Romantic love has been the subject of literature since the time of the ancient Sumerians, in 4500BC and remains a topic of interest for sociologists, linguists and anthropologists. Contemporary framings of romantic love can be understood to be socially constructed, in that cultural norms shape the way in which groups in society may think about, construct and respond to love. Whilst romantic relationships are commonly discussed within contemporary society, few studies have explored the experiences of people with mental health problems in forming or maintaining romantic relationships. Our study addressed this gap through conducting focus groups with ten people with mental health problems, six carers and six professionals. People with mental health problems viewed romantic relationships as important but felt that they were difficult to develop and maintain due mental health symptoms and the side effects of medications, self-stigma, social stigma or romantic hopes being previously dashed. They also identified a lack of support from services to develop romantic relationships, due to romantic relationships being viewed as a private matter, or depleted social networks. Carers identified both risks and benefits to romantic relationships but highlighted service users' emotional vulnerability and the potential for romantic relationships to act as emotional stressors. They also identified the need for professional support. Professionals indicated that they rarely supported people with mental health problems to develop or maintain romantic relationships. They tended to wait for the 'need to arise', highlighted the emotional risks of romantic relationships to service users and were uneasy about discussing sexual intimacy.

Environmental Education and Nutritional Behavior Based on Traditional Medicine: Reading from Internally Displaced Women's Experiences in the 2010 Post-Electoral Crisis in Ivory Coast

During the Ivorian crisis, population displacement has been observed across the country with a peak after the post-election crisis of November 2010; Thus, food system have been destroyed. In this case, green nutrition based on their pre-acquired environmental knowledge (Environmental education) is adopted, especially in their feeding behavior, in order to avoid calorie declines and to allow food cure in such a difficult period. The objective of this scientific production is to understand the determinants and logics that underpin the appropriation of Green nutrition method derived from traditional medicine, based on knowledge of the environment, plants, by internally displaced women due to war to the region of Aboisso, near the border of Ghana, in Ivory Coast.

The data are collected from the International Organization for Migration (IOM) (2009) and from the town hall of Aboisso (2010) on internal migration of women. The survey took place over two weeks during February 2011 on 213 internally displaced. Non-probabilistic sampling was used in the choice of respondents. A questionnaire, an interview guide and the observation grid were used on all respondents to allow triangulation of information.

73% of displaced women surveyed use traditional food practices due to the military crisis situation. On these, only 13% seek the advice of their spouse. The most used method at 86% is broth of crushed tree pods. The rest in leaf tea, they drink. 37% of women use the advice of a traditional practitioner (specialist in plant medicine), the rest is self-medication (55%) or advice from friends (8%) with a good knowledge of the contribution of Nature to diet and gain in calories. The choice of the traditional method, based on knowledge of environment, stems from the lack of money at 15%, the behavior of the family at 52% and the living conditions at 33%.

Less Than Perfect Brain: Pharmaceuticalisation in the Workplace

Two types of pharmaceuticalisation – with or without medicalisation – might be discussed in the context of the workplace: pharmaceuticalisation as a response to mental distress such as anxiety, panic or sadness, on the one hand, and pharmaceuticalisation as cognitive enhancement, on the other. They can be conceptualised through a range of oppositions: emotional self-control vs achievement, losers vs winners, survival vs performing at one's best/better than one's best, amongst others. I suggest, however, that such boundaries between the two conceptions are blurry, and what seems to be a heterogeneous phenomenon *de facto* represents the same process.

In other words, in this paper, I aim to understand better what work pharmaceuticalisation does in the public sphere, in general, and in the workplace, in particular. I argue that both pharmaceuticalisation of mental distress and cognitive enhancement are manifestations of the same labour relations that constrain or even deny workers' access to meaningful work. By technological means such as medications, workers in contemporary society with its conceptions of self as a responsible and active agent manage risk and vulnerability in the workplace characterised by increasingly more fragile autonomy, dignity and/or recognition.

Why People Work Past Retirement Age: A Meta-Ethnography of Meanings and Motivations in Later-Life Working

The processes of growing longevity and shrinking birth rates transform the structure of current societies and shape discussions regarding their futures – notably, the sustainability of healthcare and pension systems. In light of this, later-life working has been gaining increasing attention amongst policymakers and academics. The critics, however, argue that the assumptions of uniform ageing mask the remaining or even increasing inequalities in life expectancy and health within and between societies. This signals the ambivalence that underpins extended working life policies.

Whilst quantitative research can help us to assess the associations between individual, institutional, or cultural factors and retirement decisions, qualitative methods are adequate to pursue a deeper understanding of complex mechanisms that underpin older workers' intentions and decisions to extend their working lives. In this paper, we employ the method of meta-ethnography (Noblit and Hare 1998) to synthesise existing qualitative evidence on older individuals' experiences and motivations for working *past* statutory retirement age. We focus on workers *beyond* this age, for continuing to work implies an active (yet structured) choice for them, which is likely to differ from the experiences of workers *approaching* retirement age, who think through the matter hypothetically rather than experientially.

Drawing upon the theories of agency (Emirbayer and Mische 1998) and meaningful work (Laaser and Karlsson 2021), we disaggregate the iterational, projective and practical evaluative orientations of agency and argue that practical evaluation is the most transformative and sustainable. Its activation is, however, highly contingent upon work relationships that promote autonomy, recognition, and dignity. The qualitative synthesis also enables us to consider silenced voices in the literature. We find that the experiences of older workers in less skilled and/or less meaningful work are often absent. Yet, they are likely to differ from those in more privileged occupations that appear to dominate the empirical research.

Heritage, Travel & Tourism Industry and Policy: Sociological Context (With Special Reference to Gujarat State-India)

The Travel and Tourism Industry is one of the crucial sectors driving socio-economic growth in an economy, which is evident by the fact it that it contributes around 10% to the global GDP, valuing close to USD 9 trillion. In terms of employment, the travel and tourism industry employed around 330 million people globally; which means 1 out of every 10 jobs globally was supported by travel and tourism industry. Over the past five years (2015-19), one in four of all net new jobs created across the world has been travel & tourism, such is the potential of the travel and tourism industry to stimulate economic growth, create employment and business opportunities, and to bring social inclusiveness.

India rank 10th among the 185 countries in terms of travel and tourism industry's total contribution to GDP in 2019. Globally, India is 3rd country that has showcased a higher travel and tourism industry GDP growth (~5%) than that of the global travel and tourism industry GDP growth (~3.5%).

The fifth largest state, Gujarat, is blessed with diverse natural, cultural, and geographical history. The strategic location, long coastline, centuries old sculptures-handicrafts-arts-festivals, and globally recognized heritage sites are the gifts that make the state stand out. The State offers an abundance of experiences to the tourists both natural and man made, from World's tallest Statue-Statue of Unity, World's only home for Asiatic Lions-*Gir* Forest, Asia's longest Rope way-*Girnar* Rope way to mesmerized Indus Valley Civilization-*Dholavira*, India's first World Heritage City by UNESCO-Ahmedabad, World's earliest known dock & India's first port city-*Lothal*, and only white desert in the World-*Rann* of Kutch.

Such diversification and richness on many fronts have helped Gujarat to achieve a colossal growth in the total tourist footfall and make the state a favourable destination.

Church Building in the African Diaspora: Oriente Cuba

This paper proposes that a diachronic approach to historical sociological research has substantially assisted this researcher's comprehensions

about African descendants' church-building in the Americas. The paper reports on research findings of these descendants within the *longue durée* Americas'African Diaspora as a global, social phenomenon who arrived in officially and predominately Catholic Cuba 'after the abolition of African enslavement.' They were not Cuban citizens, were not from the U.S., but emerged and organized a Protestant congregation. The church was formed in the island's eastern, Oriente region - distinct for seminal cultural and religious expression: "Son" musical form, Africa-inspired religious traditions, distinct vocabulary vernaculars, and more. Mt. Sinai emerged as an independent Protestant congregation, not a missionary site as African descendants were not a focus of Protestant denominations' intensive post-1898 Cuban Independence War missionary activities. Nor were Blacks numerous missionary participants, though their numerical population on the island has always been outstanding.

The *longue durée* Americas' African Diaspora was used as conceptual and investigative tool for comprehending social forces, situations, circumstances, as well as intersecting issues of race, class, and the role of women that brought forth Mt. Sinai's early 20th century emergence and organization. The diachronic approach to consequential social forces of the African Diaspora's *longue durée* relation to Cuba's Mt. Sinai is necessary and important. However, base-line details of African descendants' Protestant church building in the Americas' African Diaspora are equally significant for helping to reinforce continued disciplinary expansion toward theoretical, methodological, and research populations inclusiveness.

