and practice, and its effect on Taipei's ICT networks.

The theory of upgrading nodes in global value chains (GVCs) provides a frame to assess the supply chain strategy of the Party-state. Taiwan has been a channel for investment, knowledge workers, and the expertise critical for China's industrial upgrading. Strategic coupling of lead firms in Global Value Chains (GVCs) with local industry provides a conceptual focus as I track recent changes in Taiwanese investment. Henry Yeung defined *coupling* as an integrative mid-range concept to examine inter-firm dynamics. I highlight two aspects of coupling that have received less attention to date: localized networks embedded in national and regional territories, as well as recent state policy regimes.

I have been following the ICT industry in Southern Jiangsu Province for a decade, including initial interviews, and then a schedule of briefings with Party-state offices at province (Nanjing), metropole (Suzhou), and county levels (Kunshan). How has coupling continue to evolve as political pressures for reshoring or offshoring elsewhere increase for the Taiwanese investors? Cadres have implemented policy platforms and pilot projects to anchor and advance foreign investment, with strategies of comparative significance for the GVC literature. In addition to the evolution of global supply chain management, the study sheds light on significant transitions in China's socialist modernization.

MCNAMARA, Dennis* (3700 O St NW, USA)

Japan's Educational Diplomacy – Building Knowledge Nodes in Thai Manufacturing

Will the dual crisis of the pandemic and regional political tensions in East Asia impede knowledge flows across borders? Will trading nations restrict flows critical for upgrading in Global Value Chains (GVCs)? In this paper I examine Japanese state efforts to sustain and extend their GVC knowledge nodes in Thailand. My subject is Japan's educational diplomacy in Thai industrial upgrading. The literature on upgrading in global value and production chains provides a conceptual map, while a focus on nodal evolution in major Japanese-invested Thai industrial sectors offers a window on Thai development.

Upgrading knowledge networks in the ASEAN region remains a central challenge for Japanese investors. In earlier studies I profiled how they extended their knowledge networks in Asia. Looking specifically to investment in Thailand, I profiled a transfer of manufacturing and management skills. At the time I found an initial evolution from skills to adaptive research at Toyota and Denso and larger auto firms and suppliers in ASEAN.

In this paper I look specifically to recent state upgrading strategies in tandem with local knowledge institutions. University-industry links (UILs) within the Thai Education Hub provide an initial focus. But the paper soon turns to other strategies of training and research for Nikkei firms, supplementing and sometimes supplanting efforts at local universities. I couple this emerging picture of knowledge transfer at university and industry with bilateral government efforts. The Japan-Thai cooperation on improving human resource development and R&D in Thailand promises to better organize and extend UILs. Data on cooperation was drawn from documents of JETRO discussions with the Thai Government on the occasion of the anniversary of 150 years of Thai-Japanese relations.

Functional Collaboration: Transitioning to World Care

Today humanity is confronted with an unparalleled number of major world crises – ecological, economic, political, cultural and religious – and the entrenchment and solidification of world-views.

The challenge for us, as sociologists, is how to find a way forward when the academy is locked within its disciplinary silos, when it lacks a coherent and comprehensive methodological framework for analysis, when theory and practice are alienated from one another, when policy-makers ignore research or disregard it as irrelevant. How do we devise policies, strategies and practical action when disciplines only offer partial and unrelated insights?

Disciplinary specialisation has been found wanting. It is no longer fit for purpose. We desperately need a new way of dividing up the work, a new way of specializing, a new way of dealing with complex, multi-dimensional issues, one which will more *effectively* promote collaboration among researchers.

This paper proposes a new way of understanding and doing science, a cyclic process aligned with progress where researchers specialise in methods not disciplines.

Drawing on the work of Bernard Lonergan (1972), Functional Collaboration is grounded in the process of going from where we are now to implementing something new in which we can distinguish eight different stages/types of questions in two phases: learning from the past - an empirical question, a definitional question, an historical question, a critical/evaluative question; making the future - a transformative/visionary question, a policy question, a strategic question and a practical question. Answering each question requires a different method. Research groups form around these eight methods or functional specialties - Research, Interpretation, History, Dialectic, Foundations, Policies, Systematics and Communications. Within this unifying 'framework for collaborative creativity', research groups pass their results from one specialty to the next and so contribute to the final outcome, local practical action. (For more see: http://artfulhousing.com.au/functional-collaboration/ and http://www.philipmcshane.org/)

"We Narrate Home Stories to Each Other…and We Try to Forget about All the Stresses and All the Travel": Constructing Diasporic Communities through Sport for Refugee Belonging and Livelihoods in Uganda

In recent years, forced migration and sport has received increased research attention (Smith et al., 2019; Spaaij et al., 2019). At the same time, there have been calls by scholars for the utilization of the concept of diaspora to

**denotes a presenting author.* Abstracts are organized by first presenting author's last name.

explore the intersections of forced migration, sport, transnationalism, and belonging (McSweeney & Nakamura, 2020; Spaaij & Broerse, 2019). Such research is particularly needed given the lasting implications of COVID-19, which perpetuated the migrant crisis and gave governments a reason to shut down borders, thus potentially reinforcing and buttressing xenophobic and discriminatory views of migrants by citizens (World Bank, 2020). Given these research gaps and trends, this study adopts the concept of diaspora to examine a refugee-led organization in Kampala, Uganda, that utilizes sport-for-development to foster cultural belonging and increase livelihood opportunities for urban refugees.

A participatory action research approach was implemented and included multiple forms of data collection including visual methods (e.g., photovoice), photocollage sessions, and semi-structured interviews. Findings highlight how – despite the host community often discriminating against refugees, in particular in regard to the 'burden' refugees cause – sport is taken up by refugees to: (1) build diasporic communities and consciousness through specific cultural and social practices; and (2) construct collective imagined communities for – and through – specific livelihood activities. Discussion emphasizes the way in which the concept of diaspora enables an examination of how home spaces are constructed to resist host community discrimination and other social inequalities – and how such home spaces remain in flux with power dynamics. The paper concludes with practical and theoretical insights for studies of forced migration and sport, sport-for-development, and diaspora, with particular attention to the way in which the creation of diasporic consciousness may contribute to livelihood activities that connect those forced to migrate back to their homeland.

The Problem of Unmet Need for Family Planning in Eastern Indonesia: The Importance of Husband's Role

Unmet need for contraception, apart from being determined by the availability of contraceptive facilities, can also be determined by decisions within the family. In Indonesia, the husband plays a dominant role in making important family decisions, including the use of contraception for the wife. Therefore, this study raises the role of husbands and married women in overcoming the problem of unmet need for family planning in Indonesia. Based on the results of the 2017 IDHS, there are still 10.6 percent of women of marriageable age who experience an unmet need for family planning, especially in Eastern Indonesia. The results of binary logistic regression indicate that the variables that significantly affect the status of unmet need for family planning are husband's working status, husband's age, family planning discussions with husband, number of children still living, area of residence, and level of welfare. Meanwhile, working status, education level, age of women and husband's education did not significantly affect the status of women's unmet need for family planning. It can be concluded that husbands have an important role in overcoming the problem of unmet need for family planning for women, because most of the variables that affect women's unmet need for family planning are husband factors. Married women who have husbands who are not working, husbands who are more than or equal to 39 years old, do not have family planning discussions with their husbands, have more than two living children, live in rural areas, and the poor have a tendency to have unmet need for family planning status. The recommendation of this study is to provide greater space for the involvement of husbands in family planning programs, especially for poor families in rural areas of Eastern Indonesia.

Behind the Collective Memory: Maurice Halbwachs As Empirical Sociologist

Maurice Halbwachs (1877-1945) is now best known as a theorist of "collective memory", an topic he derived, reputedly, by combining the insights of his precursors, Durkheim and Bergson. Such a contemporary depiction, however, occludes his widespread and earlier research investments. His initial works, for example, including the first of those translated into English, begin with granular empirical studies of social class. This reputational trajectory, then, from social stratification researcher to philosophical theorist, reveals the sociologist's manifold pursuits and interests.

In this paper, I examine the character of these pursuits and interests. This undertaking is done in the hope of recovering Halbwachs's works from the status of theoretical references, by embedding them in his various practical projects. I look specifically at how Halbwachs operates as a node tying together several divergent strands. He acts as a relay between early French and German sociology, a traveler sending back dispatches from The University of Chicago's sociology department, and a populariser of statistics and the philosophy of Leibniz—to say nothing of his work on memory and social class. By inspecting Halbwachs and his work in this fashion, I hope to display the concrete sociological practitioner underpinning the ossified and abstracted canonical theorist.

Gender Dynamics in Community Volunteering Practices

Australia is facing a volunteer shortage that poses a serious threat to urban and regional communities. Women have been disproportionately impacted by the steady decline in the volunteer workforce, once again bearing the burden of sustaining community life and balancing family and work commitments. Whilst previous research has shown that volunteering is inherently gendered, less attention has been paid to how these gender dynamics may be contributing to poor volunteer retention rates and volunteer shortages. Using existing literature on gender dynamics in community volunteering practices, this presentation aims to better explore the female experience of volunteering as it relates to retention rates and barriers to volunteering. Preliminary findings suggest that the current literature is limited to women's experience of formal volunteering within Anglo-Celtic community organisations. To better understand the current decline in volunteering rates it would be beneficial to expand current research to informal volunteering within culturally and linguistically diverse communities.

Exploring Mediations through Creativity: Ethnography and Theater with Maghrebi Unaccompanied Migrant Youth in Barcelona

In the crossroad between artistic creation, academia and marginalized youth we can find a space of cultural mediation through collaborative creative practices. In this paper we aim to present the ethnographic results from fieldwork conducted in Barcelona during a theater workshop with young unaccompanied migrants from Northern Africa. The workshop was an experience of personal, intra-group and intercultural mediation through creativity, during which the relations between different actors were built in a physical common space that fostered relations of affection and care. These relations allowed a deeper and embodied understanding on migration, daily life, personal goals, friendship, together with a space of mutual exchange and reflection among all the agents involved. Here we will present insights regarding the innovative methods employed, the agency of participants in the process and the impact of the resultant cultural products, highlighting the role of theatrical practices in creating a setting for non-paternalistic and non-restigmatizing experiences of natural mediation.

Qualitative Researchers in Poland and Their Research Practices in the COVID-19 Pandemic – between Experiencing a Slow Disaster, Slowing Down and Social Acceleration?

In our paper we discuss how the COVID-19 pandemic has made Polish qualitative researchers change their research practices, which changes they perceive as permanent ones, and which were only temporary solutions. What is more, our analysis provides an insight into what the researchers learnt during the pandemic, and how the pandemic research practice influenced the quality of their research.

Our data is based on a qualitative survey during the first wave of the pandemic, and 30 qualitative in-depth interviews, including a biographical component, conducted with Polish researchers from the social sciences and humanities in the summer and autumn of 2022. We also provide the data and conclusions from the collaborative autoethnography that we conducted whilst preparing our research project and conducting the qualitative interviews after the restrictions were removed.

We make an attempt to apply (slow) disaster research (Knowles 2014) and social acceleration and resonance frameworks (Rosa 2020) as analytic and interpretation tools. We also try to formulate a list of guidelines for future research in times of crisis, inspired by our participants ideas.

MEDAN, Marina* (LICH - Universidad de San Martín / CONICET, Argentina)

Citizenship Experiences in Youth Inclusion Programs in Argentina

Stimulating youth "participation" is one of the objectives of social inclusion programs aimed at young people living in poverty in Argentina. These participatory practices can involve various forms: attending a woodworking workshop or tutoring classes, joining a football team, helping with the community dining room service, leading a community project, or just to hang out with friends at the program headquarters, instead of being "at the corner".

Beyond their heterogeneity, these practices imply a "stay" in an institutional space that seeks to promote and restore human rights to a highly vulnerable population. Thus, "to stay" in these spaces would potentially have a citizen-building effect.

Based on a collaborative research work in one of these youth inclusion programs in Buenos Aires, Argentina, we wonder about the processes of learning democratic values that are possible in programs that are implemented in contexts marked by large inequalities. Access to be well treated, the audibility of demands, and intergenerational respect, stand out as key conditions of possibility not only for the exercise of "invited participation" (Cornwall, 2008), but also for the gestation of feelings of membership in institutional spaces. In the argument, we assume an experiential definition of citizenship (Lister, 2007), and distance ourselves from normative approaches for the public policies study. Based on the findings, we point out the implications that some of these participatory processes have for the formulation of public policies.

MEDAN, Marina* (LICH - Universidad de San Martín / CONICET, Argentina)

PAZ, Florencia (LICH-Universidad de San Martín / CONICET, Argentina)

La Vida Cotidiana De Niños y Jóvenes En Barrios Populares: Violencias, Temporalidades Y Tramas Estatales

La cotidianeidad en las "villas" bonaerenses está marcada por procesos de desigualdad; un agudo aumento de las violencias interpersonales, comunitarias y vinculadas con las economías ilegales en las últimas décadas; una degradación ambiental persistente en general, desposesiones e incertidumbre. Ello se aborda en los estudios sociales considerando los impactos cotidianos de la exposición persistente a las violencias en "círculos viciosos", "cadenas de violencia", y la "ausencia del Estado".

Partiendo de datos producidos en un trabajo de investigación participativa con jóvenes destinatarios de un programa municipal de inclusión, queremos enfocar en una pregunta sobre las heterogeneidades de las violencias y las complejas relaciones de estos jóvenes con agencias estatales.

Nuestro argumento es doble. Primero, las violencias expresadas en la vida cotidiana - interpersonales o comunitarias- lejos de diferenciarse simplemente a partir de "matices" responden a lógicas (instrumentales, expresivas, emocionales) y temporalidades heterogéneas (la inmediatez de las reacciones y desbordes corporales, la temporalidad mediada y asincrónica de los chismes causantes de conflicto) y por lo mismo, expresan sentidos diferenciados. Segundo, que esas violencias no se dan a espaldas o a partir de la "ausencia" del Estado, sino que acontecen, escalan o se traman con la ilegibilidad institucional, cuyo carácter laberíntico impone también temporalidades y sentidos.

Así, las violencias en la vida ordinaria no necesariamente se vinculan con un desorden que tiene que ser organizado a partir de prácticas de cuidado (Auyero y Kilanski, 2015), sino que en algunos casos expresan una gramática de superposiciones de tiempos y espacios heterogéneos.

The Josefa Segovia Foundation Inc. (JSF) and the Wellbeing of Indigenous Communities in Davao City, Philippines

Indigenous communities in Davao City, Philippines face a myriad of issues due to lack of basic social services and the impact of the Covid 19 pandemic. The Josefa Segovia Foundation Inc. is a faith based organization and NGO based set up 32 years ago in Davao City, in the southern Island of Mindanao in the Philippines. It is the social action arm of the Teresian Association, a lay international Catholic association founded by St. Pedro Poveda, a priest, martyr and educator in Spain. At present, JSF supports indigenous communities through its Governance Program providing capacity building to indigenous leaders in the five major tribes namely the Bagobo Klata, Bagobo Tagabawa, Obo Manobo, Matigsalug and Ata indigenous communities. Through its Indigenous Peoples Academy information on their rights is provided and they are assisted in accessing services from the local government in support for their people's organizations. For their economic well being, farmers cooperatives and economic enterprises for indigenous women were also encouraged. With rates

of illiteracy high among the elders, the JSF provided leadership training and encouraged volunteerism among indigenous youth as they were mobilized to provide crucial educational support during the Covid 19 pandemic to become tutors to indigenous children who were poor in reading. JSF also promoted indigenous culture and peace building efforts in their communities through its various activities including a monthly radio program in collaboration with the Archdiocese Indigenous Peoples Apostolate (IPA) espousing religious values of service, love, interfaith and intercultural dialogue and religious teachings on stewardship and care for the earth etc.

Insurgent Cities: Urban Social Movements and Mobilization in India

Urban social movements in India espouse a gamut of pertinent issues and have witnessed a rise in participation from a vast spectrum of organizations ranging from trade unions to civil society (neighbourhood/ housing/ residence welfare associations) as well as local or political pressure groups working for environmental and social justice to name a few (Domaradzka 2018). While civil society is viewed as a counterweight which is more complementary to the state rather than being an alternative, there are other kinds of emergent coalitions and organisations who are more vocal in their opposition to the restructuring of urban spaces in the neo liberal scenario.

This paper will trace the social imperatives which shaped the grassroots mobilization discourse, techniques and practices in India and specifically in the NCR region. It will throw light on the impact of trade union movement in organising the working class population and procuring a decent livelihood for them. Through a case study of initiatives taken by 'Sajha Manch' which was a coalition of diverse organisations, unions and individuals who worked on the issue of poverty, shelter, housing and environment, the paper will also examine the broadening of the idea of 'Right to the City' in Delhi. What were the ramifications of the mobilisation done by such emerging alternative groups/ organizations/ forums will be a subject matter of discussion in the paper.

Conceptual Investigation of the Social Acceptability of Drug Use Disorders Services in the Primary Health Care System from the Iranian Client's Perspective

In this qualitative study, we study the conceptual structure of the social acceptability of substance use disorders services in the primary health care system and in the framework of the interpretive-critical paradigm and using the phenomenological approach. The data obtained from 19 in-depth interviews with purposive and theoretical qualitative sampling method with recipients of health and treatment services in the Comprehensive Health Service Centers in Tehran city along and moreover two follow-up sessions during three months within 2020-2021 years. The findings from the semantic recovery of participants' lived experiences show that the conceptual structure of the social acceptability of the services is based on the four main themes of expected emotional attitudes (EEA) and perceived emotional attitudes (PEA), cost-opportunity (CO) and effectiveness of services (Es). According to the findings, the EEA include the subthemes of the attitudes towards the professions, the nature of the illness and the nature of care, and also the subthemes of PEA involve the attitudes about the moral-gender aspects, the capability of the professions, the nature of the disease, the nature of care and therapeutic interventions and the attitude of the health team towards the patient. Moreover, the subthemes of the CO are the types of accesses involving financial, geographical, time and also the adequacy and compliance of services with the client's needs. And finally, the ES includes the homogeneity degree of expected and perceived efficacy. According to the study result, although, there are some positive and valuable results, the social acceptability of substance use disorders services requires the effective steps to achieve the desirable indexes of the services. The most gaps is on the professions communication skills, the quality and adequacy of interventions based on the more priority needs of the clients, and economic-social supports for the recovered and psychiatric patients.

Family Life and Education Under the Dark Shadow of COVID-19 Pandemic in India: Some Observations

The world today is grappling with an unprecedented crisis of Covid-19 pandemic which has shaken humanity to the core and has impacted human beings in all spheres; be it health, economic or social. Not only the pandemic but also the precautionary measures like lockdown had serious implications on society. The lockdown has impacted family life, education and economy severely. Social scientists all across the world are engaging and studying the Covid Lockdown and its impact on society, economy, health, changing lifestyle and work culture. Despite of that, there is very little insight about its impact on the family life and on children's education. Thus, the present study aims to explore the positive and negative changes in the family life and the educational sphere brought about as a result of the COVID-19 lockdown. The study also looks into the rekindling of the familial bonds in this time of crisis and how family as a unit becomes a pillar of hope amidst uncertainty. In the field of education, the public education system may have to prepare itself for daunting challenges lying ahead. The Study is primarily based on existing literature, observations and interactive sessions with the people across various sections of the society

Irregular International Migration from India to Europe: Issues of Concern

Irregular migration of individuals across the globe in violation of the established laws of respective countries is a grave problem. India is not the exception. During the last few decades especially with the initiation of liberalization reforms, the menace of Irregular immigration is emerging at an alarming scale. Although there are no specific figures of the migrants available; both push and pull factors are at work in this process. Lack of employment opportunities at home, rising aspirations for a better life stimulated by the forces of globalization and the attraction of real or imaginary opportunities for high earnings in developed countries especially the European countries have fuelled this flow.

Unscrupulous intermediaries such as travel agents and brokers have exploited the aspirant migrants and encouraged them to take life threatening risks on their journeys, often using forged travel documents. Many of them have faced tragic consequences. Some of the migrants have also sold their lands and others properties to pay travel agents and brokers. Thus, the present paper will provide insights to understand the process and issues of irregular internationa migration and their consequences. The paper is based on the observation and field work carried out in the part of Punjab and Haryana (two north-Indian states), where the phenomenon of migration in foreign land is visible to a greater extent. The paper may be an important contribution to understand the trans-national co-operation and to fight against illegal immigration and promoting legal immigration.

MEHTA, Rani* (Panjab University, India, India)

Environmental Challenges and Health Risks in a Globalized Economy

The environmental effects of economic globalization have been observed to be uneven,both spatially and socially. The diffusions of resources have been determined by the economic development processes through investment, trade by transnational companies, multi - lateral institutions and the richest industrial nation - states. Thus , in an era of globalization, the developing nations have mostly to bear the brunt of environmental problems and health risks as the developed nations appropriate both the industrial and agricultural sectors' through technological inputs which marginalize the poor developing nations at the cost of the affluent nations. In the wake of the above, the developed nations must address their primary responsibility for the present environmental.crisis and make efforts to redress it , as the present structures of interdependence of trade, aid and debt make sustainable development a difficult aproposition for the developing nations. The poor in these countries are the worst sufferers and there is a dire need to provide equitable resources to them through grassroot movements. Besides, the developed nations should be ready to provide concessional transfer of clean and efficient technologies for suitable industrialization and environmental regeneration of the resources of the developing nations.

In this asymmetrical globalized world economy and the contrasting living conditions as well as lifestyles of people between the developed and developing nations, one has to address the importance of equality and civil rights to perceive and tackle environmental.problems especially associated with health

, shelter and food availability in the developing countries. This paper is an attempt to analyse the above issues concerning environment and health risks as a result of economic changes due to globalization, industrialization and consequent urbanization.

Agrarian Populism and Authoritarian Hegemony in India: Farmers' Movements and Electoral Politics at Crossroads

This paper argues that with the establishment of an authoritarian government in several democracies of the world, the challenge of contesting neoliberalism for social movements have become inextricable entangled with issues of hegemony and electoral politics. India recently saw one of the biggest farmer's mobilization in 2020-21. One of the most remarked features of the farmers' protests in India has been the distance it maintained from political parties – the resilience of the protests has also been partly credited to this. This paper argues that the ostensibly desirable separation between farmers' movements and electoral politics is historically produced in postcolonial India, and suggests that the current conjuncture of authoritarian politics in India demands a rethinking of this separation. It traces how agrarian populism has been practised in postcolonial India across social movements and party politics. In particular, it examines anti-Congress farmer mobilizations and formation of non-Congress state governments in the 1960s/70s, the rise of Other Backward Class politics and new farmers' movements in the 1970s/80s, the mobilizations around liberalization since the 1990s, and mobilizations since 2014, including the farmers' protest of 2020-21. Through this long view of agrarian mobilizations in postcolonial India, it contends that apolitical agrarian populism has lost much of its political potency and farmers have to pursue anti-authoritarian politics that lies at the intersection of progressive political parties and social movements to realize some or all of their demands. To support this conclusion, the paper also lays out the broad features of the interregnum that Indian politics is seeing in the current conjecture which is marked by a crisis of India's developmental regime, channelling popular discontent towards strengthening Hindu majoritarianism, stifling of social movements and civil society and an intensification of neoliberal economic policies.

Latin America Indigenous People and "Green Extractivism": A Challenged Relation

International policies to mitigate climate change, mainly focused on energy transition, continue to be articulated to an extractivist model that responds to a mercantilist relationship with nature which continues modifying modes of territoriality, culture, identity, the environment, and local economies. These dynamics are becoming known as 'green extractivism': a logic that sustains transnational extractive capitalism, global asymmetries of power and other currents of injustice excused in climate change mitigation. But Indigenous Peoples question and challenge the discourse and policies of sustainable development, mainly because of the contradictions observed in their territories. The case of Atacameño-Likanantay (Indigenous) Peoples and the lithium extraction in the Salar de Atacama, Chile, and the case of the Kogui, Arhuaco, Wiwa and Kankuamos Peoples and the photovoltaic energy projects in the Sierra Nevada de Santa Marta, Colombia, demonstrates that "green" extractivist activities in Indigenous territories as part of implementing national and global sustainable development policies are challenged and shaped by the Indigenous communities resurgence - their renewed demands for self-determined socioeconomic and political projects – and their conception of justice and law. In this paper, bringing a decolonial approach, I present the analysis of the relationship between green extractivist activities with Atacameño-Likanantay Peoples in Chile and the Kogui, Arhuaco, Wiwa and Kankuamos Peoples in Colombia; and how these Indigenous communities trouble green extractivist logics in their territories.

Big Social Media Twitter Data for Studying Social Connection: Case Study of Loneliness

Social media websites are increasingly being adopted by large swathes of society, and capturing various social norms. Moreover, it supports the creation of new social norms and definitions, especially in the areas of privacy, information sharing, relationship building, and coordinated action. Two main benefits of using social media as a data resource for studying social norms and behaviors, as a complement to survey-based methods, are that (1) the behavior is unsolicited by a researcher, and (2) the range of that behavior is not constrained by study design. It is thus possible to observe the temporal dynamics and the variety of the behavior "in real time". As an example of research made possible by social media data, we present an ongoing collaboration between

data science and communications researchers, wherein we monitor the self-expression of loneliness on Twitter, and social response to it, before and during the COVID-19 pandemic-related physical distancing measures in the US. We observe that, not only is there an established norm of sharing highly sensitive emotions around loneliness, this sharing increases as much as two-fold during the pandemic. The content and emotional focus also change during this period. We are also able to capture the responses to these self-disclosures, and can observe a range, from highly affirming, to dismissive and abusive. Using high-precision keyword matching, we are also able to study particular sub-groups, such as those identifying as LGBTQ+. While discussing this line of research, we highlight the advantages of using large social media datasets, including longitudinal nospan, unobtrusive easy collection via API and built-in constraints on privately shared data, as well as multi-modal possibilities of analysis. More importantly, we also discuss the challenges, including limitations in linguistic targeting, self-selection bias, and inherent ambiguity in communication, and especially focus on privacy considerations of such research.

Echo Chambers of Vaccination Hesitancy Discussion on Social Media during COVID-19 Pandemic

The COVID-19 pandemic has brought vaccination from the purview of parents and the health-compromised to everyone in the public. However, vaccination hesitancy continues to limit the impact of this highly effective intervention. Anti-vaccination views pervade online social media, fueling distrust in scientific expertise and increasing vaccine-hesitant attitudes. The pandemic brought the vaccination discourse onto the world stage, necessitating effective countermeasures to tackle the spread of potentially harmful misinformation on a global scale. Unfortunately, social media discourse has been shown to form "echo chambers" wherein individuals receive information they are likely to agree with, and surround themselves with likeminded others. In this study, we present the analysis of large vaccine-related Twitter messages in 18 languages from 2019 to 2021. First, we focus on Italy, one of the first and most affected European nations by the virus. In particular, we use network analysis to show the clusters of like-minded users, with those sharing anti-vaccination content communicating rarely with those promoting the vaccines. We show that this separation persists throughout the pandemic. However, using content analysis we find that over time the two groups speak on increasingly similar topics. Then, we turn to 28 countries, and show that many display such polarization in their vaccine debates. Moreover, we show that the anti-vaccination clusters tend to be connected across countries, making a kind of international Twitter "no-vax" echo chamber. US users are central in this network, while Russian users also become net exporters of misinformation during vaccination roll-out. Interestingly, we find that Twitter's content moderation efforts, and in particular the suspension of users following the January 6th U.S. Capitol attack had a worldwide impact in reducing misinformation spread about vaccines. We hope these findings help public health institutions and social media platforms to mitigate the spread of health-related, low-credibility information.

Populism and Its Implications to Citizenship: Insights from the Developing World

This presentation examines populism and citizenship and the ways they represent different visions for the political and social inclusion of the excluded. Drawing on experiences in the Philippines, it explores some of the populist projects that recent Philippine governments pursued and the sources of their appeal, broadly comparing them with some historical experiences particularly in Latin America. As the inequalities of the neoliberal era get deepened by the current pandemic, are we seeing the resurgence of populist state responses in the developing world? What characterizes such responses, and in what sense are they populist, or something else? The presentation concludes by examining the implications of such trends to the alternative project of deepening democracy and citizenship in the developing world.

Emploi Et Travail Des Jeunes En Contexte Néolibéral. L'Exemple De La Tunisie Postrévolutionnaire; Youth Employment and Work in a Neoliberal Context. the Example of Post-Revolutionary Tunisia

Le néolibéralisme dispose d'une forte résilience qui lui permet de s'accommoder de la rotation et du renouvellement des élites au pouvoir, voire d'une rupture révolutionnaire majeure, comme c'est le cas en Tunisie. Dans ce pays, l'option néolibérale domine les choix politiques et sociaux depuis le milieu des années 1980. Aujourd'hui, les mêmes recettes et les mêmes exigences de « réformes » sont toujours à l'ordre du jour. Cette option continue d'impacter la vie des gens, notamment les jeunes, à la fois, en ce qui concerne les difficultés d'accès à l'emploi et dans les conditions d'exercice de l'activité professionnelle. Les enquêtes que nous avons menées auprès des jeunes montrent que l'expérience de recherche d'emploi et l'expérience de travail elle-même sont génératrices d'un sentiment d'injustice profond. Elles montrent également que les jeunes sont porteurs d'une compétence critique susceptible d'alimenter, en aval, différentes formes d'action collective.

Neoliberalism has a strong resilience that allows it to accommodate the rotation and renewal of the ruling elites, or even a major revolutionary break, as is the case in Tunisia. In this country, the neoliberal option has dominated political and social choices since the mid-1980s. Today, the same recipes and the same demands for "reforms" are still on the agenda. This option continues to impact the lives of people, especially young people, both in terms of difficulties in accessing employment and in the conditions of exercising professional activities. The surveys we have conducted among young people show that the experience of looking for a job and the experience of working itself are generating a profound sense of injustice. They also show that young people have a critical competence that can feed, downstream, different forms of collective action.

The Disputes over State Capacities to Fight Hunger and Promote Food Security in Brazil

The aim of this research is to analyse how happen the disputes over the material and symbolic resources involved in the configuration of state capacities to combat hunger and promote food security in Brazil. Placing the problem of hunger in a broader context of food politics (Herring, 2015), it is observed that the national state is one of the many actors that affect the food systems (Paarlberg, 2010). In Brazil, the 2000s' experience of fighting hunger was pointed out as an example of situation in which the food question was placed at the centre of the political agenda. However, after consistent periods of food insecurity reduction, there has been a resurgence of hunger in recent years, as well as a demobilization and reconfiguration of national State actions in this area. Thus, considering the State as a pool of material and symbolic resources, which is at the same time an instrument for a certain type of agents and an object of dispute between these agents (Bourdieu, 2014, p. 105), we investigate the mechanisms through which state capacities are built. Taking into account the relationship between state action and the distribution of resources among those who compete for the power to speak and act in the name of public interest, we understand that state capacities should also be considered with reference to a symbolic order (Moretti & Bandeira de Mello, 2017). In a document analysis procedure, we examined organizational charts, budgets, and resolutions of different bodies from the Brazilian Public Administration. We found that a position of naturalization of hunger was accompanied by a dismantling of activities that were thought to be consolidated within the field of food security, indicating that socially authorized instruments of action are articulated with a series of social representations for solving (or not) public problems.

Enjoying Myself: The Subjectivity of Pleasure and Desire in the Production of Adult Content in Brazil

This paper is based on ongoing research that seeks to understand the desiring subjectivity of women who currently produce adult content in Brazil. In twenty interviews with producers of adult content producers suggest that they perceive the act of facing cameras and engaging in sexual interaction as a way of constructing identities based on desire. The production and control of their own image are inviting for many women who intend to establish themselves in the digital sex market, because, in addition to their own working conditions, they delimit the practices they carry out. This factor would reaffirm the character of their being in control of their activities and their bodies and, often, those of their clients. Clients must fit into the previously defined possibilities, a fact that can have the role of subverting the notions traditionally attributed to sex work, by conditioning clients to act according to pre-existing demarcations. Starting

from the concept of self-pornification[1], content producers' perceptions allow us to capture the narrative construction of meaning by the women who are active in this market. The sexual exposure to the gaze of the other would be an effect and instrument of a subjectivity that inserts contemporary desire and pleasure in the field of visibility. Historically, only men were fully recognized as subjects of desire[2]. In this way, the narrative of the collaborators as subjects of desire is part of this media dynamic that constitutes an important field of investigation for the sociological understanding of the present.

Labour Resistance Against Factories Shutdown in the Global South: The Case of Ford Motor Company in Brazil

In recent years, it has become noticeable that transnational corporations in the automotive sector are closing plants in Brazil, both in traditional and in relatively new territories. These decisions are often part of transnational strategies related to those companies' global restructurings in response to transformations within the automotive sector itself, such as the emergence of electric vehicles, industry 4.0 etc. The demand for automotive vehicles has been decreasing since before the Covid-19 pandemic, because of Brazilian overall economic situation, which leads to diminishing productivity in the sector. Regarding the closure of factories, the case of Ford Motor Company stands out, since the corporation decided to cease production in Brazil, leading to a mass dismissal of their employees, between 2019 and 2021. This presentation focuses on the labour responses to Ford's factories shutdown, their international and national union articulations that shaped their strategies of action. Using a qualitative method, information was collected from workers, both unionists and not unionists, through in-depth interviews. Documents released by the company and the unions involved are also analysed as well as reports in written media. As for the labour movement, despite achieving interesting Collective Agreements, their main goals, which were, at first, to keep the company from closing their plants and, later, to keep the jobs through the selling of the plants to another company, could not be reached. In part, the unionists blame the State for their lack of support throughout the whole process, since Brazil has no longer an industrial development policy. The findings also show that, in fact, despite of ceasing production in Brazil, the country remains a part of the company's global strategy, with the admission of new engineers for their Product Development unity in Camaçari (BA).

MELONI, Maurizio* (Deakin University, Australia)

Inventing the Middle Ages: Elias, Foucault, and the Colonization of Time

It is a well-entrenched legacy of social theory that with the institutionalisation of modern states something unprecedented happened in Western modernity. For instance, regardless of their profound divergences, Norbert Elias and Michel Foucault converge in providing sociologists with powerful and still today largely unproblematized narratives - the rise of civilizing manners, the birth of biopolitics and governmentality - about modernity as "a time apart, newly minted, in human history" (Heng, 2011). These narratives share two common traits: 1) an oversimplified if not caricatural view of what came before the alleged rise of modern power, i.e. the Middle Ages; 2) and a focus on a very limited geographical archive (i.e. a few Northern/Western European countries) to document the alleged shift in modes of power and social control in "the West". Building on recent medievalist work, I aim to show that both Elias and Foucault share a certain colonial politics of time with regard to the medieval past. It is colonial because in oversimplifying and erasing what was already there, not just in Europe, but in the global history of civilizing manners and biopolitics, they repeat and strengthen form of chronological ethnocentrism that make extremely difficult for sociology to reconnect histories and relations beyond European hegemony (Bhambra, 2007). Time, not just space, can be colonized and its decolonization should become a strategic part of a truly global agenda that challenges persisting epistemic injustices within social theory.

A Lot's Gonna Change: Researching Fan Perceptions of Live Music Cancellations Due to the COVID-19 Pandemic

The live music sector was severely affected by the coronavirus pandemic and the resulting global lockdowns, restrictions and travel bans. The industry declined in revenue by 67.5% in Australia and nearly 90% in the UK (Rigg & Bofinger 2022, 1; 'This is Music 2021' 2021, 22). However, while it is well known that the pandemic affected musicians, the impacts on the fan culture surrounding live music has not been devoted much scholarly attention. Fan culture is key to creating local scenes and building communities and is central to the social identities of many. The coronavirus pandemic is an unprecedented

event for the popular music industry and the fan culture it has cultivated. To explore how fans reacted to the sudden cancellation of live music due to the COVID-19 pandemic, I analysed comment data from an indie music-focused subreddit. The study was focused on the first month of cancellations, March 2020. In the presentation I show how fans on the one hand approached the cancellations with empathy, concerned for the financial wellbeing of the artists and bands forced to miss out on a primary revenue stream. However, on the other hand this was tempered with self-interested sadness when reflecting on missing gigs and experiences due to the pandemic. The preliminary analysis also shows that fans had positive feelings about the move to digital technologies during lockdowns, although these were not viewed as a proper replacement for live music. I discuss the importance of these findings for our broader understanding of the impacts of the COVID-19 pandemic on leisure activities.

Attempts to Regulate the Oil Sector: Petrobras' Global Union Network

In this paper we discuss the factors related to the process of construction and hibernation of the Petrobrás union network. During the Party of Workers' rule (2003-2016), Brazilian unions have experienced a substantial strengthening in their power resources. It was a time when consistent investments at Petrobrás enabled a widening of the labour force hired in the oil industry. As a result, unions were reinforced and were able to rebuild their bargain capability which have been strongly weakened since the 1990's. From 2009 on, the Federação Única dos Petroleiros (FUP) started conversations with the International Federation of Chemical, Energy, Mine and General Workers' Union (ICEM), then the general global union covering the oil branch, in order to create the Petrobrás Global Union Network. The latter was ultimately acknowledged in 2011 by the signature of the Global Framework Agreement, renewed in 2014. However, economic and political conditions changed dramatically in 2016 as the then President Dilma Rousseff was removed from office. The general ambiance for union activities worsened and labor market bargain became severely anti-worker as labor reform made further steps in a very narrow time. A neoliberal agenda has taken up the stage and the company was framed as a sheer way to "generate shareholder value". As an active player in sectoral industrial relations issues within the country until the rise of the rightist coalition in 2016, the FUP could bring their experience and expertise to apply within the Petrobrás Global Network into different countries where the company was established - Nigeria, Colombia, Peru, Argentina, Curaçao, Switzerland and China. This fulfilled the expectation among union-networking's promoters and policy-makers that the workers from the country where transnational company comes from be at the forefront of the global union network for helping workers from other countries where such company moves to.

The Brazilian Feminist Movement: Diachronic and Synchronic Reflections on Its Structuring and Organization

The present proposal presents the partial result of the doctoral research developed by the author whose object is the Brazilian feminist movement, which is dedicated to investigating its way of structuring in history and its contemporary consensuses, divisions and ramifications. The social determinations behind the symbolic and material relations that link and affect the action, the discursive and literary production and the institutional organization of this movement are sociologically scrutinized and analyzed. The research is guided by the theoretical delimitation of a field of symbolic production, which is based on the notion that the internal mode of functioning of this field is correlated with external markers - such as the positions of class and stratum of origin of symbolic agents/producers, their capital, their trajectories, their political and intellectual resources, etc. In addition to these external markers, the objectivation of this symbolic universe is analyzed in its relationship with other fields – economic, political, cultural. In this proposal, the focus will be given to international funding due to the fact that Brazilian feminism has been substantially nourished by such contributions during its critical phase of its constitution and consolidation in the country, extending the diachronic and synchronic reflections on the dynamics established between the feminist movement, the State and Brazilian civil society in the period from the 1970s to the present.

MENDEZ, Maria-Luisa* (Universidad Católica de Chile, Chile)

The Ordinary and the Exceptional of Neighbourhoods and Neighbour Culture

For some time now in urban sociology, the local scale of the neighbourhood has been a key arena in which to explore the many facets of sociocultural and socioeconomic change. Whether seen as a site of cohesion, belonging or collective action, or explored through the complex dynamics of distancing, distinction or boundary making, neighbourhoods, neighbour culture and neighbouring have been at the centre of the ways in which we connect structural dynamics with everyday life practices.

In order to more fully address the challenges of connecting neighbour culture and structural processes, this presentation aims to incorporate another layer of complexity to the dichotomies previously mentioned: rather than locating the neighbourhood scale as the site of everyday life or ordinary life and the macro structural level (political and economic) as the place where extraordinary events occur, I would like to reflect on the particular forms in which these opposing views are being interchanged, especially when we explore processes such as resurgent authoritarianism, xenophobia or sanitary crises. The neighbourhood level has reacted and pursued extraordinary responses and has shown how "extraordinary" events are nurtured in everyday life long before they are seen as a major social process.

This presentation will address a Latin American perspective on the tensions and continuities between the ordinary and the extraordinary of contemporary neighbourhoods and neighbour culture, some of which have been active before and throughout neoliberal urbanism, and others which have been shaped by these processes.

Understanding the Mobilizing and Organizing of Food Delivery Platform Workers in the Uk and Brazil

There has been a cycle of struggle of food delivery platform workers, starting in the UK in 2016 and growing into a series of waves across the world. In 2020, this wave arrived in Brazil, where tens of thousands of riders held a national strike. Although there is now a significant literature about these mobilisations, less is known about the deeper connections between the changing class composition of these workers and the organising features of these struggles. Using the distinction between mobilising and organising, this presentation will seek to explain the power sources that shape the common mobilising aspects of this workforce, the different organisational strategies and why a similar organising model has been successfully developed in different contexts. This was a three years ethnographic research where I spent two years working in a food delivery platform workers union in the UK and one year among many riders organising groups in Brazil.

While many research has focused on particular aspects of the platform economy struggles, I argue it is possible to integrate them into a mobilisation infrastructure framework based on three pillars: territorial connections, infrastructure of communications, and communities of solidarity. This analytical effort helps us to explain why these workers have developed so many struggles around the globe, most with similar characteristics; and why the organising solutions developed prior or after these struggles look so different. While in some places, these workers founded new unions, in other they joined traditional unions, and in some developed an anti-union position. This North and Global South comparison helps us to understand which are the factors that led to these different paths. Despite these differences, in both cases, a similar organising model can be drawn. I claim that this particular model is an interesting inspiration to other kinds of precarious workers.

MENDOZA HORVITZ, Manuela* (Universidad de O'Higgins, Chile)

OTERO, Gabriel (Central University of Chile, Netherlands)

The Power of Diversity: Class, Networks and Attitudes Towards Inequality

In this paper, we examine the extent to which class-based social networks shape attitudes towards inequality, including perceptions of fairness, meritocracy beliefs, and preferences for redistribution. In particular, we explore how distinct network compositions along lines of class (i.e., social diversity, isolation, segregation) associate with distinctive political attitudes. Drawing on Pierre Bourdieu's concept of habitus complemented with further developments of it, our theoretical framework defines attitudes towards inequality as ethical dispositions (Sayer, 2005, 2009) and conceives that personal networks may favour intersubjective negotiation (Bottero, 2009) and the development of what has been termed a 'reflexive habitus' (Sweetman, 2003). We hypothesise that different network profiles influence such attitudes beyond and above class positions. The focus of our enquiry is on Chile – one of the most unequal countries in the world. We use large-scale representative survey data collected in 2016 for the Chilean urban population aged 18–75 years (N=2,983). Our results indicate that social poverty - i.e., lack of social contacts - is strongly and positively associated with attitudes towards inequality, while social diversity - i.e., having contacts across different status positions - increases altruistic dispositions. Moreover, we found that networks dominated by low-status contacts foster meritocratic beliefs, while greater socio-economic prestige in networks does not significantly produce differences in political attitudes. Finally, we demonstrated that class homogeneity in networks fortifies the class divides in political attitudes. Taken together, these findings increase our understanding of the crucial role of networks in political divides across classes.

GUTIÉRREZ, Gabriel (Universidad Diego Portales/ Pontificia Universidad Católica de Chile, Chile)

The Ubiquity of Inclusion: Institutional Discourses and Features Shaping Socioeconomic Diversity in Schools

Chile has been studied as an extreme case of school segregation. The segregation of school systems is of concern, as it may affect the educational performance of students, particularly the poorest (Bellei, 2013). Moreover, it can contribute to weakening social cohesion (Borgonovi & Pokropek, 2017). In this context, we use mixed methods to explore those Chilean schools with exceptional levels of socioeconomic diversity, contrasting them with those with the lowest levels of socioeconomic diversity. We aim to understand both types of schools' structural and discursive characteristics to explore how socioeconomic diversity is possible and how this might relate to specific narratives about social justice. For example: Is socioeconomic diversity actively sought and to what extent does this appear as a purpose in the schools' Institutional Educational Projects (IEP) as related to redistribution and recognition? Drawing on Bourdieu's concepts, we consider these features of the schools as an expression of their *institutional habitus* (Burke, Emmerich, & Ingram, 2013). Using a mixed methodological approach, we first identify a sample of the most socioeconomically homogeneous and heterogeneous Chilean schools between 2015 and 2018. We then conduct two analyses: a) we randomly select a subsample of 60 schools from each group to qualitatively analyse their IEP; and b) we analyse the statistical association between different institutional characteristics and being a socioeconomically homogeneous/ heterogeneous school. Our qualitative analyses do not reveal a relationship between the socioeconomic composition of schools and the inclusion narrative contained in their IEP. Conversely, quantitative analysis suggests that some institutional characteristics of schools are associated with having a homogeneous/heterogeneous socioeconomic composition. Our findings foster new questions regarding the process of marketisation of education in Chile and similar contexts, as well as the public policy challenges to building a system that promotes the social integration of schools, particularly public schools.

What Is It to 'be Authentic'? a Sociological Definition Rooted in Qualitative Data

The aim of this paper is to develop a sociological definition of what it is to be authentic. The definitions of this concept in the sociological literature are of a theoretical kind, without being grounded in empirical data. I propose a sociological definition that accounts for the meanings that individuals associate with 'being authentic'. Based on a sample of culturally and linguistically diverse university students, I discuss their answers to 127 open-ended questions in a survey-questionnaire and 20 interviews through three main meanings of (in) authenticity: self-referential (i.e., to be authentic is to be true to oneself); other-referential (i.e., to be authentic is to be true to others); and nihilistic (i.e., to be inauthentic is actually impossible, because all individuals' actions can only be authentic). I conclude that individuals' choices about what constitutes to be authentic are political, and that these choices are relevant to how they live and give direction to their lives.

Urban Small-Scale Fishing Community within the Vortex of Social Exclusion (Case of Urban Fishing Community in Makassar City, Indonesia)
Buchari Mengge, Suparman Abdullah, Sawedi Muhammad
*Departement of Sociology, Hasanuddin University, Makassar Indonesia

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Urban small-scale fishing community is very problematic and complex. Poverty and social exclusion are state and process that awfully have being side by side in their day life. This study aims to analyse the process of exclusion of the small scale fishing community in urban areas. To achieve the objective, this study applied qualitative method in the process of gathering, explaining and analyzing the data.

This study found that essentially urban fishing community experienced exclusion structurally and culturally as a fundamental mechanism of exclusion in various dimensions. Starting from economic exclusion was constitutively mechanism of limitations and shortcomings in fishing production and distribution activities. Class exploitation through the patron-client relationships that benefit local financiers made it worse the economic exclusion and harm the fishing community. Meanwhile in urban structure, fishing community was trapped in polarization and segregation in poor and slum areas. The urban structure more disfavored small-scale fishing community through reclamation and other urban coastal developments that threatens and afflicts the fishing community to lose their livelihoods. Simply this study concluded that small-scale fishing community was within a multidimentionally socio-spatial mechanism of exclusion

Educational Policies, Innovations, and Actor Network Theory

This paper presents the epistemological, theoretical, and methodological assumptions of Actor Network Theory (ANT) and the centrality it gives to the associations between human and non-human actants to understand the social (disassociating itself from sociological perspectives that have neglected the role of materiality and have assumed aprioristic analytical categories in their interpretations). This approach aims to make visible actions of complex networks of human and non-human actors who, following Ball et al. (2012) and Fenwick & Edwards (2010), make educational policy. In the second section we review how ANT has been mobilized by sociological studies on educational policies in different countries. Thirdly, we illustrate ANT´s analytical productivity to unpack innovative processes by examining two studies we have carried out in the City of Buenos Aires. These analyses pay attention both to the practices of a group of teachers, and to the performative capacity of concepts and ideas, as well as to the action of objects and machines (Latour, 2008). It traces how various elements are associated and, in doing so, participate in disputes around what a good teacher should be -reorganizing central aspects of their work and promoting innovations of different sorts. The first study analyses pedagogical, labour, and social innovation policies in a technical school in the late 1990s and early 2000s. The second scrutinizes the policy of pedagogical continuity during the pandemic and its effects on teachers´ work. It pays attention to the novel adoption of a digital platform in a technical school to regulate key aspects of their work. We argue that ANT contributes to forge an attentive look at aspects that often go unnoticed in educational research and that could enrich the ways in which we problematize and study innovation as processes, practices, and meanings.

Enhancing the Learning Continuum. Toward a Renewed Integration between School and out-of-School Contexts in Italy

An enhanced integration of learning resources and spaces from both school and out-of-school contexts may be considered as a necessary part of a resilient response to the impact of the pandemic on students.

Paying attention to how schools and out-of-school actors responded to the pandemic outbreak and the post-pandemic recovery, we present a theoretical and exploratory research into the concept and the practices of integration between formal, non-formal and informal education in Italy.

Moving from the international literature on the subject, we developed a set of indicators which helped to identify critical cases (Yin 1984) of how schools and other educational agencies work together with the purpose to develop practices of hybridisation between different educational contexts and methods, where school classroom and other spaces (inside and outside school) are considered pieces of an integrated teaching-learning environment involving all young people.

A key research question is how to build democratic forms of cooperation between schools and non-formal educational agencies (i.e. based on a greater sharing of decision-making power), which go beyond the usual logics underlying the use of non formal/informal education by schools (i.e. the tendency to keep separated times and spaces of formal and non formal education, the use of informal education mainly for more

vulnerable or at risk students or as additional resources for talented students, and the adoption of informal educational methods in the curriculum activities as a voluntary choice of single teachers).

Drawing on the intersectionality theory of Noam and Tillinger (2004), we assumed that a good practice of hybridisation between formal, non formal and informal education is associated with the building of a transformational partnership between school and out-of-school organisations, where partners activate sustainable cooperation to develop new teaching-learning environments and share a learning process which transforms values and perspectives while working together.

New Reproduction Technologies, Gender, and Careers

Since in 1978 the first child conceived by in-vitro-fertilization was born, there have been incessant developments in technologies of artificial and assisted reproduction. They challenge the ways social scientists and ordinary people think about fertility, parenthood, and families. We would like to present a study on the attitudes of the general public towards different technologies of artificial and assisted reproduction. We assume that attitudes toward recent reproductive technologies are embedded in a larger cultural context of gender. With the increased employment of women, traditional gender relations are less and less able to hold (Pfau-Effinger 1998), so we would like to examine how shifting understandings of gender relations and the division of labor affect attitudes towards reproduction. Therefore, our research question focuses on the relationship between these broader cultural frameworks of gender and the attitudes towards different technologies of artificial and assisted reproduction. In our research we rely on a recent representative survey (MOSAiCH 2022) of family life, gender, and attitudes in Switzerland. The survey is highly suited for answering our research questions since firstly, it is based on a high-quality sample of respondents in all parts of the multilingual population of Switzerland, secondly, it contains a broad set of context variables and finally it covers attitudes towards artificial and assisted reproduction technologies in their breadth, from in-vitro-fertilization, social egg freezing to recent developments like the CRISPR technology.

MESJASZ, Czeslaw* (Cracow University of Economics, Poland)

Money As Information: A Complex Systems Perspective

Money, as one of the most important human inventions, has become a topic of discussion beginning from philosophy, theory of economics and finance, through sociology, psychology and ending with specific considerations such as physics (entropy and value theory, econophysics), information theory and environmental studies.

There were several attempts to develop new theories of money, e.g., Modern Monetary Theory. From a social theory perspective, the MMT is just another confirmation that money is a social construct. This conclusion is obtaining a new meaning in the era of information overabundance, the development of information technology, the invention of cryptocurrencies, and the expansion of derivative instruments. Money as socially constructed information is becoming decoupled from a real economy, and as a result, it can bring about environmental damage by overexploitation of natural resources. Without pretending to develop a universal theory of money, it can be stated that treating money as the information constitutes the core theoretical conclusion stemming from the above phenomena.

The paper aims to show how interpretation of money as socially constructed information, can be helpful in a better understanding of its role in modern society. Money is treated as an instrument of control (cybernetics) and socially constructed information. It is also shown that the entire money-based control system is complex and hierarchical.

This theoretical concept will be used in two preliminary examples. The first one shows that economic inequality is unavoidable in the modern world. In physical systems, the levels of hierarchy are separated by substantial energy barriers. In contrast, in a hierarchical information-based system, the higher levels of hierarchy, possessing the information, require only a limited relation to physical reality (tangible resources and partly intangible). The second example will show how the financial derivative instruments treated as social constructs can become irrelevant to any real economic activity.

Changing Tides: A Look into Shifting Cultural Trends in Micronesia

As a result of Westernization, typically collectivist Micronesian cultures have seen a shift toward individualist tendencies. This change can be seen throughout the spectrum of culture and its representation in society on many

　　denotes a presenting author. Abstracts are organized by first presenting author's last name.

levels. This study looks at the effects that this macro change has had on the micro level of the family. This is accomplished by tackling the individual roles and responsibilities of family members, contrasting power hierarchy and representative characteristics, as well as all the problems that arise from the culture shift. Literature on the characteristics and outcomes of Micronesian collectivist cultures is contrasted with the much sparser literature on Micronesian individualist cultures or cultures that are shifting toward individualism. As a result of the development of the situation being analyzed as well as the lack of representation from indigenous sources, literature about culture shifts in this region of the world remains limited. This presentation examines cultural differences across generations of same-house families such as, but not limited to, collectivity and leadership, responsibility and reciprocity, kinship and religion, respect and humility, and issues related to the natural environment. Each aforementioned section will have their characteristics identified across similar collectivist cultural regions in which those characteristics will be further cross-examined with their changing trends. Conflicts that arise as a result of the shifting trends are further examined through the indigenous gaze.

Intellectual Structural Violence

This communication challenges the modernist ontology of universalism in the investigation in favor of a multiplicity of possible worlds. This is what it means to summon a pluriverse to the enemy of the intellectual structural violence! Discuss the possibility of finding the limits of our own cultural investigative reflexivity, even vulnerabilities and, in turn, discovering new struggles of understanding, acceptance, and intellectual co-construction. In fact, critical ethnographic experience has been a tool that has been shaking up the researches developed at the Ocean Literacy Observatory, shaking the researchers' convictions and pushing them move towards the new. An antidote for the researcher trapped in his epistemological cages, who work on the symptoms of violence left by continuist research itself, that is, of acceptance and promotion of development in its infinite exponent.The communication proposed argues a confluence of visions of research processes – academic or not, into economic, cultural, and ecological aspects. Contradictory determinations that are observed in the academic situation will be discussed. Very little is written nowadays about the role of researcher: of those who work for a linearly unified and banking research i.e., clean, to those who oppose it, seeing it as an instrument of domination and oppression to be overcome by intellectual alternatives that are inclusive, collaboratives, and reach everyone. However, the approaches still narrow to the same path, which disregards the fundamental implication of the investigation as a political form of meeting the interests of those who represent it as a formalized institution in the four corners of the world; still insisting on the economic quadrature that is relevant to the maintenance of the current world (dis)order. The discussion in this paper focuses on intellectual structural violence as an instrumental tool of class power involving the extractivism, silencing, and trafficking of the human intelligibility.

The Knowing of Neoliberal Tide. Decolonizing the Coast Zone!

A critical reading of the ocean was experienced by a plural coastal collective involved in two scientific projects: Partibridges and Smart Fishing, in which the exercise of disengaging, reconnecting and rebuilding the current human vision and feeling towards the ocean has strengthened a radically different life praxis in the artisanal fishing community of Almada - Portugal. As a transitional space, coastal zones are emerging phenomena of a local scale, dynamic interactions between socioeconomic, cultural and biophysical forces. The movement of marginal cultural groups to the coastal urban area developed social boundaries and conflicts, as a result of the strengthening of permeable borders. So, diversity is both at the center of human encounters, as acting as a sublime display of official ideology operating in the socioeconomic mainstream. The different types of conurbation areas produce unidentified and unidentifiable physical spaces; local fishing communities located in urban coastal areas are an example. These areas are organized around our current entropy and anomie generating a space for a certain kind of invisible set of social relations, which take place within a naturalized process that characterizes the neoliberal system. Through Critical Ethnographies, images and actions merged in the coastal areas of Almada, made possible all actors in both projects were able to be researchers of their own practices, which brought a kind of diversity in the unity and it enabled an exercise of transcultural, and transdisciplinary participation. Human topology was permeated by new knowledge from the local tide, which brought an emancipation process in plural forms. This communication focuses on the challenge experienced in bringing together and demystifying the micro (symptoms) and macro (problems) level interactions centred on the local fishing life, to collectively unravel and dismantle the economic, political, and cultural processes, which structure the current environmental issues, to which the fishermen/women are sensitive.

Producing Sustainable Food Security: Socio-Technical Transitions in Australian Agriculture

Despite recent shocks and disruptions in food systems, including COVID 19, floods and bushfires, a government agricultural body has pronounced Australian food security as implicitly guaranteed as Australia "... produces substantially more food than it consumes" and possesses a vast export capacity that provides a "shock absorber for domestic food security. This optimism isn't shared by wider food system research, which has accepted that the prevailing paradigm "of producing more" is ultimately incapable of fulfilling the long-term need for the public goods of sustainability and food security. This mismatch of perspectives, draws attention to the persistent absence of a cohesive national food security governance framework for Australia.

This early-stage research program aims to transcend the "producing more" thesis, by exploring how *food systems* can accommodate system shocks *and* how they can transition towards greater sustainability and security. As such this work aims to address the current lack of conceptual clarity and empirical evidence in regards to systemic and sustainable food security. Conceptually, this paper builds on recent advances in food security scholarship, which highlight the importance of stability, sustainability and agency for food security and reconsidering the concept of food security at the 'production end' of food systems. Furthermore, by applying a forward looking socio-technical transition perspective, this work raises priority questions for transitions to a holistic food security governance in Australia.

METZ, Rudolf* (Corvinus University of Budapest, Hungary)

Folk Devil or Folk Hero? Strategic Use of Emotions in Viktor Orbán's Politics

Scholarship has long argued that specific emotional relationships feed populism: populist politicians try to convince others to concentrate their negative emotions (anger, fear, frustration, resentment) on 'corrupt elites' and 'dangerous others', but at the same time invest the positive ones (hope, pride, nostalgia, trust) into themselves as the only ones who can authentically represent and defend the morally decent people. Meanwhile, they also provoke strong anti-populist emotional reactions from those who believe they are only pushing their political community into a moral crisis via their illiberal, anti-democratic, irresponsible politics. Although the populist literature has recognized the importance of emotional relationships, little is known about how leaders use the repertoire of populist political style along strategic lines to elicit the desired emotional response (Brubaker, 2020; Moffitt and Tormey, 2014; Ostiguy et al., 2021) This presentation draws on new theoretical frameworks such as theories of social labeling (moral panic: Joosse, 2018; moral euphoria: Flinders and Wood, 2015; moral entrepreneurship: Becker, 1963) and heroic (Klapp, 1954; Goethals, 2019) and charismatic leadership (Willner, 1984; Joosse, 2014) to explore this multifaceted and antagonistic emotional relationship. Populists may follow different paths to exploit emotions and become charismatic heroes in the eyes of their followers, while others view them as folk devils due to their moral entrepreneurship and demonization. The presentation sets up a typology to distinguish between different strategies of populist stylistic repertoire: moral witch-hunting, victimization, barricade-building, and quarantinization, illustrated through the Hungarian Prime Minister Viktor Orbán's case. The analysis covers four illustrative examples from Hungary: the migration crisis (2015-2016), the government's Authorization Act during the COVID-19 pandemic (2020), the anti- LGBTQ politics (2020-2022), and recent political conflicts with the European Union (Fidesz's exile from European People Parties).

"Citizenship Learning" in Brazil: Justifications in Favor of Human Rights, Religious Education, Philosophy and Sociology at Schools (1987-2006)

Proposals elaborated from 1987 to 2006 for curricularization of the following contents for elementary education in Brazil were analysed: Human Rights, Religious Education, Philosophy and Sociology. The documents which were the source for this analysis belong to the Justice and Peace Commission of São Paulo, Deputies House, Federal Senate and Federal Council of Education collections and they include the draft of proposals, reports and oficial sentences. We also consulted official texts, books and handbooks which are produced by the agencies and agents who act in favor of the normalization of the aforementioned knowledge at schools. We sought to understand the justifications why these knowledge were institutionalized, in particular, how they were related to what we are calling "citizenship learning". We hope to contribute to the analysis of the weaving of the school curriculum in Brazil

denotes a presenting author. Abstracts are organized by first presenting author's last name.

from the point of view of Social Thought, questioning movements (more or less subtle) in the formulation of the social meanings of the humanities at schools during the democratization process.

Human Rights, Religious Education, Philosophy and Sociology are contents linked together in a common horizon of expectations which find affinities with a lineage of left-wing catholic thought of the period (called "liberation theology"). In this sense, we demonstrate that there is a historic connection between certain catholic ideals, human rights and social sciences, whose nature we need to understand if we want to recognize possibilities and limits of republican ideals in Brazil. In the limit, we are trying to unravel bundles that associated elaborations about human rights and human sciences and whose path went not only through processes of formulating a rational conscience of society but also through formulations bundled with religious assumptions which associates liberation and democratization.

Place of Residence Does Matter for Educational Integration: The Relevance of Spatial Contexts for Refugees' Transition to VET in Germany

With the large influx of refugees to Germany around 2015/16, the integration of the mostly young refugees into education and employment has become a major challenge for German politics and economy. Since formal qualification and labor market outcomes are strongly coupled in Germany, completion of vocational education and training (VET) is crucial for professional and social integration. However, access opportunities to VET are characterized by strong geo-spatial inequalities: The German districts vary considerably according to the labor market structure, economic productivity and demographic development, that constitute the supply and demand for training places in the dual VET sector, to which refugees predominantly have access. Since the placement of refugees upon their arrival in Germany is primarily based on population figures, largely disregarding further spatial contextual factors, the question of the dependence of refugees' transition chances to VET on their place of residence gains particular relevance. We examine the relationship between the socioeconomic contextual factors of the individual German districts and the transition chances of young refugees to VET. For this purpose, we analyze the representative *IAB-BAMF-SOEP Survey of Refugees* using multi-level discrete time event history analysis. In our sample, we observe young refugees who are aged between 18 and 30 years for a period of five years (2016-2020). On the supply side, we find that a higher economic productivity as measured by GDP, a low unemployment rate, and a greater number of small versus large businesses in the district are positively associated with the transition chances. On the demand side, an increasing number of school leavers with no school-leaving certificate and of people with a refugee background are negatively associated with refugees' transition chances. We conclude that the respective geo-spatial characteristics crucially matter for young refugees' training opportunities and discuss how this can create cumulative (dis-)advantages for their employment outlooks.

Re-Examining Professional Identity: The Narrative of Black Women Lawyers in South Africa

The legal profession has a strong professional identity, historically interpreted, understood, and practiced from a white middle-class and masculine perspective. For members of these privileged groups, becoming a lawyer and enacting the professional identity prescribed to a legal professional may be a natural process, owing to various forms of inherited capital. However, for marginalised social groups, becoming a lawyer is a transformative process which extends beyond knowledge and skills, excellence, professional ethics, values, beliefs, philosophy, and culture representing the identity of the legal profession.

Underpinned by a feminist methodology, in-depth qualitative interviews with black women lawyers in South Africa attempting to insert themselves into the profession, the study findings reveal that professional identity is complex, necessitating a more nuanced approach that goes beyond simple description that considers relationships and context as well. The study particularly draws attention to how black lawyers who are mothers rely on African mothering ideologies to achieve professional identity. This is because professional identity is developed and shaped by the experiences of lawyers as they negotiate their roles and positioning within the legal profession. The narrative of black women lawyers in South Africa demonstrates how professional identity is complex and juxtaposed by many other positionalities - class, gender, race, and cultural practices. The analysis illuminates how black women draw upon different identities to fulfil the prescribed lawyer identity, clearly showing how professional identities cannot be seen as descriptive, but consciously actioned and intensely contextual.

Culture and Politics of the Subaltern Child As Located in the Indian Context.

There is a growing concern with issues of children´s rights as an Eurocentric perspective that has dominated discourses on the subject. The southern child is often measured against an idealized and globalized child subject. Such normative discourses of childhood are in need of radical revision. In this paper I engage with the conceptualizations of cultural politics of childhood – politics of equality, identity and representation – as a methodological and theoretical orientation in order to unsettle the global child. I develop the notion of the subaltern child as opposed to that of the global child. I further develop cultural and political discourses of the notion of the subaltern child. Are children subaltern subjects? Are subalterns capable of challenging the representations and material conditions of their lives? I locate the subaltern child within the South Asian Indian context and discuss the diverse and complex socio-politics of its religious, class, caste, gender, age relationships in order to problematize essentialized notions of subalternity.

Intersectionality As an Approach to Impact of Covid 19 on Children

A call for an intersectional approach to Covid 19 policy was made due to minority ethnic groups being disproportionately affected. Yet children are one group of people forgotten, in the turn to intersectionality. In the context of the pandemic, an intersectional approach acknowledges the effect of interdependent systems of prejudice on both direct and indirect health effect of Covid-19. Overlapping and compunding effects of race and class coupled with gender have been investigated in the West. Systematic prejudice against children (childism) has been raised in the context of public health where children were deprioritized for vaccines despite mass SARS-CoV-2 infections among children. Taking an intersectional approach to address Childist prejudice in the pandemic would imply recognition that children are not an homogenous group – children from minority ethnic background, girls, disabled children, children living in poverty. Heterogeneousness as a group has largely been ignored in public health and policy decisions during Covid 19. Intersection of socioeconomic and demographic characteristics, such as age ethnicity, class and gender, shape childrens daily experiences and outcomes. India has the second largest number of confirmed cases in the worlds after USA. Children are facing considerable challenges due to Covid 19 pandemic, such as impact on their health and health of their care givers, as well as severe economic and social consequences. In this paper I will explore literature and data with a focus on C-19 and its effects on children.

KVALVAAG, Alyssa Marie (Nord University, Norway)

Interlocking Oppressions, Crossing Categories, and Rights: A Critical Analysis on the Impact of Categorization Defining Human Rights of Indigenous Migrants from Latin America

The international mobility of Indigenous Peoples raises questions on how Indigenous and migration rights should coexist (Mezzanotti & Kvalvaag 2022) and the role played by categorization in this process. During migration movements in the Americas, the human rights of Indigenous Peoples have largely been neglected. Indigenous status has implications for both human rights violations forcing Indigenous Peoples to flee, as well as implications after displacement, especially considering their right to autonomy in contrast to assimilationist policies. Indigenous migrants are often treated without regard for their status as Indigenous Peoples, as if their migrant status would hierarchically supersede their Indigenous one.

While national origin is normally a focus regarding refugee status, there is a disregard for the fact that national borders also divide Indigenous territories imposed by colonial power. North-centered human rights discourse reinforces imposed borders and categories which may corroborate discrimination, as the labelling of displaced Indigenous Peoples as refugees or migrants ends up defining their enjoyment of human rights, rather than upholding their rights as Indigenous Peoples. We claim the very nature of being Indigenous should result in specific protections that take into account Indigenous specificities when migrating, regardless of imposed categorizations and migratory pathways, as the process that has constructed these categories and the political purpose(s) that they serve (Crawley & Skleparis 2018; Zetter 2007) reflect 'subjective perceptions of how people fit into different spaces in the social order and of the terms on which society should engage with them in varying contexts and at different points in time' (Moncrieffe 2007, 1).

Thus, we question the role played by categorization defining Indigenous migrants' rights and seek to problematize potential challenges posed by

contested categories which are produced and reproduced by discourse, determining the law and practice of human rights in the case of Indigenous migrants from Latin America.

MEZZANOTTI, Gabriela* (University of South-Eastern Norway, Norway)

KVALVAAG, Alyssa Marie (Nord University, Norway)

Racialized Human Rights: Discriminatory Responses and Everyday Coloniality in Migration Governance in the Global North

Viewing European and North American migration governance as institutional arenas, we question the everyday coloniality of racialized borders (Achiume 2022) in the current application of human rights, highlighting discriminatory responses and racism. Race has been one of the most efficient instruments of social domination imposed on the global population as an essential aspect of coloniality (Quijano 2000). Taking discourse as a social practice, problematizing the discursive nature of power in migration governance (Fairclough 2010) and through an interdisciplinary empirical and evaluative research, we aim to challenge the discriminatory application of legal standards, the disparities in treatment between migrants, and the differing abilities to exercise and access rights.

We argue that a racialized application of human rights built on discriminatory assumptions about migrants evidence power relations which are produced and reproduced by a discourse shaped by the politicization, criminalization, and securitization of migration and the externalization of borders (Mezzanotti, Kvalvaag & Omar 2021). Discourse is connected to social structures as it produces effects on structures and is simultaneously formatted by them (Fairclough 1989), where everyday institutional practices may become the very space for discriminatory responses in migration governance. The gap between the normative aspects of law and a racialized application of human rights in migration governance becomes deeper as politics, influenced by nationalism coupled with populism, leads to parts of the human race being reduced from a status of bearer of rights to a subordinate one through a predominant architecture of authoritarianism and social segregation based on race (Mezzanotti 2020). In conclusion, we reflect on the contradictions of a contested universal human rights system now exposed by the double standards in responses to the Ukrainian exodus, particularly when compared to responses to previous displacements, and the challenges of the discriminatory application of human rights in migration governance in the global North.

MHENNI, Mourad* (Sousse university, Diraset Etude Maghrebine laboratory., Tunisia)

L'Institution Syndicale Et Les Régimes Politiques Autoritaires En Tunisie : Approche Socio-Historique

L'union général des travailleurs Tunisiens (UGTT) est considérée parmi les confédérations syndicales les plus puissantes dans la région MENA. En effet, cette confédération a été depuis toujours un acteur politique plus qu'un acteur syndical au sens étroit du terme. Elle a essayé depuis l'indépendance de la Tunisie en 1956 de jouer un rôle stratégique pour réduire l'impact des différents régimes autoritaires qui se sont succédé en Tunisie.

Cependant l'avènement de l'ère du « printemps arabe » a présenté un double défi à L'UGTT, d'une part comment négocier une conjoncture révolutionnaire risquée et contribuer à l'instauration d'un régime politique démocratique et épargner la Tunisie les désastres de la dictature politique ? D'autre part comment exploiter la phase transitoire pour acquérir des avantages significatifs pour les salariés tunisiens ?

Concernant le premier défi, l'UGTT a démontrée jusqu'à présent une grande maturité politique qui l'a permis non seulement de contrôler la phase transitoire mais surtout de réussir un exploit exceptionnel avec trois autres organisations non gouvernementales, il s'agit du prix Nobel de paix qui a été attribué au quartet Tunisien : UGTT, l'union Tunisienne de l'industrie du commerce et de l'artisanat UTICA, L'ordre national de l'avocat, la ligue Tunisienne des droits de l'homme. Il est à noter que l'UGTT était la pièce maitresse du processus qui a été couronné par le Prix Nobel, en fait les quatre organisations ont été primés pour avoir, en 2013, instauré un dialogue national qui a permis de surmonter une crise politique aigu qui menaçait la transition démocratique.

Le deuxième défi semble plus compliqué puisque la Tunisie souffre depuis l'avènement du « printemps arabe » d'une crise économique aigu, qui a empêché l'UGTT à acquérir des profits significatifs pour les salariés.

RC36-533.2

MICHEL-SCHERTGES, Dirk* (Aarhus University, Denmark)

Democracy, Authoritarianisms and Political Economy of Critique

In addition to free elections and opportunities for self-determination for their citizens, democratic societies are defined in particular by the right to freedom of expression. And in most societies, this right is also constitutionally guaranteed. On closer examination, however, it can be seen that the

constitutionally guaranteed possibility of criticism often takes place only in its (superficial) appearance, and is prevented by (institutional) social practice from being exercised to its full extent. Especially due to the influence of economically related factors, institutions such as (state) media and universities, which are supposed to be the consciousness of society, are clearly hindered in capitalist social formations. Even in times when the mantra of infinitive growth is to be broken, economy and growth are placed above democracy. Against this background, the question of the political economy of critique is explored here in order to be able to formulate possible forms of real social critique in order to come closer to the goal of a democratic society.

RC36-534.1

MICHEL-SCHERTGES, Dirk* (Aarhus University, Denmark)

Far Right Political Contra-Revolution and Critical Social Aesthetics

On the theoretical assumption that social pathologies are immanently related to the capitalist formation of society, the focus of this session is to render damaged life visible as it reveals itself within contemporary culture and everyday life. In relation to the ongoing process of globalization and the expansion of the (Western) culture industry, the reconciliation of the general and the particular seems to increase in everyday life, mirroring the flawless perfection of a shopping-mall atmosphere. However, with growing profits for the few and a tremendous increase in social inequality, and thus poverty, the sham world of perfection fails to eliminate the perception of societal power relations and violence as inevitable in related to capitalist society. By means of a critical concept of social aesthetics, bourgeois-coldness and its "alliance" with contra-revolutionary opposition is to be revealed. Is the contemporary far right political contra-revolution to be understood as a logical reaction to the experienced "aesthetical coldness"? To answer this question, the focus of analysis of this presentation will be on the relation between critical social aesthetics and the political far right.

MICHELIS, Ilaria* (University of Cambridge, United Kingdom)

Between Intersectionality and Assistentialism: Feminist Organisations Supporting Migrant, Refugee and Asylum-Seeking Gbv Survivors in Europe

Feminist researchers have often investigated the relationship between contemporary European feminist movements and migrant women in relation to social and political mobilisation on issues of gender inequality, violence, racism, and migration (Bassel and Emejulu 2017; Bernacchi 2018; Dean and Aune 2015; Lépinard 2020). However, fewer studies have focused on gender-based violence (GBV) services (such as anti-violence centres, safe shelters, and anti-trafficking programs) as a common site where migrant, refugee or asylum-seeking women first encounter the European feminist movement.

This multi-method qualitative study analyses day-to-day practices and relationships within two feminist organisations who provide support services to GBV survivors and migrant, refugee and asylum-seeking women in Italy and Serbia. It reveals their daily struggle to follow survivor-centred, intersectional, and anti-racist principles in service delivery in the context of insufficient resources, rigid institutional policies and an increasing backlash against migrants' and women's rights. At the same time, the study problematises entrenched beliefs, theoretical assumptions and practices within feminist organisations that have exclusionary and sometimes violent effects on those who seek their support. An in-depth case study on the theme of motherhood illustrates the tension between Eurocentric parenting models, feminist expectations around reproduction, and mothering as a self-affirming and anti-racist strategy for migrant, refugee and asylum-seeking women living in hostile environments.

When feminist approaches remain anchored on a singular idea of womanhood and reject forms of thinking and being outside the Eurocentric canon, migrant and otherwise minoritized survivors of GBV are denied the comprehensive support they deserve or forced to fit into Western feminist models. Thus, while contributing to discussions on plurality within feminism and resistance to intersectionality and anti-racism in European feminist movements, this study importantly demonstrates the impact of these dynamics on service provision and on how GBV is framed within the feminist movement, ultimately undermining the global struggle against GBV.

MICHELIS, Ilaria* (University of Cambridge, United Kingdom)

Later Is a Cis-Hetero Patriarchal Time Zone: Progress and Resistance in the Inclusion of People with Diverse Sogiesc in Humanitarian Response

The last few years have seen various efforts to increase the inclusion of people with diverse sexual orientations, gender identities and expressions, and sexual characteristics (SOGIESC) in the humanitarian system and, importantly, in how humanitarian responses are designed during conflict and natural

disasters. However, these efforts have only resulted in slow and piecemeal progress and they have sometimes been met with outright resistance (Dwyer 2021).

This paper draws on my experience of working in the humanitarian sector as a white lesbian woman for fifteen years and on qualitative interviews conducted with humanitarian actors working in the protection sector in 2019. I identify five main narratives that are deployed within humanitarian discussions and policy debates to justify a limited or non-existent response to the needs of people with diverse SOGIESC during emergencies: law and culture; fear of doing harm; scarcity of resources; demand for data; exclusionary (transphobic, homophobic and sexist) action.

I therefore borrow Cynthia Enloe's quote "Later is a patriarchal time zone" (2004) and add *cis-hetero* to it, to indicate how these rhetorical strategies have been and continue to be deployed to endlessly delay and sideline the needs of people with SOGIESC in the humanitarian system. Ultimately these 'delays' reinforce cis-heteronormativity and patriarchal norms in contexts where humanitarian responses take place and prevent highly marginalised individuals from accessing the humanitarian assistance they need to survive and recover. The paper concludes with recommendations to humanitarian practitioners and policy makers to address these five co-occurring narratives, resist efforts to further delay inclusion and accelerate the journey towards safer and more equitable emergency responses for affected people of all genders.

MICHELSEN LA COUR, Annette* (University of Southern Denmark, Denmark)

Like a Winter without Christmas. a Study of the Emotions, Interaction Rituals and Youth Culture Following the Cancellation of the Roskilde Festival, an Iconic Danish Music Festival.

Due to the corona pandemic festivals all over the world were cancelled in 2020. In the jubilee year of the fiftieth Roskilde Festival in Denmark, the last minute cancellation of the most notorious festival in Northern Europe, attended by 130.00 participants, 24 years of age in average, became the incentive to send out a survey during the actual festival days to investigate participant's relationship with the festival and document the emotions. The emotional state following the cancellation was used to document the festival's social and ritual importance for young people. From the perspective of sociologist Randall Collins the festival can be seen as long chains of interaction rituals, and the response to the cancellation of the complex – and cherished - social interaction performed during the festival was uncovered through questions regarding the emotional response. A mixed methods survey provided 807 answers and the findings were, that despite great sadness following the cancellation, participants aligned their expectations generating, what is known in Collins's terms as positive emotional energy (EE+), while very few expressed sadness but no negative emotional energy (EE-). The interaction rituals, they expected, were to be fulfilled next year, and the social importance as youth cultural interaction ritual ascribed to the festival showed, that the festival is regarded as a break from everyday life, as an important confirmation of friendship, and a pause from the social pressures of performance on young people in a neoliberal society. The festival provided, what sociologist Hartmut Rosa calls, resonance.

Resisting Resurgent Authoritarianism with Trustworthy and Human-Centric AI

The presence of Artificial Intelligence (AI) systems in contemporary life is increasing at a rapid rate. Technical advances are pushing the rapid development and diffusion of AI across all aspects of society. Research and training on technical advances in AI alone failed to produce trustworthy human-centric AI systems due to the lack of explicit attention to ethics, societal inequalities, and human values. While AI systems hold promise for providing models to support human decision-making in complex situations, the eruption of public concerns over issues ranging from privacy invasions by governments, corporations, and resurgent authoritarianism threaten the future design, development, and acceptance of AI systems. Numerous examples of research highlight how the use of AI models trained on large datasets encode the biases in the data, resulting in emergent racist, sexist, and other discriminatory perspectives. These examples both erode people's trust of AI systems and decrease their accountability to democratic processes and norms. In this paper we posit that a multi-disciplinary approach is required for trustworthy human-centric, and reliable AI. Trustworthy AI systems require a socio-technical approach, and are not achievable with algorithms in isolation from their sociological and political contexts. Advances in AI require a human-

centered perspective that maintains a focus on human needs and values. We draw upon research in sociology, cognitive psychology, philosophy, as well as computer science and engineering to develop our socio-technical approach to trustworthy, reliable, and human-centric AI. The manuscript discusses the rationale for and design of an interdisciplinary approach to training graduate students to be the next generation of AI scholars and practitioners who will develop trustworthy, reliable, and human-centric AI systems.

MICONI, Andrea* (IULM, Italy)

Authoritarianism without Autocracy. Constituent Power in the Age of Covid-19

The paper analyzes Italian and European regulation related to the Covid-19, with a focus on the state of emergency and derogations to the rule of law. The hypothesis we put forward is that of a new form of governmentality, characterized by the multiplication of decisional powers, the continuous remaking of the rules, and the separation between the law itself and the "force of law", as laid out by Agamben. In order to explain the institutionalization of the emergency as a new form of sovereignty, Schmitt's concept of exception will be called to action, as this deviation from democratic practices share some aspects with the totalitarian order (based on Arendt's definition) and with the crisis of bureaucratic order theorized by Weber. As a matter of fact, though, this would impose a sort of super-legality (to quote Schmitt), without requiring – unlike in Weber - the support of a charismatic legitimization of the authority. It has to be noticed that in Western countries such new authoritarianism has not been accompanied by a process of *leaderization*, and has taken its shape without the help of any populist discourse. What is more, radical derogations to the rule of law, and drastic disciplinary measures, have been imposed by governments inspired by *anti-populist* ideologies: in Germany; in Austria; in France, where Macron's success was due to his standing against Le Pen; and in Italy, under Mario Draghi's technocratic leadership. This regression towards an authoritarian governmentality hardly shows the features that we commonly associate to democratic crises – populism, personalization, rise of charismatic authorities – while being based on the radical exploitation of bureaucratic power. By means of a synoptic reading of Benjamin, Schmitt, Weber, and Arendt, we will trace the origin of this democratic *vulnus* in the dialectics between constituent and constituted power.

Apartments As Excluded and Arhythmic Spaces in the Urban Waste Regime

This paper argues that paying heed to rhythms of urban-waste related social practices, including types of waste, social groups, socio-temporalities, infrastructures, and technologies may reveal, how the waste burden can be justly distributed and secondly, how governance of waste management can address waste spatio-temporalities at apartment level. In Australia, houses and units form the basis for domestic waste infrastructures, and apartments are anomalies that disrupt this regime. Overall, recycling rates are lower in apartments, and co-mingled stream contamination rates are relatively higher. Rather than assuming this is a product of household behaviour, we take the starting point that there are alternative dynamics at play that make apartments incompatible with normalised waste regimes. Using data from two apartment projects, and an extensive literature review this paper considers waste consumption and production in apartments as a site of social action (Schatzki 2002). By examining urban and apartment waste practices through the concept of rhythms and considering waste as an institution- as established *"practice organisations that are polyrhythmic, eurhythmic complexes of practices capable of absorbing arrhythmia, and at the same time being made up of precisely those disruptions and collaborations as they fade and absorb into each other" (Blue 2019),* we illustrate that the process and practices of waste consumption and disposal in urban apartments is not linear. The practice based spatio-temporal rhythmic framework applied here leads to two main insights regarding waste in apartments, and the application of practice theories in urban studies:

1) Dynamics of rhythms present challenges for purposive attempts to intervene at various scales of waste-governance, including but not limited to the concepts of verticality, density, and transient living.

2) More than material, more than human and more than waste relationships and complexes require more attention in the governance of apartment waste and in urban research and theoretical development.

Professional Ethics: Responsibility, Accountability, or Duty? a Clarification of Terms and Research

Parsons (1968) also characterized professions and professional work in terms of altruism. He wrote: "a full-fledged profession must have some institutional means of making sure that such [professional] competence will be

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

put to socially responsible uses." My paper presents a comprehensive overview of research and terminology concerning professional altruism. It is based on (bibliometric) cluster analyses of articles in this field from 1983 to 2021. In 1983, Andrew Abbott published a paper on professional ethics, focusing on the role of professional codes of ethics. A different discourse was opened by Mark Bovens (2007) with consideration of accountability, which also applies to professionals working in or for organizations. In another strand of discourse, the duties or responsibilities of professions are repeatedly addressed, such as in the volume "Professional Responsibility" edited by Mitchell and Ream in 2015. My overview highlights the various discourses, how they intersect, and how they have changed over the past 40 years. It also examines specific discourses, such as that of professional discretion or phronesis, and the relationships with new, political discourses such as those on "Responsible Research and Innovation" or precaution.

The Art of Arriving: Reframing 'refugee Integration' through Literature

In our presentation, we use literature as a lens to study processes of refugees' arriving in Austria. For that purpose, we draw on findings of our transdisciplinary and participatory project "The Art of Arriving", in which we have created a real-world laboratory and examined if and how the meaning-making processes involved in creating and interpreting of art can foster reframing "refugee integration" concepts and provide alternative views on the arriving of refugees. By inviting and accompanying artists from different cultural realms (literature, music, photography) and with different refugee experiences during the process of jointly creating an artwork as well as by getting access to the recipients' interpretations of these artworks, we had the chance to gain insights into the various ways artistic practices unveil and contest common hegemonic expectations that shape the processes of refugees' (and other migrants') arriving. Our analysis of the short story "Außen vor" ("Being [left] out") written by Hamed Abboud, Mascha Dabić, and Anna Baar, of its creation, and reception process contributes to the ongoing debates on how refugees' artistic practices can serve as means of cultural and social transformation in migration societies.

Parenting Practices Representation in Russian-Languaged Podcasts: Scientifically Informed Motherhood and Marginalized Fatherhood

This study focuses on parenting practices representation in the Russian-languaged podcasts. Using thematic analysis we investigate 65 podcasts published on the Russian iTunes Store in May 2022. Contemporary Russian-speaking parents pick up parenting advice not only from other people (relatives, friends, experts) but also through communication, books and print press, they also use Internet resources. Even though many studies confirm the multi-channeled nature of parental information on parenting consumption among Russian-speaking parents there are still major gaps in the analysis of specific new media sources such as podcasts in the formation of their knowledge about parenting and parenting practices. Moreover, there is a limited number of papers that not only in Russia but worldwide detail the character of parenting representations in this type of media. Apart from the studies of the podcasting industry in Russia and the parenting representations in media in this country this research adds to broader studies of podcasting because it describes how this new media practice thrives in non-Western context. We conclude that the dominant representation of parenting in the studied podcasts is the portrayal of a parent as a competent, educated mother. At the same time fatherhood is shown scarcely and more as a natural personal quality, than the role, which requires education as in the case of motherhood.