Aging and Migration: Structural, Institutional, and Cultural Dynamics

Aging unfolds in the context of structural position, institutional connections, and cultural practices. In a comparative ethnographic study of experiences of cognitive decline among older adults in diverse communities in the US, migration emerged as a shaper of experience along all three contextual dimensions. Our multi-site design includes team-based fieldwork and deductive and inductive analysis of resultant qualitative datasets. Four fieldworkers collect data using observation and in-depth interviews with older adults in nine US communities diverse in ethnicity/race, region, urbanity, and socio-economic standing. Residents commonly report domestic and international migration. Migration often reflected structural factors; older adults reported migrating for job opportunities or in response to lack of work. Affluent respondents also reported voluntary domestic migration in the context of aging and health, e.g. a move from Maine to Florida for geriatric care and return to Maine after concluding family support was more important than specialized healthcare. In trans-national communities, responses to age-related changes in cognition reflected cultural and structural aspects of migration. Cultural practices of sending communities appeared to shape institutional routines at senior centers. At one center where many had migrated from China, transnational cultural practices appeared to stigmatize decline and respondents did not publicly acknowledge cognitive concerns absent a medical determination. At a center where participants migrated from Mexico, cognitive decline was implicitly acknowledged via provision of assistance to affected individuals, which quietly de-stigmatized decline. Structures of migration shaped institutions of caregiving. For example, the availability of a family caregiver for older adults experiencing decline reflected the character of transnational migration (timing, family versus individual, migrant SES). For older adults who did not transnationally migrate, migration shaped the availability of paid caregiving in local labor markets. These results suggest multiple avenues for further research on aging and migration.

Comparative Ethnography to Understand Experiences of Aging and Cognitive Decline in Diverse US Communities

Community social determinants of health (SDOH) appear to shape older adult experiences of cognitive decline, but we have limited insights into the social mechanisms by which these effects operate. Identifying the mechanisms of community SDOH is sociologically challenging and has the potential for

practical benefit. To address this challenge, we examined how structural, institutional, and cultural factors shape decision-making at major turning points in the trajectory of cognitive decline among older adults experiencing decline and their caregivers. Two turning points we examine are relinquishing driving and entering institutional care. We employ comparative ethnography: multi-site designs; team-based fieldwork; and deductive and inductive analysis of qualitative datasets. Four fieldworkers conduct observation and in-depth life history interviews in nine US communities diverse in ethnicity/race, region, urbanity, and socio-economic standing. Results highlight how older adults navigate turning points in the context of cultural practices, local institutions, and structural position. Relinquishing driving seemed unproblematic in urban communities (due to public transportation) and rural areas (where highly-impaired driving was common in all age groups) yet presented a central cultural difficulty in suburban areas where communities attempted to restrict driving while adults were still cognitively intact yet where car-based independence was central to identity and social connection. Avoiding institutionalized care was important in both affluent and low-income communities but for distinct logics. In affluent communities, staying at home was culturally prized, a demonstration of love and support. In low-income communities, staying at home was structurally necessary; institutional care was unaffordable or families feared their savings would be confiscated as a condition of care. These examples illustrate the diverse mechanisms by which community SDOH manifest in everyday life. They highlight the limits of public health models of community effects, e.g. the socio-ecological model, and new opportunities for sociological measurement of culture and institutions.

DOLAN, Paddy* (Technological University Dublin, Ireland)

Habitus Formation and Power Dynamics in American Industrial Relations

The concept of habitus has a long history in sociology, most often associated with Bourdieu, but here the concept is explored more directly in relation to Norbert Elias's work regarding sociogenesis and psychogenesis. The latter process refers to the development of new forms of habitus ("second nature" or embodied social learning), while the former concerns dynamic networks of interdependent people, or figurations to use Elias's term. While Elias refers to multiple forms of habitus, perhaps ironically his model of homo clausus (closed person) to depict the emotionally self-controlled individual imagined as (and imagining themselves to be) separate from the lives of others may lead to a tendency to reduce the complexity, contingency and variety of habitus formation and forms. In light of this suggestion, the paper explores the development of habitus in the context of changing power relations in the United States, particularly concerning industrial relations and the dynamic figuration of employers, workers, and politicians. Emphasis is placed on the specialisation of functions around the amplification and resolution of conflict and the development of the role of trade union leaders and officials. Conflict occurred also between rivals for the fulfilment of these functions, as different organisations emerged and competed for representational status in broader conflicts. American we-feelings and we-identities were invoked to identify outsiders and delegitimise their participation in conflict resolution functions.

Digital Right to a Healthy City

Recent years saw a rapid acceleration in cities' transition into sensor-enhanced smart cities (Channi & Kumar 2022). In Europe, such endeavors have been supported by the EU under Climate Neutral and Smart Cities program (EC 2021). It aims at developing the implementation of ICT and the Internet of Things to reduce the CO2 emissions and mitigate the effects of climate emergency. Such solutions might serve to address health-related concerns (Kamel Bous et al. 2011), however, many technological innovations that target public health and well-being raise questions about surveillance and who really benefits from them (Biesaga et al. 2021).

In this paper, we present the initial results of two European Commission projects: HEART and euPOLIS. Both aim at investigating the positive direct and indirect effects of Nature-Based Solutions on public health and well-being (Bozovic et al. 2017). In euPOLIS, we assess the social, environmental, and economic impacts of NBS interventions that are currently designed through participatory processes. In HEART, we investigate the benefits of regular visits to green spaces on the health and well-being of patients with a history of cardiovascular, metabolic, neural, or respiratory diseases. In both cases, we employ both traditional (surveys and interviews) as well as ICT-enhanced (based on physiological and environmental data collected through monitoring wristbands and smartphone apps) methods to study the outcomes in terms of public health and well-being of local community.

Our results will be presented within the framework of the right to the city perspective (Domaradzka et al. 2022), which emphasizes the importance of residents' participation in shaping a healthy future for our cities. We

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

will discuss the right to healthy living in the city and the prerogatives of designing for health through digital technologies and nature-based solutions.

Right to the Smart City

Cities are the main arena for testing and implementing new technological solutions (Belanche et al. 2016, Cugurullo 2020) and technological changes have been accelerated even further by COVID-19 pandemic (Wainwright 2020). While ICT become important tools for policymakers, urban planners and residents, we need to better understand the consequences of their fast-paced implementation, to avoid unintended negative effects in terms of quality of life and democratic freedoms (Swyngedouw 2016, Han & Kim 2021). This is particularly important in the view of the growing popularity of the smart city idea, which incorporates ICT to enhance the quality and performance of urban services.

The aim of our analysis is to help understand how new technologies can shape the wellbeing of urban citizens and their ability to exercise their right to the city, defined by Lefebvre (1968) as freedom to make and remake our cities according to principles of democracy, equality and social justice.

On the political level, we analyse the concept of the smart city, studying participation and consultation technologies, as well as algorithms employed in city management around the globe. On the social level we study individual reactions to application of technologies like Virtual Reality and Artificial Intelligence in the context of planning, managing and interacting with the city and focus on ICT solutions that intermediate social and community relations. Based on our study we were able to quantitatively define main factors representing different aspects of the right to the city. We also analysed residents attitudes to AI algorithms involved in city governance and studied the implementation of specific digital tool in urban management. Our goal is to link the smart city concept with the right to the city idea to create a framework for studying modern cities in a more comprehensive way.

DOMBROWSKI, Viola* (Universität Koblenz-Landau, Germany)

Constructing the Collective – Antagonisms and Ambivalences in the Alternative for Germany's Configuration of the People

Germanys right-wing populist political party *Alternative for Germany* (AfD) has a reputation of being homophobic, racist, and even antisemitic. This stems in large part from their party manifesto, in which they take a strong stance for a heterosexual nuclear family model and against 'gender ideology,' encompassing topics like female quota, abortion rights, and sex education featuring LGBTQIA+ issues. Furthermore, they propose strict anti-migration and anti-Islam legislation. In addition, high-ranking politicians of the AfD have made public statements, that are to be considered discriminatory against sexual and ethnic minorities.

Despite this, different poll and survey results indicate a relatively high number of AfD voters amongst those minorities. Additionally, the party itself has a high number of parliament members with migrant background (7,2%) and several 'ally groups,' that focus on different minority identities, have been founded since 2014: 'Alternative Homosexuals,' 'Jews in the AfD' as well as 'The New-Germans - Migrants in the AfD'.

Utilizing the Sociology of Knowledge Approach to Discourse Analysis, I analyzed 138 Twitter accounts of party members, including those of the 'ally groups', to explore this seeming contradiction of sexual and ethnic minorities associating with the AfD. This is especially of interest, as narratives of culture and society have become more tied to ideas of Whiteness as a greater identification figure, for the right-wing populists in Germany.

On the one hand, I focused on how the AfD constructs belongingness and otherness in public online discourse, and how these constructs are conveyed into consistent narratives of society, the people, nation, and culture as interlocking modes of identification. Moreover, how do they integrate the ,ally groups' into these narratives, that seem to effectively exclude them. On the other hand, I looked at how the 'ally groups' fit themselves into these narratives, and how they reify or possibly modify these concepts.

RC05-95.4

DOMBROWSKI, Viola* (Universität Koblenz-Landau, Germany)

Modes of Demarcation: Gendered and Sexualized Mechanisms of in- and Exclusion in German Right-Wing Populism

Despite starting out as a self-proclaimed 'anti-Euro' party, German right-wing populist political party *Alternative for Germany* (AfD) has quickly become known as 'anti-gender' party. This is due to its strong stance against what it calls 'gender-ideology,' and, connected to this, a pro-natalist attitude and defense of a traditional concept of heterosexual marriage and a nuclear family model.

I propose that these 'anti-gender' and sexuality politics are key concepts for populists to gain access to mainstream political discourse, and gain voter sympathy. However, I argue that they are more than an opportunistic gateway to public discourse, but are, in fact, pivotal in understanding how the *Alternative for Germany* constructs ideas of belongingness and otherness as cornerstones of 'the people'.

Taking the *Sociology of Knowledge Approach to Discourse Analysis* (SKAD), I analyzed approximately 140 Twitter accounts of AfD members to explore the interpretative patterns they communicate, in respect to topics of sexuality, immigration, the people, but also belongingness and otherness in general.

The results show that gender, as well as sexuality, are key pillars in articulating superordinate constructs, that are usually put at the core of right-wing populism, such as 'the people'. They are pivotal for the articulation of social order inside of the nation-state, as well as configuring a clear demarcation to the outside other. On 'the inside,' gender and sexuality are woven into traditional ideas of marriage, family, and the idea of a *resulting* generative reproduction. Towards 'the outside' they are used to create demarcations between a German people and 'the foreign other,' who is constructed as sexually deviant and potentially harmful to the gendered order on 'the inside'.

NAVARRO, Clemente J. (Pablo de Olavide University, Spain)

How Do Local Welfare Systems Influence Perceptions of Local Services and Quality of Life? an Analysis of Major European Cities.

According to literature, different models of local government system exist. This difference is due to the relation between the local and the central level within the multi-level governance framework shaping political and administrative capacities for local authorities. Three models are usually distinguished according to these capacities: North-Central Europe, Southern Europe and the Anglo-Saxon area; and, as a combination of the Southern Europe and Anglo-Saxon, the Latin American model (Navarro, 1998; Navarro, Ramírez and Rull, 2001; Navarro and Ramírez, 2000). These models can be studied according to three main institutional dimensions: the local political economy (market-oriented model/regulated model), intergovernmental integration (political localism/legal localism) and the form of government ('strong mayor', 'collegiate', 'managerial' models) (Navarro, 2014).

These differences between local government systems are highly related to their national welfare model. Moreover, local government characteristics shape different models of local welfare regimes depending on the content and the instruments of the policies. Based on this idea, this paper will analyse whether different local welfare regimes explain citizens' evaluation of the services they provide. To this end, multi-level regression models are applied to the information provided by the 'Perception survey on the quality of life in European cities'. Data from this survey allow us to apply this methodology to determine the existence of contextual effects caused by the institutional system of cities. Preliminary results show that the valuation of services is higher in regimes that subsidiarize more capacities to municipalities.

DONA REVECO, Cristian* (University of Nebraska at Omaha, USA)

Understanding Immigrant Integration and Integration Policies in a Semi-Peripheral Country. the Case of Chile

Immigrant integration is a complex phenomenon, which has mostly been studied in traditional settler societies. Immigrant integration, broadly defined, is the process that immigrants and their descendants undergo to become full members of the receiving society and is directly influenced by governmental policies. Its study, however, frequently focuses on how the institutional arrangements of destination countries (Global North) shape the "success" of immigrant integration, becoming a clear example of receiving country bias. In general, debates on immigrant integration can be broadly grouped into two main perspectives. The first, mostly developed by US-based scholars, is a discussion on different types of "assimilation." A second perspective, privileged by European scholars, understands integration as a dual process where both the receiving country and the immigrant adapt to each other and through which the immigrant becomes a citizen that receives a set of *Marshallian* rights. As several authors have mentioned, the "receiving context" is a key component of the "success" of this integration, but the starting point for these authors is not applicable to that of non-Global North receiving countries. In this presentation I argue that the positionality of a receiving nation, in this case a semi-peripheral country influences distinct explanations of immigrant integration and integration policies. Shared language, similarities between contexts of origin and destination (culture, values, stratification systems), national pride and conflicts, and international cooperation agreements between countries, might lead to a distinct type of integration to host societies as well as to different integration policies that need to be further theorized.

DONATELLI, Michela* (University Roma Tre, Italy)

The Conflict Dimension of the Public Library

The public library is defined as "a local gateway to knowledge" (Ifla, Unesco, 2022) and its values are connoted by values of openness, accessibility, and democracy. Moreover, the public library presupposes that written knowledge is a means of "emancipation" and "progress". But what happens when the library space becomes a space of conflict?

The proposed contribution, starting from ongoing research in two public libraries located in two suburbs of Rome, presents some reflections on the conflictual quality that the presence of the public library can assume in contexts considered vulnerable.

The book is the main object of this reflection. It is often presented as a support for knowing and improving oneself. But it is also an object that can be used to divide and build barriers between groups. The library is a resource for all, which is used as a support to promote many forms of individual affirmation while constituting a public space. It is often the only space open to all, free of charge, offering direct access without compulsory mediation. But the presence of libraries in neighborhoods also represents a source of separation. It contributes to the creation of social boundaries, and while it opens many doors to integration, it also closes others due to the fact that the relationship with reading requires specific socialization, a certain kind of individualization, and a relationship with the body based on discipline, isolation, and silence.

Starting from these premises, the article will set forth the theoretical frameworks and sociological reflections within which to investigate the issues presented.

DONATI, Francesca* (Università degli Studi Milano-Bicocca, Italy)

La Perspectiva de Género en las Iniciativas Urbanas Integral de La Unión Europea: El Caso Español (1994-2020)

Desde los años 90, la Unión Europea, en el marco de la Política de Cohesión, promueve iniciativas de intervención urbana integrales en barrios desfavorecidos con el objetivo del reequilibrio territorial. En este contexto, el género es un elemento transversal de reproducción y de incremento de las desigualdades urbanas. Por estas razones, la Unión Europea (UE) exige a los *policymakers* la inclusión de la perspectiva de género en los proyectos de intervención. Además, la UE proporciona el instrumento del mainstreaming de género para facilitarle a los mismos la integración del género.

El objetivo principal de este estudio es analizar el lugar que ocupa el género en estas iniciativas. Para ello, se han analizado los diseños de los proyectos urbanos ejecutados en España, en el marco de las convocatorias URBAN I, II, URBANA y EDUSI que abarcan el periodo 1994-2020.

El análisis se realizó con una herramienta de seis dimensiones y escala likert 1-5. Las dimensiones se seleccionaron en función del esquema del *policy cycle management* y luego se adaptaron a los proyectos territoriales. Además, este instrumento permite un análisis de doble nivel al tener en cuenta tanto la incorporación integracionista como la transformadora de la perspectiva de género. Por lo tanto, la herramienta nos permitió conocer la presencia de género en las diferentes dimensiones.

Los resultados apuntan a que la integración del género en las dimensiones de los objetivos y del diagnóstico resultó más estructurada, mientras que la evaluación, el seguimiento y la gobernanza todavía tienen una débil incorporación de las prácticas de género. Finalmente, analizando los datos desde la primera convocatoria hasta la última no es posible hablar de un proceso de aprendizaje perdido debido al diseño del estudio. Sin embargo, estos resultados nos permiten destacar la falta de institucionalización de la incorporación del género en estos proyectos.

The Governance of Care. Legislative Frameworks, Challenges and Opportunities Created By Municipal Policies

Socio-economic and post-industrial changes together with demographic changes of contemporary society make of care activities one of the most relevant challenges for welfare state and policies. Moreover, local dimension, according to the welfare literature, gains relevance. This relevance comes on the one hand from the renewed multi-level governance framework, and on the other, from the contextuality of new social risks. In fact, those new risks are highly non-homogeneous at the national level.

Within this up-and-down scaling of political powers, the local tier was enabled to develop different and new strategies to cope with the new welfare challenges.

The core of this work is the analysis of the opportunities structure created by the combination of multi-level public policies in the field of care. The focus is on the role of the municipal tier.

To do so, we did a revision of the current Spanish legislation at the three governance levels of the public administration (i.e. national, regional, and municipal). Starting from this review we propose a methodology to analyze: 1. The normative idea of the concept of care; 2. The kind of services and the instruments for their implementation.

The preliminary results of this research process have made it possible to build a legislative and conceptual map around this relevant challenge. In addition, it allowed to define criterias for the classification of care services in the Spanish multi-level governance framework.

Movements' Dynamics and Government Responsiveness to Violence Against Women: Political and Social Changes in Spain and Italy

Through a comparative analysis of policies in Spain and Italy, this article maps the interplay and tensions between women's movements and national governments in countering violence against women. It poses a special focus on the years 1996-2011, when government responsiveness acquired momentum in the two countries. It also throws new light on the notion of "autonomous women's movements." In Spain, policy formation was the outcome of dual feminist-socialist activism, leading to dialogue and collaboration between movements and women's policy agencies. In Italy, movements had an anti-institutional identity, opposing the government from the outside. In both countries, the critical factor sparking responsiveness on violence against women was not one single variable but a combination of political opportunity, movement characteristics, and dedicated women's policy agencies.