RC02-JS-117.1

MIKOLAJEWSKA-ZAJAC, Karolina* (University of Queensland, Australia)

An Ecosystemic Perspective on the Growth of Airbnb

Global short-term rental platforms (STRs) such as Airbnb can massively erode the ecology of urban neighborhoods. Their growth gives rise to compounding self-reinforcing dynamics, including the intensification of over-tourism, the loss of affordable housing, gentrification, the erosion of the social tissue, and the growth of neighborhood crime. Recent research describes Airbnb as a transnational constitutional actor, which creates a standardized global entrepreneurial middle class 'citizenship' (Sheffi, 2020; Van Doorn, 2020). Drawing on my fieldwork on anti-Airbnb mobilization in San Francisco and secondary research material on efforts to curb Airbnb in the US and the EU, it will shed light on the systemic dynamics which helped Airbnb gain dominance and investigate the ways in which platformization redraws the relationships between corporations, the state and society. In more detail, it will consider the use of scale by the platform corporation, as well as the government and anti-Airbnb social movements; for instance by investigating Airbnb's scaling of outcomes of the local political process in San Francisco, the city hall's efforts to respond to the growth of STRs using scalable techniques, and the use of independent data scrapes in anti-Airbnb organizing. Rather than subscribing to the metaphor of platform sovereignty, the paper argues for a circular, relational framing of platforms based on cybernetic and ecosystemic approaches (see e.g. Bateson 1972, 1979; Holling, 2001; Meadows, 2008). Such a view emphasizes how digital platforms such as Airbnb could not have developed without the preexisting institutional and legal structures, runaway social dynamics, such as the erosion of work and escalating 'assetization' of housing (Birch, Muniesa, 2020) that they further exacerbated.

TG10-844.4

MIKOLAJEWSKA-ZAJAC, Karolina* (University of Queensland, Australia)

Follow the Pattern: An Ecological Epistemology for the Study of Platforms' Societal Effects and Resilient Organizing

The rapid growth of digital platforms deeply transforms our societies, setting in gear effects that permeate what is usually seen as bounded entities, such as individual selves, organizations, industries, or states (Márton, 2021). In that way, their rise challenges many classical methodological assumptions, which usually urge sociologists to delimit the scope of inquiry, e.g. by focusing on a single level of analysis or a single institution. Building on recent publications (Ens & Márton, 2021; Mikołajewska-Zając et al., 2022; Mikołajewska-Zając & Márton, 2022) and previous fieldwork on anti-Airbnb mobilisation in San Francisco, I elaborate an epistemological perspective and fieldwork strategies for tracing the broader effects of platformization as well as the social responses aimed at curbing platforms' impact, which combines interviews with digital secondary data. Drawing on Bateson's (1972, 1979) ecological and cybernetic epistemology and systems thinking (Meadows, 2007), the approach focuses on patterns of relationships between heterogeneous parts of a broad system which become mobilized by circulating information. In more detail, it traces intensifying dynamics, such as the erosion of housing stock brought about by the rise of Airbnb, and responses aimed restoring a systemic balance, e.g., social mobilization for housing protections. Such an approach allows studying how platformization triggers new alliances and organizing processes, which employ digital technology, including the data generated in proprietary platform ecosystems (Barns, 2014). The paper problematises the recursive relationships, in which digital data are an inherent part of platformization, anti-platform organizing, and research. It critically addresses the question of the (non)scalability (Tsing, 2019) at play in platformization and the scale-making (Bird-David, 2017) involved in the organized responses to platformization. The paper aims at a dialogue with the recently developed extended computational case method (Pardo-Guerra & Pahwa, 2022), computational grounded theory (Nelson, 2020), and ethnography of algorithmic systems (Seaver, 2017).

MILANEZI, Jaciane* (Brazilian Center of Analysis and Planning - "Centro Brasileiro de Análise e Planejamento (CEBRAP)", Brazil)

Race and Reproduction on the Move: The Reproductive Care of Immigrant Women in São Paulo, Brazil.

A new international immigration profile has emerged in Brazil since the early 21st century, with immigrants from intra-American routes and the Global South. It is leading to a change in the racial profile of immigrants in the country compared to the European and white immigration of the last century. For instance, the universal health system has been classifying these new immigrants as Black, Brown, and Indigenous, according to the official racial categories of the Brazilian State. In the new context of international displacements in the country, São Paulo is still a central place to govern these flows. For example, municipal public policies for immigrant women have been under pressure to be adapted to this population, and the reproductive care of the Family Health Strategy (FHS) falls under this category. The paper is based on postdoctoral research, which analyzes the racialization processes of international immigrant women in São Paulo within bureaucracies of primary health care, and how these processes relate to the access and use of reproductive care. The paper will explore one preliminary finding, which is the changes in public policies in the city regarding the health of immigrant women between 2010 and 2020. Based on official health documents adopted by São Paulo in the last decade, it will show how the new public policy vocabulary intertwines with the racialization of immigrant women as Blacks and Indigenous in the Brazilian context. The paper contributes to international immigration, race relations, and Primary Healthcare by analyzing the local governance of racial inequalities among immigrants.

When Viruses Innovate! Agricultural Phagotherapy and Biopolitics in the Microbial Turn

The current revival in social science research is due to the fact that human activities are accounted for by adopting a less human-centered perspective, taking into account a diversity of entities acting within an environment. The notion of "one health" comes from it: human health, animal health and environmental health are interdependent and must be thought of in their links. Biopolitical issues are thus renewed (by integrating other forms of life, such as microbes)Our communication is part of this movement. In agriculture, the toxic nature of pesticides (for living organisms and the environment) and the need to move towards agricultural practices that take into account sustainability issues call for other forms of "biopower" (such as biocontrol), other biopolitics (other relationships to-between living organisms).

This is the case of phage therapy as a new strategy to fight plant bacterial diseases. Phage therapy, which consists in the use of bacteriophages in biological control, is now considered as a promising direction for agronomy. We have just initiated a sociological fieldwork, which aims at testing this innovative approach. This inquiry is a component of a larger interdisciplinary research project, funded by an agency of the French Ministry of Agriculture, where several teams of biologists associated with producers will test phagotherapy in laboratories and experimental stations for vegetable and tree crops.

Our presentation will present the first results of this sociological investigation, mainly on the innovation process that constitutes the development "in the making" of a strategy to fight pathogenic bacteria with viruses.

We will then discuss more specific aspects related to the « Microbial Turn », in particular with regard to their consequences on innovation practices, on the interplay of scales, on the collaborations between life sciences and social sciences and on the biopolitics at stake, in particular in terms of agency and ontologies.

MILKMAN, Ruth* (CUNY Graduate Center, USA)

Continuity or Change? the Impact of the Pandemic on U.S. in-Home Careworkers

The pandemic heightened public awareness of the plight of "essential" workers in the U.S., including that of in-home caregivers for elderly and disabled clients. Yet no fundamental change has occurred, and in some respects, the pandemic intensified the exploitation and hazardous conditions long experienced by these workers, none of whom were among the privileged who had the option of working remotely. All labor market forecasters agree that demand for this occupation, which was growing rapidly prior to the pandemic, will continue to skyrocket. Austerity politics and the limited ability of private families to pay for this type of work will continue to put downward pressure on wages. The temporary measures that some U.S. states and cities implemented at the height of the pandemic to support these workers have already been rolled back. All the indicators suggest that the casework crisis will only grow in the years to come, even if the pandemic fades from memory.

MILLEFIORINI, Andrea* (Università della Campania "Luigi Vanvitelli", Italy)

Environmentalism and Ecologism. Next New Ideologies?

The sociological debate on ideologies seems to have recently regained interest among researchers. This debate is linked to the question of populism, and whether or not the latter can be considered a 'minor' form of ideology, typical of the 21st century, as well as of other periods in the past.

However, there still seems to be little awareness in this debate of the many and varied forms that new ecological and environmental movements are taking in recent years. Especially the younger generations seem to be the most open and sensitive to forms of political and civil commitment to saving the planet. These forms of participation are different from those typical of the 1980s and 1990s, in that the new movements seem to bring with them not only a message 'limited' to issues of respect for the environment, but also appear to be endowed with a real philosophy of life, a 'Weltanschauung' that could prelude the structuring of an equally strong and recognisable ideology.

The paper sets out to investigate and deepen these aspects, in an attempt to answer the question of whether the new environmentalist and ecologist values can be, by some movement, translated and structured into a real ideology.

CHTOURIS, Sotirios (University of the Aegean, Greece)

The Role of Clinical Sociology in Disaster Resilience, Health, and Care

This paper discusses how major disasters disrupt one's ontological security and transform the relationship between the perception of individual health and individual care. Individuals who suffer a primary or secondary trauma in disaster situations most often postpone or suspend certain practices that are critical to maintaining their quality of life, health or even their very survival. Alterations in the lives of survivors differ in terms of quality and intensity. The impact in one's life is related to the social context in which the individuals experience the disaster, the degree and intensity of the events, the support structures and services offered during the immediate and long-term recovery process, and the way they integrate the disaster experience into their cultural and social identities. The loss or the immediate alteration of one's life world in situations of abrupt change and many material objects of daily life can affect one's ontological security and force survivors to question the social self and the ability to support a critical individual care and the maintenance of close social ties. The long-term impact of the effects of disasters on individuals and the health of those who have experienced them and possibly on the professionals involved in supporting them raises the need for a protocol of study and intervention within the methods of Clinical Sociology. The research also discusses examples from the USA and Greece with reference to natural and technological disasters and the methodological issues related to the qualitative and quantitative documenting health issues of people experiencing disasters.

SAGIV SCHIFTER, Tammy (The Israeli Sociological Association, Israel)

Cooperation, Synthesis, and Balance: Scientific Knowledge Featuring in Precautionary Principle

In the last decades, Precautionary Principle (PP) is adopted in environmental health policy, especially when decisions are based on controversial scientific knowledge. According to PP, if an activity raises concerns of environmental health harm, precautions should be taken, despite insufficient scientific confirmation of causality between the controversial action and the negative health implication. However, in order to formulate and employ PP, agreement between regulators, professions and professionals is necessary both on PP as the preferred regulatory strategy and on the issue for which regulation is required. Therefore, we ask - what are the attributes of PP that enable consensus on its use in situations that the scientific knowledge is disputed, controversial and uncertain. Based on a case study of policy development regarding dangers of non-ionizing radiation (NIR) from cell phones in Israel, we examine professionals and regulators attitudes and perceptions regarding PP in the process environmental health policy shaping. Analysis of data derived from legislative documents on NIR, participating observation at a professional round table and 21 semi-structured in-depth interviews with relevant professionals reveals, that PP serves as a boundary object, basis for cooperation, synthesis, and balance between and among professions, professionals, regulators, and other stakeholders. The dynamics of scientific knowledge featuring in PP is flexible enough to enable the use of controversial scientific knowledge in regulatory design. Acknowledging the strategic value of these attributes of PP as a boundary object, is used by professionals and regulators as a "compass" in policy design and allows to establish regulations on controversial scientific knowledge in the name of health.

Mongolian Attitude Toward People with Different Culture: A Discussion from Analyses of the World Values Survey Data

Using data from the World Values Survey (WVS), this study explores the Mongolian attitude toward people with culturally different background in multiple aspects. When studying Mongolian society, nationalism is a key word. Over the past dozen years or so, in particular, Mongolia has witnessed the rising tide of ultranationalist or even neo-Nazis movements. Claiming "purity" of the Mongolian people and protection of their motherland, these groups have attacked foreigners and foreign companies. Furthermore, previous studies argued anti-foreign sentiment, especially Sinophobia, could be found in the society in general. There are also studies which have revealed strong attachment to nation and exclusionism harbored by Mongolians. However, the findings have to be examined by analyzing more recent survey data collected in the country.

The study uses the seventh wave survey data of the WVS, which covered Mongolia for the first time. Whether the respondents would not like to have groups of people, listed in the questionnaire, as their neighbors is examined.

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The list includes four groups of people with different culture, namely people of a different race, immigrants/foreign workers, people of a different religion, and people speaking foreign languages. Based on the results, the study first analyzes features of the Mongolian attitude toward people with different cultures from comparison with the attitude in other East Asian societies. Then the study reveals which of the groups are more/less accepted as neighbors, how many mentions the respondent made of the groups, and what factors relate to the tendency to exclude people with different culture from their sphere of life. Such study offers a fresh perspective in the study of East Asian societies and their exclusionism.

RC20-292.5

MINATO, Kunio* (Kochi University, Japan)

Pattern of Exclusionist Attitude Toward People with Different Culture in East Asia: With Special Attention to Mongolia

Based on the comparative analyses of the seventh wave data of the World Values Survey (WVS), this study explores public attitude toward people with different cultural background in East Asian societies. Exclusionist attitude against ethnic minorities and foreign residents is one of the concerns in (at least some of) the societies, and there are already studies on the attitude toward such people. Nevertheless, what differences (race, religion, etc.) are more/less likely to trigger such attitude is yet to be explored. Moreover, whether there is any general tendency, or patterns in exclusionist attitude should be examined.

The study focuses on whether the respondents would not like to have groups of people with different culture as their neighbors, namely people of a different race, immigrants/foreign workers, people of a different religion, and people speaking foreign languages. Specifically, the study first checks which of the groups are more/less mentioned as an unwelcome group in each society. Then, it calculates how many mentions the respondents made on average. Furthermore, co-occurrences of the mentions are examined to determine the pattern of the answers in the societies. Based on the results, the patterns of the answers in East Asian societies, and differences and common features among them are clarified.

The seventh wave of the WVS covered Mongolia for the first time, and this study focuses on this country. In Mongolia, ultranationalist or neo-Nazi movements have been observed over the past dozen or so years, including attacks on foreigners, especially Chinese citizens and Koreans, and protests against mining development by foreign enterprises. Adding Mongolia to the analyses of East Asian societies will offer not only data-based understanding of the country, but also a fresh perspective in the study of the region.

MINH THI, Tran* (Vietnam Journal of Family and Gender Studies, Vietnam Academy of Social Sciences, Vietnam)

Changes in Marriage Patterns in East and Southeast Asia in Recent Two Decades

There is diversity of patterns and mobilizing factors in marriage and family among East Asia and Southeast Asia. This paper provides an overview of changing marriage patterns in several countries in the Southeast Asia (i.e. Vietnam) and East Asia (i.e. Japan, Korea, Taiwan and China). These societies share some similarities in socio-cultural ideology (i.e. Confucianism and familialism) while undergo different stages of modernization and economic development. First, the paper examines the trend of domestic marriage and transnational marriage. Less marriage is more serious in more wealthy countries in the East Asia while marriage remains a preserved value in China and Vietnam. The trend of transnational marriages in each country is fluctuated along with changes in immigration policies, gender inequality, and marriage squeeze in receiving countries and economic status of sending countries. Finally, the paper examines divorce trends. Divorce rates have shown a contradictory trend among East Asia and Southeast Asia countries due to changes in cultural norms, individualism and modernization. It is noted that the examined countries all experienced sharp declines in marriage and divorce in 2020 and 2021 due to the pandemic.

This paper calculates number and rates of marriage and divorce as well as transnational marriage and divorce by using national statistics of Vietnam General Statistic Office[1], Vietnam Ministry of Justice , Ministry of the Interior of Taiwan[2], Statistics Korea[3], Ministry of Health, Labour and Welfare of Japan[4], Statistics of Japan[5], and National Bureau of Statistics of China[6] in the period 2001-2021 in order to show changes in domestic and transnational marriage and divorce and relating similarities and unique features in specific social, cultural and economic context of these societies.

MINH THI, Tran* (Vietnam Journal of Family and Gender Studies, Vietnam Academy of Social Sciences, Vietnam)

Involvement of Vietnamese Elder in Economic Activities in the Lens of Family Ties, Low Institutional Coverage, and Gender Identity

In Vietnam, family is long-term seen as being significant for economic, instrumental, social, emotional, and care support for older adults due to our strong filial piety, high family values, low institutional coverage, and limited social services, given that the majority of older adults are living in family-based communities.

Due to increasingly migrating, nuclearlization, and individualization in Vietnamese families recently, there is an increasing withdrawal of family caregivers from caregiving upward their parents and there seems to be confusion and tension of roles and supports between family members. Meanwhile, Vietnam is observing changes in demographics and family structure, which is linked to an increase in the number of elders in need of care, drop in fertility rate, resulting in a shrinking supply of family caregivers.

Using basic descriptions and regression analysis of the quantitative datasets of the latest study on "*Family Values in Contemporary Vietnam*", which surveyed 1750 people aged from 18 years old, conducted in 2017; the study on "*Promoting elder resource in socio- economic development adapting ageing process in Vietnam*", which surveyed 400 older adults, conducted in 2020; and another study on "*Gender differentials in economic participation*", which surveyed 500 older adults, conducted in 2020; my paper first examines various economic aspects of ageing with limited family ties by analyzing typologies of care support toward older adults, examining how older adults involve in various paid and non-paid economic activities under the mobilization of gender identity, family ties and institutional coverage. Second, my paper unfolds how old adults who are experiencing solo-living, childless ageing, insufficient institutional support in various living background in Vietnam restructure their lives in terms of acculturation, re-establishing kin networks, psychological well-being in the context of family changes and limited labour market for old labour.

MIR, Md Azmain Muhtasim* (University of Tasmania, Australia)

"You Tell Us What That Needs to Look like?" Incorporating Local People's Voice in Tourism Activities in the West Coast of Tasmania

Despite a considerable debate around tourism's social, economic, and environmental impacts, the structural inequalities in tourism governance and power relations between the stakeholders such as residents, the tourism industry and local government are inadequately understood in regional contexts. Engaging local people requires selecting stakeholders from a community-oriented perspective, reflecting how inequalities, power relations and policy interactions are perceived, and factors constrain participation in tourism and community development events.

Using snowball and purposive sampling, the methods involved the researcher's reflection, participant observation and in-depth interviews for collecting qualitative data on tourism and community resources to improve the cultural capital of young people and children in selected locations of the West Coast Tasmania: Queenstown, Zeehan, and Strahan, respectively. The study also uses findings from the relevant literature review. I used critical theories on power, structure, and agency to investigate the inequalities and conflicts of interests in regional tourism collaborations. Drawing upon capital and capability theories, this paper addresses the challenges and significance of local people's participation in tourism activities for educational and community development.

The main findings indicate that West Coast's regional communities' distinctive cultural values such as town centrism, residents' understandings about the suitability of a development initiative, social and economic wellbeing challenges, literacy, mobility, and employment issues are not well-articulated in tourism collaborations. An impaired sense of exclusion remains apparent among community members due to low self-esteem, fear of rejection and misinterpretations of responsibilities which hinders their participation in tourism collaborations.

This paper will discuss how to address regional communities' unique and shared interests following a dialogical process of articulating local voice and agency in local tourism governance. Eventually, I will explain strategies to incorporate the capability of local stakeholders in exploring and converting tourism resources to meaningful cultural capital for educational and community development.

MIRANDA, Ana* (Facultad Latinoamericana de Ciencias Sociales, Argentina)

Grammars of Youth: Studying Youth Transitions from Latin America.

The purpose of the presentation is to introduce Grammars of Youth: Longitudinal Research Program which has been working at the Latin American Faculty of Social Sciences (FLACSO Argentina) since 1998. Over the years, the Program has developed projects through longitudinal research in different periods, which have demonstrated the importance of the economic and social context and temporalities in youth studies.

The presentation addresses the results of different stages and the evolution of the analysis and themes. It proposes to debate on the importance of situated studies, youth subjectivities and the incorporation of the gender perspective for research in the global south.

The Program has been greatly influenced by the GRET of the Autonomous University of Barcelona (UAB), an institute with which it develops joint work. Currently, both institutions are collaborating in the design of the Disadvantaged Transitions Index, which will be applied to household surveys in Latin America and Spain. In this way, and as a final contribution to the presentation, the results of the study, which is being carried out with the support of the Ayuda en Acción Foundation (Spain), will be exhibited.

Youth Citizen Participation: Between Social Reproduction and Political Socialization

The persistence of inequalities in political participation and its corresponding intergenerational transmission keeps open a series of questions about how socialization processes reproduce and/or socialize these inequalities from one generation to another. This study deals with the following general research question: What are the factors and mechanisms that explain the intergenerational transmission of political inequality? To answer this global question, we analyze the association between socioeconomic conditions of family origin with the different types of participation of the next generation (formal participation, activist participation, and online participation), the mediating role of family political socialization practices and the status acquired by young people through family socialization. The article makes use of data from a youth citizenship panel study applied to n=1065 young Chileans between 18 and 30 years old. The results show that socialization processes operate differently for different types of participation. The family resources model is especially relevant to explain electoral behavior, while online participation is mainly influenced by one's own achievement in education. Disruptive participation has a different (reverse) pattern, consistent with recent evidence. On the other hand, family socialization practices (conversation) are relevant for all types of participation. In all cases, it promotes participation. The implications of these results are discussed.

Alter-Activism and Engagement Among Actors of Young Adulthood.

Although it is not exclusive, youth has been mostly associated with alter-activism (Juris & Pleyers, 2009). It has been characterized by political engagement associated with "emerging adulthood" (Arnett, 2000), a transitional phase following adolescence that combines aspects of adulthood with role exploration and experimentation.

Accordingly, alter-activists' engagement involves performing specific tasks, joining affinity groups rather than formal organizations, relying on technology for political actions, and emphasizing creativity and lived experience. In addition, they have fewer work and family obligations, as well as flexible and informal participation in politics (Pleyers, 2010).

This presentation will focus on a later stage of life: young adulthood. This features a "role immersion" (Arnett, 2012) such as work, love life, and parenthood. Using the alter-activism framework, I will examine the political engagement of young adult activists in the Chilean movement against the pension model, showing resonances and challenging the concept. The analysis is based on interviews with young adults (between 30-45 years old), participant observation, and online ethnography on Facebook groups.

Results show that these young adults display a personalized involvement in the movement, where work and home life are balanced. Technologies are crucial for enabling their activism and overcoming these constraints. Moreover, they introduce their individual and professional skills for utilizing social media, learning on the spot how to use it to benefit the movement. Since they use ICTs both for leisure and activism spending a lot of time online, they overlap, creating a stressful relationship that interferes with their family and household responsibilities. Yet, activism becomes ingrained in their daily lives.

Art and Climate Change

For some time now, art has been raising questions about the over-exploitation of resources and the need to increase ecological awareness in society. In this context, ecological art has great potential to raise public awareness about climate emergency. Ecological art argues that integrating the ecological turn is more than representing or illustrating the ecological issue, or nature, through art. It is a call for radical change that involves incorporating social goals into the heart of artistic creation itself, through a conscious commitment to society while remaining art.

The objective of the paper is to offer a brief state-of-the-art and an analysis of the most significant socio-ecological practices from the art field. The paper will contribute to broaden the understanding of how art in contributing to the social, cultural and ecological transformations that are taking place as responses to the climate crisis. This presentation is related to the Research Project Socio-Ecos (PID2021-126611NB-I00).

The Role of Phenotypical Markers in Swedish Racialization

The current discourse of race in Sweden is arguably consisting of conflicting and scattered ideas. Research testify to the social relevance of race through the racializing or othering experiences of certain groups. Concurrently, discussions of race and visible differences carry a stigma and people tend to present themselves as colorblind. This multiplicity of ideas, on the social importance of racialized appearances, has potentially left an ambiguity and uncertainty how to handle ideas of visibility and difference amongst people with various backgrounds. Hitherto, studies of race in Sweden has commonly focused on: 1. experiences of racialized individuals in Sweden, and; 2. race as a social construction. These studies have provided invaluable contributions which has contradicted the common misconception that race is irrelevant in Sweden.

Through this presentation, I aim at expanding this research by: 1. focusing on perspectives concerning everyday racialization or "othering" of other people, and; 2. through a theoretical conceptualization of race which discusses the everyday perceived materiality of race. I will present results from observations where I have asked others to act as observers in my study, whereof I collected material by asking them to describe the appearances of people in their vicinity. Theoretically, I will present a material-semiotic idea by applying: the idea of race as fluid, adhering to a social constructivist idea where race is re-constructed and performed, combined with; people's everyday static and othering ideas of appearances, where the material role of race is discussed. Specifically, I will discuss the role of phenotypical markers within a colorblind discourse of appearances and racialization in Sweden. The goal is to contribute to a sustainable and appropriate way of speaking about race and categorization.

Sociology Literature in Central Asia: Meta Review for 1991-2021

The use of meta-analysis in sociology is increasing over the past decades. We use the meta-analysis to draw a map and the trend of the sociological research development in the Central Asian region after gaining independence in 1991. We analyze and summarize scholarly research articles in two common languages for this region Russian and English. The focus of this article is to find out full evidence-based information on the status of the sociology field in Central Asian countries, discipline indicators and the level of integration with the global sociological agenda. In conclusion we provide suggestions for future research of Sociology in Central Asia, potential directions for development and limitations.

Neet-Youth and Effect of Migration on Returned Migrants in Tajikistan before and after COVID19

The paper focuses on the influence of migration on youth segment of labour market in Tajikistan. Particularly, it investigates how migration experience impacts on employment status of youth, who returned home, and what is the role of education for returned migrants to join labour market. According to some researches, when a migrant returns home, he gets better jobs than

denotes a presenting author. Abstracts are organized by first presenting author's last name.

before migration, using obtained skills and capital. I argue that migration experience has negative effect on employment status in home country for returned migrants, they get worse jobs than they had had before migration. Returned migrants are more likely to be unemployed or become inactive – to fall into the NEET-group (Not in education, employment or training) than youth who has no migration history. Also, due to COVID19 the effect of migration experience may differ. So, we will investigate effect of migration to youth unemployment and it's changing over COVID19 period. To estimate the effect of migration we grouped youth into migrants and control group (youth without migration experience). This paper is based on data collected using mixed-method approach, including retrospective quantitative data on 2000 youth of Tajikistan from 2017, and data from qualitative research with NEET-youth in Tajikistan from 2019. For the period after COVID19 we will use data that is being collected among 6000 youth by End of April 2022

Social Exclusion and the Transition from School to Home: The Case of Young Girls Not in Education, Employment, or Training (NEET) in Central Asia and Caucasus

The aim of the paper is to investigate factors of 'school-to-home transition' of girls in Tajikistan. The qualitative and quantitative data was collected by implementing the theoretical framework of life-course approaches and transition to adulthood from 2014 - 2022.

Tajikistan has one of the highest level of NEET-youth in the region, and about the highest level of NEET-girls in the world? NEET (not in education, employment, or training) 35-41% of youth ages 18-29 are NEETs (Not in education, employment or training) in Tajikistan, 80-85% of them are girls. Tajikistan has one of the highest gendered NEET-youth in the world for the last several years according to data. Instead of school-to-work transition girls have higher chances to face 'school-to-home transition', i.e. dropping out of education or completing education. Life-course approaches and transition to adulthood theoretical framework could help obtain a lot of quantitative and qualitative data collected during the last years. For the paper we will use data collected from 2014 to 2022. For the first time, we will include findings on qualitative data obtained based on interviews with NEET-girls, and girls who are at risk of home violence. Findings contain both multivariate quantitative analyses and qualitative findings for clearing of findings. Summarizing initial findings, we came to the conclusion that family and individual factors, like financial conditions of the family, education level of parents, migration, level of education, and accessibility of jobs nearby have significant effect on youth employment, particularly for the girls. School-to-home leads to the social exclusion of girls. Some macro-factors, including COVID19 had more harmful effects on girls than boys.

Also, we will compare data of Tajikistan with data from Azerbaijan and Georgia.

As well, we will talk about a portal on prevention of NEET, that we are working on.

MIROWSKI RABELO DE SOUZA, Alexandra* (York University, Canada)

After the Migration-for-Development Program: A Study of STEM Student-Migrants Turned Immigrants to Canada

Study abroad programs are international partnerships involving state governments and higher education institutions. Participating student-migrants typically receive institutional and financial support which facilitates their international mobility. States that send Global South students to Global North countries aim for student-migrants to return and apply the knowledge and skills they gained abroad to developing the country's economy. Brazil's government-funded migration-for-development program, Science without Borders (SWB)/ Ciência sem Fronteiras, has sent thousands of STEM students to Canada and other countries since 2011. However, once student-migrants return home, not all decide to stay; political corruption, economic crises and increasing social inequality present educated youth with limited opportunities in their home country. But what happens when student-migrants leave again, this time as immigrants facing new challenges and without the same institutional and peer supports? Drawing on interviews with 16 SWB participants who returned to Canada and the literature on graduate migration, international student experiences, and immigrant transnationalism, I examine how maintaining transnational social relationships impacts the opportunities available to student-migrants turned immigrants and their immigration decision-making during young adulthood. I find that participants' initial return experiences in Canada were shaped by their personal (romantic) relationships, and academic relationships formed prior to, during or after SWB. Personal relationships provided participants with emotional, psychological and sometimes financial support, which influenced future plans to stay in Canada. Participants who maintained academic relationships accessed STEM study and funding opportunities; those who did not had difficulty finding employment in their field, despite gaining Canadian research and/or internship experience during SWB. These findings challenge policy assumptions about participants staying

in their home country and participants' ability to apply their academic training and work experience to either country's economy. Findings also suggest the need for policies aimed at creating additional study, funding and employment opportunities for internationally trained STEM graduates in both countries.

MISHEVA, Vessela* (Uppsala University, Sweden)

Social and Cultural Framing of Policy Responses and Reactions to the First Wave of the Covid-19 Pandemic

The variations across countries in policy responses to the outbreak of the Covid-19 pandemic have attracted a great deal of research attention throughout the world. Within the context of European liberal democracies, the introduction of restrictive measures to constrain the spread of Covid-19, including the consequences of employing such measures, have comprised the central theme of pandemic research. The countries that have chosen what will be defined here as a "liberal pandemic policy" have attracted attention primarily as "exceptions to the rule."

This presentation is interested in the "exceptions to the rule" both among the countries that have implemented restrictive measures, and among those that have implemented liberal measures. The present discussion is in fact interested in the articulation of two different rules, each of which has its own "exceptions." Accordingly, the analysis of differences in pandemic responses presented here is based on a comparison of two European countries— Sweden and Bulgaria—as representative exceptions to two different rules, with their own socio-political, cultural, and socio-psychological differences and similarities. The comparison is focused on articulating the differences not only between the types of political systems and types of democracies of these two countries, but also between their radically different epistemological positions, individualistic cultural orientations, and reliance on two different knowledge approaches (evidence based and experience based). The advantages of focusing on exceptions to the rule are discussed as well. In contrast to the overwhelming emphasis on the war frame of the pandemic as having no alternatives, this presentation proposes that the pandemic allows framing and has been framed in two different ways—as both war and peace time.

Food Security of the Local Communities and Climate Change in the Himalayas

Climate change is a threat to the entire world. Nevertheless, it is also a good opportunity to redefine the social and environmental determinants of food security in the local communities. While the inevitability of scientific solutions to climate change is undeniable, socio-cultural beliefs can be taken into account for integrated climate action for food security. Since the rapid pace of climate change is the result of interactive dimensions of social structure, the socio-cultural approach can be uniquely positioned for sustainable adaptation policies. The magnitude of the climate-induced uncertainties on the local community is not yet fully understood. This paper has twofold objectives: i) to examine the interaction between the food security of the community and local ecology and ii) to explore the gender dynamics for sustainable food choices. In-depth cross-sectional interviews of 210 households were conducted in the western Himalayan region of India. The findings suggest that besides the standard definition, a local meaning of climate change is associated with ecological and biological indicators. Further, the shift in socio-cultural beliefs has also been observed due to dietary shifts. Moreover, food insecurity is persistent not only due to scarcity of resources and economic status but also due to ignorance and the lack of awareness of nutritional values associated with traditional food habits among the affected communities. Therefore, the current study argues that integrating local perspectives in the face of climate change is crucial for inclusive food security strategies.

Combating Green Crimes in India: Analysing the Role of Wildlife Forensics through the Perspective of Green Criminology

The world has developed rapidly due to human innovation and intervention. Such unprecedented greed for growth by human beings has threatened the environment. For making a profit, humans have encroached on the periphery of non-human species thereby committing green crimes or crimes against the environment. Green crimes are spread beyond transnational boundaries. Wildlife crime is a prime example of green crime often impeding the conservation and preservation of species. Animals have been victimized through poaching and trafficking for reasons like a utility in alternative medicines, luxury items, bushmeat or the live pet trade. Globally, the illegal wildlife trade accounts for billions after Arms and Drug trafficking. In India, crimes against wildlife are at an increase due to a lack of awareness and inappropriate investigative mechanisms. It is seen that green criminals are

often released or acquitted due to a lack of evidence. The law enforcement agency often needs appropriate resources to actively investigate green crimes against wildlife. The introduction of forensic science for green crime investigation and wildlife conservation is relatively a new activity. This field of criminal investigation uses innovative scientific procedures to identify, examine and compare the evidence procured from the crime scene thereby linking it with the animal and the suspect. Further, the initiative of forensic science in wildlife conservation has been depicted through the formation of the Wildlife Forensic and Conservation Genetics Cell for strengthening the enforcement of the Wildlife (Protection) Act, 1972 of India. The following work is a descriptive and analytical study which seeks to analyse the role of forensics in investigating wildlife crimes in India from the perspective of green criminology and assess the impediments faced by law enforcement concerning wildlife forensics.

MISHRA, Nidhi* (Mahila Mahavidyalaya BHU , Varanasi, India)

Disabled Women and Family Support: A Study of Varanasi District, India

Disability is considered as a curse in person, family, and society. Most of the time family members feel ashamed, burden and worthless about their family member who is disabled. Disabled are dependent for their day to day needs on family. Most of the time siblings misbehave, doesn't respect, and ignore their presence. Disabled person lacks family love, affection and proper care. If Family is poor the condition is worst at the part of disabled women. In most of the cases they go through physical assault or sexual misbehave or attempt of rape by family members, neighbours or care givers (takers). Mothers of disabled women are always worried about some unfortunate incident may happen to their daughters.

To explore family perspective about life chances i.e. education, independence and empowerment. An empirical study for ground reality of family support to blind women was carried out. The respondents were family members of blind women, selected by purposive sampling. The qualitative and quantitative method was used for data collection. Results shows that maximum females with blindness were never had a chance to marry, those with partial disability and rich family background had chance with more dowry. Though they were capable in doing household chores. This explains that economic factor is a big deciding element for life chances. Actually family members shared that they don't want her to marry because don't trust anyone for her better care and support.

MISHRA, Nidhi* (Mahila Mahavidyalaya BHU , Varanasi, India)

Human Rights and Invisibility of Differently Abled Women: Marriage, Family and Reproductive Rights

Different ability is a complex phenomenon. Differently abled persons are considered as the most neglected and disempowered section of population. When we talk about women with different abilities, they are suffering from dual discrimination as a women and as differently abled women. They are even invisible in their fundamental rights of marriage, family, sexuality and reproductive authority. In reference to male disabled person the family stood with him, if he is from well off family. most of the time he had opportunity to get marry with normal girls, but disabled girl don't had.

In feminist approach the most relevant and burning issue is sexual objectification of women's body, but in the case of differently able women the condition is completely different and opposite. Differently able women are considered as completely asexual being and that restrict their rights of sexuality, marriage, family and reproduction. To analyse the condition in the light of rights of sexuality, marriage, family and reproductive authority, empirical research on 200 physically disabled and blind women belonging to 20 to 50 years age group, from different places in Varanasi city were taken with the help of purposive sampling. The findings show that majority of respondents accept that marriage is a biggest challenge for differently able women, and they are completely considered as a non-sexual being worthless and never can be able to manage family life and raise their kids.

MISRA, Rajesh* (University of Lucknow, India)

Integration of Economics, Sociology and Anthropology: Practice of Sociology at Lucknow (India)

The history of institutional Sociology in India is parallel with the history of Sociology in academic institutions in Europe, especially in the United Kingdom. There is a colonial context to it. There emerged two distinct institutions and practices of Sociology one at Bombay and another at Lucknow after the death of Max Weber and the First World War. Often, they are considered two different schools of Sociology in India. Both represent diverse perspectives, theoretical formulations, and substantive concerns impacting profoundly the practice of Sociology for a long-time. The approaches and substantive issues have been

influenced and conditioned by Indian philosophical theorizations, classical sociological traditions, other social scientific practices, and diverse social contexts. It is high time that we appraise the trajectories of Indian Sociology after a century. The Lucknow tradition of Sociology has been characterized by an intellectual encounter not only with the Indian history, society and philosophical traditions but also Economics and Anthropology as the teaching of Sociology at Lucknow started with Economics and Anthropology. In fact, the department came to be known as the department of Economics and Sociology. The concomitant substantive concerns and a shared interdisciplinary perspectival orientation among the followers particularly in its formation period influenced the nature of sociological practice at Lucknow. Out of a variety of concerns three main concerns are identified (i) the importance of the Indian tradition in opposition to the Western tradition, (ii) highlighting the rational modernity as reflected in planned social change, and (iii) a multi-disciplinary approach combining Indian philosophical orientations, anthropological fieldwork, economic analysis and sociological perspective and concepts. The substantive problématique is also positioned in the times and the specific cultural context that requires to be analyzed from a Sociology of knowledge point of view.

Three Mass Mobilizations, Three Religions and Differential Equations: An Appraisal of People's Unrest in Contemporary India

India has witnessed three significant mass mobilizations in recent times led by or dominated by three different religious communities – the Hindus, the Muslims, and the Sikhs. The first kind, a fanatical organized sectarian mass mobilization started eight years ago when a Hindu rightist party gained power at the federal level. Advocating a Hindu nation, a host of sectarian militant organizations have come up and have been giving a call for aggressive boycotts and hostility against minorities, mainly Muslims to the extent of proclaiming the holocaust. These non-state actors provide mass support for a Hindu totalitarian state. A plural religion becomes a tool for totalitarianism when it is converted to a political ideology to hold sway. On the other hand, two other mass movements have been against the recent enactments by the state. The one was against the Citizenship Amendment Act 2019 and the decision to prepare the National Register of Indian Citizens as the Muslims felt the legal exclusion. The movement continued for five months. The Muslims particularly women participated in the movement in a great number, among other communities. It was a non-violent civil disobedience. The religion provided the collective spirit, egalitarian orientation, moral strength for mass resistance, and solidarity. The other has been a momentous mobilization of farmers in India, mainly the Sikhs, during the height of the pandemic in 2020 - 2021 against autocratic enactments regarding agriculture. The Sikh religion provided farmers communitarian methods, collective instrumentalities, and non-violent nature of the historic mass mobilization. It is argued that various religions provide different rationality, emotionalism, collective spirit, and ideological predilections to mass mobilization, notwithstanding religious fundamentals. The character of their reinforcement varies with the relationship of mass mobilization vis-à-vis the state power, mass mobilization is against the state or it is for wielding power.

MISUMI, Kazuto* (Kyushu University, Japan)

Free Rider As Stock of Social Capital in Local Community

In this paper I define 'community goods' to capture those public goods and common pool goods that are necessary for regional community life. Then, 'local community' can be captured as the social system that consists of social interactions among residents and agencies to manage various community goods. Following Janowitz's (1952) 'community of limited liability,' residents may selectively and partly participate in community activities, and community leaders may work on their favorite community goods. I define 'community module' to indicate the sub-social system for single community goods. Then, local community is like a module complex where division of labor and sharing coexist to manage various community modules as a whole.

As community goods is an extended conception of public goods, the free rider problem is unavoidable. Free rider is discussed ordinarily by supposing a single public goods. However, in community module complex situations, it happens that a person who acts as a free rider for some modules is in fact a leader or a member of a social group that actively manages certain other modules. In a sense, every free rider can be a latent contributor, and getting his /her cooperation implies activation of bridging social capital. Thus, holding free riders in a local community to some degree works as stock of social capital.

Rational choice theorists shall consider that the free rider problem in real world requires to understand optimal arrangement of community module complex in order to realize highly mutually reciprocal state in a community as a whole. In this paper, I will introduce a threshold mechanism that explains how and when an actor changes his/her attitude between free rider and contributor; in addition, I will show some results of survey data analysis that suggest positive meaning of free rider in module complex situations.

Global Crises in the 2020s – a Luhmannian Observation

The world is currently experiencing multiple, simultaneously occurring, crises which are leading to catastrophic outcomes for large numbers of people globally. COVID-19 has been exerting its influence upon the world since March 2020, with civil unrest seen in many Western nations with a rise in political distrust. Breakdowns in international relations have led to war breaking out between Russia and Ukraine and a growing animosity between the US and China. This, in combination with two years of sporadic pandemic lockdowns, has had a massive impact on global trade, with war preventing grain from getting to developing countries and stoking fears of famine. The world economy is also in turmoil, with measures taken during the pandemic leading to rampant inflation across the globe and collapsing global markets, leaving many poor struggling to cope and the middle classes watching their financial futures collapse before their eyes.

This presentation will consider these crises through the lens of Niklas Luhmann's Social Systems Theory and discuss how we are living in a time where multiple social subsystems (namely the economic, health, and political subsystems) are dealing with perturbations created on a global scale, where the actions taken by organisations operating in specific subsystems are causing further perturbations in the environment and therefore for the other communication systems of society. It shall then consider whether it is a confluence of unfortunately timed random events which have led us here, whether the issue was a lack of environmental sensitivity across multiple social systems and whether there can be any hope of a return to some sort of equilibrium, or whether these crises are a natural consequence of a functionally differentiated global society still segmented into nation states and what that means for the world social system going forward.

ICTs in Risk Management: An Appraisal of Urban Policing in India

Supplementing law enforcement and crime prevention the police are also performing multifarious activities in present times. Risk management is one of the key functions of the urban police. Urban life faces challenges that are sophisticated, uncertain and damaging. Therefore, the urban police is required to equip themselves with the skills to provide security to the people from any threat, calamities and social crisis. The present pandemic has been an eye opener in this regard. Rising incidences of domestic violence, sexual abuse of children and cybercrimes have exposed the implications of a new paradigm of crime causation and unlawful activities during challenging hours. The Information and Communication Technologies (ICTs) have been a revelation to how technologies can prove to be handy/ useful to the police organizations. The upsurge in innovative practices through ICTs have exposed the police to a new paradigm and a new material basis for the performance of activities throughout the social structure. Taking into consideration the future of policing the present study seeks to address how ICTs can ensure efficient risk management through upgraded police practices with special reference to the police commissionerates in India.

Unpacking Adoption and Adaptation in Infrastructure Assemblages: Case of Bengaluru, India

This paper uses the 'assemblage' frame to unpack the human/ non-human history of infrastructure provisioning at the neighbourhood scale, with a focus on water. This paper draws on primary fieldwork undertaken in a neighbourhood with incremental self- constructed housing and slum resettlement housing in Bangalore, located within the municipal jurisdictional area. Though the neighbourhood is connected to the city's water- grid, the actual supply that households receive is limited and often disrupted. Over time, supplemental systems that draw on local borewells, as well as water ATMs and water tankers have been systematized to address the water scarcity conditions. The incremental build- out of these supplemental systems has been made possible through local social and political groups, in coalition with local government officials. The paper discusses how the assemblage for water provisioning may be understood as a co- functioning, shaped by practices of adoption and adaptation of technology, materials, and systems, through social and political networks, and through cycles of daily use, seasonal scarcities, material life- cycles of repair, and institutional/ non- institutional cycles of investing in upgraded/ new infrastructure. Based on findings from the

field, the paper will discuss the geographies of difference that persist across the neighbourhood, which highlight that while infrastructure assemblages highlight 'transversal logics' of instrumentality in situations where pipes do not guarantee provisioning, they are not immune to structuring that recreates and amplifies existing patterns of social and economic marginalization.

MITTAL, Priyanka* (Dr. B. R. Ambedkar University Delhi, India)

Outside Paid Work and Women's Intra Household Agency: Insights from Case Studies of Upper Class Elite Women in Delhi

This paper predominantly focuses on understanding the implications of women's outside paid work for their intra-household agency in making strategic life choices. Amartya Sen (1990, 1999) calls attention to women's earning power and their economic role outside the family as one of the instrumental factors for women's agency to take shape. The key objective of this study is to explore whether there exists a necessary relationship between paid work and women's agency. A lot of ideological as well as empirical differences exist in the debates about this relationship: on one hand, there are claims about women's economic participation yielding transformative potential for their ability to exercise strategic life choices; while on the other hand, there are contestations which argue that women's participation in paid work does not necessarily subvert the deeper structural inequalities that exist. Thus, the tensions underlying the correlation between paid work and women's agency become extremely important to be examined.

This study is primarily a result of primary research, where the interviews were conducted with two groups of two women each. One group consisted of working women while the other of non-working ones. All of these women are married and have children, and belong to the upper class elite neighbourhood areas of urban Delhi. I have analyzed these women's case studies through the use of Sen's (1990) cooperative conflict framework as it affirms the existence of both cooperation and conflict within the household to influence the bargaining power of household members and hence household allocative outcomes. It was found that paid work might be a necessary condition, but not a sufficient one for women's agency. Apart from gainful employment, other factors like women's access to educational opportunities and ownership rights, also further women's ability to exercise meaningful choice. This work will explore the inter-linkages among these parameters.

MITUPOVA, Sayana* (Russian Academy of National Economy and Public Administration, Russian Federation)

Sociology in Totalitarian Societies of Soviet Russia and Imperial Japan

This paper explores the dramatic and complicated histories of sociological development in Russia and Japan. In the first half of the last century both countries took their paths as totalitarian societies where sociology was considered a borgouise science. In the late 20ies, sociological research in the Soviet Russia stopped its existence and the term «sociology» was no more in use. Instead, it was substituted by historic materialism, political economy and scientific communism. However, at the same time in Japan with the beginning of Showa period, sociology diversified itself and new tendencies appeared. Young sociologists took preference in sociology of culture while critisizing formal sociology as being outdated. This paper is an attempt to give a parallel analysis of the development of sociology in the totalitarian societies of Russia and Japan and how social and political situations within both countries influenced their individual trajectories of sociology.

MIYASHITA, Saori* (Nagoya City University, Japan)

Gendered Formalization through Social Security and Tax Inclusion: The Case of Women Family Workers in Japan

This study examined the inclusion of female family workers in small- and medium-sized enterprises by the tax and welfare system and its consequence on the patriarchal and unequal social structures in Japan. Using public documents on explanations by tax and social security authorities and periodicals issued by small business associations since 1950s, the study found that the tax law designated business profit as the property of business owners and neglected the contribution of family members engaged in the business to prevent tax burden minimization. The coverage of social security tended to exclude family workers. Objections against such conditions by small business associations that organize family workers were only partially successful due to the social misunderstanding about such work. This (in)formalization process in the course of constructing welfare states demonstrated the understanding of the public about the family as a unit and whom to be given social protection.

Some feminist scholars provided a comprehensive picture of the exploitative relationships between spouses, including those in small family production units. However, the role of the state in regulating families lacked scholarly

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

attention. Considering a shift in patriarchy from private to public in the 20th century, analysis on family workers today is required to elucidate the role of the state and politics that produce the regulations of the state.

This issue is prevalent in highly industrialized countries, especially those that promote entrepreneurship (which frequently starts from small businesses) against the background of a contraction in formal employment, and in industrializing countries, where the importance of the family as a production unit remains high. Thus, studies that examine taxation and social security from the perspectives of gender and small businesses are required given the significance of family businesses and women's rights as individuals.

From Labour Migration to Marriage Migration: Intermarried Filipino Women Migrants and Their Integration in Japan

The Philippines is one of the countries known for its rich culture of migration and is considered to be one of the largest origin countries for migrants. Yearly, many Filipinos leave the Philippines with varied reasons for their migration; may it be in attempts to find temporary work overseas or to find new permanent places of settlement, migration is often viewed as a way to seek better lives and acquire better opportunities. The type of migration usually associated with Filipino migration is based on labour, however, given that the nature of migration follows a non-linear nor non-circular process, many migrants who were initially considered to be labour migrants were able to change their categorization. This study focuses on the experiences of migrant Filipino women who had initially entered Japan in the 1970s to the 1990s as labour migrants part of the Filipino-Japanese entertainment industry who, later on, were able to change their categorization from labour migrants to marriage migrants living in Japan after marrying local Japanese men. Using qualitative data from a larger study conducted in 2022, the study provides retrospective accounts of migrant Filipino women as they looked back and reflected on the ways they adapted to and integrated themselves in their new places of destination as they changed their statuses from labour migrants to marriage migrants. Findings of the study show that initial expectations, childhood aspirations, and the availability of various forms of capital play a significant role in the way migrant Filipino women integrate and adjust themselves to their new places of destination. Although these migrant Filipino women faced challenges in terms of integration and adaptation, they were able to overcome them through the creation and assertion of their migrant identities, and through the use of their individual agencies to manage the constraints in their current structures.

MIZUSHIMA, Seiko* (University of the Philippines - Diliman, Philippines)

Power Relations and Capital Acquisition in the Lives of Intermarried Migrant Filipino Women in Japan

In the Philippine context, marriages between Filipino women and Japanese men constitute one of the most common forms of intermarriages. Traced back to the post-war periods, Filipino-Japanese intermarriages appear in complex forms and are affected by various opportunities and constraints that shape the dynamics of intermarried couples. Looking into the experiences of migrant Filipino women who have intermarried with Japanese men during the boom of the Entertainment Industry from the 1970s to the 1990s, this study looks into the themes of power relations and capital acquisition in the lives of intermarried migrant Filipino women who are currently living in or have lived in Japan. Using a qualitative methodology in the form of synchronous semi-structured online interviews conducted in 2022, the study provides retrospective accounts of intermarried migrant Filipino women as they looked back and reflected on their experiences pre-migration, their early phases of migration, and their current living situations in Japan. In addition to power relations and capital acquisition within the marriages, the study also looks into the ways intermarried migrant Filipino women adjust and integrate themselves into their new places of destination, including the ways they mobilize and acquire different forms of capital outside their marriages. Findings of the study show that intermarried migrant Filipino women actively make use of their individual agencies to either move about or to create their own structures within their marriages and their new place of destination. Although challenges are constantly present in their lives, they are able to overcome them through actions such as negotiation and adaptation. Additionally, the role of capital, specifically cultural and social capital, greatly impacted the way these migrant Filipino women integrate and adjust, not only into their marriages but also into their new places of destination.

Job Satisfaction: An Underdeveloped Concept in the South African Sociology of Work

Employment is central to most people's lives, and the quality of one's job is a key component of overall individual well-being. Yet, the topic of job quality has occupied a very limited role in the South African theoretical models of the workplace, rendering such concepts as job satisfaction conceptually underdeveloped and their utility elusive. Such neglect is perilous in a context where there is mounting evidence that contemporary global workplaces do not align their construction in the global north and continue to expose workers to employment and work arrangements associated with precarious work and worker insecurity. Therefore, addressing contemporary workplace challenges calls for ventures into new themes and methodologies that will make it possible to understand the labour market and workplace inequalities better. To close this gap, the current study investigates the subjective orientation, i.e. worker's values, satisfaction, and meanings assigned to work by the employed South Africans. The main intention is to illustrate the value of strengthening our empirical work on what constitutes a good job in the South African context. Attitudes towards different aspects of a job and their influence on job satisfaction are considered, including wages, job security, perceived autonomy, or advancement opportunities. The study employs data collected through a nationally representative survey of 2015 on social attitudes to examine the distribution of job satisfaction and its determinants, as well as the changing work values and perceived job quality in the country.

What Are the Reconstruction Issues 10 Years after the Great East Japan Earthquake? : Case Studies of Tsunami-Affected Area in Miyagi Prefecture

I'll discusse the reconstruction progress and future of local communities in tsunami-affected areas after the Great East Japan Earthquake occured in 2011 in Tohoku area. Mental problems and social isolations have been cited as a long-term issue affecting victims. At the same time, these areas have also seen the withdrawal of supporters. These withdrawals are unavoidable as reconstruction progresses because most of the supporters come from outside the region. Therefore, the local communities must build a foundation to support victims' lives. Thus, we must ask, what kind of process has been followed? I would like to focus on the loss and regaining process of "ikigai"(=the reason for existence) of victims. I'll show you case studies in tsunami-affected area, Miyagi prefecture.

In the case of farmers in tsunami-affected area, the damage caused by the tsunami and the reconstruction policies of building "strong agriculture" changed the area's industrial structure. Most elderly farmers accepted the policies and decided to retire, but were troubled by the loss of their daily habits, and having "nothing to do." To overcome this, they restarted farming as a way of life, which was opposite to the planned policy

Not all victims could address loss of livelihood by themselves, therefore, the support activities conducted by non-profit groups (NPOs) were successful. The "Healthy Agriculture" program by NPO provided an opportunity to overcome the loss of the way of life. However, when supporters withdrew in 2016, after 5 years from the disaster, the continuation of the activities became problematic. Another NPO by the inland and coastal residents then took over, and a sense of community was created among the inland and coastal residents, who had little to do with each other before.

Based on these results, I would like to suggest discussion themes for future research on regions and communities.

MOELKER, Rene* (Netherlands Defence Academy, Netherlands)

Beyond the Greedy Family

The military family concept has been the cornerstone of military families research for many decades and still is valuable for from it spring studies into the work-family conflict and the well-being of families. However, it also is a concept based on a double dialectic. There is a tension between the soldier and the organization, and there is tension between the soldier and the family. By looking at three party tensions a much more dynamic analyses is enabled. The Greedy Family concept served its purpose in making families and the military perform better, but it did not fundamentally question military families. Feminist theory does! Trialectic theory does!

By elaborating on the Greedy Family concept we are able to get beyond dichotomous analysis and to provide insight into symbolic violence in military families, into the habitus of military families, and into new families such as same sex couples and more. Moreover, in the triadic analysis, it is possible

to construct a typology of effects of greediness on soldiering discerning four different idealtypes: the centrifugal type, the centripetal type, Organizational greed, Family greed.

In the centrifugal type the soldier is 'hollowed' out because both the family and the organization claim the soldiers' devotion. In the centripetal type the soldier is reinforced because both the organization and the family are supportive. Within the type of organizational greed the organization is paramount and claims the family as part of the military engine. In the family greed type the needs of the family come first at the expense of the soldi er and the organization.

The Construction of Reality through Inclusion Wars. Inclusion and Culture in an Organization on the Periphery

War is associated with destruction, but war also means creation. War also constructs or constitutes civilizations. Future wars create new realities. The paradox here is that Baudrillard got it right. We talk about war but in fact it is not war. The tension today is about who gets to belong and who doesn't. Inclusion wars (which are therefore partly domestic) are about the "spoils" of welfare states. Can outsiders assert claims when incumbents oppose them? This war is largely virtual and aimed at keeping some groups out thanks to mediating populist politics and using disinformation as a weapon. This weapon increases the fragmentation already present in society. Within this context, today's armed forces fight in cities, on the cyber battlefield, using information and influence as tools, based on networks and targeting the population as "targets" to serve the interests of their "own group.

In a professional armed force, the military profession is becoming more and more like an ordinary profession. It is less an institution or vocation and more an 8-to-5 employer-employee relationship where good pay and working conditions determine whether people are attracted to it. Still, there is a failure to find enough staff, to recruit enough female colleagues (11%) and even less to find Dutch nationals with a migration background willing to join the organization (about 4%). Is it acceptable for the military culture to differ from the general Dutch culture or will we then have a state within a state where different norms and values apply? Can Defense afford to remain a peripheral organization, which although trusted by the population and with a sufficient budget, enjoys low legitimacy?

Scales of Violence: Iranian Kurdistan in Context

Feminist activism has generated international and national policies on violence against women, whether around awareness-raising, legal measures, or prosecutorial mechanisms. Implementation, however, can be ineffective or inconsistent, reflecting persistent cultural and gender biases or bureaucratic inertia. Context, therefore, matters, and it does so at different scales. International organizations may play an important role in policy and norm diffusion, but states may prioritize other issues or be unwilling to commit to implementation – or even adoption of robust laws and policies – for a variety of reasons. Some groups of women may be less protected than others. Where states are committed to ending VAW, they may be hampered by limited financial and human resources. Norms about gender relations and domestic violence may vary from one sub-national area to another: more egalitarian in more developed regions, more patriarchal in less developed or marginalized regions.

Building on and contributing to contextual global sociology, this paper will begin with an overview of laws and policies adopted across the Middle East and North Africa region, and some problems of implementation. It then turns to Iran, to elucidate Iran's divergence from the global and regional trend and reasons behind that divergence. To highlight sub-national variation, the paper delves into the case of Iranian Kurdistan, where resource and ethnic specificities constitute a distinct case of violence and intersectionality, and where the "continuum of violence" encompasses the household, community, the state, and the international system. The study draws on official reports and data, along with field research on forms of violence and weak policy responses in Iranian Kurdistan.

Proteins & Amino Acids Requirements: History of a Normative Definition

Amino acids are subsets of any proteins and essential in the cellular synthesis in the human body and, therefore, human health. This paper analyses the thematization related to the definition of the proteins and amino acids requirements, their dissemination and popularisation. In the community

of "disseminators" of nutritional knowledge, a broad consensus generally posits that - where essential amino acids are not incorporated at once from an animal product consumption - legumes and cereals must be consumed at the same meal so the amino acids complement each other's. Further analysis of the scientific literature suggests that the unit of mealtime is not based on scientific evidence. Indeed, some articles explicitly question the need for consumption at the same food intake and open the perspective of a wider time scale. One of the debates seems to be the time frame of protein metabolism. More specifically, the diversity of the time frames of the processes associated with the creation of a pool of free essential amino acids: (1) Digestion in the upper and lower digestive tract and (2) turnover of muscle tissue proteins (FAO, 2013). By exploring the meso-social interactions between actors from international political organizations, mediatic and scientific arenas regarding the definition of the proteins and amino acids requirements and their echo with ethical, health, and ecological debates, this study intends to shed the light on the social dynamics of the norms related to protein consumption and, ultimately, transition.

Metabolic Rifts through an Intersectional Lens and Restorative Practices As Ways in Which to Address Environmental Alienation

As social networks become more embedded in modern colonial-capitalist systems, the greater the separation and disconnect from the environment. Disconnects from the environment result in metabolic rifts which are an expression of the alienation of nature. Metabolic rifts are a disconnect, if not complete loss of connectivity with place and country, the repercussions of which are differentially distributed and experienced, but have major implications for environmental and human health and wellbeing. Environmental alienation deteriorates cultural, historical, and context specific environmental knowledge and practices. Especially as capitalism continues to estrange people from nature, particularly for marginalized people who have historically been subjected to primitive accumulation and/or currently disproportionately bear environmental burdens. Theories of intersectionality are applied to conceptualize, examine, and understand the complexity and multidimensionality of how metabolic rifts are differentially experienced among people, and how restorative practices can (re)shape environmental alienation. Recognizing how processes of domination, exploitation, assimilation, accumulation, and appropriation influence disconnect from nature provides a fuller understanding of how current rifts have come to be. As environmental change continues to alter the biophysical makeup of place, socioenvironmental interactions and relations also shift and become an important aspect of understanding adaptivity and resilience. Restorative practices are an expression of agency through which people take action to restore metabolic rifts and address environmental alienation. Some of those restorative practices are presented to demonstrate lived experiences and alternative imaginings of what it means to (re)connect with the environment in the 21st century.

MOHAMMADI, Monireh* (Yorku University, Canada)

Free Speech and Its Limit

Hate speech laws in Canada are commonly regarded as protecting vulnerable groups from the harms of hate speech. The law in Canada, however, is inadequate in the guidance it provides on matters related to hate speech and its harms. In particular, this inadequacy in legal guidance has resulted in excessive subjectivity in two respects: (i) around the interpretation of what constitutes harm to others and (ii) about the reasonable limits on free speech. The excessive subjectivity in these two respects has had negative effects on individual rights and public participation, and has also contributed to certain structural inequalities. Furthermore, these structural inequalities are, on balance, more detrimental to vulnerable groups than the harms of hate speech itself. The structural harms in question can be divided into two categories, namely, 'consequences' and 'ramifications.' Consequences are apparent and include, but are not limited to, the laws' chilling effect on free speech, self-censorship, and the sometimes inconsistent and arbitrary adjudication of hate speech cases in courts and tribunals. Ramifications, on the other hand, are those outcomes that develop over time through the interaction of law and hate speech politics, and they include, but are not limited to, the impairment of public participation, the transformation of the public sphere, the migration of free communication to encrypted cyber spaces, more online hate speech, and the violation of the right to privacy by tech companies.

Notes on the Coming of a Topological Citizenship Among the Valmikis in Delhi

This essay provides a critical appraisal of the civil versus political society formulation of Partha Chatterjee that has influenced numerous analyses about modes of contentious subaltern politics in most cities of the developing world. Using ethnographic vignettes, I herein argue that civil society (CS) and political

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

society (PS) actors, in their engagement with the state, have been found to use an array of methods that belong to both these groups. I add to this critique by looking into another aspect, viz., the question of context or the spatial dimension. My argument here is that the spatial/ territorial underpinnings of subaltern agency further problematise the presumed trade-off between neo-liberal, material aspirations and affective/ cultural moorings of subaltern groups and hence there is a need to develop more productively relational understandings of citizenship like topological citizenship, which accommodates spatio-temporal changes in modes of political engagement.

I call these tactics deployed by subaltern community leaders among valmikis as topological citizenship because has two key facets. Firstly subaltern agency, herein, has emerged as a differentiated entity with a heterogenous composition (i.e., which involves a melange of civil society actors like traditional chiefs or pradhans, youth leaders, neighbourhood association representatives etc.) Secondly with the onset of regimes of populism and middle class aspirations amongst subalterns, subaltern agency has shaped up as per temporal demands (i.e., the affiliation community leaders have with political parties at the Ward/ State/ Central level) and spatial materiality (i.e., the type of neighbourhood in which the Valmikis' reside – legal colony, unauthorised colony, resettlement colony, urban village). Finally, in so doing, this essay iterates the salience of brokerage as a new praxis of negotiation with the Everyday State in both South Asian (Bjorkman 2015) and non-South Asian (Koster & van Leynseele 2018, James 2011) contexts.

MOHANTY, Bibhuti Bhusan* (Department of Sociology, India)

Displacement Movements and the Emerging State-TRIBE Relationship in India

In the past few decades India has witnessed rising protest movements among tribals against acquisition of land for large industries, dams, mines, or special economic zones. The available studies on these displacement movements though vary in style and temper, by and large, they subscribe to the thesis that there is an exploitative relationship between state and the tribes. State is portrayed as opposed to the tribals and vice versa. Based on recent displacement movements in the state of Odisha, eastern India, the present study analyses the processes of negotiation between tribals and state, fallout of these movements and its consequent effects on tribals and development planning of the state. The analysis challenges the thesis on state-tribal relationship premised on the exploitative model and advances the argument that displacement movements have given rise to a new kind of cooperative relationship between state tribes. The process of long negotiation and dialogue involved in the displacement movements not only sensitized the state about the development experience of the tribals, their customs, rights, life and livelihood but also made the tribals familiar with the rules, regulations of the state administration and the nuances of democratic process. It is argued that in the emerging scenario while the state considers tribals as a partner of development the tribals restored faith on state's sensitiveness to their dissent voices and concern for inclusive development. Ultimately the analysis revisits the larger debate on state- tribe relationship in India.

A Journey Towards Making Half of the Sky for Women: Pradan Story

PRADAN[1], a 40-year-old NGO working in rural development, visualizes a just and equitable society for self-sustaining change in human condition. In 2008, when PRADAN took up UN Women project on "Gender Equality", it created an upheaval within the organisation. An organisation aspiring to create a just and equal society '**out-there'** cannot shy away from its '**in-here'** reality of having only 17% women employees. It was high time for creating an environment, where women equally feel encouraged to come, stay and grow – feel valued and respected. Since then PRADAN has continuously attempted to be gender-equal with a goal of 50% women across levels.

The scoping study indicated that organisation is facing deep culture, *not only leadership style,* issue. Based on the institutional framework 'Gender at Work' and Gender Integration Framework, PRADAN instituted processes both formal and non-formal like women caucus, gender curriculum for newcomers, men-in-gender and gender audit to change the situation. It is not so easy to change deep-seated culture of an organisation, for it, long-term commitments are required. The Steering Group, an autonomous body consisting of senior members was formed to trigger and oversee these change processes.

One of the most tangible change measurement tools, the Gender Audit, helped in periodic stock taking to understand the current issues and accordingly steps were taken to work on agenda. The issues discussed in women caucus came to formal meetings and all these culminated in drawing up the gender policy and a strategy paper for making PRADAN a Gender Just organization.

PRADAN has made some journey, with more women joining as trainees and into leaders roles, women taking up non-stereo-typed work like agriculture and livestock, availing provisions like menstrual leave and flexi work. Though still a long way to go, the paper intends to share the learning so far.

The Impact of the Socio-Economic Status of Female Single Parent Families on Street Children Phenomenon

One of the most common causes of street children is extreme poverty. Family breakdown also appears to be frequently cited as a strong factor for street children phenomenon due to many children growing up living without one or even both of their parents. This paper aims to understand how the socio-economic status of female single parent families influence the street children phenomenon.

To address this question, the paper uses the feminist methodology and a qualitative research paradigm. Data was collected from street children beneficiaries of the two drop-in centres in the North West Province of South Africa. Fifteen(15) street children as well as their fifteen (15) parents were interviewed, which makes a total of thirty (30) participants.

The study found that, street children from female single parent family structures formed a higher proportion compared to other family structures as they live below the poverty line. This paper argues that due to not having access to economic resources equally to men, women are seen as incapable of raising children due to the economic challenges they face. This then ultimately affects children in such families as single parents face a huge challenge of taking care of their children on their own, which ultimately drives children to the street.

Unfortunately, women in South Africa still face additional challenges that hinder them from accessing employment. This is evident to the 2021 unemployment rate statistics that were released by the Statistics South Africa (Stats SA), that the rate of unemployment among women was 36,8% in the 2nd quarter of 2021 compared to 32,4% amongst men according to the official definition of unemployment.

This paper thus suggests that, there should be micro-finance/ socio-economic programmes and other supports to single female parents as key strategies to address the phenomenon of street children.

Women Employees in Hospital Sector : A Study on Techno-Stress during Covid 19 Pandemic in a Super Speciality Hospital in Bhubaneswar, India

In India, the first wave of the pandemic brought on by COVID 19 was characterized with a total lockdown in March 2020. Every element of our lives, including the way we work, were affected by the pandemic. Women globally makeup over 70 percent of workers in health, including those working in care institutions. In Bhubaneswar the number of women employees of the total health workers is nearly 50%. in Kalinga Institute of Medical Sciences too, 50% of health care workers are female. They are on the frontline of the fight against COVID 19. As a result of the pandemic-they faced longer shifts at work, techno stress due to constant exposure to threat and additional care work at home. Women health care mangers in comparison with other healthcare professionals, have an increased likelihood of undergoing techno-stress at workplace. Since knowledge about the reasons and severity of techno-stress and about the stratagems women healthcare managers use to handle it is limited, the objective of this study is to address the experience of techno-stress among women health care workers and the actions they employ to address it. The present study seeks to explore the time frame in relation to exposure to health technologies used during pandemic, its effect on their mental and physical health and its impact on their familial responsibilities after working hours.

Still Women "the Second Sex" in Sports? (Analysis of few concerning issues from global and indian perspectives)

Today, sports are more fundamental to human civilization and entangled with human rights than ever before. As the globe commemorates more than seven decades since the signing of the Declaration of Human Rights, the timing is ideal to examine the connection between women's sports participation and human rights.

Gender discrimination (in various forms) is prevalent in the global sports arena, preventing women from competing on an equal level with men. It

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

contradicts the Olympic Charter (one of the five "Fundamental Principles of Olympism"), which prohibits "any kind of discrimination," including discrimination against women. Sports are still viewed as a masculine realm as reflected in media, social institutions and its discriminatory practices.

In many parts of the world, adult women are treated as if they were minors who lack the capacity to make decisions for their lives. Therefore, women's active participation in competitive organised sports is unquestionably a distant dream.These evidences are found in many Islamic nations throughout the globe. Brunei, Qatar, and Saudi Arabia, all sent women athletes for the first time in the 2012 London Olympics .This could be possible because of international pressure and cooperation spearheaded by the International Olympic Committee (IOC).

In india also gender related discrimination and aversion towards sports participation is very much evident as a result in the new millennium women participation in sports at various levels remains a distant dream.

This paper critically examines a few issues pertaining to women's participation in sports worldwide from a feminist human rights perspective. Our discussion will be based on a reflection of the action taken by international human rights committees to resolve gender issues in sports participation and will suggest the action to be taken by the concerned authorities to address gender discrimination in various forms, so far as women's participation is considered in India.

Reproductive Injustices in South Africa: A Case of Forced Sterilization of HIV Positive Black African Women

Colonial myths about Africa are characterized by narratives of bestiality, promiscuity, gynaecological abnormalities, and perversion. This colonial narrative also portrays African womanhood as oversexed, primitive, ugly, and beastly. Meanwhile, enslavers used African female reproductive capacities in pursuit of power, wealth and sexist, racist oppression and denied enslaved women their rights to motherhood. Ironically, these reproductive capacities were later constructed as burdensome to capitalist economies in the post-colony. This lasting racist and sexist legacy is reflected in the forced sterilisation of HIV positive South African women. This paper considers the documented accounts of 48 HIV positive black African women who were forced to consent to sterilization and subsequently, were subjected to cruel and degrading treatment and violation of their rights to act voluntarily. In this case analysis, I re-read these cases through a decolonial feminist lens to suggest the need for exposing coloniality that continues to perpetuate the intersecting systemic oppressions and power dynamics that underlie the reproductive challenges faced by marginalized women. Further, through a reproductive justice lens, the paper reinforces the need to recognize that the ability of women and girls to make meaningful choices about their reproductive lives is shaped by intersecting systemic oppressions (e.g., racism, sexism, classism, heterosexism) and thus, warrants activist efforts to ensure a firm stance against reproductive injustices. Further, it re-centers the position for sexual, bodily autonomy and reproductive decision making for marginalised groups.

MOITRA, Anusuya* (MURALIDHAR GIRLS' COLLEGE, India)

Care in Contagion : An Account of (Dis)Abled Children's Lived Experiences in Kolkata during Covid 19 Pandemic

'Care' in informal relationships of (dis)abled children and their non-(dis)abled family members are popularly conceived as a binary form of exchange between care-receivers and care-givers. This dependency dynamic espouses the overwhelming narrative of 'burden' of care and plays a determining role in shaping the everyday life experiences of (dis)abled children and their able-bodied kins. It is also instrumental in stripping (dis)abled children of their agency, structuring unequal relationships of power with their care-givers and relegating them a subordinate status within the family in specific and in the ableist society in general. Against this backdrop, the current presentation attempts to understand the experiences of children with loco-motor (dis)abilities and their parents confronting Covid 19 pandemic, during which outsourcing care activities, availing assistance of institutional care facilities and dependance on community support was halted by lockdown, for containing the deadly virus. The study used Intersectional approach, for which primary data has been collected from 20 children with loco-motor (dis)abilities and their parents from different social classes and genders belonging to the age group of 14-17 years, residing in Kolkata. The pandemic ushered in a plethora of challenges, ranging from threatening livelihoods, jeopardizing household activities, disrupting access to education and healthcare services, curbing social security nets, in addition to which absence of substantive measures of the State for (dis)abled accentuated the vulnerabilities of these children, magnified the challenges for their care, and created a 'new' normal order, engendered with potentialities for further intensification of pervasive structural inequalities for them. Class positions played a more decisive role in influencing care-receiving experiences of the children, within the family than their genders. Children, however also contributed occasionally to household work, assisted their parents in daily activities thereby emerging as partial care givers, and altering the uni-dimensional dynamic of care exchange in relations with their able-bodied care-givers.

RC25-380.3

MOITRA, Anusuya* (MURALIDHAR GIRLS' COLLEGE, India)

Sexuality, Sign Language and Deaf Culture : A Sociological Exploration in Kolkata

There is acute dearth of information and understanding about Deaf culture in India, likewise the notions of sexuality of deaf people is circumscribed by taboos. Also research on sexual experiences of people with deafness is quite sparse. This is more so, because Indian Sign Language (ISL), which is an integral component of Deaf culture, experiences a marginalized status in Indian Society, which consequentially reduces deaf people into a linguistic minority, who encounter severe communication barriers, in the course of their life in a community that is ignorant about their language. The paper attempts to explore the experiences of youth with hearing impairments with respect to sexuality. It tries to understand the challenges faced and strategies used by them for acquiring information, communicating feelings, negotiating risks of abuse in the process of developing their respective 'sexual-self'(s) using sign language. Qualitative approach has been used in the study, whereby primary data has been collected from 15 respondents with hearing impairment, belonging to age group of 19 to 28 years, residing in Kolkata with a questionnaire. It has been observed that absence of teachers, with knowledge and skill of sign language in school had made it highly difficult for youth with hearing impairments to acquire information, clarify queries or convey opinions during sexuality education classes in the years of adolescence. They had to rely mostly on printed and internet sources to develop understanding of safe sex, pleasure, contraception and other issues related to sexuality. Many prefer online dating, as face-to-face communication becomes more challenging for them, because most hearing partners are not well versed with cues of sign language. Lack of recognition and awareness about sign language was seen to severely impact sexual experiences of youth with hearing impairments and reinforce their marginalization.

MOK, Julius* (Asia Institute, University of Melbourne, Australia)

Multiculturalism in Refocus: An Institutional Strengthening of Australia's Multicultural Compact

This paper argues the fundamental value of the multicultural compact developed in the early 1970s amidst the institutional dismemberment of White Australia. It argues that while recent academic and public debates centred on interculturalism are worthwhile, the historical dismantling of racial hierarchies requires a refocused form of multiculturalism that recognises how Australian society has often been exclusionary to its first, last, and often most recent Australian citizens. Such a position, this paper asserts, requires shifts from solely race-based understandings to that of cultural racism to meet the challenges of contemporary Australia. Expanding what constitutes racism beyond its essentialising biological element allows for greater focus on the hierarchies within races. The Black Lives Matter movement and the outcomes of Covid-19 pandemic in Australia show a disjointed form racism evolved from the largely race-based dynamics of the White Australia Policy that persists in systemic form today. The lack of a federal anti-racism strategy since 2018 underscores the pronounced undervaluation of cultural racism, and this paper thus advocates for an institutional strengthening of Australian multiculturalism based on Nancy Fraser's notions of recognition, redistribution, and representation. It concludes with reflections on to operationalise these notions in the context of Australia's current political and policy environment.

MOK, Julius* (Asia Institute, University of Melbourne, Australia)

The Ethnocracy of Singapore: Ethnonationalism of Hybrid Regimes

This paper explains how regimes deploy ethnonationalism as a legitimising ideology for the autocratic management of otherwise democratic states. In ethnically diverse countries, ethnonationalism functions as a unifying ideal by which to fuse individual ethnic groups' aspirations with that of the collective state. The paper examines the case of Singapore as an illustration of ethnonationalism that is both democratic and simultaneously authoritarian. It argues that the Singaporean state has propagated a nationalism based on ethnic/racial demarcations whilst claiming to serve citizens "regardless of race, language or religion." Empirical demonstration of this duality is found in histories of Singapore's socio-historical processes of nation-building, which show how the state's semi-autocratic legal and electoral mechanisms based on identity cleavages function in the pursuit of democracy. The paper concludes

with some discussion of whether forms of ethnonationalism that swing between democratic and autocratic associations also structure the politics of other Southeast Asian states.

The Value in the Valley: An Autoethnographic Reflection of Teaching in a Context of Structural Inequalities during COVID-19

There is an emerging body of literature that highlights the extent to which 'emergency online education' – brought about by the COVID-19 pandemic and its related lockdowns – impacted teaching and learning in university settings across the world, Much of this scholarship, however, however, tends to focus on the unprecedented challenges that this transition brought for academic staff students. The aim of this paper is, therefore, to highlight the positive aspects of this transition. The paper draws from personal and comparative experiences of teaching at both the undergraduate and postgraduate levels before and during the pandemic in South Africa, one of the most unequal societies in the world. Particular focus is on how some of the emergency and/or forced teaching practices that were adopted during the pandemic enhanced inclusiveness and greater access to learning for students coming from lower socio-economic strata of society. The paper is important against the background of calls for the development of a post-COVID pedagogy for higher education that takes the diversity and circumstances of both academic staff and students into consideration.

Materialising Identities after Apartheid: Shweshwe and the Long Shadow of Empire

Material Identities explores the entwinement of a resist-dyed cotton textile, *shweshwe*, with various authenticity discourses in post-apartheid South Africa. These, Lebogang Mokwena argues, represent contemporary attempts to craft and assert liberated post-apartheid cultural identities. Focused on various visual mobilisations of the textile and its synonymity with black women and South Africa, the book is structured around five case studies. It draws on various sources, including traditional and new archival repositories, museum exhibitions and catalogues, artworks, and performances. *Material Identities* argues that shweshwe extends potent and multiply generative visual, material, and symbolic affordances for various protagonists.

Theoretically, the cases reveal the complex, evolving visual-material and symbolic power of an object that anchors the identity of a post-colonial country and various individual and institutional identities. It reveals the strategies for the industrial, ideological, cultural, and symbolic construction of artefacts while capturing how objects make place and materialise identities. Though concerned with specific social processes, institutional histories, and cultural identities, Mokwena proceeds from the material-historical and global-structural conditions that shaped shweshwe's production, linking a declining British textile industry with an emergent Apartheid import-substituting industrial strategy reliant on the exploitation of cheap black labour. Working outward from that point, she proposes, we obtain a richer understanding of the political and cultural economies that have shaped the production of the object.

Mokwena's book recovers the obstinate shadow of imperialism in contemporary elaborations of post-apartheid identities. An excellent materiality-centred ethnography of a country and its people from the prism of a textile,*Material Identities* exhibits the power of objects and their histories in shaping culture and economy. It reminds us that imperial penetration was a political, cultural, and industrial process and the elusiveness of the quest to repudiate and transcend these imperial legacies. The book elegantly comments on the aspirations, anxieties, and contradictions after Apartheid.

Revisiting "Native Life in South Africa"; Excavating Sol Plaatje As a Public Sociologist

Numerous accounts exist of Sol Plaatje and his long and varied career nospanning literature, translation, politics, travel writing, journalism and print culture in Southern Africa and across the Atlantic. Presumably, all stones on Plaatje's life and trailblazing contributions across these domains and as part of a trilateral transatlantic dialogue between South Africa, the United States, and the United Kingdom have largely been turned. However, although Plaatje was all these things (and more), I argue that he was also a public sociologist. In this paper, I offer a new reading of his seminal text, *Native Life in South Africa*, with a specific focus on his methodological contribution to studying native life in the early 20th century. This article combines a close textual analysis of *Native Life,* archival investigation, and a rereading of select biographical sketches and commentaries on Plaatje's work and life against a broad cultural-political context. In piecing together Plaatje's ethnographic method in writing *Native Life,*

I argue that Plaatje is not so much a "forgotten" sociologist as an unclaimed one. Indeed, a sophisticated yet undeclared sociological vision underpinned Plaatje's ethnographic reportage in *Native Life*; which married his personal-political commitments with a methodical, evidence-based public-sociological inquiry. I conclude the paper by highlighting three implications for sociology that flow from claiming Plaatje for our discipline. First, given the many transnational challenges of the 21st century, the necessity of a globalist orientation that connects national "problems" to global geo-political arrangements and struggles (as well as audiences). Second and relatedly, a public sociological practice should form one of the pillars of the discipline. Finally, creative and sustained linkages with and participation in active political struggle are possible and warranted. In this regard, Plaatje's implicit sociological vision was apposite for his and our times where sociology, to paraphrase John Goodwin, is craft and politics.

Classroom Diversity: Lessons from South Africa

This paper talks to the experience of teaching students from diverse backgrounds in a South African university. The paper outlines some of the challenges that come with teaching students from diverse backgrounds defined by race, class, gender and sexual orientation. Its argument is that teaching in a context of the diversity of student backgrounds, demands appreciating the classroom as terrain for an encounter with counter-epistemologies that are brought to bear on the classroom by the diversity in question. Teaching as such is about dialogue and the negotiation of intersections that classroom diversity presuppose. The paper enters conversation about the classroom diversity in order to speak to the broader socio-economic and political context of South Africa more broadly.

MOLAPO, Sepetla* (University of Pretoria, South Africa)

Responsibility As Care: Thinking Solidarity Beyond Productive Forms of Care

This paper thinks responsibility via a reading of death as a construct of indigenous African thought. It claims that read through death as a construct of indigenous African thought, responsibility opens an avenue towards an understanding of solidarity as a non-productive form of care. Understood as such, responsibility positions care as the cornerstone of the experience of community, where community denotes the recognition and embrace of difference. The paper sees this conception of solidarity as having the potential to challenge solidarity as a product of the contemporary entanglements of religion, politics and economics defined by productive forms of care.

Interacciones En Una Escuela De Alternancia: Narrar y Analizar Con Fotografías

Nos proponemos indagar un corpus fotográfico correspondiente al trabajo de campo etnográfico realizado en el marco de nuestra investigación colaborativa en una escuela de alternancia de la provincia de Buenos Aires, Argentina.

La propuesta educativa de alternancia conlleva que durante el ciclo lectivo lxs estudiantes alternen su permanencia, una semana en la escuela y dos en la residencia familiar. Interpretamos que el enfoque pedagógico de la alternancia efectúa otro modo de producir conocimiento que va más allá de los binarismos teoría-práctica, saber científico-saber popular, naturaleza-sociedad. A partir de ello, nuestra propuesta invita a sumergirse en la praxis de la pedagogía de la alternancia situada en el Centro Educativo para la Producción Total (CEPT) a través de fotografías para alcanzar un análisis de las interacciones entre actantes humanos y no humanos desde la perspectiva de la ontología relacional de Haraway (2019) y el enfoque de la red de actores (Latour, 1992).

Con el objetivo de conocer las múltiples relaciones que lxs estudiantes del CEPT establecen con otrxs actantes, las imágenes son utilizadas para desplegar las diferentes acciones que éstos efectúan al interactuar con objetos de la naturaleza y de la tecnología, seres humanos y no humanos durante su permanencia en el CEPT.

A partir de nuestra reflexión metodológica que alcanza la transposición de datos visuales a datos textuales y su interpretación, presentamos los aportes que nos brinda componer con imágenes a través de una estrategia de montaje (Fernández Polanco, 2013). Esta perspectiva junto a la ontología relacional de Haraway (2019) y el enfoque de la teoría del actor red (Latour, 1992), nos

permite ampliar el lente de la mirada vinculada a los objetos, cuerpos, espacios y sus interacciones, acciones que se retratan en las imágenes y se instituyen como constructos del pensamiento.

The Role of General Politic Orientations in Welfare Goals

This abstract is a continuation of a previous work presented at the RC55 Social Indicators meeting in Valencia in 2018 and a line of research on the potentialities and limitations of the comparison of social state models in Latin America following the contributions of Fernando Pedrosa and Fernando Filgueira. Taking into account its proposed typology – Stratified Universalism, dual regimes and exclusionary types -, a cluster analysis is carried out again to measure the relationship between the evolution of the achievements in a series of well-being indicators, the decrease (or not) of gender gaps and the continuity of certain political orientations. The latter is measured with a continuity strength index that feeds on the results accumulated in electoral contests, describing the levels of retention or loss of parliamentary majority and subnational governments. The data comes from ECLAC databases The presentation is organized in three parts. A first part where the countries that would enter the Filgueira typologies are updated. A second part in which we postulate a hypothesis of heterogeneity since, particularly in the countries of the stratified universalism group, the changes in political orientations did not affect the performance of the welfare indicators. And a third part, where a sub-hypothesis about the incidence of conflicts and gender dynamics is presented.

Educational Dis/Advantage: Expanding the Spaces of Assessment

As social researchers, the kind of things we study is in part determined by how we think about the world; what we find is in part a reflection of where we choose to look; and how we interpret the things we identify often depends on our positionality. In this paper, we argue the need to widen the aperture of the lens we use to investigate educational dis/advantage. In particular, in education equity research, beyond measuring opportunities and outcomes of target groups, we argue the need to consider the substantiveness of opportunities as well as the subjective conditions and objective contexts that mediate how people transform their resources into outcomes. From this position, we propose an expanded evaluative framework that outlines five spaces for assessing educational dis/advantage: position and disposition; capital interaction; capability expansion; conversion ability; and conditioned choices.

'ignite That Change from within' - Young People's Use of Social Media to Drive Collective Action Against Gender-Based Violence

Collective action can be a driving force for young people, led by the examples of others, to encourage change that prevent violence. For some, such changes can be very ordinary and easily overlooked. For example, naming and calling out the social conditions of gendered relations is one step toward shifting harmful practices which can be undertaken through identifying inequalities or demonstrating alternative discourse (Hennessy, 2006; Butler, 1993). Drawing from nine focus groups with 32 young people (aged 16-25) who share social-media content about preventing gender-based violence, this paper discusses how they found social media effective for social change, despite identifying intersectional limitations of taking part in a neoliberal market. Using a materialist feminist and post-structuralist thematic analysis of how inequalities are realised through the institutions, processes and lives of young people, the paper explores how some young people using social media have provided a means to expose the need for the growth of representative and inclusive discussions about preventing gender-based violence. For them, creating and sharing messages from lived experiences that others could relate to directly challenged more commonplace narratives and directives about violence and how they had previously understood violence. These young people also described measuring and understanding the impact of their influence to benefit from using social media platforms, even if they saw that such actions also be weaponised against them, or to make them compete within organisations. Finally, I describe participants' shared actions to support more equitable participation in their social spheres. The practices that young people in this study describe promoting discursive change and collective action online that reveal necessary disruptions for more support in everyday actions and structural change, which requires ongoing care as a practice of shared labour.

Does the Impact of Social Exclusion on Health Inequalities Differ between Genders?

In recent years, there has been a growing interest among researchers in clarifying the relationship between social exclusion and health inequalities. An increasing number of studies are concerned with social exclusion and health inequalities; however, it has rarely been discussed whether there are any gaps or differences in the relationship between social exclusion and health inequalities. This analysis will use one of the nationally-representative panel data sets called the Japanese Life Course Panel Survey 2007-2021 (waves 1-15). One expected conclusion is that the situations of social exclusion affecting health inequalities including subjective health, mental health, and physical problems that limit work and home activities may differ with respect to gender. Specifically, previous studies found that the social aspects of childhood such as experiences of being bullied at school and poor family atmosphere as a child, social aspects of adulthood cases (dissatisfaction with parents), and economic aspects of adulthood cases (subjective poverty) influenced health inequalities. However, in this context, how gender gaps/differences will affect economic and health outcomes remains unknown to be seen. For example, previous studies showed that disadvantageous experiences of social aspects of childhood had a negative impact on health inequalities. Given this analysis, investigating gender gaps may clarify that women are more likely than men to have a variety of negative health-related outcomes in adulthood. Furthermore, according to previous studies, adults who experience social and economic disadvantages are more likely to be affected by health problems. Statistical analyses on gender differences will identify that women's health is more likely to be affected by social aspects, while men's health is more likely to be affected by economic aspects.

MOMOSE, Yurie* (The University of Tokyo, Japan)

Intersectionality and Employment Policies: Women with Health Problems

A major problem of employment situations and equal employment policies in Japan is that although the policies focus on reducing gender gaps, they are based on the assumption that the gender gap is the sole factor in employment inequality. On the other hand, the gender gap has not been included in the discussion of social policies regarding people with disabilities. Furthermore, one major problem with Japan's social policy is that not all people with health problems do not receive institutional support, for some of their conditions do not fit the government's definition of disability. This paper aims to identify the difficulties faced by women with health problems using an intersectional approach. This analysis will use one of the data collected from the Japanese Ministry of Health, Labour and Welfare's "Survey on difficulty in living, national survey of children with disabilities and persons with disabilities." The analysis showed that there were gender differences in economic opportunities among people with health problems, and healthcare and welfare measures for assisting people with disabilities did not provide any access to those who had health problems. Those with health conditions were not issued disability certificates and thus were not provided life support services and individual benefits. Therefore, they were more prone to lose economic opportunities. Therefore, women who are in the gray area of disability may find themselves excluded from social policies and the labor market. In order to promote women's activities in employment situations and equal employment policies, removing the assumption of gender being the sole factor and associating those policies with measures in other fields outside of gender should be essential. Concerning multiple inequalities will make "a society where everyone can fully demonstrate their abilities," which is the goal of the government's employment equal opportunity policies.

MOMSEN, Claire* (Social Policy Group, Australia)

Integrating Culturally, Ethnically and Linguistically Diverse Communities in Rapid Responses to Public Health Crises

Migrant and refugee women were particularly affected by the COVID-19 pandemic, both in terms of health outcomes and economic impacts. The Australian government's response to the COVID-19 pandemic provided an opportunity to examine how we can more effectively engage with CALD communities in all their diversity during public health crises, and may also have valuable insight for other large-scale emergency response and preparedness.

People born outside of Australia were more than twice as likely to die of COVID-19 than Australian-born residents. People from the Middle East are over-represented in these statistics. The reasons for this are complex and not yet quantified; lower vaccination rates in CALD communities could have been due to the lack of health facility access, or a dearth of culturally/linguistically appropriate information, higher rate of exposure to vaccine misinformation, or even higher exposure to the virus due to essential work being undertaken by migrants.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

According to the Grattan Institute (2021), women lost more jobs than men (8% women versus 4% of men at the height of the crisis); their unpaid work increased by an hour a day, particularly in response to remote learning; and they were less likely to receive government support. Migrant and refugee women were especially impacted by a lack of access to financial assistance, as others in their community or family groups who may have supported them previously were also affected by the economic downturn.

Our policy paper (and further work still being completed in this area) concludes that several conditions are critical to communicating effectively with CALD communities in times of health crisis:
- Pre-establishing trust;
- Preparing culturally/linguistically appropriate resources in a timely manner;
- Engaging with multiple community leaders who can reach across gender, age, and other sub-groups;
- Soliciting and acting upon feedback about the most effective vaccine communication strategies.

ABASOLO, Anacorita (University of the Philippines, Los Banos, Philippines)

Neighborhood Food Retailers, Food Security, and Rural Precarity in Times of Crisis

Neighborhood food retailers, such as sari-sari stores in the Philippines, play a crucial role in community- and household-level social relations and food provisioning in the global South. In a time of heightened risks and uncertainties due to climate change and the pandemic, neighborhood food retailers are increasingly being positioned as a crucial mediator in ensuring food access in times of crisis. This paper complicates this emerging narrative by focusing on the case of sari-sari stores (neighborhood home-based microenterprises) in Capiz, a province in the Philippines frequently impacted by catastrophic tropical cyclones. Based on our field research in 2021 and 2022, we show how sari-sari stores provided low-income households food relief after several devastating typhoons hit the province in the 2010s and during the COVID-19 pandemic. It is the ubiquity and flexibility of these microenterprises, more importantly their capacity to sell cheap processed food items on credit, that contributed to addressing acute food insecurity in poorer communities. Drawing from the burgeoning scholarship on climate precarity, however, we also show that these microenterprises are vulnerable to the same shocks and are unable to ensure access to nutritious foods, especially among the rural precariats. Therefore, these stores are both a relief to environmental crisis and a symptom of rural precarity. We then argue for the need to recognize the complicated role of neighborhood food retailers in the global South in mediating food security in the context of environmental crises. Examining such complexities require attention to not just the supply chains of food vis-a-vis crisis situations, but also the vulnerabilities and precarities of the individuals and households dependent on these institutions and the local and broader political economic particularities they are in.

Investigative Co-Production. a Look from the Dialogic Methodology

The study of methodologies in the social sciences is reduced to a fragmented, methodically naturalized investigative method that systematizes its theoretical and empirical contents. However, in recent years there has been an important development in the advancement of various collective-participatory-dialogical methodological proposals with different denominations and with emphases, among which we can mention collaboration, participatory action, socio-practice, militancy, Horizontal Production of Knowledge, co-research, and finally the co-production. All these proposals seek to enhance the creative and creative capacity of science for transformation. This paper has the objective of presenting the theoretical development of the methodology of co-production investigative, because, unlike the other methodological proposals this methodology proposals involved in the production of knowledge: the scientific paradigm (theory, practice, technique, and epistemic framework), the collective or social intellect and the modes of production of knowledge that question epistemological individualism in the hegemonic way of building knowledge of "normal" science; then, the investigative co-production method encompasses the collective co-creation of knowledge for transforming social reality and to question the social intellect, and at the same time the co-construction of the cognitive collective that generates them. With the purpose to create a third

knowledge and establish a reciprocity relationship with the other, both in the production process and in the transfer of knowledge and make explicit that this proposal can be a methodology and a philosophy of praxis. Where knowledge is linked to social transformation and that this construction of knowledge is validated as a common good and human right to creation, based on an overcoming science that is ethically appropriable and eco-socially appropriate; and thus achieve the epistemic turn to the scientific paradigm.

Does Parental Education Shape Gender Wage Gaps over the Life Course? New Insights from Australia

Does parental education shape gender wage gaps over the life course? And if so, are the differential effects of parental education most pronounced at the top or bottom tail of the distribution? To answer these questions, we draw upon 15 waves of annual panel data from the Household Income and Labour Dynamics in Australia (HILDA) Survey among a representative sample of Australian men and women born between 1960 and 1981. A series of unconditional quantile regression models reveal gendered effects of parental education on children's later wage trajectories, which are particularly concentrated at the tails of the distribution. Specifically, for higher educated men, the wage premium for parent's higher education is concentrated at the top of the wage distribution where the gender wage gaps between men and women are most pronounced. In contrast, for higher educated women, wage premiums attached to parental education are concentrated at the bottom of the wage distribution where a substantial fraction of highly educated women are concentrated. Conversely, higher educated women's wages are compressed at the top while higher educated men's wages are compressed at the bottom. These findings suggest that parental education does not have the same effects upon generational mobility for women as for men but that the differences are most evident at the tails of the distribution. In this context, it is young men who can best translate their early advantages into later earnings and career progression over the working lifetime.

Parental Joblessness and Children's Personality Traits

While exposure to parental joblessness during childhood is associated with negative socioeconomic outcomes in early adulthood, it is unclear how living with parents who do not work in paid employment is linked to the formation and maintenance of personality traits in adolescence and early adulthood. These personality traits themselves may go on to affect children's socioeconomic attainment, thereby acting as a key mechanism of intergenerational stratification. We use household panel data from the Household, Income, and labour Dynamics in Australia (HILDA) Survey ($N = 5,366$) and a multilevel random effects model to investigate whether long-term exposure to parental joblessness during childhood or adolescence is associated with children's subsequent measures of personality traits. Analyses controlling for a set of observable confounders finds that greater exposure to parental joblessness during childhood is associated with significantly lower scores on measures of agreeableness, emotional stability, extroversion, and openness to experience in early adulthood. Supplemental analyses do not yield significant heterogeneity in effect sizes by gender or birth cohort. These findings add to our understanding of the long-term effects of joint parental employment patterns on children, moving beyond analyses of children's labor market outcomes or short-term wellbeing outcomes such as child poverty. They suggest that experiencing parental joblessness before personality traits become stable is correlated with personality traits that tend to be less valued by modern labor markets.

A Relational Framework to Reconnect Property Rights to the Common Good

Individuals, societies and governments are increasingly seeking to become more empowered in the local to global decision-making processes associated with the exercise of property rights. Within a Western Colonial context, property rights are a privilege that is contested and negotiated within reductionist transactional frameworks that narrowly define relationships and accountabilities between agents. Property rights have been defined and redefined over time, maximising and protecting private, individual privileges. Yet, transactional approaches routinely fail to provide opportunities to secure the common good - a substantive conception of the *moral good* – the original intention of the social construction of 'private property'. 'Private interests'

were always intended to be sub-ordinate to the common good because of individual vulnerability to act out of narrow self-interest, rather than for the good of the collective. In contrast, relational approaches are grounded in concepts of stewardship, ethics and Indigenous onto-epistemologies and practices of 'Nature', tying directly to the collective norm character of the common good. Here, an ethical approach is considered fundamental to the privilege of occupying a space and consuming the resources of that space. We propose a framework to show how relationality can improve how we account for: the interconnectedness of individuals and societies; non-human species; future generations of all species; places of spiritual and cultural significance; Indigenous onto-epistemologies; intergenerational justice; and inequality, particularly with respect to privilege-holders and non-privilege holders. Within this framework, we recognise that: the relational strength between agents and their capacity to influence the common good is far from equal; scale is an important dimension in the distribution of power and influence; and how accountability is secured from and by each agent is highly variable across institutional scales. We examine the capacity for existing and emerging legal mechanisms to support a relational approach to property in the redistribution of associated privileges.

MOORE, Ethan* (University of St Andrews, United Kingdom)

A New Framework for Understanding Cryptomarket Participants

This paper presents a novel theoretical framework for illicit-market analysis – namely, a qualified Rational-Choice-Theory (RCT), referred to as the HIPI-model, which recognises both the economic and non-economic rationalities of market participants. This framework is then applied to illicit cryptomarkets, challenging dominant narratives that characterise digital markets as traditionally economically motivated.

Firstly, the paper presents the HIPI-model and situates it within the broader theoretical tradition of RCTs. Secondly, the paper applies this framework to cryptomarkets, concluding that the economic rationalities of market-participants is often overstated – many participants do not embody the ideal utility-maximisation that the market enables. Moreover, it is argued that cryptomarkets exhibit several market phenomena, which economic-RCTs fail to illuminate – namely, addictions, socio-political enterprises, subcultural ideologies, collaborations and communities. The HIPI-model can provide crucial insights to mitigate these deficits.

Thirdly, the paper considers the objection that ostensibly ideological and moral rationales are actually 'neutralisations', and therefore, explanatorily redundant of market-participants' behaviours. It is argued that this narrative overlooks the possibility of subcultural moralities, and the profound significances these shape for individuals.

Finally, the paper addresses the theoretical implications and limitations of these findings – primarily, recommending that researchers depart from cynical, economic narratives which dismiss non-economic rationales. Rather, the author hopes that more studies, utilising digital ethnography, will investigate the moral, performative and ideological systems, in which market-participants immerse themselves.

Heterogeneous Effects of Police Shootings on Crime Reporting Practices and Changing Implicit Sentiment Toward Police

Amid inconclusive evidence concerning whether police violence affects crime reporting behavior, I assess whether shootings by law enforcement officers delay or deter reporting of victimization experiences in subsequent weeks. Data on 149,000+ reported crimes in the weeks around 400+ shootings by law enforcement officers in the city of Los Angeles reveals heterogeneous causal effects that vary by police shooting incident type, severity of the victimization experience, and the social context in which events occur. I find that shootings by law enforcement officers generally affect which crimes are reported without affecting the timing of crime reporting. Effects differ significantly across sample years reflecting effects of heightened discourse and skepticism concerning the validity of police use-of-force practices. In these years, shootings by Los Angeles Police Department officers led to an increase (decrease) in the proportion of victims who identify as White (Hinospanic) among those who chose to report victimization experiences that involved direct contact with a perpetrator. Also during these years, White and Hinospanic crime victims delayed crime reporting by a day or more after fatal shootings, fatal shootings of unarmed persons, and shootings of persons showing signs of mental illness implicitly indicating that such events were negatively perceived. There is little evidence of significant changes in crime reporting practices of Black and Asian crime victims following shootings by police officers. While legal cynicism has been characterized as a frame reflective of subculture in Black and disadvantaged communities, findings here-in offer evidence of behavior consistent with such views can develop in other settings.

Crisis Diverted: The Handling of Public Crises in the Twenty-First Century

This paper is interested in what happens when emerging public crises are moved into a soft legal realm of inquiry, investigation, and review. It is anchored in an analysis of the official response to the fatal shooting of Jean Charles de Menezes by UK Metropolitan Police Officers in 2005, following his misidentification as a terrorist suspect. The official response involved overlapping lines of investigation into 'what happened', including a review by the (then) Independent Police Complaints Commission, an inquest, a Scrutiny Report, and Crown Prosecution Service review. Such multi-layered responses to brewing public crises are customary in the twenty-first century, and this paper suggests that we see this review-work in terms of a distinctive institutional domain. This presentation seeks to identify the key features of the soft legal realm, including the deferral of decision-making to a central soft legal mechanism and a focus on the empirical question of 'what happened?' The paper considers, too, how the soft legal realm responds to impulses towards crisis, and as part of this identifies a tendency for central soft legal mechanisms to become over-burdened and bracket-out concerns and voices.

MORALES, Josafat* (Universidad Popular Autonoma del Estado de Puebla (UPAEP), Mexico)

From Oil to Lithium: Extractivism in the Mexican Social Imaginary As Political Legitimizer.

Since the expropriation of 1938, oil has occupied a central place in the Mexican social imaginary, strongly linked to nationalism (Morales, 2020). Despite time and changes in the economic model, oil continued to be part of the country's magma, providing legitimacy to the Partido Revolucionario Institucional (PRI) governments for many years. With the arrival of Andres Manuel López Obrador to the presidency, the State has recovered its central role in the oil industry, setting aside the 2013 energy reform. Likewise, with the discovery of considerable lithium reserves, the government seeks to monopolize its exploitation, creating a state-owned company that will control its entire productive chain, as PEMEX used to do with oil. Furthermore, the government has generated a nationalist discourse that tends to place lithium within the social imaginary, as the PRI did years ago with oil.

Thus, this paper seeks to identify how the Mexican State has used extractive products to legitimize different regimes, favoring their incorporation into the social imaginary. Based on the proposal of Cornelius Castoriadis' magma and the differentiation between social theory and social imaginary proposed by Charles Taylor, we suggest that oil has occupied an important place in the social imaginary, linked to legitimizing PRI governments. Also, we propound that the current government seeks to make lithium a similar case.

This project is part of the work of the Group "Conflictos ambientales, extractivismos e imaginarios" of the *Red Iberoamericana de Investigación en Imaginarios y Representaciones (RIIR).*

Los Think Tanks En Chile En Tiempos De La Politización (2011-2022). Análisis Del Campo, Estudios De Caso y Proceso Constitucional

Los think tanks son instituciones fundamentales en el debate público, político e intelectual en Chile. Sus funciones de investigación, consultoría y diseño de políticas públicas, particularmente relevantes desde la transición a la democracia, resultan imprescindibles para comprender el desarrollo político chileno contemporáneo. Estas instituciones, además, han sido actores clave en la rearticulación de poder entre el Estado, la sociedad civil y sus diversos grupos sociales. De hecho, en los últimos años han venido ejerciendo en Chile un rol de mediación social, política y también cultural ante un contexto de crisis de legitimidad de la política. Un ciclo histórico iniciado con las movilizaciones estudiantiles del año 2011 y que se proyecta hasta la actualidad, donde la agenda político-cultural, además de económica, ha quedado claramente marcada por el debate constitucional. Entre medias, están los llamados "tiempos de la politización" (PNUD, 2015), que se traducen en una mayor demanda de participación de la ciudadanía y la sociedad civil en los procesos políticos. Bajo este ciclo, han nacido nuevos think tanks en Chile, varios de ellos ligados a las derechas, algunos con perfiles más intelectuales, y otros más combativos y alineados con el movimiento libertario internacional. Además, desde las izquierdas también han emergido nuevos think tanks ligados a la renovación política que representa el Frente Amplio. Son centros de acción o activismo social, dedicados a tejer redes con organizaciones y movimientos sociales, y que han introducido en la agenda temas ligados a la reforma previsional, la educación, el derecho a una salud pública o temáticas de género.

Trayectoria De La Sociología En Chile. De Su Temprana Institucionalización a Una Sociología Plural Para Una Sociedad Diversa.

La trayectoria de la sociología en Chile siguió un temprano proceso de institucionalización y consolidación desde los años 50 hasta el quiebre del golpe militar de 1973. Bajo el contexto adverso de la dictadura, la sociología se implicó en los procesos sociales y políticos de transición a la democracia. El contexto democrático post 90 permitió el desarrollo de la disciplina aprovechando los nuevos espacios universitarios, hecho que hace que la disciplina esté hoy presente desde el Norte al Sur del país. Además, la sociología recuperó su conexión con su sociedad tras el estallido social de octubre de 2019. Se destaca cómo la sociología chilena ha sido una sociología anfibia al cambiar sus identidades según fue cambiando su propia sociedad, pues se modernizó, se profesionalizó y fue también capaz de integrar distintas perspectivas como de vincular dinámicas macrosociales e históricas con procesos locales. Además, es una sociología internacional y latinoamericana a la vez, pero condicionada por los códigos y la competencia que impone la lógica de investigación basada en la productividad académica.

Australian Rules Football, Discourses of Race and Racism, and Challenges for Anti-Racism

Australian Rules Football (AFL), a popular national sport played at all levels (from small rural communities to large cities, and by all genders), and a focus of massive daily commentary and speculation, is a prism for exploring the dynamics of race and racism, and the possibilities and pitfalls of anti-racism struggle, in Australian society. Highly symbolic moments like Indigenous player Nicky Winmar pointing to his black skin in response to racist taunting by opposition fans in 1993, the racist booing of Indigenous player Adam Goodes (2014-15) in response to his stance against racism and support for Indigenous rights, that ultimately drove him out of the game, Brazilian-Australian player Heritier Lumumba's attempts (from 2020) to highlight the systemic racism of the Collingwood football club that led to his estrangement from the club, and in 2022 accusations that Hawthorn football coaches were involved in separating Indigenous players from their partners and families, shine a spotlight on the hierarchies of race in Australian society. These examples also indicate the difficulties of putting race on the agenda, in the context of systemic racism and denial, and also the extraordinary toll on Indigenous and other AFL players who have spoken truth to racial power, in a context of ongoing white domination of the AFL. This paper uses this case study (drawing on a wide range of public and media commentary) to investigate the ongoing difficulties of discussing race and racism in Australian public life. AFL teams, and AFL administrators have engaged in fitful and flawed attempts to enact anti-racism strategies, through policies, and also through commitments like Indigenous rounds. This paper explores these anti-racism attempts, while highlighting the ant-racism efforts and strategies of Indigenous and other AFL players.

African Kids Can: Using Social Media to (re)Claim the African Youth Narrative in Australia

The 'African gangs' narrative has hyper-problematised and criminalised Black African migrants in Australia for over a decade. In 2016, following the 'Moomba riots' in Melbourne, the African gangs narrative re-emerged once again within national media and political discourse inciting racialised 'moral panics' that exacerbated already existing anti-Black African sentiment in Australia. The racist 'majoritarian narrative' of African youth's 'terrorising' and 'running riot' in Melbourne's city centre, resulted in significant consequences for the African community in Australia who were subjected to increased experiences of police targeting, racial profiling and racism and discrimination. Significantly, it has been noted that, in the face of these overwhelmingly negative portrayals, African young people have felt invisible, disempowered and psychologically defeated by the media. This paper employs the use of the critical race methodology 'counternarratives' to explore the use of social media by Black African young people in Australia to challenge the racist and inaccurate 'majoritarian narrative' of African gangs. Drawing on six months of social media ethnography and multiple participant interviews with African youth participants (n=15), this paper argues that social media is a significant

site where African young people in Australia (re)claim their narratives as African kids who 'can'. Ultimately this paper argues that when told from Afrocentric perspectives, digital counternarratives visibilise Black contributions and collaborations, and Black excellence, disrupting dominant discourses that devalue, disempower, exclude and singularise African people - and their stories - in settler-colonial Australia.

Afrocentric Digital Belonging: Theorising the Social Media Practises and Experiences of Black African Young People in Australia

African Australian diasporic literature has drawn attention to the highly racialised, criminalised and discriminatory experiences that shape the way that Black Africans experience belonging in Australia. We build on Kwansah-Aidoo and Mapedzahama's (2018) typology of 'Fractured Belonging' by exploring Black African young people's digital practises and experiences of social media. To do this, we draw on a multi-method study with African young people in Australia (n=15), which used social media ethnography and multiple participant interviews to argue that African young people use social media to agentially craft and claim their own spaces of belonging. We suggest a three-part typology - 'Afrocentric Digital Belonging' – which involves three core processes: (re) cultivating identities and Black spaces, evoking boundaries, and forging digital/ physical connections. We propose that through these core processes, digital spaces can offer new ways of navigating, contesting, (re)imagining and forging new understandings of belonging for Black African young people who live in predominantly white spaces.

Exploring Ethical and Technological Issues in Online Interviewing during COVID-19: A Thematic Analysis of International Research

This paper synthesises international research literature on the ethical and technological challenges and opportunities of biographic, narrative research published during the period of COVID-19, related to lockdowns and major restrictions (e.g. from January 2020 up to September 2022). While there is a growing corpus of literature on practical and ethical challenges, solutions and personal reflections of researchers during COVID-19, evident in the plethora of published research since 2020, there are few attempts to thematically analyse and categorise this literature and to explore similarities and differences in researchers' responses to Social Distancing (SD) and ethical and practical questions and solutions across countries. This paper, based on on-going work by the authors into the reconfiguration of social life during and post-COVID lockdowns, aims to advance research and is a resource for the training and education of biographical scholars globally, highlighting the diversity of work into research approaches and confluence and convergence in biographic narrative researcher's experiences. Importantly, it calls for more global interdisciplinary and transdisciplinary research, delineating what traditions, novel research approaches and recent research policies internationally can tell us about future directions for biographical research.

Exploring the Multidimensionality of Veterinarian's Communications in the UK and Ireland: Knowledge, Cultural Scripts and Power in Large and Small Animal Veterinary Clinics

This paper focuses upon how different but intersecting veterinary knowledge cultures are both influenced by and also shape diverse and dynamic communicative conventions, narratives and cultural scripts in small and large animal veterinary clinics in the UK and Ireland. Drawing upon biographic narrative interviews with 40 practicing veterinarians, veterinary nurses, and veterinary specialists, we elucidate the multifaceted dimensions of veterinarians' communicative conventions with farmers and pet owners during clinical encounters relating to diagnosis, treatment and other veterinary interventions including euthanasia and post-euthanasia. We argue that different concepts of 'knowing' regulate veterinarian communications with farmers, pet owners and non-human clients in a range of professional settings, like examination rooms, farmyards, clients' homes, and soothing rooms and 'backstage' in private communications between veterinary professionals, families and friends. In this paper, 'knowing' refers to complex knowledge cultures that operate in veterinary clinics and in specific geographical and occupational communities that regulate social interactions, power relations and culturally legitimised ways of behaving. Significantly, 'knowing' also transgresses traditional

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

boundaries between tacit and explicit, and lay and scientific knowledge that are frequently discussed in extant literature. We argue that different yet convergent forms of knowing offer potentially fruitful conceptual avenues for deepening our understanding of veterinarian's knowledge and illuminate the multidimensionality of their everyday professional and personal interactions with humans and non-humans.

Transformative or Market-Driven Solutions to Social Challenges? the Social and Solidarity Economy and Its Impact on Southern European Cities: The Case of Bologna.

I will discuss my current research project that aims at better understanding the relationship between SSE and transformative change in a specific context, drawing inspiration from the action-research approach. In this way the whole process is configured as a social construction resulting from the dialectical interaction between different actors (researcher, social entrepreneurs, local administrators, etc.). In this sense the restitution of the research results will be a fundamental moment of exchange among the participants. On the one hand, I conducted semi-structured interviews with members of local organizations and institutions dealing with SSE (i.e. research, funding, advocacy). The intent is to help frame the discourse on SSE and compare it with actual practices. On the other hand, I conducted qualitative and in-depth analysis of the selected case studies combining different research tools. When possible, I conducted participatory workshops with practitioners to co-construct impact indicators using the 'Theory of Change' (Anderson, 2005) as a working tool. Later on, based on both them and existing literature, I will conduct impact analysis of the organizations with the support of semi-structured interviews and online questionnaires. Participant observation and document analysis will support data collection and analysis as well.

Urban Collective Action in the Field of Security: Empirical Comparative Research on Neighbourhood Watch Groups in Modena.

Perception of urban security is a major sociological and social psychology research theme. Political parties, institutions, citizens seek after best options to provide sense of security. However, the general attitude from policymakers is to propose a sort of solution that can fits everywhere, regardless of social context of neighbourhood or city. In Europe, the most common way to enhance a good security perception in urban fabrics has been identified in the mobilization of citizens trough Neighbourhood Watch Groups (NWG). These are groups of citizens who help police with reports, about urban decay, suspicious activities, promote gatherings, cooperation, extension of networks, conviviality. However, we still know little about these mobilizations. Are activities promoted by NWGs oriented to enhance the sense of security, or promote social control on urbanization? In other words, claiming security, do NWGs promote behaviour accepted from only a part of the residents (homophobic or racist behaviour)? Conviviality aims at creating sociality among different groups, or raise a sense of belonging only to a part of the residents? To answer these questions, 12 NWG (out of 93 actively operating) have been selected on census data on heterogeneity and socio-economic frailties of different neighbourhoods in the municipality of Modena (187.000 inhabitants), Italy. Census data on population and services have been used to select neighbourhoods. Interviews to NGW leaders, municipal managers, local police, local associations, and journalists have been interviewed. Netnographies on chat groups of NGW and participant observations at NGW events have been conducted on these realties in fall-winter 2022/23. It is ongoing research, but preliminary results show how social heterogeneity in the neighbourhood play a pivotal role in the development of these groups, thus leading to the hypothesis that processes of creating mutual consensus could be challenging and will be carefully observed both with quantitative and qualitative research tools.

What Role for Digital Health in an Ageing World? Patterns of (in) Disposition

An ageing population is a great challenge for health agencies. Elders need peculiar attentions in terms of care, treatments, monitoring. The result is a huge expenditure for National Health Systems (NHS), which must face consequences of often inappropriately treated health conditions, frailties. Western countries are already experiencing this trend. Italian over 60 population represents 30% of the overall population, with a rise that will continue in the next decades. Advancements in preventions efforts have been made, also thanks to first attempts of digital health services. However, few studies have promoted a screening of over 60 population, to understand the autonomy of the elder population, and to assess the digital equipment possession, digital competences and propension to the adherence to digital

health services. This study aims to fill this gap, through a survey implemented trough Activities of Daily Living (ADL) and Instrumental Activities of Daily Living (IADL), questionnaires, asking also about digital technology possession and competences and disposition to digital health services, to a stratified sample related to age (over 60), sex, income, neighbourhood, living in the municipality of Cremona (70.000 inhabitants), one of the eldest Italian municipalities. As is a ongoing research, the aim of the survey is to reach 1300 respondents. With this study, it is intended to better understand the level of autonomy of elder population, when and at what conditions digital health services are suitable to better assist the elder population. A better understanding of these dimensions will be beneficial for the scientific community to understand how digital technologies could enlarge inequalities in access to health services, and how this is related to digital divide and/or to an indisposition towards the use of digital technologies in matters of health. Moreover, it could help policymakers to consider wisely when and at what conditions invest in digital health technologies.

MORI, Ahmed* (Johns Hopkins University, USA)

The Politics of Real Utopias: Labor Regimes in a Cleveland Laundry Cooperative

Worker cooperatives feature prominently in conversations about alternative forms of production in the context of solidarity economy, "real utopian," and degrowth frameworks. Drawing on interviews, this paper argues that two facilities of a laundry cooperative - part of the Evergreen Cooperatives initiative in Cleveland, Ohio - embody distinct labor regimes that illuminate the limits of possibility for social transformation under these frameworks. It argues that Erik Olin Wright's real utopias project insufficiently grapples with workplace politics, focusing too heavily on the institutional design of prefigurative projects with too little concern for the philanthropic and state structures, market pressures, and ideological justifications that underpin them. Both labor regimes showcase the contradictions of top-down development of alternative economic formations by philanthropic and state actors that provide worker-owners with little agency, capacity building, and education. Both regimes also highlight the tensions of scaling cooperative development projects as market discipline subsumes the democratic character of the cooperative.

Does Entrance into Private Junior High School Make an Actual Difference in Students' Learning? a Case in Japan

Studies on educational inequality have repeatedly shown that socio-economically advantaged families use their resources to give their children greater access to better learning environments. Indeed, going to a private junior high school is often reported positively in media as having a positive impact on a child's academic and personal development through its school environment and educational programs. However, while previous research has identified that students from a higher socioeconomic background in metropolitan areas tend to make such choices, research has yet to fully elucidate the consequences of actually attending private schools.

Focusing on private junior high schools in Japan as a case of "tracking" in secondary education, this study examined their effects on students' learning and development, as well as their influence on parental perception during junior high school years. Analysis using a Japanese Longitudinal Study of Children and Parents revealed that students are placed in a more academically challenging environment when they enter private schools, and their satisfaction with lessons and schools improves to some extent. However, the findings indicated no notable differences between going to public and private schools in terms of social interaction with friends, self-esteem, and non-cognitive skills (i.e., self-control and inquisitiveness).

Therefore, although there are socioeconomic differences in access to private junior high schools, coupled with differences in parental expectations in Japan, there may not be much difference in the actual consequences in child's development at least during junior high school years. One possible background to these results is the underlying role of public schools in Japan. Another explanation to this background may be that privileged families "find its way" to exploit opportunities (Triventi et al. 2020), whether they send their children to public or private schools.

Knowledge Production Process of Grassroots Environmental Activism Against the Newly Emerged Environmental Pollution: A Case Study of Pfas Pollution from U.S. Military Bases

This presentation examines the knowledge production process of the grassroots environmental activism against environmental pollution caused by PFASs (per-and polyfluoroalkyl substances) chemicals from the U.S. military bases in Okinawa, Japan.

PFASs are chemically synthesized, non-water-soluble compounds that had been widely used as waterproof coatings and fire extinguishing agents. Due to

denotes a presenting author. Abstracts are organized by first presenting author's last name.

their nature, they are very slow to decompose, so they are often called 'forever chemicals', and they accumulate in the environment as well as inside the human body and are strongly linked to a host of cancers, developmental disorders, immune dysfunction, and infertility. Extinguishing agents containing PFASs have been used in firefighting drills for aircraft and factories at military bases on a regular basis. In the US, the nature of the substances was recognized by the companies that produced them in the 1970s, but due to the strong connection between the US environmental administration and chemical companies, the compounds were not strictly regulated, and finally being regulated since the 2000s worldwide.

Knowledge production process of the environmental activism has been discussed particularly at the intersection of social movement studies and the sociology of science to date (Frickel et al. 2010; Hess 2009; Richter, Cordner, and Brown 2020). The previous literature mainly focuses on the environment-corporative relation of environmental pollution in the western countries. This presentation on the other clarifies the state-and-foreign-military-driven environmental pollution structure that is unique because the Japanese legal structure cannot address the pollution inside the U.S. military bases stationed in Japan due to the international treaty, namely the Status of Forces Agreement.

This presentation first examines how this state-and-foreign-military-driven structure was formulated. Second, I will argue how the grassroots environmental activism seeks to transcend the limits by analyzing their tactics to reveal the actual pollution causes and sites.

MORI, Yasunori* (Hakuhodo Incorporated, Japan)

Cultural Capital Determines How Happy One Feels in Japan

Pierre Bourdieu (1977) points out that there exists a "synchronicity between high culture and dominant class," such as high social status and classical music, and also low social status and popular (or non-classical) music. Also, Bourdieu defines cultural capital as "instruments for the appropriation of symbolic wealth socially designated as worthy of being sought and possessed" (DiMaggio, 1982). In this paper, the author refers to "Seikatsu Teiten" (Hakuhodo Institute of Life and Living), or chronological lifestyle survey, that has been conducted biennially since 1992 among males and females ages 20 to 69 within the 40 km radius Tokyo metropolitan area (Tokyo, Saitama, Chiba, Kanagawa, and Ibaraki Prefectures) and 30 km radius Hanshin area (Osaka, Kyoto, Hyogo, and Nara Prefectures). Survey results from 1992, 2002, 2012, and 2022, show that the fact is that people who were happy were more likely to have participated in cultural activities such as putting up New Year's decorations and celebrating "Hinamatsuri (Doll's Festival)", " Tango-no-Sekku (Boy's Festival)", or the birthday of a family member during the previous year (p < .001). Thus, in Japan, cultural capital is not only the indicator of social status of the person but also of how happy someone feels.

Bourdieu, "Cultural Reproduction and Social Reproduction," in J. Karabel and A. H.Halsey, ed., Power and Ideology in Education (New York, NY: Oxford University Press, 1977) 487-511.

DiMaggio, "Cultural Capital and School Success: The Impact of Status Culture Participation on the Grades of US High School Students," American Sociological Review (1982), 189-201.

MORIYASU, Junko* (Hyogo Association of Certified Social Workers, Japan)

TATSUKI, Shigeo* (Doshisha University, Japan)

Training and Empowerment of Social Service Professionals and Community Leaders for Inclusive Drr

In normal times, long-term care services make it possible for older vulnerable people and PWDs to live in their own neighborhoods. In the event of a disaster, however, it is impossible for social service workers/professionals to rush out to and rescue each of their clients at the same time. In times of emergency, neighbors are expected to help each other; that includes older vulnerable people and PWDs. However, neither the social service nor the crisis management departments have been collaborating in order to provide seamless normal and disaster time coordinated responses.

In 2018, the Hyogo Association of Certified Social Workers（HACSW）started the "Disaster Preparedness Training" program for social service professionals working mainly with long-term care program users. The program aimed to enable social service professionals to incorporate normal time long-term care service plans with disaster time evacuation plans in collaborations with local residents' informal supports. This model is based on the action research that has been conducted in Beppu City, Oita Prefecture since 2016. By September of 2022, approximately 2,500 professional social workers as well as related human service professionals and municipality administrators had completed the training modules over a five-year period.

In addition to professional training, HACSW had begun initiatives to empower local community leaders by providing "Individual Evacuation Plan Development Training" since 2022. The participants consisted mainly of members of voluntary disaster prevention groups, community welfare committee members, neighborhood resident association presidents, and other human service professionals who would play a key role in organizing communities to participate in the training and learn the significance of planning individualized evacuation support plans.

These training programs represent initiatives that would promote the active engagement of older vulnerable people and PWDs and the realization of "no one left behind" through the "all-of-society engagement" of the Sendai Framework for Disaster Risk Reduction.

Shared Spaces and Community Practices: Evidence from New Multi-Residential Dwellings in Melbourne

Globalisation, modernity, and neoliberalism continue to (re)shape the ways that humans associate and practice with others and their local environments. But rather than fade away during this time, community continues to be a normative goal and outcome for many human endeavours. Characterised by a desire for shared identity, belonging, and safety, communities appear in ever-growing shapes and sizes across an increasingly uncertain and unequal world. Because of these factors the concept remains burdensome, resistant to clear definitions and prone to analytical ambiguity. In relation to built environment research, various housing-tenure models exist that claim to support and sustain a 'community' through personal, social, design, and management factors. Quintessential in these models are shared spaces, areas where residents can elect to take part in communal practices. But how the personal, social, design, and management features of shared spaces affects belonging, safety, and shared identities remains unclear, most pertinently in market-driven housing. This presentation will provide early findings from a doctoral thesis evaluating three new multi-residential dwellings in Melbourne, Australia, that vary by resident size, tenure, shared spaces, building management, and participation in market speculation. Focus groups, spatial mapping, and autoethnography are used to triangulate, expand, and develop better understandings of resident practices in shared spaces, including how they affect relations of belonging and collective identity. This research aims to further knowledge at the intersection of community practices, shared spaces in multi-residential dwellings, and the perpetual mediation of differences in a shifting and uncertain world.

MORONI, Sheyla* (Università degli Studi di Firenze, Italy)

CELLINI, Erika (University of Florence, Italy, Italy)

From Peppa Pig to Young Partisan Movements.

25 September marked the victory in Italy's political elections by Giorgia Meloni, leader of the Fratelli d'Italia party, which belongs to the right and is not without ties to the fascist party (see the tricolour flame in its logo). Meloni's victory was predictable as it demonstrates the diffusion of a new public/political discourse that, through certain cornerstones, proposes a return to nationalism, to a more traditional vision of the family, and to a series of issues in line with the European right-wing parties, especially with that of Hungarian Prime Minister Orban.

Our work takes its cue from a series of political initiatives by Meloni aimed at supporting the traditional family, from some reactions to a cartoon, Peppa Pig, which featured an episode with a two mother family, strongly criticized by Meloni, from a series of related speeches dealing with the issue of gender rights, gender education, ect (see Meloni's discourse with VOX).

Meanwhile we will follow possible resistance movements activity such as Sentinelli (a young antifascisms movement) and the ANPI (National Association Italian Partisans)

Methodology:

The methodology will be qualitative and based on the reading of the following texts, and quali-quantitative, carried out by selecting some words recurrences present in different texts types, analysed through the use of specific content analysis (for instance Text Search Query) programmes.

In deatail we'll analyse:

- The party programmes from the beginning of the Meloni Secretariat;

- The party website as it appears in the days close to the elections and during the construction of the government;

- Meloni's Facebook and Twitter profiles posts until the conclusion of the establishing of the government (until June 2023)

-Sentinelli and ANPI facebook profiles

- Decisions and the main family policies will be followed.

(Research conducted by Cellini-Moroni-Pezzoli)

RC06-114.1

MORONI, Sheyla* (Università degli Studi di Firenze, Italy)

CELLINI, Erika (University of Florence, Italy, Italy)

Modern Family Throught the Eyes of Giorgia Meloni and Those of Pope Francis

25 September marked the victory in Italy's political elections by Giorgia Meloni, leader of the Fratelli d'Italia (FDI) party, which belongs to the right and is not without ties to the fascist party (see the tricolour flame in its logo).

Our work takes its cue from a series of political initiatives by Meloni aimed at supporting the traditional family, from a series of related speeches dealing with the issue of gender rights, gender education, ect (see Meloni's discourse with VOX).

At the same time, it analyses the discourse on family and gender of Pope Francis I and the Vatican, which, in some cases, seem to challenge FdI in a direction of greater adherence to reality and shows a signifying openness to include 'multiple' and 'different' possibilities of family making.

The methodology will be qualitative and based on the analysis of the following texts, and quali-quantitative, carried out by selecting some words recurrences present in different texts types, analysed through the use of specific content analysis programmes (for instance Text Search Query).

More detailed we will analyse:
- The party programmes from the beginning of the Meloni Secretariat;
- The party website as it appears before and during the construction of the government;
- Meloni's Facebook and Twitter profiles posts until the conclusion of the establishing of the government (until June 2023)
. – Pope Francis Twitter profile post
- the official website of the Vatican
https://www.vatican.va/content/vatican/it.html
- the OLIR (Ossevatorio sulle libertà religiose) data base
- In addition, decisions in the composition of the government, the main family policies will be followed.
We will try to underline the discrepancies and / or concordances between the two positions
(Research conducted by: Sheyla Moroni, Erika Cellini and Silvia Pezzoli)

RC43-613.4

MORRIS, Alan* (University of Technology Sydney, Australia)

Housing and Inequality in Australia

In Australia housing is playing a central role in accentuating and perpetuating inequality. This paper, drawing on primary and secondary data, discusses the various ways in which housing tenure in Australia contributes to wealth and income inequality. It argues that a neoliberal housing policy framework and accompanying financialisaton of housing have facilitated a dramatic increase in house prices, the neglect of social housing and a deepening wealth and income divide based on housing tenure. With respect to wealth, the key divide is between outright homeowners verse low-income private renters and low-income households in mortgage stress. The wealth of outright homeowners has grown substantially in recent decades and many have been able to acquire a holiday home and / or investment properties thereby intensifying the wealth divide. Approximately a third of Australian households are now locked out of home ownership for an extended period or even lifelong. Housing tenure status also has an impact on the disposable income of households. For example, low-income outright homeowners are invariably in a far better position with respect to disposable income than their counterparts who have large mortgages or are private renters. The intergenerational implications are profound. Housing wealth (or the lack thereof) is playing a major role in reproducing class inequality.

MORRIS, Joe* (Sheffield University, United Kingdom)

Performance-Scheduling in the UK's Warehouses: Race, Restraint and Resistance

It is frequently noted that the development of logistics labour is predicated on managerial attempts to eliminate unproductive time and maximise productive effort through performance management (Newsome, 2015) and flexible scheduling (Pulignano et al., 2022). This process is, however, complex, uneven and incomplete, with control over the use of workers' time and effort continuing to be subject to dispute (Goodrich, 1920). Yet this insight has tended to be neglected in accounts of recent managerial initiatives in warehousing where labour is predominately comprised of migrant and racially minoritised workers. While discussions of 'temporal flexibility' and 'performance management', have emphasised managers' attempts to achieve greater coordination between labour supply and production requirements, reduce indeterminacy, invade porosity and intensify work. On the other hand, it has failed to engage with these developments in sufficient conceptual depth.

The present paper draws on ethnographic research inside two warehouses in the Sheffield City Region in the UK. An investigation of the operation of performance-scheduling, meaning the coupling of workers' performance rates with workers' schedules, is analysed as an outcome of *struggle*. The paper reveals that attempts to commodify labour time in the warehouse vary according to the reach of informal work practices and the capacity for different migrant/refugee workers to exercise some control over the effort bargain. In doing so, the paper reveals the distinctive labour power characteristics of White migrants from Eastern Europe and Black Refugee workers, highlighting how different migrant labour hierarchies in the warehouse internalise and respond to the performance-scheduling nexus. Theoretically, the aim is to provide a deeper conceptual understanding of the UK's migrant labour force's role in circulation.

MORTENSEN, Therese* (Lund University, Denmark)

Human Rights As Social Service: Vernacular Rights Cultures in a Rights-Based and Neoliberal India

India is a state that both acknowledges the rights of children as a guiding national policy principle, but also outsources much rights implementation to private actors such as NGOs. This article asks what happens to the concept of "rights" when their implementation is dependent on the voluntary sector. Based on ethnographic material from one NGO-dependent child rights programme, and with the conceptual framework of "vernacular rights cultures," the article finds that for "semi-governmental" social workers, the concept "samāj sevā" (social service, social work) intermingled with the rights concept to an extent that rights were conceived as something to be "given" and "mediated" by social workers, and not only claimed from the state. With this, I argue that if we want human rights theory to reflect the ground, we should take the conceptual consequences of actual rights practices – such as NGOs being "subsidiary" duty bearers to the state – seriously.

'Feels Good or Not Good?' Intersecting Emotions, Energy and Awareness to Reach a Sense of Well-Being. the Case of Core Energetics' Practice.

Holistic practices' success and credibility heavily draw on their ability to subtly tie the metaphors of personal transformation with some elements of scientific knowledge. This is the case of core energetics, a technique of self-development that was initiated in late 1960s by the psychiatrist Pierrakos as he combined Bioenergetics approach (which he developed himself with A Lowen, a student of the psychologist Reich) and the spiritual framework related to the Pathwork that he came across with as he met Eva Broch in 1971. Based on a fieldwork (observations and interviews) I have conducted among core energetics practitioners since early 2022, I will describe how the principles of this mindful-body technique unfold during the collective and individual sessions. As sensations, emotions and energies intersect to build a sense of personal release and awareness, I examine how these highly emotional and physical shared experiences are driven by embodied relationships to other participants and to the leader. I will then discuss the issues related to this practice in light of local regulations.

Italy's New Policies to Tackle Violence Against LGBT+ People: The Beginning of a New Era?

Gender-based violence represents a form of victimization, based on the patriarchal matrix, which results in producing and reproducing structural gender inequalities. It is exercised not only against women, but also against lesbian, gay, transgender and, people of non-conforming gender. In Italy this phenomenon is constantly increasing, but despite this the law enforcement policies implemented so far have been fragmented and rather weak.

After a long parliamentary process, in 2021 the bill Zan – the law that should have dealt with preventing and combating forms of violence based on sex, gender, sexual orientation, gender identity and disability - was definitively rejected by the Italian parliament. Despite this, through a parliamentary expedient, the left parties, promoters of this law, managed to save part of it and enable the creation of a program aimed at supporting, assisting, and preventing violence against LGBT+ people. In 2022, this led to 37 projects being financed across the Country to create "Centers against discrimination" and 2 shelters for people who are victims of violence.

As a part of Italian National Project PRIN2021 "Stereotypes and prejudices: the social representation of gender-based violence and contrast strategies ten years after the Istanbul Convention", we show you the first results of a research carried out with a qualitative approach (in-depth interviews, key stakeholder interviews, and participant observation) in a Center against discrimination in Reggio Calabria (Southern Italy) and a shelter managed by Gay Center in Rome. The goal is to analyze the actions and working methods of these organizations and to identify "good practices" that can represent new policy suggestions for local and national political players.

The Risks of Sharing Suffering in a Context of Extreme Inequality and Violence amidst Brazilian Homeless Population

Researching on a risky landscape, configured by inhabitants' practices and narratives, through which daily risks of police, partner and kin violence, drug abuse, disease and death are managed, is an emotional rollercoaster.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

My research about risk management practices of the homeless population in downtown Brasília, Brazil, during the Covid-19 pandemic, has exposed me to the risk of seeing, sharing and writing about suffering (Claudia Mitchell, 2018) in extreme conditions of inequality. To partially connect (Donna Haraway, 1995) to this world, I entered a "moral economy of sharing" (Philippe Bourgois and Jeff Schonberg, 2009) with around 40 participants, by working with an NGO of damage reduction that specializes in homeless women and sex workers. This economy entails the "art of noticing" (Anna Tsing, 2015) to whom, what and when to share, translate and exchange, emotions, world views and objects-services, so that the connection therein established, in intra-action (Karen Barad, 2017), can effectively create some sort of escape from the caritative logic that dominates Brazilian relations of social protection, embedded in more than 500 years of catholic colonialism and racial subalternity, with its inbuilt mechanisms of perpetuating inequality (Sara Ahmed, 2004). The experiential experts of the damage reduction NGO have taught me how to work on the thin layer between homeless agency and necessity, freedom and moral rules, escaping the caritative emotional trap. This is relevant to constitute the subject of social protection *in* the encounter with state provisions, weaved by a network of intermediaries and brokers. To promote such encounter is a tricky business, producer of and produced by neoliberal social and security regimes, with radical state budget cutbacks for the former and augmented resources for the latter, enforcing individual, familial and community devolution of responsibility for risk management, whilst reinvigorating punitive sovereign and disciplinary remedies.

The Metamorphosis of Interdisciplinarity: From Unity of Method to the Search for Deeper Insight

The sociologist Stefan Nowak (1925-1989), a faithful disciple of Paul Lazarsfeld, and at the same time a typical representative of the professorial Polish intelligentsia, religiously indifferent and of left-wing but non-communist sensibility, felt confused when one of the invited guests in the 1980s at a seminar of the Methodology Department stated that "the source of modern nations is the saving sacrifice of Christ". Nowak had been running the seminars and organising conferences for years, at which representatives of other disciplines, not only from the social sciences, appeared alongside sociologists. This was in line with the ethos of the post-war representatives of the behavioural sciences, who emphasised that interdisciplinarity was based on unity of scientific method. Transformations in the philosophy of science and the metamorphosis of the sciences themselves shattered this picture. Nowak's disciples, inspired by anti-positivist currents from the West, the internal criticism of survey sociology and carried away by the experience of the Solidarity social movement, rejected the positivist model of science as the scientific ideal and research programme of Polish society. One dimension of the change was the attitude towards other disciplines.

Young sociologists from Nowak's circle, rebellious towards their teacher, were inspired by philosophy, history, psychology or theology in their research on religion (as a key area of social life in the 1980s). I will argue that not only has the references within these disciplines changed (other authors and currents have become key), not only has there been a choice of affinity with the leading disciplines (i.e. history instead of psychology), but also the very nature of interdisciplinarity has changed. Paradoxically, despite the anti-positivist belief in an autonomous and fundamentally untranslatable perspective between disciplines, the role of feedback from these disciplines increased. There, they sought not to supplement the sociological perspective, but to deeply ground it.

Teaching As Remembrance and RE-Memberment: Centering African Maternal Legacies of Knowledge in Decolonising Sociological Thought and Teaching

The paper seeks to center African maternal legacies of knowledge as a decolonial critique of Euro-American dominance in knowledge production and pedagogies in African universities. We tap into the 'ontology of the mother' as a bases to access alternative knowledges generated by African women scholars and activists, while using them to create ontologically and epistemologically differently situated teaching spaces for humanities and social science students. Using indigenous healing epistemologies and methodologies to access hidden and various maternal knowledges, we highlight the violent epistemic erasure of these knowledges within South African universities, which we argue perpetuates the epistemic alienation and exclusion of African students.

We unearth the emerging principles and practices underpinning indigenous feminist healing epistemologies and methodologies by examining the works and practices of 5 African decolonial humanities and social science women scholars and activists- Harriet Ngubane, Nomathamsanqa Tisani, Nokuzola Mdende, Yvette Abrahams and Mmatshilo Motsei. In excavating these oft forgotten scholars and marginalised knowledges generated, they remind us what we have forgotten, or rather that we have forgotten that we have forgotten. Finally, by introducing the concepts of 'teaching as remembrance and re-memberment', these indigenous feminist healing epistemologies and methodologies will be explored in action where students will be invited to the epistemic habit and grammar of remembrance and re-memberment, thus ultimately centering the notion of the teacher as a healer. In these ways, the paper goes beyond the limited parameters of coloniality of knowledge, power and being, by underscoring the limitation of the decolonial scholarship to reflect and elaborate on knowledges and experiences of African women and the global South. We thus believe that in centering the 'ontology of the mother' both in scholarship and our teaching practices, the paper will make important contributions in the domains of African feminist thought, indigenous epistemologies and methodologies and feminist pedagogies.

Social Movements As Agents of Change: Fighting Intersectional Food Inequalities, Building Food As Webs of Life

What does the diversity of social movements and food initiatives tell us about processes of social change? I argue that they offer a productive analytical lens to observe social change because they identify injustices and dynamics of inequalities in the food system and are actively engaged in transforming these. Alternative local food initiatives react to the environmental impacts of globalized food relations; food sovereignty movements highlight class inequalities and power asymmetries in the food system that affect people's rights to culturally appropriate foodways; food justice movements denounce institutional racism; feminist movements fight persistent gender inequalities from food production to consumption; vegan movements defend animal rights. These are often mapped into different world regions, with food justice movements more present in the US; food sovereignty movements louder in the Global South, feminist food movements more active in Latin America, and local food movements commonly in the Global North. This article brings together diverse strands of activism and research on social inequalities related to food under the conceptual umbrella of food inequalities. In addition to concept building, it contributes to a sociology of food studies by mapping the geopolitics of knowledge about social change behind the growing mobilization around food issues.

Decolonising Critical Social(ogical) Theory: Enfleshing Post-Covid Futurities

'Decolonial/anti-colonial Black, Indigenous and Mestiza feminist movements and scholar-activists foreground how the oft-touted apocalypse that the Covid-19 pandemic heralds is not new, nor does it signify the great rupture into chaos that those from within modernity-coloniality often claim it to be. Rather Covid-19 is preceded by and will be out-lived by the apocalyptic anti-life onto-epistemological logics that are foundational to the (re)production of hetero-patriarchal capitalist-(settler) coloniality. However, one would commit the violence of reproduction of the epistemological logics and (ir)rationalities constitutive of the current system if the story ended there. We have survived (despite our losses) and our survival points to the urgent necessity and responsibility of (critical) social(ogical) theory to listen to the story of the pandemic from a Black/Indigenous genealogy and to begin the sense-making of the Covid-19 pandemic, from prior to this particular virus, outside, against and beyond the politics of knowledge of critical social(ogical) theory itself. Thus, I invite you to journey to an affirmative re-enfleshment of reason and theory-making in relation to and dialogue with Black, Indigenous, and subaltern Mestiza feminist movements in southwest Colombia and in southeast so-called Australia in the unceded lands of the Awabakal and the Worimi. I explore this through the metaphor, the materiality, the cosmology and the herstory of the mangrove swamps a knowing-being otherwise (in)visible to the dehumanising gave of Whiteness and bring to thought some stories of a politics of knowledge of/as the Black/racialised and feminised body/flesh. To do this is to suggest that the co-creation of pathways which are life affirming and life making beyond and out of the post-Covid 19 conjuncture involves an epistemological- political project which decolonises and feminises the containments of reason and knowing (non)being of coloniality/modernity.'

MOTTA VIVIAN, Mariana* (Freie Universität Berlin, Germany)

Crises of Democracy, Authoritarianism, and Aspirations for the Future in Contemporary Brazilian Sociology

The problem of authoritarianism and the multiple crises of democracies are well-established themes in the field of political sociology, and the recent strengthening of authoritarian leadership as excessive manifestations of authority in many parts of the globe has once again brought this debate to the fore. At the same time that several recent comparative studies have sought common denominators to explain this phenomenon, many investigations have also tried to highlight the particularities of each situation and specific patterns and contingencies involved in the success of specific authoritarian discourses. In Brazil, the election of a political leadership with strong anti-democratic and authoritarian traits to the highest office of the executive power in 2018 activated renewed sociological debates on authoritarianism and democracy in the country. Nevertheless, whereas, on the one hand, the idea of a crisis of democracy seems to be consensual among diagnoses of contemporary Brazil, on the other hand, there also seems to exist a growing dissensus in relation to the explanatory and prognostic dimensions that form these diagnoses. By exploring such diversity, the present work aims to feature some of the answers provided by those on the periphery of the socio-scientific production of knowledge. The selected literature is, thus, qualitatively typified and analysed in order to highlight the contributions that contemporary Brazilian sociology can bring not only to the debate about the present in crisis but also to the making of possible alternative futures.

MOTTA VIVIAN, Mariana* (Freie Universität Berlin, Germany)

Sociology and the Mappings of Possible Futures: Aspirations and Anticipations in the Different Diagnoses of Brazil's Present

The present work is part of a broader interdisciplinary project regarding the dynamics of aspirations and anticipations formed by different protagonists, projections and processes directed towards the future. In particular, it proposes the discussion of sociology's role in mapping possible futures through such dynamics. By producing interpretations of the present, sociologists are constantly engaging in the enunciation of assertions concerning the past and future of communities, being able not only to address underlying problems of social order but also to outline anticipations and aspirations within societies. This is especially so in societal contexts of crisis and change. The rise of authoritarian leaders throughout the world in the past few years, for instance, has mobilized the most varied interpretive practices. In Brazil, recent transformations in the political scenario, especially the recrudescence of far-right-wing forces, have aroused the interest of social scientists and increased demands for sociological explanations of the present. In this context, different representations of the present, past and future of democracy in Brazil have been developed, resulting in a very rich set of diagnoses, mostly based on different reading dimensions of social reality. Given the recent nature of these transformations, however, such discourses still lack a comprehensive articulation – an issue that is heightened by the fact that new ways of understanding these entangled temporalities are constantly being produced. In what way is the present constructed and explained in sociological analyses of contemporary Brazil? Which pasts are mobilized in the narratives concerning the crisis of Brazilian democracy? How do such diagnoses, which are endowed with diverse aspirations and anticipations, discursively map possible futures in the country? These are some of the questions that have driven the present study. The qualitative analysis focuses on the relevant and pertinent academic literature published from 2018 onwards.

Perception of Unfairness and Emotions at Work. a Comparative Analysis of Workers in Restaurants and Universities

This paper aims to explore the links between perception of unfairness and emotions in the workplace. This study is based on a comparative survey on well-being that was conducted in Quebec in two distinct work settings: restaurants and universities. The comparative perspective reveals a discrepancy between perception of unfairness and anger. The experience of unfairness is highly associated with anger. Yet, while "anger or resentment" is reported to be felt more often in restaurants than in universities, the proportion of workers perceiving unfairness at work is higher in universities than in restaurants. Why does "anger or resentment" less systematically translate into perception of unfairness in restaurants? To what extent feelings of "pleasure or joy" and "gratitude or indebtness" mitigate the perception of unfairness in restaurants? How do feelings of "isolation or loneliness" and "sadness or sorrow" contribute to more frequent perception of unfairness in universities? To answer these questions, a two-fold approach is used. A statistical analysis is first used to highlight the mediating role of emotions in the relationship between organizational justice and the perception of unfairness. The meaning of the perception of unfairness is then examined through both a qualitative assessment of the reasons reported by the workers in perceiving unfairness at work and an analysis of in-depth interviews conducted with restaurant managers and university chairs of department.

"New" TRANS Women: Reproducing Intersections of CLASS and Gender in Postcolonial India

In the past decade, we've seen increased attention to newly emerging identity categories, with particular attention to transgender identities. In the future, more such categories (especially around gender and sexuality) are likely to emerge. In media and popular culture, it's often assumed that the emergence of new categories is liberating because new categories allow people to fully express themselves. This presentation questions these assumptions by drawing on 18 months of fieldwork in Bangalore, India to offer an ethnographically-grounded intersectional analysis of the new category of transgender woman in urban India. Exploring new categories that circulate globally, but are taken up in locally specific ways and shaped by histories of postcolonialism, imperialism and current global capitalist systems reveals a fruitful direction for the future of intersectionality.

In many countries, people identify as either cisgender or a variation of newer non-cis identities like transgender, nonbinary, etc. India is unique due to the existence of recognized (yet stigmatized) groups of gender non-conforming *hijras*. Transgender is a newer category that is connected to global LGBTQ+ activism and often opposed to the traditional category of *hijra*. I explore the growing divide between *hijras* and newer transgender identities in India.

As members of an emerging group, trans women engage in identity work to educate others about their identities. I use an intersectional lens to locate the emergence of the trans woman within patriarchal and postcolonial histories that shape contemporary Indian womanhood. I find that trans women align themselves with a popular construction of womanhood in past and contemporary India, the "new" middle-class (cisgender) woman. As trans women align themselves with middle-class, respectable (cisgender) womanhood, they distinguish themselves from their disreputable "other," the *hijra*. I ground my analysis in both postcolonial histories and current rhetoric of women's "empowerment" in liberalized economies.

Addressing Gbvh: A Critical Assessment of Garment Union Strategies in Cambodia

Gender-based violence and harassment at work (workplace GBVH) is a global, complex and intractable issue that impacts millions of workers' lives. For a long time, however, it remained unremarked upon and undealt with. This changed in recent decades, when activists around the world began campaigning against workplace GBVH internationally and in different local contexts.

In Cambodia, the government, international and local civil society organisations and unions recognise that GBVH is a serious problem and have made commitments to eliminate it from the world of work. There have been campaigns, primarily at the national level, trying to influence policy, promote law reform and strengthen law enforcement, and raise awareness of different stakeholders about the need to combat GBVH. Unions are no exception.

This paper critically assesses the impact of garment union interventions on GBVH in the Cambodian context, drawing on the perspectives of grassroots unionists and women workers. Based on qualitative fieldwork conducted in three different garment factories in September and October 2022, the paper identifies the limitations in current approaches and identifies opportunities for better addressing GBVH outcomes. It argues that the most significant potential for impact lies within the labour movement at the grassroots level, where unions' substantive membership is based.

MOUZAKITIS, Angelos* (Univeristy of Crete, Greece)

Social Imaginaries and Modernity: Revisiting the Conception of Autonomy in Castoriadis's Works

The concept of autonomy holds a pivotal place in the conceptual framework Castoriadis developed following the 'ontological turn' in his works, insofar as it is offered both as a conceptual tool for the demarcation and analysis of modernity and as an ideal that could –and should- shape political action in both its individual and collective manifestations. However, the concept of autonomy also generates –and is dependent upon- a number of tensions and ambiguities. First, it relies upon a strict differentiation with the concept of heteronomy and on the distinction between creative processes of *instituting* and usually reified *instituted* forms of social and political life. Second, Castoriadis suggests that modernity is plagued by a –perhaps insoluble- tension between the two core imaginary significations of modernity, viz. autonomy and technical mastery. Also, the Greek *polis* and the Greek conception of *anthropos* play a quite significant role in Castoriadis's interpretation of autonomy and democracy. The first question I would like to explore is to what extent

Castoriadis's conceptualization of autonomy and democracy can provide us with an adequate framework for the elucidation of current manifestations of modernity. I would also like to consider ways in which Castoriadis's thought can shed light to the possible relationships between the development of techno-science and the prospects of democracy, especially if brought in dialogue with post-humanist perspectives. Also, although the distinction between autonomy and heteronomy in Castoriadis's works is primarily heuristic it invites a dialogue with Levinas's critique of ontology and his concurrent attempt to ground ethics and political philosophy on the notion of *heteronomy* interpreted qua absolute priority of the Other. Importantly, the hiatus between autonomy and heteronomy can serve as the locus for a radical reconceptualization of selfhood and otherness as well as for individuality and collectivity under conditions of modernity.

RC50-696.2

MOWATT, Rasul* (North Carolina State University, USA)

Colonial Pedagogy & Touring Empires

The colonial history has not only impacted the peoples of the world, but also the very geography in which we inhabit. The imprint of the British Empire is one that has had the most lasting imprint of all other Empires. This is where cultural artifacts and historical objects play a role. As a cultural studies-situated presentation, this discussion considers the function of *An ABC for Baby Patriots* and the activities of Thomas Cook & Son agency in their role of aiding and perpetuating imperialism. The texts of their times can serve the field to present discussions on the pedagogy to colonize by way of touring the possessions of an empire. Setting them together, the colonial object of this children's book and the activities of the colonial project through the Cook agency opens a space of understanding how the field of tourism can critique colonialism in the present-day and likely further opens up a space to understand how an Empire indulged in the spoils of colonialism during the era of the book's conception. This interrelationship of a children's book and the activities of Cook reflected a way in which "settlerism" and colonialism functioned throughout the society of the United Kingdom. The Cook agency allows for a peering into a process of making colonizers from 1840 to 1930. A travel agency like Cook went as far as serving as a military transport over and across the oceans of the world, although it kept this service hidden from the public view. Colonial objects can aid us in understanding tourism as a tool of colonialism. And this relationality implicates the role of tourism in aiding and abetting colonialism and imperialism. In our contemporary period of accurate and inaccurate calls for decolonization, objects of colonialism are important evidence to the ubiquity of brutality of colonialism.

MOWATT, Rasul* (North Carolina State University, USA)

The White Nationalist Animation of Public Space

A Missouri militia stated, "...some of the places we train are public parks where you can find all sorts of people frequenting the area" (Donovan, September 2010). Uniquely, what we are witnessing as the national political climate in the United States, isn't just the interplay of normal populist sentiments but instead the increasing performance of racialized populist political sentiments in the very physical spaces of society, leisure-based public spaces. There is insufficient evidence to suggest that leisure spaces have not been overtly managed as neutral, benign, and free of the political. But the lack of an intensive analysis and critique of how they are managed beyond the aesthetic, functional, and accessible remains under-researched. In particular, how have they been sanctioned and used by White Nationalists in the promulgation of White Power, in particularly within the United States? What ways have managers of these spaces enabled their use in such a way? Has leisure and leisure spaces been an effective intersection for White Power advocates to advance their call? The aim of this presentation is to discuss this intersection at four historical cases: 1) the 1925 & 1928 Ku Klux Klan Marches on Washington; 2) the 1939 German-American Bund Rally in New York City; and, 3) the 2017 Unite the Right Rally in Charlottesville, VA alongside additional discussion on what is now named as the Attack on the U.S. Capitol on January 6, 2021. Leisure spaces have been and continue to be dangerously neutral or restrictive in empowering vulnerable populations, while being quite willing to accommodate and sanction the actions of dominant and threatening populations against the vulnerable. The focus here is on the actions of the State or the State-sanctioned actors in affirming histories of racial dominance.

Tracing the Tensions of Networked Feminism on Reddit's r/Twoxchromosomes

The Internet and social media platforms have come to represent a new frontier for women's rights advocacy and feminist organising, providing unanticipated potential for coordinated collaboration, discussion, and action on a global scale. Yet the rapid pace of technological advancement, the endless integration of the Internet into our everyday lives, and the corporate colonisation of the digital field have culminated in a neoliberal digital culture that informs the ways in which people understand and interact with feminist thought.

Drawing on recent research into one of the largest English-language online feminist communities: Reddit's r/TwoXChromosomes (2XC), this paper traces the impact of neoliberal digital culture on the practices and politics of contemporary networked feminism. Specifically, the emergence of anecdotal self-disclosure as a legitimate form of political participation is problematised.

The practice of sharing personal experiences and individualised anecdotes is shown to be highly lucrative within the 2XC community, both in terms of the frequency with which it appeared in the dataset, and the amount of intercommunity attention such practice attracts. Yet these moments of self-disclosure do little to deconstruct prevailing mechanisms of power and authority as they exist within a gendered society, and instead work to re-centre the individual experience as paramount in the face of inherently collective issues. In turn, this generates a form of feminist practice that undermines collective struggle and social solidarity and raises questions as to the political effectiveness of networked feminist communities that subsist within the framework of for-profit media platforms such as Reddit.

"It's Not a Linear Process": Designing Systemic Interventions with Communities

The fallout from the COVID-19 pandemic exposed (and in some cases intensified) structural inequalities around the world. The perpetuity of these inequalities provokes the reproduction of complex, interrelated social problems including unemployment, discrimination, and poverty that often concentrate in already disadvantaged communities. Tackling complex problems, such as social inequity, requires a focus on social systems: a recognition of the non-linear and dynamic interactions between institutions, people, place and material conditions that produce (or constrain) social action in everyday life. The design of interventions that target the social-systemic conditions of inequality can seem daunting. However, complex social systems that (re)produce the conditions of inequality are fertile ground for interventions designed with communities. In this presentation, we outline an ambitious program of work designed to strengthen the local system impacting on the lives of young people in disadvantaged Australian communities. Our work draws on traditions of Community Based Participatory Action Research and System Action Learning, we describe our approach to understanding the local system, defining complex problems that are relevant to, and resonate with the community, and identifying underlying local conditions as targets for intervention. Our approach is novel, embracing both methodological and theoretical pluralism: from a metaphor-inspired system map to the local co-production of knowledge and new ways of measuring systems change in social institutions. Finally, we will share the challenges of what it takes to intervene in the social systems of a community, including issues of role duality and the ongoing (re)negotiation of power when there are multiple collaborating organisations, and when a University is a key actor in the system.

MOY, John* (Queensland Fire and Emergency Services, Australia)

Emergency Services Volunteering in Australia; Pandemic Impacts

Recent disaster events across Australia including 2020 Victorian bush fires, the New South Wales floods in 2021 and of course the global pandemic, provide a timely reminder that disasters are increasing in severity, frequency, and cost. As part of Australia's strategy to prepare for, respond to and recover from these events, is a large, dedicated volunteer emergency services workforce. Volunteer emergency service organisations such as rural fire and state emergency services are significant contributors to Australia's disaster management capability. A capability that the literature shows, contributes greatly to individual and community resilience.

Rather unexpectedly and alarmingly, and despite the increase in disasters and the reliance upon emergency services volunteers to 'respond', the actual membership across many of Australia's volunteer emergency services volunteer agencies is in sharp decline. This raises many questions, including is the global pandemic responsible for this sudden decrease in volunteers? Or was this decline inevitable? If the pandemic did impact upon emergency services volunteerism, what can be done to reverse this alarming trend?

My research addresses such questions, and seeks to propose a new, national sustainable model for emergency services volunteering to help mitigate this decline. It seeks to go beyond simply recognising what motivates (and demotivates) emergency services volunteers, by offering a solution to this emerging dilemma. Whilst some attempts have been made to mitigate

this challenge, most emergency services agencies exist today, as they did when first established. We now live in a world which continues to be impacted by the pandemic, and with volunteers the backbone of Australia's disaster management resilience strategy, will emergency services volunteerism survive? This session will suggest that the solution in mitigating declining emergency services volunteerism, within the pandemic environment, lies with a reconceptualisation of volunteer emergency services participation.

RC39-574.1

MOY, John* (Queensland Fire and Emergency Services, Australia)

Emergency Services Volunteers: Professionals or Potterer's?

At the heart of Australia's disaster response and resilience strategy is a large and dedicated volunteer emergency services workforce. These well-established volunteer emergency service organisations provide a significant contribution to Australia's disaster management capability as they are incorporated into emergency management planning and heavily relied upon by the communities they serve. State-based, volunteer fire fighting agencies, and the State Emergency Service (SES) provide a capability which substantially contributes to individual household and community resilience. Australia boasts one million emergency services volunteers, thus providing an important element to reduce the populations vulnerability to disasters.

Despite Australia's heavy reliance upon its volunteer emergency services workforce, the nature of Australia's volunteering landscape is dramatically changing. Alarmingly there has been a sudden and rapid decline in traditional, organisational-based volunteering, which entails regular training and credentialling, with a move towards an episodic approach. This recent rise of the episodic volunteer as opposed to the trained and committed volunteer, raises the question of professionalism. Are episodic volunteers to be considered as unpaid professionals, or are they simply potterers, dabbling in disaster response when it suits them? How should we consider these emerging 'mud army' entities and will they replace the need for established organisations such as the SES? Or is there a place for both?

This presentation will highlight my research which seeks to propose a new, national sustainable model for emergency services volunteering to help mitigate rapidly declining emergency services volunteerism. My research proposes that for Australia, the solution in mitigating declining emergency services volunteerism lies with a re-conceptualisation of volunteer emergency services participation. I will demonstrate that despite public perception to the contrary, Australia's volunteer disaster management workforce is sophisticated, credentialed and regulated, and far more than simply a group of enthusiastic amateurs who only come out to play when the rain stops.

The Quotidian Use of Mobile Phone: Turning the Ordinary to the Extraordinary

Mobile phone is not merely a technical device of which people happen to be known as users; instead, the digital machine called mobile allows the users to (re)discover life in strange ways. What is typically considered impossible turns out to be the contrary: Difficult, at times dreary, but doable. This paper presents the findings of a nation-wide study in Bangladesh on the quotidian use of mobile phones among the disadvantaged youth—those with little to no formal education and are from poor socioeconomic backgrounds. We interviewed 193 mobile phone users from seven Divisions of the country; almost 50% of them are female. The interviews were recorded, transcribed, and translated. To gain an in-depth understanding, we employed sequential interviewing techniques, conducted several rounds of follow-ups, and collected relevant evidence. With access to mobile phone, the Illiterate or nearly illiterate people venture into an uncharted territory: Recognize the alphabets (often as image); learn new language; type by using voice-to-text option; read the text replies by activating text-to-voice option; save image, audio, and video files on the cloud; and use advance editing skill to create videos and post them on TikTok. For them the digital device is not merely an extension of spheres of life; it enacts the dynamism of life itself with which humans are endowed but barely materialized. The vitality of the device is manifest exactly when the laymen users inadvertently lack access to mobile phones: Life without mobile phones tends to feel sterile, restless, entrapped. On the contrary, frequent access to this machine—put into action by animated human bodies—enacts an intriguing mode of sociality, which seemingly makes vulnerable the well-accepted norms along the lines of class, social status, age, and gender.

MOZUMDER, Mohammad* (Bangladesh Institute of Development Studies, Bangladesh)

Virtuous Obsession or Hyperbole: Mobile(phone) Munchies

Addiction to mobile phones is well-known, but do users change the addictive habit to practice judicious use of the phone? How does the transitioning from regular use to addiction play out? Apart from vicious addiction, is there

something called virtuous obsession? This paper answers these questions using the findings of a country-wide study with the young, un(der)educated mobile phone users in Bangladesh. 200 young (15-35 years old) users were interviewed from the eight Divisions of the country; 95 of them are female. Supplementary evidence such as browsing history, technology diary, and audio-visual records were collected. Analyses of the transcripts show that there are five types of use of mobile phones: Nominal use, cultivating attachment, oblivious use, addictive use, and, finally, professional use. Gaming (such as Free Fire and PUBG), entertainment platforms (e.g., TikTok and Likee), and YouTube and Messenger are vastly popular among them. Transitioning from attachment to addiction proceeds slowly and subconsciously. Breaking that addictive habit, however, requires sudden upheavals, shocking incidents, e.g., hacked profile, breaking-up relationships, and losing phone set. The study finds that users combat the addictive habit by switching from one sort of activity to another, seeking exhilaration instead of exasperation. Finding a ray of hope in a life typically seared by frustrations–for example, an employment opportunity after a long wait–helps them make a sudden break. Finally, I argue that both addiction/apathy towards technology are responses to unfulfilled social expectations. It is less about the individual/technology but more about the society in which both the users and devices come to (inter)act. Certain happenings and events contribute to making it a reasonable choice for social agents to nosedive in the digital world; certain other arrangements, conversely, push them to desperately seek an exit—reimagine life on their own terms.

Digital Sociology and Desire for Omnipresence: Introducing a Key Conceptual Tool

Since the pandemic spread of the virus SARS-CoV-2 or "Covid-19" globally took place in 2020, life has moved increasingly online. The present abstract seeks to introduce the notion of "desire for omnipresence" (Mozzini-Alister, 2021) as a transdisciplinary conceptual tool of academic research through a sociological lens. Therefore, the main goal of this paper will be articulated along three different sections: the first, aims to contextualize previous developments on the concept of desire for omnipresence as well as give a closer insight into how it emerged in my own path as a researcher; the second, aims to address the sociological approaches where this conceptual tool can be articulated, exploring how the seemingly distant practices of mediation via social media and Tantric meditation intertwine through the concept of anthropotechnics (Ludueña, 2012); the third and final section addresses the implications of this conceptual tool. Hopefully, this endeavor will illuminate new approaches to the study of media, its relationship with the human mind, and the current desire to be more than just a body.

Under the Same Southern Cross: Exploring a New Sociological Model from the Intersections between Brazil and Australia

The terms "First World" and "Third World" emerged in the article "Three worlds, one planet", written by the French demographer Alfred Sauvy in 1952, to describe the different political position countries occupied in a Cold War context: the "First World" was composed by Western Europe, the USA, and their allies; the "Second World" by the Soviet Union, China, Cuba and the Communist bloc; the "Third World" were the nations that didn't aligned with neither of these two former groups. After the collapse of the Soviet Union and the end of the Cold War, "First World" became a development standard to describe the "rich" and "developed" countries composed by the USA, Canada, Europe, Japan and Australia, and "Third World" the "poor", "under-developed", or "developing" countries mainly encompassed by Latin America, Africa, and some parts of Middle East.

Coming from a "Third World" country, Brazil, to live in "First World" countries since 2016, I felt in my skin the consequences of such epistemological bias. Unfortunately, "Third World" became a category populated by sticky words and images such as violence, corruption, social inequalities, prostitution, lack of education, backwardness, and "uncivilized" – all qualified as "bad", "avoidable", and, mainly, "non-desirable". But what if by maintaining these views, we are actually missing the opportunity to embrace the richness that these epistemologies have to contribute? What if the answer for the issues that "First World" societies crave for are in the non-spoken qualities of "Third World" societies? And vice-versa?

My proposal out of this ontological dilemma is inspired by the "symmetric anthropology" developed by Bruno Latour (2001, 2009) to build a "symmetric epistemology of development" where the concepts of "First" or "Third" World are substituted for a vocabulary that horizontally captures the core differences between these two systems.

Authoritarian Innovations in the Polish Industrial Relations: From Liberal to Illiberal Illusory Corporatism?

The victory of the right-wing populist Law and Justice (PiS) party in the 2015 elections in Poland has been sometimes described in terms of an illiberal turn (Bustikova and Guasti 2017). But, even before this, a neoliberal transformation had been taking place in Poland. A fundamental element of this transformation was the introduction weak, or "illusory" tripartite institutions (Ost, 2000), used by liberal governments to maintain the appearance of workers' participation while suppressing social conflicts and assuring compliance with international standards. This institutional tactic can be understood as what Ford, Gillan and Ward (2021) describe an authoritarian innovation in labour governance, whereby governments make changes in policy or practice that appear to enhance labour rights but ultimately seek to dampen labour conflict and political contestation.

The underlying weaknesses in Poland's tripartite system are revealed in the government's response to two very different external shocks: the global financial crisis of 2008–12 and the Covid-19 pandemic of 2020–22. Drawing on data gathered through desk research and 30 expert interviews with social partners, the paper argues that the political change in 2015, when PiS came into power and started to take over core democratic institutions, and the Covid-19 pandemic, simply shored up earlier authoritarian innovations introduced in the 1990s when Poland was reinventing itself as capitalist and democratic country. At the same time, the post-2015 developments were novel in the sense that populist leaders formally praise social dialogue and worker participation while at the same time actively undermining it. As this paper argues, since the government has 'hijacked' some key points on trade unions' agenda, organised labour itself needs to become more experimental, mobilised and political if it is to retain its autonomy in Poland's industrial relations system.

Organising Potentials in Logistics in Times of Crises. the Case of Poland

The logistics has been labelled as "choke points" (Alimahomed-Wilson & Ness 2018) in the global capitalist supply chains due to the structural power of workers who can disturb the smooth circulation of capital and goods on which capitalism relies. The Covid-19 pandemic has further increased workers' structural power given the growing reliance of customers on on-line orders. Simultaneously, workers' power resources are systemically undermined by the platformisation of the industry which causes the temporal and spatial disappearance of workplace boundaries..

Drawing from the literature on power resources and union organising in the logistics, this paper addresses the question of the conditions which allow workers' structural power to be translated into associational power. The notion of "organising potentials" is introduced to understand the role of informal and weak forms of workers' mutual care and solidarity and the circulation of repertoires of resistance in the development of collective discontent, protests and, in some cases, their collective interests' organisations.

Based on narrative and focus group interviews with workers, as well as expert interviews with trade unionists, managers and employers, the body of the paper explores the organising potentials and workers' protests during the pandemic in the case of four sections of the logistics within the private sector in Poland: logistic centres, parcel-delivery, online food-delivery and truck transport. It is argued that the analysis of the organising potentials requires considering both their structural power and a range of other factors: the diverse forms of employment precarisation across the sector, external and internal solidarities and the international diffusion of the repertoires of discontent. In conclusion, the differences between better organised logistics centres and disorganised other parts of the industry (in which informal, bottom-up and weak forms of protests emerged) are discussed in the context of a broader debate on the platformisation of economy.

Writing a Multisensorial Field

The paper discusses ways of writing a field through a sensory ethnographic research. My study explores the social life of frankincense, its materiality and human entanglements. Frankincense is an aromatic resin harvested from the Boswellia Sacra (sacra for sacred) trees unique to Dhofar, southern part of Oman. Frankincense grows in a dry micro-climate, foregrounding the diverse geographies of the region. Precarity marks everything in the field, as Boswellia trees grow on their own symbiotically, and re-enter the capitalist world market and as symbols of a new nation. However, this paper goes beyond the discourses of nationalism and heritage practices.

Frankincense as a material entity that can be seen as a metaphor to understand the entanglements of people, environment, and trans-regional histories of migration and trade. Moreover, frankincense navigates multiple registers that are sensorial —haptic, olfactory and ethereal — religious and spiritual. Frankincense resin is extracted by damaging the tree, and by making incisions in its bark. Milky white sap is slowly secreted and dribbles down like teardrops clumped together, making of frankincense — matter in formation, brings us to the possibilities of life. At the souq, frankincense is graded and sifted like diamonds. The quality is not determined by smell, instead traders rely on taste and a uniform colour.

The use of frankincense makes it a symbolic field that seamlessly navigates across the Indian Ocean. Here, air functions as a heuristic device which encompasses atmospheric experiences, among them fragrances. The materiality of air and the density of our many human entanglements — also attend to the solidifying and melting edges between people, regions and events. Therefore giving frankincense a different place in social-anthropological inquiry. This paper aims to understand ways of writing and doing sensory ethnographic research; through engaging with the everyday and intimate encounters of a multi-sensorial field.

MUCHHALA, Bhumika* (Thrid World Network, USA)

Structural and Knowledge Power of Austerity in the World Economic Order: Examining Dependency in the Global Political Economy and Rethinking Delinking through Decoloniality

The political rationality of austerity is examined through the structural power of finance and the knowledge power of economics. Structural power defines the operational mechanism of austerity and involves the consolidation of global financial actors, the state's growing reliance on private credit, and state restructuring. Structural power is enforced through financial-political mechanisms that discipline many South states into internalizing a compliance to macroeconomic behavior that favors creditors and investors. Obstacles to economic diversification in many South states, particularly through trade agreement rules, challenges the generation of sustained domestic revenue. In turn, many South nations turn to selling their sovereign bonds at high interest rates in order to attract investors and raise financing, thereby implicitly committing to a 'sound' economic and financial landscape amenable to investors and markets. The knowledge power of austerity is conceptualized through western economic philosophy, actors and regions and defined by key features of coloniality, such as universality, singularity, and ideology. A decolonial turn toward epistemic delinking involves seeking geographical-historical knowledge located in subordinated spaces and embodied forms of knowledge through enunciation and action of the bodies cast out by coloniality. Confronting knowledge power requires a pluriversality of knowledge systems while refraining from categorizing non-hegemonic systems of thought as 'Other,' while aso embarking on a decolonial practice of methodology and pedagogy. Embodied knowledge is expressed through the experiencing of austerity politics through the prisms of gender and race, which propels boundary crossing within grassroots social movements.

MUELLER, Georg* (University of Fribourg, Switzerland)

Comparing Countries with Regard to Their Resilience Against Unhappiness

In the psychology of happiness there is a widely accepted hypothesis that life-satisfaction oscillates around a set-point given by nurture and nature. This assumption implicitly supposes a *homeostatic* mechanism, which leads to resilience against unhappiness. Thus, the present paper aims at the exploration and *quantitative* description of the collective resilience at the national level, which may be challenged by economic crises, natural disasters, military conflicts, pandemics, etc. In particular, we are interested in which countries the postulated resilience really exists, in order to compare its homeostasis in terms of the time needed to restore the original set-point and to analyse whether there are limits of unhappiness below which the initial set-point is not restored anymore.

In order to tackle these questions, the author analyses country-specific time-series of the *World Database of Happiness,* which was founded by the Dutch scholar Ruut Veenhoven. By means of *polynomial regression,* the temporal change of happiness is explained by linear and squared differences between the current national level of happiness and its long-term mean-value. The interpretation of the statistical results depends on the signs and the significances of the estimated polynomial regression coefficients of the analysed countries.

If *none* of the extracted regression coefficients is significant, there is no homeostasis and consequently no resilience. If only the *linear term* is significant and negative, there is unlimited resilience: *any* deviance of happiness from the initial set-point leads to a correcting change of happiness. The more negative the linear regression coefficient, the faster and more efficient is this homeostatic process. If the *quadratic* regression coefficient is *negative* and significant, formal reasoning shows that there is only *limited* resilience: should happiness temporarily sink below a certain limit, it will not return anymore to the initial set-point and the original homeostasis is irreversibly destroyed.

Inequality and the Amount of Information Contained in Male and Female Gender

This contribution deals with the entropy of privilege distributions. Entropy is a double-faced concept, although it has a single mathematical representation.

On the one hand, entropy means uncertainty, i.e. *lack of information*: the higher the entropy of the distribution of a social privilege, the lower the information about particular privilege-holders. By comparing the entropy of a whole population with the conditional entropies of its subpopulations like men and women, it is possible to calculate the information "contained" in these subgroups.

On the other hand, entropy also means variation, i.e. *inequality:* The higher the entropy of the distribution of a social privilege, the higher the inequality among the privilege-holders: Thus it is possible to calculate the *overall inequality* of a population as well as the *particular inequalities* within its subpopulations, like e.g. men and women.

This paper attempts to unite the two different faces of entropy. By mathematical reasoning it is possible to show that the *total inequality* of a privilege distribution is a weighted sum of the inequalities within its subpopulations plus a weighted sum of the information contained in each of these subpopulations. The first weighted sum of this equation measures *inter-individual inequality.* The second is also called synentropy (mutual information) and describes the *inequality of opportunities* between the subpopulations.

In order to illustrate the use of the afore-mentioned concepts, the author analyses the educational attainments of EU-countries according to gender and birth-cohorts. Data source for this purpose is the European Values Study, which offers highly standardised data. In countries, where the norm of equal educational opportunities of men and women is perfectly realized, the synentropy of education should be *zero*. Otherwise it is always higher than zero and a split of information contained in male and female gender will offer clues for further analyses.