#Fightvirus to Win "Hearts and Minds": Rethinking Propaganda through Covid-19

The aim of this work is to investigate whether and how the Coronavirus narrative was used as a strategy of cultural soft power by Xinhua News (or New China TV), which is the most influential broadcaster of the Country, wholly funded by the Government (Thussu et al., 2017).

Following the political narrative of "China and the World in the New Era" (White Paper, September 2019), this study explores how Xinhua News has used the main purposes of the project to visualize the Chinese way of #FightVirus on YouTube.

The work started with a previous corpus linguistics analysis of the aforesaid White Paper, made by Sketch Engine tool (Kilgarriffet al., 2004). This allowed to identify the recurrence of items in order to find useful categories for the scope.

Then, the Xinhua News narrative on YouTube was monitored from 19 January 2020, when the first video about Covid-19 was published on the channel, to 25 March 2020, the day in which China achieved zero new infected. The analysis of the videos was conducted using a mixed method: leveraging YouTube Data API, it was possible to obtain and analyse all videos and comments published by Xinhua News in the suggested period. By comparatively analysing items of the White Paper and YouTube contents, it was possible to find an adherence in the narrative.

Using YouTube, the broadcaster has managed to explain how to win the fight against the virus: through a society with Chinese characteristics. In other words, Xinhua News has symbolically conveyed how the modern Chinese identity, which mixes harmoniously culture, technological advancements, popular values and a strict control of the State, can be the "antidote" to the virus.

Visibility and Propaganda in Tiktok: #Ukraine and #Russia

TikTok has emerged as a popular space for self-expression (Stahl & Literat 2022) and political activism (Media Serrano, et al. 2020), mainly for young users. The inextricable linking between the algorithm and the users' production on TikTok has posed new challenges on how the platform can be investigated by researchers and how some topics appear to be recurrent solely in different "sides of TikTok" (Eriksson Krutrök 2021).

Considering this evidence, it is considered useful to investigate whether and how the narrative about the ongoing military conflict between Russia and Ukraine was present on TikTok.

In fact, even before the first day of war - 24th February 2022 - the platform witnessed a rise of interest in the military conflict in terms of participation and content production.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

But how can this interest and/or participation adhere to the platform's logic of hyper-personalization and intrapersonal engagement? In other terms, how has the conflict shaped or being shaped by Tiktok innovative algorithmic design?

Through a discourse analysis of Ukraine/Russia-hashtagged TikTok videos, it was possible to evaluate a) what kind of narrative is attached to the use of #ukraine and #russia within the platform, b) how visible and dominant those kinds of narratives are within and outside the platform and c) which are the actors involved.

The dataset was obtained by using the Bellingcat TikTok Analysis Tool, with a final search for #ukraine/#russia performed on 24th June 2022. Furthermore, each post was evaluated quali-quantitatively, to understand which of those contents were visible and appreciated through the platform, as well as the actors involved.

The results seem to demonstrate how TikTok's logic can colonize the political narrative, by steering the users' preference towards more visible and easily spreadable content, no matter the topic nor the truth.

Reproducing Information Disparity and Health Inequity Via Risk Communication during the COVID-19 Pandemic: A Qualitative Study on South Asian Migrants in Hong Kong

South Asian migrants in Hong Kong is a unique and interesting site to examine how language and communication can reproduce information disparities and health inequity for two reasons: (1) the South Asian population has constantly grown, reaching a population of 101,969 in 2021 accounting for the largest migrant group in Hong Kong; (2) despite Hong Kong's claims of being a global city, discrimination is widespread and particularly affecting individuals of South Asian origin.

Based on semi-structured in-depth interviews with 40 South Asians and 11 key informants from NGOs, healthcare institutions and government, this study aims at: (1) exploring how COVID-related risks are communicated and perceived by the South Asian migrants; and (2) exhibiting how disparities in accessing and using COVID-related information are shaped and re-shaped under the city's changing anti-COVID strategies, which ironically integrate considerations on the "language barriers" faced by the migrants.

The study finds that: (1) A mismatch in the demand-supply of information was obvious but the emerging structural barriers that further hindered the migrants' access to information were less visible; (2) Language barriers were portrayed as the main problem, yet social isolation were covered up; (3)While informants relied on a multiplicity of sources and intermediaries to gather information, these channels did not guarantee equal access to relevant and accurate information; rumours and misinformation were more accessible via personal network and social media; (4) Translations of official health promotion materials into ethnic and migrant languages were perceived as either poor, partial or delayed; issue of health literacy emerged as no facilitations were provided to enhancing migrants' skills and abilities in comprehending health information.

This paper ultimately shows that when information is not tailored to ethnic and migrant populations, confusion and uncertainty, infodemic and misinformation are likely to occur and thus reproduce health inequity among the vulnerable populations.

Uncomfortably Numb: On the Administration and Experience of Alienation in the 21st Century

The question of alienation can be thought in terms of how people are prevented from transcending an alien world; or otherwise put, how all rationality alien to the existing world is twisted into the rationality of that world. At an advanced stage of alienation, the very experience of freedom becomes something alien and frightening. The need for transcendence is concealed by the swirl of products and experiences available to consume. In the mid-20th century, amidst the increasing committism of enjoyment in the consumer society, Marcuse started pointing to the existence of a kind of comfortable alienation. The alienated subject, tranquilized by the surrounding objective world of things, had come to be at home in that world. Scratch the surface of this homely alienation, however, and one found despair and distress. This underlying discord hampered the manifestation of any total equilibrium and pointed to a fundamental desire for freedom, an instinctual rebellion, a resistance on the physiological level. Today, amidst increasing discomfort and hardship, we might expect the chances for liberation to be ripe. But even when individuals are aware of the sources of their anguish, they have shown a

tendency for continually reconciling themselves with existing reality. This paper looks at how advanced technologies of social control—social media and the precise algorithms behind them—function to strip the need for transcendence away from people, turning them around in a kind of cybernetic feedback loop of manipulated needs and new avenues of escape. One role for critical thinking is to help people understand why their attempts at satisfying their needs are so unsatisfying. Insofar as critical thought is about seeing the difference between alienation and the forces capable of overcoming it, the task for thinking today is to seek out possibilities in what appears to be an impossible situation.

Problem or Solution? (In)Justices and Government-Sponsored Programs of Shadow Education in Literacy

Literacy education generates tensions over distributive, recognitive and representative dimensions of justice (Woods, Dooley, Luke & Exley, 2014). Government-funded shadow education (SE) for students with low achievement (e.g., historically, the *Tutorial Voucher Initiative* (Australia) and *No Child Left Behind* (the US); and now, COVID-19 policies) provide opportunities for exploring these. SE is academic tuition which supplements school programs but is not provided by the school. Typically organised by parents, and supplied on a for-fee basis, SE is associated with problems of equity that have prompted world-wide efforts to control the phenomenon (SE-as-equity-problem). However, governments sometimes organise and sponsor SE to solve equity (and other) problems (SE-as-equity-solution). Both types of policy have been canvassed in a highly influential series of at least eight global and regional reviews that began with Mark Bray's (1999) UNESCO-sponsored research synthesis, and are widely discussed in the literature. In this paper we home in on the policies relating to SE-as-equity-solution.

We probe the priority accorded the re-distribution of conventional discursive resources through government-sponsored SE. To this we bring a political economy framework which accounts for curriculum as the inner work of schooling (Deng, 2018). An alternative to the more culturalist approaches of neo-institutional and postcolonial SE researchers, this enables insight into the multi-dimensional particularities of (in)justice in the context of government sponsorship of SE.

Unveiling the Resurgence of Authoritarian Legacies in Latin American Democracies: The Case of Politico-Sexual Violence (PSV) in Recent Social Mobilizations

Latin America is generally seen as a region where stabilized liberal democracies have consolidated after widespread authoritarianism. However, along with examples of clear authoritarian resurgence (Venezuela and Nicaragua), a growing criminalization of rights' defence and dissent also afflicts the rest of the continent. As a state practice targeting citizens involved in the defence of rights -comprising environmental rights- and democracy, criminalization includes a vast array of mechanisms: from threats and false accusations to new laws restricting democratic rights, recurrent use of states of emergency, penalization, as well as direct violence against human rights defenders-HRDs. Numerous specialists, national and international organizations, wonder whether the continent is experiencing deliberalization of democracy, or even a wave of true de-democratization which might reveal close links to the authoritarian past of the continent.

To answer this question, we examine Politico-Sexual Violence (PSV). While used widely by police forces to deter demonstrations during the 2019–2020 social uprising in Chile, as well as in other countries, PSV's origins as a concept created by Chilean feminists can be traced to the Pinochet dictatorship, designating the institutional use of sexual terror against dissidents and political prisoners. VPS was never acknowledged by transitional justice nor included in

any of the Chilean Truth Reports (1990 and 2004). Its massive use in recent social mobilizations sheds light on the transfer of institutional practices of state violence from authoritarianism to democracy. PSV's use in countries which were not part of state terror regimes such as Colombia and Mexico also reveal the importance of discursive practices of criminalization enabling the transmission of state violence through narratives based on recurring gender-based accusations for being immoral, deviant, and dangerous for the social order. We will also assess the current influence of conservative religious groups in reinforcing these narratives and their role in possible regime changes.

The Case of "Intellectuals" and "Digital Influence" in Brazil

The case of "intellectuals" and "digital influence" in Brazil

This communication is a part of a doctoral research which is still being handled. The aim of this presentation is to analyze the social dimension of "making opinions" on digital platforms such as: Twitter, Instagram, Facebook etc. Specifically, I refer to the "opinions" produced by Brazilian "academic intellectuals" and its social dimension and disputes. This kind of movement of "academic intellectuals" on internet in Brazil takes place for one decade, at least. However, it has increased since around 2015 when researchers and professors declared their participation in that commonly classified "war of narratives". This engagement was centered in both dynamics: synchronic: as a part of an internal political crises in 2016; and diachronic in relation to the historical opposition between "media" and "academy" in Brazil.

I focus on three dimensions of this problem: 1. The "collective biographies" of theses intellectuals which I have been still mapping in terms of a "prosopography"; 2. The symbolic and social differences between two different types of intellectuals who are taking part of these public debates on digital platforms, they are: "academic intellectuals" – with a solid and institutional career, engaged in defense of institutions, especially universities and science production – In relation to the "media intellectuals" – those more engaged in the journalistic agenda, as well as the propaganda and marketing, commonly classified by the media as "pop intellectuals" and finally, 3. The marketing professionalization of "public intellectuals" in the rules of "digital influence".

Empowering Instruments or Agents? Analysing Development Discourses of Young Women's Empowerment in the Pacific

A surge of attention on empowering young women in international development programs arose in the late 2000s, when organisations including the World Bank and the Nike Foundation argued it was critical to achieving economic growth and poverty alleviation. A number of scholars have critically analysed the World Bank's papers and public comments (Chant, 2016; Hickel, 2014) and the Nike Foundation's marketing materials (Switzer, 2013), highlighting that young women tend to be positioned as instruments for achieving benefits to communities, states and firms, rather than agents who are complex and have their own goals and desires. "Young women's empowerment" has since trickled into regional and country-level strategies, and in recent years, the Pacific region has become a particular focus for gender programming, due its allegedly low performance on indicators including women's representation in parliament, and rates of gender-based violence. This presentation will explore the specific understandings and justifications for young women's empowerment evident in recent development discourses focused on the Pacific, by critically analysing recent strategies, papers and NGO marketing materials from the last five years. Empowerment is a buzzword – fuzzy, contested and messy – and in this presentation I show how this messiness and contestation looks through a document analysis. In the presentation I will highlight how constructions and understandings of young women's economic, social and political empowerment can vary, and how the framings of young women's contributions, abilities and skills may differ, depending on the particular organisational priorities and justifications for investment in young women. Interrogating the meanings and logic behind initiatives that intend to empower young women is crucial if the development sector is to build young women's capacity as agents, rather than relegate women to being instruments or objects, of development and social change.

Why History Matters for Unions

Trade unions have long histories which inform their organisation and approaches. And, historically while unions have often been active at a regional level, more recently this appears to be less so, particularly with the reforming of and decline of regional confederations in settler societies such as Australia. This

development means that unions may face decision-making processes made by corporations and governments that often are made outside regions with little consideration of workers and their unions. In regional settings where myriad factors influence union formation understanding how union voice is articulated and factors influencing different approaches is critical to understanding the effectiveness of worker representation.

Tasmania has a long labour history however, little has been written on trade union formation, fracturing and re-formation at regional level. Briefly this is an island region where union confederations have been place-based across the island; more recently these confederations have either disappeared or have amalgamated with the remaining confederation relocated to the capital city, Hobart far to the south of the primary and secondary industrial conurbations where union membership is located. Such features pose major challenges to individual unions, and the main confederation, Unions Tasmania.

Via an historical analysis, we examine the form of organisation adopted by trade unions in the region over time, tracing confederation formation and activity from the early 1920s to the mid-1940s to their demise by the 1990s with a concomitant shifting locus of power to Unions Tasmania. With no confederations in the North-West, what does this mean for place-based worker voice? We investigate how historically and spatially relationships within, between and across unions and other regional civic actors developed to understand what resources and capacities unions might need to contribute to contemporary regional socio-economic development.

Pain Experiences in Female Parathletes: From the Contributions of David Le Breton

The article presents a comprehensive analysis of the experience of corporeality of women with disabilities and its relationship with pain, understood in its complexity. We use a socio-anthropological analysis, considering the body as a biopsychosocial construction and taking Le Breton as a reference author. The field research, with a qualitative and hybrid approach, was carried out with a group of women sitting volleyball players. The following were used: sociodemographic questionnaire; life's history; open questionnaire; and, report on pain. Pain appeared as a reality implied in the corporeality of all participants. Physical pain is intertwined with feelings and emotions such as fear, incapacity, rejection and abandonment, serving a subjective dimension. We conclude that women's corporeality is given new meaning from experiences with pain and in the socialization process through participation in sport.

Doing a Study in a (Post) Revolutionary Context Reflection on a Study " the Performance of Bodies in Protest Assemblies in Tunisia on December 17, 2010".

We led a study about bodies performances in protest rallies in Tunisia on 17 December 2010. We relied on qualitative analysis through discourse analysis of the events as reported in the Tunisian press (mainly). In addition, we led interviews with activists who participated in these protests. We selected five examples of protest assemblies in post-revolutionary Tunisia. We argue that they constitute a temporal and spatial intensification of the protest gatherings that the country has witnessed in the (post)revolutionary context. They also reflect the social, economic, and political transformations that society, in general, has undergone. Our aim is not to compare the five examples but to understand the characteristics of each scene within these scenes. We seek to understand the evolution of the staging of bodies in space and over time.

In this paper, we return to our study to understand our position on the research and the different "choices" we made in the methodology. We reflect further on the conditions of our study associated with the research period, for example, and the transformations that are taking place in Tunisia. These transformations in the country's history have produced feelings and ways of seeing and existing within the world. We propose that a revolution is an event that has stylized the bodies.

We also suggest examining these five examples to understand their importance as choices for studying the assemblies of protesting bodies in post-revolutionary Tunisia. They are not only key events that have already occurred in the country's contemporary history; but also "key events" for understanding the current situation, and precisely the so-called "post 25 July 2021 process" in Tunisia. We also point out the limits of these examples for understanding a complex context, especially as Tunisia has undergone several social, economic, and political changes in a short period.

Negotiation of Collective and Individual Candidacy for Long Covid Healthcare in the Early Phases of the Covid-19 Pandemic: Heard, Diverted and Rejected Candidacy

This paper analyses people's experience of establishing their need and legitimacy for, and experiences of, healthcare for long Covid symptoms, drawing on semi-structured interview data collected using identical methods in five countries (UK, US, Netherlands, Canada, Australia) during the first ~18 months of the Covid-19 pandemic in 2020-1. At this time, long Covid was an emergent, sometimes contested, condition with scant lay or professional epidemiology for patients and professionals to draw on in their sense-making of often bewildering constellations of symptoms.

The paper extends the construct of candidacy, using this as a theoretical frame to make sense of the various positive and (more often) negative experiences that patients report in their quest to understand their long Covid symptoms and seek support from healthcare professionals. While candidacy is usually understood in terms of how individuals negotiate and justify access to a health system, we propose an additional layer of 'collective candidacy', whereby people with prolonged symptoms following Covid infection collectively identified and named their condition, and fought for recognition, in the face of uncertain scientific knowledge and lack of established treatment pathways.

As individuals, patients commonly experienced 'rejected' candidacy, i.e. feelings of being disbelieved, discounted/uncounted and abandoned, and of their suffering being invisible to the medical gaze and society. Patients who felt their candidacy was 'heard' or affirmed had more positive experiences, despite still struggling with debilitating/life-changing symptoms; they appreciated being believed and having recognition of their changed lives and bodies and uncertain futures. At their best, these more positive healthcare encounters were described as a process of 'co-experting' with the patient and healthcare professional collaborating in a joint quest for a pathway to recovery. The findings underpin the importance of giving credence to, and learning from, patient experience in new and emerging areas of illness.