Dairy and Eggs in Canada: Superior Performance Using Superior Methods

This presentation investigates how supply management allows the dairy and egg sectors to invest in their industries in the form of progressive programs and the most current technologies, which allows them to perform at a very high level, both in terms of technology and environment sustainability. As well, it will link Canadian performance and productivity in dairy and eggs to superior on-farm performance more generally through a comparison of the industry in Australia.

Some critics claim that supply management breeds inefficiency and farms that are too small to compete on a global scale, if Canadians in those areas were so inclined. As well, it is generally believed by those critics that Canadian dairy and egg farmers are not resilient, adaptable and flexible. In my presentation, using international comparators from Australia, I will refute those allegations with real life, real time examples of how Canadian dairy and egg farmers are the opposite of that characterization.

Indeed, Canadian milk productivity ranks among the very highest with respect to international peers, while Canadian hens lay an average of 305 eggs per year which also compares most favourably with yields found elsewhere.

In terms of innovative programs sponsored by the various provincial dairy organizations, and by Egg Farmers of Canada, there are many. For the latter, investment and research in animal care and food safety, the latter through the Start Clean – Stay Clean program, are both state of the art programs. Similarly, the take-up by dairy farmers of the latest robot and innovative barn technologies is indicative of a resilient, adaptable and flexible industry.

Dairy and egg farmers in Australia struggle to earn a living wage with their industries on a cyclical basis. These cycles are characterized by oversupply, farm chaos, and widespread farm closures that we do not see in Canada.

Tribal Education in India: Deconstructing the Acculturation Hypothesis

'Adivasis' or the tribals constitute 8.6% of India's population, accounting for more than 104 million people (Census of India, 2011). While there have been positive attempts on the part of the Indian government to universalize education in the country, yet the tribal literacy rate (58.96%) is well below the national average (74.04%) (ibid). Furthermore, the tribal students experience high drop-out rates in school and this is evidenced from the statistics that out of 100 tribal students taking admission in standard I, 67 proceed till standard V, 41.9 study till standard VIII, and only 13.9 students successfully complete standard XII (Report of the Ministry of Tribal Affairs, 2013).

This paper thus attempts to offer a subaltern perspective on education and in the process unearth the socio-economic barriers that tribal students face in schools. Contextually, the paper investigates the reasons for high drop-out rates, the perception of the parents about the school and education in general, the social standing of the tribal graduates, and the teachers' attitude towards the tribal students. Further, the attitude of the educated (acculturated) tribal youths about their identity and culture is also studied. Finally, potential solutions are proposed for designing an inclusive, child-centric educational curriculum.

A non-experimental, cross-sectional research design was used in this qualitative study and the main tools of data collection were observation and interviews. In-depth, unstructured interviews were conducted with the key stakeholders i.e., tribal students, teachers, school administrators, parents, and graduates. Furthermore, content analysis of books, question papers, enrollment registers, etc. was undertaken for gaining a deeper understanding. The study was conducted on the Santal, Birhor, Kharia, and Lodha tribes of Bankura, Birbhum, Puruliya, and Paschim Midnapore districts of West Bengal state in India.

MUKHERJEE, Somdatta* (Sister Nivedita University, India, India)

Bodies, Emotions & Borders: An Ethnography on Indian Army

Nurturing bodily strength and fitness is one of the important prerequisites in Indian army. During the early modern period in India wrestling and some associated exercises were indispensable for military preparation. At present different physiological standard have been set as some of the prerequisites. Awareness of nurturing bodily strength and fitness allows and gives space for a better understanding of the 'culture of body' in general within a specific military sub-group that directs to a particular 'body of culture'.

Emotions are expressed through different body-techniques. And the regimented life demands controlled body-techniques. I have tried to explore how far that control directs to the control of emotions (vice-versa) and thus gives shape to a 'different culture'. Now, when I write 'different culture', I mean its difference from the 'generalised culture' of Indian society. Here, I focus mainly on the physical culture that relates typical accepted body techniques as specific expressions of emotions that shape social and collective identity.

I have extensively used the theories of Foucault, Goffman, Damasio, Le Breton and Mauss to explore, explain and describe the interface (especially the cultural mechanism that creates a boundary and also bridges the gap) between Indian society and army with the help of my ethnographic experience.

Growing up Queer in 21st Century India: Unpacking Everyday Geographies of Gender in the Lives of Lgbtqia+ Youth

This paper focuses on the lived experiences of gender and sexual minority youth in urban India to unpack the way they co-construct and negotiate their gendered identities in the context of rapid social, economic and cultural changes that are currently afoot in the country. It draws on oral histories of 30 LGBTQIA+ young adults who came of age in urban India in the first two decades of 21st century as they reflect on their experiences of navigating school, family and community spaces as children and young people. Their narratives highlight how colonial-era anti-sodomy laws, postcolonial notions of masculinity and femininity, and neoliberal forces in contemporary India interact with global queer popular culture and activism to shape discourses and material practices around gender. The stories of these youth further illuminate the way deep-seated class, caste and geographical inequalities in Indian society fracture the way queer youth navigate binary gender categories within their everyday geographies. While there is now a growing body of sociological literature that foreground the way gender and sexual minority youth think about and enact gender in their everyday lives (Robertson 2019; Travers 2019; Meadow 2018; Pascoe 2011), there is a paucity of scholarship that focus on these issues in the global south. Therefore, by centring the lived experiences of and challenges faced by queer youth in India, this paper pushes contemporary sociological debates on youth and gender in new directions and in the process highlights the limits of queer theories of gender developed in the global north. It concludes by reflecting on the way queer youth are contributing to emerging public conversations around gender diversity in contemporary India.

Self-Centering Process, Meritocratic Conceptions and Political Identity in Working Class in Argentina in the 21st Century.

The current diffusion of a meritocratic ideology is instrumental in the moral justification of the growing class inequality and adverse living conditions, experienced by large groups of working class in our societies in the twenty-first

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

century. However, the empirical results of an exploratory research on different groups of workers, carried out in Argentina in the last decade, indicate that the effectiveness and incidence of meritocracy is linked to the occurrence of a broader and more complex process.

Based on the results of our study, we propose to focus on the pre-existing epistemic and moral identity on which the meritocratic ideology necessarily operates. The meritocratic discourse impacts and is conceptually integrated by individuals if it suits their available mental schemas to understand and judge the social processes. What they cannot fit into those schemas is deleted, or remains unobserved. Meritocracy only contributes to reinforcing certain types of pre-existing representative identities, characterized by a process of epistemic and moral self-centering. In such identities, a retributive conception of social justice prevails, making the individual the exclusive responsible for the living conditions experienced. They don´t observe cooperative or confrontational relationships (intra-class and between classes) in the description, explanation and evaluation of the situation experienced - personally and inter-generationally - in the family history.

As a working hypothesis, we propose the incidence of this set of factors in the support by part of the working class for regressive, unequal and undemocratic political projects, such as the one carried out during Mauricio Macri 's government (2016-2019). It is plausible that the progressive improvement that workers objectively experienced during the previous governments of Nestor and Cristina Kirchner, was attributed by them to their individual effort exclusively, instead of being understood as a logical consequence of the redistributive policies promoted between 2003 and 2015.

Networked Ecologies, Marginalized Citizens, and Participatory Governance: Case of Smart City Bhubaneswar, India

The networked ecologies of the smart cities solicit contemporary citizens to transition into co-creators and decision-makers to become engaged citizens. However, the engagement of marginalized citizens within the Global South has always been a concern for scholars. Thus, exploring marginalized citizens' capacity to coproduce within the networked ecologies becomes vital. Hence, this study explores how the marginalized sections of an Indian smart city negotiate with their immediate urban entities and engage with governance. To assess the marginalized citizen's engagement, we investigate the Socially Smart Bhubaneswar (SSB) Program of the smart city Bhubaneswar due to its community-centric attributes involving youth and children. We draw from the ideas of network societies and urban commons to probe the social capital and the social agency of the marginalized within the networked smart cities. The study conducted in-depth interviews and focus group discussions with diverse stakeholders of the SSB program in four selected slums in March 2022, followed by a qualitative thematic analysis. The investigation inferred that community youth leadership developed through participatory collaboration furnished a civic platform for citizen engagement. Further, the networked collaboration instituted the required forms of social capital, enabling the marginalized citizen's agency for bottom-up participation. This research extends the discourses on smart cities and marginalized citizens through the empirical case from the Global South, suggesting the necessity of commons-driven governance.

RC35-JS-135.2

MUNDÓ, Jordi* (University of Barcelona, Spain)

Fiduciary Relationships

Fiduciary relationships were originally conceived and instituted by Roman (private) civil law to deal normatively with asymmetrical inter-individual relationships in which a Principal has an interest in the performance of a certain action, but does not have the necessary experience, time or means to carry it out herself. Therefore, the Principal needs an Agent to execute that action, who is supposed to have the necessary experience, time or means, but who does not necessarily have an interest in performing it to the Principal's satisfaction. In this sense, it is a problematic and potentially dangerous relationship for the Principal, since it confers a high margin of discretion to the Agent. This is why, whether in private law or in democratic political relationships, the Agent must be accountable. Just as contemporary political science and political philosophy are keen to investigate the complications of fiduciary relations between the sovereign democratic citizenry ("We the people", "volonté générale") and their institutional representatives as a serious problem of collective action analysis, it is also crucial in economy and society field to revisit this conception. Property is a case in point. To analyse the issue of property in the contemporary democratic societies beyond the narrow framework of property understood as absolute, it is necessary to understand that contemporary social constitutionalism has conceived property in fiduciary terms. Our hypothesis is that the idea of the social function of property, public trusts and the commons, analytically can best be captured -and programmatically articulated more consistently- from the assumption that any property (private, public or common) can be conceived as a fiduciary concession made or sanctioned by the instituted public power on behalf of the people and ultimately subject to the common good. This includes reflection on the presumed fiduciary duty we have to preserve the common heritage of mankind.

Japan's Housing Cost and Subjective Well-Being during the COVID-19 Pandemic

This study investigates the effect of housing expenses on life satisfaction in Japan during the COVID-19 pandemic. The pandemic saw a rise in the number of applications for the temporal Housing Security Benefit, which has remained high compared to the pre-pandemic era. This is suggestive of the potential risk of precarious housing situations. Housing cost accounts for a substantial percentage in living expenses; however, relocation to decrease housing expenses is challenging during the pandemic's uncertainty, since a residential location is strongly related to the spatial distribution of services and one's job opportunities. We conduct regression analysis on the COVID-19 special survey data of the Japanese Life Course Panel Survey. It reveals the negative impact of heavy housing expenses on life satisfaction after controlling the effects of some other variables. Among those who live in rental houses, the housing cost burden of employee housing is low compared to other rental abodes. Companies still play a crucial role in offering housing welfare in Japan despite International Labour Organization recommendation on employee housing. In contrast, housing cost burden of social housing is not necessarily low as income of the social renters is also low. These structural inequality in Japan bifurcate people based on the housing situation. It is desirable to adopt measures to provide affordable rental housing to mitigate the burden of housing cost, which affects people's subjective well-being.

MURANAKA, Aimi* (University of Duisburg-Essen, Germany)

(Un)Expected Return? the Study on the Vietnamese It Professionals Mobilities and Japanese Private Intermediaries

The return of the skilled migrants attracts scholarly attention at macro-level in terms of the country's development policy, but the studies on how the return is planned and reflected by the skilled migrants and private actors remain scarce. Under the serious labour shortage and the harsh competition of securing the skilled workers in the region, the Japanese business seeks the foreign skilled IT professionals despite the country's restrictive migration policy. Moreover, the Vietnamese-nationals now largely contribute their skilled labour to the IT sector in Japan. Despite the mutual interest, a certain number of Vietnamese professionals return to Vietnam. Based on multiple onsite and online fieldwork research, this study investigates how the Japanese business, namely Japanese private intermediary actors, Vietnamese professionals in Japan and returnees consider and reflect on the return to Vietnam. The findings of the study are summarised as follow. Firstly, the work experiences in Japan are positioned as a stepping-stone and a short-term stay by both Japanese intermediary actors and Vietnamese professionals. Although their return is positioned as a part of business strategy by the Japanese intermediary actors for the cross-border labour market between Japan and Vietnam, some Vietnamese skilled professionals remain in Japan and become mobile within Japanese labour market to pursue upward career mobility. Secondly, the return to the country remains an option but not as a settled plan in this labour market, and the career progression in Vietnam is not necessarily linear. The findings of this research suggests that the examination on the return of migrants assists in capturing a part of the intricate mobilities of the skilled labour market in the region, instead of solely focusing on migrants' departure, arrival and participation in the host society's labour market.

MURASE, Risa* (University of North Carolina, Chapel Hill, USA)

The Invisible Glass: From Criminality to Conditional Exclusion in Japanese Media Coverage of Migrants

Within an increasingly global trend of "illegalization" of migration, Japan stands out as an outlier. Terms such as "crimmigration" (Stumpf 2006) which refers to the increasing merger of immigration and criminal law have aroused. However, Japan deviates from such international pattern, transitioning from a restrictive to a more permissive policy stance toward migration. The 2019 revision of the Immigration Control and Refugee Recognition Act (ICRRA) officially announced to broaden the visa status for immigrant workers enabling for the first time in Japanese history the *legal* entry of unskilled foreign workers. Thus, as immigrants are increasingly becoming illegalized around the world, Japan follows a distinct pattern of immigrants increasingly becoming *legalized*. Although many studies have focused on restrictive policies leading to a diffusion of negative discourse concerning immigrants or vice versa, focusing on the case of Japan, I ask how legalization affects the framing of immigrants within media. Taking a mixed methods approach (Atheide and Schneider 2012; McConnell

2018), I use quantitative and qualitative analysis to code 1,929 articles. A comparison between two major Japanese newspapers (Yomiuri Shimbun and Asahi Shimbun) differing in ideological leaning and a comparison between two periods 1987-1990 and 2016-2019 when major immigration policy change took place, are made. By looking at specifically how law is framed within media, the goal is to add more clarity to the mechanism of how laws may affect the public discourse of immigrants. I argue that contrary to what past literature would imply, symbolic resources of law do *not* automatically translate into media and thus indicate that legal change is not sufficient for change in media framing of minorities. Rather, my analysis implies that even when minorities *do* attain legal status, they continue to be excluded through the concept of "conditional exclusion".

How Do Consumers Choose Lawyers? Findings of a Japanese Survey

As lawyers increase in number and practice in a more competitive legal service market, their ways of private practice for individual clients tend to diversify. It is now common for many lawyers to have websites of their law offices and some of them use their website to actively obtain clients. A few law offices utilize TV and radio commercials to solicit clients.

Given this changing private practice of lawyers, we asked Japanese people how they perceive various types of law office advertisements and TV-radio commercials and what kind of information concerning lawyers and law offices they consider important when they try to choose a lawyer. Our survey results show that people perceive their advertisements more or less positively and that they take the specialty of a lawyer, no disciplinary action, and clear criteria of payments almost decisive in choosing lawyers to solve their legal problems.

Innovating Fragile Patients Care during COVID-19: A "mixed" future for Digital Health?

Innovative e-prescribing protocols (ricetta elettronica) relying on the user's technological capabilities might fail to guarantee access to medication to the most digitally illiterate, fragile, and forced to remain-at-home part of the population: the elderly. Our empirical work shows that interdigital (connected) agents' "invisible" work securing medication availability to old people may turn innovation aging failure into success during and after COVID-19 pandemic crisis. Previous literature showed the importance of considering situational practice and informal work that may support aging care besides "formal" processes. Moreover, building on the theoretical work of Mol (praxiography, 2002, 2010) and Murero (interdigital communication theory 2005, 2012), we aim at empirically highlighting the introduction of e-prescription in Italy. We will present the results of a longitudinal qualitative research we have been conducting since march 2020 (ongoing), with an ethnographic approach that highlights the intermediating role of mobile technology affecting formal and "invisible" practices; these act "for and around the elderly care". For example, new tech-based practices may modify four existing domains by: a) changing places of access to care (avoid doctors' offices during the pandemic), b) creating new networked connections between professionals (family doctors, pharmacists, caregivers), c) redefining objects and meanings (prescription dematerialization), and d) creating innovative "invisible workers" (neighbours, voluntaries, pharmacy-deliver-men. This happens thanks to the technology-mediated role of three actors: family doctors, pharmacists, and most importantly interdigital agents (competent user of ICTs); the former "invisible" workers do not appear in the "law" introducing e-prescribing. However, our findings confirm the crucial importance of the mediating role of digitally competent agents (substituting caregivers during the lockdown) making e-medication a large success, indirectly affecting "innovating aging" access to digital health during the pandemic and further affecting the "mixed" future of digital health care terapeutics in different areas and subjects, from teens (SMILER serious game) to the elderly.

MURERO, Monica* (University Unina, Italy)

Interdigital Agents Innovating Digital Care during and beyond COVID-19 : a bottom-up future for Digital Health?

Our empirical work shows that interdigital (connected) agents' "invisible" work securing medication availability to old people may turn innovation aging failure into success during and after COVID-19 pandemic crisis. E-prescribing protocols (ricetta elettronica) relying on the user's technological capabilities might fail to guarantee access to medication to the most digitally illiterate, fragile, and forced to remain-at-home part of the population: the elderly. Previous literature showed the importance of considering situational practice and informal work that may support aging care (Miele et al, 2022; Fornasini et al., 2016; Bruni e Gherardi, 2007; Gherardi, 2004) besides "formal" processes. Moreover, building on the theoretical work of Mol (*praxiography*, 2002, 2010) and Murero (*interdigital communication theory* 2005, 2012) we will present

the results of a longitudinal qualitative research we have been conducting since march 2020 (ongoing), with an ethnographic approach that highlights the intermediating role of mobile technology affecting formal and "invisible" practices. Our main point is that these interactions act as a bottom-up social innovation in the complexity. For example, new tech-based practices may *modify four existing* domains by: a) changing places of access to care (avoid doctors' offices during the pandemic), b) creating new networked connections between professionals (family doctors, pharmacists, caregivers), c) redefining objects and meanings (prescription dematerialization), and d) creating innovative "invisible workers" (neighbors, voluntaries, pharmacy-deliver-men. This happens thanks to the technology-mediated role of three actors: family doctors, pharmacists, and most importantly *interdigital agents* (competent user of ICTs); the former "invisible" workers do not appear in the "law" introducing e-prescribing. However, our findings confirm the crucial importance of the mediating role of digitally competent agents (substituting caregivers during the lockdown) making e-medication a large success, indirectly affecting "innovating aging" access to digital health during the pandemic and further affecting the "mixed" future of digital health care.

Community between Openness and Closedness

In this paper our interest in collaboration and solidarity is built from a case study of a multicultural estate in north London, UK. This location was chosen for its 'ordinariness' and seemingly unexceptional qualities of place and design. The research is situated in the context and intersection of cities as welcoming and inclusive in times of churn and mobility. Drawing from theoretical debates about everyday life, urban design and the open/closed features of space and place the presentation explores how residents create community. The paper includes data collected during and after the Covid-19 pandemic, and it weaves together the (natural and social) histories of space, the microspatialities of everyday life and the idea of a progressive sense of place, building on the work of Doreen Massey. We aim to show how Massey's progressive politics draws from the local to build a global sense of place, politically and analytically. As in her histories of Kilburn, London and Wythenshawe, Manchester we suggest that a focus on fluidity, movement the microspatialities of everyday life contain a struggle between openness and closedness in ways that transcend any dichotomy between those two poles and we indicate how everyday solidarities between and across residents occurs in this space.

Energy Demand: Sustainable Transition or Dangerous Addition to Fossil Fuel Emissions?

Renewable energy is increasingly used to generate electricity, and electricity will progressively be used to power vehicles. But this should not be confused with an overall transition to clean, sustainable energy. Globally fossil fuels are still the primary source of most electricity, and the internal combustion engine prevails for vehicles. Fossil fuels remain the source of eighty percent of the world's energy because renewable energy has not replaced carbon polluting energy but instead is being added to it. Addition, not transition, has characterized energy consumption because attractive fossil fuel practices are being innovated and expanded, such as jet-fuelled flying and international conferencing, bunker-fuelled cruising, information and communication technology powered by fossil-fuelled electricity, increasingly popular cremation fuelled by propane, natural gas largely prevailing for heating, industry still mainly powered by fossil fuels, enormous concrete buildings constructed by combusting natural gas to make cement, and fossil-fuelled killing machines of war proliferating. As countries develop and populations become more affluent, their energy demand and fossil-fuelled practices increase. China has become a leader in wind and solar energy and the manufacture of their components, but it has also become the world's biggest carbon polluter. Texas has the largest wind farms in the USA but is its biggest carbon emitter. Theories of a unidirectional transition from polluting fossil fuels to clean, renewable energy are oversimplifications that are aspirational and not factual (yet?). A multi-directional, multi-faceted explanatory analysis is needed to understand the depth of the climate crisis. The multi-directionality of the evolution of fossil-fuelled practices confronts what has hitherto been unidirectional, namely the accumulation of long-lasting greenhouse gases in the atmosphere and hence sea-level rise, increasing frequency and intensity of human-caused drought, wildfires, floods, extreme weather, etc. Contributing a nuanced analysis of climate change and social change is the objective of this presentation.

Displacements and Dissolutions: Mothers with Mental Health Problems and Everyday Violence Beyond the Caring Network in Santiago

For decades, social policies of reproduction in Chile have been based on a maternalist approach sustained in the central place that women hold in the organization of family life. This approach has reinforced the importance of a maternal ethos that somehow prevails in women's self-understanding and praxis. Women have been fundamentally addressed as mothers, mediators, providers and collaborators in the care of others, while rarely seen as recipients of care. At the same time, they are addressed as deficitarian subjects, infantilized and subjected to a logic of control that is, many times, in turn, resisted. Parallelly, recent sociological and anthropological work in Chile show that citizens in general, and women in particular, are impelled to "cope by themselves", as institutions often present themselves as challenges or spaces of dispute, while they face the need to be responsible for the most diverse aspects of their lives and reproduction beyond them.

In a context in which women -particularly those who are mothers- are expected to fulfill a range of responsibilities towards others, confronting the onslaught of everyday structural violence(s), the question of how women who are mothers and who live with persisting mental health issues that limit their caring self is a relevant one. In this presentation we focus on the experiences of two women who are mothers of young children, and who have been left aside from the network of care provided by their own mothers and separated from their children. By deepening in their experiences I address the actualization of an ethics of dissolution (Pinto 2014), by which precarious, emerging and disseminating caring threads soften the hardships they confront, irregularly. At the same time, I interrogate the kinds of relations they actually and potentially develop with a state that struggles to interact with them beyond stereotyped roles.

Beyond Reform: Using Feminist Abolitionist Discussions with Institutional Ethnography

This paper will focus on Institutional Ethnography and feminist abolitionist discussions around policing and prisons, considering how abolitionist strategies and critiques disrupt reformist and apolitical impulses in some versions of Institutional Ethnography. Drawing on my PhD research and current monograph project – an Institutional Ethnography of UK university audit processes – I consider how academics' reading, writing, and performing of 'boring' bureaucratic processes can both reproduce institutional inequalities and potentially disrupt them, but that there are limits to this sort of reformist responses to institutional demands. Using abolitionist thought, I consider the carceral logics inherent in audit culture, and attempt to find abolitionist responses, alongside highlighting the direct connections between UK universities and carceral systems.

Diversity and Exclusion: An Institutional Ethnography Exploring Youth's Emotions Linked to Intersecting Experiences of Violence

This paper aims at presenting a new Institutional Ethnography (IE) research project that centers on emotions linked to experiences of violence. This project focuses on youth's experience of diversity and exclusion and, more precisely, starts from the standpoint of those enrolled in qualifying school programs in Belgium. I question why they are (self)oriented towards these school orientations and how this might shape their aspirations towards the job market? What work do they do in relation to (preparing to) entering the job market? How is this coordinated with others and do they develop strategies in that perspective? Including here a focus on resistance.

In order to do so, I draw from P.H Collins' (2020) proposition to look at "violence as a saturated site of intersecting power relations". In other words, how might an experience of violence shed light on the ways in which intersecting powers, mutually construct one another – and how is resistance or anti-violence also configured at that sight. Following her works, I will thus propose ways of thinking about these young people's emotions linked to their daily experiences of violence in a context where they are stigmatized and marginalized by markers of differentiation as a starting point, as a node from which a deeper understanding of institutional ruling can emerge. I contend, and will argument, that these ideas she develops in her latest book , *Intersectionality as Critical Social Theory*, are useful for building bridges between IE and the study of emotions, and are important because of the space they leave to map out how individuals resist amidst having their everyday lives being organized by institutions.

What about All That Data We Didn't Use? Putting in Dialogue Data Analysis in Institutional Ethnography with Other Methods.

This paper aims to reflexively and critically engage with my experience of bringing an IE perspective to non-IE research team. It uses as focus the data I collected with children living in shared physical custody in Italy – part of the ERC Starting Grant project *MobileKids: Children in Multi-Local, Post-Separation Families* (PI Prof. Laura Merla).

The research I led was framed as an IE, aimed at starting from these children's standpoint and understanding how their everyday, mobile, experiences are socially organized. I did participative interviews with 22 children (which I've met 2 to 3 times) and one or both of their parents. The data collected is thus large and dense. In this paper, I will put in dialogue the two ways in which I analyzed the data: one done in a "classical" thematic analysis approach using Nvivo coding (for the needs of the larger project), and the other one following the IE approach of mapping ruling relations. Results include, among others, a reflection about the different *type* of knowledge that comes out of both approaches – namely, a broader overview of a social reality that is analyzed through various structural factors in the "classical" approach, and the more in-depth path that highlights the organization by one specific Institution with IE. But also, considering the frustration we sometimes feel in IE when we end up mobilizing only a small portion of data to follow more specific social relations, I will highlight the pros and cons of engaging into both types of analysis for one same body of data.

Eldercare Staffing Issues & Personal Support Workers' (PSW) Job Quality

Background: Occupations relating to eldercare and caregiving have gained major importance in the age of rapid global ageing. Personal Support Worker (PSW) is an occupation that is tasked with providing emotional, physical, and psycho-social support for seniors in a variety of care settings. The significance of its role in eldercare has emerged as a result of COVID-19 outbreaks within institutional long-term care homes, with some homes reported very high rates of morbidity and mortality. The aim of this research is to assess the job quality of PSWs in Ontario (Canada), and to study the overall factors that impact the job quality, desirability, and reputation of the PSW occupation. **Methods:** The PSW occupation was critically analyzed using the OECD framework for measuring and assessing job quality. Key areas of focus included earnings and compensation quality, employment and labour market security, and the job environment. To substantiate the analysis, qualitative interviews were conducting with staff with participants who have experience working in eldercare facilities. **Findings:** PSWs tend to have low job quality and compensation when compared to other occupations involved with eldercare. PSWs lack access to employment benefits (paid leave, pension plans, etc.), have low job security, and have high rates of turnover. Job demands of PSWs are high, as they are often required to care for upwards of 8 seniors (per PSW). The job also entails exposure to physical health risks and occupational health hazards. **Recommendations:** Develop effective and standardized education and training programs; regulate the PSW occupation under the Ontario Regulated Health Professions Act, 1991; provide increased opportunities for full-time employment and better job security; update PSW compensation rates to be commensurate with those performing similar duties; and design a framework for professional development that will allow for promotion prospects.

Transversals in Migrant Workers Rights: Mahidol Migration Center's Social Lab, Policy Dialogues, and Alternative Politics

According to the IOM, as of 2019 Thailand has close to 4million migrant workers from neighboring Myanmar, Laos, Vietnam, and Cambodia, which about half are undocumented. The 2017 reforms in Thailand's migrant worker regulations sought to integrate the in-country undocumented into the regularization process through various complex and costly country identification, work visas and permits, and health security protocols. The

most recent 2021 Covid registrations increased the costs and complexity of procedures, which in-turn increased the exploitative practices by some brokers' overcharging, employers' excessive deductions, and government low-level corruption. In all, the situation has increased worker precarity.

We will discuss findings from Mahidol Migration Center Social Lab's projects aimed at addressing complex challenges in Thailand's inter-sectoral dialogues and participatory research. Our project is focused on shifting national-level discourse about employment industry and brokerage practices, as well as migration policies and their implementation toward rights-based agendas. Currently, several sectors including agriculture, fisheries, domestic-home care workers, and tourism are excluded from national standard labor laws and full migrant worker protections. Our paper engages in the potential to co-produce knowledge (in the form of policy/research briefs), co-design policy recommendations, and co-produce digital journalistic trainings.

The paper will also discuss the degree to which the local impacts of the program were achieved and the challenges experienced in:

1) building local government and university researcher connections with NGOs/CSOs and migrant leadership,

2) developing an in-depth understanding through sharing evidence and co-produced research (in the form of research and policy briefs at the social lab activities), and

3) engaging media digital journalists' and student-journalists' production in line with and for migrant leadership and migrant advocate NGOs/CSOs.

The Figure of Femeconomicus – Postfeminist Reconfigurations of Femininity in Financialized Welfare State

During the past few years, we have witnessed a proliferation of financial self-help that invite women to save and invest to the financial markets, a phenomenon conceptualized here as "financial feminism". Also in Finland several social media influencers have profiled themselves as feminist figures whose aim is to raise awareness on women's financial well-being and investing as a strategy for women to fight gender inequalities. This article focuses on this recent cultural turn that this financial feminism creates. Main interest is to study entanglements of postfeminism and financialization and how they are changing gendered subjectivities. The analyses draw on new original online ethnographic data on financial feminism in social media, focusing on social media influencers profiling in women's financial advice and gender equality. By asking what kind of figure FemEconomicus is, the aim is to study what kind new ideals and desirable femininities are mediated in social media through financial feminism and how these ideas are dis/connected from feminism and the politics of Nordic social-democratic welfare states in new ways. More in detail the interest is to study how women are invited to find new kinds of affective relations with work, care, marriage, money and consumption as well as with the welfare state. Of interest is to study what kind of political work this figure does.

MUSZEL, Magdalena* (Fundacja Zatoka, Poland)

Feminist Movements and Opposing Anti-Gender Campaigns in Poland.

Trust in representative democracy and institutions has considerably dropped in the past decades, due to structural societal transformations at national, and global level (della Porta 2013). These have been responsible for decreasing voter turnout, dropping partisan membership, and growing feelings of insecurity among the population (Crouch 2016; Norris 2011; Castells 2019).

To respond to these challenges, the anti-gender movement criticizes so-called 'gender ideology', broadly understood as the excessive focus on, and development of, gender equality policies and sexual and reproductive rights, and its critique of patriarchy, acting in defence of traditional gender roles. Because of these, scholars tend to emphasise the central role that gender has gained in defining and problematizing contemporary political, economic and social relations; particularly after a decade characterised by multiple crises.

After the 2015 elections (presidential and parliamentary) such concepts have become mainstreamed in Polish politics, with several initiatives undertaken by the government aimed at pushing the right-wing populist agenda. With the support (also financial) of non-state actors, such as the ultra-conservative think tank, Ordo Iuris, these processes escalated and began to influence various aspects of life, resulting in a nearly full ban on abortion in Poland since 2020.

At the same time, some of these initiatives, especially those concerning reproductive rights, were met with popular resistance peaking in 2016 and 2020 with protests against plans to restrict laws on abortion.

In this presentation, different strategies and tactics of the Polish feminist movement (that is behind these protests) are portrayed, including the use of legal procedures and mobilisations of different parts of the society, pointing out to growing intersectionality of contemporary Polish feminist movement. The empirical material used in this presentation comes from research conducted for the Horizon Europe funded project FIERCE - Feminist Movements Revitalising Democracy in Europe.

KIGURU, Gatitu (Kenyatta University, Kenya)

"Hustler" Vs. "Dynasty" Discourse in Kenya: A Herald of Issue-Based-Politics or a New Frontier in Othering

Political campaigns in Kenya, like elsewhere on the globe, have always been divisive. The division has, traditionally, been along ethnic lines with political alliances being tribal rather than ideological. Indeed, the strength of Kenyan political parties has always been largely defined by the numerical numbers of the ethnic communities from which their leadership is drawn. Such ethnic alliances have been the unstable foundation of Kenyan democracy and have resulted in catastrophic ethnic clashes. While the 2022 elections in Kenya were as divisive as ever, there was a marked shift in the axis of division. The winner of the presidential election ran on a 'hustler' tag and painted himself as the representative of the economically disenfranchised and impoverished majority. This majority was pitted again the 'dynasties' that have been at the helm of political and economic power since independence. Some political commentators were quick to celebrate what they termed as a shift to issue-based-politics and a sign of democratic maturity. The 'hustler movement' found voice and support even from outside the political class. Musicians, the press and the ordinary Kenyan social media creators took up the rallying tag and gave it, we argue, a menacing tone that could lay the foundation of prejudices against people and groups. Using data from lyrics and posts in selected social media platforms, we show that the so called 'issue-based-politics' of the 'hustler movement' quickly degenerated into polarising invective. The data shows a tendency to oversimplify and personalize issues by placing all blame on the 'other' while placing a misplaced messianic calling on 'our own'. We argue that this kind of discourse, far from entrenching mature politics, opens up a new axis of political division that is far from being issue based.

PALACKAL, Antony (University of Kerala, India)

Celebrating the Feminine: Intersectionality of Nature, Culture & Woman

Set in the overarching frame of the reality of gender paradox in the State of Kerala, a developing region in the Indian subcontinent, the paper seeks to unfold the intersectionality of the organic triad – nature, culture and women - in reimagining the feminine. Problematizing the question of gender paradox within the dystopian picture of the developmental trajectory of the region, christened as 'Kerala Model of Development', the paper intends to embark on a sociological enquiry into feminine subjectivity within a gendered regime. The Nayar matriliny in Kerala originally gave rise to a socio-cultural milieu that was woman-centric within the prevailing caste and cultural matrix. The cultural elements such as customs, rituals and festivals further contributed to ascertaining and celebrating the feminine powers and autonomy and built gender relations on an equitable plane. The paper, employing an ethnographic gaze into this cultural matrix of the matrilineal tradition, endeavors to recapture the nature-culture continuum in an attempt to redefine women's position that was ruptured by the colonial modernity.

Disconnection and Distress in the Age of Pandemic: A Comparative Study Among Students in Higher Education

Educational system was one of the most affected sectors on account of the outbreak of the pandemic that threw immense stress on the student population across the globe. The paper intends to sociologically navigate through the psychosocial health of the students in higher education in Kerala, India and International students in Kingston, ON, Canada, since the outbreak of the Covid Pandemic. More specifically, it t aims at unearthing the causative and contributory factors in the cognitive, emotive and conative domains implicating the psychosocial health condition of the student population under study. Hence, the primary task of the study involves unraveling the shifts in their cognitive (thinking), emotive (feeling) and conative (willing/acting) domains, the triple faculty that constitutes a personality. The study uses narrative paradigmatic framework and employs concurrent mixed method in capturing the empirical data. The insights of the study, it is hoped, will be beneficial not only in addressing the psychosocial health adversities of the pandemic on the student community, but also for similar cases of disasters in the future.

RC32-476.3

NABI, Shabnoor* (University of Toronto, Sociology Department, Canada)

On the Question of Postcolonial Sociology and Its Representation Politics: What Does It Reveal and What Does It Conceal?

The dominant gender and development frameworks, including classic modernization, developmental idealism, and human capital model, claim a positive relationship between women's educational attainment and their overall socio-economic power elevation via greater female labor force participation. The gradual extension of this neoliberal discourse into the sphere of western feminism and its agenda for the global South has rendered women's pursuit of education and employment as a marker of progress and modernity. Interestingly, postcolonial theorists and feminists highlight how it is the racialized Muslim woman/girl subject of the 'troubled' and 'crisis-stricken' developing countries of the global South that frequently gets presented within the neoliberal feminist discourse as the epitome of 'wasted' resource in need of rescue. Following the production of this binary girl-subject, stripped from its socio-political subjectivities, key postcolonial theorists argue for the need of sociology to adopt a postcolonial lens with interconnected histories framework in order to shift its focus from essentializing and hybridizing categorizations to interactional understanding of social relations, historical processes, and practices across multiple spaces. While I do find value in connected histories framework, I argue that its proposed application as part of the call for a 'postcolonial sociology' continues to put us at the risk of analytical elisions and bifurcations. Following this theoretical lacuna, I extend Julian Go's (2013) interconnected histories approach to analyze gender relations in the context of a postcolonial Islamic nation-state of Pakistan. I particularly show how distinct conceptions of postcolonial Pakistani nation and nationalism pave(d) way for a whole new set of power relations and hierarchies surrounding religion, nation-

state, and gender order. I ultimately suggest the need of a *renewed* postcolonial lens that not only incorporates interconnected histories (presuming co-constituting anticolonial consciousness), but also the associated semiotics of the internal national politics in redefining the conceptions of postcolonial sovereignty, modernity, and development.

NACLERIO, Emanuela* (Erasmus University Rotterdam, Netherlands)

In Search of Sustainable Work: Micro-Entrepreneurs' Narratives and Practices of Craft

In recent years, craftwork and making have been increasingly considered by academic reflections in terms of their possible contribution to sustainability and innovation of production (Bertacchi and Segre 2016, Grodach et al. 2017).

On the one hand, scholars in economics and management have been looking at makers' activities as a way to overcome capitalist dynamics of growth towards a more sustainable production of goods that prioritise cooperation over competition (Vincent, 2022: Kroezen et al. 2021). On the other hand, scholars in the field of cultural studies have often associated craft and creative workers, underlying the role played by internal systems of rewards, creative autonomy and freedom in organising work (Hesmondhalgh 2013).

In the global north, the growth of consumers and producers' interest in craft goods has been related to ethical values of authenticity, locality and sustainability (Bell et al. 2021; Banks 2010). Refusing standardised mass production, craftwork provides not only for unique cultural and symbolic goods but also for an alternative and non-instrumental approach to both production and consumption.

In this context, makers' imaginaries and practices have been considered key to understand possible futures of work that deviate from profit-oriented economic rationales (Sennett 2007; Rosa et al. 2018). However, other scholars have dismissed enthusiastic understandings of craft work, pointing at the ambiguities that permeate craft working environments in relation with issues of employment instability and neoliberal entrepreneurship (Jakob 2012; Rantisi 2014; Luckmann and Thomas 2018).

Using a qualitative approach, this paper aims at considering craft micro-entrepreneurs' narratives of work to understand how they construct discourses and practices of autonomy and sustainability in a context of work dominated by neoliberal values of competition. Through the analysis of in-depth interviews, the study shed light on how values associated with craftwork are embedded and negotiated in makers' everyday activities.

NADARAIA, Khatia* (Universidad Carlos III de Madrid, Spain)

Cognitive Aging Trajectories of People Aged 50 and over in European Countries

This study tests the critical period/latency model of memory decline, which builds on the framework of stress research. The critical period/latency model refers to a limited window of time during which stress can have harmful or protective effects on development. Data from SHARE allow us to quantify the rate of cognitive decline (not just cognitive performance at a given point in time). To estimate the course of cognitive ageing over time, I selected the sample of those who participated in seven waves (13 years) and had no missing memory data. The final analytic sample consists of 5280 respondents. I rely on a general measure of memory performance that is the sum of individual scores on the two tests of immediate and delayed recall. The proxy for social and material deprivation is an index of long-term household wealth and well-being based on asset ownership, access to utilities, household characteristics and the occupation of the main earner, as proposed by Filmer and Pritchett (2001). The latent growth curve mixed effects models were applied to estimate the trajectory of cognitive ageing over time. I found evidence that the rate of decline in memory scores (the slope over time) differs significantly by social background. Even after controlling for years of education and occupational position at midlife, the association between memory performance and social background remains. There are thus considerable differences in the profiles of age-related cognitive decline. These differences can only be partially explained by different class trajectories. Thus, origin appears to have long-term effects, consistent with a critical period mechanism. The results suggest that the rate of decline is less pronounced for individuals with a high social origin than for those with a low social origin.

RC28-400.2

NADARAIA, Khatia* (Universidad Carlos III de Madrid, Spain)

Socioeconomic Family Background and Major Depressive Disorder at Age 50 and over

Evidence suggests that a person's social class (life chances) are associated with different probabilities of experiencing stressful life events, and that therefore a person's class position influences psychological well-being. However, this framework does not take into account early life stress. Based on the toxic stress model, which states that recurrent environmental stress in early childhood alters children's developmental process and produces

socially patterned health risks, it is plausible that material deprivation has a long-lasting scarring effect on the occurrence of depressive moods in later life, independent of life trajectories such as educational attainment, occupational position and physical health. This study draws on data from the Survey of Health, Ageing and Retirement in Europe (SAHRE). It is the first attempt ever to compare the Toxic Stress Model with the Stress Process Paradigm. The aim of the empirical analysis is to disaggregate the influence of family socioeconomic background on depression using mediators such as educational attainment and occupational position in adulthood. The influence of childhood socioeconomic conditions is captured by the following variables: Housing conditions and overcrowding, parents' cultural capital (number of books in the house at age 10, parents' highest educational attainment) and father's occupation. The mediating role of educational attainment, occupational position and general physical health is examined using the KHB method, which allows us to factor out the influence of material deprivation that remains after adjusting for the proposed mediators. I found evidence that socioeconomic status in adulthood contributes little to the overall effect of family socioeconomic background on depression, implying that childhood socioeconomic status exerts its influence on depression through channels other than educational attainment and occupational status. This study is the first indirect test of the Toxic Stress Model. Further interdisciplinary research is needed to fully uncover the impact of childhood material deprivation on major depression.

An Analysis of the Interpretation of Their Work By Male Salespeople Working for a Japanese Cosmetics Company: Are They Key Players in Changing Gender Norms?

This study uses male salespeople in the Japanese cosmetics industry as a case study to clarify how they interpret their jobs in what are considered to be "female jobs." Previous studies have assumed that beauty industry workers are women and have positioned them as victims of exploitation of their motivation under low-wage labor. In recent years, however, there has emerged an argument that it is precisely in the beauty industry that women strategically utilize their "femininity" to achieve professional status. In this context, male salespeople in the Japanese cosmetics industry, a growing trend in Japan since the 2010s, are essential to consider in this debate. It is because they are men entering and working in what has been considered a female-centered, low-paying "female jobs," and therefore have the potential to change the existing gendered labor landscape. Will they be critical players in transforming gendered occupational images and labor practices, or will they reproduce existing gender norms about labor? To clarify this research question, this study conducted semi-structured interviews with 10 Japanese salespeople at cosmetics companies from August to September 2022. The analysis revealed that they did not position their jobs as "female jobs" but rather as jobs that help them realize their identity, and they described their jobs as rewarding. Here, we can see the transformative potential of the "beauty profession = female profession." On the other hand, they were aware of the stigma attached to their "female jobs." Moreover, they expressed dissatisfaction with their ability to support their families in the future due to their low salaries. The significance of this study is that it focuses on men, who have been invisible in gender studies of the beauty industry and redefines them as crucial players in shaking gender norms in the industry, making visible the difficulties they face.

The Labor Market Positions of Immigrant Workers in Japan: Skill Transferability and Institutionalized Inequality

The labor market positions of immigrants usually differ according to their countries of origin. Immigrants from western countries are more likely to enjoy better positions than those from other countries. The economic assimilation theory explains this difference by using the concept of "transferability" of human capital that immigrants have accumulated in their home country. The more transferable to a receiving country immigrants' accumulated human capital is, the lower their possibility of experiencing downward social mobility becomes. In Japan, this explanation has been used to explain the relative advantage of immigrants from western countries over those from non-western countries. However, few studies have tested how employers evaluate human capital accumulated in different countries. In the present study, we shed light on this point by using an online survey of registered monitors of an online survey company who have experience working in a human resource division. We found that human capital (academic degree and working experience) accumulated in western countries are valued less than those accumulated in Japan and to the same degree as those accumulated in Asian countries. Thus, we cannot say that human capital accumulated in western countries is more transferable than that accumulated in Asian countries. To seek alternative explanations, we investigate distributions of countries of origin of immigrants by statuses of residence by using the Statistics on Foreign Residents. It suggests that human capitals accumulated in western countries are transferable in limited occupations such as language teachers and legal/accounting professionals. Furthermore, lower labor market positions of South Asian immigrants have been institutionalized through binational agreements

between Japan and South Asian countries for technical intern training and specified skilled worker programs. Our results show the significance of policies of sending and receiving countries to explain the labor market positions of immigrants in Japan.

Navigating Risk and Uncertainty in High-Risk Activism: 'Ethical-Emotional Capture' and Its (dis)Contents

This paper examines the role that emotions play as activists at risk (human rights defenders) navigate risk and uncertainty. Drawing on a study with 407 people who defend human rights in Colombia, Mexico, Egypt, Kenya, and Indonesia, I proposed that people continue to engage in risky and costly forms of activism because they have experienced a process through which they are 'captured' ethically and emotional by their causes. This concept of *ethical-emotional capture* undergirds their moral obligation – to themselves and to others – to act in the face of danger, risk, and uncertainty. I explore the significance of guilt and compassion as motivators, and the necessity of managing anxiety, fear, and disappointment. As they persevere, the risks and costs of activism that human rights defenders experience becomes woven into their experience of *ethical-emotional capture*.

Children's Overall Subjective Well-Being Change during the COVID-19 Pandemic: A Global Multi-National Analysis

As a response to the COVID-19 pandemic, social distancing measures have been implemented worldwide, increasing children's mental health problems. However, there are lack of evidence how the impacts of the pandemic reflect in children's overall subjective well-being (SWB) assessments. Inspired by Ryan & Deci's self-determination theory and recent results of Wu and Lee (2022 in Child Indicators Research), we aim to examine how the COVID-19 pandemic has affected children's overall SWB, including the role of Coronavirus and school anxiety, social distancing experience and psychological needs fulfilment in this.

We use up to 21,646 primarily 10–13-year-old children's data from 20 countries across the globe collected in 2021 as the part of International Child Well-being COVID supplement Survey. Overall SWB is measured with happiness with the life as a whole before and during Coronavirus pandemic. We use descriptive statistics and binary logistic regression analysis.

We found that during the COVID-19 pandemic children's overall SWB has decreased overall and in all selected countries. The largest mean decrease has occurred among Bangladeshi children and the smallest decrease among Russian, Spanish and South Korean children. Different profiles of SWB change occur - overall, 59% of children can be labeled as 'decliners', 29% of children as 'no changers' and 12% as 'gainers'. Overall, 'decliners' tend to have higher Coronavirus and school anxiety, experienced more social distancing measures and agreed more that they felt loneliness compared to 'no changers' and 'gainers'. 'Decliners' and 'gainers' tend to be less satisfied with the freedom they had and agree less that they were good at managing their daily responsibilities compared to 'no changers'. Regression analysis confirm that all these factors matter in explaining children's belonging to SWB 'decliners' compared to 'no changers' profile.

In conclusion, our study confirmed the importance of keeping schools open to save children's SWB.

Lead and Lag Times of Countries in a Gentler World

According to Pinker (2011), Ingelhart (2018) and Welzel (2013), the human world has been moving toward more tolerance and less violence. We aim to quantitatively specify this trend toward "a kinder, gentler world" for various indices using extrapolations from previous decades. Linear extrapolation from previous decades is the simplest, but when indices are defined to run from 0 to 1 (100%) or vice versa, it risk leading to absurd values, negative or exceeding 1. We avoid this by using exponential approach to a ceiling of 1 or a floor of 0, over time. Integrated Values Database 1981-2014 and dataset "WVS Wave 1 to 6 Key Aggregates" are used in these analyses. We first, compared to world average, list the lead and lag times of 26 countries for Welzel's Gender Equality (TGE) and for Nahkur's Societal Index of Interpersonal Destructiveness (TSIID) scores. This will illustrate the type of results the method used can produce. For example, we found that TSIID ranges from a 25-year lag (Russia) to a lead of more than 100 years (Sweden) compared to world average, while TGE ranges from a 31-year lag (Georgia) to a lead of 78 years (Norway). Next, the method leading to such results is explained and applied to measures like Welzel's Emancipative

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Values Index and question about respondents' locus of control (both ranging from 0 to 1) Finally, we compare the patterns in time for all indices/measures investigated, as well as the lead and lag patterns of individual countries.

Revisiting the Question: Does More Money Mean Higher Well-Being?

Despite the volume of literature exploring the relationship between disposable income and global life satisfaction assessments, there is a lack of empirical investigation exploring the relationship between broader notions of economic living standards and subjective wellbeing. This paper addresses this gap by comparing two alternative individual based well-being frameworks. The economic living standard indicator framework is a set of economic resource metrics that append disposable income with income streams form non-cash services (including in-kind social transfers) and annuitised non-home wealth and home wealth, as providing the full range of potential consumption possibilities that affect an individual's economic living standard. The subjective well-being indicator framework takes account of an individual's cognitive evaluation of their life based on domain-specific life-satisfaction questions. These two frameworks are compared over time and across older and working-age groups in Australia using person-level data from the Household, Income and Labour Dynamics in Australia (HILDA) survey for 2010, 2014 and 2018. In the context of an ageing population, these two cohorts face specific challenges. Macro-level challenges include the ability of government to mitigate declining labour force participation rates with increasing health, aged-care and pension-related fiscal pressures. Micro-level challenges include maintaining social cohesion across and within generations and the quality of life of individuals over the life-course. The paper explores the relationship between the twin objective and subjective realms of well-being, with empirical analysis focussed on providing insights into the nature of advantage and disadvantage within and across age cohorts. The different frameworks provide evidence of for whom and in what way does wealth, home ownership and in-kind public, in addition to income, have on an individual's cognitive evaluation of their life.

Food for Life, Food for Thought – an Evaluation of Hunger Free District Project and Community Kitchens in Kerala (India) As a Model to Build Social Capital and Good Governance

The small state of Kerala in the south west coast of India is often highlighted for its unique social indicators and quality of life at par with developed nations despite low GDP and economic growth. This paper is an evaluation of two novel state programs - Hunger free District Project (HFDP) and Community Kitchens - that has put people at the forefront targeting food security in the pre- pandemic and pandemic period alike. For mixed methods involved, 342 older adult beneficiaries out of 482 total beneficiaries of HFDP were surveyed. Qualitative analysis used case studies. By bringing women in SHGs and NHGs, HFDP and community kitchens became participatory. The dialectical process of state intervention and performance of mobilized groups and public bodies has resulted in a system of 'Support - led security 'as distinguished from 'Growth – led security' (Dreze and Sen). The study proved that optimum use of available resources and integration of appropriate stake holders will give tangible results for improved QOL. Gendered work received acceptance as economic activity and destitute people found them dignified, accepted and included in governance. People centred policies and public action laid foundations for interdependence, quality, trust and bondage within the community accumulating considerable social capital for good governance. Research suggests that by increasing involvement of families, interaction of stakeholders and extending capabilities of care, HFDP and community kitchen may be used as model for accumulating social capital not only for India but also for nations across the world.

Optimum Digital Skills As Species Capital for Older Adults – the Significance of Digital Language Brokering.

Digital divide among older adults was a major challenge during the pandemic in developing countries like India. E-health, , e- certificates from local self governments, e-commerce, e - payments for goods and services, e-submission for services like social seurity pensions and different relief benefits as well as packages, virtual social relations, virtualization of rituals, ceremonies, festivals and social gatherings - all have made a pandemic induced 'virtual shock' to older adults. Upholding the aims of Sustainable Development Goals and WHO's appeal for Age Friendly Communities, the research aims to understand intergenerational support as a crucial factor for making 'aging in place' a reality. Research introduces the concept 'Digital Language Brokering'. The research design is descriptive and used mixed methods. Samples were selected using random sampling method from the selected districts in Kerala. Inclusion

criteria were accessibility, possession or use of digital devices and services. Interview schedule was the tool. Age, gender, education, income, family and place of residence were used as the variables. Statistical analysis was done using SPSS. FGD and narrative analysis were conducted focusing SHGs, NGOs, and Old Age Homes etc. Thematic analysis of qualitative data supplemented survey findings. Bourdieu's theory of habitus was used to explain the dynamics of digital world for older adults. Research concludes that Digital Language Brokering is an effective tool to exchange digital skills and reduce generation gap. It enriches all the four species capitals and is capable of developing itself as a Species Capital on its own.

Public Attitudes Towards State Support for the Self-Employed during the Covid-19 Crisis in Japan

This study investigates public attitudes towards providing financial support to the self-employed, a less research issues in otherwise rich literatures on welfare attitudes. As in other industrialized countries, although social protection for the self-employed in Japan is almost non-existent, some exceptional benefit schemes were created during the Covid-19 crisis. According to the study by Giuliano Bonoli et al., when exposed to significant economic risk, most self-employed workers favor the provision of financial support and override ideological preferences for less state intervention. However, very few studies examine the change in attitudes of Japanese self-employed workers. Therefore, we analyze to what extent the self-employed change their public attitudes, the changes more pronounced than in other forms of employment. In additions, if there has been a significant change in the self-employed, we analyze what factors have contributed to that change. To describe the change of public attitude, we use the data sets from Japanese Life Course Panel Surveys (JLPS) project by Institute of Social Science, The University of Tokyo. To capture changes under the Covid-19 crisis, we use the data conducted in 2019, 2020 and 2021. The total sample size use 4800 and JLPS covers from 20 to 40 yeas old as of the end December 2006. The main dependent variables are opinions about the government's responsibility to reduce income inequality and the expansion of social security. The independent variables are changes in living conditions and the use of life and business support programs during the pandemic. Based on the results of the analysis, we discuss the direction of social protection for the self-employed in Japan.

Cultural Barriers to Leaving Their Places of Origin: Thinking of "Place Attachment" in the Japanese Context

This study aims to explore how people decide to live in their places of origin and to think about the relation between their decisions and their feelings of belonging to the places (place attachment). Several macro- and micro-level studies of place attachment have been conducted in psychological and sociological fields (Feldman, 1990; Gustafson, 2001; 2009: Pollini, 2005). Their studies show that where they live, where they move, and how they feel place attachment is significant in thinking of the relation between place attachment and geographic mobility. The interests in Japanese international migration for marriage and labor have not been common for the last few decades since Japanese people tend not to move internationally compared to people from other Asian countries. It is worth noting that Japanese tend not to move even domestically. They identify relatively small places as their hometowns, which are not nation-wide but prefecture-, town-, or village- scales. It seems that they have a stronger place attachment to their "hometowns." However, exploring why they live in their places of origin through qualitative interviews with young people from a particular place in Japan, I found that those who remain in their places of origin had not had any opportunities to think seriously about their future careers and of the possibility of living away from their hometowns. In contrast, those who had advantageous family backgrounds had chances of moving geographically for university education. The determination of leaving their hometowns or not is embedded in Japanese educational, occupational, and marriage systems, not in culture, so that some had never had a chance of even considering living away from hometown. Their choices of staying in their hometowns are made through their feeling "fear" of living away from their hometowns and "unconscious options" rather than a more active feeling of place attachment.

NAKANO, Kenshin* (Institute of Labor Economics and Industrial Sociology, Aix-Marseille University, France)

How Does the Platform Work Destabilize the National Employment Systems ?

The work of digital platforms is disrupting the employment regime that forms the basis of the welfare state in the old industrialized countries, albeit in different ways in different countries. While this general observation applies more or less to many countries, a detailed analysis of the cases of different countries shows social differences that platform technology could not make

disappear. Thus, through a comparative study between France and Japan on the case of mobility platform – especially food delivery workers –, my presentation proposes to show different forms of installation of the platform economy, focusing both on the place of these workers in relation to the dominant form of employment and the criticism addressed to platform work.

In fact, although these platform workers carry out their activity with a independent status all over the world, this status does not imply the same thing from one country to another in relation to the employment norm and structure in force according to country. In my research, unlike the French self-employed status which is at opposite to the employed one as the basis for worker protection and regulation, the contrast between employed and independent workers in Japan is not so clear-cut, which is a reflection of the dual employment structure in Japan.

According to my hypothesis, these differences in the place that platform work occupies in each society also influence the direction of criticism toward platforms. While in France various actors, in particular trade unions, have more or less mobilized to align the protection and regulation of platform workers with that of employed workers, in Japan, weak protection and regulation for non-tenured employees seems to be prompting actors to seek a new form of protection and regulation, the outline of which is not yet defined.

Approaches for Buiding Sustainable Communities in Flood-Prone Industrial Complex Areas

The purpose of this study is to investigate the current community's disaster coping capacities and social vulnerabilities by conducting self-capacity assessments, identifying the vulnerability groups, investigating the critical facilities in the communities, and collecting their 2011 flood experience for building sustainable communities in flood-prone industrial complex areas. After the 2011 flood in Thailand, the industrial estates/parks established several soft and hard flood countermeasures. One of the typical hard flood countermeasures was building a 5-6meter water wall around estates/parks. This, however, means an increased flood risk in the surrounding communities. Thai worker is the key reason why companies do not leave the industrial park/estate. They work for the companies but are also residents of the communities. Through this study, the coping capacity, social vulnerability, and flood risk, including flood experience and geolocation data, were gathered and analyzed. Furthermore, critical facilities such as public institutions, schools, temples, and hospitals (shelters, etc.) that should be protected as a priority were also investigated. The results clarified their capacity gaps and identified vulnerable and risk areas with their narratives in the target communities. Based on the findings, for instance, inundation simulations are reflected in the GIS map before a flood. Community leaders may order volunteers to immediately remove the elderly and vulnerable individuals to safer evacuation centers through safer routes that are not at risk of flooding. In addition, the disaster experience can be used as a hazard map and various purposes, such as training materials and disaster scenario formation, during regular times. As a result, this study demonstrates how to identify, visualize, and use community-level disaster coping capacity and social vulnerability in flood-prone industrial areas. These procedures and findings can be applied and contribute to building sustainable communities in different industrial areas both inside and outside of Thailand.

Declarations for Net-Zero By 2050 As a Turning Point for Climate Policy: Linkages between Vertical and Horizontal Diffusion

Sub-national governments are a crucial non-state actor for mitigating climate change. This importance has recently strengthened as increasing numbers of municipalities declare net-zero carbon emission goals by 2050 to support the Paris Agreement, often well ahead of national governments. In Japan, net-zero declarations have also diffused widely among local governments, with more than 750 declarations appearing by the end of August 2022. On the other hand, the Japanese government declared a goal to eliminate all carbon emissions by 2050 in October 2020, which was followed by the announcement in April 2021 to raise Japan's target for the year 2030 to a 46% reduction of GHGs from 2013 levels. Climate policy in Japan, which has historically prioritized feasibility and consensus building with industry, is hence currently undergoing a major paradigm shift towards backcasting-style planning.

This study examines the diffusion of net-zero declarations across Japan, elucidating the mechanisms that drove this turning point in domestic climate policy. Based on theory from the literature on policy diffusion, we carry out a case study on Kanagawa Prefecture to investigate the dynamic process by which mutual interactions across national and sub-national governments and horizontal diffusion across city governments drove the diffusion of net-zero targets across Japan. We also verify the effect of transnational networks along with other drivers and barriers. Using data from semi-structured interviews and document analysis, we find that adoption of the net-zero target began with progressive cities belonging to transnational networks. After this trend

was noticed and promoted by the Ministry of the Environment, the increase of declarations at the sub-national then spurred the adoption of a net-zero target by the national government, which further propelled the emergence of net-zero declarations across Japan's municipalities.

Social Class and Gender in a Solitary Society: The Impact of COVID-19 Pandemic in Japan

This presentation aims to examine whether the COVID-19 pandemic has exacerbated the isolation of people under fragile social security systems and whether this isolation has led to anxiety and poor mental health, particularly among lower social classes.

Modern society is an individualized society in which individuals must construct their own identities instead of relying on their origins or reference groups. Although this resulted in a society that allows greater freedom of choice based on the value of diversity, it also promoted a *liquid* society, which implies the destabilization of firm value standards and identities. In addition, Japan has a rapidly aging population with a declining birthrate, and other industrialized Asian countries are also expected to face similar risks.

The COVID-19 pandemic has altered people's behaviors. Although our society had already been individualized prior to the pandemic, direct contact with people was drastically reduced to minimize infection risks. The pandemic has compelled individuals to isolate themselves, thereby weakening their social connections. Consequently, this pandemic may have aggravated the situation by segregating people in vulnerable positions, such as those with insecure employment, single people, and those with family members in need of care, from society. This may have resulted in people's pessimism toward the future and deteriorating mental health.

Thus, this presentation uses the data from a longitudinal survey, which has been conducted annually in Japan since 2007. The sample comprised Japanese men and women born between 1966 and 1998. The data revealed that direct interpersonal contact has substantially decreased after the pandemic and that men's mental health has remained fairly stable, whereas women's mental health has worsened.

Money, Love and (co)Parenting. Post-Separation Parents' Negotiations about Economic and Care Responsibilities Towards the Children

The spread of shared physical custody is growing in Europe and in several countries around the world (Bernardi & Mortelmans, 2021). In parallel, far more studies are available than in the past on post-separation co-parenting practices, conflicts and the consequences of separation on family relationships and well-being (Amato 2011, Koster *et al.* 2021; on Italy Barbagli e Saraceno, 1989; Naldini et al. 2021). However, several studies have focused on the gendered economic consequences of divorce. The interest has been primarily on the potential negative impact that it has on children. After the separation parents may become the actors of divorce conflicts on the meanings of money and decision-making processes around the residential *time* and child support *payment*. Money may become the battleground within which to understand the potential trade-off between financial provision and caring, between 'her' and 'his' idea of 'proper' child time, care and maintenance. Vivian Zelizer offers an alternative model to the most used utilitarian framework, which focused on the relational, social and symbolic meanings of money. According to this author, people are constantly "earmarking money", creating new currencies and giving money new meanings. The paper explores how mothers and fathers meanings around child maintenance in the context of dual residence arrangements. It focuses on how parents create, maintain or negotiate legitimacy and sense of deservingness of the child-support payment. The study draws on qualitative interviews with 40 separated mothers and fathers in Italy. Results indicate a wide array of trade-off between financial and care provision which co-exist with contested, dynamic and interrelated dimensions which are associated to post-separation parenting configurations. Gender differences and inequalities emerged in meanings, negotiations and power around intimacy and money. The results are of interest especially in the Italian context of the persistent gender asymmetry in care and financial responsibilities.

A Feminist Critique of Institutional Racism and Gender Essentialism: In Defence of Namibia's Track Athletes

This paper is a critical response to World Athletics and the western ethos of athletics for their sustained systemic exclusion of women, particularly

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

black women. We make a case in defence of two Namibian athletes, Christine Mboma and Beatrice Masilingi, who were removed from the 400-meter race in the 2021 Olympics in Tokyo, Japan due to the World Athletics testosterone rule. The rule appears to be primarily applied to female athletes from the Global South. This article argues that the testing regulation is demeaning, is based on questionable science, and targets women based on racial and gender stereotypes. We posit the testing regulation to be problematic and demeaning to all women, as it implies that women having high testosterone levels places them at a competitive level similar to that of men, and that testosterone is the sole key to their athletic success. This strategy, which we see as a form of institutional racism and sexism, has been widely criticised in international scholarship, media and other public spheres. Mboma and Masilingi are amongst the black women who have recently been excluded from elite sports and subjected to this kind of scientific racism and gender essentialism. Other athletes include South Africa's Caster Semenya, Burundi's Francine Niyonsaba and Kenya's Margaret Wambui. Caster Semenya, an Olympic athlete, "was subjected to genetic, gynaecological, psychological, and endocrine gender verification" (Swarr et al., 2009). The article will unpack how black gender-non-conforming bodies pose an administrative challenge for institutions such as World Athletics, and how as a result they are othered through overt human rights violations. Our critique of gender essentialism is also extended to racist, sexist, homophobic and transphobic people in the Namibian context who seemed to be offended by witnessing this systemic violence in their performativity of nationalism.

An Analysis of Jobs and Livelihoods Affected By Covid-19 Pandemic: A Social Protection Perspective

Covid-19 pandemic caused drastic changes to the world of work and people's livelihoods. The national lockdowns and other restrictions imposed by government resulted in the disruptions of economic activities. While some people were able to successfully do their jobs online and from home, others lost employment and jobs opportunities temporary or permanently. The consequences have been a loss of livelihoods, particularly those employed in the retail, agriculture, hospitality and informal trading. These are workers who are rarely covered by social protection. In examining the impact of Covid-19 pandemic on Namibia's labour market, this paper will analyse the extend of job loss in terms of sector, gender and social groups. It will argue for a comprehensive social protection. It will also look at the challenges of returning to work and transition to new ways of working conditions postcovid-19. Furthermore, the paper highlights the role of social grants in cushioning job losses in the most affected economies as a result of the pandemic crisis. Data will be drawn from Namibia Statistics Agency (NSA) and other published data from literature including author's research on the world of work and social protection in Namibia.

NAQVI, Ijlal* (Singapore Management University, Singapore)

Schools of Citizenship

Among undemocratic regimes, Singapore stands apart for its stability, wealth, and its strong international standing despite its leadership's steadfast refusal to concede any superior legitimacy to liberal democracy. For these attributes it serves as a model to countries in Asia, Africa, and beyond who would seek to imitate its development trajectory while limiting political opposition. Examining civil society in Singapore gives us the opportunity to look at the limits and boundaries of the state in an undemocratic context, and to examine the extent that civil society can fulfill its traditional democratizing functions under such circumstances. Also, drawing on the ample literature on voluntary associations and the state in the US and elsewhere, a comparison can be drawn on the mechanisms of public engagement and their consequences for social capital and democratization across these different contexts.

The evidence from Singapore suggests that the processes and pedagogical function of associational life are intertwined; in the absence of free space, practices of participation lose their democratic luster and can make little contribution to effective governance. In this there is a remarkable continuity of governance practices across democratic and non-democratic settings. Further, there is a similarity of effects both in the proliferation of structures which offer participation without power, and the capacity for empowered deliberation to be generative of pro-democratic social capital. These mechanisms of engagement—'schools of citizenship'—appear to function consistently at a small scale across contexts, in that group structures and leaders shape behavior, and the behaviors shape norms and expectations of participation.

Multidimensional Civic Engagement Among Older Adults in Europe: Individual and Country Level Variations and Drivers

Previous research on civic engagement among older citizens suggests that individual characteristics such as gender, socioeconomic status, and health influence the ways and the extent to which they engage civically. However, older people's civic engagement is also assumed to be shaped by the context in which participation occurs. National level aspects such as the type of welfare state regime, reflected by for example measures of social expenditure, the coverage and generosity of pension rights and at risk of poverty could affect the possibilities for being civically included but has, however, been examined to a lesser extent, especially using a cross-country approach. The role of culturally embedded attributes, including ageism and the level of individualism, also remain relatively unexplored. Furthermore, as a multidimensional concept, civic engagement includes different activities (e.g., informal helping behaviors, formal volunteering, or political participation) which could be differentially influenced by individual and country level aspects. The aim of this study is thus to examine individual and country level factors associated with various forms of civic engagement in later life across Europe. We use data from the European Quality of Life Survey (EQLS) conducted in 33 European countries during 2016. The sample of the present study includes over 12,000 individuals aged 60 and over. Civic engagement is assessed through formal volunteering, associational participation, political participation, and informal helping behaviors. Multilevel regression analysis is used to explore individual and country level effects on each measure of civic engagement. The results are expected to increase the understanding of variations in, and drivers of, civic engagement in later life and whether these differ between different welfare state constellations across Europe. The study will thus contribute to a more deepened and multidimensional evidence-base regarding factors that facilitate or hinder older people to be civically engaged.

NASTOVSKI, Katherine* (York University, Canada)

The Trials and Tribulations of Institutionalizing a Rank-and-File Led Labour Internationalism

Drawing from interviews of union activists, leaders and staff in Canada in the early post Cold-War period, this paper critically examines the ways activists sought to sustain a rank-and-file led model of labour internationalism.

In the 1990s, there was significant momentum within Canadian unions for expanding the engagement of rank-and-file union members in international solidarity actions. This momentum translated into the mobilization of union members on issues of international solidarity on a huge scale. This was particularly evident in the organizing in opposition to free trade agreements and later what would become the anti-globalization movement. In this period, unions activists succeeded in extending their engagement with rank-and-file members on a number of fronts, from education to mobilizing members in coalitions and demonstrations. During this time, activists also explored different avenues for sustaining their work. In some regions, this took the form of cross-union cooperation in committees of councils and federations, in others it translated into committees or staff positions being established. In finding ways to sustain this model of international labour solidarity, activists were confronted by contradictions and new problems posed by institutionalization. In this paper I will critically compare the efforts to ensure sustainability of a rank-and-file led labour internationalism through various forms of institutionalization within unions.

Were any of these efforts successful? What can we learn from these efforts about the challenges of sustainability posed by this model of labour internationalism? And how did these various approaches to sustainability through institutionalization shape the politics of rank-and-file internationalism in the post-Cold War period?

RC29-425.1

NATAL, Ariadne* (Peace Research Institute Frankfurt (PRIF), Brazil)

Determinants of Police Lethality in Brazil

The excessive use of force by Brazilian military policies is a severe problem. In the last decade, Military Police officers on duty killed at least 38.000 civilians in Brazil, with annual data showing continuous growth, rising from 1.05 victims per 100,000 inhabitants/year in 2011 to 2.6 in 2021. Although the magnitude of the problem is known, there is a gap in research exploring its conditioning factors, that is, what are the variables that help explain police lethality, which we propose to do in this paper. State-level data (27 states) over the last 12 years (2011-2022) indicate different Spatio-temporal trends, suggesting the contextual aspect of this phenomenon. Based on a literature

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

review, we establish three main hypotheses to be tested in inferential models verifying their effects on the dynamics of police lethality. H1. Structural: in this perspective, we consider the effects of economic and socio-demographic characteristics of the states (the hypothesis is that the greater the vulnerability, the greater the lethality); H2. Situational: considers the levels of criminality and police victimization (we hypothesize that the greater the threat, the greater the lethality); H3. Political-ideological: considers ideological political orientation of the state governors and president in office, as well as the presence of a punitive political agenda (the hypothesis is that right-wing governments with punitivist policies would have higher lethality rates). We test the hypotheses using regression analysis and discuss the results, findings and implications.

Development Vis-a-Vis Nature in Assam Context: People's Right and the State

Assam, a constituent state of India comprises of numerous ethnic communities had a rich heritage of conserving nature in traditional way by various communities. The colonialism (1826-1947) created various hierarchies of jungles (forests) for conservation of nature which can be said as the British forest policy. However, most of the categories, rules in terms of forest conservation were continued by the post-colonial state. It is seen that the rapid urbanization, developmental projects etc. have pushed the ethnic communities to the margin as well as displaced them in terms of land rights and rights over the natural resources. This paper looks into some of the issues bringing in some of the case studies where the state ignores the men-nature relationship in the name of forest conservation. At the same time, we also see the abuse of the nature in massive scale under the name of development as well as popular protest. In Assam context, the anti-big dam movement was one of the organized resistance movements of the people of Assam which is still continuing. Numerous micro level resistances are also seen in various intensities. The paper will explore some of those to understand the environmental issues and resistance movement in Assam.

Relooking the Assam Movement: Memories, Memoire and the Vernacular Press

Assam Movement (1979-85) was one of the longest mass movements in the post-colonial Assam led by the students (All Assam Students Union) of the state with the demand of expelling illegal Bangladeshi citizens living in Assam. It is also one of the most studied social movements from multiple perspectives across disciplines of humanities and social sciences in the local academia. Though the soul demand of the movement was expelling of illegal Bangladeshi citizens living in Assam, but at the same time it also reflected the identity crisis of the local population, addressed the Assamese nationality question, questioned the uneven federal structures etc. However, finally it reduced to a movement or a debate to decide the cut-off year for identifying illegal citizens. Scholars, authors both in academics and in popular cite various census data, population growth rate, colonial policies, land issues to analyse the movement. Though it was a mass movement, still it was marked with undemocratic elements and characters, massacre, state-violence and so on. In this article instead of looking into the numbers or statistics of illegal Bangladeshi nationals where the movement based upon that created a sense of identity crisis or a popular anxiety among populations, I have looked into the autobiographies, memoires and memories of many known and unknown leaders, journalists, police officers etc to understand the very essence and multiple nuances of the movement. It would inform us how the movement worked in the micro level. I would also take the liberty to relook into the role of the vernacular press especially in the formative years of the movement to understand the movement.

Sensitive Content: The Genealogy of Algorithmic Aura in Visual Culture

This paper may contain information that some people might find upsetting. It is an attempt to genealogize the algorithmic aura in visual culture and to argue that contemporary desires for algorithmic intervention in the visual culture predate the digital age and go back to the invention of photography as an objective tool that visually captures (part of) reality.

From Du Bois, Benjamin, and Berger, to contemporary critical algorithmic scholars, the social practice of codifying data in images is described as intertwined with socio-cultural classifications, such as race, gender, and other categorizations that are perceived as having visible attributes, while hiding other sorts of data, thereby turning them invisible.

Today, the ability to capture reality, extract and identify data, take actions based on such data, or create virtual realities is expanding, having higher (although not necessarily more accurate) performance and resolution operating at a greater speed and influencing more spheres of the daily lives of a growing number of people around the globe. Simultaneously, the role of algorithms in the dialectic relations of production, circulation, dissemination, and interpretation of images is also expanding and developing its own aura.

What may be identified as "the algorithmic turn" in contemporary visual culture receives its aura by the de-subjectification of visually-based social practices. When the perceived neutrality of algorithms shifts the responsibility of its consequences from the human subject to the automated and learning machine, it becomes crucial to trace its genealogy, to re-subjectify the human agency in this "algorithmic turn," to open new possibilities for accountability, transparency, responsibility, and equitable algorithmic interventions in the visual sphere, as well as to evaluate in this context the growing return to analog visual practices.

NATIKAR, Subhaschandra* (Karnatak University, India)

Medical Corporatism: Commodification of Healthcare

India's stance has gradually shifted from welfare state to that of capitalist economy owing to winds of privatization and liberalization. An attempt is made in this paper, how the healthcare sector has responded to these trends of neoliberal capitalism. The trends seem to suggest that healthcare sector, once primarily served by public and charitable hospitals and private clinics and viewed as service oriented institutions, have been commercialized to the extent of assuming the structures and functioning as streamlined business with corporate culture on par with any other industry, trade and commerce with an emphasis on economic performance and economic efficiency to maximize returns for the corporate stakeholders. With rise in lifestyle diseases and incidence of epidemics and pandemics, the sphere of healthcare, which also includes diagnostics, medical insurance and other auxiliary services, has come to be the dominant player in the service sector in India, still growing at an exponential rate. This trend toward corporatism in healthcare is further accentuated by the rise in medical tourism, of which India is the most sought after destination not only for developing but even for the developed countries. The healthcare industry in India today is dominated by the listed companies having chains of hospitals in every area of medical specialty, managed professionally like streamlined corporate bureaucratic entities, devoid of ethos and ethics of medical profession (service) which is inherently inimical to delivery of affordable and inclusive healthcare. The paper, based on the survey of reports and factual accounts concludes that healthcare in India, which was once spearheaded by socially embedded institutions guided by socialist and philanthropic ethos has come to assume the structure of an aggressive and competitive industry, profiteering from sickness, owing to the winds of commercialization and corporatism sweeping through this sector of immense public interest.

Finding' Home Grounds' Far Away from Home: Malabari Migrants and Football in the Kingdom of Saudi Arabia(KSA).

The Gulf boom in the 1970s kicked off the trend of a massive influx of people from the Malabar region of the South Indian state of Kerala to the possibilities offered by the Post-oil Gulf economy. With these economic migrants from the interiors of Malabar, they took their version of football, the Seven-a-side game, which I call 'Malappuram Football', to the grassy, sandy, and concrete pitches of the respective host nations. Following the question, what did the Gulf migration do to the Malappuram football, this paper describes and discusses how Malabari migrants transported a local sporting culture to the various 'South Asian Pockets' of the Kingdom of Saudi Arabia and deployed it to shape the nature of their communitarian, regional, and class belongings and behaviors. To uncover the broader impacts of the migration of the sporting culture of Malabar, in this paper, I trace the game's evolution from an amusement activity to an organized practice made possible by the migrant life of the game. In doing so, I explore how the playing fields in the KSA modified the structure, style, language and consumption of a 'hybrid sportoid' form which has been providing an arena to experience and perform the embodied dispositions of the men of Malabar since the 1930s. Providing the narratives of the major stakeholders of Malappuram Football in the KSA, I showcase the scope of a local sporting culture in capturing the dynamics and nuances of the transnational mobilities of humans, ideas, capital, practices, and meanings, and the way it reshapes and reconfigures the interactions and entanglements between the global and the local in an increasingly globalized world.

Care, Work and Family Wellbeing in Times of Crisis: COVID-Lessons on Access Inequalities to Childcare for Families in Britain.

The COVID-pandemic and the public health measures introduced in its wake, such as lockdowns and social distancing, radically changed family life and daily routines. The pandemic had particularly dramatic effects on households with dependent children due to the closure of schools and childcare settings. In this paper we present findings from a mixed-method project examining the impact of COVID-19 on family wellbeing and work/care arrangements of families with children aged 0-12 in Scotland/United Kingdom. In our research we bring together insights on the COVID-experiences of working families based on 50 qualitative interviews with parents from different households (low income, single-parent, ethnic minorities), with findings from a large COVID-survey on Scottish families' work/care arrangements and secondary analysis of UK Household longitudinal data (UKHLS – Understanding Society) on changes in parental and child wellbeing during the pandemic.

While our research highlights the intense impact of COVID-19 on family wellbeing particularly for vulnerable households, including the struggle to juggle childcare with work and other responsibilities, it also sheds light on issues that run much deeper: namely the systemic gaps in childcare provision for certain groups of families and certain geographical areas (remote rural; disadvantaged urban). These challenges were exacerbated by the pandemic, but already existed before in the context of structural tensions inherent in the UK early childhood education and care (ECEC) system between a universal early education logic and marketized childcare. The finding that families in the UK tend to perceive work/care reconciliation conflicts as personal rather than political, leads us to critically reflect on the political economy of ECEC and conditions for policy change.

Household Food Systems during Lockdown: Food Diaries of Filipino Mothers in Poor Urban and Sub-Urban Households

Studies have documented the erosion of the country's food systems due to government impositions, but at household level the COVID-19 pandemic-impacted food system of lower-class Filipino households was only examined in terms of nutritional quality. The present study aims to report on how aid-dependent household food systems are functioning in the everyday lifeworld of poor households. Using the solicited diary method, we collected the lockdown experiences of ten women from two resettlement communities in managing the pandemic food system. The household food system in both communities has had to adapt to pandemic-induced uncertainties and, at the same time, has been shaped by aid in the form of food and cash from relatives, friends, neighbours, governments (national and local), and non-government organizations. We found that recipients tend to prefer cash assistance over food aid, due to the increase in freedom and the potential to improve overall welfare of the household members. The results also showed that women are at the helm of making the food system work for the household. We found that women are goal-driven and strategic in rationing the food and preparing the meals. The value of aid for the households goes beyond its food security objective; it also contributes to maintaining the women's psychological well-being and strengthening their spirituality during the crisis. Nevertheless, government's social targeting of aid could be improved, and food and nutrition security interventions could be more professionally dealt with.

NAVARRETE, Teresa* (344617, Mexico)

Life Histories of Young People Who Have Participated in Organized Crime Groups

Organized crime is present at the community through groups or cells or even at the family level, being part of the lives of many young Mexicans. The criminal career of young people begins at a very early age, most of the time, consuming drugs and starting to sell them on a small scale. However, drug sales are not the only illegal activity that feeds the organized crime economy; there is a connection with other crimes such as extortion, car theft, kidnapping, homicide, among others, which are part of common crimes and are rarely investigated as part of organized crime.

The PhD research "*Life histories of young people who have participated in organized crime groups*", preliminarily shows the heterogeneity in the cases analyzed: low tolerance to frustration has been a fundamental factor in initiating and continuing a criminal career, likewise, the mechanisms for joining

these groups have required the networks with which the young people relate, whether in school, the neighborhood, friendships and even the family. On the other hand, the criminal trajectories of these young people are complex; although they have been in prison for a specific crime, most of the time common crimes, they have committed more and in different circumstances.

From the biographical approach and retrospectively, this research has identified the construction and motivating force that led them to become part of organized crime or, in their case, how they were recruited and why organized crime meant a life path for them. The analysis of the information from the life histories was processed with Atlas.Ti software, and the following fields were used to classify the information: Family, Relationships, Youth, Neighborhood, Alcohol and drug use, School, Criminal career, Violence, Structural stresses and barriers, Initial employment, Life in prison, Religion, Satisfactions and risks, Expectations and aspirations for the future.

Institutions and Communities Life: Towards CROSS-National Comparative Analysis of Urban Scenes

The study of institutions has been a relevant analytical tool to analyse community life and change, from classical community power studies to more contemporary studies on multi-level governance and local government systems and their role in explaining socio-spatial processes and inequalities. This perspective adds an institutional perspective to the more classical approach based on socio-economic socio-cultural processes (for instance, classical Chicago School or political economy perspectives).

For instance, previous proposals about cultural scenes localisation and change have focused on a socio-economic or socio-cultural perspective (neighbourhood social composition, creative occupations, lifestyles, innovative business,...). However, local government systems and urban policy are also relevant factors explaining urban changes, including patterns of cultural scenes localisation or change. First, at the local level, specific initiatives promoted or applied in municipalities could enhance different kinds of cultural scenes according to their policy orientation toward the classical development and redistribution framework. Second, at the national level, local government systems could shape different opportunity structures for policy actions and, therefore, scenes localisation and change. For instance, the market-regulated orientation promotes different local policy agendas and governance processes.

This presentation tries to highlight the importance of the institutional approach in community research and its application to an innovative approach to analyse the cultural life of cities (scenes).

Sentiment Analysis on Twitter of the Different Stakeholders Involved in the COVID-19 Vaccination Process in Spain By Using Machine Learning

We present a procedure based on the combination of machine learning techniques, in particular sentiment analysis and multivariate statistical methods, to evaluate the evolution of the mood of the different stakeholders involved (central government, opposition, regional governments, and citizens) during the vaccination phases against COVID-19 in Spain. This procedure was developed in the Grupo Decisión Multicriterio Zaragoza (GDMZ), within the framework of the multidisciplinary project *Cognitive Citizen Participation in Public Decisions. Socio-sanitary applications* of the Government of Aragon. A total of 41,669 tweets from users in Spain published between 27-02-2021 and 31-12-2021 were analysed. Different sentiments were assessed using a list of Spanish words and their associations with eight basic emotions (anger, fear, anticipation, trust, surprise, sadness, joy and disgust) and three valences (neutral, negative and positive). In addition, we examined how the different emotions were distributed in the tweets using various descriptive statistics and obtained a trajectory graph, which is a representation of narrative time versus emotional valence. The results achieved illustrate that this type of analysis could help assess the mood of the different stakeholders involved and gauge social support for policies aimed at mitigating the effects of the pandemic and achieving the desired herd immunity.

NAVARRO, Jose* (TU Dresden, Japan)

Are Non-Believers Richer Because Their Populations Grow Less? the Economic Growth Contribution of Populations By Religious Affiliation Compared to the Unaffiliated, 1970 - 2020.

In this paper, we aim to provide a global overview of how economic growth has performed in the decades between 1970 and 2020, not focusing on geography exclusively, but by religious affiliation. Religion, or the lack of it, is as a marker of identity that transcends geographical borders.

Describing patterns of economic growth by religious grouping gives novel insights into the global development process that can inform new research into the different performance of national growth strategies, and the policies that guide that economic growth.

A growing body of research within economics and sociology began arguing 20 years ago for explanations for economic growth that should go further than traditional factors to include a nation's culture. Culture has been found to influence micro-economic outcomes by affecting personal traits such as willingness to work, honesty, attitude to saving and trust in strangers. Religion is an important part of culture, especially in nations at lower levels of development, where religious institutions play an outsize role in the provision of health, poverty alleviation and other social services.

The aim is not to look into causal links between religion and economic growth, but to inform how the economic growth performance has effectively fared over the past 5 decades.

Social Policies in Times of Austerity: The Influence of Women's Representation on Public Welfare Effort at Local Level.

The body of literature on political representation and gender has been shaped through numerous research studies that have shaped and operationalized the concepts of political representation. Some of the main contemporary questions in this field of research that need more in-depth empirical answers include: how does the substantive representation of women in public policy materialize? and how effective is women's political representation in promoting greater equality between men and women? (Childs et al.2013, 493). Moreover, analyses of political representation and gender have tended to focus on the national or regional level, while empirical studies at the municipal level have been scarcer. However, at this level of government the presence of women in political life seems to be higher, a phenomenon that may provide an opportunity to study the interactions between descriptive-substantive representation in contexts closer to individuals, where they spend most of their daily lives.

The aim of this study was to analyze how the representation of women is related to the effort of local governments in welfare policies, as well as to test whether female political representation conditioned the intensity of austerity policies applied to the local welfare system during the period of the great recession in Spain. To this end, a multilevel cross-sectional design was developed based on a database of Local Corporations Members in 8,108 Spanish municipalities during the last five legislatures (1999-2019). We use the information on budget settlements provided by the Ministry of Finance from 2002 to the present to study the spending orientation of local policies. Multilevel regression models were applied to study cross-sectional differences between municipalities and the evolution of social spending as a function of women's representation in local politics.

Time Heals? on the Effects of Death in the Family on Children's Educational Achievements

This is a study on the effects of death in the family, that is experienced at different ages in childhood, on the subsequent scholastic achievements of children. We address three main questions: 1) What are the differences between socio-economic strata in the odds that children experience the death of a parent or a sibling? 2) Is there a difference in the relationship between a death in the family and the educational achievements of the remaining children when the death occurs at different ages in childhood? and 3) Is there a difference in the effects on achievement of the death of a parent and the death of a sibling?

We analyze a unique database, which draws information from various administrative, educational, and demographic data files on most persons born in Israel between 1985 and 1998, their parents and their siblings (n=1.1 M). The database includes detailed information on family's socioeconomic characteristics, dates of death of parents or siblings, if such occurred, achievements in secondary school matriculation examinations, and more.