Nascent Authoritarianism and the Populist "Free Speech Crisis" in the UK: The Importance of the Sociology of Education

Education has become a 'problem space' (Dillabough, 2021), where authoritarian and populist state politics play out. In England, the so-called "free speech wars" concerning universities have become a central site for the articulation of populist conceptions of the sovereign British subject - the conservative elite white male (see Virdee & McGeever, 2018). Through a critical discourse analysis of how students are constructed in British right-wing media publications and in key government speeches and legislation from 2012 to 2022, we analyse the way the 'free speech' movement aims to address a perceived crisis of social reproduction. We argue that white conservative elites use this movement to ensure the endurance of their valued ontological, epistemological and ideological positions. The 'free speech crisis' thus provides a sanctioned political platform for the manifestation of a deeper 'white anxiety' over the reproduction of elites in and through higher education, given changes in university demographics. Drawing on the sociology of race and education, we show how the 'free speech' discourse developed by the press, and the governmental legislative defence of 'free' speech, act to ensure that higher education in England remains the "epistemological domain of whiteness" (Sriprakash et al., 2022). Understanding social reproduction in this way reveals the university as a site where racial modes of populism are enacted: a 'free speech crisis' is manufactured whilst higher education autonomy is under threat. We conclude by calling on sociologists of education to ensure

that they are attending to the way 'crises' in this political landscape impact the conditions of their knowledge production. Although it is important that sociologists address global crises, it is also imperative that we attend to the university environment, actively challenging the increasingly constrained places universities are becoming, and empowering students to engage in truly agonistic politics (Honig, 2007).

DRAGOS, Simina* (University of Cambridge, United Kingdom)

The Conditions Under Which Nationalism Slips into Authoritarianism: Lessons from the Romanian Context

This paper uses the case of Romanian nationalism to illustrate the argument that nationalism, being an exclusionary political ideology or governance rationality, can easily lead to authoritarianism. I make three main points. Firstly, I argue that Romanian nationalism cannot be disentangled from racism and processes of racialisation (see also Popa, 2020). This can be seen in Romania's 19th and 20th century history, when nationalism repeatedly became synonymous with 'Romanian superiority' and thereby precipitated violent politics, not least interwar fascism. Secondly, drawing on Arendt (1951) and Mbembe (2019), I contend that nationalism, both as ideology and as governance rationality, defines human rights as 'national' rights, thus ranking human beings in terms of their desirability and even humanity. Nationalism is a vehicle for conflating ethnic identity with political rights, as evident through the Romanian state's department and efforts for 'Romanians everywhere'. Thirdly, the racialisation associated with nationalism, and its reflection in the legal and political realms, set the grounds for the justification of authoritarianism in the name of 'national interest'. I argue that, when faced with real or manufactured political crises, a state fuelled by nationalism is quick to resort to authoritarianism in the name of the nation, to protect the nation. This argument is increasingly relevant regarding Romania, as the state faces a major population crisis: a quarter of Romanian citizens live abroad. The rise of the populist far-right 'Alliance for the Union of Romanians' is, thus, not surprising, but concerning. This argument makes a contribution to scholarship which critiques the celebration of nationalism as an emancipatory project, but also the Orientalist distinction between misguided, Eastern 'ethnic' nationalism and developed, democratic 'civic' nationalism. Instead, I propose a framing of nationalism as a racialised system of representation, which helps us understand that all nationalisms hold the potential for authoritarianism.

DREHER, Jochen* (University of Konstanz, Germany)

Critical Phenomenology and the Life-World

The presentation decidedly outlines a phenomenological perspective with an impact on critical theoretical reflections specifically based on the concept of the life-world. The aim of this focus is to achieve a standpoint that takes into consideration the subjective viewpoint of the Other and allows to analyze the lifeworldly constitution of phenomena as social inequality, justice, power and violence as well as the subjective and intersubjective experiences of alienation, reification and suffering. In this sense, the ethical injustice of discrimination is seen as a process in which the subject is hastily opposing social typifications on the other subject. This way, the other subject is reified, while the perspective of the experience of the other is disregarded, neglected, distorted, suppressed or eliminated. In reification processes, the individual subjectivity of the Other, his or her intentionality, expressivity, identity, and autonomy are not taken into consideration and are disregarded, and furthermore, they may be even replaced by thing-like, anonymous typifications. As far as social roles are concerned, there is a total identification of the individual with his or her assigned typification. With respect to phenomena as racism or sexism, "reifying typifications" do have negative, pejorative connotations in the form or stereotypes, prejudices etc.

'"Reason of State" As an Organising Stance for the World As We Find It.'

A number of partly interlinked crises have traversed Western societies in the 21st century – from terrorism, financial meltdown, and political polarization, to increasing inequality, climate change, the COVID-19 pandemic, and war in Ukraine. Whereas late 20th century intellectuals hubristically claimed that we had reached 'the end of history' (Fukuyama, 1992), history is now again on the move, throwing up crucial political and organizational questions related to survival, security, and stability. In attempting to respond to this, commentators, theorists, and public intellectuals are now debating which 'new' organizational principles and political arrangements might be adequate to cope with the somber outlook facing Western societies. Fewer, however, pause to consider whether already existing – but now largely denigrated and 'old fashioned' – organizational principles, public institutions, and political moralities can *still* be

206

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

of assistance in fostering political order, security and a *civil* society, in the literal meaning of that contested term. In this piece, I want to explore the latter route. More precisely, we focus on 'reason of state' as an organizing principle and form of 'political morality' through which prudential leadership can be cultivated and exercised. Over the last forty years, and increasingly since 1989, howmever, reason of state as a prudential political and organizational stance has been swept away on a tide of cosmopolitan, neo-liberal, and globalist enthusiasms, and the backlash to these evident in recent and ongoing populist discontents. As we once again stare crisis and disasters in the face, the time has come to reconsider the extent to which the key comportments and organizational principles making up the foundation of the Western territorial state continue to be of use as guidelines for prudential conduct in an insecure world.

DU TOIT, David* (University of Johannesburg, South Africa)

Labor Agency, Resistance and Resilience: The Experiences of Migrant Male Domestic Workers in South Africa

Paid domestic work is considered one of the most vulnerable and exploitative jobs in the world. Despite formalization, domestic workers have little collective bargaining power to improve their working conditions. Research almost exclusively focuses on the experiences of female domestic workers regarding job-related challenges and the experiences of male domestic workers are often left out in the debates. In South Africa, while black African men once dominated the paid domestic work sector during colonialism, today, only a small proportion of domestic workers are men, mostly from Zimbabwe and Malawi. Despite the small proportion, it is not clear how male domestic workers experience domestic work and what strategies they implement to improve their working conditions. This article draws on Cindi Katz's typology of agency and explores how male domestic workers exercise agency to change and improve their working conditions. Based on 14 in-depth interviews with male domestic workers in Johannesburg, findings show that they use a combination of resistance, resilience, and reworking strategies to improve their working conditions and livelihoods. However, this study argues for a stronger collective agency to change and improve the working conditions for all domestic workers in South Africa and beyond.

RC02-39.7

DU TOIT, David* (University of Johannesburg, South Africa)

Outsourced Maternalism: A Consequence of Outsourcing Domestic Work to Household Cleaning Service Firms

The term, maternalism has been widely used in paid domestic work literature and it refers to the unique interpersonal, nurturing, and emotionally driven relationship between female employers and female domestic workers. Maternalism derives from paternalism, which evokes an authoritarian supervisory role between employers and workers, where workers are often treated as childlike. Maternalism essentially occurs when employers use gestures of charity, unsolicited advice, and assistance to domestic workers, while domestic workers reciprocated gratitude by performing unpaid extra working hours, and are loyal and committed to the household and care needs of the employer and her family. However, paid domestic work has changed in recent times with the rise in outsourced domestic cleaning service firms that render professional, quick, and hassle-free household cleaning services. People no longer have to employ domestic workers directly but can rely on a domestic cleaning service firm that not only takes care of the household cleaning needs but also the red tape of employment contracts and other legislative matters. While this trend has been documented by studies, what is less documented is how these outsourced domestic cleaning service firms also take care of the personal and family needs of the domestic worker. The relationship between the client (former employer) and domestic worker becomes business-like and impersonal. What is not documented is how maternalism becomes outsourced as well as the physical domestic work tasks. Hence, the term 'outsourced maternalism' is coined, a term that has not been discussed in the literature on outsourced domestic cleaning services. A broader and deeper understanding of this term is necessary as one needs to know who takes care of the personal needs of domestic workers in an outsourced relationship and what this means for domestic workers. This paper debates 'outsourced maternalism' from a South African context.

Elderly Caregiving, Family, and Inheritance: Narratives from the District Court of Ayodhya (India)

Literature suggests that amid the looming grey tsunami, the context for most elderly abuse cases is property dispute. In this context, it is imperative to explore the relationship between motives and decisions regarding bequests and elderly caregiving in Indian society in current times. To this end, the paper ascertains the trend of court judgments on bequest decisions and family care for the elderly in Indian postcolonial legal history. Who will care for the elderly, and how do such concerns regarding family care for the elderly affect an individual's bequest decisions? These questions lie at the heart of the present study. Drawing from analysis of property dispute cases, narratives of legal actors (lawyers and litigants, among others) in the district court of Ayodhya (India), and interviews conducted with residents of two old age homes in Ayodhya, the paper examines how family care for the elderly, filial piety, bequest motives, and decisions regarding bequests are connected in unique ways. Further, it examines the role of the modern welfare state in this dynamic. By examining the relationship between the modern Indian state and family, the paper argues that over the years, the tendency of the Indian state has been to take up less and less responsibility for the maintenance and well-being of the elderly while securing their property rights within the sphere of their family. With most existing research based in Western contexts, the present study offers critical insights into family care and elderly caregiving in a non-Western cultural context.

Gender and Child Malnutrition in Rural West Bengal (India): A Qualitative Analysis

The increasing number of malnourished children in India has led to a continuous debate about the underlying drivers of this phenomenon. Although the importance of the socio-cultural factors has been acknowledged, the role of the mothers who are directly involved in performing crucial childcare practices, have been largely ignored. Through a detailed qualitative study based on primary data, this paper explores the gendered dimension of child malnutrition by focusing on the caregivers' narratives and engage with the key cultural aspects of Indian (Bengali) society that have a strong bearing on a child's health, including nutrition. This study uses practice theory to understand the structural determinants of child malnutrition. Bourdieu's (1990) discussion on practice helps to understand practices as the result of the intersection of an individual's habitus with contextual social fields. Keeping this in mind the paper presents the socio-cultural context in rural West Bengal under which the practice is performed and the role of gender behind the same. Ethnographic techniques involving thick fieldwork, participant observation, narrative interviews, and focus group discussion were used for data collection. This study proposes crucial policy implications and contributes to understanding the intra-household contexts where essential practices and strategies occur to ensure the mother's and child's nutritional well-being. This paper emphsises that to promote gender equality in society, it is crucial to make the community an important stakeholder and make the community aware of its symbiotic positive outcomes. Apart from the mother-child dyad, it highlights the need to integrate the wider household and community environment, social structure related to gender, hierarchical patterns of authority, and normative systems of values and beliefs, to present a sociological understanding of child malnutrition in rural India.

COVID-19 Pandemic and the Role of Religious Institutions in India

This study highlights how the uncertainties of changing world during pandemic encountered by human beings and their quest for spiritual life resulted in the metamorphosis of long established organized religions and increased presence of new religious movements. The role of religious institutions (both old and new) in India during and after the COVID-19 pandemic has posed questions which have not been addressed adequately in the mainstream academia and which needs sociological examination.

Religious institutions played both a proactive and negative role during COVID-19 pandemic. Religious institutions played a proactive role in overcoming vaccine hesitancy and building vaccine confidence. Religious institutions also provided their places of worship and other infrastructure to create safe venues for administration of COVID-19 testing and effective delivery of the vaccines. Some of the religious institutions were instrumental in addressing stigma and discrimination amongst communities and also create awareness on measures required to prevent and contain the spread of Covid-19. Beside proactive role there has also been negative role of religious institutions in terms of organizing religious congregation. For example, religious congregation at *Tablighi Markaz,* the global headquarters of the *Tablighi Jamaat* in the Nizamuddin area of Delhi in March 2020 during first wave on COVID-19 in India became the epicenter of transmission of corona virus. Further, religious congregations during *Kumbh Mela* in Haridwar in April 2021 during second wave approximately 100 million people gathered. Close proximity during these religious congregations was against the social distancing norms and it significantly increased the transmission risk of novel pathogens.

This paper by drawing upon primary and secondary sources would provide a crucial insight into the role played by religious institutions during and after COVID-19 pandemic in India.

The Public Sector Communication on Covid-19 in the Hybrid Media Ecosystem: A National Survey on the Italian Citizens' Perception.

In the network society that is characterized by an increasingly hybrid and convergent media ecosystem (Jenkins et al. 2013), health discourses are generated from multiple online sources. In this context, public health institutions try to "inhabit digital environments" with awareness of the e-patient phenomenon (DuPré 2014; Ferguson 2007). In the case of Covid-19 pandemic, public institutions have accelerated the use of digital media to deal with the phenomenon of infodemic (PAHO 2020). This problematic information is linked to fake news and disinformation and it has spread above all on social media wich are very useful tools for reaching and informing citizens in health crisis, but they involve critical aspects (inequalities, digital divide) (Coombs 2020; Lovari et al. 2021). According to the studies on crisis and emergency communication, it's important to treat communication on the various aspects of the pandemic in an integrated, multi-channel and inter-institutional way.

We conducted a study on Italy that has been particularly affected by the pandemic since the beginning of 2020. The research purpose was to detect which information sources were used by Italians during the pandemic and the role that public health institutions' communication played, emerging the citizens' point of view: what do citizens think about the pandemic information provided by institutions? According to citizens, which traditional and digital communication media are used by institutions during the pandemic? And how do they use them? The study was conducted with a quantitative method: telephone interviews with a structured questionnaire that were subjected to a stratified sample of Italian citizens (1001 units), in May-July 2021. The results of the survey, highlighted differences between citizens in relation to their attitudes towards information sources and health institutions communication.

Discrete-Time Multistate Modeling for Life Course Analysis

Many social processes can be represented by individuals being in, and transitioning between, a finite number of states. Examples include transitions in the labor market, between marital states, and many more. Statistical modelling of such processes can be done using multistate models. Multistate models come in two different variants: discrete-time and continuous-time. While continuous-time multistate models have been extensively described in the literature, there is little guidance on their discrete-time counterparts. This is unfortunate since many data sources – regularly spaced longitudinal surveys in particular – naturally lend themselves to modelling in discrete time.

We provide new theoretical and practical insights into discrete-time multistate models (DTMMs) for panel data. From a theoretical perspective, we establish a set of theoretical estimands which can be studied using DTMMs and which are linked to life course theory and the concept of cumulative (dis) advantage. Moreover, we present novel technical results which counter one of the main criticisms of multistate modeling: multistate models usually rely on the Markov assumption, which implies that the studied process is memoryless. While this assumption likely is false for many potential applications, we show that several quantities can be consistently estimated using DTMMs even if the Markov assumption does not hold. Finally, related to the previous two points, we argue that DTMMs can provide adequate representations of population-level quantities, while being less well-suited for individual-level predictions.

From a practical perspective, we use data from SHARELIFE to show that DTMMs provide good representations of real-word data, and that finite sample bias is modest. An in-depth example is provided using data from the U.S. Health and Retirement Study. Finally, we briefly remark on a novel Stata package and existing R packages for the estimation of DTMMs.

Online Discourse of Vaccine Hesitancy Concerning COVID-19 Vaccination in Russian-Language Social Media

Decision-making towards vaccination is particularly relevant in the context of the COVID pandemic. The vaccination decision-making is often considered in terms of "for" or "against". But usually, decisions about vaccination lie in the middle of these extremes. The majority of people is not being strong supporters or opponents of vaccination, but have some doubts about the necessity of vaccination. Doubts about vaccination in spite of the availability of vaccines are called "vaccine hesitancy". In the digital age vaccine hesitancy is significantly influenced by information from the Internet and discussions on social media. The research of the language of such discussion is very important for understanding attitudes of people towards vaccination.

The aim of our research was to describe the language of COVID-19 vaccination discussions in social media and reveal main discursive strategies of vaccine hesitancy. We analyzed Russian-language social media discussions around COVID-19 vaccination. 6000 comments were selected from four most active discussion groups. Thematic analysis was implemented for data organization and interpretation. 14 themes were identified in data, some of them: 1) concerns about safety, 2) suspicions about political or economic forces driving the COVID-19 pandemic or vaccine development, 3) discussion of the lack of knowledge about the vaccine, 4) anti-vaccine or conflicting messages from officials, 5) doubts about the possibility of holding vaccine manufacturers legally liable and so on. Several discursive strategies that contribute to vaccine hesitancy were identified: vaccination as a risky measure that can cause more negative health effects than benefits; vaccination as a tool to make profit; vaccination as a means to restricts the civil rights; vaccination as an unnecessary measure, since the coronavirus is not a great danger. The understanding of vaccine hesitancy discourse contributes to more effective vaccine campaigns. The research was supported by RSF (project No 22-18-00261).

Patient Activism Strategies in Digital Space in the Light of New Epidemic Risks

Patient activism is important but often overlooked resource of the public health system. Until recently patient activism was limited to the activities of organized social movements of vulnerable groups and their allies, aimed at the redistribution of health care resources, public recognition of their problems, gaining better access to health resources and greater control over health and well-being. New epidemic risks (COVID-19) are changing the nature of patients participation and patient activism, not limiting it to certain vulnerable groups and their advocacies or 'disease-specific' movements and groups but spreading it to the widest segments of population. A significant part of patient activism in these new conditions was transferred to the digital space. Patient activism becomes diffuse, latent, and more difficult to identify and investigate. The aim of our research was to reveal main strategies of patient activism in Russian-language digital space in the light of new epidemic risks. Through the application of qualitative research methods to online discussions in Russian-language social media and interviewing the representatives of patient associations, we identified different forms of patient activism in Russian-language digital space including: networks of mutual assistance; exchange of resources and information; peer-to-peer education; advocacy for patients and doctors; individual diffuse activism. We revealed several strategies of patient activism in the context of new epidemic risks: association around individual health issues; association around group health issues and creating group identity; building public representation of health problem; public opinion mobilization; performative actions; critique of medical expertise; protest activity. The results if this research are important for better understanding transformations of patient activism and patients participation in modern times. The research was supported by RSF (project No 22-18-00261).