We find the following: 1) Death in the family is more likely among Arabs than among Jews and is negatively related to (pre-death) family income. 2) The death of a parent or of a sibling depresses subsequent educational achievements, and 3) the effect of a parent's death increases with the child's age at which it occurs, while the negative effect of the death of a sibling, declines with the child's age at which it was experienced.

We discuss these findings in view of the psychological literatures on bereavement.

Exploring Populist Epistemologies: Knowledge Practices of Law and Justice's (PiS) Supporters

Despite various crises including the rising cost of living and the ongoing conflict with European institutions, the right-wing populist Law and Justice (PiS) party still enjoys sizeable support of 25-30% of voters in Poland after seven years in government. Various explanations for this continuous electoral support have been proposed, focusing on the government's social policies, nationalist discourse, the takeover of public broadcasters, or the use of conspiracy theories. However, these partial explanations are insufficient to explain the party's popularity, unprecedented in Polish politics both in its size and stability over time. This paper proposes a more comprehensive approach by conceptualising PiS supporters as an epistemic community with its own assumptions regarding the world and appropriate modes of reasoning, along with a range of knowledge practices that construe and maintain a particular vision of the socio-political reality. Thus, this paper aims to analyse (1) how do PiS supporters organise and structure various social categories and identities to make sense of the world; (2) how, as an epistemic community, do they create and legitimise knowledge; and (3) how do they process and interpret politicians' speeches and media articles. To answer those questions, 24 individual interviews and four focus groups have been carried out with long-time PiS supporters, mainly from central and eastern Poland. Preliminary conclusions from the interviews, which extensively employed projective techniques and verbal protocol to explore voters' epistemological and cognitive processes, suggest that it is the construction of an epistemic community with a consistent vision of the world and clear interpretation procedures that stabilises political support, rather than any specific benefit from the PiS government. Moreover, the interviews emphasise the role of negotiating social identities and categories and suggest that populists' supporters are much more active in this process than previously thought.

RC26-389.4

NAWROCKI, Michal* (Faculty of Sociology, University of Warsaw, Poland)

Studying Populism As a Knowledge Phenomenon: Theory and Practice

The concept of populism has long been used by social scholars to analyse various socio-political ruptures. However, with the advent of the so-called post-truth politics era the way those divisions are studied changed profoundly. With the declining trust in established epistemological authorities, political polarisation increasingly translates into epistemological ruptures, while truth and reality became themselves important objects of the political debate. Thus, the way populist movements construct and nurture 'alternative' knowledge systems and visions of what is factual has become extremely relevant for scholars of populism. While there is a growing number of studies analysing populist knowledge and counterknowledge practices, cases of denialism, and the use of conspiracy theories, various elements of populist epistemology are studied separately, and there are no common theoretical assumptions that would arrange all those elements into a comprehensive epistemic theory of populism. This paper proposes a basic theoretical framework for an epistemic approach to studying populism that is based on established discursive, communication, and socio-cultural approaches but goes beyond some of their assumptions and emphasizes the need to study populism as a knowledge phenomenon. Thus, populism is conceptualised as a set of epistemic interventions: discursive and non-discursive practices that construe the people as a political subject and result in the emergence of a populist epistemic community. The latter is based upon distinctive discursive practices, political styles and performances, communication topology and practices, and cognitive, affective and social psychological processes that all come together, creating a particular vision of the world. Apart from describing the epistemic theory of populism, this paper presents how it can be implemented in research practice, discussing methodological insights and conclusions from 24 individual interviews and four focus groups conducted to study populist epistemology in Poland and indicating useful research techniques, such as the verbal protocol or projective techniques.

NAYAK, Akhaya Kumar* (Indian Institute of Management Indore, India)

Revival of a Protest Movement: The Struggle of an Indian Village Against Mega Development Projects

On 14th January 2022, the administration dismantled a few betel fields in Dhinkia village of the Indian state of Odisha. This resulted in a violent clash between the protesting betel farmers and administration, injuring several of them. These betel fields were built in the land acquired for the proposed steel plant by POSCO in 2005. After a decade long movement led by POSCO Pratirodh Sangram Samiti (PPSS), POSCO withdrew the project and handed the land over to government of Odisha. However, in 2017, the land (2700 acres) was allocated to Jindal United Steel Limited (JUSL) which proposed to invest 65,000 crore INR (Approximately 8.7 billion USD) to build a 13.2 MTPA integrated steel plant. However, villagers of Dhinkia are determined not to let JUSL occupy the land. PPSS, re-emerged as the *Jindal Pratirodh Bheetamati Suraksha Samiti,* is mobilising the people against JUSL. The revived movement with the same but renamed SMO touches upon issues such as environment, land rights, forest rights, right to livelihood etc. This paper earnestly attempts to study the distinguished features of this revived movement vis-a-vis its earlier version. The data were obtained from both primary (in-depth interviews) and secondary sources. The study finds that a revived movement instead of moving in the direction from mobilisation to institutionalisation, capitalises on the previously mobilised resources, more specifically on the established linkages, and tries to directly build pressure on establishment from the top while continuing the vigorous protests in the grass roots. However, these don't guarantee quick success to the movement. The establishment uses several new strategies to demobilise movement constituents and mobilise a stronger counter movement. Supported by establishment and infused with abundant resources, this counter movement becomes highly counterproductive for the revived movement. The findings of the study are significant addition to the social movement literature.

Teaching Climate Change Course in an Engineering Institute

I have designed a course title Climate Change and Society, which is offered as an open elective. Being an open elective it is opted by B.Techs, M.Tech, M.Sc and PhD students. This course entails fieldwork (apart from lectures), wherein the students are exposed to the rural areas and understand how climate change impacts the local communities. The course is taught in a manner which make the budding engineers sensitive towards understanding and developing innovations and technology which can a go a long way in fight against climate change. As being at a technology institute, 'climate change and society' course also help them to see climate change from a social science perspective rather than just from a scientific discourse. Students after having done the course feel enthusiastic and have acknowledge that they never thought how climate change could impact the local communities especially the ones who are under-represented, marginalized in many ways in India. Making the engineers recognize that societal impact of climate change is so grave, make the success of this course.

Traditional Water Wisdom and Water Management: A Viewpoint from Thar Desert, Rajasthan, India

The present development paradigms in the global South appear significantly infused with the neo-liberal and neo-colonial agenda which is driven by market forces and transnational actors of monopolization. Many-a-times the environmental knowledge of the west prompt the state in the global South, to take up a grand knowledge hegemony of managing water scarcity. With climate change, desertification is a major concern which is creating land degradation and water in-access in global South. Furthermore, climate change is wreaking damage with far reaching consequences on local communities across manifold social categories, especially in hierarchical caste based society like India. Taking Western Rajasthan which is part of the Thar desert of India, falling under the desert climatic arid zone, this ethnographic study examines the role of local communities and their agency in the restorative development by managing natural resource of water, through traditional wisdom. Local communities in these regions face the brunt of water scarcity the most, due to desert ecosystem and the rise of desertification and climate change. Through our ongoing research, we argue to look at alternative measures to combat the desertification in realm of climate change, to learn from the historical legacies/ legacy thinking of water governance, and to gain the capability to take well informed decisions, in which women are at the center stage. Under extreme climatic conditions, even micro-level water conservation attempts by the local communities, hereby the case of local farming technique in the case study, can

increase water availability at the local level, setting a precedent for a model to replicated across inter and regional trajectories. The ethnographic study highlight the importance of traditional community based water management as a promising tool for combating climate change related water scarcity in the Thar region of India.

Militarisation and Political (in) Security in Contemporary Zimbabwe

This study seeks to augment studies on authoritarianism in Africa through examining how militarisation shapes political security, defined from a human security perspective as denoting the ability of people to live in the social order that respects their basic human rights, observes the rule of law and guarantees political freedom. Using the case of Zimbabwe, a militarised authoritarian state, a critical security studies-inspired human security conceptual framework and primary and secondary sources, the study will argue that the militarisation of politics and the state results in political insecurity. It will demonstrate that the Zimbabwean government has failed to uphold the fundamental freedoms enshrined in the country's constitution such as safety from torture, freedom of expression/speech, association and assembly and the right to vote principally owing to militarisation. In search of emancipation from this political insecurity, Zimbabweans responded using various tactics such as flight, silence and feigning to be part of the ruling Zimbabwe African National Union Patriotic Front party. These political survival tactics enabled some citizens to regain their political voice while others managed to secure themselves from physical harm only. The study will conclude that a militarised authoritarian state is incapable of resolving a number of problems, especially political insecurity.

Role of Sociological Theory in Deconstructing Sociological Phenomena in Africa – the Social Exchange Theory and the Small House in Zimbabwe

Sociological theories illuminate various sociological phenomena found in Africa and act as conceptual and analytical tools in deconstructing sociological knowledge. This study uses the lens of the social exchange theory to analyze the small house practice in Zimbabwe. The 'small house practice' is the trend among married men in Zimbabwe to maintain a single woman as a quasi-permanent sexual partner outside official marriage. This relationship is considered subsidiary (small) compared to the official marriage yet it is important to the welfare of both man practicing it and the unmarried woman being looked after. The study reveals that those engaged in small house interactions are rationally seeking to maximize the profits or benefits, especially in meeting basic individual needs of both the man maintaining a small house and the woman being looked after.

More Than Just Good Friends: Rethinking Neighbours in Contexts of Urban Multiculture

Drawing on earlier studies of urban multicultural social life in the UK, this presentation explores the everyday 'publicness' of the neighbour and neighbouring practices. It thinks through the ways in which recent work on social infrastructure might be productively applied to neighbour relations in ways which take us beyond the dominant decline of neighbours and social trust arguments. The presentation asks, in contexts of urban churn where proximate ethnic and social difference is a very ordinary (if agonised and/or antagonistic) residential experience, might neighbour relations offer the potential to work as more radical sites of pragmatic community and multicultural place-making?

NECKEL, Sighard* (University of Hamburg, Germany)

Awareness: Paradoxes of an Emotion Program

Closely linked to current conflicts on minority rights, anti-discrimination, and diversity, awareness has emerged in recent years as a specific practice of discrimination avoidance. In this paper, awareness is examined as an emotion program that specifically seeks to generate regard for the concerns of individuals and groups whose identity claims are considered contested. Drawing on qualitative data from field research, which resulted from explorations of various anti-discrimination practices up to today's club scene, the action problems, unintended consequences, and paradoxes associated with awareness are analysed. Awareness claims to raise sensitivity to discrimination and to contribute to the struggle against it. However, these claims are also

associated with new problems in the prevention of discrimination, which cannot be tackled by awareness itself. By relying on a politically motivated form of emotion management, affective tensions are created that themselves refer back to awareness practices. In addressing these paradoxes of awareness, emotional sensitivity does not resolve experiences of discrimination when it leads to subjective feelings and emotional reactions becoming the decisive indicator of perceived power relations. How awareness practices could avoid such problems and paradoxes will be discussed in conclusion.

Tackling the Climate Crisis: Infrastructure, Foundational Economy, and the State

The paper deals with the significance of infrastructure for tackling the climate crisis. Firstly, I will critically examine the individualisation of the climate crisis as a question of personal lifestyle. Instead, I will use the Corona pandemic to highlight how decisive a society's infrastructure is for handling existential risks. I will then refer to the programme of a "foundational economy", which emphasises the importance of material and providential infrastructures and regulatory state activities for social and ecological change. In a further step, I discuss the status of infrastructure in current sociological theory criticising actor-network-theory and posthumanism for decoupling the shaping of the material world from any politics. My own suggestion is the concept of a "public sphere of things", concluding with some remarks on the necessity of "symbiotic transformations" (Erik Olin Wright) for any socio-ecological change.

Transnational Grandparenting Challenged By the Covid-19 Pandemic: Frustration Experiences and Digitally Mediated Coping Strategies

Transnational grandparenting has been documented as an important form of intergenerational solidarity within transnational families, especially in the case of so-called "Zero Generation" grandparents, i.e. migrants' parents moving back-and-forth across borders to take care of their grandchildren. While digital technologies play a key role to keep ties at a distance, physical co-presence is indispensable to provide childcare during regular visits and periods of cohabitation, both in destination and origin countries. Yet, the Covid-19 pandemic has temporarily put an unexpected term to cross-border mobilities on a global scale and have hindered the expression of transnational grandparenthood in physical co-presence.

Based on qualitative semi-structured interviews with transnational grandparents residing in Switzerland, we question how they experienced this disruptive event. In particular, we investigate to what extent their grandparental practices have been disturbed, and how their ICTs use and mediated co-presence changed to maintain meaningful relationships with their grandchildren in this crisis context. Our findings show that while ICTs-mediated co-presence intensified during lockdown period and served as a substitute for physical copresence, the experiences of transnational grandparents varied in contrasting ways. Thus, the forced immobility prompted both creative coping strategies using ICTs, and intense suffering and annoyance. Moreover, the quality of relationships that grandparents have with their grandchildren' parents greatly influenced their experiences and adaptation efforts.

NEDERVEEN PIETERSE, Jan P.* (University of California at Santa Barbara, USA)

Compare Globalization 1990-2020

Differences between 1990 and 2020—geopolitical, geoeconomic and cultural—are staggering. How do leading themes of 1990s social science—such as globalization, convergence, modernity, nationalism—fare thirty years later? How was 'culture' embedded in 1990s political economy and what are interactions nowadays? This talk revisits a paper on Global Culture 1990-2020 in TCS, with a wide angle that snapshot assessments lack. Let's add these questions: Do differences between hegemonic ascent during the 1990s and hegemonic decline since 2008 matter? If we factor in 2022, does expansive authoritarianism make a comeback or is it a blip? How do 1990s 'culture wars' compare with the 2010s and onward?

RC07-122.2

NEDERVEEN PIETERSE, Jan P.* (University of California Satna Barbara, USA)

Ukraine War, Clash of Authoritarianisms, Global Resets

Ukraine is the terrain of a clash of authoritarianisms. It was a 'post-American world' until Russia invaded Crimea and Ukraine. Now Nato expands further East and to Scandinavia. The US targets both Russia and China. Food, energy, supply lines, shipping routes, inflation, weapons, inequality are on the table. More than half the world doesn't back the US approach. Would extending the US alliance to the Indo-Pacific with a Pacific Treaty Organization be a good idea? The rule of power looms larger than the rule of law. Assange cautioned that as authoritarian societies become opaque to themselves, they become ungovernable.

Black-White Differences in Goal-Striving Stress and Depression in the Nashville Stress and Health Survey

This research investigates racial differences in the relationship between goal-striving stress (GSS) and major depressive disorder (MDD). GSS assesses the degree to which individuals feel they have achieved their ideal life. GSS refers to the discrepancy between options and opportunities, and aspirations and achievements. Prior research shows that such discrepancies are associated with lower happiness, lower life satisfaction, and lower self-esteem. This paper extends that work by analyzing the impact of GSS on major depression in the Nashville Stress and Health Study (Nashville, Tennessee). We hypothesized that (1) Black Americans will display a lower prevalence of MDD compared to White Americans; (2) higher GSS scores will be significantly related to higher MDD for both Black and White Americans; (3) the GSS-MDD relationship will be stronger for White Americans than Black Americans. Our findings are consistent with these predictions. Black Americans have lower odds of MDD compared to White Americans and high GSS predicts greater odds of MDD for both groups. There is a significant race-GSS interaction such that the association between GSS and MDD is stronger for White Americans in comparison to Black Americans. We conclude that Black-White differences in mental disorder are the joint product of structural determinants and cognitive experience. GSS captures the subjective sociocultural experiences necessary for a deeper understanding of the interpretation and meaning of racialized structural barriers for Black Americans.

Urban Patterns of Neighborhoods' Inequities during Covid-19 Pandemic

Among government responses to the Covid-19 pandemic were lockdowns and border closures. Lockdowns are characterized by temporary restrictions on leaving home and operating businesses, shops, and services to prevent transmission, whereas border closures seal off a place from the outside world, aiming to keep it Covid-19-free. During border closure, but in the absence of lockdown, life is close to normal. However, the long-lasting impacts of border closures on urban patterns of neighborhoods' inequities have not yet been deeply studied. The goal of this paper is to develop new insights into the impact of border closure, especially in response to the Covid-19 pandemic, on the development of housing inequalities in the neighbourhoods of concern. For a case study, we selected Hong Kong: one of the most densely populated metropolises with one of the strictest border-control and quarantine measures in the world since the beginning of the Covid-19 outbreak. Before the pandemic Hong Kong as an international centre was known for being a popular tourism destination. We focused on changes in urban patterns and gentrification caused by transformations in tourism dynamics, where local tourism has replaced international tourism. We thus used Covid-19 both as a driver of changes in gentrification processes and as a natural experiment setting. The research used a mixed-methods approach. The results of the research assess positive and negative effects that rapid urban changes in times of crises have on local housing situation.

The Stories of Filipino Pregnant Teenagers and Teenage Mothers during the COVID-19 Pandemic

The study aims to tell the meanings of the stories of the Filipino pregnant teens and teen mothers during the COVID-19 pandemic. The teens were interviewed using screen-mediated, in-depth interviews, where 28% of the participants were pregnant, 61% were mothers and 11% were pregnant and also mothers. More than half or 61% of the teens are in consensual union with their partners and staying either with the teen's family or partner's family while there are two who are married and living with their respective spouses. The resulting themes that emerged from their stories are as follows: First, the teen mothers face multiple burdens because they lacked both the financial capability and emotional support. Early pregnancy is a health risk for the mother and the child. Second, pregnant teens and teen mothers also involuntarily drop out from school due to unplanned pregnancy. Third, an unplanned pregnancy, however, does not mean an unwanted pregnancy. Fourth, being pregnant and a mother during a pandemic brings about longingness for their friends and relatives. Fifth, the majority of the youth find their children to be a blessing and the source of inspiration for them to strive for a better life. Teen pregnancy, just like pandemic, is a global phenomenon. Institutionalization and implementation of current policies and programs is recommended to address the prevention, support, and care for teen pregnancy.

Carbon Taxes, Redistribution, and Environmental Attitudes in Comparative Perspective.

While carbon taxes are effective in steering consumption in more environmentally friendly directions, they tend to be unpopular and thus difficult for policymakers to implement on a large scale. Carbon taxes impose extra costs on households and tend to weigh more heavily on the poor and other groups who spend a larger share of their budgets on energy and related commodities. Placing this extra financial burden on economically vulnerable households is something that also more well-off citizens may find unfair. Besides the regressive nature of many carbon taxes, people may also have different views on how the costs for carbon neutrality should be divided between households and the industry.

This project is guided by the belief that social policy may act as an effective buffer against such adverse distributive outcomes of decarbonization, and thus indirectly increase support for climate policy. The welfare state is the main political arena for providing social security and resolving distributive conflicts by creating positive-sum solutions (or societal compromises) between various interest groups in society. Previous research has highlighted the role of the welfare state in balancing inequalities based on class, gender, and age. In this paper we ask if the welfare state also carry potential to create a new social contract in the 21st century for the sake of slowing down global warming?

The empirical analyses are based on micro-level attitudinal data from the European Social Survey, and imputed carbon taxes from the European Household Budget Survey. Social policy (in the form of replacement and coverage rates at country level) is treated as an intervening variable that may moderate the relationship between inaugurated decarbonization policy and climate policy attitudes at individual level. We will thus empirically test the pathways whereby social policy matter for climate policy attitudes.

Intersectionality and Climate Justice: Implications for Assisted Ecosystem Adaption on the Great Barrier Reef

The UN Decade on Ecosystem Restoration (2021–2030) calls for international and national commitments to scale up the restoration of degraded and destroyed ecosystems with ambitious goals to support climate change mitigation, adaptation, and resilience. In response, assisted ecosystem adaptation has emerged as a mechanism to address extreme climate impacts in social-ecological systems at regional scales. Assisted ecosystem adaptation refers to a suite of potential strategies to accelerate evolutionary responses to climate pressure. Questions of risk, equity and justice arise within assisted ecosystem adaptation given (i) associated long time periods and large spatial scales (ii) the potential for a significantly altered relationship between humans and nature and (iii) decision-making under extensive scientific uncertainty. Risk is entangled with the exercise of power - to control or influence the definition and evaluation of risk will influence (in)action taken in response. Risk perception, vulnerability and resilience are shaped by social locations linked to legacies of intersecting systems of privilege and oppression such as colonial ecological

violence, capitalism, and dispossession – systems that have been implicated in the production of uneven climate impacts and environmental injustices. Climate justice scholarship seeks to *inter alia* understand how risks, and associated power structures, have impacted people differently and disproportionately, to ultimately redress resultant injustices in fair and equitable ways. I reflect on these implications in the context of Australia's Reef Restoration and Adaptation Program for the Great Barrier Reef, a multi-institutional partnership focused on developing feasible interventions to accelerate the recovery of degraded reefs and help coral species adapt to unprecedented environmental change. I argue that attention to and application of intersectional theories and climate justice frameworks in assisted ecosystem adaptation is key to addressing ecological risk, environmental damage, social inequalities, and underlying power structures while catalysing systemic transformation in coral reef social-ecological systems.

The Language of Discrimination: Assessing Attention Discrimination By Hungarian Local Governments Using Machine Learning

In our study we assess the responsiveness of Hungarian local governments to requests for information by Roma and non-Roma clients, relying on a nationwide email study that applied a randomized controlled trial design.

Two methods were used in parallel to evaluate the response emails: traditional qualitative coding and machine learning (ML). Both methods provided evidence of attention discrimination.

The methodological novelty of using ML with Natural Language Processing (NLP) is that we treat discrimination as a classification problem and study to what extent emails written to Roma and non-Roma clients can be distinguished, which in turn serves as a metric of discrimination in general. We show that it is possible to detect discrimination in textual data in an automated way without human coding, and that ML may detect linguistic features of discrimination that human coders may not recognize. To the best of our knowledge, our study is the first attempt to assess discrimination using ML techniques.

Our ML models worked significantly better compared to random classification, confirming the differential treatment of Roma clients. The most important predictors showed that the answers sent to ostensibly Roma clients are not only shorter, but their tone is less polite and more reserved, supporting the idea of attention discrimination. A higher level of attention discrimination is detectable against male senders, and in smaller settlements.

A randomized controlled trial is a design that provides the strongest causal evidence. We showed that if it is applied in a digital environment, the resulting massive amount of textual data can be evaluated by using NLP and ML techniques. This result offers an inspiring opportunity for future social research.

Entre Constructions Et Contractions Argileuses, Retrait-Gonflement Anthropo-Lithique

Aux côtés des blocs argileux, la communication propose de faire connaissance avec d'autres rapports de force que ce type de roches instille avec le monde. En quoi les argiles ne s'en tiennent pas aux transformations humaines ? Comment se manifestent ces manières d'exister, d'agir ou de réagir ? Avec quelles formes de présence et auprès de quelles entités ? Dans quelle mesure sont-elles perçues par les individus et les sociétés ?

En poursuivant ces questionnements (Némoz (dir.), 2021-2022), l'enquête des relations argileuses s'enquière d'activités et de dynamiques lithiques relativement méconnues en sciences humaines et sociales. En géologie, elles ont pu être initialement mentionnées à travers l'expression de « retrait-gonflement » à partir des années 1950. Celle-ci renvoie aux capacités molles et malléables des argiles qui, dans les sols, se gorgent d'humidité en fin d'hiver, puis se rétractent par assèchement sous l'effet d'une faible pluviométrie et d'une hausse de la chaleur au cours du printemps jusqu'à l'été, voire l'automne. En France, près de 63% du territoire métropolitain est aujourd'hui exposé à une telle mouvance des argiles (ONERC, 2018). Eligible au dispositif catastrophes naturelles (Cat-Nat), elle fragilise et menace la solidité des bâtiments et la sécurité des habitants de milliers de logements et de communes ces dernières années. Autour de ces appréhensions anthropo-lithiques, plutôt qu'une juxtaposition des images, c'est un réseau non-linéaire des socio-écosystèmes que révèlera l'étude *auprès* de leurs composants et *avec* les manières de percevoir et d'évaluer leurs liens.

From Socialist Utopia to Social Heterotopia in BesançOn, a Historical Sociology of French Cooperative Housing.

Studies of cooperative housing and residential systems are still relatively compartmentalized into separate scientific domains. To gain a deeper understanding of the relationships between the two, the article presents a historical sociology at the intersection of local and national scales, in Besançon, 'capital city' of Franche-Comté in France. Questions regarding joint as well as separate changes in these relations have led us to investigate the past to make the present situation intelligible.

This shift in approaches aims to better understand how power and "the political" adapt to what is new. By avoiding an opposition between the various temporal as well as spatial scales of observation of interactions, our approach seeks to move beyond a linear and developmentalist conception of innovations, and of their history.

The analysis of residential cooperative projects initially focuses on one of the birthplaces of the socialist utopia. Two of its founders, Charles Fourier and Pierre-Joseph Proudhon, were born in Besançon in the 18th and 19th century respectively. The former is known, in particular, for having developed the idea of a so-called "phalanstery", a large, shared housing building (Fourier, 1822), and the latter, an advocate of mutualism, coined the famous phrase "Property is theft" (Proudhon, 1841).

This article does not merely examine the development, between that landmark period and the present day, of cooperative housing ideas, but also the trickle-up and discontinuity effects it has generated, considering its empirical embeddedness in the housing system. Through the actors, norms and policies governing the productive and distributive functions on the territory, we will trace the complex history of a heterotopia (Foucault, 1967), using the mixed methods of sociology to investigate long-time nospans.

Intergenerational Transmission of Human Capital in India: The Role of Gender and the Extended Family

The present paper contributes to the limited literature on multigenerational educational mobility in India. The study utilises data from the India Human Development Survey for the year 2010-11. The study employs fixed effects regression models to examine the extended family's influence on the children's educational investment. The study finds that grandparental education has a significant influence on the educational spending of children, net of parental education. Further analysis suggests that such an influence is direct and is not mediated through the parental generation. The findings also reveal interesting heterogeneities in the grandparental effect across gender, parental background and family structure. The crucial role of the extended family in influencing children's educational investment extends beyond the influence of grandparents and includes the significant impact of aunts and uncles. The study concludes with a discussion of the policy implications of such multigenerational effects and its gendered nature.

Rural Youth Research in Pandemic Times: Methodological Approaches through an Argentinean Case

The COVID-19 pandemic brought about a change at different levels of society. From the economic, health and social effects, but also those in the order of scientific research in social sciences. Different studies emerged in this context, seeking to understand these impacts and also with new ways of studying social reality. This work seeks to be a contribution to the reflection on the theoretical-methodological decisions regarding the study of a particular population: rural youth. The case of young people from horticultural families of the General Pueyrredón District is taken as part of the doctoral thesis of this author. On the one hand, it seeks to demonstrate the decisions regarding the obstacles that emerged from the pandemic to carry out the fieldwork, as well as the alternatives that were deployed, their limitations and potentialities. On the other hand, it will seek to capture the conceptual theoretical approaches that emerged from the pandemic context. The work is presented as an advance around the doctoral thesis entitled "Make and remake your life. Young people from horticultural families facing their possible futures" that has financing through the doctoral scholarship in strategic topics granted by CONICET.

The Challenges of Building Inclusive Communities: The Contribution of Studying Housing Social Representations and Practices in Portugal

The provision of housing has historically been associated with the (re)production of social, economic, and territorial inequalities. Moreover, the rise of financial markets, actors, and motives in housing provision has dramatically increased such inequalities. In Portugal, the impacts of housing financialisation include increasing inequalities in housing comfort conditions, socio-territorial segregation, forced evictions due to rising housing prices or conversion of long-term rental contracts into short-term rentals, impoverishment of the most vulnerable population, and negative psychosocial impacts as financial motivations are related to social exclusion and discriminatory housing practices. Inequalities due to financialised housing are at the core of the current challenges faced in cities to achieve greater social equality, inclusion, justice, and full citizenship.

Ensuring the right to adequate housing for all requires the contribution of differentiated actors (e.g. policymakers, owners, investors, activists) with frequently opposing interests, namely when private property rights collide with the property as a social function.

To deepen the understanding of stakeholders' social representations and practices about housing and explore the cues that promote (or prevent) collaboration between them, two group discussion sessions were held in June of 2022. The group discussions were conducted in Lisbon and in Porto with six participants each involving heterogeneous groups with stakeholders with different relations and points of view about housing.

The preliminary results evidence the importance of the socio-economic-historical and political contexts in social representations about housing and housing practices but also justice concerns (e.g., resentment, procedural justice) and processes of inclusion/exclusion. Moreover, results highlight that mobilizing negative stereotypes aiming at protecting individuals' positive social identity makes it more difficult for the dialogue between stakeholders in order to build more tolerant and inclusive communities. Results are discussed considering the complex challenges of thinking and acting together to realise the right to adequate housing.

Development Sociology Under Scrutiny. Challenges of Post-Colonial Critique

Development sociology started from the naïve notion of development as modernization according to the "Western" model. From then on development sociology underwent a series of changes. Recently the post-development debate has criticized the core concept of "development". The latest challenge is the post-colonial debate that accuses social science in general of "epistemic violence" with a dominating Euro-American definition of science suppressing any other knowledge. At first sight, development sociology can contribute to this debate with earlier works that offer critical analyses of colonization and the resulting global dependencies. Development sociology may challenge the Euro-American-centrism referring to its long-standing research outside the Global North. However, more of the same will not help it. Development sociology should ask itself whether it is still caught in sociological concepts of the Global North and the relating "sociological canon". The in-depth knowledge of the societies of the Global South should be used as an empirical foundation for the provincialization of sociological concepts and theories. The overcoming of epistemic violence includes also a self-critique that includes the domination of northern research institutes over the southern (junior) partners, who often have to follow the topics set by the research institutions from the North. We need a dialogue on equal footing. When development sociology takes the necessary steps, it might play an important role to develop a new "global sociology" that overcomes the still existing epistemic violence. Whether this contribution to a global sociology should still be called "development sociology" is an open question.

Formatting Engagement in Participative Art Collaborations

Recently, we can observe an increasing interest in participative practices. Notions of co-creation, active citizenship, activation, citizen involvement etc. point to hopes for social innovation deriving from collaboration with formerly excluded actors. Those collaborations have also been criticised for being a burden for participants, questioning professionals' autonomy, or being a myth. These different evaluations of participative practices tend to base their judgements either on the involvement of new actors as per se innovative, or, on

external causual effects of these collaborations. Yet, they show little awareness for internal processes for the involved actors, ambivalences and modulating practices throughout the work process.

Based on 15 open interviews, which I analysed leaning on Documentary Method (Bohnsack 2013) and from a practice-theoretical perspective (Reckwitz 2002, Nicolini 2012, Hui 2017), I explore how actors format their engagement at the example of participative art projects. Participative art projects can be understood as extreme case for participative practices, as they not only collaborate, but – in opposite to other forms of collaboration – also need to display exactly the internal differences they are dealing with.

We can understand participation as a specific form of collaboration, which is linked to alternative organizing (Dobusch et al. 2019), by temporarily involving others in the core processes of art production, which formulates a claim on the involved person themselves. Participative art is characterized by different social positions and organizational roles of artists, as professionals, and participants, as experts of their life-worlds. I will argue that both practice modulation, evaluation and negotiation at different moments of the work process and with different points of reference, that is the (imagined) audience, and the artwork setting. While artists decide on participants involvement, but also modulate artistic expressions as non-professional, participants engage with artists and each other, shifting work process and arctic forms.

RC37-549.1

NEUSIEDLER, Alice* (Yale University, USA)

Organizing for Solidarity with Participative Art Pracitces

Recently, we can observe an increasing interest in participative art practices to foster social change. Interaction has been emphasised as an artistic practice of social critique since the so-called "social turn" (Bishop 2006) and is increasingly funded after the "participatory turn" (Virolainen 2016) in European cultural policy strategies has been stated. Thus, strategies of how to include formerly excluded actors into art production has become an urgent topic when organizing for solidarity, both in theory and in practice (Sachs Olsen 2018; Ćalović 2015).

Despite the hope placed into participative art practices for their disruptive potential and promise of authentic insights into others' perspectives, they have also been criticized for being a burden, a myth and for the lack of agency for participants. While critical perspectives point to relevant dilemmas for art collaboration, they were often motivated by a wish to dissolve differences between involved actors, and therefor unable to acknowledge the multiplicity of differences within these collaborations and unable to be attentive to different conditions in this artistic work process. To better understand challenges but also potential of this form of art collaboration, I explore how art collaboration practices lean on, integrate, but also are challenged by internal differences for a collective artwork.

My presentation is based on 20 open narratively informed interviews with artists and participants, and website images from participative art projects in the fields of fine arts, theatre and dance from Northern, Western, and Eastern Europe, such as a critical history project, an intervention in social housing, and a queer theatre production. Leaning on the Documentary Method (Bohnsack 2001), and with a practice-theoretical perspective (Nicolini 2012; Gherardi 2007) I explore their different strategies of organizing for solidarity. I will show how artists and participants construct alternative perspectives of artists, participants and the artwork when organizing for solidarity.

NEWMAN, Simeon* (University of Michigan, United States)

Social Theory and the Sociology of Clientelism: A Critical Prolegomenon and Gramscian Proposal

The study of clientelism has fallen out of favor in sociology, leaving the field dominated by political scientists who embrace rational choice-theoretic principal-agent theory and a few beleaguered gift-theoretic anthropologists and allied sociologists. This is unfortunate for political-sociological theory because clientelism captures a wider variety of political phenomena than perhaps any other peer concept. In an effort to revive the sociology of clientelism, the essay attends to associated conceptual problems and payoffs. It surveys definitions of and normative issues related to the study of clientelism. It undertakes an immanent critique of the leading figures in the recent clientelism literature to identify *soliciting subordination* as the core of clientelism. It identifies the accomplishments and shortcomings of the leading theoretical traditions, gift theory and principal-agent theory. And it shows that if we instead center soliciting subordination we gain both a lens for unifying phenomena hitherto thought to be very different under a single conceptual scheme and a model that can help explain political development, both of which help further a broadly Gramscian political sociology.

NEWTON, Caroline* (Delft University of Technology, Netherlands)

To a Design Based on Solidarity

Design studios are the preferred method of teaching architecture and urban design. This instructional technique dates back to the Ecole des Beaux-Arts and the Académie d'Architecture of 19th-century Paris, where the atelier was run by a master architect known as the Patron. This educational setting reinforces the architect's image as "artist-genius" (Till, 2009, p. 160).

This contribution demonstrates how feminist pedagogy deconstructs and recreates the studio as a space for critical and engaged learning.

We begin by examining the classic studio pedagogy. Then, the author's experience of studio teaching at three design institutions (UCL (London), KU Leuven (Belgium), and TU Delft (Netherlands)) is used to demonstrate the design studio's empowering and transformative potential. The KU Leuven studio shifted the focus from the "master architect" toward a multidisciplinary platform of engaged partners. The UCL studio demonstrates how an embedded method, which immerses students in real-life circumstances, forces them to rethink their positionality. Through a process of unlearning and relearning, their previously acquired knowledge and the illusion of its superiority are challenged. The TU Delft studio illustrates how combining feminist studio pedagogy with a critical, engaged planning approach, heavily influenced by Peter Marcuse's work, provides a situation in which established methods of doing things are called into question. As the studio begins by exposing conflicts (from inequality or poverty to women's struggles to including a diverse range of "others" in processes of co-creation), it invites students to examine issues from various perspectives, reflect on their own positionality, and experiment with embodied and immersive methods of learning and knowledge creation.

We conclude that this revived studio pedagogy, emphasising "relations of mutuality, co-responsibility" (Mohanty, 2003), enables students to accept being startled by urban reality and refuse to be persuaded by simple answers and conventional thinking but to design on the basis of solidarity.

Gender Equality or Just More Involved Fathering? a Critical Examination of the Division of Childcare in Hong Kong's Professional Middle-Class Families

In recent decades, the ideals of paternal involvement in childcare and co-parenting have been widely celebrated in Hong Kong and elsewhere, but are these signs of gender equality in the family? Based on in-depth interviews with 27 parents of professional middle-class families in Hong Kong, our findings indicate that fathers have been significantly involved in parenting, enjoying a more dyadic relationship with their children. Mothers' expectations of paternal involvement, fathers' privileged class positions and assistance from domestic helpers – a unique social practice in Hong Kong and some Asian countries – have contributed to fathering involvement. Nevertheless, we are not seeing a new form of gender-equal parenting emerging in professional-middle class families; instead, couples still value the notion of male breadwinner and mothers still do more childcare and housework than fathers do. Furthermore, couples endorse an ideology of "complementary differences" to condone the uneven division of childcare. Our analysis of the co-constructions and negotiations between mothers and fathers highlight the importance of the mutual and cultural influences that spouses have on each other. Moreover, by paying attention to the class, social, and cultural dimensions of parenting, we show how well-resourced, liberal Chinese families prioritize family harmony and children's development to the extent that gender inequalities in childcare are tolerable and trivialized.

Older Vietnamese Migrants' Social Support Networks: Typologies and Determinants

Social support networks (SSNs) are important resources for older adults, contributing to their social, emotional and physical wellbeing. However, many older adults can experience a disruption to their SSNs as a result of their own migration or the migration of others. Building on the growing body of research demonstrating that SSNs can be sustained across distance and national borders, this paper examines the types of SSNs and the determinants that facilitate and hinder their continuity and expansion following the migration of Vietnamese migrant grandparents to Australia. We report on fine-grained ethnographic interviews and online participant observation conducted with 22 grandparent participants. Research findings reveal that older Vietnamese migrants' SSNs comprise at least three forms: *local, distant and virtual*. These

SSNs are engaged by *individuals* (kin and non-kin) and *institutions* (public and private). The sustainability and growth of the SSNs are governed by numerous factors including educational and professional backgrounds, digital literacy, health, language proficiency, transnational experiences, strengths of SSNs themselves, care responsibilities, and different political views and cultural values. Drawn from the research findings, we recommend that policies aiming at supporting older migrants with CALD backgrounds should consider the types and determinants of SSNs to well assist their access to different types of support and care in late life-course transitions.

RC22-333.4

NGUYEN, Hien* (The University of Western Australia, Australia)

Transnational Religion: Continuity and Adjustment of Religious Beliefs and Rituals Among Vietnamese Migrant Grandparents in Australia

While religion has been examined as an important dimension of migration, the roles of religion in the lives of older migrants have received little attention. In conducting fine-grained ethnographic interviews with 22 older Vietnamese migrant grandparents' lived migration experiences in Australia, we found out that religious beliefs and ritual practices continue playing an important part in supporting their transnational lives. Migrant grandparents practice rites in their own ways, which are illustrated in three case studies. Research findings also indicate that many of them, especially the grandparent visitors and recent grandparent immigrants, prefer not migrating their non-living ancestors with them to Australia. They continue sustaining the cult of their non-living ancestors in their homeland with the assistance of distant kin and Information and Communication Technologies (ICTs), which is embedded in practices of distant care. Moreover, experiencing differences in religious beliefs in the new living setting, Vietnamese grandparent participants have modified their ritual practices, reducing the quantity and complexity of rites but still emphasizing veneration from their hearts and minds to non-living ancestors and deities. Cross-cultural and migrant experiences have thus contributed to reconfiguring older migrants' ritual practices and gradually shifting their religious beliefs towards multicultural politics, which deems ritual practices a private affair. This does not align with the common belief in their homeland, where ritual practices are communal and maintained by big family clans and the whole community. The continuity and changes of ritual practices and religious beliefs of Vietnamese older migrants indicate the complexities and fluidity of religious manifestations in supporting and impeding older migrants' development of senses of belonging and preservation of cultural values and identities. It also highlights the role of digital technologies in continuing and preserving religious and cultural identities in late-life migration.

Son Preference in the Family in the East and Southeast Asian Contexts

This article analyses levels of son preference in three Southeast Asian (SEA) cities in comparison with the East Asian (EA) region. Son preference in the family is measured through the answers to two statements: (1) 'Preferred gender, if only one child is allowed'; and (2) 'Families must have sons to maintain the continuity of the family line'. The data are drawn from the East Asian Family Survey conducted in Japan, South Korea, China, and Taiwan in 2006, and the Comparative Asian Family Survey conducted in Bangkok (Thailand), Hanoi (Vietnam), and Kuala Lumpur (KL, Malaysia) in 2010-2011. Bivariate and multivariate analyses are applied.

Contrary to the assumption that son preference in the family is stronger in the EA region, the survey results show that son preference is actually more pronounced in SEA cities. In all 3 cities of SEA, more males prefer sons than do females, while more respondents with low education prefer sons than do those with higher education levels. However, importantly, the roles of these factors vary by region. For the first statement, the results are as follows: (i) Education is not a significant variable in Bangkok, but is very significant in Hanoi and relatively significant in KL. (ii) Son preference is markedly higher for males in Bangkok, but no significant sex differences are observed in either KL or Hanoi. (iii) The 20-29 age group exhibits greater son preference than do other age groups in Bangkok and KL, while the opposite trend is observed in Hanoi. For the second statement, the age factor does not play an important role in Bangkok. On the other hand, while the respondent's gender is not a significant factor for Hanoi, none of the three factors (i.e., of the age, gender or education levels of the respondent) are significant in the case of KL.

The Family We Choose: Co-Living 4.0 and Community Building in the Digital Era

With the global trends in the sharing economy, its latest addition, **coliving facilities** – a modern shared housing model usually facilitated with the help of technology – are making headlines in Viet Nam. Aspiring to transform and redefine urban living for young people while at the same time reducing waste through the sharing of resources, coliving models have been billed to be "*the end of urban loneliness*" by building a network of like-minded members who share interests and values. In reality, the community established through these models usually attracts - and are only affordable - to a very niche group of residents who bring in distinct characteristics, giving them a family of choice in these residential complexes. Drawing from ethnographic findings in a coliving facility in Ho Chi Minh City, this presentation seeks to unpack these narratives permeated by coliving startups and their residents, to understand their community-building journey, uncover the existing and newly emerging forms of socialities as well as investigate the innovation journey in bringing these market-oriented models to an increasingly open emerging economy like Viet Nam. Contrasting with other and former forms of shared accommodation space that existed in recent history, some questions are considered: How do the residents and staff narrate their stories and relationships? In what ways do the members relate to one another? What are the hopes and aspirations that are attached to this new mode of sharing as compared to the old ways? Who are included, and who are left out, in this effort to disrupt the residential housing market? This paper will attempt to answer these questions by bringing together ethnographic research to paint a picture of the new and expanding coliving movement in Vietnam and Asia.

Involving Traditional Owners in the Creation of a Sustainable Transformative Change: Lessons Learned from a Climate Adaptation Mission in Victoria, Melbourne

Local governments have mainly disregarded the expertise of Australia's traditional owners in climate adaption planning. This neglect leads to the dominance of western scientific method and knowledge in the development of adaptation strategies, which may not reflect the concerns and ambitions of Traditional Owners. This article reports on a one-year co-designing process led by BehaviourWorks Australia of the Monash Sustainable Development Institute, which aimed to connect Traditional Owners and Local Governments in Victoria, Australia's Dja Dja Wurrung Country. In this process, we have utilised an interdisciplinary approach involving the behavioural and social sciences, as well as tools such as stakeholder engagement, behaviour prioritisation, and communication, in order to support the development and evaluation of changes in the relationship between Traditional Owners and local governments. Lessons learned from this method could be valuable for audiences concerned with societal transformation.

Navigate the Complexity of Climate Adaptation Co-Design Process: Reflections on Knowledge Co-Production

Knowledge co-production has been considered as an important tool in designing an effective climate adaptation planning. Yet, this process often faces increasing challenges such as the complexity of the problems, differences in viewpoints and approaches, time and resources constraints. In this article, we reflect on the process of using social science including tools such as stakeholder engagement to facilitate a year-long climate adaptation mission in Victoria, Australia. This co-designing process involved various partners and stakeholders coming from Federal, State, Local government agencies, civil society organizations, research institutions, Traditional Owners' corporations, who represent different concerns and viewpoints regarding climate challenges facing vulnerable communities in Victoria in particular and Australia in general. This article will highlight the challenges arising from this process as well as lessons learnt from the use of behaviour change tools such as challenge exploration, evidence review, stakeholder engagement, behaviour change identification and prioritization in guiding two groups of stakeholders through complexity and facilitating shared decision-making. This article expects to contribute a policy recommendation that aims at building inclusive and effective climate change adaptation action.

Emerging Trends in the Platformization of Domestic Work in South Africa: Marginal Formalization and Deepening Informalization of Domestic Work Employment

Digital platform technologies of the gig economy have brought about a new labour form in the occupation of domestic work whereby domestic cleaning work is now being managed and organized virtually though an online platform or 'app' operated by private technology companies, and provided to householders on a convenient and on-demand basis. This paper analyses the emerging impact of this new form of 'platform domestic work' by focusing on domestic workers' approach and engagement with platform-provided cleaning work, and their employment relationship with the platform. An interpretivist case study on ten platform domestic workers and their platform company in Cape Town was conducted by the author to engage with this issue, using in-depth interviews and analysis of published company discourse material. A key finding from this case study was that platform domestic work is providing much needed employment in the sector and is being used by domestic workers a networking tool to secure work on and off the platform. 'Platform leakage,' the practice by platform customers and workers of transacting outside of the platform following their initial service interaction, was hence a key practice employed by workers to augment their incomes and gain access to better work opportunities outside of the platform. This paper argues that far from formalizing and modernizing domestic work through the twin forces of commercialization and the gig economy, the phenomenon of platform domestic work is facilitating a process of deepening informalization in the occupation of paid domestic work through the inherent practice of platform leakage by domestic workers on the platform.

"I Need to be Heard": Community Based Participatory Action Research to Explore South Asian Women's Health Experiences in Hong Kong

Largely being inaudible and invisible, very little is known about how the South Asian women in Hong Kong participate into the process of production and circulation of knowledge about health and illness, how they (attempt to) overcome the barriers for their equal access to healthcare, or how they invent their own strategies to fulfil their role as a carer.

In order to reveal the social, economic, cultural, and political factors that thwart South Asian women's equal access to healthcare services in Hong Kong, to unravel the challenges that they have faced as well as the strategies they have taken to confront such challenges, and to develop an action plan for the South Asian women community to empower themselves when they strive for equal access to health care in Hong Kong, this study employed a Community Based Participatory Action Research (CBPAR) approach.

CBPAR is the combination of Participatory action research and Community-based participatory research and allows for the co-production of knowledge and learning through action and reflection by including South Asian women as research partners. Action research has not been done enough in Hong Kong, just as the academic world and the lifeworld of the public are often segregated.

Through this study, we intend to create a new form of community based research model so that the segregation between the two worlds can be ended.

'Nice Little Life-Hack'? No and Low Alcohol Drinks and New (non) Drinking Practices

Recent research charts a decline in drinking rates in a number of Western contexts, particularly amongst younger people. Capitalising on this trend, the Alcohol Industry is increasingly producing and promoting a range of 'no and low alcohol' (NoLo) drinks, designed to resemble alcohol in taste, smell and branding yet without some of the perceived 'negative' consequences of alcohol (such as hangovers and short and long-term health effects). Whilst an emerging body of research is considering the implications of this expanding market – particularly in relation to alcohol harm – further research is required in order to facilitate a more comprehensive and nuanced understanding of the ways in which these products are actually used by consumers. Drawing on qualitative research with both non-drinkers and drinkers who consume NoLos, this paper will consider the novel (non)drinking practices that NoLos enable. This includes

'hybrid' models of consumption that allow drinkers to switch between alcohol and NoLo products in a bid to be 'healthy' and 'productive' consumer-citizens. Findings are considered against a backdrop of healthism and neoliberalism that compels consumers to be their 'best self' and take individual responsibility for health and wellbeing, and recommendations for future research directions are offered.

Participatory Visual Approaches to Enable Insight into the Complex in- and out- of School Lives of Children and Youth.

Over-reliance on a limited range of methods to generate data, particularly survey and interviews, has contributed to the under-representation of children in sociological research. Visual and multimedia methods provide expressive and participatory opportunities for children and youth to express their thoughts, view and experiences. As Kress and van Leeuwen have stated, the visual mode offers 'different potentials', not just for expression but for 'the formation of subjectivities' (2006, p. 40).

This paper brings together two researchers using visual methods in participatory research with children/youth in England and Australia. The *Voices* project investigated experiences of COVID-19 through drawing, writing, interviews, comics, and action cycles involving 1860 children aged 5-18 across multiple life facets. The *How Do You Connect* project involved 60 grade 5 children in producing and talking about network diagrams representing social interactions with peers, and their mediation through digital tools.

Knowles (2018) notes that every viewer is 'part of the social conventions of seeing in a particular (conventional) way' and yet has agency to 'search for new ways of seeing, ways that challenge and re-arrange social conventions' (p. 9). In this collaboration new insights were enabled, particularly as each researcher had not been involved in the production of the other's data. This raised questions of interpretation; how this is framed by the research process and by the researcher's interpretive repertoires. When the viewer is adult and the images are produced by children, how are power relations involved in the acts of image elicitation and meaning-making?

Networks of Pro-Social Activism in Favour of Migrants: A Case-Study in Sicily

In recent times, the functions carried out by pro-migrant associations in Europe seem to highlight a blurring of humanitarian volunteering and political activism: volunteers form social groups that become politically active when government institutions oppose their solidarity actions, while in their demonstrations, activists expose the political injustices perpetrated against migrants. This blurring defines networks of civic activism in a pro-social key, which seem to adopt actions aimed at extending the rights of some groups to others (della Porta, 2020).

The purpose of this paper is to analyse the protest actions carried out by the networks of pro-migrant activism in Sicily, in order to understand (1) if these networks use migrant issues to reach purely political objectives, or (2) they organize demonstrations (lobbying, petitions, acts of civil disobedience) aimed at establishing a society that respects human rights.

The research methodology is based on the application of a triangular research design, which aims to collect and combine data from narrative interviews with pro-social activists (*first phase*) and semi-structured interviews with migrants (*second phase*), who took part in the demonstrations of these networks in Sicily (e.g. the protest for the *Diciotti ship* and the closure of Cara of Mineo). At the beginning of the first phase, the Delphi method was applied (De Luca, 2010), through which it was possible to: (1) create an interactive dialogue with participants on the most important questions emerging from the early interviews; (2) identify new interviewees and optimize the interview protocol for further analysis of prosocial activism practices in subsequent interviews.

The Impact of Individuals with Profound Intellectual and Multiple Disabilities on Peer Relationships of Non-Disabled Siblings

Background: The study looked at the impact of having siblings with profound intellectual and multiple disabilities (PIMD) on peer relationships of research participants. The results of study may help to increase the knowledge of FQOL regarding the life situation of siblings of individuals with PIMD, which can be used to provide better suited support for parents and siblings of children with PIMD.

Method: The research was qualitative. An unstructured interview technique was used for data collection. Information obtained from non-disabled siblings of individuals with PIMD served as research material used in this study. Inclusion criteria for this study were the age of typically developing subjects (17 to 24 years-old) and having a sibling with PIMD. The analysis and interpretation were based on the procedures of the grounded theory.

Results: Participants of study reported both positive and negative experiences of having siblings with PIMD that affected their relationships with their peers. The research results were classified into five main domains. Each of the domains to present certain lability as regards the relations with peers and relations with the family.

Conclusions: The results of study show that young adults with a brother or sister with PIMD have some difficulties in establishing relationships with their peers, especially closer ones based on friendship, emotional and intimate relationships. At the same time, research confirms that siblings of individuals with PIMD have high levels of empathy and understanding for others as well as sincere attachment to family.

Counteracting Inequalities in Early Childhood - Can Educational Curricula in Kindergarten Do the Job?

Education is relevant not only at school, but already in kindergarten. Among other aspects this development can be seen in the introduction of educational curricula, which are supposed to enable targeted promotion of school-relevant competencies. Whether and to what extent the implementation of educational curricula in early childhood education and care (ECEC) compensates for educational inequalities (German education report, 2020; Conference of the German ministries of youth & culture, 2004) is the central question of my research project.

Oriented on the model of qualitative multilevel analysis (Hummrich & Kramer, 2018), I conducted interviews with ECEC provider representatives, parents, and educators, and participated in parent-educator meetings. I analyze the data collected in this way in a content-analytical reconstructive way (Kuckartz & Rädiker, 2020) and relate them to each other with regard to (non-)fit relations of actor-specific perceptions of education. Initial findings from interviews with ECEC provider representatives show that they do not only act professionally, but also based on prejudice. If the aspect of prejudice is considered in more detail, it becomes apparent that a wide variety of determinants of social inequality (Solga et al., 2009) is invoked when it comes to implementing educational curricula, pointing to problems in the reduction of educational inequalities. In fact, how educational inequalities can be compensated in ECEC remains unclear, except that reference is made to compensatory support (Nienhaus, 2021a & b; Meyer, 2017).

Contributing to critical inequality research with my paper, I would like to reconstruct divergent perceptions of education. Assuming that a focus on education can also lead to the creation or overemphasis of educational inequalities, I would like to conclude my paper with a critical discussion of the question of whether the implementation of educational curricula in ECEC to compensate for educational inequalities can be meaningful at all.

Childbearing behind Bars: The Experience of Filipino Pregnant Prisoners

Many women who enter prison come from the margins of society. Most are of reproductive age, and many are mothers. Thus, they have distinct reproductive health needs. Feminist scholars and activists have argued that women's imprisonment is a pressing reproductive justice issue. Despite extensive literature on the reproductive well-being of marginalized women, the experience of pregnant prisoners is under-researched. This research presents a qualitative interpretation of women's pregnancy experience in the largest Philippine women's prison. The study was conducted in 2020 and involved semi-structured interviews with 18 pregnant prisoners. This study builds upon existing knowledge and literature and highlights the institutional context of the pregnancy experience of incarcerated women. Through thematic analysis, the study's key findings are organized into three broad themes: a) Lack of control and autonomy, b) Disrupted mothering role, and c) Social networks

as coping resources. These themes embody the women's narratives of how their pregnancy and motherhood status appeared secondary to their 'prisoner identity', exacerbated by their experience of systemic scarcity and sense of powerlessness in prison. Imprisonment was the fulcrum on which the women's experiences of pregnancy were negotiated and balanced. The study showed how women navigate the system to negotiate entitlements and deal with their childbearing needs. This research contributes to the growing reproductive justice discourse by highlighting how imprisonment infringes on women's fundamental reproductive health and rights by confining them, limiting their access to quality reproductive health care, disrupting their resources, and separating them from their children.

The Praxis of "Story Work" from Land to Table: Rhizomatic Considerations for Regional Food Systems

The context of "story work" in this paper is framed by a community-university initiative focused on cultivating a regional food system in southwest Virginia, USA. The Roanoke Foodshed Network (RFN) is an emergent and praxis-oriented food and farming community engaged in the politics and practice of growing a culture of resiliency, care, and cooperation for a healthy and just food future. With an emphasis on regional food systems, this network seeks generative ways to open new possibilities that transcend the material and bodily inequities of our globalizing food system and its historical legacy of extraction and struggle in the foothills of Appalachian Virginia. One such approach uplifts the role of storytelling to bring forward rhizomatic possibilities for co-creating a dynamic network and support system for the common goal of good food for all. For this paper, we first describe our narrative inquiry and rhizomatic storytelling methodology as a form of critical praxis and network weaving. Like others, we propose that narratives do more than convey distilled "best practices" about the way partners in the network organize for healthy food access and ecological sustainability in their communities. Instead, stories of food work from land to table are a generative space for opening up new possibilities, transforming knowledges, and enacting collective action. We also explore several themes of "resonance" co-analyzed across 15 narratives from a diversity of food system actors in the region that serve as a seedbed or an "assemblage" to organize the network towards its vision. We conclude with considerations for exploring the rhizomatic quality of regional food systems through story to offer opportunities to reconceptualize sustainable food systems transformation in more expansive and life affirming ways.

Health Interprofessional Training and Practice in Mexico: The Initial Signs of a Monopoly Crack

Medical monopoly in health services has been uncontested since the creation of the Mexican modern health care system in 1943. The state provided guarantee of monopoly practice to the medical profession -without responding to a specific demand from it- as a key driver of the expansion of public institutions between 1943 and 1970. Since then, medicine was dominant and other groups, including nursing, were basically following instructions. However, university-trained nurses have increased exponentially in the last 20 years mounting pressure to participate as a full professional group in clinical areas. Besides, in the last 15 years WHO has been insisting on the convenience of establishing health teams to provide services at primary level of care and the need of interprofessional training models to achieve this goal. The account of two experiences of interprofessional training in Mexico is presented, one at primary level of care that provides services to rural populations and one at a private hospital unit that provide services to affluent populations in Mexico City. The first one shows that nurses are capable to acquire knowledge and compete to perform functions along with doctors at health centers, particularly the autonomous provision of ante-natal care consultations and birth care. The second one shows the difficulties of nurses to maintain high levels of performance in environments where doctors are fully dominant, in order to match those levels obtained by their medical colleagues. Nursing is expanding its role in primary care level. Cracking medical monopoly by expanding the

denotes a presenting author. Abstracts are organized by first presenting author's last name.

role of nurses in Mexico is occurring initially at this level which Mexico urgently needs to strengthen by allocating well trained and fully committed personnel, with special emphasis in nursing.

NIHEI, Norihiro* (The University of Tokyo, Japan)

MARUYAMA, Masao (The University of Shiga Prefecture, Japan)

The Transformation of Civil Society Organizations in the Tokyo Metropolitan Area from 2006 to 2019

Since the 1990s, research on civil society organizations in the West has focused on the "becoming business-like" of civil society organizations. This concept is an umbrella term that encompasses the phenomenon of depoliticization and mission drift of them which are caused by the change of organizational structure and identity from social movement to business entity, as organizations are driven by the pursuit of funding in quasi-market. Neoliberal urban politics has been noted to promote this business-like transformation of civil society organizations. In the context of the privatization of public services in Japanese cities as well, governments are increasingly selecting civil society organizations through outsourcing and providing subsidies, forming cooperative relationships with nonpolitical or submissive groups while excluding critical social movements.

The purpose of this study is to determine how the relationship between government, market, and civil society has changed in Japan's neoliberal urban governance since the 2000s, and how civil society organizations have been transformed in this context.

To this end, we conducted surveys of civil society organizations in the Tokyo metropolitan area in 2006 and 2019. Using the data, we perform multivariate analysis to clarify why and to what extent organizational transformation such as increased reliance on business income and a growing tendency to see themselves as "entrepreneurs" rather than "activists" have been underway, and to what extent these changes have reduced organizational activism. Through the above, we capture how the neoliberal urban context in Japan has affected civil society.

Key findings include the followings. As urban administration have outsourced social services to the private sector, civil society organizations tend to have engaged in business, while political activities such as advocacy and protest have decreased. At the same time, they tend to have lost confidence that they had achieved their goal of solving social problems.

The Thirty-Year Consequence of the "Feminization of Migration" in Japan: Through the Vulnerabilities of Thai Women's Social Security in Old Age

Currently, Thai female migrants who have resided in Japan since the 1990s are preparing for retirement. This report focuses on the consequences of their migration to Japan as spouses of Japanese husbands and employees with limited employment opportunities in Japan. Their pension is the basic economic income for retirement life. During their working age, they tend to depend on their husband's social security based on the male breadwinner's system. Their employment opportunities exclude them from workplaces with good welfare, similar to Japanese women with the embedded gender gap in Japan. In addition, they tend to find jobs in ethnic businesses without social welfare, such as restaurant workers and massage therapists. These social security disadvantages cause vulnerability in old age. Previous studies have argued that ethnic businesses promote chances for a hierarchical shift (Light & Roach 1996). However, the women are only able to make ends meet on the income during the working age, and thus do not prepare for old age. This paper explores Japan's pension system based on the embedded gender gap in social structure and family relationships.

The data are based on fieldwork from 2016 to 2021 in Japan. The narratives of Thai middle- aged women who resided in Japan for almost three decades and have had experiences as employees in ethnic businesses are analyzed.

The research results show the thirty-year consequence of migration to Japan for Thai women is poverty in old age. The causes of poverty are dependency on the male breadwinner system and employment disadvantages, especially in ethnic businesses. These findings show the consequences of the exclusion of migrant women who become extremely vulnerable in their future old age. This study therefore contributes to revealing intersectional points on the social structure with the embedded gender gap and asymmetry of power relationships in Japanese families.

How Ireland Attempted to Avoid Stigma on Disability through the Legalization of Abortion

In Ireland, The Health (Regulation of Termination of Pregnancy) Act was passed in January 2019. The Act permits termination of pregnancy to be carried out without restriction up to 12 weeks of pregnancy and stipulates that one of the conditions for allowing abortion after 12 weeks with condition present which is likely to lead to the death of the foetus either before or within 28 days of birth, without specifying any abnormality of the fetus as ground for. In Japan, on the other hand, since the legalization of abortion in 1948, abortion on the grounds for fetal abnormality has not been explicitly stated as legal abortion, but in fact it is presumed to have been held for socio-economic reasons. The Irish abortion law was passed in an era of more accurate and liberalized on prenatal testing, so how was the term "disability" perceived in the process of its passage, and how did it function in the text of the law and in the guidelines for medical practitioners? In October 2017, while Ireland was considering legislation, the UK received a recommendation from The United Nations Committee on the Rights of Persons with Disabilities (CRPD) to modify the existing fetal clause, which this may have had an impact. To look at these arguments, this report analyze materials included these from the Oireachtas archives, and documents of relevant organizations, including the UN. Through the enactment of this abortion law, how did Ireland attempt to achieve the avoidance of stigma on disability and the decriminalization of doctors who perform terminations when the fetus has a fatal abnormality that results in death shortly after birth? This report clarifies the logic behind this approach, and thus point out the challenges that Japan's abortion-related laws have.

Reverse Migration in Pandemic Crisis: Russia's out-of-TOWN Spaces As an Adaptation Resource

The 2020 COVID-19 pandemic had a significant impact on migration flows in the Russian space: the factors attracting the population to megacities have reduced their impact, giving rise to centrifugal factors, which in turn led to an increase in atypical migration processes, primarily to massive the outflow of citizens to out-of-town spaces. This process can be termed crisis deurbanization. The article examines the features of the current Russian epidemic de-urbanization, taking place in the specifically Russian conditions of incomplete urbanization and, at the same time, the beginning of the post-urbanization stage. We interviewed Russian citizens who left cities during the March-April COVID-19 crisis 2020 for short, medium and long distances to country houses in Moscow, Vladimir, Kostroma, Vologda and Nizhny Novgorod regions. The so-called second homes of the townspeople from now on fully began to combine recreational, quarantine-sanitary and work functions, which allows them to be used for long-term residence and after the end of the crisis. This clearly enough indicates the prospects for the formation in the future of settlement clusters of immigrants from megacities especially during the current war conflict.

Authoritarianism and Attitudes Toward the Environment in Rural and Urban Central Europe: A Cross-National Analysis of the Three Waves of EVS Data

Existing research suggests that democracies take better care of the environment than autocracies and totalitarian systems. However, as a growing body of literature warns about the backsliding of liberal democratic principles and the rise of a right-wing authoritarianism even in established democracies, we ask whether a positive relation between authoritarian attitudes and anti-environmentalism can be found in these countries. We, therefore, examine this relationship in eight Central European countries: Austria, Croatia, Czech Republic, Germany, Hungary, Poland, Slovakia, and Slovenia. These countries share a strong geographic and historical connection and most also the legacy of communist/socialist regimes, which can still be felt in their social, economic, political, and cultural arenas.

We present the results from the cross-national analysis between environmental and authoritarian attitudes from the three waves of the European Values Study data (1999, 2008 and 2017). We relied on authoritarian personality traits as defined by Altemeyer (1981) to construct the *Authoritarianism Index* and on the available items from the EVS to construct the *Environmental Indifference Index*. We also examine socio-demographic characteristics as possible predictors (sex, age, level of education, income), with particular focus on rural/urban differences as these have been shown to be good predictors of both types of attitudes. The results show that in all analyzed countries there is a positive correlation between authoritarianism and personal disinterest in environmental protection. In all countries, there is a rise in the desire to have a "strong leader" and in other authoritarian items, more pronounced in rural and smaller urban areas. There also still exists the wish to put the care for the environment before economic and personal interests, but this is in decline and less prominent in rural and smaller urban areas.

NIKOLAS, Ana-Maria* (DeZIM-Institut, Germany)

Migrant Youth Activism and Alternative Inclusive Futures:

Not least since Fridays for Future and Black Lives Matter, political and academic debates refocus on the politicization of youth and their participation in social movements and protest events. Young people seem to express their political ideas in rather volatile and spontaneous mobilizations organized through social media. This neglects that the youth is also organized in associations and other organizational forms to influence politics like other civil society organisations. Even less acknowledged are migrant youth organizations or migrant youth self-organisations (MJSOs) –and their vision of open, diverse, and plural societies. This contribution takes a different perspective. It discusses the political participation and activism of migrant youth organizations in the field of youth politics. In order to do so, we are looking at the network structures of migrant youth activist at federal, state and city level. We use the network analysis to show patterns of exclusion and inclusion. We find connections among MJSOs as well as some crucial brokers which bridge structural wholes and disadvantages in terms of resource distribution and degree of professionalization. In sum, migrant youth remains underrepresented in formal youth politics arenas, but we also see new dynamism in form of newly emerging organizations and alternative youth networks creating their own spaces of alternative futures of migrant inclusion in German society.

WIBAWANTO, Gregorius Ragil (Universitas Gadjah Mada, Indonesia)

The Life-Affirming Nexus of Religion and Youth Activism in Indonesia

Youth viability can be productively defined as young people's common focus on strengthening connections between domains of life, and where possible, challenging dominant practices to effect change. The positive social and environmental activism of young Muslims and Christians in Indonesia can be understood this way, as attempts to shape the world according to theological precepts of divine harmony and making a better world. This paper draws on research with Muslim and Christian youth activists in Indonesia, including instances where they come together to challenge counter-productive practices in wider society. First, a recent study confirmed that young Muslim environmental activists base their environmentalism firmly on Islam as they understand it. Their 'ecological habitus' was amplified by their 'sacred capital' as a form of symbolic capital. They saw themselves as *khalifah* – God's lieutenants on earth; taking on the stewardship of the natural world with emphasis on maintaining harmony and balance. Second, a subsequent study of young Catholic activists in Indonesia indicated the extent to which they reached out through interfaith coalitions to local moderate Muslim youth groups, with whom they shared discourses of nationalism and democratic reform. Once again, the young activists were seen to scaffold from core precepts of their own faith to develop common cause in pursuit of long-lasting social harmony.

NIRAULA, Ashika* (Canada Excellence Research Chair in Migration & Integration Program, Canada)

International Students and the Pandemic: Changing Migration Aspirations and Pathways?

For more than a decade Canada has steadily poised itself as one of the world's leading destinations for international students and highly skilled migrants. Faced with the unexpected COVID-19 pandemic crisis, the Canadian government implemented a series of temporary measures in 2021 that aimed to facilitate temporary migrants', including international students and post-graduate work permit holders, access to permanent resident status. Such policy measures helped to establish the image of international students as valuable contributors to the country's economic success and competitiveness. Nevertheless, little is known about how pandemic-related uncertainty, ambiguity, and ignorance have shaped the migration aspirations and pathways of international students and post-graduation work permit holders. Previous studies indicate that international students are more likely to be vulnerable to the direct and indirect effects of the COVID-19 pandemic due to their precarious legal, social, and economic status. In this paper, we examine the ways the COVID-19 pandemic crisis has impacted the migration-related decision makings of two groups of international students – i) actual international students in Canada, including the Post-Graduate Work Permit holders and ii) prospective international students outside Canada. Drawing from an online survey data (n=500) and in-depth interviews (n=105) with actual and prospective international students to Canada, we analyze how socio-demographic factors, employment prospects, and health risks have influenced international students' migration-related decisions during the pandemic times

amidst a dynamic Canadian immigration policy. By employing the notion of critical junctures, we argue that international students' migration aspirations and pathways – where, when, and how to move – is a multi-stage and multidimensional, often embodied by ambiguities and complexities.

Rhetorics of Choice and Coercion on Surrogate Motherhood

Surrogacy is one of the desired and choice-based reproductive technologies for family formation, yet surrogate mothers are subjected to unethical treatments and victims of unbalanced power relations in India. Such treatment obscures women's free decision-making and can be detrimental to their maternal self. Recently, the Surrogacy (Regulation) Act, December 2021 has received the President'**S** approval to regulate surrogacy practices by limiting them for altruistic motives which has again provoked the burning debates regarding reproductive technologies, women's emancipation and procreative labour. The primary question that needs to be explored is whether surrogacy is really a choice providing technology or it is just another illusion of patriarchy. The paper thus explores women's agency, maternal freedom, and surrogate arrangements in Indian society. The complexity of the implementation of the law, vulnerability of surrogate labour, woman's bodily autonomy and reproductive choices have been analysed. This has been done through comprehensive feminist discussions on motherhood experience in terms of enforced vs. voluntary to find the way to protect women's freedom and subjectivity in the task of 'mothering as empowerment'.

NISHAT, Atufah* (Centre for Studies in Social Sciences Calcutta, India)

Sleeping Bodies As Protesting Bodies

Historically there has been a creation of a binary between mind/body, nature/culture, production/reproduction and public/private. Every binary constitutes within it a hierarchy. Within the dualism of mind/body, culture/nature, private/public and production/reproduction, women have been relegated to the realm of the lesser, that is to the realm of the body, nature, private and reproduction. This paper will seek to study the involvement of Muslim women in the anti CAA NRC protest movement in Kolkata, India. This paper will look at the bodily act of sleeping at the protest site. It will attempt to understand how the corporeal act of sleeping as an act of resistance at the protest site upturned the dualism of mind/body, nature/culture, private/public and production/reproduction divide. All societies, communities, and people from past to present organize themselves to sleep in one way or the other. Sleep is often considered to be non-social or non-event act as it lacks individual control or social interference. However, even if sleep is considered to be a non social practice, the context, meaning and cultural connotations that one attaches to sleep makes it a social act. Therefore sleep even though considered to be an individual act, is always constituted by the social. Sleep as a social act is socially embedded. Since sleep comes to our corporeal bodies and it is our body that experiences sleep, sleep also becomes an embodied act. Therefore sleep is not only socially embedded but also embodied (Williams, 2008). This paper is a qualitative paper that will bring forward the narratives, experiences and emotions of twelve women who participated in the protest and will try to look at how sleeping bodies of women produced resistance and transgressed the binaries.

Women's Time in Domestic Work over the Life Course: Evidence from Women Born in the Late 1960s through Early 1980s

Although the gender gap in domestic work is persistent in the Japanese context, research shows that women's time in domestic work is on the decline. This paper investigates how women's time in domestic work have changed across cohorts, with life-course perspective taken into account, and how these changes are relevant to behavioral and demographic changes occurred among women, such as increase in labor force participation, late marriage, and lower fertility. Using the Japanese Panel Survey of Consumers (JPSC), we run the liner regression models to predict time in domestic work for women born from different birth cohorts (1965-69/ 1970-73/ 1974-79/ 1980-84 birth cohorts) aged 25 to 39. Then, Oaxaca-Blinder decomposition is applied for the women from the 1965-69 and 1980-84 birth cohorts. Results indicate that the decline in time for domestic work among younger cohort of women is mostly accounted for compositional changes; that is, longer time in paid work and having fewer children among women in 1980-84 cohort are relevant for their fewer time in domestic work. Additionally, the results indicate that for women from the 1980-84 cohort, having a partner in the household did not increase their time spent domestic work as much as it did for those from the 1965-69 cohort. This may imply a shift in marital power relations among younger cohort.

Language and Representation of Health, Science, and Credibility in COVID-19 Pandemic: Analysis of COVID-19-Themed Manga

Since the beginning of the COVID-19 pandemic, many professional and amateur manga artists in Japan have created diverse COVID-themed manga and adjacent art (Holmberg, 2020). Japan is home to a vibrant manga industry and culture (Kinsella, 2000; Lam, 2010), with a stable educational science manga genre (Berndt, 2017). While the efficacy of visual narratives in improving health literacy during COVID-19 is acknowledged (Jarreau et al., 2021), it sheds light only on the communication from the experts. To better understand the pandemic discourses, it is crucial to consider the lay public's expertise (Wynne 2004). Manga is a popular medium for the public to express their interpretation and experiences of such messages, thus a rich venue to understand the lay public's knowledge of COVID-19-related health and science. This paper's aim is twofold: First is to identify the landscape of COVID-related multi-panel sequential manga discussing health and science. Secondly, it aims to provide a preliminary analysis of the language and representation of health and science in the political manga essays that critique the authorities' responses to health, each from the conservative and liberal spectrum. It preliminarily selected Kobayashi Yoshinori's *Gōmanizumu sengen special korona-ron [Declaration of arrogantism special COVID edition]* and Bōgo Natsuko's *100-nichi de shūsoku sinai nihon no korona-ka [COVID Pandemic that does not end in 100 days]*. It asks: Who are the authors and the readership? How do authors visually and linguistically represent health and science? How are concerns about infection and prevention in their daily life connected to health and science? What narrative structures, tone, and mood are employed for what effect? What evidence are they drawing? What and who are considered to be credible, and how? Through the analysis, we examine the role of manga in the COVID-19 pandemic.

Countries Embracing Maternal Employment Have Opened Schools Sooner after COVID-19 Lockdowns

The Covid-19-pandemic-related closure of schools has affected the majority of the world's students and remains a contentious issue. Using data from the UNESCO school database, the ISSP 2012, and country-level panel regressions, we leverage simultaneous school closures during the first wave of Covid-19 lockdowns to estimate the effect of gender ideology on school reopening schedules. We show that societal gender ideology has likely influenced school reopening policies: Societies with more supportive attitudes toward maternal employment reopened schools significantly sooner and more comprehensively than societies with less supportive attitudes toward maternal employment, relative to other reopening measures and net of infection rates. We test and exclude a variety of potential confounders, such as a country's maternal employment rate, GDP, or social spending. We bridge political science and feminist welfare state scholarship, which both theorize that 'ideas matter' for social policy, and argue that school closures were perceived as less problematic in countries where more people support the ideal of a stay-at-home mother. Gender ideology may thus have affected decision-making on which social activities and groups should remain relegated to the private sphere for longer durations after first Covid-19 lockdowns, via gender ideology normative framing or gender ideology bias.

The Power of Two: Second Birth Rate Differences between Couples with Homogamous and Heterogamous Educational Pairings

In many high-income countries, homogamous tertiary-educated couples display higher second birth rates than heterogamous couples with one tertiary-educated partner. This finding fits with pooling theory, yet, its underlying mechanisms remain poorly understood. We probe pooling theory by testing whether educational pooling operates linearly across couples' constellations. Prior studies used rather coarse educational pairings categories, leaving the question of finer-grained sub-patterns within broad pairing groups unaddressed. Using data from Finnish registers, we extend prior research by differentiating between lower and upper tertiary education, and modeling educational upgrading processes within couples. We find that the difference between highly educated homogamous and heterogamous couples is mainly due to the low second birth rates of heterogamous low pooled resource couples with a lower tertiary-educated and a medium- or low educated partner. Second

birth rates are highest for all types of couples, in which at least one partner has upper tertiary education, regardless of the second partner's education and including heterogamous large distance couples. Our findings underscore the couple's relevance as a powerful yet often overlooked analytical unit for family formation processes, and extend resource pooling theory. Lower and upper tertiary education emerge as distinct, and appear to contribute differently to risk- and resource pooling. This makes their differentiation crucial for deeper investigations into the couple-fertility-education nexus.

Empowerment of Women through Self Help Group: A Study of Kudumbashree

This paper attempts to examine two inter-related issues. Firstly, what is the impact of Self Help Groups (SHGs) known as Kudumbashree among the marginalised women in India? Secondly, how Kudumbashree empowers the Malayalee women politically? Kudumbashree was introduced in Kerala in 1998 to empower women and alleviate poverty. Hence, it has been recognised as an effective strategy for the women to fight for their rights in both rural and urban areas. It has become the world's biggest women empowerment programme since 5 million women approximately have become members of Kudumbashree in Kerala. Basically, this programme encourages women to be economically and politically empowered by attending group discussions, learn skills like debating, writing, reading, and involve in decision making process. It also imparts education to the poor illiterate women through adult education. In the past decades, Kudumbashree has empowered numerous voiceless and invisible women to be politically empowered through the Panchayat elections. Besides, some women have been economically empowered by increasing the per capita income. For instance, they have been trained by Kudumbashree to work as taxi drivers, construction workers, entrepreneurs, organic food farmers and the like. It is interesting to observe that women's exposure to Kudumbashree enables them to be well equipped with skills and perform much better than other women in governance. They create their own agency and attempt to uproot the patriarchal system.

Racism, Cultural Differences and Hyphenated Identity of North East Indian Women in Hyderabad: A Feminist Perspective

This paper attempt to locate the subject of racism and the hyphenated identity of North East Indian Women in Hyderabad from the feminist lens to understand the intersection of race, tribe, caste, patriarchy, and gender, especially during the COVID times. Hyderabad draws workers from many parts of North East India who are not unionised. Thus, they have become a docile labour force suited to the global economy whose policy of 'hire and fire' and optimisation of wages is helpful for multinational companies and the service sectors. This labour force which has become docile and has multiple identities, all of which intersect. The intersection of a global economy, ethnic identity, and the like are susceptible to racism. All ethnic organisations in Hyderabad are masculinised as women are excluded from leadership. This paper will address three issues. Firstly, how the North East women are culturally different, and their differences are encountered with some responses of discrimination? Secondly, how a depoliticised and docile labour force who are the product of globalisation becomes a junior partner in the neo-liberal market? Thirdly, how the hyphenated identities of North East women are confronted in Hyderabad as gender relations get strained with increasing tensions between men and women as the later is made an easy target of exploitation, harassment, and exclusion? Some women face the brunt of belonging to a hyphenated identity as they are subjected to racial slurs from being called 'coronavirus', chinkees', 'chinese', etc. Thus, they have to experience the process of intersecting between caste, tribe, and race. The Study employed the purposive sampling involving individual interviews and case studies.

Interferences in the Secondary School Pedagogical Bonds during the Pandemic

The pandemic had shaken the Argentine education system by suspending, just at the beginning of the school year, a structuring trait of the school format: presentiality. For many months, the "pedagogical continuity" took place in very different ways, in dialogue with the deep inequalities that characterize the secondary level of schooling.

The presentiality suspension and classrooms return almost a year later profoundly disrupted the pedagogical bond-building process. Due to its curricular-encyclopedic organization, secondary school has an emotional grammar that hinders fluid relationships and mutual knowledge between teachers and students. During the pandemic, different artifacts interfered in

this bond-building process, affecting teachers' emotional experiences, which have nuances depending on the school and the social sector with which it works.

During isolation, the school space explodes in the particularities of each household; devices -whether cell phones overflowed the school temporality with the omnipresence of WhatsApp throughout the day or screens for synchronous classes with connectivity fluctuation problems- took prominence altering the interaction forms. When students return to classrooms, their grouping "in bubbles", the air filters implemented, and the use of masks all altered the teaching practices and the possibility of mutual recognition. In this paper, we are interested in reconstructing the emotions crystallized in these artifacts that make "noise" and interfere in the establishment of pedagogical bonds, exploring the meanings assumed by these artifacts in the daily experience of teachers during the pandemic.

Ambiguous Attitude and Modest Organization: Pursuing the Postmodern Military

The Japan Self-Defense Forces (JSDF) can be viewed as a postmodern military. To persuasively demonstrate the need for a capability to deal with modern war and organized violence, military organizations must focus on the relationship with society and address the gap seen on the front. Since their birth, the JSDF have been facing the inconsistency present in the Constitution of Japan, which has an article renouncing the forces for war.

A previous ISA report by the author examined the postmodern characteristics of the JSDF as presented by recruitment videos and posters. The postmodernism seen in the recruiting videos in which applicants repeatedly ask themselves questions and the recruiting posters that link violence and *Kawaii* (cute) were not an issue, but rather the understated and soft self-presentation of the army, which aims to permeate into applicants' interiorities and the cityscape surrounding.

This presentation aimed to examine the above problem through a recursive observation of the contact points between the military and society. For the military organization, an important piece of information is how the Japanese public perceives military service. The Japanese willingness to fight for their country's wars, as indicated by the World Values Survey, is distinctive. The rate of positive answers is the lowest in the world, but the rate of negative answers is not the highest. The rate of 'Don't Know' (DK) is the highest in the world. In another survey conducted by the author, the DK respondents included two groups: those who were indifferent and those who were highly concerned about the military and world affairs. How does the military attempt to persuasively demonstrate its value to such citizens?

The ambiguous attitude of civil society toward military affairs and the modest attitude of the military toward society resonate with one another.

Pandemic Crisis, War, and Resurgent Authoritarianism. Challenges for the Future of Social Indicators Research: Introductory Presentation

This introductory presentation reflects about the question whether and how diverse societal developments, but in particular the pandemic crisis, climate-change and related anti-climate-change policies, the current Russian war against the Ukraine, and a tendency towards resurgent authoritarianism are challenging and affecting social indicators research now and in the foreseeable future. A retrospective view to the beginnings of social indicators and quality of life research in the 1960s shall highlight the mission of this newly established and by then rapidly growing field of social research as well as to remind us of its goals and societal background. Contrasting the current situation and developments with the past shall allow to draw some conclusions concerning successful activities and failures, prevailing and obsolete research goals and not least needs for new directions and innovative pathways to follow in future research activities.

Cero Emisiones Al 2050

Aplicando un modelo matemático de transición demográfica, se ha determinado en prospectiva, que la población mundial llegaría a estabilizarse en el 2050 en 9,000 millones de habitantes. De este total, siete mil millones habitarían en áreas urbanas y 2,000 millones se mantendrían en zonas rurales especialmente de continentes como África y Asia. Desde 1950 la población predominantemente rural (75%) en el Perú se ha trasladado a las ciudades. El fenómeno fue calificado como "desborde popular" por José Matos Mar del Instituto de Estudios Peruanos. Las grandes migraciones interculturales han transformado el mercado interno y la economía, con significativas

repercusiones en la sociedad y la cultura del Perú. A nivel global, Perú así como China y la India dejarán de emitir gases de efecto invernadero (GEI) a partir del 2050. Los GEI resultado de la deforestación, la agricultura intensiva y el consumo de todo tipo de combustibles fósiles en actividades de producción, comercio e industria, podrían otorgar un beneficio económico para nuestro país y América Latina de 98 mil millones de dólares al 2050, según el "Estudio técnico hacia la carbono neutralidad en el Perú en el largo plazo", elaborado por el Ministerio del Ambiente (Minam), a través de su Dirección General de Cambio Climático y Desertificación. A partir del artículo 12 del Protocolo de Kyoto (COP 3) se determinan los mecanismos de desarrollo limpio para la adaptación y mitigación del cambio climático. Revisando los estándares para las contribuciones nacionales para disminuir significativamente las huellas de carbono. Para lo cual debemos describir las herramientas y procedimientos para la caracterización del clima actual y futuro a nivel local, regional y nacional en el marco de la implementación de medidas de adaptación al cambio climático, proyectos de intervención, programas presupuestales y financieros.

NOMVETE, Sandla* (Nelson Mandela University, South Africa)

Understanding the Agency of Women, Power Shifts in Migrant Households in Mpondoland and How That Begets Continued Migrant Labour By Men to the Mines.

This paper emanates from ethnographic work and in-depth interviews conducted in villages of Mpondoland in Flagstaff and Lusikisiki in the Eastern Cape Province, South Africa. Using the concept '*imibutho*', the paper highlights the expansive and superlative social reproductive roles of women in migrant households herein captured in the concept transformed femininity. It aims to show how the position of Mpondo women in migrant households in the labour sending areas influence continued reliance in mining migrant labour by Mpondo men in the post post-apartheid era. Fundamentally, the paper argues that transformed femininities have challenged the traditional make up of migrant household which has always rested in masculine authority. Thus, the paper demonstrates a gendered shift in power dynamics in the migrant household.

Coercive Control in/and the Family Law System in Canada: Foregrounding Survivors' Voices

In many countries, coercive and controlling behaviour has become a focal point for family and criminal law legislation seeking to address the social problem of gender-based violence. For instance, changes to Canada's *Divorce Act* have expanded its definition of family violence (FV) to include coercive control as a relevant consideration in family law cases. The voices of FV survivors have a vital role to play in informing the just and equitable applications of these policies in family courts and in society more broadly. Their experiences reveal critical gaps, failures, silences, and injustices, as well as vital acts of resilience, indicators of progress, and powerful reminders of what is at stake in the everyday work of legal professionals, gender-based violence advocates, and social researchers. This paper examines survivors' experiences in Canada's family law system documented by the Canadian Domestic Homicide Prevention Initiative with Vulnerable Populations (CDHPIVP) project, a six-year national research project. It centralizes the perspectives of survivors as a form of critical knowledge into how family court proceedings are often weaponized by abusers to perpetuate a regime of coercive control. The paper examines key findings from the CDHPIVP project that pertain directly to Canada's family law sector, but these also bear relevance to processes of violence more broadly. Specifically, the paper shares survivors' insights into how coercive control, barriers to support, and the legal system itself shape processes of continued violence, surveillance, and/or secondary victimization. In recognition of these systemic concerns, the paper highlights promising strategies developed in an ongoing knowledge mobilization project, Supporting the Health of Survivors of Family Violence in Family Law Proceedings, to suggest ways that cross-sector collaborations among social scientists and legal professionals can advance "trauma- and violence-informed" approaches to supporting FV survivors.

What Predicts Retirement Intentions of Older Workers (45+) in Long-Term-Care? a Systematic Review

Extended working life among older long-term care (LTC) workers is considered a key solution to prevent future labor force shortages. However, the opportunity to extend working life is unequally distributed within different occupational sectors. Workers with physically demanding work tasks, as in LTC, tend to retire early, and their intended age to retire may not correspond with political aims of postponing retirement.

The aim of this systematic review was to investigate factors associated with retirement intentions among LTC-workers aged +45, using an analytical framework derived from the Job Demand-Control-Support (JDCS) model and a theoretical framework of *push-pull* explanations.

Method

This review was guided by PRISMA. The literature search was conducted in seven databases: Web of Science, PubMed, SocINDEX, Scopus, CINAHL, PsychINFO, and Medline, with filters: peer-reviewed articles published 2000–2021 and English or Nordic languages. The screening was performed independently and double-blinded. The first phase resulted in 4 489 records, the second a full-text review of 100 records. Joanna Briggs Institute quality assessment tool was used to assess the risk for bias. ATLAS-ti.9. was used for a narrative synthesis and analysis of the final six included records.

Result

The result confirms that research on older LCT workers is scarce, as few and mainly cross-sectional studies were identified. The preliminary results challenge previous assumptions on the associations between health- and several work-related factors and retirement intentions. There was a clear association between Support and retirement intentions, e.g., LTC workers experiencing few challenges and development intended to retire *early*, and LTC workers acknowledged for good work and seniority intended to retire *late*. However, concerning the associations between job satisfaction and Demand, e.g., physical strain and *early* retirement intentions showed mixed results. Final results from the review will be presented at the conference.

The Illiberal Radical-Right Populist "People": From Politics of Fear to Anti-Gender Politics

The present talk aims to disentangle the complex ideological project of constructing the "People" undertaken by illiberal radical-right populist forces in Europe. To do so, I deploy an intersectional lens to examine the manner in which said project is underpinned by a series of paradoxes: privileged (white) politicians (mainly men) proclaiming themselves the true voices of the "People", largely depicted as economically vulnerable (white) (men and women). The "People" are to be defended against the corrupt and distant elites whose irresponsible policies constitute two sets of challenges: the open-borders policies have allowed dangerous migrant Others (particularly men) who posit a danger to the cultural (and racial) distinctiveness of their nation; the gender+ equality policies have allowed radical activists (particularly women and sexual dissidents) into the state apparatus who posit a danger to the traditional family upon which the nation rests. More clearly, I suggest superordinate intersectionality as an analytical perspective to address these paradoxes. In my approach, I scrutinise the interactions between several axes of difference and inequality: masculinities (for gendered hierarchies), heterosexuality (for sexual hierarchies), elites (for class systems), and whitenesses (for racialized and ethnic structuring). I illustrate these with examples from across Europe, that focus explicitly on the apparent imbrications and discrete disjunctions between the politics of fear against the migrant Other and the anti-gender politics targeting women and sexual dissidents.

The Interface between Authoritarian Innovations and Labour: Implications for Indian Workers

Some democratically elected leaders are constantly innovating to shrink spaces of voice and accountability through subtle practices that are framed as democratic, but in fact involve democratic backsliding. Practices such as 'inclusiveness, popular control, considered judgment, transparency, efficiency and transferability' designed to promote democratic deepening, may in fact be used to subvert democratic norms by promoting exclusion of voices, concentration of power in decision-making and disempowering citizens by controlling information and constraining political conversations (Curato and Fossati, 2020).

This paper examines the use of authoritarian innovations in India, under the Modi government. As it argues, the government has employed governance styles, rhetorical tropes and policies to restrict workers' access to information and disable dissenting voices while simultaneously seeking to appeal to the working class. For example, it has tried to cajole workers into submission by making calls for a 'compassionate' approach to labour issues while, at the same time using the garb of transparency to dismantle inspection systems and decriminalizing offences related to labour infringements in an attempt to make compliance simpler for employers. Other examples include the conversion of 29 existing labour laws into four simple labour codes, which the government argued would simplify matters for the working class but in fact rolled back protections for waged workers . These changes gave establishments employing less than 300 workers an unfettered right to hire and fire, severely diluting safety norms, weakening the inspectorate, deregulating the labour market and curbing workers' ability to strike. In a third example, the government has acted to reduce the role of organized labour in policy-making forums, excluding unions.

In short, the government has mobilised rhetorical tropes and governance styles that, in the quest for efficiency and productivity, side-line dialogue with trade unions while appealing to workers in the name of nationalism.

RUSSO, Concetta (University of Milan-Bicocca, Italy)

Reconnecting the Social with the Medical Experience in the NICU: The Role of s Digital Technology

This paper presents the ParWelB (Voicing Preterm Parents' Experiences) project, which is an interdisciplinary study aiming to elaborate a pivoted socio-psychological model for assessing preterm parents' wellbeing during and after the hospitalization in Neonatal Intensive Care Units (NICUs). The main objective of the project is to reconnect the social dimension with the medicalized experience, also through the integration and support of digital technology, thanks to a tailored webapp. The ParWelB webapp allows the research team to gather information on parents' wellbeing through the administration of validated scales for stress levels. Moreover, the webapp is intended to send immediate alerts for parents who need psychological support, activating the interdisciplinary team. The concept of "technology-in-practice" (Timmermans and Berg 2003) allows a critique by scholars in the social sciences, while considering the modalities in which the "social" and the "material" intertwine in technologies for health care, with complex consequences. Thus, digital technology (i.e. the webapp) becomes a tool for redefining and strengthening medical and psychological practices and for reconnecting with the socio-relational dimension of medical practice. The webapp also defines a dimension of the environment in which the quality and the type of wellbeing and relationships (also with healthcare staff) are shaped, offering new possibilities of knowledge building implementation. Exploring some results of in-depth interviews with parents engaged in the study, we could understand their first-hand experience with the webapp. Parents' perspectives on the webapp as a possible tool for monitoring their wellbeing, as well as their desires, will be crucial for future implementation of support strategies, in order to design an aid that will cover their needs.

Interest Formation of Workers in the Global and Fragmented Economy

In theories about working class power, the formation and existence of workers interests is usually seen as a given, despite the fact that it requires political processes for these interests to emerge. With the increasing relevance of fragmented economies in the context of transnational companies and the expansion of subcontracting and self-employment, the fragility of this interest formation is increasingly visible. In this presentation, we will investigate the formation of workers interests in three sectors in Brazil: a) delivery and logistics, and the activities of the section Post & Logistics of the global union federation UNI in urban logistics in Brazil, and their use of global union networks and global framework agreements. The fragmentation of workforces across various countries gives rise to the project of reconnecting these workforces via transnational unions. b) the work of installation and maintenance of elevators in Brazil by electromechanical technicians. Three multinational elevator manufacturers depend on self-employed workers and small companies to install and maintain the elevators, or employ their own workers for these services. The diffusion of those workers in these three modalities is a challenge for unionization. c) Self-employed truck drivers in Brazil transport the bulk of road freight and due to their exposition to market prices for inputs like diesel,

tyres and vehicle repair they have similar grievances as transport companies, in distinction to the demands of employed workers who ask their employers for higher wages and better conditions of work. Thus, despite the fact that most self-employed workers are disguised wage workers, their immediate interests lead them to mobilise jointly with transport companies, which is a challenge for the formation of working class interests.

Environmental and Social Challenges of Managing a Satellite City at the End of the Intensive Suburbanization Phase. a Case Study of Luboń Near Poznań (2020-22)

Environmental and social challenges of managing a satellite city at the end of the intensive suburbanization phase. A case study of Luboń near Poznań (2020-22)

The presentation examines a municipal government decision-making process involved in elaborating strategies for their community's sustainable development. The presentation is based on the case study of the local government of a thirty-thousand satellite city in a metropolitan Center of Poznan, Poland. in the northern part of Central Europe.

The century-long history of industrialization and seventy years of urbanization is thought-provoking and provides a basis for both a long-run perspective and analyses that strongly curate contemporary conditions. Declined agricultural industrial base combined with the intense inflow of new residents, challenged the local government to elaborate new, postindustrial development strategies. Revitalized thinking clashes with the trends in local public opinion and expectations focused on meeting needs.

The presentation identifies three sets of factors impacting the local officials' decision-making in devising development strategies for their municipality: (1) past dependencies of agricultural industrialization of this municipality since 19c. (2) needs and expectations by distinct groups of the contemporary local constituents; (3) the tendency to shorten and reduce the perspective of development goals to the sphere of quality of life. Authors indicate the tendency to respond "populistly" to public pressure for simple measures related to meeting quality of life needs in opposition to development-oriented strategies. Hence, in the development model typical of the Polish experience, individual leadership plays a special role.

The presentation is based on a research project which took płace between 2020-22 and included quantitative research (N=237 and N=187) and qualitative research (group interviews, expert interviews, in-depth interviews and research walks) on samples of city residents.

NOWOTNY, Slawomir* (Chancellery of the Prime Minister, Poland)

Old War Threat and New Generations

The "End of History" was not just another proclamation of the renowned thinker (Fukuyama), but also a general mood having real social consequences in the domain of defense and security. With the end of the Cold War European societies felt relieved of concern for safety of their countries which ought to be ensured by professional armed forces. Military service became merely another kind of job for those interested. Even the annexation of Ukrainian Crimea and parts of Donbas by Russia in 2014 was not a wake-up call for Western societies. It was only on February 24, 2022 for the red lamp to come on. Especially in Central and Eastern European countries, in the vicinity of the Russian Federation hopes for peaceful future began quickly to fade away. Hence different measures have been undertaken to counter these threats: developing total defense systems, common defense training, return to conscription etc.

That is the side of "demand" (for safety). On the "supply" side we see new conditions defined mainly by contemporary needs and habits of prosperous Western societies. Liberal individualistic attitudes of new generations seeking individual "happiness" and "comfort", the weakening of the ethics of responsibility among consecutive generations X, Y, Z – all this is incompatible with traditional community ethos or republican sense of responsibility for common good, once constituting social fundamentals for a country's resilience and safety. Concern for the protection of the natural environment or the rights of minorities, however just and laudable, hardly improve abilities to resist potential military aggression.

The crucial issue for the states in the region is how to match their defense structures and types of service with today mental inclinations of the young generation. The presentation will indicate some examples of how sociological research can help to solve this issue in today Poland.

Social Vulnerability and the Reasons of Victims' Death in the 2011 Tohoku Earthquake and Tsunami: Based on the Researches on Victims and Local History in Otsuchi Town, Iwate Prefecture

Over 20,000 people died in the 2011 Tohoku earthquake and tsunami (hereafter referred to as "3.11 tsunami") including disaster disaster-related deaths. It's very rare for so many people to die from a natural disaster in a developed country, which has taken a certain degree of measures against natural disasters initiated by the government. Therefore, it is extremely important to assess why victims of this natural disaster died and how we make use of those deaths for disaster preparedness in the future.

This report aims to address three questions about 3.11 tsunami: 1) how victims behaved and died when tsunami struck, 2) what social vulnerability leading up to the disaster (e.g. development and the practice of helping vulnerable people in the area and so on) drove the victims to their deaths, and 3) what kind of disaster prevention measures have been created in the affected areas based on the lessons learned from the deaths of the victims. In this report, I adopt a case study about Otsuchi town in Iwate prefecture. This area was particularly heavily damaged by 3.11 tsunami.

This report emphasizes the importance to discusses the process before and after the disaster as well. Previous studies on victims in 3.11 tsunami often discuss only their behavior at the time of tsunami attack and their living conditions at the time of disaster as reasons for such behavior. However, this does not explain how social vulnerability had evolved in the affected areas, nor does it adequately analyze why victims died. Without an accurate analysis of why the victims died back to before the disaster, disaster prevention measures in the future could lead in the wrong direction which people suffer huge damage again. Therefore, this report emphasizes the process before and after the disaster as well.

NOZAWA, Atsushi* (Tokyo Keizai University, Japan)

Environmental Justice Versus Human Rights: Via a Lesson from Minamata Disease

Environmental justice is one of a key concept both for the birth of Environmental Sociology (ES) in Japan and for the future development of ES on a global scale. This presentation will discuss Japanese contribution to a new direction for mainstream ES via a lesson from Minamata Disease (MD): the long-standing disputed pollution conflict since mid 1950s.

The rise of anti-pollution movements and expressing solidarity with MD victims can be seen as a starting point of ES in Japan, and its implication is taking exception to disproportionate burden of the harmful environmental effects to local people. This is the why ES is Japan is called "victimology", which is based on the idea of environmental justice. This presentation will focus on the negative or byproductive influence of victimology.

The point is that raising an objection by a disability rights movement group to the anti-pollution movement. They criticized as follows: Talking about MD as a massive tragedy with particular emphasis on the birth of congenital victims is directly connected with denial of being born and leading a life in a society with disability. Protecting environment and showing solidarity with victims sometimes is achieved at the expense of people with a certain type of disability. Their criticism can be another starting point of ES in Japan and its own contribution.

The tense relationship between victims and people with disability, in other words, environmental justice and human rights is not only the problem of the past but also serious issue in the future. Certainly, there is only one planet, but there are many values in a global and diversified world. How do we handle values in tension? (Re) thinking from another starting point of ES in Japan will become a guiding principle for today's and future conflicts related to environment and ES.

MWANGI, Phyllis (Kenyatta University, Kenya)

Youth Languaging: A Peek into Their Attitude Towards Sex and Sexuality

Language shapes the way we think about life and influences our actions. By extension, language influences conceptualization and expression of sexuality. This paper seeks to explore how youth languaging influences their conceptualization of sexuality and by extension their attitudes and behavior surrounding sex and sexuality. By using casual conversations, focus group discussions around the topics of sexual relationships, sexual desire, contraception, pregnancy and abortion, risky sexual behavior, STIs and HIV and abstinence, the study set out to identify and analyze the language used by youth to discuss these issues which are related to sexuality; to establish the

youth's understanding of the meaning of selected words and expressions such as 'niko kutu" (I am rusty) and to assess the influence of the youth languaging on their sexual attitudes and behavior.

It was found that the youth use a mix of overt and covert language when discussing matters sexuality. The language is littered with figurative and discursive language that impact both their conceptualization of sexuality and their attitudes and behaviour. The sexual act, for example, described as "kupiga mechi" (playing a match) is reduced to a mere game played for pleasure and can be won or lost with no serious implication. Thus, engaging in casual sex for pleasure becomes a norm among the youth. The study recommends that the youth need more sexuality health literacy and incorporating their languaging into such programmes would be a good entry point into their socio-cultural contexts for discussion of important sex and sexuality matters.

Does Bride Wealth Give a Man Power over a Woman? Conflict of Culture and Women's Rights in Nigeria

Husband control and mistreatment of women in a marriage are frequently justified by a narrative centered on bride wealth. There are records of women resisting the custom of bride wealth, as well as legislation to regulate it, but how it defines gender relations and reinforces violations of women's rights has not been thoroughly investigated. The bride price is a set amount of money that constitutes a part of the bride wealth. Bride wealth refers to material goods and services given by the groom's family to the bride's family as part of the marriage ritual in many patrilineal societies.

Traditionally, in Nigeria, as in many other countries, bride wealth denotes marriage, while bride price return denotes the end of a marriage. This study investigates the cultural meaning of bride wealth, as well as men's and women's interpretations of the practice. Although this research was carried out in Nigeria, the findings are applicable to other societies where bride wealth is practiced. In-depth interviews are conducted with four key informants, and 25 men and 19 women in a union. Their responses are thematically analyzed.

The findings suggest that bride wealth legitimizes marriage. Every material in the bride's wealth represents something important to the marriage, such as fruitfulness and peace. However, there were differing views on whether bride wealth gives a man a right over a woman and what those rights are. According to some participants, bride wealth integrates the woman into the man's family and gives her equal rights with the man. Others believe it grants a man authority over a woman while prohibiting maltreatment. Others saw bride wealth as proof of male superiority and justification for husband dominance. The findings are discussed in relation to women's rights, with recommendations for intervention.

Outcome of Interventions to Improve the Quality of Intrapartum Care in Nigeria's Referral Hospitals: A Quasi-Experimental Research Design

Background
Available evidence indicates that Nigeria's high maternal mortality rate is attributable primarily to events that occur during the intrapartum period.
Objective
To determine the effectiveness of the multifaceted intervention in improving the quality of intrapartum care as reported in exit interviews conducted in intervention as compared to the control hospitals.
Methods
The data were collected from results of exit interviews conducted with 390 women who received intrapartum care in two intervention hospitals and 362 women who received care in two control hospitals. The interventions were: 1) development of a strategic plan; 2) re-training of maternal health providers; 3) provision of protocols and reminders on optimal intrapartum care; 4) clinical reviews of delivery care, and 5) health information to pregnant women. Quality of The quality of intrapartum care was assessed and compared using twelve quality indicators selected from the WHO recommendations for positive childbirth experience. Poisson and logistic regression were conducted.
Findings
The interventions showed a modest 6% increase in overall quality of care, and demonstrated beneficial effects in women's perceptions about care quality.; lower rates of caesarean as compared to vaginal delivery ; prompt repair of episiotomies; and better pain management in labour..

Conclusion
As the interventions improved five out of 10 signal functions of intrapartum care, it is evident that multi-faceted interventions that address various components of intrapartum care are moderately effective in improving the quality of intrapartum care in Nigeria's referral hospitals. Our approach in identifying interventions based on formative research is important, but a process of integrating the implementation activities into normal maternal health delivery system will enhance the effectiveness of this approach.

NUBLA, Frances Michelle* (Ateneo de Naga University, Philippines)

Barriers to Women's Economic Participation: The Case of a Small Island Community in the Philippines

Although the Philippines has performed well regarding overall gender equity, improving women's economic engagement has remained a challenge. With the use of exploratory research, this study examined how sociopolitical and cultural factors in the context of a small island community impede women's economic participation. The in-depth interviews showed that the primary duties of women as housewives and mothers, limited economic opportunities and government support, and the remoteness of their community from the political and economic center are the factors that inhibit them from engaging in and accessing work. Meanwhile, key informant interviews with members of the local government pointed to the island's remoteness and absence of an active fisher's organization as the reason for their inability to provide support to the community. The study reinforced the importance of providing structural support (e.g., policies, intervention programs) and advocating for progressive gender norms and beliefs to improve women's engagement in and access to livelihood. The result also called attention to the need to include remoteness as part of the intersectional analysis of gender.

NUGGEHALLI, Roshni* (Youth for Unity and Voluntary Action (YUVA), India)

Youth Protagonism in Urban India

Amid shifting political and social contracts in India, young people are viewed both as a labour force that can propel economic growth and as a potentially problematic demographic to be restrained from questioning and dissent. Within this context, this essay advances a theory of urban youth protagonism in India, focusing on young people marginalised by caste, religion, and material deprivation.

Specifically, the essay conceptualises citizenship in urban India and outlines how formal education affects the construction of this citizenship, before exploring the concepts of collective agency and protagonism to unpack youth self-determination and their influence on decisions-making processes. Based on two examples of collective agency from youth groups in India supported by a local non-profit, Youth for Unity and Voluntary Action (YUVA), it showcases how young people construct their own understandings and practices of citizenship. It highlights that despite a narrow focus on civic behaviour in formal citizenship education, it is possible to enable action and agency for urban youth.

Next, the essay offers pathways for supporting youth protagonism in order to create real shifts in the status quo toward substantive youth citizenship, in the Indian context and more broadly. It argues that attention towards strengthening collectives, working towards community level transformations and creating an enabling environment are the elements that support young people to construct expansive forms of citizenship. These elements are interdependent and yet distinct, and if encouraged can strengthen critical engagements with elite, unjust ideologies and policies.

Finally the essay outlines that youth work facilitating protagonism and citizenship for marginalised groups has implications for Southern contexts beyond India. It suggests discussion points on how diverse groups of young people can exercise their protagonism and construct citizenship in different contexts.

NUGROHO, Stefani* (Atma Jaya Catholic University of Indonesia, Indonesia)

Repressions of Academic Freedom in Post-Authoritarian Indonesia

Since 1998, Indonesia is no longer an authoritarian country, and repressive rules against higher education have been canceled. As a matter of fact, academic freedom is now guaranteed in higher education law. However, a closer examination of the practices in higher education shows that repressive acts against academics continue to happen, particularly when they discuss certain topics such as communism, the oppression against Papua, LGBTQ, and non-mainstream interpretations of Islam. The repressive acts are in the form of physical violence, as well as virtual harassment. Interestingly, the main perpetrators are no longer state institutions but illiberal civil society organizations.

Talking Back through Tiktok: Countering the Stereotypes of the Chinese Indonesian in Comedy Sketches

The paper examines how young Chinese Indonesians counter longstanding stereotypes about the Chinese Indonesians in their comedic videos on TikTok, Instagram, and YouTube. The Indonesian majority discriminates against the Chinese Indonesians and considers them as the Other, a group that does not really belong to the nation. During politically turbulent times, like in 1965, 1974, and 1998, the Chinese were the target of widespread mob violence. While older generations are weary of displaying markers of the Chinese identity in public, the younger generation embraces their Chinese-Indonesianness through comedy sketches, including by asserting themselves as "Cina," a term that is considered derogatory by the previous generations. Through these short videos and their responses to the viewers' comments, the youth engage with the complexity of their minority identity, discuss head-on "sensitive" or "difficult" topics, display the heterogeneity of Chinese Indonesians, and assert their allegiance to the Indonesian nation. In short, through short videos relayed in the virtual space, the young Chinese Indonesians "talk back" to the majority.

Dilemmas and Disparities Among Working Mothers in Japan: The Meaning of Paid Work and Mothering Under Neo-Liberal Motherhood Discourse

Previous studies have revealed various challenges that women in developed countries face in trying to combine employment with housework and parenting (Hochschild 1989). While the Japanese government is eager to increase women's participation in the labor force, critics claim that these seemingly women-friendly policies reflect ideologies of "neoliberal motherhood" (Miura 2015), which pushes women to take responsibilities both as workers and as caregivers at home. Although such policies and discourse are likely to exacerbate inequality among women, few studies have revealed the lived experiences of simultaneously being a mother and a worker from a social class perspective.

This study draws on in-depth interviews with 55 employed women with children under 6 years of age in Tokyo to understand how they interpret and negotiate the contradictions of employment and mothering in their everyday lives. Specifically, it focuses on the differences between non-college educated women and college-educated women, highlighting divergent meanings attached to paid work and mothering as well as strategies that they employ to solve the dilemma.

Our analysis reveals that non-college-educated and college-educated women interpret paid work and childrearing differently. High school graduates tended to see their husbands as the main earner and themselves as financially supporting their family, while those with vocational school education or college degrees saw both parties as the main earners. Regarding child-rearing styles, high school graduates tended to "follow a child's lead," while college-educated women supported the idea of "parents leading a child" and managed to engage in intensive mothering. Both in paid work and childrearing, college-educated women gained support from their husbands and workplace, while high school graduates faced more obstacles and had fewer resources to interweave work and motherhood. These findings suggest deepening disparities among working mothers and their effects on unequal educational opportunities for children from different social backgrounds.

Biographical Research Near the Front Line: Strategies, Challenges and Positionality

The paper addresses the methodological approach and outcomes of the study of displaced young people and their families in East Ukraine (before the outbreak of military actions in the country in February 2022) as part of the AHRC - funded project Cultural Artefacts and Belonging conducted by the Department of Education, University of Oxford in 2021-22 in collaboration with V. N. Karazin Kharkiv National University Ukraine. Qualitative biographical interviews with internally displaced individuals (IDPs) in Ukraine were part of the data collected through a variety of methods: online scoping studies, biographical interviews and qualitative interventions and were aimed at better understanding mechanisms of self-identification of forced migrants and how dramatic changes in individuals' lives related to forced migration and on-going conflict were reflected in the process of their self-identification. Due to the Covid-19 restrictions and proximity of the place of research to the on-going military conflict in East Ukraine all data was collected using online methods

(asynchronous and synchronous). Recruitment of the participants was carefully guided by the local gatekeepers: schools and researchers in East Ukraine. The paper discusses research strategies of the biographical empirical work: proximity to the military action areas; sensitivity of the topic of IDP (for the informants and researchers) and extreme conditions under which the research took place.

The Posted Workers Directive – Social Protection of Workers Under Transnational European Solidarity?

The movement of posted workers – employees who are sent by their employers to carry out services in a different EU Member State on a temporary basis– is regulated by the recently revised Posted Workers Directive (2018), which must be transposed by June 2020 in every Member State. Under the solidaristic idea of "equal pay for equal work at the same workplace", the Directive intended to better the working condition of these workers. Given the globalized European labour market and being posted workers a high flexible form of labour, solidarity cannot be seen as national issue anymore. Transnational solidarity is needed to tackle the problems posted workers confront, to implement the regulation and to defend their rights. Still, trade unions have troubles reaching these highly mobile workers. Lack of knowledge of the host country language, short periods of time in each working place, long working hours and living isolated from the host country society do not make things easier.

This article asks how social protection of posted workers can be provided if problems for transnational solidarity arise from the Directive itself, which stems from the freedom to provide services and considering that there is no unified social protection system in Europe. At the same time, trade unions at the national level do not have the resources to deal with these workers. Using expert interviews with trade unions and employers' organisations at the EU level and document analysis, and following the ideas of bonding and bridging (Morgan & Pulignano, 2020), we focus on the importance of transanational acts of solidarity conducted by transnational as well as national trade unions. At the same time, we take a look at the lobby actions transnational unions do in order to push for better standards regarding social protection and the coordination of social security systems.

Exploring Voice and Marginalisation: Critical Reflections on Black Young People

Abstract: Despite ongoing scholarly debates about young people on the margins, childhood transitions and marginalisation in general terms; there is more to explore about the agency and reflexivity of Black young people on issues of racial discrimination, race-impacted marginalisation and social justice. The literature on young people, from political and sociological perspectives, has majorly focused on youth participation and such issues as apathy and disengagement from civic life. However, the strategic place and space young people occupy as agents of social justice is often inadvertently neglected. The study is concerned with understanding Black young people's views, thoughts and ideas on inequality and discrimination, and exploring what shapes their views.

Young people are put at risk of marginalisation when there is a disparity in opportunities and attainment of individual potentials (Mowat, 2015). The literature provides insight into the higher likelihood of Black young people experiencing discrimination in the educational system, disproportionate care in the health system, racial identity profiling and economic disadvantage in comparison with their white British counterparts. This study is framed in terms of human rights and explores the role of critical consciousness in the construction of identities and the use of voice to counter marginalisation. Finally, it extends discussions on critical agency and eliciting the voice of Black young people against marginalisation.

Stakeholders Perspective on Correctional Officers' Attitude As Predictors to Recidivism in Maximum Security Custodial Center in Southeast, Nigeria: A Qualitative Analysis

This study aimed to explore stakeholders' perspectives on correctional officers' attitudes as predictors of recidivism in a Maximum Security Custodial Center in Southeast Nigeria. The study argues that the tendencies of inmates in Nigeria to relapse into crime or not after release from incarceration may be influenced by the attitude of correctional officers. A phenomenological research design was used in this study. Thirteen criminal justice stakeholders were interviewed, including inmates/ex-inmates from Enugu, Nigeria. The convenience sampling technique was used to select the participants. The interviews were thematically analyzed.The findings showed that widespread corruption among correctional officers could be an enabler of recidivism. In addition, the study found that the predominant use of punitive rather than rehabilitative approaches among officers may influence recidivism. The study also revealed that the negative attitudes of correctional officers toward inmates, which affect recidivism, were made worse by the poor working conditions in Nigeria's correctional institutions.The correctional institutions in Nigeria have not shown sincere commitment and responsive actions towards correctional management. Thus, this study recommends that state and non-state actors in Nigeria's criminal justice system must prioritize transparency, accountability, and monitoring in the custodial centers and improve officers working conditions.

JUMA, Quin (United States International University - Africa, Kenya)

The 'Transgressive' Nature of Trade Union Discourse in the Kenyan Academy: The Case of the Kenyatta University Universities Academic and Staff Union (UASU)

In most countries today, the workforce of both large and small scale enterprises, including educational institutions, enjoy the right to form trade unions. Such unions enable workers to come together to build what has been termed a 'collective voice' strong enough to communicate by talk and by action, to management the realities of aspects of their work that are dissatisfying; those that are frustrating them, among others. In the Kenyan public university today, there is the Universities Academic and Staff Union (UASU) whose existence and functions is in jeopardy. The strength of the collectiveness of the UASU voice is waning, and is relatively inaudible. Notwithstanding there is in existence, a constantly growing body of unionism talk/narratives: spoken; written; formal/non-formal on UASU entailing not only political undertones, but is social and economic in nature. This talk from among UASU membership, between each individual university UASU and the respective institutional management, and between the UASU national office and the responsible All Public Universities' Vice Chancellors' Management Committee is marked: clearly positioned words and statements, carefully selected vocabulary, particular syntax, among other discourse features on strongly held assumptions and meanings the UASU. The objectives of this paper are two-fold. The first is to identify how idea of the UASU as a trade union is specifically articulated, confirmed and, or disputed in the available texts noted above.. The second objective is to determine how some such ideas verify or disconfirm held understood mandates of UASU as a collective voice in trade unionism in Kenya today. An eclectic approach will be adopted to draw relevant tenets from Grice's (1975) concepts of implicature as developed by Grice in his Conversational Implicature (1975) and markedness as developed and presented by Trubetskoy, (1939; 1969), and by Haspelmeth (2006).

O'BRIEN, John Eustice* (Portland State University (ret.), Monaco)

Durkheim's Rediscovered Lessons from 1892: Institutional Sociology from Study of Crime?

2022 marked the publication of a recently discovered *Notebook* from an early Seminar (*Lécons de Sociologie Criminelle 1892-93*), by Emile Durkheim. Handwritten by his nephew, Marcel Mauss, it constitutes a nearly verbatim record of Durkheim's lecturing.

Based on my detailed exegesis (VEng) of the 150 printed pages of these *Lessons*, for ISA2023, I propose a historical reconsideration of Durkheim's Project, with a review of the major points of criticism.

He defended his thesis for a Doctorate later in the fall, 1893. These *Lessons* marked a final opportunity for Durkheim to present his program, sharpen his argument, expose his critical stance, and demonstrate his original method of assembling and using data.

Defining Sociology as the 'science of social facts', these *Lessons* document the foundations of Durkheim's work: he was a radical social-institutionalist, who refused individualist reductionism, controversially announcing:

"*A society is in a real manner over and above the individual; it is the all the individuals are the parts. Society is a superhuman power because it is the resultant of a multitude of human forces.*"

Use of crime as a normative case for exploration of the structure of his system-institutional program, certifies him as sociological theorist and not as criminologist.

As concerns practice, the *Lessons* constitute a practical workshop on how to do sociological work, showing development of his original view of society as comprehensive system, using evidence drawn from a secondary data pool of crime and conviction data, that were assembled for the purpose.

In addition to providing fascinating examples of crime and conviction, he introduced key terms marking his career: Exteriority and Constraint; Social versus Institutional Action; Social Fact, Anomie, Altruism, Integration, Collective Conscience, Collective Sentiments. He used these terms to identify categories of normative social action and conditions that result less from individual will than from institutional processes.

RC19-283.3

O'BRIEN, John Eustice* (Portland State University (ret.), Monaco)

Thomas Piketty's Package of Structural Reform: Intellectual Fame without Practical Consequences?

Thomas Piketty recently generated a pair of related works: *Time for Socialism: Dispatches from a World on Fire* (VFr 2020, Veng 2021); and *Un Brief History of L'Éqalité* (VFr 2021). The first is a collection of 60 op-ed articles published in Paris, the second a monograph, updating his project and announcing his new insistence about Democratic Socialism.

In the ISA session, in addition to briefly summarizing his project, I will attempt to size up Piketty's view, by contrasting it with other images of a '21st century welfare state', by Joseph Stiglitz and Gosta Esping-Andersen.

As developed in "*Dispatches*", after knowing some good times, the European model *État-Social* (Welfare State) is moribund. His audacious alternative favoring global socialism is developed formally and called for in his "*Brief History*". Together, the two books mark a radical turning point in Piketty's mode of discourses.

Countering accusations from the Left that he is insufficiently driven by revolutionary vigor, and from the Right for hiding Marx in his pocket, he has decided to take his critics head on.

While he places equality on parallel footing with inequality, the sense of these terms diverges. Inequality is forcefully economic: more for the wealthy, less for the rest. Equality concerns access to the means of a good life, politically, socially, and economically. He's concerned with both.

His radical institutional economics is at odds with the heterodox view. He builds his case by applying a historical-materialist method drawn from Marx, without being an Orthodox Marxist.

His plea for socialist reform of the Welfare Model of State, fits with his structuralist position, that normative categories of social action are constituted institutionally, and thus only structural change can improve them.

He closes his "*Brief History*" with a 16-point proposal for a "democratic and federated, decentralized and participative, ecologic and multi-ethnic socialism".

O'MALLEY, Stephen* (Gender and Disaster Australia (GADAus), Australia)

Resilience in a Riskier World – Adapting and Transforming for the Future

The notion of resilience in the context of Emergency Management conjures notions of failure...the need to do better next time. Why would one strive to be more resilient if not due to an incident in which there was a sense that they failed or that they were maybe at fault? We are all responsible for our own actions and how those actions affect the safety of others. In order to formulate a plan that may lead to disaster survival, one must assess their level of resilience and plan around ones lived experience or what one has learned from the lived experience of others. We must listen to the voices of survivors to inform us of how we can stay safe before, during and after disasters. What about the voices of the survivors of the hidden disasters that research tells us is a vial feature in the aftermath of the disasters we have become all too familiar with, including pandemics? The lived experience of victims and survivors of domestic and family violence is the key to women and children living free from violence before, during and after disasters. Violence against women is clearly a gendered issue which impacts on everyone. It is universally recognised that to prevent all forms of violence against women before it occurs, we need to address the determinants of men's violence against women; namely gender inequality and adherence to rigidly defined gender roles. It will require organisational leadership and significant culture change for the Emergency Service Organisations to be an influential contributor to the prevention of gendered violence. We must improve our ability to collaborate and coordinate our approach, so that we can become a meaningful contributor to the violence reduction strategies outlined in the National Plan to Prevent Violence Against Women and Children 2022 - 2032.

The Multiplication of Borders - an Example from the Construction Sector

The construction sector is one of the sectors that demand migrant labour. Often to precarious working conditions that differ from native workers with permanent contracts. The migrant workers are hired directly, through agencies or become mobile units within multinational corporations. This paper investigate the categorization of migrant workers, in the European context of the construction sector, due to nationality, employment conditions and profession. These factors generate a diversity of conditions, rights and protection or the lack of it for the worker. Through critical theoretical perspectives on borders the paper describe the relation to labour migration in the construction sector as well as how this can be understood as new forms of territories and borders that emerge. Finally, the paper offer reflections on the contemporary meanings of these new frontiers as central for capitalism as well as to processes such as construction that is so firmly connected to a physical place.

Barriers to Accessing the Criminal Justice Services in Post-Apartheid South Africa: Reflections on the Policing System

South Africa is reported as among world's most unequal societies, where capitalist culture prevails. It is also a democratic state with one of the most comprehensive and progressive constitutions, where the state assumes to provide citizens with equal access to the criminal justice system. Given the contradictions on ground, the criminal justice systems is practically and observably not equally accessible by all citizens of diverse social and economic categories. Against this backdrop, this paper interrogates various barriers encountered by the citizenry in accessing the services provided by the policing system and structures in the country. Relying on secondary sources, and being foregrounded by some theoretical propositions, the paper argues that access to various services in the police system are commodified, costly and further complicated by other police personnel and policing exigencies. Also, important observation from the available sources further suggests that the quality of access to the policing services is a function of citizens' social and economic variables, including race and residence status in the country. Based on the above, this paper concludes that the 'free and equal access' to criminal justice presumption remains a wish rather than reality in the country. Ways to enhance citizens' equal access to the police services are recommended in this paper.

Blowing the Whistle in National Security and Defence Organizations: Navigating the Tensions between Transparency and Secrecy

This study investigates the organizational and political problems generated by whistleblowing in a national security context. After Snowden's and Manning's major leaks of classified materials, public opinion in several countries have tilted towards considering whistleblowing within the national security realm in a more favourable light. By putting themselves in harm's way, and fighting for a higher cause, whistle-blowers are perceived as contributing to nourishing ideals that keep democracies vibrant. In exploring these themes, scholars have portrayed whistle-blowers in the national security realm as 'tragic heroes', because the hardships and destinies they must endure resemble those of the characters in Ancient Greek tragedies. In this study, however, we depart from this route and instead focus on the less explored tragic organizational and political consequences that 'successful' whistle-blowing might have for the organizations that come under scrutiny in conjunction with whistle-blowers' disclosures. By developing and utilizing an 'ethics of office-inspired' typology through which whistleblowing can be categorized, the study argues for whistle blowing as a type of professional activity which rests on distinct mixtures and combinations of whistle-blowers' views of responsibility, professionalism and the public interest. Empirically, we draw on two types of data: (a) claims of wrong-doing in the Danish Defence submitted through a whistle blower line, and (b) public accounts of whistleblowing cases in the Danish Defence. On this ground, we theorize the motivations and circumstances that have defined whistleblowing in the defence and security sector, and we discuss 'the problem of ambiguity' this raises in regards to the ethics of whistleblowing. Finally, we highlight how our findings raise a number of fundamental questions concerning transparency and secrecy in contemporary national security contexts.

Some Integration Issues in NATO's Collaborative Workforce: A Study of Multi-National Military Headquarters

In the dawning of a new era of great power rivalry and the ongoing conflict between Ukraine and Russia, NATO has regained status as a military bulwark of the West. The Alliance has been strengthened through increased civil and military budgets and new alliance members. For years, NATO's planning was dominated by questions of how to win military engagements against small or, at most, medium-sized adversaries. As the alliance's most important strategies now confirm, this is no longer the case. From this follows a need for the alliance members to coordinate and synchronize strategic objectives, mind-sets and work procedures. However, for any large complex organization the problem of ensuring that its constituent parts act in accordance with overall policy is a central and continuing concern. The specialization of subunits, which allows the organization to undertake complicated tasks, requires an equally developed system of integration to bind them into an operational whole.

This paper investigates multi-national military headquarters as situated sites for integration and learning. Empirically, the study is based on interviews and observations of the multinational military headquarter in Bagdad during NATO's Mission Iraq (NMI). The analysis shows how a set of diversely skilled people are working together on a complex task over a limited time period, presenting a range of organizational challenges such as conflicting mission purposes and goals; lack of expertise, innovation and task effectiveness. Nevertheless, the study depicts that multi-national headquarters provide several integration and learning opportunities for the system's members, such as professional and inter-organizational growth.

OBUAKU-IGWE, Chinwe* (University of the Western Cape, South Africa)

Exploring the Effectiveness of Mental Health First Aid Program for Young People in South Africa

Approximately 30.3% South Africans would have experienced a form of mental illness in their lifetime. With the outbreak of COVID-19, Young people in South Africa are faced with many challenges, among which is the complex issue of poverty, unemployment, increasing psycho social stressors and poor access to mental healthcare services. Having a mental health first aid program, a standardized emotional/psychological wellbeing educational program as a first response to support and refer them to available intervention or professional services is crucial to de-stigmatize and increase access to mental healthcare. This study explored the effectiveness of a mental health first aid program on improving young people's attitudes, knowledge and general mental health- related behavior, using qualitative Focused Group discussions,

analysis of records and intensive observation between October 2021 to June 2022. An assessment of the pilot project which was conducted among social science students between age 18 to 34 years, revealed a reduction in stigma, increased openness about mental health challenges and increase in utilization of professional services among participants (n-548) of the MHFA program, following the 13-week program. Based on analysis of course content and focused group discussions, I conclude that four factors contributed to the overwhelming satisfaction experienced by participants: (1) the utilization of peer tutors in administering the training (2) the inclusion of mental models and centering participants' agency in creating and administering training content (3) the availability of peer mentors and a mobile application which makes referral (social prescribing) and access to professional intervention easy and, (4) the inclusion of friends and family as accountability partners.

Multilayered Diversity in Global Family and Gender Studies: A New Vista from Asian Insider Perspectives

With the aim of creating common foundations for international collaborative research within and on Asia, the first project, conducted under the guidance of an international editorial committee of experts from nine Asian societies (Japan, Korea, China, Taiwan, Vietnam, the Philippines, Indonesia, Thailand and India), comprises the collection, translation, and sharing of important researches from Asian 'insider' perspectives, published in the various languages of the region. The outcome is the four-volume set, *Asian Families and Intimacies* (Sage, 2021), covering themes of 'Family Ideology', 'Patriarchy,' 'Sexuality', 'Marriage', 'Care Regimes', and 'Gender'.

Read together, the essays suggest that the world is not a simple clash of civilizations. The civilizational boundaries between the regions are also crossed by other boundary lines, based on the fundamental differences in kinship systems that divide 'patrilineal Asia' from 'bilateral Asia'. The centres of patrilineal Asia -- China, India and the Middle East -- are also the centres of great civilizations. Many chapters shed light on the processes of the Sinicization/ Confucianization, Sanskritization and Islamization of originally bilateral societies. Confucianization, for instance, when imported and reshaped in Korea and Vietnam, transformed local norms, institutions and practices regarding marriage, inheritance, and kinship group membership. Confucianism is not simply a tradition.

Similarly, the expansion of the European civilization, known as 'modernization', was accompanied by the imposition of a modern form of patriarchy, based on a male-breadwinner/female-housewife gendered division of labour, as well as pseudo-patrilineality. The 'invention' of the surname by King Rama VI of Thailand is a particularly interesting case in point whereby, despite Thailand's dominant system of bilateral kinship and uxorilocal residence, the inheritance of the surname through the male line was established, following the European, rather than the Chinese, system.

These different layers influence each other at various times and to various degrees, constructing a dynamic diversity in Asia.

Analyzing the Migration Experiences of Tamil Nurses Returned from Malaysia

We conducted a survey of nurses from Tamil Nadu who had experienced labor migration to Malaysia to examine how labor migration affected them in their daily lives and workplaces before and after their migration. Data were obtained using a questionnaire survey of 127 nurses returned from Malaysia between November 2018 and February 2019 in the states of Tamil Nadu and Karnataka. About three-quarters of migration to Malaysia was short term, lasting less than three years, and very few nurses had been there for more than five years.

The study investigates what changes returned migrants perceive before and after their migration experience. The changes were identified in seven categories: economic and financial conditions, social status in India, nursing skills and knowledge, communication skills, language (English) proficiency, patient care, and self-confidence. The degree of change was measured on five levels: very upward, upward, no change, downward, and very downward. More than 60% of returned nurses felt positive changes (upward and very upward) in all seven categories. While the nurses, on average, felt positive changes as a result of their migration experience, 30-40 % of nurses answered that there was no change, and a small number of nurses said that the situation had worsened.

These findings suggest that in the case of temporary short-term labor migration, such as migration to Malaysia, labor migration may not always have the positive outcomes that nurses expect, and similar findings could be found in the case of the short-term labor migration of nurses to the Gulf countries. Although migration to work abroad was once seen as the key to success for nurses and their families, the destination and length of migration have different effects on nurses' lives after they return home.

COVID-19 Pandemic Situation Experienced By Polish Youths in Light of the Participatory Research Approaches

The presentation will include two empirical research studies from Poland, involving youths. The studies were carried out during the pandemic of COVID-19 and consecutive lockdowns, media unrest and educational challenges of digital transformation. The periods of lockdowns and online education in Poland were amongst those that lasted the longest in the world. They had an immediate effect on the personal, private and educational sphere of young people's development, aspirations, views and life opportunities. In our presentation, we will showcase the discourses formed by youths about their situation, their outlook on life, agency and power distribution. The research paradigm is of qualitative, interpretative nature, cutting across sociology, pedagogy and anthropology, through the lens of constructivism. Discourse analysis is used as the method of analysis of obtained empirical data. The research was aimed to be as participatory as possible for the concerned research participants, and the permission to carry out the research with youths aged 14-17 was granted by the ethical committee at the Maria Grzegorzewska University. The experiences and narrations of youths form interesting historical records of our times and serve as exploratory insight into the lives of teenagers in Poland during these challenging times, allowing us to see what it was like to be a recipient of online education and a subject of adult decisions on safety and personal freedom.

ODZIEMCZYK STAWARZ, Idalina* (Jagiellonian University, Poland)

Social Representations of Vaccination in the Context of Family Experiences – Insights for Behavioural Interventions

People in the high-risk groups taking voluntary vaccinations remain at a low percentage, which points to the need for more profound reflections on the socio-cultural background of vaccination-related experiences. Existing studies focus mainly on anti-vaccine attitudes among parents or medical personnel approach. Analyses including biographical experiences, intergenerational impact, or concerning the family as the lay referral system are underrepresented.

The paper presents social representations of vaccination - the system of values, ideas, metaphors, beliefs, and practices linked to this phenomenon - which exist in family networks of older persons who make different decisions regarding voluntary influenza vaccination. An essential element is to indicate social representations' common core, peripheral elements, and internal contradictions. An additional objective is to explore the relationship between decision towards vaccination and the biographical health experiences or family patterns influencing older participants' health practices.

The study involves a mixed method approach: survey questionnaire and biographical interviews with three or two generations within one family. To recreate the social representations profiles for the two types of families – older people who have received influenza vaccination in the last three years and with those who did not – we use 1) free association method on the open-ended answer regarding associations with the words: "vaccinations", "influenza" and "health"; 2) content analysis on biographical interview transcripts; 3) scores on the scales for measuring attitudes towards vaccination and 4) survey data regarding vaccination experiences.

It seems particularly valuable that the use of a combination of the elements mentioned above provides insights for behavioral interventions. In order to maximize the potential efficacy of interventions, it is necessary to understand behavior and behavior change. This research goes further and tries to include an understanding of what can underlie health-related behaviors – the social perception of the phenomena to which those behaviors are linked.

RC25-379.4

ODZIEMCZYK STAWARZ, Idalina* (Jagiellonian University, Poland)

The Language of Health Threats and Preventive Measures - Biographical Narratives of the Older People Vaccinated and Unvaccinated Against Influenza during the COVID-19 Pandemic

Health risk perceptions may play a significant role in accepting and engaging in preventive actions toward those risks. Agreeing on language definitions and using different ways of naming or explaining may change the perception of phenomena. Language is a medium for creating, transforming, and transmitting ways of understanding. It is through language that we can recreate those interpretations.

The paper compares language used to create biographical narratives about health during the life course of older people who make different decisions regarding voluntary influenza vaccination during the COVID-19 pandemic. The main focus is to compare the wording and metaphors used to talk about 1) influenza & COVID-19, and 2) vaccination and other preventive actions against infectious diseases.

The study involves survey questionnaires and biographical interviews with older citizens who have received influenza vaccination in the last three years and those who did not. To recreate the narratives about health-related risks and preventive or mitigating actions, we use 1) the free association method on the open-ended answer regarding associations with the words: "vaccinations", "influenza" and "health"; 2) content analysis on biographical interview transcripts;

To reach more socially active and engaged older people with more peer contacts, the participants were recruited via Senior Activity Centers in Cracow. I assumed they could be "super spreaders" of specific ways of creating language images of infections and vaccination. Thus, their perspective can be used as insights for more inclusive and adequate communication within health programs and interventions and to promote health initiatives at every stage of life.

MITSUKO, Kawazura (Diversity Research Environment Promotion Headquarters, Japan)

The Specialties of Women Consultants Who Stand Against Gender Injustice at the Forefront of Counselling and Support in the Public Sector

Although women's consultants form one of the three institutions of women's protection programme (i.e., women's consultation offices, women's consultants, and women's protection facilities), the specialities and working conditions of women's consultants have not been discussed in depth to date. This is because women's consultants have been neglected as a minority profession in Japan. In this study, we conducted a nationwide survey of public women's consultants (n=1,500) at the forefront of counselling support in the public sector, to clarify the current status and issues faced in their profession.

We indicate the issue of irregular employment of women's consultants, which has not been discussed in previous studies using social support and systems theories. Furthermore, we clarify the specialities and labour status of women's consultants who are involved in public counselling and support. In particular, we examine the position, role, and difficulties faced by women's consultants in each municipality. Notably, women's consultants have also been newly responsible for responding to child abuse and domestic violence since the 4th revision of the Domestic Violence Act (2019). Thus, we present a fair evaluation of standards for women's consultants. We reposition the labour theory, focusing on the specialities in public counselling and the problem of irregular employment among women's consultants, and suggest policy recommendations for the same.

OGAWA, Reiko* (Chiba University, Japan)

Contested Nexus between Migration and Refugee Regimes in Japan

The unprecedented level of population aging has brought a huge pressure to deregulate Japan's migration regime to open-up for labor migration. In sectors such as care work, where the labor shortage is chronicle, migrants are increasingly becoming an integral part of the care workforce. Migrants in the care sector are desired as they are predominantly young women from Southeast Asia, who can be easily controlled and disciplined. Japanese language and culture are used to justify the disciplining, tame the difference, and to create docile subjects. Migrant women who will come and go will not create any threat as they will not become part of the nationhood unless they marry a Japanese. Thus, her reproduction with man from the same ethnicity is not welcomed neglecting her right for family formation and citizenship.

This construction of desirable, yet disposable bodies of migrant women stand in sharp contrast with Muslim men and his families who are wanting to be evacuated from Afghanistan. The Afghans who seek for help were mostly

former students who studied in Japanese universities under the government scholarship. The refugee recognition rate is extremely low and the government almost completely neglected their request and fortified the borders. Neither Muslim families who will never become part of the nationhood, nor Muslim women who may not become labors are welcomed.

These cases inform us the interlocking nature of the policy based on gender, ethnicity, class and religion categorizing young migrant women as desirable insofar if she can work but Muslim men from a poor country undesirable even though he has a Ph.D. The crisis of social reproduction in Japan based on gender discrimination intersects with racialized state which continue to resist in redefining the idea of nationhood to be more inclusive.

OGAWA, Tomu* (Showa Women's University, Japan)

The Social Problematization of Patriotism in Japanese Youth Discourse

This study is an attempt at a meta-analysis of discourses that problematize patriotic tendencies among Japanese youth. In the Japanese society that is the subject of this study, youth patriotism has been repeatedly problematized as an attitude of concern rather than a desirable attitude. However, youth patriotism is not immediately seen as a problem in every country. It is considered to have different aspects depending on the historical and cultural background of each country. If so, how has youth patriotism gained understandability as a problem in Japan? In this study, we focus on discourses that problematize youth patriotism in Japan and clarify how they have acquired understandability as a social problem. The method of analysis will be ethnomethodological research, which aims to identify descriptive ways in which people's speech and discourse in everyday situations are made comprehensible.

The first result of the analysis at present is the interpretation of behavior using ideological concepts. In youth discourse, the use of ideological concepts makes it possible to interpret some behaviors of young people as political behaviors, independent of their consciousness. Second, generational comparisons are made using youth categories. The behavior of young people is seen as an attitude specific to the youth generation, precisely because they are subjected to the youth category. In this way, comparisons can be made with the political ideological tendencies of the author of the youth discourse when he or she was a member of the youth generation. When the author was of the youth generation, patriotism and nationalism were perceived as conceptually linked among the leftist youth of Japan. This conceptual linkage made it possible for the patriotic behavior of the contemporary youth generation to be understood as a social problem.

Experiences Transferred—How Reintegration Program for Women Returnees Expands during the Pandemic:the Case of the Philippines

Migration from the Philippines to Japan had been characterized as feminized and exploitative phenomena since the early 1980s. Amidst of this trend, some migrant and feminist NGOs had been working on the issues of migrant entertainers and their Japanese Filipino Children (JFC) and one of their main activities is reintegration program for returned women, who are also single parent of mixed-race children.

This paper focuses on the reintegration program of an NGO in the Philippines which had been providing the reintegration program for returnee women from Japan for more than two decades and explores how this program has been expanded during the pandemic.

The programs which this paper examines prioritize the psycho-social reintegration as well as livelihood program. For women returnee who had difficult experiences in both at work and in their private life in Japan, reintegration in their own family and community is not easy challenge. "Unsuccessful" return of entertainers, who have been stigmatized in the Philippines due to their occupation in Japan, need the special care and it takes longer time than the other migrant returnees to solve their socio-economic problems aside from their mental recovery. Thus, those programs for former entertainers, have eventually become holistic ones and the programs themselves have become the "third place" for returnee women where they can share the same experiences with other returnees and even, they reconstruct their new identities. During and after the COVID-19 pandemic, this program for former entertainers were expanded in unexpected ways, involving different stakeholders and new clients.

This paper will explore the possibility of "transfer of experiences "of returnees from different sectors and destinations, and will try to figure out the new aspects of re-integration program.

Migration As a Tool to Addressing Poverty: Case Study of Selected Social Investment Programs in Rivers State

Globally, of the 190 million or so migrants in the world today, almost 50% are females; many, possibly the majority having moved from and within developing countries. The integration of a gender perspective into development policies and programs often contributes to their efficacy and sustainability.The research discovered as a norm that migration especially to earn cash transfers etc. can be an important motor for poverty reduction and growth in many states however little is still known about the actual linkages between gender, migration and poverty reduction at the local levels and the policies to make these linkages work for poverty reduction. This paper critically reviews the various projects and status and confirm baseline for measuring the impact of these processes. It went further to highlight causes and effects of social in vestment opportunities provided for women and girls.It highlights the strong will of women to search for improved livelihoods through migration efforts by land and sea. Also,in the event for working with women, it is key that in empowering women, primarily means that leaving to areas with an assured source of support in form of a variety of support services is a key driver. In concluding, the paper strongly recommends that home grown opportunities and understanding of the priority needs of these target women and girls will in no small way enhance their livelihoods and improve their quality of life so they can more actively participate in their own development process.

OGOE, Sally* (University of Manitoba, Canada)

Measuring Success: Predictors of Successful Economic Integration of Resettled Female Refugees.

There is a growing political, academic and practical interest in refugee integration in Canada. The challenge, however, is that not much of the existing research focuses specifically on refugee women and their unique experiences beyond mental and physical health. My study contributes to addressing this gap by examining their successes and challenges in the Canadian labour market. Using the 2016 version of the Longitudinal Immigration Database (IMDB), this paper addresses the question: What are the characteristics that predict economic success among refugee women in Canada? A secondary question asks, to what extent does arriving during an economic recession influence the income of refugee women? I use Critical Race theory, Intersectional theory and Segmented Labour Market theory informed by a quantitative research design to address these questions. These theoretical perspectives help to understand the findings suggesting that the barriers in the Canadian labour market help to sustain existing racism, discrimination, and inequality refugee women experience.

Meanings of Work Among South Koreans during the Economic and Health Problems Due to COVID-19

In the action-theoretical perspective on embeddedness, individual life is embedded in multiple areas, and work life is loaded with multiple meanings. Furthermore, what work means varies among individuals. It changes in different social contexts. This study addresses whether and how the COVID-19 crisis affects meanings of work in S. Korea. By using the data from the 2021 Values in Crisis, this study conducts latent class analysis (LCA) and multinomial logistic regression analysis. LCA purports to find typical types of meanings of work. Regression models analyze what anticipates these types. First, Koreans are classified into five subgroups, depending on how they signify work: work as versatility; work as futility; work as initiative; work as imposition; and work as volatility. Second, the greater people are exposed to economic difficulties (e.g. unemployment and closure) or health problems (e.g. infection and suffering) during the pandemic, the more likely they are to perceive their work as versatility or volatility, and less likely to perceive it as futility. Third, workers who experience both economic and health problems are more likely to signify work as initiative or volatility than those who undergo neither. Fourth, these patterns are stronger among workers who undergo economic or health problems early (in 2020) than late (in 2021). This study discusses implications for changing attitudes toward work during crises including the current pandemic.

Social Dynamics of Women's Alienation and Empowerment in Patriarchal Rites

Women have dynamic interactions with people attending funerals in Korea. Funerals tend to follow the patriarchal Confucian traditional culture and women are marginalized in male-centered funerals. The distinction

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

between men's and women's roles makes women feel left out, and these gender inequalities cause shame in women. The emotion of shame leads to the act of resistance(Honneth, 1992). Accordingly, this study was conducted with the following questions. With whom do women conflict and struggle over gender discrimination? How do women independently perform their identity at a funeral? Based on these questions, this study conducted a "literature survey" of Confucian documents on traditional funerals and analyzed "in-depth interviews" with five female 'sangju.' Sangju refers to a person who represents the bereaved family at a Korean funeral. As a result, modern Korean funeral culture followed the patriarchal Confucian tradition. The funeral director was playing a role in maintaining and strengthening it as a 'guardian of tradition'(Giddens, 1991). On the other side, women faced difficulties in being recognized as 'sangju.' Especially families made up of only women had to find men who could represent the bereaved families among distant relatives. In these traditional funeral norms, women faced limitations in leading funerals. Participants in the study were also alienated and discriminated against due to the male-centered funeral system. And they were frustrated and ashamed of the fact that they couldn't do anything because they were women. However, participants acquired sangju status by conflicting with funeral directors and the elderly in the family, and they also broke away from funeral norms and created a new funeral style. This means that female sangju has established its own new identity. In conclusion, this study found that female sangju justified their identities as 'responsible sangju' and 'responsible head of household' through a symbolic struggle within social networks.

RC42-609.1

OH, Jimin* (Sogang Univ., Republic of Korea)

Symbolic Struggle for the Recognition of Women in Patriarchal Confucian Funeral

Funeral rituals have changed over time in Korea; however, today it has become the place of gender conflicts where symbolic struggles occur between traditional Confucian patriarchal authorities and gender-equality-oriented feminist voices(Bourdieu, 2001). In particular, there is still a stereotype that the role of 'sangju' (i.e., the head of the bereaved family at funerals) should be occupied only by a male. In what process of symbolic struggle can a female take the status of sangju? In the case of female sangju, what do they feel and experience? What affirms their performativity as a woman against patriarchal authority? To answer these research questions, I conducted "content analysis" on the Confucian documents and "in-depth interviews" with five female sangju. The findings of this study report that 'female sangju' is not recognized as the head of the funeral ceremony and those women in such an important position of the head would feel shame, humiliation, and alienation: At the funeral, people treated female sangju as a mere 'young woman' or 'unmarried woman.' The treatment made them ashamed and frustrated. Especially, female sangju experienced a sense of powerlessness due to gender discrimination. In the case of female sangju, they were divided into 'formal sangju' and 'substantial sangju' in the funeral rite. Also, female sangju tried to struggle to recognize and fulfill their role as 'responsible sangju' or 'responsible head of household.' Female sangju performed a new form of funeral rite in the cultural context of the active practice of post-traditional rituals(Butler, 1993). This study analyzed the social dynamic of women at the funeral rite from alienated status to an empowered position.

RC36-535.1

OH, Sunjin* (The University of Tokyo, Japan)

Responsibility for the Other As Prime Factor of Alienation from Time

\ In this paper, I argue that it is necessary for social theory to posit the aspect of the responsibility for the Other as one of the main factors of alienation. According to Bauman, the responsibility for the Other is the sole momentum to vacate one's own ontological estate and reach to time. This point of view can contribute to overcoming the limitations of the ontological sets of the alienation theory.

First, I explicate the ontological accounts of alienation with two threads: the Hegelian-Marxist tradition and Romanticism. Referring to these two, Hartmut Rosa and Rahel Jaeggi projected a theoretical revival of alienation as an absence of "resonance" or "relations of relationlessness."Reflecting on a growing need to deal with the existential aspects, both emphasized relationships with the world remarked by bodily incorporation, perceptive and emotional relations with objects or metaphysical relations with the mythical, thereby indicating that "the social" forms only a small part of the good life. The tendency to prioritize the ontological proofs, however, is indifferent to the vexing nature of moral decisions and any ambivalence or endemic uncertainty.

To handle this limitation, I focus on Zygmunt Bauman's concept of morality, which thematizes time with an emphasis on the responsibility for the Other. Morality can be incorporated only when time enables the fundamental ambivalence of identity, say, that the state of "I" always comes with "not I." In Bauman's view, an identification of the "I" is not a self-confirmation within the relationship with the world but always about morality as a prime factor of time. In this way, Bauman's idea of morality could set new criteria for emancipation in relation with the temporal momentum of the existential aspect and deconstruct the ontologically designed order of alienation and emancipation.

Pressure to Perform: An Institutional Ethnography of Australian Post-Secondary Music Students' Health

Music provides joy and meaning in human societies worldwide. Yet, studies indicate that more than 80% of tertiary music students experience playing-related health conditions (PRHC), such as repetitive strain and performance anxiety (Ioannou and Altenmuller, 2015; Cornett and Urhan, 2021). To address this, some post-secondary music programs have begun to add health education to their curricula. Despite these efforts, improvements in the prevalence of PRHC have been slow to occur in a domain where the curricular focus is on the musical product, not on the physical and mental processes required to achieve it. Research suggests that the structure and practice of post-secondary music education may contribute to this high prevalence (Perkins et al., 2017). Using an Institutional Ethnography approach, our study aims to map out how music students' day-to-day work is hooked into the discourses, texts and social relations of post-secondary music curricular practices in ways that impact their work and health.

Through interviews with students and staff, observations of practice and performance regimens, curriculum texts, course/unit texts and progression pathways, we seek to account for how the students' experiences of post-secondary music education in one Australian institution get organized. We will report initial findings on how this organization produces a disjuncture between students' awareness about how to maintain their health, and the varied pressures students experience in the management of their day-to-day work and health.

By identifying how post-secondary music students care for their health during their program, and the textually mediated coordination which serve to contest or even undermine positive health behaviour, the research seeks to provide new ways of understanding health and wellbeing in music education. An Institutional Ethnography approach promises to advance knowledge about music student health and the field of music education.

Images of the Body in Vaccine Science – an Ethnographic Study on a Nordic-West African Vaccine Trial

This paper will focus on how contemporary biomedical vaccine trial science imagines the human body and the immune system. It presents results from an ethnographic study where a cutting-edge pharmaceutical trial testing a diarrhea vaccine was followed for two years. The trial offers an opportunity to detect the various ways in which bio-medical researchers view and enact their objects of research, human immunity and corporeality, both as lived everyday experience when conducting the during trials in Western Africa and Northern Europe, and during the processes of designing, carrying out and explaining the trials to diverse audiences. We suggest that the focus on time and futurity in these trials betrays an ambivalence within biomedical conceptualizations of the human body. This has to do with a tension between knowing the body as an object in the immediate present and dreaming of other corporealities in the not-yet-knowable future. We will argue that open-ended orientations into futurity enables the biomedical trial to hold together its diverse, and conflicting, ontological and epistemic assumptions about the body.

Privilege, Entitlement and Situatedness: Nordic Student Anxieties in a Feminist Classroom

The proposed paper discusses student data on the theme "university", "race" and whiteness in a Northern European university. The data reveals a dissonance between the extent to which racism, whiteness and transgender issues are discussed and debated in this context, and the availability of practices that would appear meaningful to them. Discussions on privilege and positionality are often interpreted in ways that distress, as they feel hyper-aware, yet compelled into an uncomfortable silence. The paper argues that this anxious, melancholic passivity is in contrast with the sharp analysis and rage against what they carefully contemplate as structural injustices.

The overall study analyses qualitative interviews and memory work texts with Sociology and Gender studies' students at the local university. The student data shows, that while they value their studies especially for equipping them with a theoretical tool kit for the analytical work on power, university did not offer much in the way of dealing with the affective range of living a feminist and anti-racist life. The paper argues that by identifying the blue registers in young

feminists thinking it is possible to further disentangle and de-essentialize the concepts positionality, priviledge and entitlement. Thus, the anxieties in the student data point at gaps in the pedagogy of feminist sociology.

Why Do Nationalists Support Migration?: Structural Economic Nationalism and Multicultural Transformation in Japan

This paper examines the role of nationalism in Japan's drastic policy changes in migration and migrant incorporation in recent years. Contrary to its stereotypical image of being a closed country with restrictive migration policies, Japan has been widely opening its migration gates through various policy reforms in the past decade. In 2019, the Japanese government officially opened its labour market to migrants in 14 occupational sectors, including agriculture, elder care and construction, which used to be labelled as 'unskilled' and 'semi-skilled.' Its total national budget for migrants' incorporation also increased to 21.1 billion yen (US$146 million), which is twice the size of Australia's equivalent federal budget. Furthermore, in contrast to growing anti-migrant sentiments in the West, various data show that the majority of Japanese support migration even during the COVID-19 pandemic. While the conventional literature has attributed Japan's low level of migration to ethnonationalism, it cannot explain the recent changes happening in the last decade. Labour shortage is definitely one of the key factors, but it also existed in the 1990s without resulting in the open-up of its labour market or the public support for migration. How can we explain this multicultural transformation in Japan where nationalism is also growing? Based on both qualitative and quantitative data, this paper puts forward the concept of structural economic nationalism, arguing that economic nationalism has a structural affinity with pro-migrant sentiments under certain conditions.

Changes in Socio-Economic Inequality of Educational Opportunity: How Competition to Higher Education Entry Influenced Its Effect?

A purpose of this research is to analyze the relation between inequality of educational opportunity and social structural and institutional setting. Sociological studies have argued that social inequalities in educational opportunities change with social circumstances. The industrialization thesis asserted that the influence of social background on educational attainment would decrease as achievement is emphasized. Whereas the industrialization thesis deals with changes in the principles of selection process in wide-ranging social changes, including economic and production systems, the system and its conditions of educational selection also change the social inequality of educational opportunities.

Advancing to higher education requires higher academic ability and capacity for additional economic costs. Japanese universities charge tuition fees even at the national universities. In addition, most of the students had to pass the entrance examination to enter the university. Ultimately, college admissions in Japan are determined by households' ability to pay for tuition and by academic ability to pass entrance exams. It is an interesting to understand how it relates to the change in the situation of advancing to higher education. How influences of these two factors on educational attainment changed is analyzed based on Japanese social survey data.

Under such circumstances, as competition becomes more severe, the academic achievement's effect on educational attainment will increase. Whereas if competition is relaxed on the contrary, it can be assumed that the effect of economic conditions of family will increase because of degradation of academic standards. We test whether this phenomenon occurred in the postwar Japan. For each cohort, the impact of the economic condition of family (estimated father's income) and the academic achievement (self-evaluation) at junior high school on educational attainment, and their relationship to college admission competitiveness (number of university entrants / number of university applicants) are examined.

The Accent That We Speak: Examining Identities of Filipino English Language Teachers in Japan

While the awareness of English as a Lingua Franca becomes widespread in Asia, the Philippine English language continues to gain recognition as one of the varieties of English. This development has contributed to the increase of Filipinos teaching English online or moving to countries, such as Japan, where there is a recurring theme on native speakerism. This paper aims to examine issues on gender and race that have emerged from a broader research of the professional identities of Filipino migrants teaching English in Japan. These Filipino teachers as permanent residents or transient migrants who have professional experiences and educational background that is not necessarily related to English language teaching contribute to raising intercultural

awareness and diversity through English language teaching in Japan. This qualitative study explores teachers' narratives that are analyzed through a social constructivism approach. Through their work relationships and pedagogy, the Filipino teachers exercise their agency while they bring social returns that may be (dis)advantageous as they subconsciously promote a positive image of the Philippines and break stereotypes. The emerging identities of Filipino English language teachers in Japan not only promote diversity in English language teaching but also raise awareness of Philippine English and inclusion in contemporary Filipino labor migrants as English language educators.

Trans Belonging and Transgendered Lives in Japan during COVID-19

Labor and family migration have made the Filipinos one of the biggest migrant groups in Japan. Although there are many scholarly works on Filipino migration to Japan, the cases of queer migrants have been overlooked. These queer migrants include Filipino transgender women or transpinay who inititally moved to Japan for work or family. Drawing on the discussions of "trans" belonging (Bhanji, 2012), this study aims to examine narratives of transpinay migrants and reveal how migration policies, Japanese society, and COVID-19 generally affect the migrants' transgender lives in Japan. This is accomplished by looking into the migration trajectories of transpinay migrants who came to Japan during the 1980s, 1990s, and 2000s. Using grounded theory, qualitative data was collected through netnography and semi-structured interviews about the participants' background, gender identity, transition, visa, relationships, occupation, experience at the detention center, and coping strategies during COVID-19. While migration policies in Japan recognize cisgender immigrants, the status of transpinay migrants is negotiated according to their visa and personal relationships. Still, these transpinays choose to stay in the host society because they feel safer and experience less discrimination than in their home country; this favorable comparison contributes to the transpinays' sense of (un)belonging to the host country and resilience during COVID-19. Transpinay migrants' pathways include obtaining a visa and being (un)recognized transgender women. Their migration trajectories reveal how their sense of trans (un)belonging is influenced by their experiences as transpinay migrants in Japan.

OKANO, Ichiro* (Tokyo University of Agriculture and Technology, Japan)

Differentiation or Centralization?: An Attempt at Unifying the Two Sociological Viewpoints on Modernity

Sociology has roughly two types of theoretical points of view on the modern society: one regards it as becoming increasingly subordinate to one dominating force; the other regards it as divided into many subparts. Marxist studies have observed the involvement of people into capitalism. Weber's theory of rationalization, Lukács's theory of reification, and the criticism of instrumental reason by the Frankfurt School have all seen the world as progressing into an abstract and one-dimensional scheme. On the other hand, Durkheim's observation of the division of labor, Simmel's theory of social differentiation, and social systems theories by Parsons and Luhmann have seen society differentiate into multiple domains. Both trends of thought have convincing points which are difficult to ignore, and it was Jürgen Habermas who tackled the challenging task of combining them. He did it by regarding social systems (economy and law) as equivalent to instrumental reason. He build on Weber's notion of multiple ways of rationalization and developed the theory of communicative reason. The difficult point, however, is that social systems are thought to stem only from instrumental and strategic action, so that his whole view plunge into a kind of dualism. An alternative way for incorporating pluralistic view of the society while retaining the emancipatory potential of critical theory might be that we regard social systems as not the incarnation of instrumental reason but as realms of interaction based on people's mutual recognition. Furthermore, today's social systems are still in their infancy and not fully differentiated from each other. And they must be democratized and become open to people. In the session, I would like to take an example in the field of science and trace how science has changed from small group activities to a big enterprise and finally starts involving people outside of the scientific community.

The Politics of Linguistic Relativity in Japanese English Education

As globalization proceeds, English is penetrating into every corner around the world including Asian countries, and the dominance of English is evoking a range of controversy. In Japan's context, English has always been seen not as a transparent tool of communication but as something that influence people's ways of thinking. From the Meiji era, for example, teachers in Japan have often been criticized for students' bad performance of English, and their

counter-arguments have been that students can get cultural or educational benefit through English even if they are still poor at its practical use. This paper investigates the history of English education in Japan and finds how such connection between language and thought has been used in English education policies and debates among critics. They have regarded English as an example of Western culture, as the bringer of international understanding, or even as a high-level intellectual exercise. Around the end of the millennium, however, English changed its outlook with its seemingly more transparent and exchangeable features as an international language. Did English cease to deliver special messages of its own? Wallerstein's notion of "European universalism" gives us an insight into this transformation. He argued that orientalism is now diminishing its power as an ideology. Instead, "scientific universalism" serves as the ideology of the power relations in the capitalist world system, where humanities are seen to be subordinate to science. Here, English has become the language of science, which endows it with its dominant power today. English still has its message and is not transparent. To move beyond European universalism including scientific universalism, Wallerstein argued that we need a "universal universalism," where science and humanities are reunified. This might be the way beyond the modern world system and beyond the dominance of English.

The Immigrant Bargain in Marital Decision Making Among Nigerian Immigrants in the United States

All parents have dreams that their children will lead more successful lives than they did. Immigrant parents similarly have these aspirations; however, those aspirations are often framed around parental sacrifices endured when immigrating. According to the concept of the "immigrant bargain", immigrant parents undertook many burdens, struggled through demanding migration processes, and settled in a new land to give their children a better life. Using this theoretical framework, I explore the implicit and explicit ways that Nigerian immigrant parents and their children negotiate the marital decision-making process. The immigrant bargain captures how immigrant parents and their children frame achievement and success. It posits that the children of immigrants feel the need to make up for their parents' sacrifices through their achievements. Although achievement is traditionally defined in terms of academic or occupational successes, a key insight of this paper is its exploration of how immigrants and their children also frame achievement and success based on the choice of a marital partner.

In this paper, I argue that if the success of the second-generation validates the sacrifices of immigrant parents, then the inverse is likewise true. The failures of the second-generation may incur the burden of shame for both the child and parents. Among Nigerian-Americans, success is not only measured by educational attainment and social mobility, but also in terms of picking an endogamous partner of the same ethnicity. In elaborating these points, this paper forefronts the voices and stories of parents and presents explanations for their preferences for their second-generation children's marital partners. My findings are based on ethnographic data, focus groups, and life-history interviews with 75 participants. My research shows that while second-generation children do not always enact their parent's preferences, they often internalize what I call the "parental gaze", thus, factoring their parent's preferences into their marital decision-making.

Are They Going to Replace Us? Perceptions of Robots, AI, and Technological Futures Among Europeans

Robotization and Artificial Intelligence (AI) are expected to change societies profoundly. Robots and AI are becoming more humanlike and take over tasks normally done by individuals. Collaborative robots are particularly interesting as they are visible for people in their everyday lives. Understanding human perceptions and trust towards new technologies is important considering the broader societal and psychological impacts these technologies are likely to have. This presentation focuses on perceptions and attitudes toward intelligent technologies. Sociological research and theory on social capital is helping us to understand how new technologies are welcome. We expect that low social capital predicts fearful attitudes towards collaborative robots and intelligent technologies. We also consider technologization as a group phenomenon based on social identity approach. Ingroup identification with technologically advanced people is likely to lead in more positive attitudes towards collaborative robots and intelligent technologies. Our findings are based on extensive cross-national and longitudinal data: 1) *Self and Technology* cross-national surveys that will be collected in November 2022 from Finland, France, Germany, Ireland, Italy, and Poland.; 2) *AI in Society* longitudinal survey (2021–2023) from Finland; 3) *WorkSome* longitudinal survey (2019–2023), and 4) *Digital Age in Finland* survey (2017–2020). Survey items include measures on attitudes and trust towards robots and artificial intelligence, social relationships, social capital, ingroup identification, and usage of intelligent technologies. We will consider whether we are currently in a phase where we could talk about new digital divide due to the rise of intelligent technologies. We reflect this process

in the context of on-going swift from thinking economy to feeling economy as suggested by Huang and Rust who state that intelligent technologies are taking over thinking tasks, while humans can still specialize in feeling tasks.

How Did the Japanese Nursing Association Respond to the COVID-19 Crisis?: New State and Society's Relationship during the Pandemic

As the number of public servants at the national level in Japan is limited compared to other OECD countries, the Japanese government is forced to mobilize the various organizations that exist in civil society to compensate for the scarce resources. Nursing is not an exception. In situations where the demand for nursing services increased, professional nursing organizations, such as the Japanese Nursing Association (JNA), worked closely with the government to provide the required services. However, in the process of responding to the COVID-19 crisis, the Japanese government did not mobilize human resources through the JNA network. For instance, the enforcement order of the Worker Dispatch Law was revised in stages, and from April 2021, nurses were dispatched to remote areas, social welfare facilities, vaccination centers, and temporary medical facilities through private employment agencies. This was in contrast to the doctors, dentists, and pharmacists, who were mobilized through the three professional associations (Japan Medical Association etc.) and other agencies. Why was the Worker Dispatch Law revised in response to the growing demand for nurses instead of mobilizing them through nursing associations? How did the JNA respond to the growing demand for nursing care? Most of the studies that have examined the political response to the COVID-19 situation in Japan have discussed the national–local relationship and its challenges under the pandemic, but few have examined the relationship with civil society organizations. Therefore, this study investigates how the JNA responded to the increased demand for nursing staff. In addition to the relationship between the association and government, we will focus on the link between the association and its members, that is, the nursing staff. The purpose of this research is to clarify the changes in the policy process surrounding nursing care and provide the basic data necessary for future research.

Transnational Religious Flows and the Role of Religioun in Settlement of the African Community in Australia.

This paper seeks to examine the role of religions and their intercontinental movement in settlement processes of African community groups in Australia. Africans are fundamentally religious; religion and spirituality characterise all areas of African life. Religions play a major role in the settlement process of African Australians in the creation and leveraging of community centres for cultural activities, family gatherings, celebrations, mourning as well as spiritual comfort and healing for individuals and families that are struggling with social, mental health and parenting issues. While African migrants have settled in Australia, and now call it home, they maintain religious and cultural rootedness as those living in Africa. This is their one way of maintaining cultural and community connection in Australia. This paper argues that religious identities among African migrants is not just merely a religious trend, but also a way of cultural connection that may be different from the host society and may possibly carry the concepts of viewing African community groups as 'other'. During transaction and settlement, and regardless of where they may be located across Australia, African Australians seek connection and a sense of belonging with the religious institutions in Australia. African Australians also seek to express their religion and spirituality by identifying and actively participating in various religious and community initiatives started by African Australian clergy and ministers of religion.

Assessing Propaganda Effectiveness: The Case of Russia's War in Ukraine

Since Lasswell (1938:9) propaganda is considered as one of three chief implements of warfare, along with military pressure and economic pressure. Russia's invasion in Ukraine revives public and scientific interest in war propaganda. The Russian government tightly controlled the mass media even prior to the start of the full-scale war on February 24, 2022 (Russia came 150th in the list of 180 countries rank-ordered by the degree of press freedom: Reporters Without Borders, 2021). Recent amendments in the Penal Code and Articles 31 and 151 of the Code of criminal procedure of the Russian

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Federation criminalized public transmission in this country, including by means of social networks, 'deliberately false information about the deployment of the military forces of the Russian Federation.' Ukraine has more degrees of press freedom (97th rank). Mass media in this country tended to be controlled by oligarchs as opposed to the government prior to the war (Makhortykh & Bastian, 2020). The use of a 'united informational platform' to disseminate the news relating to the war is mandated by the Ukrainian government, however. Effectiveness of propaganda is compared (i) across countries (Russia, Ukraine, and the US), (ii) in function of the medium (traditional media, social media) and (iii) using two different methods (content analysis and a survey). According to Ellul (1973:x), 'whoever handles [propaganda] can be concerned solely with effectiveness'. Propaganda effectiveness is understood as the propagation of war-related messages stated by the government through various media with no or few distortions. With the help of content analysis, the message at its source (war-related statements of political leaders) is compared with the message received by the target audience. In addition, the degree of agreement with key propagated messages using an index of propaganda developed by Kyiv International Institute of Sociology is measured using mass survey data.

Forced Migration Trajectories: Displacement and Pathways to Humanitarian Protection Among Ukrainian Arrivals to Australia

More than 7 million Ukrainians have fled Ukraine since Russia's invasion, making it Europe's worst refugee crisis since the end of World War Two. This article is one of the first pieces of research-based examination into the journeys of Ukrainian displaced people in Australia. It provides unique knowledge about the dynamics underpinning migration trajectories of Ukrainians towards Western countries that don't share borders with Ukraine and are popular among Ukrainian asylum seekers, placing particular emphasis on the factors that shape the 'where' and 'how' of journeys. The focus is on several structural and agency factors guiding perceptions and choices regarding destination and trajectories of forced migration: the policies/decisions/frameworks by Australian government bodies which establish the mechanisms and infrastructure for receiving refugees; as well as the financial capital, social networks, migrants' own perceptions and feelings about where to go, when to do it, and how. This article is a valuable resource for promoting and establishing a unique framework taking into account the new structural conditions that shape the current Ukrainian arrivals to Australia, fully in accord with local contexts and current global political, social and migration challenges.

War, Social Sciences, and the Apocalypse

A ghost travels the world: the spectre of endless and irreversible social and war conflicts. With spending in 2020 of 1,482 billion dollars -- in the ten countries with the most military spending --, and defence institutions as the main global employer – 6.8 million jobs (SIPRI) in 2020 -, we are facing an institutional giant. The dangers of a new military holocaust arise from this institutional excess, and not only from the characteristics or psychology of the political-military leaders. These giant institutions have survival needs that generate a social dynamic, which in turn increases the probability of armed conflicts and violence with irreversible damage to humanity. These factors once again bring into focus the need to redesign defence and military institutions. Resizing? International regulation? New legal or civil society regulation? These are new questions for new scenarios. Anthropological, historical, and geopolitical research have addressed these issues and the problems of permanent institutions of war. Reflections on peace flourished in the Enlightenment with Kant (1795), Saint Simon (1830), Montesquieu (1748), and others. Today, with new war scenarios in Europe and the invasion of Ukraine, it seems necessary to rediscover these reflections and return them to the analytical focus of the social sciences. It seems necessary to make these problems visible so that human survival does not hang from a perpetual random thread. If human civilization collapses in a warlike apocalypse, the social sciences will have been a useless historical exercise.

Cyberreligiosity in Young Catholics: Integration or Overcoming of the Digital?

The influence of technology and the virtualization of reality has penetrated diverse social spheres, including religion. The latter has allowed the development of cyberreligion and cyberreligiosity as phenomena with empirical extensions. Among highly digitized generations, religiosity is structured by virtuality for doctrinal responses or for integration into communities that respond to spiritual needs. With the potential of smartphones, along with the speed of the internet, cyberreligiosity plays an increasingly important role in the construction of a less formal religious social reality that is in constant movement.

This study examines how socio-technological integration contributes to the construction of cyberreligiosity among Catholic university groups. We have undertaken qualitative systemic-phenomenological research based on information collected through semi-structured interviews. The sample consisted of subjects participating in religious activities at Chilean universities. Structural semantic analysis was used to analyze the data.

The results show that participation in virtual communities facilitates the organization of daily religious activities, allowing constant communication. The incorporation of virtuality recontextualizes and updates religious information independent of institutional setting, time and space. Specifically, the complete division of online from offline experience is practically impossible, since the use of different digital platforms contributes to various communication objectives, undervaluing and omitting non-digital information channels. This group finds it difficult to generate a religious imaginary without permanent virtuality.

We conclude that technological ergonomics and multiple platforms generate channels oriented to the generation of a form of cyberreligiosity integrated into the daily life of the individuals that engage regularly with virtuality, thereby creating an exclusive symbolic universe, while also maintaining traditional ecclesiastical practices.

Therapeutic Assemblages and Tensions between Health and Religion. Migrant Populations Experiences in Mexico.

This paper discusses the articulations and tensions between health and religion from the therapeutic trajectories of migrant populations in their passage through Mexico. These populations have scarce access to healthcare services, so they configure diverse care assemblages to handle their health problems. In the therapeutic trajectories of migrant populations, it is possible to identify both the articulation and the tension between biomedicine, traditional medicine, and religious practices to pursue health and wellbeing. At the same time, their trajectories could integrate practices of self-attention, search for public and private healthcare services, and non-specialized care. Based on the analysis of the therapeutic assemblages that migrants articulate during their time in Mexico, we will show how health and religion are understood and experienced in the pursuit of wellbeing.

Youtube and Amazonia on Fire: Dismantling Keystone Science and Technology Institutions

In this paper, we analyse the attacks on INPE, a Brazilian keystone institution for Science and Technology, and environmental monitoring. We focus on the period between august and october 2019, when wildfires spread across Brazil and the Amazon, disinformation proliferated on social media and the president of INPE was dismissed. Climate denialism was used to dismantle Brazilian institutions providing evidence of environmental degradation.

The paper examines the articulation between governmental measures conducted by the federal government and informational attacks that put under siege established institutions. In particular, we first assess the budgetary and organisational reform of the INPE during that period. Second, we focus on Youtube, a major social media, to investigate how disinformation is organised and used to legitimate denialist governmental discourse and reforms.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Using newspaper articles, we organise a timeline of events concerning INPE. Using the Youtube Data Tools, we extract all videos from the period related to the amazon fires, and manually identify the narratives and arguments constituting disinformation. We then map and analyse the disinformation networks. Then, we search the Official Journal for any changes in the budget, appointments and organisational structure of INPE, between the dismissal of the INPE president and the end of 2019.

We find several cuts in the INPE funding and several reappointments of key members, including its director. We find several narratives discrediting official data and the causes of fires, mainly from youtube far-right and entertainment channels. Those findings suggest a broader and deeper attack on democratic institutions. Disinformation mimicking official discourse is used to legitimise the dismantling of institutions providing evidence against the official discourse.

Understanding the articulation between political agendas and the new modes of disinformation is key to preserving healthy democratic debate, especially regarding environmental issues. We also highlight the central role of social media in disseminating disinformation.

Teaching Sociology and "School without Party" in Brazil

In Brazil, sociology became a compulsory subject in high school in 2008, however, with the advance of the conservative agenda and with the educational reforms carried out after Dilma Rousseff's impeachment in 2016, sociology lost its status as a compulsory subject. After the election of Jair Bolsonaro in 2018, authoritarian conservative movements gained visibility in Brazil, with emphasis on their performance in the educational field. One of the main agents in this field stands out the movement "Escola sem partido" (School without party), which has acted in what he demonizes as "fighting ideological indoctrination in schools". In this work, we analyze the impacts of this movement on the teaching of sociology, as well as the challenges for the teaching of this science in basic education in the context of the rise of authoritarian conservatism in Brazil, taking as the main milestone the election of Jair Bolsonaro in 2018.

Legal Professionals and Democracy in Brazil: Local-Global Struggles to Reshape Professional Forces in the Judicial and Public Safety Systems

The relationship between legal professionals and politics occupies a central place within Brazilian social science and political debate. Classical studies converge in their understanding that legal professionals comprise an ambiguous group which shares moderate liberal values, tending towards conservatism. Contemporarily, this pendulum has swung in an antidemocratic direction. We aim to better understand this intriguing scenario. Our point of departure are contemporary developments within the sociology of professions, and in particular, the understanding that the social construction of professions occurs not only through the establishment of tight boundaries to demarcate a professional practice, but also through the blurring of boundaries – between the professional and the political, or between different established types of professional practice. We work with the image of a "tug-of-war" between democratic and antidemocratic positions, seeking to observe and understand the different meanings that such tensions may acquire on the boundaries between professions and politics, between professional segments or between justice and public safety professionals. Based on this framework, we propose an empirical research using multiple methods, including a survey of justice and public safety elites, collection and analysis of documents, inquiry into media and social networks, observation of institutional practices and semi-structured interviews with legal and public safety professionals.

Subalternity As a Social Figure of Nonidentity: Spivak and Adorno

This paper aims to build connections between Critical Theory and Postcolonialism by approaching the categories of subalternity and nonidentity as they appear in Gayatri C. Spivak and Theodor W. Adorno's works. Although the latter does not discuss in length the problem of Colonialism, the starting point of this study is a comparison of their perspectives on the mutual implications between social and epistemological forms of domination.

In *Negative Dialectics* Adorno describes the form of thinking specific to modern bourgeois society as based on the primacy of identity. The structural role of the principle of exchange in Capitalism is linked to a logic of integration that prioritizes what is identical when determining the object. Adorno displays the violence intrinsic to the rational process of knowing since what is qualitatively diverse receives the mark of contradiction and is systematically demoted or excluded. That is why he is extremely cautious about the social results associated to modern rationality, as freedom or progress. They must be bonded to the oppression of nonidentity that constitutes not only the object in the cognitive relation but also the subject in itself.

It is precisely this suspicion against the neutrality of modern rationality that brings Adorno and Spivak closer. Especially in *Can the subaltern speak?*, Spivak highlights how Western colonization is steeped in epistemic violence, which silences or justifies the subjugation of native knowledges as irrational or barbaric. Subalternity is characterized as a structural form of domination, whose damage in the subjective formation results in a lack of political voice and communication.

In this cross-fertilization, subalternity would offer a social figure for the abstract category of nonidentity. The "rationalized rage at nonidentity" of which Adorno speaks would, as well, shed some light on the logic of domination that runs behind practices of colonization and genocide.

Analysing the Social Impact of Climate Change

The impacts of climate change in society are wide and diverse as well as the ways humanity respond to them. Citizenship is a key actor in providing information and in expanding understanding about natural phenomena, contributing to a dynamic process of knowledge production. Citizens' reactions in front phenomena related to climate change are very relevant also in the processes of contributing to build up forms of sustainable development all over the world. Interdisciplinary scientific collaborations in dialogue with citizens are key to expand our understanding of these impacts of climate change in societies and to improve social responses to this phenomenon This paper presents interdisciplinary research from natural and social science aimed to analyse the social impact of hydrometeorological events. Previous scientific literature has already contributed analysing the role that social media can have in preventing natural disasters but there was a lack of knowledge on the different ways citizens can react through social media in front of hazardous hydrometeorological events that are or can be related to climate change. Specifically, this paper is addressed to analyse the different forms of intentionality of Twitters' messages related to hydrometeorological events. Through four experiments implementing the methodology of social media analytics, the findings indicate different forms of intentionality (preventing, informing, denouncing, complaining, adapting and questioning aspects related to climate change) in Twitter's messages depending on contextual circumstances and the characteristics of the Twitter's profiles. These outcomes provide relevant insights for the definition of social media communication strategies which can promote specific responses and concrete measures or actions from citizens, governmental and non-governmental organisations in front events related to climate change.

Intersectional Analysis of Risk

This paper maps a current trend in risk research, namely intersectional analysis of risk. In the last decades the concept of risk has spread into almost all kinds of societal domains. The original focus on technical and environmental risks has transferred to areas such as health, crime, regulation, social inequality, public and social policy, and global risk as well as the management of risks in everyday life and intimate relationships. Scientific advances and the global media have together created a long string of alarms about risks of different magnitude: from more recent the Covid 19 pandemic, to terrorist threats. The distribution and impact of these risks are not equal, instead they tend to follow and reinforce already existing structural inequalities. In the wake of this development we have seen a growing body of feminist and intersectional approaches in the study of risk. The two perspectives informs each other: On the one hand, the intersectional perspective advance risk research by clarifying how new complexities in the reproduction of social inequalities brought about by globalization and the intersections between social class, gender, ethnicity, and other social categorisations, are connected to the production of risks. Risk research, on the other hand, inform intersectional analysis by clarifying the mechanisms in risk governance that are reproducing old inequalities (i.e., class and gender) and producing new inequalities. Through a systematic literature review, this paper aims to map insights and viewpoints from scholars regarding

intersectional analyses of risks associated with inequality on an individual, group or community level, including analyses of individual perception and behaviour, policy, mass media and discourses

Holding and Harnessing Distress: A Critical Discourse Analysis of Emotions in Australian News Reporting on Climate Change and Climate Anxiety

Eco- or climate anxiety is growing. International studies estimate the prevalence to range from 25 to 68 per cent (Pihkala, 2020). Young people are even reconsidering their intensions to become parents, with 20 per cent of Australians aged 18-24 citing climate change in decisions not to reproduce (O'Shanassy, 2021). The emotional sequela from climate change is clear. How to conceptualise it and respond to it is not. This presentation offers findings from a critical discourse analysis (CDA) of Australian news articles published in 2022 reporting on climate change, climate-related weather events and the changing school curriculum on climate change. Specifically attending to content on emotions, through this CDA we produce knowledge on the emotional discourses employed within such media. These emotions range from reductionistic conceptualisations of climate anxiety as individual pathology to relational notions of emotions linked to climate change as a shared phenomenon and collective emotion management responsibility. Drawing on theorisation of emotions in sociology (e.g., mass emotional events) and education (e.g., epistemic emotions), we explore what differing discourses and implicit conceptualisations of emotions *do* in the context of this looming environmental crisis in a post-truth world.

Interactions of Power and Social Pedagogical Recognition: An Analysis of Narratives of Pupils Who Use Alcohol and Drugs in an Upper-Secondary School Context in Sweden

The aim of this study is to contribute new knowledge about interactions of power and social pedagogical recognition in narratives of students who use alcohol and drugs in an upper-secondary school context. In this context, the student narratives create and re-create a series of images of varied treatment by professional actors (e.g., teachers, student coordinators, counsellors). The reproduced power interactions in narratives describing the practices of professional actors are significant for student learning, teaching, nurturing, inclusion, change, discipline, and identity creation. In these interactions of power, professional actors are portrayed as significant power-wielding others or as rejected power-wielding others, two verbal portrayals that contribute to the verbal production of four analytical categories: 1) social pedagogical identity, which in previous studies has been classified as social identity (e.g., alcohol and drug user, ethnic identity, victim identity), and pedagogical identity (e.g., pupil identity, teacher identity, desired successful pupil identity, desired successful teacher identity, invisible student identity); 2) social pedagogical interactions of power related to verbal representations of situational images, control, monitoring, invisibility, discipline, prejudice, devaluation, victimhood, and the other; 3) varied descriptions, narratives, representations, and reproduction of social and pedagogical aspects of learning, teaching, nurturing, inclusion, change, and discipline; and 4) varied constructions, reconstructions, productions, and reproductions of learning, teaching, nurturing, inclusion, change, and discipline in the social and pedagogical sense. The social pedagogical recognition of the "other party" in the pupil–professional actor relationship is especially important for achieving the aims of including pupils who use alcohol and drugs in a learning context and enacting positive change through the creation and re-creation of social pedagogical identities (e.g., successful pupil identity) in the upper-secondary school context.

OMOMOWO, Kolawole* (University of Namibia, Namibia)

The Practice of Collective Consumption of Housing in a Fragmented Social Policy Context, Windhoek, Namibia

Article 95 of the Namibian constitution entrenched the rights to social welfare for citizens. However, the right to housing is conspicuously missing. The Namibia state has left housing distribution totally to the caprices of the market forces in a context of high rates of poverty, inequality and unemployment. Literature tends to emphasise indirect right to housing, informed by the country's ratification of some international human rights conventions / instruments, such as Article 25 of the Universal Declaration of Human Rights, linked to international law-friendly disposition of the constitution. Article 144 of the constitution provides for the express incorporation of international agreements, to which the country is a signatory, into the Namibia's legal system. This paper studied the collective consumption of housing by communal association. The association used their monthly membership contribution to buy a block of land, they initially occupied illegally, from the municipality as a collective. The land was shared into individual plots between members to build their houses, however, municipality services such as electricity is consumed at the association level. The municipality initially provided a small loan to assist members to build their houses, but such loans are no longer available. The practice of this communal association and their interaction with the municipality demonstrated the power in the collective to negotiated access to land, despite legislative limitations. It is argued that the practice of collective consumption could be the route to accessing basic needs and amenities to improve social wellbeing in a fragmented social policy context.

The Unions Are Afraid? Trade Unions Perspective on Minimum Wages in the Contexts of Unemployment, Poverty and Inequality

The discourse of minimum wage is often crafted as technical market forces versus social justice, the need to balance business sustainability with living wage for workers. This discourse often results in views such as increase in wages will lead to loss of employment, though not always supported by empirical data. This paper interrogates the inception of the determination of minimum wage in Namibia from the perspectives of the trade unions and employer's organisation. The prevailing political economy of high rates of unemployment, poverty and social inequality and fragmented social protection context provide contexts of bounded rationality limitation to unions perspectives. Therefore, the unions are cautious in demanding for a significant increase in wages. While Article 95 of the Namibian constitution provides for the promotion of social welfare of citizens, through the payment of living wage, the industrial relations context characterized by colonial-apartheid low wage regime persists in post-independence Namibia, which hinders the achievement of decent standard of living. It is argued that gaps in the extant labour legislations and tripartite framework, such as Labour Advisory Council (LAC), will forestall the achievement of significant improvement in wages.

Social Construction of Childhoods Related to Multiple Sclerosis Illness

There are growing discussions in the fields of aging, disasters, health, and childhood. This study is entitled "Social Construction Of Childhoods Related To Multiple Sclerosis Illness". Childhoods are rarely evaluated in the linkage of disasters, illnesses, disasters, and aging. However, the analysis of childhoods related to illnesses from sociological perspectives is much rare in comparison to medical studies. Pandemic conditions made some turning points in that approach. It is necessary to study follow-up situations and social constructions in them and their linkages to a healthy environment for all family members in case of short, medium, and long-term illnesses. The present study focuses on the childhoods of the MS patient, the patient's child, and their aging process and linkages in between.

The study will be deriving theoretical and conceptual foundations from childhood sociology, sociology of aging, sociology of health, and disaster sociology. As an analytical approach study will be focusing on the life cycle approach

Methodologically literature review will be carried on, comparative case studies will be derived from worldwide studies and this will be giving the base for the discussion of findings of the field study with the families of MS Patients and their children in Elazığ, Turkey.

Preliminary findings will be evaluated. The necessity of merging childhood and aging and the importance of understanding the social construction of childhood and aging will be put forward with findings (international, national, and local comparisons). Thus the importance of the awareness of social construction and aging in relation to MS illness will be discussed.

Social Construction of Volunteer Groups and Aid in Forest Fires

The growing number of devastating wildfires and forest fires are affecting larger communities. As Prof.Dr.David Bellamy was introducing the structure and conditions of nature that may create a risk of fire as a part of the life cycle of the trees at the beginning of the 1990s in Nottingham, UK. However, the interference of humankind is another important indicator of the well-being of the nature and environment which came forward heavily in our experiences.

We have not yet fully learned that we are a part of the environment and nature and should be living as a part of it. Following the Rio conference in 1992, many studies were carried out on the linkages between the environment, society, ecology, and agenda 21. At the Habitat conferences, the importance of the management of local, national, and international levels was discussed and the rise of local management has risen in the second half of the 1990s. Now the sustainability goals for 2030 have been posed. Under the conditions of necessity between strong, reliable, and mindful linkages among international, national, and local sources during the mass climatical change effects and wider forest fires reveals once more the importance of early acting and voluntary groups. This study derives findings from different countries' experiences (Such as the USA, Australia, Greece, and Turkey) from the literature. Specific examples will be from the fieldwork of recent forest fires in Turkey 2021-22.

During the analysis, the focus will be on the construction of volunteering groups (formal, spontaneous, and transitions between them), their training, education, and participation of volunteers in the digital and in-person programs Thus the importance of volunteer groups' construction, development, and placement in different services across a range of prevention, preparedness, response, and recovery phases of disasters will be discussed with examples.

ONET, Mihaela* (Université de Strasbourg, France)

Le Corps En Patrimoine Comme Enjeu Culturel De l'Immortalité De La Corporéité En Société

L'approche moderne du corps en sciences sociales se déploie comme une quête de l'immortalité qui diminue son exposition aux vicissitudes de l'histoire du temps présent et de la seconde ère du postmodernisme (Vandenberghe, 2022), dont le poids a impacté la manière dont les corps se définissent et interagissent. Cela pose des interrogations sur la revalorisation de l'« esthésie » du corps automatiquement „mû par une âme » (Le Breton, 2008[1990]). Nous proposons ainsi un parcours revigorant pour le corps contemporain en mutation via le « chemin mystérieux », sa revalorisation immortelle par une mise en patrimoine de la corporéité. Notre communication cible une analyse épistémologique dont la visée est de mettre en valeur d'une part l'historicité, l'imaginaire, la transmission rituelle et mémorielle du corps en patrimoine et d'autre part, la libération humaine du malheur que l'Anthropocène induit aux émotions corporelles et de ses limites physiologiques par une évasion corporelle volontaire (David le Breton 2008[1990]) à travers les pratiques patrimoniales agissant sur le corps en mutations transcendantales sous le sceau de la culture. Pour mieux répondre à cet enjeu, nous suivons une démarche théorique aboutissante à ces deux interrogations : 1) Quels sont les facteurs qui contribuent à la transmission intergénérationnelle du corps en patrimoine par une valorisation de la mécanique corporelle pérenne via les émotions patrimoniales expressives des gestes, des rites et rituels (David le Breton, 2021) moyennant les valeurs spirituelles plébiscitées au sein des communautés ? 2) Quelle serait la meilleure approche patrimoniale du corps selon les exigences épistémologiques en sciences sociales qui engage les individus à adapter leur comportement sous l'impact transformateur du fait patrimonial où les corps sont habités et qui facilite la transmission transcendantale de l'immortalité physique libératrice de la pratique des traditions permettant ainsi au corps de surmonter l'écueil de sa souffrance?

Decolonising Asian Tourism in Thought and Practice: Macao As Plasmatic Modernity

To examine what may be termed 'postcolonial' conditions of Macao, this paper uses postmodern metaphors of plasmas and plasmatic effects. Going beyond the three common states of matter in solid, liquid and gas which have garnered philosophical and sociological attention in analysis of contemporary societies (Bauman, 2000; Berman, 1982) and building upon such foundations, this paper asserts that Macao is a 'plasmatic entity'. In physics, plasmas are defined as the fourth fundamental state of matter consisting largely of charged particles – electrons and/or ions. Rather than choosing between the more structural analysis suggested by a more 'solid' and rooted understanding or the fluid and mobile metaphors of postmodernist perspectives, this paper argues for a focus on what charge 'ionises' the air between what is solid and liquid – what initiates and drives the key social processes between the grounded and structural and the fleeting and fluid. Using observations from the interactions Macao's neon-lit casino-laden tourism landscapes and its multi-cultural everyday spaces of post-handover still Covid-19 'plasmatic environments', this paper conceptualises 'plasmatic effects' for social analysis and identifies and examines its utility and implications for decolonising Asian tourism in thought and practice.

International Retirement Migration in Thailand and Malaysia

Though transnationalism is one of the main concepts in migration studies, 'social cohesion' has emerged as a major concept to deal with immigrants in English countries in recent years (Healy et al., 2016, p. 3). According to Mizukami (2016), "social cohesion" shows the way of social participation for transnational migrants and how to build the solidarity between transnational migrants and host society. As described, a concept "social cohesion" for international migrants is a common concept in English countries but in Asian countries or Asian migration studies, it is very few that is focusing on "social cohesion" between transnational migrants and host society. I deem that it is important to do research on the relationship between transnational migrants and host community members in not only western countries but also Asian countries such as Japan where the immigrant population has been increasing or Thailand and Malaysia where there are various ethnic groups including the Japanese community.

International retirement migration(IRM) is one of the new transnational migration patterns. Although emigrating from home countries to overseas as retirees has been a common choice for Western people since 1960, it is a new trend in Japanese society for elderly people to live overseas as transnational migrants. Therefore, in migration studies in Japan, there are only small amounts of literature which focus on IRM, specifically, the number of sociological studies dealing with IRM is extremely limited. On the other hand, it is interesting to note that some literature shows the findings that Japanese retirees in Thailand make success to build an interactive relationship with their host society. They bring my research project significant implication to consider social cohesion between international migrants and host society.

For these reasons, I deem focusing on the case of IRM is effective to consider and strengthen the concept "Social Cohesion".

Making Decent Employers Perpetrators: A Denationalized Perspective on Informalization within Japan's Technical Intern Trainee Program

The COVID-19 pandemic continues to confound lives and livelihoods across the world, and it has exerted the harshest impacts on those who were already in vulnerable positions before the crisis, including people on the move such as refugees and temporary migrants disproportionately engaged with precarious and insecure jobs. Despite temporary migrant workers' concentration into less stable employment conditions and the sectors most affected by the pandemic, they are often excluded from the states' support packages, and their hardships and continued contributions to their economic recovery have been completely ignored. With such situations in mind, drawing on the critical discussions on the global expansion of the "informal economy", this article aims to explore how Japan's increasingly utilization of the Technical Intern Training Program (TITP) as a method to recruit migrant labour on a temporary basis has been driven by the synchrony of what Zoran Slavnic (2010) calls "informalization from above" and "informalization from below" within the neoliberal restructuring of the Japanese immigration regime. By doing so, it will demonstrate the ways in which the contentious operation of the TITP has led to the abuses of technical intern trainees' human and labour rights under the construction of unequal capital-labour power relationships.

The Complexities of International Mobility for Global South Scholars in an Era of Covid-19

The covid-19 pandemic exposed and exacerbated the glaring inequalities across races, gender and socioeconomic status. For the mobile scholar from the global south, this situation became more disturbing, as the scholar had to find ways of connecting with the outside academic community for academic collaboration despite all the challenges associated and brought on by the covid-19 pandemic. The combination of lockdowns, mobility restrictions, changes in visa rules and regulations, unequal access to life saving vaccinations, non-access to good health care facilities, technologies, and disaster preparedness, just to mention a few examples, may all have a long term impact on the participation and engagement of global south scholars with their counterparts in the global north. This paper looks at ways in which feminist sociologists navigate anti-immigration policies in a bid to remain relevant in global north collaborative research and scholarship. It further contends that the promotion of diversity and inclusion in scholarship may not be feasible in the near future, especially when there are no more access to underrepresented scholars due to the bottlenecks and complexities surrounding the mobility of global south scholars.

The Intersectionality of Conflict, Migration and Human Trafficking in West Africa

Armed conflicts in most African countries destroys livelihoods, severely damages national economies and causes mass population movements. Through heightened insecurity, wars increases the vulnerability of women and children, and promotes dramatic survival strategies such as prostitution and often involves the abduction of women and children into armed groups/factions. Increased poverty of survivors, particularly widows and female headed-households, is an endemic feature of armed conflicts, with many of them becoming internally displaced people (IDP). Migration as one response to armed conflict and insecurity, results in large refugee populations, exposing the most vulnerable to an array of dangers including discrimination, sexual violence, intimidation, recruitment into armed forces and trafficking. Stringent entry requirements into many global north countries have increased the regulation of population movements. When would-be migrants fail to meet these requirements, they may resort to illegal means of migration, giving rise to people smuggling and trafficking. Analysing data from survey questionnaires administered to a non-probability sample of representative populations from Nigeria and Ghana, two countries in West Africa with massive diaspora population than other West African countries, and using a gendered lens in the analysis of the data, this study argues s that while the 2030 Agenda on Sustainable Development explicitly incorporates migration into global development frameworks and processes, migration continues to play subordinate roles in development policy and programming. This research contends that there is a need for policy makers to take into consideration the ways in which increased barriers to migration, irregular and insecure migration, bad working conditions, and a lack of protections for female migrants and their families can also result in vulnerability to human trafficking.

Scholarship As a Never-Ending Process: Asianising Knowledge and Its Perils

In the context of doing tourism research in Asia, local Asian knowledge and perspective should not be subjugated by western knowledge (e.g. Yang & Ong, 2020). Tourism scholarship has to be decolonised. However that process of decolonisation has to be interrogated.

First, knowledge can only be presented as partial truths (Clifford & Marcus, 1986). The replacement of postcolonial scholarship by an Asianised form of scholarship simply shifts one form of politics to another.

Second, promoting Asian scholarship can be regressive, if not dangerous. Many Asian societies discriminate people based on gender, ethnicity and religion. It is dangerous to replace respected scientific practices with "pre-enlightened" modes of knowledge production, allowing these modes to be considered scientific methods (Chang, 2021; Ooi, 2019)

Third, Asianisation may give rise to another set of colonisation politics. An alternative image of the Other can be invented and perpetuated by local Asian scholars (Ooi, 2019). Asianisation as a project of nationalism will merely move from one form of oppression to another.

Tourism scholars should respect local perspectives and scholarships, and in the same spirit, they should also challenge and address inequality, oppression and injustices that are inherent in Asian societies, that may come with an Asianised scholarship. Otherwise, we risk going back to feudalism and authoritarianism.

Creating Multicultural Collaboration in Local Civil Society in Superdiverse Urban Neighbourhoods. the Case of Borgerhout, Belgium.

This paper is concerned with the challenge of creating multicultural collaboration within and between local civil society organizations in superdiverse neighbourhoods in Western cities, more particularly the neighbourhood of Borgerhout in Antwerp, Belgium. It starts from a survey amongst local civil

society organisations (n=379) which showed that both membership and leadership of local civil society organizations is pre-dominantly white and does not reflect well the existing ethno-cultural diversity in society, signaling weak levels of collaboration between ethnic groups. We also observed that while local civil society organizations value community building and generating interpersonal solidarities very strongly, doing so amongst citizens with a different social backgrounds is valued significantly less. This suggests a local civil society context which discourages ethnic-culturally mixed civil society organizations.

Against this background, we explore through an in-depth qualitative case study socially innovative practices that promote multicultural collaboration in local civil society in the Antwerp neighbourhood Borgerhout, which has for long been the prime example of Flemish urban multiculture. We find that, despite the hostile environment created by the electoral rise of the extreme-right the past decades and more recently the trend towards neo-assimilationalist urban diversity policies, a more ethnically mixed local civil society is slowly but steadily emerging in the neighbourhood. We show how this is amongst others related to the emergence of an immigrant middle class, the supportive role played by social work organisations and the bottom-up dynamics in youth and sport clubs.

ORIAN WEISS, Catherine* (RMIT University, Australia)

Social Reproduction Theory and the Position of Wigrant Women in the Subaltern Labour Market

Social reproduction theory is increasingly being used to understand the experiences of migrant women in employment in Western countries. I understand social reproduction theory to be centrally concerned with the analysis of 'daily' and 'intergenerational' reproduction of labour power (see, e.g. Nakano Glenn 1992, 1), where 'daily reproduction' refers to the daily activities that keep people alive and healthy, such as cooking, cleaning, and taking care of children, the sick and elderly; and 'intergenerational reproduction' refers to the activities that keep the population of workers alive across generations, such as gestation and childbirth. Researchers such as Sara Farris (2017) use this theory in highly productive ways to explain phenomena relating to migrant women's position in the subaltern labour market. Farris, for example, analyses the construction of Muslim women as "victims to be rescued" and Muslim men as "dangerous Other" in order to funnel racialised migrant women into the care and domestic sectors in Western Europe, thus providing a source of cheap and exploitable labour in areas of growing demand.

Social reproduction theory was developed by socialist feminists and, in its usage here to analyse racialised migrant women's role in reproducing class structure in western society, it maintains a socialist focus on class hierarchy and race/ethnicity over sex/gender. In this presentation, I sympathetically interrogate this perspective, asking what the focus on class and race/ethnicity brings out in the analysis of migrant women's situation, but also what is obscured. I ask what a perspective focusing more centrally on sex/gender in might add to the understanding of migrant women in the subaltern labour market, to complement and perhaps enrich existing analyses drawing on social reproduction theory.

The Military and National Politics: The Civilian-Military Leadership Interest Convergence

This study interrogates the experiences of Nigerian troops in the war against Boko Haram. The paper's contribution is bi-dimensional. First, it adds to the empirical literature on Boko Haram by analyzing the perspectives of rank-and-file troops. The study finds 10 forms of corruption affecting troops. These have contributed to inability to defeat Boko Haram. Second, the paper adds to theoretical scholarship on civil-military relations and persistence of small wars. It challenges the bureaucratic-organizational model and the focus of civil-military relations theory on civilian *control* of the military. The study emphasizes the need to focus on the texture of the relationship between civilian and military leaders. The paper argues that the bureaucratic-organizational model has limited relevance to militaries in the postcolony and proposes a *civilian-military leadership interest convergence thesis.* The findings are relevant for understanding the spread of terrorism in sub-Saharan Africa, the persistence of small wars in non-Western, illiberal quasi-democratic societies and the ways in which national politics affect the military in the global south.

Unpacking the #Bringbackourgirls Movement: Mobilization, Internal Dynamics and State Repression

The #BringBackOurGirls (#BBOG) movement was formed shortly after the kidnapping of over 200 high school girls in Nigeria in April 2014. Scholarship on the #BBOG privileges its deployment of social media to garner global attention to its cause. There is increasing focus on whether the movement achieved its primary objective — the release of all the kidnapped girls. Much of the analysis

relies on media or secondary accounts. This paper draws on interviews and participant observation (2015 to 2017) to explore (1) the on-the-ground mobilization of the #BBOG, (2) the movement's intricate internal dynamics before, during and after its worldwide ascendance and (3) the failure of state repression against the #BBOG. The implications of the #BBOG experience for social movements in the global south are articulated.

Post Urban-Rural Frontiers? Examining Diverse Island Urbanisms in the Philippines

Islands tend to conjure images of tourist beaches or rural peripherality. They rarely figure into the urban studies literature as theoretically generative spaces that can potentially reinvigorate urban knowledge production. In empirical terms, urban studies mainly foreground inland spaces and barely represent the nature of coastal cities such as island cultures, increasing watermark on the coast, and urban island mobility patterns. Attending postcolonial provocations that advocate for urban theorization beyond the usual Anglo-American context, our paper interrogates the urban-rural interface of island cities. In particular, we foreground the various urban expressions reshaping island dynamics using two case studies in the Philippines— gender dynamics of transnational island urbanism and island memories of women baby boomers. We respond to the session on *Political Contestations Along the Urbanization Continuum* by moving the discussions on urban political contestations beyond the urban-rural binary. We argue, rather, that those labeled as urban and rural areas are mutually reinforcing spaces of island urbanism. The paper alludes to diverse urban issues taking place in island environments, including efforts to reconceptualize how we frame islands. We hope to offer a thinking space with alternative pathways to urban political subjectivities where the islands and waters are a part of conversations.

A Time to Start Anew?: Negotiating Immobility Among Return Migrants in the Philippines

Developing nations have often been criticized for limited efforts in reintegrating its returning citizens. In the case of labor-exporting nations like the Philippines, scholars have largely portrayed government agencies as either helpless in aiding return migrants or merely driven towards redeploying them overseas. However, relatively fewer studies have sought to examine what motivates different state responses to returnees and how political interests can shape their experiences on the ground. In the context of the pandemic, I argue that reintegrating former migrants was a politically urgent issue, as thousands of Filipino workers returned to the Philippines after losing their jobs overseas. Based on interviews with 55 Filipino cruise workers, I illustrate how the Philippine government sought to manage migrants' forced return by framing their immobility as an opportunity for permanent resettlement – a time for migrants to start their lives anew without the hardships of working far from home. I show how a key part of this narrative was an emphasis on skills training and entrepreneurship, placing it upon cruise workers to adopt new capacities for the pandemic economy. Underlying this discourse was the state's belief that the service skills cruise workers had honed onboard their ships were useless in the pandemic economy. As such, efforts to put a positive spin on their sudden immobility focused on reskilling them for alternative livelihoods within their communities. Eventually, such programs failed to reintegrate cruise workers in the manner the state envisioned, despite massive public funds and support. This case provides an important example of how migration governance involves not only regulating people's movement, but managing their immobility as well.

Flexible Universities, Unlikely Destinations: Coping with Uncertainty at the Periphery of International Higher Education

Studies on international student migration have mainly centered on the experiences of prestigious universities within wealthy nations like the US. Largely ignored are how institutions in the Global South can also take advantage of worldwide demands for international degrees and compete for foreign students. In this presentation, I share findings from a qualitative study on the emergence of an unlikely education hub in the Philippines, a country widely regarded for sending migrant workers overseas, yet relatively unknown as a destination for international students. Up until the COVID-19 pandemic, the Philippines received an influx of students from India, China, and the Middle East, with the vast majority enrolling in low tier, for-profit universities. This project examines how school administrators and educators altered curriculum and degree offerings in order to cater to a wide range of foreign students.

These institutions sold not only the symbolic capital of higher education degrees but academic programs specifically tailored to students' needs, desires and limitations. In the context of the ongoing pandemic, I argue that more universities will struggle to attract students from more diverse backgrounds, increasing pressure for educators to cater to multiple consumer demands and emerging trends in the global market. Examining such flexibility will be a key part of understanding the structural changes that shape international student mobility in years to come. While traditional academic centers will continue to attract international students in search of prestige, I argue that we will also see the rise of individuals seeking flexible universities, where school administrators shape academic programs, university spaces, and classroom teaching in line with the changing demands of student consumers.

Racionality and Time

Decision making linked to rationality within the field of game theory obeys general models of behavior subjected to an imaginary where the hierarchy of actions and weightings in utility are homogeneous and static among the subjects, the following proposal conditions this decision-making to the course of life, a situation that allows us to recognize the way in which the order that prioritizes one action over another changes over time, which presupposes diverse rationalities.

For this study, a game theory analysis is carried out on the hiring model of a region in central Mexico, in which there is a preponderant occupation and in which the form of intervention of the subjects represents variations that enable them to participate within of the labor market, even with the same occupation, due to different factors. A detailed analysis is also made on the nature (a priori events that condition the probability of occurrence and that limit the action of the players) that lead us to understand the structure from which the subjects start to accept certain conditions within their work, that, although they can be considered precarious, they can represent a better response given their starting condition and their possibilities.

Among the results found, we have a significant difference in the decisions made by sex and by age of the participants, which clarifies why certain behaviors are observed in hiring preferences between men and women, as well as differentiated risk aversion by the age of the participants. The results also allow us to see how employers in the region understand and take advantage of this situation to increase their productivity, which presupposes a rationality subservient to their own interests.

Recovering Ego's Memories: Some Reflections from Collecting Personal Networks of Older People

During 2019 and 2021, I studied the personal networks of older people from a mixed-method approach. More specifically, the main question was how older people used their social support network to cope with their pensions. In this context, there was collecting information from 30 older women and men living in Santiago, Chile, by 2019. During the three months of fieldwork, there were collected the complete life history of each ego and then their support networks in their most important events. Afterwards (or sometimes during the interview), there was asked to each interviewed about their thoughts on visualising their networks. It was also given them the opportunity of making changes to those. In this presentation, I will present some reflections on the process of using Vennmaker, talking with ego, helping or making it difficult for the ego to remember, and other lessons learned from fieldwork constructing personal networks of older people.

Simmel, the Adventure, Memory and the Self.

Simmel's sociology and philosophy provoke serious reflection on the role of the relational in the development of the self. The question of the relational form of personal ethics, attracts attention from various Simmelian scholars. The *Law of the Individual* in particular, provides a vigorous theoretical discussion and point of departure on the conflicting nature of the 'ought' (*Sollen*) with the 'actuality' (*Wicklichkeit*). Simmel's perspective here enables us to consider upon the function of social relations in personal ethics, and the shaping/understanding of one's experiences in different forms of life. These are shaped, importantly, by continuous relations we experience in the everyday, which Lee and Silver (2012) amongst others have expanded upon considerably. For Simmel, this is never a finished project, and the conflict between 'ought' and 'actual' remains consistent throughout life.

One of the difficulties with this approach, I argue, is that it negates the past and the formation of the self through prior experience, and importantly memories. In this paper, I want to consider upon the impact of past relations,

specifically experiences with emotional qualities, on this ongoing and never completed 'ethic'. Social interactions leave indelible impressions on the psyche, especially those accompanied by extreme emotions, which I argue shape our 'ought', and bring it into conversation/negotiation with present day relations. This paper seeks to do this by incorporating Turner's (2008) appeal for social theory to embrace neuroscientific advancement. By using work on emotional memory from this area of scientific work, I argue that moments experienced with significantly negative or positive emotions, work into the 'ought' of our everyday. Although research in this space is still limited, these findings help to articulate Simmel's relational further, and provide contemporary ground to tread reflectively and carefully with his concepts and ideas.

Continuing to Face the Unpredictable: Fukushima As a City Laboratory for a New Way of Life

Unpredictable events, such as disasters and epidemics, sometimes result in suffering beyond imagination. Important to note is that the suffering imposed is deeply social, as it is part of the social structure and history. Conversely, it is also worth investigating under what social structures enjoyment can be experienced in unpredictable events. Although several works have examined the temporary formation of a "Paradise built in Hell," characterized by people's spontaneous mutual help after a disaster, such studies have not clarified the medium- to long-term social conditions related to community formation while focusing on the psychological recovery process.

Due to the evacuation order following the Great East Japan Earthquake and nuclear accident in 2011, the population of 12,800 people of Odaka Ward, Minamisoma City, Fukushima Prefecture, was reduced to zero. Although the evacuation order was lifted in July 2016, only a quarter of the population returned. Local characteristics of community revitalization, focusing on biographies retelling the process of reconstruction in Odaka Ward, are analyzed and discussed in this report.

When the evacuation order was rescinded, everything was a local issue in the devastated town. However, because there was nothing there, the returnees cooperated to reconstruct their lives and create a new neighborhood by rediscovering and utilizing the nature that originally existed in the area without being bound by common sense or vested interests. In the reconstruction process, the community's goal was not to attract large corporations or rely on subsidies, but to create a diverse business environment in which many small-scale sustainable businesses could thrive. The goal was to foster a positive climate for entrepreneurship by attracting and supporting the challenges of migrants who wanted to achieve self-fulfillment. In sum, the biographies show Fukushima as a city laboratory for new ways of life, fostering a local culture that can cope with unpredictability.

"Words" That Communicate: Queer Performances As Public Health Activism

During the HIV/AIDS crisis of the 1990s, public health activism among sexual minorities in Japan was achieved through the People Living with HIV themselves without any support from the government, especially for the first decade. Several studies have suggested that the gay magazines and medical information magazines launched by the People Living with HIV (PLWH) played an important role in sexual health education and fostering hope for survival of PLWH. However, with the exception of distributing condoms, it is not clear how they actually approached sexual minority communities, and their methods have not been fully elucidated. This report aims to describe how AIDS activism expanded, using oral/life history interviews, gay magazines and biographies, and to clarify its relevance to social theories such as the queer theory, life politics theory, and stigma and resilience theory.

The results revealed that the AIDS activism investigated in this study focused mostly on building relationships to "get people to listen" to stories about HIV they generally did not want to hear. The attempt used to establish this relationship was the practice of "gender trouble" in queer theory. It became clear that the participants were attempting to expand their activism spatially by clarifying and incorporating the content of the information they wanted the audience to hear as a "community of sentiment" within the cityscape. This report contributes to a theory of practice on how vulnerable groups work with their surroundings (others) for the inclusion of HIV/AIDS as one of their own problems and realities.

Navigating Spatial and Social Mobility through the Transnational Space: An Intergenerational and Gender Approach

The aim of this paper is to analyse the articulation between social and spatial mobility strategies of transnational families, through a perspective that considers gender and generation as essential variables when defining the mobility (and immobility) trajectories of individuals. To this end, we conceptualise social and spatial mobility on the basis of projects, strategies and trajectories, from three levels: micro, applied to the individual migrant; meso, to the family; and macro (structural determinants). The research considers a transnational approach to social mobility, as a process that is articulated through the space of origin and destination. The methodological strategy used is based on a multisite ethnography and longitudinal fieldwork. Biographical interviews were carried out with transnational families of Latin American origin (from Brasil and Ecuador), selecting different members of each household group, belonging to at least two generations. A total of 69 interviews were conducted.

The main results highlight the role of transnational family dynamics in the articulation of spatial and social mobility, as well as the importance of undertaking actions of solidarity and resilience, especially for women. The strategies analysed, from an intergenerational perspective, show how the trajectories of social and spatial ascent, descent or stagnation are not linear. That is to say, the migrant of reference may experience a rise in the social hierarchy, at the same time as another family generation may experience downward social mobility, resulting in trajectories defined as "non-concordant" throughout the different social spaces in which the migratory process is constructed.

Planning Crisis: The Promise of New Political Actors & Forms of Agency in Post-Disaster Mocoa

During the evening of March 31, 2017, a major avalanche swept through the Colombian city of Mocoa, killing three hundred and thirty-two people in roughly thirty minutes. With a total of twenty-two thousand people impacted, this catastrophe is the fifth largest climate disaster in the history of the country. This research project is the first comprehensive study analyzing the long-term implications of the disaster on urban governance, framing an ongoing "planning crisis" that has normalized post-disaster conditions. Despite the alignment of major national political commitments, international cooperation, and a multi-million-dollar humanitarian budget, government plans have not been implemented. But in contrast to popular perceptions that the lack of results in Mocoa suggests the failure of planning, the project explores the success of multiple counter-agencies that have been activated to neutralize official plans. I answer the following questions: a) How have the causes and implications of the disaster been understood differently by government planners and civil society organizations? b) Which actors have taken part in planning recovery efforts, and c) How have differences in purpose, power and levels of achievement, determined which planning actions are taken or not taken? Using qualitative data recorded over a period of four years, I study "insurgent planning actors" (Miraftab, 2016) in Mocoa's comprehensive planning and disaster recovery processes. As an extreme case illustrating the work of urban planners in a small city bounding Colombia's urban frontier with the Amazon rainforest, the project contributes to our understanding of "enunciatory communities" (Fortun, 2001) to explain how new actors emerge and activate inside and outside of the planning process. Reflecting on the opportunities and challenges that they face, I approach the concept of "planning crisis" to discuss the prospects of a new planning paradigm with epistemological, political and ontological considerations to help "decolonize" the planning profession (Miraftab, 2016).

Return Migrants, It-Bpo Industry, and Virtual Home-Based Workers in the Philippines during the COVID-19 Pandemic

Overseas Filipino migrants and Information Technology-Business Process Outsourcing (IT-BPO) industry have often been examined together. Overseas remittances and the IT-BPO industry are both significant sources of foreign exchange for the Philippine economy. Furthermore, both sectors tend to rely on highly educated female workers, and many current workers in the IT-BPO industry have worked or hope to work abroad. During the COVID-19 pandemic, the government and business communities expected that the IT-BPO industry, responding to a rapid rise in demand from abroad, functioned as a reservoir for returned migrants who lost jobs in their host countries. At the same time, the pandemic accelerated the growth in a virtual home-based workforce (e.g., virtual assistants) who worked under direct contracts with foreign companies or individuals. Many workers in IT-BPOs moved to virtual home-based work due to their strong preference to working from home. In this presentation, I will focus on 1) the interaction between the overseas migration workforce and the IT-BPO workforce and 2) the effects of the pandemic on the interaction between the two, paying close attention to the increase in virtual home-based workers. In this examination, I explore how the IT-BPO industry and virtual home-based work have functioned in the case of returned migrants in the Philippines.

From Partner to Bully: The Rise of Precarity in China's Walmart Retail Stores

From Partner to Bully: The Rise of Precarity in China's Walmart Retail Stores
Eileen Otis, Department of Sociology and Anthropology
Northeastern University
In 1996 the global retail behemoth, Walmart, launched its flagship China retail store in Shenzhen, not far from the factories that produced goods sold on its North American shelves. In its early years of operation, the firm that is notorious for its low-wage employment in the U.S., offered well-paying jobs, useful skills training and a culture of dignity to its mostly rural migrant employees in China. However, just a decade later the firm began a descent into low-wage employment, precaritized jobs and a culture of bullying. This paper follows the path of Walmart's travels in China from a high-road employer that successfully cast itself as partnering with workers to a low-road and deeply resented employer, as it grew into one of the country's largest retailers, with 438 outlets. The analysis is based on in-depth accounts of veteran workers, in addition to data collected from interviews and ethnographies of stores in 7 different cities. Workers described the processes through which Walmart dismantled a labor regime viewed as benign and beneficial, replacing it with practices like flexible scheduling that created a precarious workforce and ultimately contradicted the firm's core principles. These processes combined bullying with legalistic contract rituals integrated into the labor process, which produced "uninformed consent." Central to worker resistance was the Walmart Chinese Workers Association, an internet forum created to support employees across the country especially by prompting "informed nonconsent" among workers. I supplement workers' accounts with analysis of the Association's newsletters, discussions, and announcements. I examine the interplay of control and resistance, including brief strikes, as workers struggled against the degradation of work.

What Just Transition Do We Want? Suggestions for Public Opinion Research on Eco-Social Policies

'Just transition' to carbon-neutral and socially just societies form a cornerstone in the European Green Deal, and eco-social policies to deliver on these objectives are top priority for an increasing number of national governments. Despite the prominent place just transition currently holds in the political and academic arenas, little is still known about public support for a just transition and for eco-social policies. In particular, the emerging literature investigating people's attitudes in this field presents at least a couple of important gaps. First, existing studies have mostly focused on the correlation between support for social policies and support for climate policies, framing them as two separate entities and hence neglecting the relevance of their interconnections. Second, as just transition has arguably grown into a contested concept, not all eco-social policies are the same and due distinctions should be made. Against this backdrop, this paper makes two important contributions: First, building upon a review of literature, it operationalises the different understandings of just transition into one integrated analytical framework, distinguishing between different types of policy goals, instruments and governance procedures. Second, on the basis of this framework, it critically reviews existing attitudinal research and proposes survey questions that better approximate the complexity of public support for just transition. Sound survey data is key to informing policymakers about what kind and degree of just transition has the potential to gain a significant degree of legitimacy.

Social Capital Formation Among Third Sector Organizations

Measuring social capital has been a challenging task over the past few decades, and, still, many of its dimensions and manifestations have not been thoroughly or evidently explored. The possible causes may be the ever-changing evolutionary perspectives that take place within the various levels of analysis—micro, meso, and macro—or within the various settings, where some of its core dimensions—bonding, bridging, and linking—are developed, or even among the contexts where its core determinants and features—trust, norms, connections, ties, etc.—are observed. Having in mind the various streams of research and theoretical discourses on social capital formation, this paper aims to surface the identification of the possible evidence on the formation of social capital among social economy organizations, and particularly among social enterprises. In doing so, it aims to explore the relational and cognitive features that drive social enterprises in their interorganizational cooperation with other social enterprises and third-sector organizations. The findings suggest that the central components of social capital, such as the sharing of common

values, trust, reciprocity, and trustworthiness, are among those features that support cooperation and engagement in common activities among third sector organizations.

Tracing Grain Digitally from Farms to Markets. Promises, Trials, and Lessons for Technological Design

Smartphone applications for sustainable farming practices, algorithmic counselling services, sensors to provide information to consumers: digital technologies are applied at various levels of food value chains. This digitization is aimed at optimizing and reinforcing the integration of human and non-human actors into agro-food systems through data flows. Literature emphasizes the rush of dominant actors in agro-food systems towards gathering farmers' data in order to move forward industrialization in agriculture (Fraser, 2018; Bronson and Sengers, 2022). At the same time, scholars point out that even the most powerful and best resourced firms struggle to enroll farmers in their databases (Friedberg, 2017; Hatanaka et al., 2022). This communication studies digital traceability tools, i.e. technologies producing data on farmers practices and grain characteristics to optimize value chain through the circulation of information among actors. Grain production monitoring is targeted by private actors who envision a way to optimize its management, trace quality characteristics, or implement new environmental practices through record keeping software, data platforms, smart tractors, and sensors. Through a Science and Technology Studies perspective, this communication is based on a qualitative fieldwork based on interviews with businesses that are designing traceability platforms for grain production (a multinational corporation and a startup), academic researchers specialized in traceability. First, we assess the promises and pitfalls of digital traceability in grain value chains. We review the economic opportunities that motivate pursuit of differentiated markets and a consumer-driven food system, and we review the institutional and technical challenges that actors face. Our analysis highlights how these challenges lead the actors to 'pivot' – i.e., advance adaptive strategies in response to failures. Secondly, and in relation to the Cornell University computer science – social science collaboration that funds this study, we offer a reflexive perspective on how to incorporate these pivots into processes of digital agriculture design.

Enemies, Emotions and the Making of Authoritarian Media: The Turkish Case

Existing studies of democratic backsliding highlight the silent revolution in values, the breakdown of norms due to polarization, and the malleability of laws as triggers for institutional decay. Focusing on the recent experience of media decay in Turkey, this paper instead presents the role played by emotions in the breakdown of democratic institutions. It argues that when governments succeed in creating emotional climates that stall the likelihood of coalition-building between opposition groups, institutional actors transform the institution from within as to give it a more authoritarian structure. Between 2007 and 2010, Justice and Development Party in Turkey upended the previous construct of the nation, stigmatizing previously power-holding secularists as enemies of the nation while depicting the religious community as the core of the nation. In this context, pro-Islamic and liberal journalists came to think of their news practices as a means of empowering the previously excluded groups and took pride in attacking the secularists at the expense of violating journalistic standards. Secularist journalists, on the other hand, resigned, founded new outlets, or exercised self-censorship under increased feelings of uncertainty, fear and fury. Pro-Kurdish and leftist journalists confused by the possibility of punishing the perpetrators of previous exclusion, refrained from acting in solidarity with the newly contentious secularists, often using their journalistic conduct to attack the previous power structure. Altogether, journalistic responses to the emotional climates created by the government's construct of enemy increased the practice of fake news, lead to extensive levels of self-censorship, and pushed critical news-stories to outlets with limited readership in Turkey. Based on the Turkish experience, the paper shows that the interplay between different emotional climates explains the bottom-up transformation of institutions. The argument of the paper builds on field work and in-depth interviews conducted with journalists in Turkey between 2011 and 2014.

OVERBYE, Einar* (Oslo Metropolitan University, Norway)

Converging and Diverging Trends in Global Welfare Outcomes

Do welfare arrangements become more similar or more different across countries? The debate has been heated at times. It is, however, three questions rolled into one. The first question is if *the political goals of rulers* have become more similar. The second is if the *welfare policies they pursue* are becoming more similar. The third question is if *welfare outcomes* have become more similar. "Convergence" with regard to any of these three items may not imply "convergence" with regard to the other two. This paper includes a brief

discussion on goals and policies but concentrates on welfare outcomes, since similar outcomes can be reached by different policies, or without any policy goals on behalf of rulers at all.

To investigate outcomes we must operationalize "outcomes", plus decide where fairly reliable measures of these operationalizations exist across most countries. In addition, we must decide on measures of "divergence/convergence in outcomes". A much-used distinction is between absolute and relative empirical measures. We apply the term relative convergence (divergence) when observing a drop (rise) in the value of the coefficient of variation, and the term absolute convergence (divergence) when using the statistical variance or standard deviation as a criterion.

The paper limits attention to aggregate measures of social welfare and health that are available across most countries: The Human Development Index, global under-five mortality, average annual incomes across countries with/ without control for population size (plus differentiating between absolute and relative income differences), and finally changes in average life-cycle incomes. The time period is 2000-2020/1. Methodological and theoretical problems when interpreting the results are discussed, including how changes in within-country differences interact with changes in between-country differences.

OYARZO, Gemita* (Universidad Autonoma de Chile, Chile)

La Reinvención De Lo Político: Actores, Proyectos Colectivos En Disputa,Trayectorias De Movilización e Institucionalización De Los Movimientos Sociales Del Chile Del Proceso Constituyente.

El protagonismo del movimiento político indígena, del movimiento feminista y del movimiento ambientalista en la Convención Constitucional (2022) mostró la emergencia de actores colectivos que, aunque no eran nuevos, nunca antes habían debatido en un espacio institucionalizado de deliberación política. En un contexto marcado por la fragmentación y la desconfianza en las instituciones democráticas, la competencia de proyectos colectivos y de las diversas demandas identitarias levantadas por estos tres movimientos, ha sido señalada como la razón principal del fracaso del texto constitucional que no convenció a grandes mayorías.

Así, la derrota electoral del proceso constituyente chileno (2022) deja interrogantes abiertas sobre la capacidad de los movimientos sociales de continuar desarrollando sus agendas de movilización en los próximos años. Este trabajo sostiene que, pese a sus resultados electorales, el proceso constituyente puede interpretarse como un laboratorio deliberativo, en el cual, los actores emergentes acumularon experiencia y capital político. Este balance del caso chileno, junto con la discusión de algunos conceptos centrales de la teoría de acción colectiva (Melucci, 2002; Mc Adam y Tarrow, 2010; Diani, 2015) y de las emociones asociadas al compromiso político (Whittier, 2001; Jasper, 2012; 2013; 2018; Flam, 2005; 2015; Della Porta y Giugni, 2013; Poma y Gravante, 2015; 2017; 2018; Pleyers, 2017; 2018; Poma, 2019; Gravante, 2020), permiten suponer la continuidad de la demandas por el reconocimiento y de las luchas de los movimientos por ocupar espacios de representación.

La presentación discute los resultados preliminares de una investigación cualitativa basada en entrevistas a dirigentes y participantes de los tres movimientos. A través de : a) la evaluación de sus estrategias políticas y formas de coordinación; b) la reconstrucción de sus prácticas de organización y de; c) su disputa por ocupar espacios institucionales, el trabajo aborda las fluctuaciones y dificultades de la reconfiguración del campo de acción colectiva.

Part of the Problem or Part of the Solution: The Ambiguous Contribution of Companies and Branches to Inequality and Exclusion from Late Work in Sweden

Although there is rich literature on factors that affect participation and exit patterns of individuals in late working life, the emphasis on individual decision making rather than employer behaviour. However, the employer's decision to hire older employees play important role in unemployment and exit of the older workers in late working life.

This paper aims to understand the link between company characteristics and the companies' employing behaviour of the older employees. Using Swedish registry data that involves all companies in Sweden that have at least one gainful employee between the years 1990-2018, this study investigates how do age and education composition, sector, the scale of the company and labour market structure affect companies' likelihood of hiring older employees.

This paper shows that companies with high share of older employees, single workplace and small-size companies are more likely to hire older employees. While companies in energy, transport, education, health, cultural services sectors are more likely to hire older employees, companies in information and communication, trade, hotel, and restaurants are less likely to hire older employees. Moreover, labour demand seems to be adversely linked with the share of older employees among newly hired employees. Companies in the regions with high unemployment are more likely to hire older employees while companies in the regions with high labour demand are less likely to hire older employees.

The study contributes to the understanding of inequality among the groups that are structurally distributed in different sectors, regions and type of companies in late working life.

La Loi ᴅe La Nature Et La Loi De La Société Chez Durkheim Et Bergson

En tant qu'ensemble systématique de méthodes d'intelligibilité du réel, la science s'est d'abord appliquée à explorer les phénomènes de la nature et le corps humain, avant d'examiner notre *psyché*. La démarche scientifique a donc « colonisé » l'ensemble du réel.

Suivant cette logique, Durkheim a fondé la sociologie. Il soutient qu'il nous faut élucider le social selon le principe des relations de cause à effet, ce qui revient à introduire le déterminisme dans les faits sociaux. Les faits précédents produisent les faits suivants et les déterminent.

Les sciences ont tenté de résoudre le problème de la clarification scientifique de nos actions en découvrant les lois de la nature. Par ailleurs, ce n'est pas un hasard si la notion de « lois » emprunte au vocabulaire juridique. C'est notamment cette notion de « loi » que je veux interroger.

L'ambition de cette présentation est d'étudier s'il est possible d'élucider la véritable nature de la vie de l'existence humaine, complexe et créative au moyen de la science. À cette fin, nous introduisons une perspective de la pensée de H. Bergson, le philosophe de la vie. En remarquant le mot de « loi », Bergson aborde ces problèmes et tente d'élucider ce qui provient des forces qui influencent nos actions.

Bergson a critiqué la tendance à dépendre du fondement de droit pour la loi physique. Cependant, ses critiques vont au-delà de la confusion entre les deux types de lois, les lois physiques et sociales. En outre, le caractère absolu de la loi naturelle elle-même est discutable. Selon lui, les lois naturelles ne sont pas présentes *a priori* en tant que données, mais ne sont qu'une des méthodes de reconnaissance que nous avons adoptées pour nos propres besoins. Dans cette présentation, je voudrais réexaminer le concept même de loi.

OZLU DINIZ, Simay* (Baskent University, Turkey)

Amenity Migration and Relational Space

From a relational sociological perspective, space is not independent from time and people are in a constant relationship with physical location and social status (power). Amenity migration, which is generally researched as retirement migration, is emerging as a "lifestyle immigration" seeking a less crowded, healthy, cheap and quality life rather than economic concerns. While this phenomenon is concentrated in coastal and touristic places, it affects the biopsychosocial (BPS) health status and life satisfaction of individuals. The purpose of this study is to understand the motivations of amenity migrants in Turkey, as well as their health and welfare status, spatial adaptation processes and socioeconomic changes they exert in their new places after Covid. A qualitative method is used among subgroups of gender, socioeconomic status, location, Covid and health condition of those who migrate from big cities to rural areas such as Bodrum, Kuşadası, Datça and Ayvalık before pension. The research which is conducted with firsthand and secondary data together with direct and indirect observation (interviews-6, internet-5, media-5). Different data sources were used in the form of a triangulation. The analysis of the findings was made with axial coding in line with the concepts included in the open coding according to the grounded theory. The reasons for migration were summarized as escaping from the chaos and system of the city. The post-migration changes of immigrants were revealed as human relations, time, nature relationship, trust, productivity and minimalism. In addition, it is understood that while some immigrants adapt to the new local life in a minimalistic pattern, others try to convert the lifestyle in a way that is similar to the city life. Different categories of migrants were used accordingly in the typology.

How Peacekeepers As Leaders Embrace Dynamic Tensions?

The paper examines how military leaders serving as peacekeepers navigate complexity and adapt to it. The theoretical discussion is embedded in two distinct, but related streams of research developed in different theoretical contexts that inform our understanding of how leaders act in and adapt to complexity. Those streams are research on Complexity Leadership Theory and adaptive peacebuilding. The article seeks to answer the following question: What are the dimensions of complexity and their intertwined tensions and actions that open the adaptive space for emergence in the peacekeeping operations context? Focusing on tensions and actions highlights their intertwined nature and the dynamism spurring adaptive leadership.

The findings are based on 29 interviews with military leaders with command experience on peacekeeping operations. The findings introduce five dimensions that unpack complexity into structural, functional, security-related, professional, and steering-related complexity and provide empirical evidence on balancing actions relating to complexity in a peacekeeping context. The paper develops an analytical framework for peacekeeping. It also contributes to Complexity Leadership Theory by unpacking the complexity into dimensions, unpacking the actors into groups and communities with commitments, and by addressing power relations and the dark side of their emergence.

A Wallet on Your Phone: Preliminary Findings on the Salvadorean Bitcoin Bet

In November 2021, newly elected president Nayib Bukele announced that El Salvador would adopt bitcoin as legal tender, making the small Central American country the first in the world to do so. While this was not the first time El Salvador combined authoritarianism and economic initiatives to bolster the nation's links to the global economy (coffee in the 1860s, maquilas in the 1960s, dollarization in the 1990s), we choose to focus on this "virtual turn" to investigate new strategies for economic development in the Global South.

While many in the international financial press and academic establishment questioned the economic advantages of such a move, views from bitcoin enthusiasts and investors ranged from praise to disapproval. In El Salvador, the efforts towards a digitalization of the economy have been centrally framed as a zero-cost attempt to raise living standards. However, some sectors of the population met bitcoins with scepticism and suspicion, expressing concerns on the higher risk of corruption and money laundering.

Preliminary data suggest that two parallel economic/monetary systems might be developing, further marking the divide between ruling, internationally minded elites and the popular sectors of the population, and in which political allegiances play an important role. The paper will also provide comments from ongoing research on bitcoin in everyday lives, with a focus on the political and social backgrounds informing peoples' understanding and economic choices. Finally, we interrogate how digital economies and virtual currencies may reaffirm or produce new forms of inclusion/exclusion (Maurer, Musaraj and Small 2018).

Radical or Radicalized? Role of Power, Discourse, and Subjectivity in the Jan 6th Insurrection

In 2020, the US Department of Homeland Security (DHS) identified white supremacists as a "persistent and lethal" threat to the United States. While research on radicalization has identified several individual-level risk factors associated with criminal extremism, scholars are generally in agreement that there is no single profile of an extremist. The unrepentant behaviours associated with extremism and the dissident ideology carried out by those who attacked the Capitol on January 6, 2021, have changed American politics forever. This case study explores Donald Trump's role in influencing Jan 6th insurrectionists to act violently using Michel Foucault's work on self-formation, which deals with the relationship between the three main and intrinsically connected forces: power, discourse, and subjectivity. The findings of this presentation suggest that each of these forces has a unique relationship with one another, and these three forces have an enormous influence on the formation of an individual.

Collaborative Research in Gender and Refugee Studies: When the Dream Methodology Is Not Possible

This paper reflects on an action/collaborative research project that took place in Portugal between 2019 and 2021, which focused on a gender and intersectional analysis of the experience and trajectories of refugee women. As a researcher committed to collaboration and participatory process during research, the team encountered multiple difficulties, both during fieldwork as well as when trying to articulate with refugee women. Our proposed methodology included "community researchers" and "action research related to emancipatory and/or empowering interventions". However, along the way, several obstacles interfered or conditioned the original plan, from encountering "gate keeping", administrative and bureaucratic, cultural and linguistic barriers. Moreover, our positionalities as researchers from the Global South and feminist are not always enough to reach out and make the difference. Several challenges arose during the research process, leading to multiple plausible solutions or patchwork to arrive to acceptable compromises. Yet these solutions may not be ideal for participants, or researchers, even if research findings still fill a relevant gap, both in research and policy-making. This paper will reflect on the rocky research path, the solutions envisioned and the learned lessons which could inform future research.

Navigating Precarity and Power Dynamics: Fieldwork during Crises in Rural Sri Lanka.

In this paper, I reflect on undertaking research during multiple crises: the global pandemic and extreme economic and political disruption in Sri Lanka in 2022. Focusing on the power dynamics associated with in-person fieldwork and within national-level feminist organisations, grassroots organisations and their members, I also focus on the positioning of doctoral students within feminist research.

My research focuses on women's multiple forms of resistance against the labour and livelihood system created by agri-companies in Monaragala, Sri Lanka. I conducted fieldwork between May- October 2022, amid the covid pandemic and economic crisis in Sri Lanka.

The new forms of fragmentation created by multiple crises required me to constantly reformulate my fieldwork plan based on the nature of the problem at that point. I had to consider the shortage of essential consumables and the volatile political situation in the country and constantly adjust my fieldwork plan to cause minimum inconvenience and discomfort to the participant and myself in challenging times.

On the other hand, I had to also navigate between the politics of women's activists in three organisations and understand the exploitations within the women's organisations, contributing to broadening the understanding of what constitutes feminist engagements, the nature of these engagements and the disjuncture between theory and practice.

While women in rural organisations claim national-level organisations used them, I witnessed women's leadership within these rural organisations using power over their workers. As an outsider to the community and an activist in the larger feminist movement, I had to situate myself within these power dynamics in my study.

In this paper, I will share the challenges I faced while conducting fieldwork to reflect on how crises create new forms of precarity for doctoral researchers and how I situated myself as a doctoral student within feminist research.

Precarious Work and Women: Employment in Agrarian Economies in Rural Sri Lanka

Following the liberalisation of the economy in 1978 and the introduction of new economic reform programmes in Sri Lanka, labour flexibility increased throughout various sectors. In agriculture, it was instigated by factors such as land dispossession in the 1980s and, at present, the non-availability of ready cash. Women started working as daily wage earners in agrarian companies, contributing to increasing precarity among women workers in rural agrarian economies.

The nature of precarious forms of employment in agrarian economies changed with the introduction of new agrarian companies. Over time What was initially women working for a daily wage in the agricultural sector in the 1980s and 1990s has now transformed to add new forms of employment with agrarian companies employing women as agency-hired employees, commonly known as outsourced labour. This new trend creates an informality in formal economies with limited job security, health and safety regulations and a lack of employer accountability.

Women's contribution to the economy employed under these arrangements is undervalued in the national income accounting as they are not recognised as part of the core workforce. The new labour precarity created with the introduction of the new agrarian capital in rural Sri Lanka also contributed to changes in gender hierarchies.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In this paper, using a Feminist Political Economic perspective and the case study of Monaragala, Sri Lanka, I will examine the commodification of women's labour and the nature of the various precarious forms of employment available in the rural economy following the introduction of the agrarian capital. I will look at push factors for women to join these companies as daily wage earners. I will argue that these types of employment create a persistent state of dependency on agrarian companies and a constant state of poverty among women in rural agrarian economies.

The Algorithm Role in Medical Practices: The Case of Tonicapp

Recently arose several digital platforms developed for health purposes. In this background the datafication logic drove towards expressions as the *Internet of medical things:* an approach oriented to health data analysis held by digital practices and ICT use in support of remote diagnosis. On the base of the algorithm logic of digital apps duly trained because of medical needs, the suggestion of social science is today oriented to comprehend if and how the relation between doctors who make use of these apps and their patients changes, as well as the medical practices have changed because of the apps support.

Ascertained this background this paper is focused on the operation of *TonicApp* (tonicapp.it): a digital mobile support granted as medical device developed in Portugal and recently widespread in Spain, France and Italy.

The main feature of *TonicApp* concerns the exclusive access and use of the medical professionals only and the associated opportunity for them, with the help of other professionals as i.e. engineers, data scientists etc., in generating, storing, collecting and sharing multiple health data as diagnosis, treatments and well-being data.

In order to understand the social impact of this platform, a multi stage methodological path is proposed.

First of all, an exploration of *TonicApp* is held for a structural analysis of its digital architecture and functions. Later, a second research phase provides a participant research action in collaboration with a per quota sampling of user-doctors. In this way, by the later qualitative interrogation shaped on the medical experience of research co-participant we aim to return interesting results in terms of personalised medical assistance paths; new treatment opportunities; potential risks related to the availing of artificial intelligence and the empowering perception to use algorithms in support of medical practices.

Determinantes Del Acceso a La Justicia En El Ámbito Laboral Desde Una Aproximación Cuantitativa. Un Análisis Del Caso Mexicano

El objetivo de este trabajo es brindar elementos que contribuyan a situar y estimular el debate sobre el múltiple cruce en el que hoy se encuentra la gestión de las instituciones que imparten justicia, en particular en el ámbito laboral, y en el que confluyen factores de muy distinta índole: jurídicos, legales, administrativos, pero también, sociales, demográficos y culturales. Como caso particular se identifican y reconocen aquellos factores que inciden en la población mexicana para el acceso a los servicios de la justicia laboral, en el marco de la reciente reforma de la justicia laboral en México. Para lograr lo anterior, se utiliza la información proveniente de distintas fuentes: encuestas y datos institucionales. Los datos permiten destacar el fenómeno de acceso a la justicia es regulado por racionalidades diversas, las cuales pueden tener una base social, cultural, económica, política y simbólica, por lo que tanto el derecho como el acto de acceder a, se encuentra vinculado a una amplia gama de prácticas y fenómenos sociales, que lo atraviesan y condicionan en diferentes grados y en distintos momentos. Bajo esta condición, analizar este fenómeno implica considerar una variedad de situaciones, dificultando la formulación de una definición general y exhaustiva que dé cuenta de la diversidad y complejidad de las realidades que abarca. Esto último, es lo que se busca mostrar y discutir con este trabajo.

Educación, Pobreza y Cultura Como Elementos Claves Para Explicar El Fenómeno Del Trabajo Infantil. El Caso Mexicano Como Ejemplo

El fenómeno del trabajo infantil es complejo, pues se vincula con condiciones estructurales de desigualdad y pobreza de las familias. Desde esta perspectiva, las visiones simplistas han demostrado ser ineficaces, pues medidas tales como la prohibición absoluta del trabajo de niñas y niños, sin ir acompañadas de políticas integrales de combate a la pobreza, han tenido como consecuencia una mayor informalidad y precarización de las condiciones laborales. Esto obliga a profundizar en el conocimiento del fenómeno del trabajo infantil desde una visión que considere a niñas y niños como verdaderos titulares de derechos, examinando las causas y consecuencias que la vulneración de estos derechos tiene, no solo en la vida de los niños y sus familias, sino en el desarrollo social, político y económico del país. Esta investigación busca profundizar en el conocimiento del fenómeno del trabajo infantil en México, como un referente para la construcción de un modelo analítico general, desde la perspectiva legal y empírica, con el fin de sacar a la luz realidades subyacentes, persistentes y muchas veces ocultas. Se realiza un recorrido general de diversos instrumentos jurídicos, tanto nacionales como internacionales, que permitirán definir teórica y conceptualmente, así como categorizar el fenómeno. Adicionalmente, se realiza un análisis empírico a partir de la información proveniente de la Encuesta Nacional de Trabajo Infantil (INEGI, 2019). Con estos datos se llevó a cabo un análisis descriptivo que a partir de la aplicación de pruebas de hipótesis permite diferenciar características particulares del fenómeno según variables de corte seleccionadas. Para complejizar el ejercicio, se recurre a un modelo multivariado, empleando la condición de actividad de niñas y niños como variable dependiente y las características sociodemográficas de la población infantil y la de los jefes del hogar, así como características de los hogares como variables explicativas.

On the Trail of the Everyday Cultural Conversation: Benefits and Limitations of Use of the Experience Sampling Method (ESM) in Sociology.

In a context of increasing interest in studies based on data continuously produced by connected digital devices, our study interrogates the relevance and biases of an original survey method based on multiple micro-surveys self-administered by smartphone app. Based on the Experience sampling method (ESM), we carried out in the context of the H2020 project INVENT (European Inventory of Societal Values of Culture as Basis for Inclusive Cultural Policies) three semi-longitudinal surveys deployed simultaneously in nine national contexts using three different data collection structures. The ESM approach can reduce memory biases related to the restitution of lived experience and to the moment at which someone answers a "one shot" questionnaire. The ESM is widely used in psychology and health studies, but it remains rarely used in sociology. Halfway between an online survey and an analysis of activity traces on connected digital devices, the innovative studies we conducted allow us to examine the advantages and limitations of such a method in the context of a sociological analysis. The paper shows that, despite the epistemological advantages (observed and potential) of such an approach, in its current state the requirement of high respondent willingness and availability reinforces the overall selection bias of the survey.

El Cuerpo, Los Sentidos y El Sujeto En El Alzheimer: La Enfermedad Contada Por Los Familiares

Desde las últimas décadas del siglo XX se ha observado la generalización del diagnóstico del Alzheimer para tratar patologías relacionadas con la pérdida de memoria, lesiones cerebrales y senilidad. Recuperando el concepto de "demencia", la razón médica se constituye como "voz autorizada" para significar experiencias de desplazamiento del sujeto de sus lazos sociofamiliares, de sus competencias cognitivas y adaptativas, así como de su propia subjetividad, atribuidas a daño neurocerebral, causado por la predisposición a la enfermedad. Esta forma de tratar la enfermedad tiende a producir efectos de objetivación y de "retirada subjetiva". ¿Será inconcebible pensar en el Alzheimer más allá de esta dimensión estrictamente neurológica, fisicalista? Así, nos interesa dialogar con la noción lebretoniana de "desaparición del sí" (Le Breton, 2017) para pensar estos vectores de subjetivación ligados a la experimentación del Alzheimer: ¿Qué modos de experiencia del sujeto con el mundo, con los sentidos, con su identidad y su cuerpo se pueden describir? Para dar cuenta de estas dimensiones, movilizamos, como marco teórico-analítico, un diálogo con la antropología del cuerpo, las emociones y los sentidos de David le Breton. Traemos, como material empírico, narrativas de la enfermedad, constituidas a través de entrevistas con familiares y cuidadores. En cuanto a los impasses subjetivos, entre otras dimensiones analizadas en los relatos, encontramos narrativas de extrañamiento, de desorientación,

de búsqueda de resignificación, vividas por los familiares/cuidadores ante los cambios percibidos en los enfermos de Alzheimer. ¿Dónde está el sujeto en ese cuerpo que se marchita, que se extraña, que llega a no reconocerse más? ¿Dónde persiste el sujeto en sus nuevas formas de sentir, tocar, percibir y relacionarse con el mundo? ¿Cómo se describe esta reorganización de los lugares y vínculos sociopsíquicos inducida por la posición de sujeto Alzheimer? Estas son las preguntas que queremos desarrollar a partir de las narrativas.

The Test for "Post-Neoliberal" Governance: Harnessing Human Value with Residual Competition

This presentation does not elaborate on an "alternative" mode of corporate governance or global governmentality as such. In principle, it develops an immanent Foucauldian critique of the market-like instruments that neoliberal thinking has promoted for the management of state institutions, NGOs and companies. This critique, however, will allow us to pinpoint a flaw that neoliberal solutions have from their own point of view. And once we have this internal or immanent reason for the suboptimal character of "market competition" as a principle of organization, it will become possible to delineate a "post-neoliberal test" for the kind of instruments of governance that would definitely overcome this flaw, a test that will still apply to the policy maker or managerial author who insists in resorting to the market form for inspiration.

In the current debate about "stakeholder capitalism", this kind of immanent guiding post has been lacking. The traditional principle of MSV (maximizing shareholder value) has been denounced for promoting the extraction of value rather than its creation. Yet critics of the new proposal have also come to question how management decisions could be orientated with precision by such a multi-perspectival referent and realistically steer away from such a clear-cut managerial point of reference as MSV .

My argument will go along the following lines: The function of a market is in principle to help us find or "discover" value produced by the creative actions of others and to reward or "harness" the production of that value. The strictly economic market coordinates this twofold task via the price mechanism, but when the market is approached as a governance instrument, its discovery function could be performed better through a dispersion of humanist agents assigned with the task of allocating incentivizing rewards based on non-standardized and deeply qualitative evaluations of individual cases.

PALMBERGER, Monika* (Department of Social and Cultural Anthropology, Austria)
GOETSCH, Barbara (Department of Social and Cultural Anthropology, University of Vienna, Austria)

Ageing in Times of the Pandemic: Experiencing the COVID-19 Pandemic in Care Institutions

The older persons we spoke to in a narrative-ethnographic study in two retirement homes in Vienna, Austria, consistently maintained that they were not afraid of the COVID-19 pandemic. Crises, we were told, happen. They will pass. And if not, 'we have had a good life', residents would declare. These unanimous declarations were contrasted by different views of the residents about the measures taken. While some welcomed the measures and accepted them as inconvenient but necessary, others saw restrictions on movement and the surveillance of their activities as 'stealing their lifetime'.

In our contribution, we reflect on the narrative constructions of identity and presentations of self we witnessed in two different old people's homes in Vienna. We approached residents through two different avenues: first, through participant observation in communal activities, where we, among others, examined the way residents interacted among each other. Second, through narrative interviews on a one-to-one basis. We encountered a diversity of reflective life stories and experiences and strategies in dealing with adverse life situations such as illness. When talking about hard times, narratives of personal experience that referred to WWII emerged as prominent, often put in relation to thoughts on the current war in Ukraine. Strikingly, older people's efforts of meaning-making and agency in times of adversity showed important connections to early life experiences and their embeddedness in social relations in the present. We consider the residents' existential observations in two care institutions in light of work in phenomenological anthropology and sociological work on generation and social relations.

PALMBERGER, Monika* (Department of Social and Cultural Anthropology, Austria)

Digital Media in the Lives of Young Adult Refugees: Taking on New Responsibilities and New Family Roles

Based on ethnographic research in Vienna, including "digital diaries" as a key research method, this paper explores how young adult refugees from Syria, Afghanistan and Iraq maintain intimate relations with family. Their care

practices are not only required to overcome vast geographical distances but also undefined and often long periods of separation. Considering this specific situation, digital media – as the core means of "doing family" over distance – gain a specific momentum in refugees' lives.

This paper not only examines how these media, with all their limits and restrictions, are adapted to serve continued informal care relations and to enable emotional support across distances, but also what role they play for refugees in organizing their lives in Vienna. Ultimately, I discuss how new dependencies on the Internet and the mobile phone affect established family relations and roles, especially in respect to gender and generation. In particular, I pay attention to what this means specifically for young adult refugees.

Combating Climate Change through Institutional Complementarities? Social Protection Policies and Citizen Support for Fossil Fuel Taxes in Europe

We start from the IPCC notion that combating climate change requires comprehensive collective action by states, markets, and citizens. The state has a crucial role to play and carbon taxes have been identified as one of the most potent means for reducing carbon emission levels by making carbon emissions costly. However, to make a difference, carbon taxes need to survive the short-term political cycles, and the opposition to carbon taxes is strong. We argue that to reduce opposition to carbon taxation, a climate change mitigation strategy may benefit from including social protection policies in order to increase acceptance of carbon taxes. Such a strategy would also help sustain a 'just transition'. The paper employs ESS survey data and the Social Insurance Entitlements dataset (SIED) to test whether and how specific features of social protection programs are associated with stronger support for fossil fuel taxes among different groups of citizens in the European countries. We aim to make three main contributions, one theoretical and two empirical: (i) we make a theoretical contribution by elaborating a framework that includes both egotropic and sociotropic motives behind citizen support for climate taxes, (ii) empirically, we disentangle the characteristics of specific social protection policies and their association with citizen support for climate taxation, and (iii)) we test for cross-level interactions between specific welfare policies and individual-level sociodemographic and attitudinal factors to investigate the importance of egotropic and sociotropic mechanisms for citizen support for carbon taxation. The results lend support to the significance of sociotropic mechanisms and give clear indications of the fruitfulness of this approach.

Social Protection in East and Southeast Asia and the Great Recession

Recent decades have seen the broadening of social protection to the global South. Given their rapid economic growth and structural transformations in these countries, it is easy to see the need for social protection but the uneven democratization is a potential break on the expansions of such systems. The emerging East and Southeast Asian welfare regimes therefore deserve increased attention and here the Great Recession and its imprint on the social protections systems is particularly interesting as a stress test of the observed expansionary trends. While the paper provides a description of recent development trends of social insurance programs in East and Southeast Asia, the main purpose of the paper analyze to what extent these welfare systems were changed during the Great Recession and also to identify other important drivers for change. The study suggests that while there were few changes to the social insurance systems in relation to the crisis in East Asia there is a general trend towards expansion and increased coverage rates, even if considerable coverage gaps prevail.

Governing Guestwork in the Global South: Temporal and Spatial Logics of Migration Control and Social Reproduction in Thailand

How do states control labor migration? Literature on migration control theorizes the capacities of liberal democracies in the global North to enact restrictive immigration policies amid various constraints to state sovereignty. This paper shifts focus from national immigration frameworks to subnational regimes of labor migration, which further simultaneous state efforts to welcome migrant workers while preventing their long-term integration into

society. Drawing from multi-sited fieldwork in Thailand, I argue that the state reacts, with limited control capacity, to concurrent global and regional pressures on how it governs migration, necessitating varied policies and subnational governance practices that differentially regulate and shape the social reproduction of labor in different locations. State policies reinforce distinct regimes exhibiting varying emphases on temporal and spatial logics of control, shaping how they are reproduced in the long term. Leveraging a time of intensified guestwork formalization in Thailand, the paper offers a multiscalar framework for theorizing guestwork governance based on a comparison of the developmental, regulatory, and reproductive dimensions of two regimes. Especially relevant to the global South, findings illuminate processes shaping the formalization and long-term reproduction of global precarious work.

PALMIERI, Emerson* (Universidade de São Paulo (USP), Brazil)

A Critique of the Idea of 'informational Overload' in the Digital Space.

There has been much speculating if society has evolved into a new stage referred to, sometimes, as "Hyperinformation society", specially with the rising of the internet. In this stage, there would be a high degree of interconnection between informational contents, since restrictions of time and space are greatly diminished by digital technologies and because of that people would be overloaded with a big flow of information. Although the proposition of a high interconnectedness degree is correct, I argue, however, that it doesn't lead people to experience an overloading of information. Drawing from some of Niklas Luhmann's theoretical concepts I argue that, in digital environments, communications are put through a process of contingency reduction in order to be able to produce future communications. In other words, a content in the internet cannot be communicatively related with every other content available in it.

This process of contingency reduction can be observed in two different processes:

1. At some degree, online contents reflect the functional and expertise differentiation of society. They are organized by topics of interest (science, cooking, cars, etc), one does not simply talk about everything. So, a content of one kind (scientific articles, for example) doesn't relate to one of another kind (religious speeches, for example). They are part of different networks of communication that already existed before the internet.

2. The role of algorithms in directing contents to people. The more we see about a content, the more an algorithm will indicate to us future communications similar to that content. Moreover, algorithms often recommend us opinions about a topic that are alike, creating "ideological bubbles" which restricts the entrance of different perspectives and the possibility of dialogue.

Concluding, I argue that these processes restrict the scope of visibility of people regarding online contents, so they don't experience an overload of information.

Pathways Towards Sustainable Food Security: A Study of Forest-Proximate Communities in Odisha, India

Lately, we have been increasingly witnessing the effects of environmental change and other stresses on food systems across the world, and the resultant disruptions in food security pathways. Based on an empirical study of the pathways through which forest-proximate communities in India access food, this paper examines how dependence on different food sources affect food security outcomes. Through this analysis, I provide insights on how the coping and adaptive capacities of rural communities to food system shocks may be strengthened.

This paper is empirically rooted in a one-year fieldwork conducted in 2021-22 during which I studied factors affecting the food security of approximately 400 households in Thuamul Rampur, a highly forested and tribal administrative block in Odisha, India. As food security vulnerabilities in the rural context are highly seasonal, the same households were repeatedly surveyed across three seasons. The household surveys were supplemented by data collected through seasonal surveys of 13 local food markets as well as interviews and focus group discussions with a variety of stakeholders. Food security is measured here using individual dietary diversity scores (DDS) and household food insecurity access scale (HFIAS).

Preliminary results show seasonal variations in the relevance of different food sources and highlight the importance of source diversification as a strategy to ensure stability and sustainability of local food systems. Although agriculture is the main contributor towards individual dietary diversity across all seasons in the study location, its importance is particularly pronounced in the winter season when harvests from rain-fed crops are available. Seasons of water shortage and low agricultural produce enhance the role of forests and markets. This study, having been conducted during the COVID-19 pandemic,

also provides insights on the potential of wild foods and traditional forest-based agricultural practices to act as buffers against the effects of disruptions in market mechanisms.

Platform Riders Under COVID-19 in Mainland China

Under COVID-19, both the intensity and content of delivery work have transformed, inviting new recordings and theorisations. I use the theory of gamification to analyse Meituan and Ele.me (the two largest delivery platforms in China), in the context of the pandemic in mainland China. This ethnographic study focuses on male part-time delivery workers. The findings of the research are drawn from 50 in-depth interviews along with intensive participant observation for six months. I examined gamification from both above and below. I argue, to maximise the companies' profitability and productivity, the management elite deliberately uses gamification-from-above to motivate delivery riders to work harder and more voluntarily, enabling riders to motivate themselves as well as exploit themselves more effectively. Gamification-from-below captures playfulness in pursuit of work. Because games are playful, fun, and able to alleviate boredom, gamification-from-below is an ideal form of resistance against the ideology of the managerial elite of the companies.

Another major finding of the study is related to emotional and bodily labour, including sexual labour and aesthetic labour, conducted by the delivery workers. I explain that the emotional labour borne by delivery workers is not only directed towards customers but also merchants and security guards. This is unremunerated work, yet it requires effort and tact. Due to the pandemic, the service offered by the delivery platform has become much richer. Furthermore, in the field of delivery, unlisted and unrecognised, sexual, and aesthetic labour can be involved, which has transformed the delivery platforms into a space for sex work and the consensual exchange of sex. Since platforms do not formally list or advertise these services, the companies cannot be held liable for any consequences. This study explores how takeaway workers struggle and submit to this additional labour, in the face of the abandonment of the platform.

Rally Around Populist Leader Under the Shadow of War

Under the shadow of war, can democracy sow the seed of destruction? Previous literature of rally-around-the-flag suggest that the outbreak of war boosts the popularity of democratic leaders. The wealth of research highly concentrates on the US because wars are rare events. Nevertheless, it is the concerns for war that are common and yet understudied case for most democracies. To fill the gap in the literature, I argue that the concerns for war drive people to support a populist leader. Specifically, the public are tempted to succumb to their urge for survival at the toll of compromising the election and congress. The effect of rallying around populist leaders is stronger for young democracies where democratic values have not yet taken root. Based on the seven waves of World Value Survey, the results show that people are more likely to support a populist leader when they are more concerned for war. The findings shed light on the role of war and peace in shaping the consolidation of democracy.

PAN, Hui* (Nanjing University, China)

The Spatial Operation of Power: The Tension between Administrative Boundaries and the Living World: The Example of the "Toilet Revolution" Project in Rural China

This article investigates how state power is practiced in a spatial sense by the case of the "toilet revolution" policy in rural China. This policy is part of China's rural revitalization strategy, which aims to convert the latrine pit in rural households to toilets to improve the habitat environment of rural areas. By the case of the "toilet revolution" policy implementation in a northwestern Chinese village, this article shows how China's government tried to turn its modernization imagination into reality by means of spatial regulation. And, beyond the state's purpose, this article also discusses what impact did this sanitary toilet renovation have on the daily life of rural people and how did they understand of this change? According to the field observations, the rural people and the state regime do not share a common understanding of the rural space. In the eyes of state regime, the rural space is a data collection presented in drawings and documents with administrative boundaries, it tends to carry out various planning and transformation projects to it; while in the eyes of the rural people, the rural space is their living world but with no prospect of economic development, so most of them choose to move to the city for their livelihood purposes. The tension between 'transformation' and 'mobility' leads to double confusion about state governing to both the government and social members. On the one hand, rural people are not really interested in national projects such as toilet renovation because it does not directly improve their economic situation, accordingly, the state regime is unable to achieve its

governance goals through these renovations. Moreover, the identity confusion of rural people generated in their livelihood mobility further exacerbates this governance confusion.

Las Profesiones En Cuestión

El panorama en la Argentina, como en muchos otros países latinoamericanos muestra que los procesos de "*institucionalización*" del profesional es más débil que en los países desarrollados, pero en algunos casos como en las ingenierías, la medicina o la abogacía han tenido una importante repercusión en el desarrollo y además están relacionadas con los paradigmas de crecimiento a nivel territorial, educativo y político. A esta debilidad institucional histórica de países más jóvenes se agregan procesos de cambio recientes que afectaron fuertemente los campos profesionales y ponen en cuestión su existencia.

La hipótesis en debate que está por detrás de estos planteos, no siempre es explícita, pero se puede formular como *la desaparición de las profesiones tal como se conocen hoy* o dicho de otro modo, *las profesiones enfrentan una gran transformación que se da después de un proceso de implosión o explosión* debido al impacto de los procesos de globalización, transformación de la producción, de la organización del trabajo, de los cambios tecnológicos, de la internacionalización de la formación y los recientes períodos de guerras y pandemias.

Estos temas son el objeto de estudio de los Laboratorios MIG, que trabajan con un dispositivo de recolección de datos basado en la articulación de los métodos cuantitativos y cualitativos. La recolección de los datos de tipo cuantitativo se realiza por medio de una encuesta de tipo longitudinal, la cual hace hincapié en la trayectoria de formación-empleo.

Rethinking Disposability: Reimagining Urban Transformations Via an 'Urban Lab'

Compound 13 Lab (www.compound13.org) is an experimental design and learning space in Dharavi, Mumbai. The project team works closely with those employed across the informal waste management sector, drawing on the experiences of individual workers and their families, exploring models of creative learning using diverse technologies, and discussing and analysing technology and policy developments that affect the future of the waste sector. This approach helps to investigate what a just and equitable transition towards sustainable cities and low carbon futures might involve. It foregrounds the perspectives and experiences of frontline workers in waste management, whose voices are rarely heard in policy debates about sustainable urban futures. The political ecologies of waste in Mumbai, as in many mega-cities across the global South, are built upon complex economies of informal waste work, hidden networks, underacknowledged socio-spatial relationships, and subaltern lives. The 'human as waste', enacted through processes of othering, is part of an invisibilised reality of how wasted bodies are both embedded in commodity chains, and used up by them.

C13 Lab sets out to challenge blind spots in urban governance that cast the urban poor as victims of change rather than agents of change. It seeks to facilitate ways in which the urban poor can contribute to meaningful conversations about urban futures, inviting serious consideration of the self-management and upgrading of homegrown neighbourhoods. In this way we attempt to confront ingrained legacies of colonialism and exploitation, aware of the caste and class relations inscribed into the social and spatial politics of the city. Through this hybrid configuration of experiential and academic knowledge, alongside NGO,ACORN India, we have created project outputs in a variety of media which foreground the voices and perspectives of people usually invisibilised and marginalised in policy and planning debates.

Fighting for Rights While Negotiating Informality: Struggles of Domestic Worker Organizing and Everyday Inequalities during COVID-19

The COVID-19 pandemic galvanized domestic worker organizations in cities like LA and New York to emphasize the need for the State to heed their demands for worker rights including health and safety protections as well as wage related regulations. On the other hand, the pandemic also caused immense strain on the daily lives of the workers by being exposed to dangerous work situations and facing issues from job loss to forced as well as unpaid or undercompensated overtime labor. In many of these situations, the workers were forced to negotiate often on highly unequal grounds with their employers to maintain a livelihood. Against the backdrop of these juxtaposed realities, this paper explores the terrains of the domestic worker organizing to explore the question- how do workers engage with the organizing goals of legitimizing labor while negotiating specific localized structural informalities imposed by their labor conditions? The paper focuses on the conundrum faced by the workers and worker organizations of establishing the domestic worker as a 'distant professional' and a 'service provider' while relying on appeals of morality and empathy to negotiate working conditions and everyday struggles. I argue that the devaluation of domestic work through informality of the sector holds a central role in producing this dissonance and arresting the enterprise of legitimizing paid domestic work.

Role of Social Capital in Shaping the Learning Experiences of University Students in India: A Case Study of Postgraduate Students of Banaras Hindu University

Social capital in the field of education is not a new area of study. After Bordieu's (1986) and J.Coleman's (1988) works, this area has received ample attention. this study will be devoted to exploring how the presence or lack of social capital at an educational institution is shaping the learning experiences at the universities. Learning itself is considered an amalgamation of different experiences developed at the social and individual levels. The learning experience is the interpretation of a student about the interaction and learning activities in which they participate. A student of university education experiences the benefits of social capital while participating in learning activities, classroom activities with peer groups, and while residing in hostels. The learning experience is shaped by personal and social factors. So, it is necessary to study how different social networks, the level of trust between the members of a social network, bondings, interactions, and shared vision of students play an important role in shaping the Learning Experiences of students.

As the study aims to derive the functions of social capital in formulating the learning experiences in the university system, seeing this association from a functional perspective will be more appropriate. Data will be collected through means of Questionnaires based on different Social Capital measurement tools and learning experience measurement scales, Focused-Group discussions, and unstructured interview schedules.

Everyday Denial and Reconstruction of Social Identity: Anecdotes from Raji's Lived- World

The Republic of India enshrines Article (46) mandating Scheduled Castes and Scheduled Tribes to be protected against all forms social injustices and exploitation; instead there exists several indigenous communities that struggle hard to catch the development canoe. The Raji tribe is a Particularly Vulnerable Tribal Group (PVTG) with the total population less than thousand; dwelling majorly in the eastern part of the Pithoragarh district of Uttarakhand (India). This paper contains narrations from six villages (Altadi, Ganagaon, Bhagtiwara, Kutachaurani, Bhagichaura, and Kimkhola) that are inhabited by Raji community in the Pithoragarh district. The wandering in Central Himalayas, Kumaon was from September 2021 to April 2022. This paper attempts to bring forth the continued reinforcement of racism on an everyday basis in the lived-world of Raji community. With their distinct dialect, historicity, and spatiality the individuals hailing from the Raji's fold face demeaning utterances from the people of the dominant culture. *'Jungali'* (Wild) remains a perennial reference for the Raji populace. These often ignored everyday *'speech acts'* open apertures to different dimensions of racism. This term *jungali* is not a reference in isolation but it also reveals a system of *'beliefs'*, *'social structures'*, and *'discourses on cultural dynamics.'* When interacting with the Raji beings and discussing their experiences with this 'everyday racism' few were unable to comprehend the query, as if the structure of 'racism' has turned *doxic* among Rajis. With the limited stack of capitals (in Bourdieu's vocabulary) and unempathetic attitude of dominant community, Rajis are in a *'primal state of innocence'* and are compelled to refigure their *'social identification'* and secure their existence in society. With this improvised 'social identification' i.e moving closure to Hindu ethics; Raji's are eyeing to secure material and symbolic profits.

Crafting Professional Identities in Call Centers. a Critical Theory Perspective

In the context of labour arbitrage, Romania became home of an expanding outsourced business service sector. Many graduates work in 'call centers': a generic term for various types of customer-oriented services in different

denotes a presenting author. Abstracts are organized by first presenting author's last name.

employment regimes and company structures. This research examines, through a critical theory perspective, the managerial strategies aimed at crafting professional identities and maintaining compliance in inherently precarious environments. It is based on critical theory postulation that, in order to maintain the status-quo of 'oppressive workplaces', and without recourse to stronger monetary incentives and force, there must be 'moral justifications' in place, sufficiently powerful to be accepted by a critical mass of people (Boltanski and Chiapello, 2005: 10). Based on in-depth interviews with managers and HR staff, with call center operators and following thematic analysis of managerial outlets, the presentation unpacks several mechanisms, metaphors and symbols to maintain young people's adherence to the demands of work. It is argued that the repertoire of neo-liberal tropes (authenticity, personal development, learning and growth) creates legitimacy for an (arguably) precarious youth employment sector in an emerging economy. The paper suggests that young employees appropriate the structures and the master narratives, whilst lacking a solid repertoire to critically engage with them. Eventually, in various degrees, they are complicit in reproducing the justification regime they are subject to. However, the presentation calls for recalibrating the views on the neo-liberal managerial strategies, in ways that account for both their ideological and instrumental weight, but also for the personal functions they do meet for young graduates at the base of the occupational pyramid: validation, sense of belonging, social connection and the symbolic dignity of a middle-class imaginary, despite occupying contradictory class positions.

PAPADELOS, Pam* (University of Adelaide, School of Social Sciences, Australia)

Greek Migrants Ageing in Australia: An Intergenerational Perspective

Quality ageing for migrant communities is a challenging issue for countries with diverse migrant populations, including Australia. This paper investigates perspectives on ageing from three generations of Greek migrants living in South Australia and their perceptions about the role of the family in elderly care and support. Semi-structured interviews were conducted with 14 first generation Greek-born post-World War II migrants aged between 76 and 89 years old, and surveys were administered to their children and grandchildren. Findings reveal that while there were consistencies among the participants across the three generations about who should provide support there were differing expectations about the level and frequency of that support. In line with cultural expectations, many elderly migrants indicated that they want family support with daily living such as shopping, cooking, paying bills and attending medical appointments as well as social companionship. While their children and grandchildren agreed that it was their responsibility to look after their elderly, they resented the time it took away from their other responsibilities, including paid work, and were not always available when needed. In addition, there were significant gender disparities in the level and frequency of support provided, with daughters assisting more than sons. Very few older migrants received support from service providers. Indeed, few older migrants knew what services were available and many stressed that such services should only be used in exceptional circumstances. These findings have implications for the implementation and delivery of services to this population, which impacts on the lives of second-generation carers, mostly women, who bear the burden of providing long-term care.

The Ideological Discourse of the Contemporary Russian Autocracy: Functions and Registers

The official ideological discourse (OID) of contemporary Russian autocracy is, along with brutal political repressions within the country and military aggression abroad, one of the main components of its modus vivendi. The old Soviet official discourses, like all political discourses of the epoch of modernism, needed belief in the truth of certain ideology. Unlike these discourses, the new Russian OID is a post-modern by its very nature: instead of its own ideology it offers a diverse menu of scraps from a wide variety of ideological narratives of the past (from Slavophilism and traditional Russian imperialism to Geopolitics and Stalinism).

There are two distinct registers of OID: historical and newspeak. In the framework of its historical register, the OID offers a selection of falsified historical narratives about Russia of the past (from "the state of all Eastern Slavs" of the Saint Vladimir (10-th century) via virtual "Holy Russia" of the Russian Church and the Empire of the Tsars till the USSR of Stalin) and about key events of the Russian history (like the "Great Victory" over Nazi Germany) that must be repeated and returned (yes, the war in Ukraine is described as a repetition and continuation of the war against Nazism). In the framework of the newspeak register, the OID forms a totally falsified image of the current political reality through a set of linguistic signs that legitimize any actions of the Russian authorities and at the same time stigmatize any actions of their opponents and threaten them.

The authorities support dominance of the OID in the sphere of public communications by constantly increasing censorship and repressions under special laws and at will. With that, the repressive function is inherent in this discourse as such: it is designed to suppress disagreement with the authorities at the level of individual consciousness.

Passive Revolution through Racial Inclusion in South Africa

How does racial capitalism shape postcolonial transitions? Drawing from my recent book, *Fractured Militancy*, this paper considers the centrality of racial capitalism for movements and livelihood in post-apartheid South Africa. The project draws on long-term fieldwork in and around the townships of Johannesburg, including 29 months of ethnographic observation and 287 interviews. Two decades after the dramatic transition from apartheid to democracy, these neighborhoods are erupting in protest. I trace rising protests back to an elite-driven process of "passive revolution through racial inclusion," which dangled the possibility of change but preserved racial inequality and economic insecurity, and weakened civil society. Residents used militant protests to express their deep sense of betrayal and to demand recognition and community development. Yet, the passive revolution reinforced divisions based on urban geography, nationality, employment, and political orientation. While attesting to ongoing struggles for Black liberation in the wake of formal racial inclusion, the South African case also warns of the threat that racial capitalism and elite class struggles present to social movements and racial justice everywhere.

PARFITT, Claire* (University of Sydney, Australia)

The Possibilities and Limits of Ethical Capital As a Vehicle for Political Action

The expansion of privatised retirement security has forced workers to rely on financial markets to provide respite from work towards the end of their lives. Attendant to this process has been the reorganisation of class and power relations and, in particular, the rising power of investors.

Reorientations of the state since the 1980s have also put more pressure on the private sector to resolve social and ecological challenges. Long and complex supply chains and production networks have complicated lines of accountability. The concentration of economic resources and power among investors and brand name firms puts them in the crosshairs of political struggle.

Over the last few years, with the extraordinary rise of ESG investing, environmental, social and political issues are increasingly treated as risks to capital accumulation. In this context, labour-as-consumer and labour-as-investor occupy a conflicted space for political action, where financial assets are imbued with ethico-political content and become a site of struggle.

Drawing on some recent case studies, this paper will explore the contradictions, limitations and possibilities of financial assets and markets as a vehicle for protecting labour rights and advancing climate action.

PARK, Chunwoong* (Jeonbuk National University, Republic of Korea)

Developmental Mind in Post-Colonial Cold War South Korea, 1960-1980s

While a great deal of research has thus far contributed South Korea's state-led developmentalism to the economic growth in the 1970-1990s, few have examined what and how the different fractions of bureaucrats and intellectuals constructed the developmentalism out of a post-colonial cold war context. By investigating policy collaboration and conflicts among key players in governmental organs and state-sponsored institutes, this study finds that because of the Japanese colonial legacies and the US influences, South Korea's developmentalism consisted of an array of ideologies incorporating statism, corporatism, mercantilism, and monetarism. Based on this finding, the present study proposes that the state-led developmentalism be understood as a flexible and transformable ideological frame molded by bureaucrats and intellectuals who had learned in the Japanese education system but later became resocialized alongside the US.

The Effect of Uncertainty on Justice Evaluations

Previous research on procedural justice posited that because people tend to confirm their position in a group by fairness of decision-making process of the group, situational uncertainty make people to be more sensitive to justice information. It is also predicted that the more people are sensitive to justice information, the lower the justice evaluations would be. Based on that, we hypothesized that uncertainty of everyday lives makes people to evaluate their rewards from society lower. Using Korean General Social Survey (KGSS) data, we tested the relationship between uncertainty in life and justice evaluations. The results reveals that the income level is positively related to justice evaluations. However, controlling for income level, perception of uncertainty is negatively associated with justice evaluations. In addition, we found a moderating effect of sub-concepts of uncertainty perception; the effect of social uncertainty on justice evaluations is moderated by physical uncertainty and economic uncertainty. These results are consistent with previous research which stressed the role of stability and predictability of rewards on justice evaluations.

Segmentation of Lifestyles for Home Appliances Using Sociodemographic Variables in Korea

To tackle climate change, carbon emissions reduction is crucial in all areas. In the residential sector, where energy consumption, lifestyle, and socioeconomic variables are closely related, it can contribute to demand-side management by exploring the relationship between home devices and household characteristics. In this study, by factoring home appliance data, it is analyzed that who prefers which home appliances and how much. For the analysis, 2,520 households samples from the 2018 Korea Household Energy Panel Survey were used.

As a result of the study, home appliance factors are largely classified into two categories. In case of air conditioners, PCs, vacuum cleaners, and washing machines, the larger the household and house, the higher the income, and the younger the city dweller, the factor score is higher. It can be seen that the desire for thermal comfort, cleanliness, and entertainment is associated with higher economic levels and cleanliness preferences among younger age groups.

In case of TVs, rice cookers, and refrigerators, the older the household, the higher the factor score is in rural households. In particular, the factor score is the highest when the number of household members is two. It seems that these home appliances are mainly used in small households of the elderly. However, there is a difference in that TVs and vacuums are not proportional to the income level and are preferred by households living in detached houses, whereas refrigerators are mainly used by households living in apartments and proportional to income.

It was possible to identify which household appliances were preferred by various socioeconomic groups in this study. In the future, Consideration of more variables is necessary to understand the relationship between lifestyles and social groups in more detail and to analyze in depth how these relationships are from.

Disaster, Authority, and Selection of Records: Typology of Patrilineal Succession in Joseon Society(1392-1910)

Joseon society(1392-1910) is discussed as a society in which the power of the family group was differentiated and interwoven around patrilineal kinship and marriage network. This study aims to analyze how patrilineal succession was realized in contrast to the orthodox ideology of paternal lineage in Joseon society. For that purpose, this paper examines how the paternal lineage was formed in a variety of ways depending on the circumstances of the disaster and the prestige of the individual and family. The materials used were "Sunwonsokbo"(선원속보 in Korean) that compiled the genealogy of descendants of the Joseon Dynasty and disaster records over the Joseon periods. Sunwonsokbo has been compiled through several kings to protect the social status of the Jeonju Yi clan and to strengthen the family identity and foundation of the dynasty and covered most all pedigrees in the collection of 1900-1902. Records were based on the genealogy of the paternal male,and the information of the wife and the daughters was also included. Although cases of the paternal descendants of the Jeonju Lee clan are vast, data has flaws such as omissions, intentional interpolation, and inaccurate descriptions.

In order to distinguish how stable and diverse the lineage succession is , we analyze the pattern of the sequence of birth years from the self to the fourth generation ancestors. Under the assumption that the frequency of disasters and individual/family prestige have a significant effect on the pattern of the birth year sequence among 4 generations, we construct a model for estimating the pattern of the birth year sequence and check the validity of the model. In addition to the actual succession, the analysis also considers the effect of biases from the selective observations in the sequence of paternal birth years. The effect of bias is estimated and used as a data modifier.

Toward Historical Comparison of Migration Regime: The Concept of "Immigration Control Regime" in Japan

The purpose of this paper is to identify what the research on Japan's history of immigration control regime (Nyukan taisei) has revealed, and what produced such scholarship in relation to neighboring Northeast Asian countries. Unlike the rather neutral concept of migration regime, some activists and scholars in Japan have used the term "immigration control regime" (Nyukan taisei) since the late 1960s, in order to oppose the amendment of the Immigration Control Act, to address the ethnic discrimination in Japanese society, and to raise the issue of Japan's responsibility for colonialism. Such activism produced scholarship on the historical origin of post-war Japan's immigration control policy, and the findings are often referred until today, as a basis for conducting research on Japan's immigration control policy and a means to tackle Japan's systematic violation of human rights committed by the today's Immigration Services Agency of Japan. In other words, the concept of the immigration control regime in Japan enabled researchers and activists to point out systematic and institutional racism, pursue research on the historical origin and particularity of Japan's immigration control policy, and identify the borderline of Japanese in post-war Japan. The fruits of the studies conducted in and after the 1970s were revisited after the 2000s when new testimonies and written documents became available in Korea thanks to the democratization and historical reconciliation projects. In this regard, the research on Japan's history of immigration control policy should now move a step further, to international historical comparison to seek the origin of the immigration control regime in Northeast Asia.

Deconstruction of Urban Commons Movements in Seoul: How to Conceive of Commons Crisscrossing Differentiated Society?

The 6.3 km-long, abandoned Gyeong-eui railway in Seoul became a controversial symbol of the commons in South Korea. The controversies started in 2016 when urban activists and displaced squatters took over one section of the railway close to downtown and named it Gyeong-eui railway commons (G-commons) to reclaim the commons for all citizens, neither market nor state, and to protest its profit-oriented redevelopment and non-democratic decision-making. Korea has integrated itself into the world of neo-liberal development. The state has offered strong support for privatization and the commodification of tangible and intangible public assets. G-commons, owned by a government-run company, was supposed to be developed for a luxury residential and commercial area. Despite a drawn out five-year resistance, G-commons was enclosed in 2020 and will be re-developed by private developers.

This paper deconstructs the competing/conflicting issues and concepts of the commons raised or developed by G-commons movements, and suggests a new commons approach. Commons is generally defined as a system consisting of a resource, its users, the institutions binding them and the associated processes, not just by G-commons movements, but also by the commons school. This approach assumes an agglomerated society arbitrarily combined with favorable political, economic, and social elements for commons, where commons would function. We argue that this assumption is not suitable for functionally differentiated contemporary society, and only leads the commons experiment such as G-commons movements into an impasse. Drawing upon N. Luhmann's social system theory, to conceive of commons crisscrossing differentiated society, we identify commons as a type of social communication system about a unique object, and classify it into three dimensions: a social functional system, a social organization, and a value. We examine the social conditions in which each dimension of commons functions, and discuss its implications for urban commons movements and commons studies.

The U.S. Health Care Safety Net and Farmworker Health, 1989-2016

Inequalities within and across labor, financial, and legal status hierarchies in the U.S. underlie patterns of immigrant health. But can inclusive policies mitigate these negative impacts? We examine how one immigrant-inclusive federal policy, the Community Health Center (CHC) program, has shaped health care access and use among U.S. farmworkers of varying legal statuses and nativities. Linking administrative data on CHCs with the National Agricultural Workers Survey from 1989-2016, we document considerable geographic variation in farmworkers' county-level access to CHCs. Preliminary findings show that undocumented farmworkers are significantly more likely to have used health care in counties with CHCs than those without CHC infrastructure. Moreover, foreign-born farmworkers also have a lower probability of reporting barriers to care when they live near CHCs. These findings suggest that CHCs improve health care access among foreign-born and undocumented farmworkers, highlighting the potential for public policies to reduce population health inequities in the United States.

Cultural Dynamics and New Art Collectives in the Port Zone of Rio De Janeiro

This communication aims to discuss the relationship between urban intervention policies, based on the creation of creative clusters in the Port Zone of Rio de Janeiro, and new institutional arrangements that have emerged in the region. The paper is the result of long-term research, carried out by a large team of researchers, and discusses the effects of urban policies on the small autonomous cultural collectives that emerged in the area during this process, inserting new concepts and meanings for the use of art into the debate. The communication seeks to understand the relationships between the emergence of urban projects, new institutional arrangements for culture, the processes of emergence of artivist movements and the politicization of culture. By analyzing the city's recent scenario, since the covid-19 pandemic and the long period of social isolation, the paper also aims to discuss survival strategies in a scenario in which an economy highly dependent on urban circulation is profoundly affected.

Tensions and Disputes over the Glocality at the Inhotim Museum for Contemporary Art

In the official discourse, the Inhotim Museum began to be conceived by Bernardo de Mello Paz in the mid-1980s. Built on the collector's farm as a Botanical Garden and a non-profit institution, the foundation was opened to the general public in 2006. Built in the city of Brumadinho for the conservation, exhibition and production of contemporary works of art, Inhotim currently presents itself as one of the most important private foundations of contemporary art in Brazil, holding a collection that consists of works by Damián Ortega, Rikrit Tiravanija, Cerith Wyn Evans, Franz Ackermann, Janet Cardiff, Olafur Eliasson, Matthew Barney, Chris Burden, Helio Oiticica, Adriana Varejão and many others.

As in other private institutions, the creation of a museum builds for its patron a public image that confuses collector and collection, making museum projects adhere to biographical narratives (Duncan, 1995; Sant' Anna 2011). From the point of view of the museum project, it is therefore important to understand how it is possible to establish a tense relationship between the project for an international institution and a farm located in a city of 38 thousand inhabitants, a place symbolically marked by the local experience. More than that, however, it is also important to understand the tensions between local experiences – marked by the relationship with the Brazilian mining industry, by the production of commodities for the international market and by the slavery past – and the presence of an international art that starts to be produced as a creative economy resource, capable of mediating global relationships and commodifying culture (Harvey, 2011). Tensions that become all the more relevant after the disaster led by the Vale do Rio Doce Company in Brumadinho, in 2018, when more than 270 residents of the city died buried by the rupture of the Córrego do Feijão dam.

Analysis of Content Warning Usage across Course Modalities

How do women, gender and queer studies students' attitudes towards the use of content warnings in online versus face-to-face courses compare to that of criminal justice students? With the shift to pandemic online learning, I implemented the practice of including a content warning on Canvas for students to reflect on at the start and end of the quarter to alert students to materials in my gender studies courses and criminal justice studies courses. Data come from 298 pre-and post-responses from students enrolled in one of three courses taught between Spring 2020 to Spring 2022: 1) a Sociology course cross-listed with Women's, Gender, and Queer Studies on *Gender & Sexuality* (n = 128 students), and two Sociology courses that are part of the Law Studies Minor and Criminal Justice Concentration within Sociology: 2) *Contemporary Issues in Criminal Justice* (n = 107 students), and *Gender, Crime and Violence* (n = 63 students). Courses were taught in a variety of modalities due to the shifting COVID-19 regulations allowing a unique opportunity to see how students respond to viewing potentially upsetting to traumatizing materials on their own in lockdown conditions or with their peers in virtual or physical classroom setting. Students' responses reveal the fear of being judged by their professors or peers for their emotional reactions (or sometimes lack of reaction) during class meetings. Some students, including mothers and those with past experiences with victimization, desire to view some content alone so that they can pause or step away or schedule it at times that they are "mentally prepared" or are not with their children or partners. While most students did not find the content warning necessary, end-of-term reflections illuminated students' understanding of empathy, positionality, and future career applications. The findings have implications for course/curriculum design and professional socialization.

Using Experience Sampling Method in an IE

In this presentation, we discuss the use of Experience Sampling Method (ESM) as a part of data collection for an Institutional Ethnography in a Higher Education Setting. Using ESM technology, participants are prompted to respond to the following questions at random intervals throughout three weeks across a 4-6 month period:

1. Where are you?

2. What are you doing? (Prompted to complete the EMA if applicable)

3. How are you feeling?

4. Who are you with?

Responses to these questions, coupled with rating scale responses on affective, cognitive, and motivational aspects of their momentary experience are then organized into a timeline of a typical day, and then participants will be asked to describe salient events in one-on-one in-depth interview(s). This method provides an additional method of data collection in an Institutional Ethnography with the aim of creating a daily log that can be explored further in a daily interview. The goal is provide structure for the exploration of participants everyday experiences and a template for traditional IE mapping exercises. Our hope is that the use of ESM in an IE will extend the methodological literature on the role and use of IE in research settings.

Learning Indigenous Women's Stories of Opioid Use from the Intersections of Feminist-Based Interviewing Methods, Postcolonial, and Indigenous Feminist Scholarships

This paper brings together the fields of feminist-based interviewing methods, advocated by second-wave feminist sociologists, and postcolonial and Indigenous feminist scholarships. The aim is to examine the strengths and perils of these approaches in learning the stories of opioid use of Indigenous women and to expose interlocking power relations these women experience in their lives leading them to use opioids. The analysis begins by exploring the un/commonalities of emerging histories of the three approaches and identifying analytical points of intersections, including the absence of women and marginalized individuals' knowledge in sociology and other disciplines, and the possible solutions to end the absence. Then, this paper explores tensions between these three approaches as it unpacks the lack of an intersectionality approach in feminist-based interviewing methods in examining power relations associated with the absence of women of colour's perspectives in Western-centric knowledge production methods. This section also explores the place of Indigenous women opioid users' narratives in Indigenous and postcolonial feminist scholarships. Finally, the paper reflects on my practices of emotionally attached, conversational, and reflexive approaches of feminist-based interviewing methods in doing interviews with ten Indigenous women opioid users in our broader research project: Opioid Crisis: History, Science, Regulation at Brandon University, Canada. The section also discusses how postcolonial and Indigenous scholarships assisted me in exposing and challenging the damaging impacts of colonial, racial, neoliberal, patriarchal and other power relations on these women's lives in our study. Ultimately, I argue that future research can be benefitted by using an emotionally engaged, conversational and reflexive approach in their interviewing methods to learn marginalized individuals' accounts and can be more politically involved by using intersectional theories about power.

The Opioid Crisis: The Problematization of Professional Responsibility in Pain Medicine

This article extends the work of Emma Whelan and Paul Asbridge's (2013) on the oxycontin crisis and the strategies used to establish blame and responsibility in the medical literature. We draw upon the Foucauldian notion of social problems and the method of discourse analysis to examine 32 articles from 3 medical journals to understand how the opioid crisis is represented in the profession of pain medicine. We aim to understand the truth claims about the opioid crisis, the discursive processes by which actors were made responsible for the crisis, and what solutions were provided in dealing with the problem. We found that the pain medicine journals tended to focus on the responsibility of physicians for their part in the crisis, whereas the addiction journal tended to focus blame on the patients. This difference, we argue, signals different relations of discourse organizing the production of these kinds of statements. What both journals share in common is the identification of problematic behaviours as the cause of the crisis, and responsibilize individuals to fix the problem, in lieu of state intervention or regulation of industry. By problematizing according to an individual level of explanation, broader, systemic causes are omitted in the examined texts. The article concludes by considering the implications of these omissions and how the assumptions that underpin social problems shape regulatory interventions.

Resignificación Del Derecho a La Ciudad: Inclusión De Una Agenda Feminista En Dos Ediciones Del Foro Mundial De La Bicicleta (Lima, 2018 y Quito, 2019)

El movimiento activista en favor del uso de la bicicleta tiene más de veinte años en América Latina. El Foro Mundial de la Bicicleta (FMB) se creó en el 2012 por las y los activistas de la región. Hasta el 2017, los líderes del espacio eran varones (70%); sin embargo, la asistencia de mujeres al foro era más del 50% del total, evidenciando así, una territorialización donde predomina un liderazgo masculino. Entre el 2018 y 2019, debido a una serie de estrategias realizadas por las activistas, el liderazgo de mujeres se fortaleció. Pese a que no alcanzó paridad, el cambio en ambas ediciones fue significativo. Es justamente, en este cambio que se centra esta investigación. A través de un análisis cualitativo, y el uso de herramientas etnográficas, exploro dos dimensiones: las estrategias y los discursos producidos por las activistas en las versiones del FMB7 (Lima, 2018) y FMB8 (Quito, 2019). Considero que ambas dimensiones se utilizan con la finalidad de colocar una agenda

feminista en el FMB. El argumento central de la tesis es que, en el proceso, las activistas plantean nuevas concepciones del derecho a la ciudad (Lefebvre), lo cuestionan y lo resignifican; muchos de sus aportes convergen con propuestas planteadas por varias académicas y geógrafas feministas (Tovi Fenster, Ana Falú, Shelley Buckingham, entre otras). Este proceso podría representar un cambio significativo al interior del movimiento y, por lo tanto, una transformación en algunos espacios que promueven las activistas en sus ciudades.

Housing Practices of Indian Diaspora in Frankfurt: Welfare-State Equity or Nationally-Bounded Inequalities?

The paper focuses on the evolution of Indian diaspora in Germany through their housing practices. The rapidly growing numbers of highly skilled Indian migrants (HSM) represent the latest stream within the existing heterogeneous 'Indian Diaspora' resultant of varied phases of earlier Indian migration to Germany. Framed within the context of recent intense migration influx into Germany, where migrant integration into the local urban fabric represents a persistent challenge, this research investigates the housing choices of the rapidly growing Indian diaspora in the metropolitan Frankfurt region as the conveners of both integrative and differentiated spatial practices linked to identity creation. This group of newcomers, theorised as diasporic cosmopolitans, have been drawn to Germany as a leading member of the European Union, during the past decade and a half and adapted to a non-Anglophone, global, living and working environment as the context for their rising socio-economic aspirations. These aspirations are reflected in their housing choices. Frankfurt presents an ideal location for comparative investigation within the Indian diasporic community with strong presence of both the labour-based and highly skilled Indian migrants.

Methods include Urban mapping and spatial analysis of housing distribution patterns of Indian diasporic groups, interviews with real-estate agencies, relocation agencies, ethnic religious institutes, Indian migrants and media analysis. Investigation of residential locations of the Indian HSMs with the labour migrants as a control group within the Indian diaspora in Frankfurt reveal residential segregation consequent of subtle discrimination towards migrants. What is also uncovered is the pivotal role played by the German welfare-state and its social-housing provision as a propellant for distinct difference in home-ownership rates and homeward orientation amongst these two groups. This stark difference in-turn reproduces strong class-consciousness within the two diasporic streams of Indian migrants echoing older more familiar nationally bounded socio-spatial structures of class segmentation.

Power Dynamics in out-of-Hospital Emergency Care: The Community First Responder – Ambulance Clinician Relationship in the United Kingdom

Introduction
Community First Responders (CFRs) are volunteers trained by ambulance services in the United Kingdom (UK) to deliver out-of-hospital emergency or prehospital care while an ambulance is en-route. How power dynamics establish the relationship between CFRs and ambulance clinicians and their implications for patient care are poorly understood.
Method
In a qualitative study, we conducted 47 interviews with patients and relatives (5), CFRs (21) and CFR leads (15), ambulance clinicians (4), and commissioners (2) from six rural ambulance service regions in England, UK. Thematic analysis, supported by NVivo and guided by medical dominance theory (Willis, 1989), enabled the identification of themes and subthemes.
Findings
The analysis revealed multi-layered experiences of power execution and hierarchy in the implementation of CFR schemes, with the emergence of both collaborative and authoritative relationships while attending patients experiencing emergencies in the community. The establishment of the relationship hinged largely on the attitude of the ambulance clinicians, and so the power to execute and influence the relationship was centralised in the approach of the clinicians. By recognising that CFRs can be a valuable supplement to ambulance services, a cooperative relationship was established that improved patient access to and provision of prehospital emergency care. However, ambulance clinicians exercised professional power and often dismissed the value of CFRs' first-aid treatment, documentation of the patient's

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

condition, or complexities of their role. Restricted access to vital technologies impeded the timeliness of CFRs providing patient care or sharing information. In interactions with ambulance clinicians, nonetheless, CFRs were able to exercise countervailing power to command respect to a limited extent, which was beyond the realm of their regulatory policies.

Conclusion

Ambulance clinicians interacting with CFRs assume and execute a range of power which influences prehospital care delivery. These dynamics are explained in line with the theories of medical dominance and countervailing power.

PATEL, Gupteswar* (Community and Health Research Unit, University of Lincoln, United Kingdom)

SIRIWARDENA, Niroshan (Community and Health Research Unit, University of Lincoln, United Kingdom)

Role of Community First Responders during the Pandemic in England; An Understanding of Field and Power Dynamics

Introduction

Community First Responder (CFR) schemes are a community engagement programme that have been adopted and supported by the National Health Service in England, where CFRs are trained to respond to patients needing emergency medical care. The *field* in which CFRs operated changed with the onset of the COVID-19 pandemic, which caused the health system to restructure their priorities and objectives. How the application of systemic power affected CFR operations and the understanding of the broader *field* remains underexplored.

Method

In a qualitative study, we conducted 47 interviews with patients and relatives (5), CFRs (21) and CFR leads (15), ambulance clinicians (4), and commissioners (2) in England. Thematic analysis, supported by NVivo and guided by Bourdieu's theory of *field*, enabled the identification of themes and subthemes.

Findings

The ambulance services implemented the broader NHS agenda for managing the pandemic and its repercussions, which represented changes in *field* with changing priorities and strategies. Initially, CFRs were not assigned work and stood down while making deterministic judgments, with CFR practice being determined by institutional interests rather than the needs of communities in which they operated. Later in the pandemic, with persisting uncertainties within the changing *field*, CFRs were engaged in community-based and welfare services, where CFR practices were conducted in accordance with their individual *habitus*. The CFRs who were adapted into the new *field* involving welfare services normalised the ambulance service determined revision of CFR roles, but the concomitant disengagement with the aspiration to provide community-based care, which led to the prospects of deskilling and eventual workforce attrition.

Discussion/Conclusion

The Bourdieusian perspective of the CFRs' role and power dynamics highlighted the notion of top-down policy implementation. The CFRs restructured their roles around the instructions provided rather than feeding back their community needs, as might be expected from a community engagement initiative.

M.a.Student's Activities in Leisure Time-a Sociological Inquiry.

Parker argues that leisure activities are conditioned by various factors associated with the way people work. In particular, he suggests that the amount of autonomy people have at work, the degree of involvement they find in work, and their level of intrinsic job satisfaction are directly related to their leisure activities. Burns noted that leisure Provides considerable freedom for the individual to exercise choice and design and to create and find meaning in life for example design of gardens, hair styles, clothes, life styles etc.

Joffre Dumazedier argues that leisure values are increasingly influencing work in a number of ways. He notes that many people, Particularly the young, choose jobs with reference to the type of leisure they want. They look at the leisure facilities available in the area when they selecting a job.

Now a days the importance of leisure values is increased in industrial Societies. Keeping in mind above I choose 40 students of M.A. Sociology at the Gujarat University and try to analyses of their leisure activities like; playing games, Participate in Play, reading a novel., visits new places, tree Plantation, enjoy music & dance, maintaining cleanliness, driving, social work, earn money etc.

Rethinking on Gandhiji's Nai Talim Education System

Nai Talim is education of humans into thinking and productively working and not training of animals into writing and reading leading a dependent life. Nai Talim is not alienated assumption-based learning of a given reality but it is involved experiential learning of evolving reality. Education provides and reinforces the value systems. It creates the interpreters as well as Performers. Interpretation is to be based on experience of performance as well as interaction with the local real world and not estranged from it. Nai Talim is Practice of truth and non violence in the learning environment together by the teacher and the taught. Holistic knowledge in is non violent and is filled with truth.

Method of Nai Talim includes Preparing the Place of study and keeping it clean. Students learn to manage the school and its resources in turn through election Periodically. The students learn local history through discussion with elders and local geography by visiting neighbourhood. Mathematics and sciences are to be learnt in the classroom as well as learning a productive and economically Valuable trade and also playing games and participating in sports. Learning morals through. song, dance and drama on lines of great thinkers and social formers is a way to learn language.

In this Nai Talim education system, here are covered some basic principles & theories; Gandhiji's philosophy, Basic education, purpose of education, methods of education. education through craft, art and work with the Indian context.

Class from a Peripheral Perspective: Informality, Work, Labour and Migration

This paper narrates three moments concerning the history of the working class in India.

In the early 20th century, the working class was perceived through its Eurocentric mirror- as part of the industrial manufacturing units and in turn defining the industrial city. This meant a conceptual collapse of industrialization and manufacturing with urbanization but also of urbanization with the city. This evolutionary perspective that agrarian societies move towards industrial and urban societies universalized the historical and cultural patterns of European modernity. The Indian census for example defined the urban as consisting of 75% of its population working in non-agricultural activities.

The second moment occurred in the 70s, after the growth of concept of informality. This way of perceiving the working class legitimized the Eurocentric binary of formal (manufacturing) and non-formal or informal sector (non-manufacturing) sectors but also the enumeration and inclusion of women and all those who worked as self-employed, or in petty businesses, who were unregulated by law and not organized oftentimes doing illegal work. Today this group constitutes 86 to 92% of India's working population.

The third moment in May 2020, after the lockdown. As all work stopped, shops and businesses closed and supply chains frozen, all workers lost jobs. Graphic images of workers forced to walk on railway tracks, or cycle to reach their villages raised queries regarding the way internal migration was being organized post neoliberalism. Now research has documented that almost half of all urban workers are circulatory migrants with little to no housing and other citizenship rights. They migrate in time nospans of 6 months to 3 years, from north and east to west and south India creating new geographies of uneven and unequal processes of poverty, inequalities, and exclusions across the country. Is this the pathway to the new transition and transformation process?

The Future of Touch in Human-Robot Interactions

Since all robots are physically embodied, the key to more naturalistic interaction with them outside of the laboratory is the use of sensory and motor cues with nonverbal criteria, such as facial expressions, handshakes, hugs and so on. In recent years, a new type of 'socially assistive robot' (SAR) has been designed to encourage social interaction behaviours with human users. In this paper I investigate the sensory qualities of artificial embodiments (their physical appearance, capacities of motor mimicry) of recent generations of robotic toys and artificial companions within the home and healthcare settings. By examining recent examples of social assistive robots (SAR), in particular SoCoRo and HuggieBot 2.0, I ask: what can historic and current nonverbal communication studies teach us about haptic protocols and motor mimicry? How are touching behaviours fostering prosocial behaviours, and what potential is there for using robotic platforms as experimental laboratories to investigate the futures of touching?

Impact of COVID-19 on Women in Kolhapur District, Maharashtra. India.

The COVID-19 pandemic and resultant lockdown (March 2020 to January 2022) demanding social distancing' and 'stay at home' orders have disproportionately burdened women and girls in Maharashtra. Gendered experiences of COVID-19 are shaped by the intersection of inequalities in the labour markets; intrahousehold power relations during stay-at-home and lockdown orders in the matters concerning care, stress and domestic violence; sexual violence and child sexual abuse in camps/shelter homes, gendered experiences of household responsibilities, personal care and frontline healthcare service providers, government intervention for food security, shelter for homeless migrants' workers, testing for coronavirus, impact of shift in priorities of the public health services regarding non-coronavirus patients and predicament of women in need of reproductive healthcare services; differential impact of COVID-19 infection and resultant mortality and morbidity rates by gender, caste, ethnicity, and class. The lockdown period has also forced women to bear the burden of unpaid care work, both, in terms of housework, home-schooling of children and enhanced care burden of the sick, children and elderly and unprecedented domestic violence.

The COVID-19 pandemic is harming health, social and economic well-being worldwide, with women at the centre. First and foremost, women are leading the health response: women make up almost 70% of the health care workforce, exposing them to a greater risk of infection. At the same time, women are also shouldering much of the burden at home, given school and child care facility closures and longstanding gender inequalities in unpaid work. Women also face high risks of job and income loss, and face increased risks of violence, exploitation, abuse or harassment during times of crisis and quarantine.

Soft POWER, a New Race for Democracies

Soft power is the ability of a country to persuade others to do what it wants without resorting to force or coercion. Soft power lies in a country's attractiveness and comes from three resources: its culture, its political values and its foreign policies. According to Brand Finance's Global Soft Power Index India ranks 27th in terms of soft power. Present reflection of soft power shows increased interest (especially by smaller nations) in investing more and doing well in elite sports; impact of participating and winning as it gives the status of a great geopolitical actor. The need to deliver on soft power is for creating goodwill, as a strategic investment, post pandemic changes, trade and investment flow, to build an image of a trusted and reliable partner. Through this I will present the role of Indian Classical dance in specific as a soft power in Para diplomacy and sub diplomacy and try to bridge the gap in how culture plays an important role in creating strong democracies.

Health Social Movement to Access Required Primary Care: A Case Study in a Rural Primary Health Centre, India

The objective of this study is to explore the way to improve the access to primary healthcare through the health social movement (HSM). The study adopts a qualitative approach with a pragmatic worldview. Previous studies have shown that large number of primary healthcare centres in West Bengal are not capable of providing quality healthcare because of lack of staffing or poor infrastructure. For this study, we purposively selected a health centre in a village where people engaged in HSM to improve better health care. The village we selected is away from the mainland and surrounded by seawater. According to the 2011 census, the health care centre provides services to over 6000 people. In 2011, the government-sanctioned posts indicated a lack of healthcare services due to the shortage of healthcare staff. Upon the request of the people of this jurisdiction, the village council wrote a petition to the department of Health and Family Affairs (HFA) requesting to recruit the sanctioned number of health care staff. After waiting a few months with no reply from HFA, the village council took the advice of a non-government organization and file a Writ petition to Kolkata High Court and received favourable order in 2016. A few months later the sanctioned number of health care staff were posted by HFA which gradually improve the quality of healthcare services. The study shows that access to healthcare for the population can be achieved through the help of the judiciary system. It needs organized community action by proactive members of civil society and the help of non-governmental organizations.

Patients' Experiences with Telemedicine Treatment System: An in-Depth Study in Rural West Bengal, India

The telemedicine treatment system is globally relevant and it has been implemented in India at the patients' doorstep.

The objective of this study was to explore rural patients' experiences with the telemedicine system in contemporary times, especially the challenges and opportunities faced and changes felt in the doctor-patient relationship.

The study adopted a qualitative approach with a pragmatic worldview. We collected data through in-depth interviews of patients who availed of Telemedicine ever with a semi-structured interview schedule. We selected first the Rampurhat Health District of West Bengal for study and then selected the Community Health Officers (CHO) attached to respective thirty-four Health and Wellness Centres (HWC) randomly from the list of CHOs. We selected study participants by systematic random sampling method from the benefitted patients' list provided by CHOs - One benefited patient per CHO list. We gathered no new information after 18 patients, thus selected. So, the Sample size was 18.

The majority of the participants were found satisfied with telemedicine treatment. They didn't need extra digital literacy to avail of this as CHOs' helped them as liaisons with the doctor and patients. The participants saved time and money for travelling to the hospitals to get treatment. They felt the same connectedness with the doctor during teleconsultation as in face-to-face consultation. They needed improvement in telemedicine services like enrolment of more specialized doctors and more logistic support such as printed prescriptions.

The study revealed that the implementation of a telemedicine system opened a new avenue to make reach treatment to the inhabitants of remote rural areas. This study identified some challenges of this system which could give directions to the policymakers on the improved way of telemedicine implementation.

Sustainability and the Idea of "Minimum": "Individuals" in the Making of Our Future

A deliberate recourse to "individual", in order to console the man-nature rifts that have been pointing to life-threating consequences, is evident in some of the contemporary discourses on environmental degradations and our responses to it. The "individualization of responsibility", as has been termed by Michael Maniates, not only puts the onus of "going green" over "growing grey" on the shoulder of the citizens but also points to the idea of "minimum" as a necessary precondition that can only be fulfilled at the individual level as a supplement to the institutional-governmental strategies to deal with the environmental issues. The practice of pursuing "minimum" in everyday life may, in some cases, go against the aggressive moves of what is known as capitalocene, but curtailment of needs may contribute significantly to the restoration of the already damaged environment. Though there is no objective criterion to fix the parameters of "minimum", its subjective definitions may philosophize the "need-greed" dichotomy with a positive note to make a future sustainable and rational. The dialectic, however, revolves around the issue of individual as a "consumer" and individual as a "conserver" in a market-oriented culture. Placing "individual" at the center stage, this paper explores the possibilities of the behavioral restraints, expressed through the idea of "minimum", traditionally existing as a matter of fact in many cultures, as a panacea to the man-made ailments of "nature".

Dancing in the Street As Feminist Empowerment. the Choreographic Discourse of Bellywarda and L'Armée Des Roses

The vindication of female bodies in public space is a constant in feminist social movements. Whether occupying the streets in protest of women's rights and equality, against sexual harassment and rape, or involved in other social demonstrations, the role of the female body in public space conveying a social message is vindicated by artists from all disciplines. In the field of dance, some companies perform expressly in public spaces with the precise aim of conquering it as a stage to make female bodies visible, highlighting their diversity and demanding more equality and freedom.

In this article, we analyze through collective interviews the choreographic discourse of Bellywarda (FatChanceBellyDance©) and L'Armée des Roses (cancan), two French companies committed to the spread of feminism in the street. With the aim of studying the appropriation of public space, the interaction and reception with the public, the social links between dancers and the transmission of feminist values, we have addressed the observation of dance and interviews from Sociology of emotions, the phenomenology of urban spaces, and women's studies.

Unheard Voices – the Lived Experiences & Coping Mechanisms of Young Zimbabwean Homosexuals.

Over the last couple of decades, the LGBT community has continued to grow as the world has become open and accepting of the community. However, this is not the case for all the countries across the globe. Some countries still criminalise consensual same-sex acts and LGBT individuals live in hiding and in fear. One such country is Zimbabwe. This paper is an account of the lived experiences and coping mechanisms of young Zimbabwean gays and lesbians who are residing in Zimbabwe and South Africa. While South Africa's post-liberation state entrenched sexual rights in the constitution, Zimbabwe's post-independent state has strongly opposed homosexuality and has denigrated and rejected same-sex relationships. Gays and lesbians have had to navigate extreme difficulties and find coping mechanisms to survive repression and surveillance in Zimbabwe, often fleeing to South Africa to enjoy greater freedom. It is seen that for Zimbabwean homosexual youth, social networks have the potential to be supportive and enabling – whether family, friends or church-based – but they often increase pressures, making it difficult for the young gay person to live a free and non-prejudiced life. Networks are contradictory – some are constraining and debilitating (as in the case of family, religion, friendships) but, at the same time, some of the young people reach out to them because under the circumstances, they are of the greatest help. Learning to understand how to draw on their strengths is vital for survival. Understanding the dynamics of patriarchy is also useful to know why gay men are strongly disfavoured in Zimbabwe whilst lesbian women are tolerated. The voices of young Zimbabweans suggest that, apart from drawing on the support of networks such as family and churches, building a sense of self-acceptance is vital to lay the basis for a better future.

PATTERSON, Matt* (University of Calgary, Canada)

Cultural Planning in North American Chinatowns

The co-construction of place and race has long been a core concern within urban sociology. However, with important recent exceptions (e.g. Hunter et al. 2016; Hom 2020), race and ethnicity have not been central to the literature on cultural planning and placemaking. Bridging these distinct literatures, this presentation investigates cultural planning and placemaking within 14 North American Chinatowns through an analysis of policy documents, placemaking projects, and interviews with community activists. While they have existed since the 19th century, many North American Chinatowns today face significant threats, including gentrification, demographic and linguistic shifts within North America's Chinese population, suburbanization, and, more recently, anti-Asian racism and the economic fallout of the COVID19 pandemic. In response to these challenges, "Save Chinatown" movements have emerged across the continent, often adopting cultural planning and placemaking strategies aimed at protecting the social and cultural characteristics of these neighbourhoods. In doing so, these groups are required to translate abstraction notions of race, ethnicity, culture, and identity into concrete policies, design guidelines, and placemaking projects. In analyzing this translation process, this presentation

expands our understanding of cultural planning beyond the area of economic development, demonstrating its use in constructing collective identity and confronting systemic racism. Moreover, by drawing comparisons across neighbourhoods, the analysis provides insight into the potential and limitation of cultural planning, as well as how its effectiveness is mediated by contextual factors that include local political structures, real estate markets, and transportation infrastructure.

Ethics Vs. Participation? Navigating the Tensions within Collaborative Research with Children in South Africa

University-based ethics review boards almost always define children as "vulnerable subjects," particularly when they occupy additional marginalized subject positions like being poor, racialized, queer, disabled, and/or from the global south. This paper explores how such attempts to protect vulnerable subjects may contribute to their further silencing, in terms of not just whether they can participate in academic research projects, but what constraints are imposed on their participation and the research and public scholarship outputs it produces. Often dissuading researchers from including children at all, research protocols typically default to cautionary protectivist approaches that require children's individual identities to be hidden and severed from the forms of knowledge, cultural production, and self expression they produce in ways that are often at odds with community-based NGO practices, children's own wishes, and many of the articles contained in the UN Convention on the Rights of the Child. Based on the author's ongoing collaboration with two children's NGOs in South Africa, this paper explores the tensions between institutional ethical protocols and the local needs and wishes of children themselves to consider the following: How can researchers and policy-makers balance the sometimes contradictory mandates to on the one hand protect children from exploitation and harm, and on the other to guarantee their right to participate and express themselves, as protected in the UN Convention on the Rights of the Child? In an increasingly digitized world, how can research outputs--including forms of public scholarship--based on children's cultural production and participation be made available to the broadest possible audience, and in accordance with children's own wishes and interests? What protections should be put in place, in ways that interrupt rather than re-entrench systemic, historical inequalities between the global north and south and between adults and children?

RC55-739.2

PATTINASARANY, Indera* (Universitas Indonesia, Indonesia)

Analyzing the Impact of the COVID-19 Pandemic on Happiness in Indonesia

World Happiness Report 2021 shows that many countries experienced a decline in happiness levels since the emergence of the COVID-19 pandemic, including in Indonesia. Previous studies of happiness during a pandemic have focused on certain aspects of certain community groups, used limited size data, relied mainly on online surveys with convenient sample selection of respondents, and used pre-pandemic evaluations of happiness through respondents' memories. Each of these shortcomings has methodological and empirical implications that lead to incomplete and inaccurate conclusions about changes in happiness levels caused by the pandemic.

In an effort to overcome the limitations of previous research, this study analyzes the factors that affect the level of happiness in Indonesia before and during the COVID-19 pandemic using the 2017 and 2021 nation-wide Happiness Level Measurement Survey (SPTK). The SPTK survey was conducted through face-to-face interviews and respondents are representative the provincial level. SPTK assesses the level of happiness of respondents through the Cantril ladder. The survey did not directly ask questions related to respondents' exposure to the pandemic. However, data collection in 2021 conducted at around the peak of the pandemic in most provinces in Indonesia implies that respondents' assessment of happiness levels in 2021 is partly influenced by their exposure to the pandemic.

This study employs pooled cross-section data analysis with multi-level ordered logistic model. The determinants of the level of happiness include demographic and household characteristics, socio-economic factors that can influence respondents in assessing their level of happiness, and indicators related to the spread and intensity of the COVID-19 pandemic. Realizing that pandemics have different effects on happiness levels between groups of people, this study will dissect the data based on certain characteristics. The latter includes urban vs. rural residences, provinces with high vs. low rates of pandemic-exposed people, and cohorts.

PATTINASARANY, Indera* (Universitas Indonesia, Indonesia)

Anxiety, Depression, and Social Class before- and during the COVID-19 Pandemic in Indonesia

The COVID-19 pandemic has had undesirable effects on people's lives which causes people to have excessive anxiety and depression. The increasing

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cases of anxiety and depression caused by the COVID-19 pandemic and their consequences have been widely studied. These studies suffer from weaknesses such as the use of longitudinal data that was collected only once, limited sample size, the use of different mental health measurements between studies, and the use of memory recall in evaluating mental health before the outbreak of the COVID-19 pandemic. Furthermore, many studies on the incidence of anxiety and depression based on social class have been conducted, but only a few covered the effect of the COVID-19 pandemic.

This study analyzes factors that affect the level of anxiety and depressions for each social class in Indonesia before- and during the COVID-19 pandemic using the nation-wide Happiness Level Measurement Survey (SPTK) of 2017 and 2021. The factors that will be used in this analysis are (i) demographic and household characteristics, (ii) social classes constructed based on the respondent's education, occupation, and income, (iii) macro socio-economic factors that influence people's mental health, and (iv) indicators related to the COVID-19 pandemic spread and intensity. The quantitative analysis will employ pooled cross-section data analysis with multi-level ordered logistic model.

Overall, compared to 2017, survey respondents reported higher levels of anxiety and depression in 2021. Preliminary findings (before the construction of social class) show stark differences between employed and non-employed respondents in evaluating depression levels. Reported levels of depression did not differ between genders among those who worked, while among the unemployed, women rated depression level lower than men. In addition, provincial unemployment rate does not affect the level of depression among those who work; however, among the unemployed, the higher the unemployment the higher the reported depression level.

Analyzing Anti-Posco Movement of Odisha: Through New Social Movement Perspective

Anti-POSCO protests had started in 2004-05 against the proposed $12 billion mega steel plant, at village *Dhinkia, Jagatsinghpur* district in *Odisha*. Unlike the other resistance movements of Odisha, that were fought and studied on the issues of rehabilitation and resettlement, ecological degradation, loss of livelihood and local identity, the anti-POSCO movement is studied with a nuance that examined the rise of SMOs and networking among the civil society organizations in the process of mobilizations. Thus, based on the New social movement (NSM) perspective this exercise envisions two objectives, such as: (1) to study the rise and role of SMOs in the Collective mobilizations process and (2) to study the decisive role of CSOs in shaping the movement. While pursuing the trails of collective mobilization, we found the strategic use of children and women in the movement, which was conspicuous. Further it was found that the CSOs are in concert with the principal SMO the PPSS. The analysis ended up in the discovery of a three fold nexus, i.e, (i) between the political parties and SMOs, (ii) between the SMOs and the NGOs/ INGOs, and (ii) between the NGOs and the grassroots level voluntary organizations. This verified the NSM based-proposition pertaining to the networking among actors.

Further analysis, from the vantage of NSM perspective enabled us to diagnose the causes of the movement, such as; (i) intensive debate among the state, project affected people, *development elites, professionals from both governmental and non-governmental organizations and multilateral agencies over* the approach to development, (ii) state government's failure to build consensus among various stake holders like, affected people, political parties, civil society organization and local grassroots organization, (iii) Govt's failure to convince the local people that they are the true beneficiaries, (iv) the mobilizations were not based on voluntary action, rather on coercion.

Studying Kashipur Resistance Movement through Michael Cernea's Impoverishment Risks and Reconstruction Model of Displacement

The paper in hand is a study of a resistance movement to the UAIL project in Kashipur block that shook Odisha's Rayagada district during the 1993-2013. The study envisions two objectives; (i) Studying the mobilization for the resistance movement by the PAPs; and (ii) Analyzing causes of the resistance movement at Kashipur. The paper makes use of New social movement perspective to analyze the course of the movement and uses Michael Cernea's IRR model to analyze the empirical data pertaining to displacement caused by the project in the adjacent villages.

In view of the first objective the paper articulates the slow but steady fomenting of the resistance movement, the role of the Social movement organization/s, the process of collective mobilizations that took violent turns, and the role of civil society organizations involved there in. The second objective of the paper pertains to the empirical study (sample of the PAP from the two R&R colonies near the Ramibeda refinery plant) about the extent of displacement caused by project and its effects on the PAPs, through the seven indicators of Cernea's IRR model such as: landlessness, joblessness, homelessness, marginalization,

food insecurity, loss of access to common property resources, and social disarticulation. So they fought for their rights over the land and adequate compensations. This study found that due to the loss of agricultural land, the PAP has been gradually transformed into daily wage earners (sort of a de-peasantization process). Further the data findings revealed the emptiness of the SEIA report (part of the feasibility study) and the great extent of deprivation and impoverishment caused by the project among the PAPs which rendered them ready recruits to the resistance movement. Hence it is concluded that in democracies PAPs may adhere to non-institutional means or combination of institutional and non-institutional means for solutions.

The State of Personal and Interpersonal Emotional Labour in Australia: Results from a National Survey

With the emotionally demanding service economy booming in Australia, it is timely to (re)assess the extent, social context, and recipience of the emotional labour (EL) performed by the Australian workforce. With some exceptions (e.g. legal, care work, unemployment), Australian research on EL has been minimal. There has been little attempt to measure it nationally through survey data, and (as in most countries) no distinction made between personal EL performed on oneself (e.g. calming or motivating) and the interpersonal EL performs on another (e.g. supporting, cheering, soothing, another). This paper examines aspects of personal and interpersonal EL within Australia using national data from the Australian Survey of Social Attitudes (AUSSA). Findings reveal novel gender and sector dynamics around the performance and recipience of personal and interpersonal EL.

Who Are Fathers Caring for Emotionally? Results from an Australian Survey of Interpersonal Emotion Management

While father's may be increasing their emotional engagement with their children in recent decades, many aspects of their emotional care practices remain unclear. Do fathers preference emotional care for their sons over their daughters? And what of their partners; has much changed since Duncombe and Marsden identified highly unequal intra-household emotional work between husbands and wives in 1993? I examine aspects of the performance of personal emotion work (upon oneself) and interpersonal emotion work (upon another) for family members and friends, comparing Australian fathers and mothers, using national data from the Australian Survey of Social Attitudes (AUSSA). Preliminary results show parents living with children are more likely to manage other's emotions, and that mothers are more likely to engage in emotional care of children than are fathers. However, I also find that female children are more likely to receive emotional care than are male children regardless of the parent's gender, which refutes gendered accounts of parent-child dyads where parents feel closer and emotionally support their child of the same-sex to a greater degree. The repercussions for ongoing issues around gender inequity and father's involvement in emotional care will be discussed.

Social Bonds and Diversity Index in the United-States: The Relevance of the Durkheimian Theoretical Approach of Social Attachment

This paper applies the theory of social attachment, based on the pioneering work of Durkheim, to explain the relationships between *social bonds* and *diversity index* in the United States at the federal state level. The theory of social attachment contains four types of social bond, which refer to different spheres of morality and normative systems: the *lineal* bond (*domestic* morality), the *elective participation* bond (*associative* morality), the *organic* participation bond (*occupational* morality) and the *citizenship* bond (*civic* morality). First, we create social bonds indices based on HDI technique for reflecting the four types of social bond. This measurement process shows the frequency of configurations of social bonds and the most occurred social attachment regime(s) across the United States and by federal states. Second, we do cluster analysis of social bonds by federal states, and we discover the most influential variations between the federal states regarding the social bond statistics. Third, we reveal the correlations between selected socio-economic variables (focusing on poverty and inequality) and the social bond indices. At the end, we focus on racial and ethnic diversity in terms of correlations between the index of diversity and the social bond indices. Throughout this analysis, we answer to: What are the similar states and how the state clusters dissimilar from each

other in terms of social bond indices? The states with relatively good economic performance are mainly regulated by which social attachment regime? The states with relatively good social protection coverage are mainly regulated by which social attachment regime? What is the racial and ethnic diversity profile of each social attachment cluster? Do the clusters with greater racial and ethnic diversity perform better regarding economic and social protection aspects? Does the lineal bond become significant when the citizenship bond is weak?

A Comparison of Domestic Worker Protections Around the World

Domestic workers are some of the most vulnerable and least protected workers in the world even as they provide some of the most essential carework that props up the rest of the economy of a country. And yet even as it is acknowledged that domestic workers rarely receive the full set of labor protections that other workers enjoy, what is less acknowledged are the wide discrepancies across countries in terms of the degree of policy protections provided to domestic workers. By leveraging original data we have compiled via the Global Care Policy Index (GCPI) project on a diverse set of 30+ countries' care policies, we explore the significant variation that exists in the degree of policy protections provided to domestic workers around the world. With regression analysis, we also assess different theories that have been put forward to explain the degree of labor rights provided to domestic workers in a country.

Gender Equality As Attitude or Context: What Matters for Fertility?

This study aims to examine the effect of individual gender egalitarian attitudes on fertility ideals, specifically focusing on the effect of attitudes towards domestic gender equality. Additionally, it seeks to explore whether the effect of individual gender egalitarian attitudes on fertility ideals varies by country context. Data were used from the 2012 International Social Survey Program (ISSP) module on Family and Changing Gender Roles, and includes information on participants from 39 countries. We utilize multilevel modelling to understand the effects of both micro and macro level gender equality on fertility ideals. Our results show that individual egalitarianism is negatively associated with fertility ideals, with a unique effect of attitudes towards both public sphere gender equality as well as domestic sphere gender equality. Further, the study highlights the importance of societal gender equality in influencing fertility ideals, as well as in modifying the association between individual gender egalitarian attitudes and fertility ideals.

Childhood in First Person

La infancia en primera persona: niñas, niños y adolescentes migrantes no acompañados en Chile

El objetivo de esta ponencia es caracterizar el fenómeno de la migración no acompañada de niñas, niños y adolescentes en Chile, desde el cruce de diversas categorías de desigualdad (edad, sexo-género, origen nacional), conocer las trayectorias migratorias infanto-juveniles desde la enunciación protagónica y aportar en el diseño de políticas públicas de inclusión social. Se presentan resultados de un Proyecto FONDECYT 1221337.

Hasta ahora, eran pocos los casos de ingreso por pasos no habilitados, pero dada la nueva ley migratoria (que impuso la exigencia del visado consular) y el cierre de fronteras debido a la pandemia, se han comenzado a registrar un incremento de situaciones de niñas, niños y adolescentes que migran sin compañía adulta, tal como ocurre en países de mayor tradición migratoria. El crecimiento económico del país continúa siendo un factor que incide en que Chile sea un destino de la migración intrarregional. No obstante, el estallido social de 2019 vino a cuestionar desigualdades persistentes y fruto de eso, hoy nos encontramos en un nuevo proceso de pacto social. También ha contribuido a reconfigurar los flujos migratorios. En este sentido, resulta oportuno plantear el presente estudio para conocer el fenómeno de la migración de niñas, niños y adolescentes no acompañados.

El estudio se realizará en la zona norte del país (Arica y Parinacota y Tarapacá), por ser el principal punto de ingreso y área de frontera, y zona centro (Metropolitana y Valparaíso) principales ciudades de asentamiento de la población migrante. La muestra del estudio serán personal técnico, activistas, dirigentes de organizaciones no gubernamentales (ONG), profesionales de servicios públicos y autoridades regionales y nacionales que trabajan en el tema de la infancia y adolescencia migrante no acompañada, a quienes se les aplicará una entrevista en profundidad.

Unaccompanied Migrant Children and Adolescents in Chile

The objective of this paper is to characterize the phenomenon of unaccompanied migration of children and adolescents in Chile, from the intersection of various categories of inequality (age, sex-gender, national origin), to know the migratory trajectories of children and adolescents from the protagonist enunciation and to contribute to the design of public policies for social inclusion. Results of a FONDECYT 1221337 Project are presented.

Until now, there were few cases of entry through unauthorized crossings, but given the new migration law (which imposed the requirement of a consular visa) and the closing of borders due to the pandemic, there has been an increase in the number of children and adolescents who migrate without adult company, as occurs in countries with a greater migration tradition. The country's economic growth continues to be a factor affecting Chile as a destination for intraregional migration. However, the social outburst of October 2019 came to question the persistent inequalities and as a result, today we are in a process of redefinition of the social pact and has also contributed to reconfigure migration flows. In this sense, it is appropriate to propose the present study to learn about the phenomenon of migration of unaccompanied children and adolescents.

The study will be conducted in the northern part of the country (Arica and Parinacota and Tarapacá regions), as the main entry point and border area, and the central area (Metropolitan Region and Valparaíso), the main cities where the migrant population settles. The sample of the study will be technical personnel, activists, leaders of non-governmental organizations (NGOs), professionals of public services and regional and national authorities working on the issue of unaccompanied migrant children and adolescents, who will be interviewed in depth.

PAVLICH, George* (University of Alberta, Canada)

A Sociology of Accusation: Social Lore, Law, and the Criminally Accused

Drawing on the work of sociological and legal scholars that founded *The Journal of Legal and Political Sociology*, this paper will argue that socio-politically charged accusations provide the foundation for criminal law. Though the journal only existed from 1942-47, under the active leadership of Georges Gurvitch, it published several important sociological, political, anthropological, and realist works on law at the time of the second world war. Referring to selected passages (eg. by Gurvitch, Kelsen, MacIver, Parsons, Sorokin, Pound, Llewelyn), I attempt to show that historical performances of criminal accusation forge the groundwork upon which criminal law comes to rest. That is, the translation of social life to legal idiom is ritually forged through a politics of accusation that categorizes transgression. The 'political sociology' of accusation is thus juridically generative, as will be further illustrated through a Canadian example. Focusing on what is now known as Alberta, it will highlight how a newly created Northwest Mounted Police Force (1814) first set about enforcing colonial law by establishing 'theatres' (eg. preliminary examinations) where performances of criminal accusation could be staged. Here, prohibited social practices were transcribed into colonial notions of law and order; thus translating local lore to a criminal law that ascribed responsibility for social conflict (born to settler colonial structures) exclusively to individually accused persons. It will conclude with a brief reflection on the implications of the aforegoing for a critical sociology of accusation.

Narratives of Women about Their Identity and Name Choices after Marriage

Name and surname are seen as an important foundation of every individual's personal identity and changing any of these elements can be

stressful. Meanwhile, in many countries, including Poland, despite the lack of legal coercion, there is still a patriarchal tradition and social expectation that a woman will take her husband's surname after marriage. This tradition is so deeply rooted in culture that it has not been questioned in Polish feminist literature so far. However, in official statistical data, a slow but significant emancipatory change can be observed, consisting of an increase in the number of women who choose to retain their maiden name. It is interesting trend in the Central and Easter Europe country, where the RC Church has a stronghold in a traditional, patriarchal division of gender roles. The presentation will show the narratives women provide for their name choices with particular emphasis on identity and emancipatory factors. Data obtained from in-depth interviews were analyzed using MAXQDA. The presentation will focus on discursive research methodology.

Articulating Reef Futures: Community Narratives on Human-Assisted Ecosystem Adaptation in the Great Barrier Reef

The Great Barrier Reef is a rich material-semiotic assemblage co-fabricated in a myriad of biological lives and physical forces. Human communities, practices and imaginaries are interwoven in this assemblage, adding to its emergent possibilities. Accelerating climate impacts has stimulated significant investment, via the Reef Restoration and Adaptation Program, in exploring new ways for humans to affect the Reef assemblage using a suite of scientific practices and technologies to restore, replicate, and synthesize important ecological connections and functions as they become impacted by climate change. As marine scientists and engineers grapple with the technical and logistical challenges of broadscale ecological intervention, a program of engagement seeks to mobilise communities in the creation of Reef futures that are socially acceptable and just. In this paper, we discuss the outcomes of an early stage in this engagement: a series of intimate, deliberative discussions with over 100 Reef traditional owners, community members and stakeholders about futures for the Reef including those associated with the possibility of human-assisted ecosystem adaptation. Using a series of composite narrative maps, we trace the process through which participants imagine futures for the Reef and articulate alternative possibilities for human action and influence in the Reef assemblage. These maps show preferred pathways imagined in practicing local forms of care and respect for the Reef to allow it room to express its inherent ability to recover and self-manage, and in enhancing and extending the Reef's potential to act as a political catalyst for more ethical and transformative human-environment relationships. While these pathways were imagined to be different from those created through human-assisted ecosystem adaptation, we reflect on how technologically-mediated adaptation might be deployed and designed in concert with the everyday relations that communities practice with the Great Barrier Reef and the ways they imagine its future.

Inequality in Healthy Life Expectancy in the Asia-Pacific: A Cross-National Analysis

Differences in later-life health across the Asia-pacific are poorly understood. This research examines gender and cross-national differences in healthy life expectancies using longitudinal sample survey data from 5 Asia-Pacific countries: Australia, China, Indonesia, Japan and South Korea during the period between 2007 and 2018. Health expectancies are estimated for three outcomes: physical functioning, self-rated health, and self-reported diagnosis of major chronic diseases. We generated multistate life tables to estimate harmonized life and health expectancies.

Our results demonstrate the considerable heterogeneity in life and health expectancies within the region. We find that men and women in Japan and Australia have substantially higher healthy life expectancy, and can expect to live greater proportions of their remaining lives free of functional limitations, ill-health and chronic diseases. To illustrate, an Australian woman can expect to live 61% of her remaining life at age 65 in self-rated good health, and 65% of her remaining life free of chronic diseases. In contrast, a women in South Korea can only expect to live 21% of her remaining life in self-rated good health and 58% of her remaining life disease-free. A comparison between the two studied middle-income countries further reveals that although China has a higher life expectancy as compared to Indonesia, the lives of older adults in China are more severely burdened with functional limitations, diseases and ill-health.

There are consistent gender differences in healthy longevity across all five countries. Women in all countries live longer, but they spend higher proportions of remaining lives with functional limitations and self-rated poor health. At the same time, in all countries except for China, women can expect to live more disease-free years and fewer years with chronic diseases. Our findings highlight that the direction and magnitude of gender differences in health differs across dimensions of health.

Kids Feeling Good about Being Indigenous at School and Its Link to Heightened Educational Aspirations

The formation of aspirations is a crucial milestone in the personal and cognitive development of children, pivotal in the orienting their directions and pursuits in life as they enter adulthood. One's aspirations pertaining to education are especially valued, and nurtured, across the Western world. Various studies have shown that, for children who are Indigenous, their connection to, holding of, and safety in their Indigeneity contributes to better educational results, as well as a more advantageous maturation, and stronger physical and emotional wellbeing. This presentation presents findings from a quantitative study from the Wave 8 K cohort of The Longitudinal Study of Indigenous Children, Australia. It examines the way in which cultural identity influences one's aspirations to complete secondary school amongst 499 Aboriginal and Torres Strait Islander and Torres Strait Islander children who are 10.5 to 12 years old. We find that children possessing comfort in their identity as Indigenous people, especially during their schooling, is associated with a greater likelihood of wanting to finish their secondary education. Our findings further affirm the necessity for additional awareness and support by educators in the classroom for Indigenous children.

Segmented Transition: Patterns in a Life-History Study of Electricity Workers amidst Industrial Change

That energy transition impacts different workers differently is widely recognised, but the diversity of situations and positions energy workers experience is little understood. How does the transition to low-carbon electricity take shape within the longer run processes of labour market segmentation in electricity? This paper reports on findings from a comparative study of energy workers in Australia. It investigates the work and lives of people employed in electricity and related industrial sectors. Data from life history interviews is presented to interpret the labour processes and social implications of transition for different workers. The study compares the experiences of workers across a range of roles, from frontline construction, operations and engineering to the work of administration and management. Patterns of change for energy labour as Australia decarbonises its electricity sector must be understood part of a longer run patterns of segmentation and division in the electricity labour force. The historical character of electricity workforce stratification is emphasised to understand dilemmas of solidarity and regulation as a class process.

The Conditions of Possibility for Environmental Justice

Environmental justice (EJ) movements constantly work at diagnosing structural barriers to change and creating power through collective actions. In doing so, these movements embody EJ theory in practice. What forms of social movement power, strategy, and solidarity create the enabling conditions for environmental justice? On what bases do scholars and practitioners agree and where do differences in praxis emerge? This paper reports on two segments of a larger international study using Q methodology to empirically examine the discourses emerging and circulating about EJ globally and what lessons such EJ discourse offers to both scholarship and policy. We outline how EJ activists and scholars interpret the multi-dimensional barriers to change, before reflecting on the forms of strategy and organising practices they emphasise as necessary for creating change. Our findings highlight strong agreement about the importance of strategic focus on racial and socioeconomic injustices for successful EJ movement strategy. Three approaches within this broad agreement were identifiable. A communitarian decolonial approach focused on solidarity with indigenous and other marginal social groups. A structural disruption approach focused on networked power from below as a strategy of transformation. And a third of technology and local knowledge, particularly the ways in which technology is enabling local knowledge as an avenue of participation, recognition, and inclusion in forums of public engagement and legal or political challenge. Our data revealed most disagreement among about strategies that target policy frameworks and legal institutions. The paper reflects on the implications for EJ movement praxis when the state is such an ambivalent target for EJ claims.

Disrupting Masculinism in Public Policy Responses to COVID-19: Unmasking the Gendered Dimensions of the Pandemic

The COVID-19 pandemic has intensified existing social and political inequalities throughout the world. In social justice responses, the primary focus has been on socially vulnerable populations affected by the coronavirus: those in the global South, women, those who are older, those with disabilities and chronic health conditions, those on low incomes and those who are black, Indigenous and people of colour. In the context of these social divisions, it is important to note that more men are dying from directly from COVID-19 than women; although women face escalating levels of violence associated with men's responses to the virus. Men's greater historical vulnerability to the coronavirus can be explained in part by gendered differences in perceptions of risk associated with mask wearing, hygiene practices and social distancing, which are seen by many men as signs of weakness. Men's gendered sense of invulnerability is also related to masculinist anthropocentrism which is at the heart of increasing human pressures on the natural environment that are driving the emergence of diseases. Furthermore, masculine invulnerability is also evident in public policy responses shaped by masculinist political leadership styles, gendered nationalism, sovereign manhood and populist far-right narratives about male entitlement, selfishness and conspiracism. If masculinism and its role in naturalising domination of the earth, structural inequality and violence, is to be challenged, men will need to embrace a feminist ethic of care at the levels of planetary, political and personal life.

Cities for a Guaranteed Income: The New Urban Politics of Antipoverty Policy in the United States

"Only a crisis—actual or perceived—produces real change," Milton Friedman (in)famously declared, "When that crisis occurs, the actions that are taken depend on the ideas that are lying around." The duty of radical reformers, he believed, was "to develop alternatives [and] to keep them alive and available until the politically impossible becomes the politically inevitable." It was not until the socioeconomic crises of the 1970s that neoliberal activists were able to seize an opportunity to act, after decades in the wilderness. Arguably, a story resembling this can be told about the stalled and crisis-mediated history of guaranteed income (GI) initiatives, which deliver cash transfers as remedies for poverty and socioeconomic insecurity, and which have recently departed the realm of the politically impossible to become practical and popular, if hardly inevitable. Variations on the idea of a guaranteed (or basic) income have circulated for decades, indeed centuries, but in the space of five years GI has lurched from the ideational margins into the policymaking mainstream. In the US, a conspicuous surge in GI advocacy and experimentation predated the COVID-19 pandemic, later to be significantly catalyzed by the crisis. Since 2018, more than a hundred cities have launched pilot projects, most of them in conjunction with the progressive coalition Mayors for a Guaranteed Income.

Drawing on participant observations and interviews with key actors in the new wave of antipoverty policymaking, the paper presents an analysis of these convergent conditions of conjunctural crisis and municipal mobilization. It asks whether the embrace of GI across scores of US cities signals a paradigm shift in social innovation "from below," an after-effect of federal and state-level abrogation, or contradictory combination of the two, and whether this episode should be read as yet another mutation of late-neoliberal urbanism, or perhaps its incipient transcendence.

Mobilising Academic, Indigenous and Local Knowledge for Inclusive Agricultural Development: A Case Study in the Upper East Region of Ghana

In recent decades, academic recognition of indigenous-local knowledges has increased, as these knowledges are uniquely positioned to provide communities with the ability to cope with shocks in their food systems. This has led to a call for increased participation of indigenous-local actors in agricultural development processes, and the inclusion of their knowledges. Nevertheless, inclusive development can only be realized when there is sufficient recognition of diverse knowledges of stakeholders. Yet how this recognition may be enhanced without producing or maintaining epistemic injustices, is a topic for debate. This study posits that in order to gain an understanding in this, it is essential to study the diversity of perspectives on what knowledge constitutes and how the politics of knowledge shape these perspectives. This is done within the context of an empirical case in the Upper East region of Ghana. The research looks at how different actors within the agricultural development arena conceptualize indigenous and local knowledges, along with their appreciation of different knowledges (academic, indigenous, farmers',

...) within the process of inclusive agricultural development. This case details diverse perspectives on agricultural innovations, their development process and whose knowledge is taken into account or deemed valuable, based on fieldwork undertaken in 2021. For this qualitative research, 32 semi-structured interviews were undertaken, alongside participant observations, informal conversations and focus groups with a diversity of stakeholders. The initial findings show that more often, an emphasis is placed on knowledge external to the community, as being more 'innovative' and 'verified', by external actors. Furthermore, indigenous-local knowledges are included in development processes, insofar as they support that external knowledge. This showcases that there is a dominant perspective on which knowledge is accepted, shaped by traditionally powerful actors, reinforcing existing epistemic injustices. The article concludes by putting forward strategies towards mobilizing diverse knowledges in inclusive development processes.

Understanding Knowledge Politics between Migrant and Local Farmers in Forikrom, a Community in the Transition Zone in Ghana

In a move for more decolonial approaches to research and development, the importance of a pluriversal approach, one that is inclusive of vastly differing ontologies, epistemologies and knowledges, cannot be overstated. What this looks like in practice, is a debate that is also held within the field of agriculture and food, where there is a need to align existing food systems with the needs and knowledge of local communities (i.e. food justice and epistemic justice). The politics that come into play in these processes, have a significant impact on how these processes and its outcomes are shaped. It is therefore important to gain a better understanding of how these knowledge politics work within the field of agriculture and food. An empirical case within the transition zone of Ghana, where different ecologies and social groups meet, is described: the community of Forikrom. In this predominantly yam-farming community, migrant farmers and local farmers come into contact with each other and other stakeholders. Migrant farmers travel within the borders of Ghana, often from the more Northern regions towards Forikrom and further South in the country. The differing social power of these groups is studied, along with possible effects on knowledge politics and epistemologies. In this qualitative research, about twenty semi-structured interviews were conducted, along with participant observation during farm visits and one workshop with interviewees. Initial findings, as the analysis and discussion of results is ongoing, point to a differential in power and influence on agricultural knowledge creation and knowledge exchanges between groups of farmers. Social dynamics, such as potential stereotypes and peer pressure, are important when it comes to which knowledge is put into practice. We conclude by providing recommendations into creating more inclusive and just environments for agricultural knowledge exchanges.

PEECK-HO, Catharina* (Carl von Ossietzky Universität Oldenburg, Germany)

Securitization within European Democracies: The Example of the British Prevent-Strategy.

Debates on how to deal with terrorism have a continuity in the course of the 20th and the beginning of the 21st century. This is a particular problem for democracies, which need to meet this challenge without extensively trench on upon the freedoms of citizens. Securitization processes can ultimatley affect everybody in daily-life.

The attacks of September 11, 2001, in New York and the subsequent attacks in Europe (e.g., in London in 2005, Madrid in 2008, and Paris in 2015) led to a thematization of terrorism as a threat to European societies, which resulted in an increasing presence and anchoring of the topic in the national security strategies and legislations of various countries (e.g., Great Britain, Germany, France, and Italy). At the same time, the question of what means are legitimate in the fight against terrorism and to what extent security can be created for populations at all came into focus: the introduction of security technologies such as facial recognition programs, cameras, but also related educational measures is anything but uncontroversial. Security remains unavailable, as, for example, the Rhineland-Palatinate Minister of the Interior Roger Leventz stated in the wake of the Trier rampage in Germany on 1.12.20: "We live in a very free society. If the car becomes a murder weapon, then it's difficult to say as a state, we can stop that 100%. No, we can't."

The contribution approaches the topic using the example of the British Prevent-strategy, which had a model function for different countries in Europe. Based on a analysis of measures in the fields of community work and education, it will be discussed how justified concerns about public safety in the context of concrete measures can result in cuts in the civil liberties of citizens that may pave the way to illiberal democracy.

Vulnerability, Inequality and Citizenship: The Example of Sanctuary Cities in the United States

Citizenship is closely linked to questions about vulnerability and inequality: Bryan Turner (2006) states that an outcome of the genuine vulnerability of human beings is the foundation of social institutions "that come to constitute what we call 'society'" (Turner 2006: 26). As debates on illegal migration show, though, the access to social institutions is in many ways restricted by citizenship status, creating and strengthening inequalities from the global scale to people's everyday experiences. On the other hand, developments of recent years have demonstrated how even noncitizens can transform the rules of citizenship and gain access to rights under certain circumstances (e.g., Isin 2008).

I want to take the interconnection of the vulnerability of human beings and the institutionalisation of membership in a nation state as a starting point to discuss this field of tension. The example will be Sanctuary Cities in the United States as they imply a contradiction: while social movements managed to open up spaces for participation and limit the fragile status of being undocumented and potentially subject to deportation, the general problem of a lack of citizenship status with all its potential consequences is not solved. As studies show, this leads e.g. to a permanent fragility that migrants have to manage in their daily lives (e.g., Gonzales 2015). The example of discourses on the topic in San Francisco draws attention to the connection between citizenship and inequality. They show that citizenship should be addressed as a field of tension between legitimizing exclusion and the ways people successfully make rights claims.

Older Migrants and Older People Living in Socially Disadvantaged Communities' Perspectives on Barriers and Enablers to Civic Engagement

Civic Engagement in older age is starting to be a topic of discussion amongst policymakers. Following scholars' studies, as well as their analysis and conclusions from the last 40 years, we are starting to deepen our knowledge on certain categories of engagement such as volunteering or voting, but we are still pending to understand other ways of engagement like political engagement or informal support to others. In addition, when older persons live in socially disadvantaged areas or —having a non-European background— have migrated in adulthood, studies hardly ever reflect their perspective. This paper explores the vision of these two groups of older people, under the umbrella of the cross-national project CIVEX: exclusion from the civic engagement of older people in five different countries in Europe. Understanding civic engagement as a multidimensional construct, one hundred older people have answered in-depth interviews providing their views on enablers and barriers to civic engagement, from four different countries: Sweden, Belgium, Finland and Spain. After analysing these life-course interviews, the outcomes provide a compass of different enablers and barriers to civic engagement, ranging from personal facets to more contextual, organizational or relational ones. Considering the axis of analysis used —the contextual group, different expressions of civic engagement, and the country where the interviews were conducted— enablers and barriers showed differences and similarities. A major outcome of the study revolves around the need for agents involved and policymakers to enhance civic engagement amongst older people with a non-European background who have migrated in adulthood and older people in socially disadvantaged urban communities. It's of the utmost importance that this enhancement observes: (1) the specific circumstances of the life curse of the individuals in these groups, (2) the multidimensionality of civic engagement, and (3) the social and political context where this engagement takes place.

Deliberative Participation As a Contribution to a Constructive Relationship between Science and Society

How can science, politics and society orient themselves to stem the democratic drift of some current phenomena, such as the "scientific authoritarianism", the rise of populism and political apathy?

The ISEED project - *Inclusive Science and European Democracies* - is working to build a new concept of "deliberative participation" aimed at improving both the quality and legitimacy of inclusive decision-making process. In line with this aim, we have provided an overview of participatory and deliberative tools affecting techno-scientific issues. In addition, we have carried out 50 interviews with European scholars and practitioners, analysed with a careful use of content analysis oriented by Grounded Theory.

Through the interviews the concept of "deliberation" was investigated trying to verify the levels of power that the actors exercise in consultative and deliberative processes. The analysis of the democratic contexts has shown that the level of inclusion is different in the European areas as it is linked to the historical, cultural and geopolitical background. In fact, some of the elements that can determine effective participation are: organization and transparency of political systems, infrastructures, economic resources and a mutual relationship of trust between citizens, policy-makers and experts.

This presentation proposes the results of the analysis indicating strengths and weaknesses due to the different contexts and methods of carrying out participatory practices. The tools studied and improved in Europe during the last twenty years are not sufficient to enhance the effective expansion of the democratic space if some important conditions do not guarantee a new balance of power between policy-makers, experts and civil society.

Often in research and participatory projects great attention is paid to the elimination of barriers to inclusion. However, removing the barriers is important, but not sufficient if we do not rethink the democratic spaces within which participation itself is considered only a method.

Post-Security and Environmental Governance

Environmental governance has remarkably diversified over time. Looking at regulatory approaches one can distinguish for example between command-and-control, market-based and self-regulatory ones. All of them aim to a major extent to anticipate adverse events. Various forms of anticipation have emerged, according to different accounts of the character of the issues one is confronted with, of the agency about them, and of the temporal framework of action. Prevention was the first, followed by precaution. Yet, since the late 1990s other forms of anticipation have emerged, gaining growing relevance, namely pre-emption and preparedness. First goal of the paper is to discuss the differences between these forms of anticipation and earlier ones; differences which indicate a major shift in environmental governmentality. Second goal is to elaborate on this. I will focus on preparedness – an approach developed especially with respect to biological threats – and consider the empirical case of the management of the Covid-19 pandemic. Based on an analysis of the main regulatory documents enforced by the Italian government between the beginning of 2020 and the end of 2021, I will show the way preparedness has been concretely deployed. Ample recourse to disciplinary measures created tensions with the securitarian logic of health apparatuses and the preventive character of many approaches and instruments, including vaccinations, contrasted with the precautionary framework of their actual implementation. Preparedness played a limited role at a surface level, yet its actual import can be gauged by detecting in the Italian government's measures an emergent approach that intensifies some features of security up to engendering a qualitative change. The contours thus emerge of what may be called post-securitarian environmentality, some implications of which for environmental governance and environmental sociology will be addressed at the end of the paper.

"La Protesta Es Un Derecho / Pero No La Violencia": Criminalización De La Democracia En Las Américas y Respuestas Dialógicas

El enunciado-título de esta ponencia, "La protesta es un derecho / Pero no la violencia", podría aplicarse a prácticamente todos los gobiernos de América, tanto de derecha como de izquierda. La criminalización del ejercicio de derechos fundamentales (como los de manifestación, asociación, expresión, etc.) parece ser una característica del Estado y hasta del Gobierno Representativo (Manin) tanto se constata en prácticamente todos los gobiernos de la consolidadas democracias del continente. Sin embargo, cada país o contexto tiene sus especificidades que deberían permitir ciertas distinciones dentro de la categoría general "criminalización".

Si bien, prácticamente todos los gobiernos democráticos del continente asumen el derecho a la protesta, todos también proceden a una deslegitimación de las protestas concretas al tipificarlas como violentas y reprimirlas "con toda la fuerza de la ley". Este mecanismo discursivo común servirá de base a la comparación de diferentes tipos de criminalización en Chile, Colombia y México. A gruesas, mientras en Chile se asoció la violencia a fuerzas extranjeras ("estamos en guerra"), en Colombia se mantuvo un esquema de guerra interior a pesar de los acuerdos de paz y en México se intenta asociar la violencia al narcotráfico.

Más allá de estas distinciones –que conllevan también diferentes formas de represión–, el análisis discursivo de estas formas de criminalización no sería completo si no se tomara en consideración las reacciones de les manifestantes y de la opinión pública. Este análisis dialógico de las respuestas sociopolíticas a

las estrategias retóricas de legitimación de la violencia de Estado nos permitirá evaluar la eficacia de aquellas estrategias, de criminalización tanto como de resistencia.

En estos tres casos, gobiernos de derecha fueron remplazados por gobiernos de izquierda después de haber intentado criminalizar el ejercicio de la democracia (isonomía). ¿Criminalizarán las disidencias, estos nuevos gobiernos de izquierda, como se ha visto anteriormente?

Politics and Professions in Public Management of Social Policy – between Inequalities Regulation and Authoritarian 'Governmentality'? (Política y profesiones en la gestión pública de la política social – ¿Entre regulación de las desigualdades y "gubernamentalidad managerial"?)

En las tres últimas décadas, independientemente de la configuración nacional de los sistemas de bienestar de la segunda posguerra, los gobiernos de numerosos países emprendieron una amplia reestructuración del sector público, y las políticas sociales experimentaron el rediseño y escalonamiento en su gestión. Si la investigación social europea es rica en este tipo de caracterización, los objetos y procesos en debate a la luz de los estudios latinoamericanos dan cuenta de las mutaciones inducidas por el quiebre de los modelos de desarrollo y los efectos de la volatilidad del capitalismo a escala de la región. La reorganización de las políticas sociales constituye un resultado ambivalente de las reformas tendientes a contrarrestar el incremento de la pobreza, transfiriendo competencias de gestión a los niveles locales y/o a organizaciones sociales confrontados a las demandas emergentes del ajuste estructural.