Trust, Distrust and Electoral Technologies: Revisiting the Electronic Voting Machines Failure in the Netherlands 2006-07

In 2006, the city of Amsterdam adopted the use of Electronic Voting Machines that was already in use in the Netherlands for a few years. This adoption fostered the reaction of a group of activists who created a group named "We Do Not Trust Voting Computers" and started a campaign to show that the system used was insecure. They successfully managed to push the government to withdraw its use by 2007.

We aim to present the results of a case study revisiting the case, shedding light on the elements bringing to the construction of trust and distrust towards electronic voting machines. This proposal is framed in a broader research project that is assessing 1) the process of creation of trust and distrust, understood as separate theoretical constructs, and 2) its impact on the use of sensible technologies such as electoral technology (internet voting, DRE voting machines,...). The presentation will present the development of the electronic voting crisis that occurred in 2006-07. It will analyze the combination of discourses by the relevant stakeholders in the process and how they influenced the creation of trust and distrust. Differently from what some other perspectives on the research of trust state, this presentation will show how understanding trust and distrust as separate concepts (not as opposite endings of the same logical continuum) allows us to detect elements that are, at the same time, bringing trust and distrust in the equation.

How (Latin)American Is the Decolonial Perspective in the Social Sciences ?

Is the decolonial approach in the social sciences a Latin-American or an North-American approach ? It may seem odd to even ask such a question but it appears that most studies or critiques about it take a stand for one or the other. The present communication will try to suggest a different angle, using the methodology of the circulation of concepts and thinkers and proposing a conceptual genealogy of the constitution of the Modernity/Coloniality group from the late 1980s to the early 2000s. This travel will consider the creation of the Latin-American Subaltern Studies Group in 1992 in the United States by the connection of American and Latin-American Latin-Americanists to the South Asian Subaltern Studies Group formed - in and outside India - from the early 1980s ; the parallel formation at the University of Binghamton (State of New York) of a more informal network gathering American and Latin-American sociologists, anthropologists, philosophers and social scientists around the concept of coloniality forged by Peruvian sociologist Anibal Quijano in the early 1990s. These two parallel histories sometimes intertwined but their paths eventually split up in 1998 with the first steps towards the constitution of the Modernity/Coloniality Group after the World Congress of Sociology in Montreal (August 1998), a meeting held at Duke University (October 1998) and a workshop at the Fernand Braudel Institute in Binghamton (December 1998). This chrono-logic is absolutely fundamental to understand the rise of the "decolonial" approach and the concomitant decline of the "subaltern" Latin-American approach in the US.

DUFOIX, Stephane* (University of Paris Nanterre, and Institut universitaire de France, France)

Who Needs to be Decolonized?

For now a number of years, and even decades if we carefully, and literally, read and listen to voices and texts coming from Latin America, Sub-Saharan African, Asia and the Arab world, calls for decolonization of sociology - often calls for its indigenization, even though this has remained a bad word to utter - have multiplied themselves, even in Europe and North America. The meaning of "decolonization" could and should be addressed in details, but this communication would like to focus on a more discrete issue: whom shall we decolonize if this happens to be a possibility?

Why asking this? Because decolonizing is often understood as an external process that implies the withdrawal of the colonizers and the advent of the colonized, as though it were a zero-sum game: what was gained is lost and what was lost is gained. However, this conception of decolonization of «something» does not entail nor address the decolonization of «someone». Focusing on the latter implies a deeper sociological analysis of how colonization had operated, especially as far as culture and knowledge are concerned. As it had set aside, silenced or even suppressed native beliefs, languages and cosmovisions, these have often been replaced by new ones, those of the colonizer.

Decolonizing sociology implies to work directly on the lingering of mental structures that still consider the Western orientation to be the right one. Even if this understanding starts to loosen up a little, especially with the calls for decolonization we mentioned above, this is not enough. We have to «decolonise the mind», as Ngugi wa Thiong'o had it thirty years ago. Not only the still «captive minds» of the South but also the still both «captor» and «captive» minds of the North.

Disaster in Alcohol Research: Composing New Directions for Thought and Action

Interest in alcohol consumption occupies a long-standing niche in disaster public health research. Underpinned by quantitative methodologies, research in this area has largely sought to map the patterns and correlates of drinking in 'post-disaster' contexts. Alcohol consumption is regularly positioned here as a probable and troubling consequence of disaster events: a maladaptive behavioural response to psychological hardship and collective trauma. With the emergence of the COVID-19 pandemic, the impact of this literature has grown markedly. Research on the disaster-alcohol nexus was frequently mobilised to support scholarly speculation on the public health impacts of the pandemic, fuelling early concerns that drinking rates could increase, and that pre-emptive political action was needed.

Despite the growing prominence of disaster-alcohol research, this field has thus far avoided critical scrutiny. Few scholars have paused to consider the kinds of knowledge and knowledge-making practices that dominate disaster-alcohol research, much less the kinds of evidencing practices that might enrich our understanding of 'what happens' to alcohol consumption in disaster conditions. In response, our paper seeks to slow down thinking on alcohol and disaster. We explore how alcohol-disaster research constitutes disaster, alcohol consumption, and the relationships between them. In doing so, we argue that this literature is constrained by its tendency to 1) produce disasters as temporally bounded, decontextualised, and depoliticised events and 2) reify drinking as a static, asocial behaviour driven by individual pathology.

In turn, we map out new directions for thinking about and intervening in alcohol consumption in disaster contexts. Critically, this involves shifting attention away from static images of drinking behaviour and towards the local and shifting social worlds of alcohol consumption. We argue that such knowledge-making interventions are important, not only for questioning and apprehending the diverse impacts of disaster events on alcohol consumption, but for anticipating and responding to disaster-prone futures.

The Rise of Quantification in High-Risk Supply Chains: Sustainability Champions' Human Rights 'Risk' Management

As companies are increasingly expected to govern their global value chains (GVCs), new ways of risk management are being introduced to address persistent global labor and human rights violations. In this paper we investigate how companies go about implementing these new ways of risk management, in their organizations and their GVCs. Their attempt to rationalize organizational policy and practice implies the introduction of new ways of measuring and quantifying sustainability. We aim to understand how these practices diffuse as they are passed on and translated throughout GVCs. In so doing, we observe how risk management policies impact key suppliers, how they are taken up by them, and how they influence suppliers' accountability.

For a period of three years, we conduct in-depth case studies of six Belgian companies and their GVCs through document analysis, on-site observation and interviews with different company actors. The companies can be considered 'sustainability champions' in different high-risk sectors (textiles, diamond, coffee, cocoa and natural stone). We see how these companies, who each have different organizational structures that we link to an ideal-typical organizational model, share a same discourse on transparency, relying on short supply chains.

Our study concludes that within the same transparency discourse different organizational models lead to different strategies, making specific actors and practices visible, while eschewing transparency in other areas. Further up the value chain some suppliers are better able to cope with the recent developments in measuring sustainability outcomes than others. Suppliers who can graft novel measuring practices on existing organizational or social structures are at an advantage. Those who cannot, struggle to adapt and are driven towards other markets, or further into poverty. By examining these dynamics, our study reveals power imbalances crucial to the understanding of contemporary evolutions in the private governance of human rights in our globalized economies.

Bears and Rivers As Rights Holders: Between Capitalist Fetishization and Ambivalent Instrumentality

Today it has become impossible to deny the socio-ecological collapse we are living through; food shortages, sick rivers, extinct animals and charred forests are just a sample of this. In 2008, Ecuador proposed to stop extractivism by granting rights to nature, to Pacha Mama, and thus create a mechanism to contain environmental devastation. In other words, it sought to break with the anthropocentrism of "human rights" to embrace a sociobiocentrism that ensures the reproduction of life. Similar strategies have emerged in countries such as New Zealand, Bolivia, Colombia, Canada, and Bangladesh. In addition, we see initiatives such as "Stop Ecocide!" attempting to declare the destruction of ecosystems an international crime. However, does it make sense to recognize "rights" to nature? Although the concept of rights appears inherently positive, there are reasons to question its use. The idea of the right holder in the legal world parallels that of the commodity holder in the economy. The same model of the capitalist individual that is driving us to extinction is proposed as a response to climate change. It seeks to juridify a bear or a river to reconceive

it as a selfish and isolated landowner, a litigant with exclusive interests who expects to be heard and protected by courts. Inspired by Evgeni Pashukanis' critique of law, in this paper we critically assess the strategic but pernicious use of rights to stop the socio-ecological crisis.

DURAN MATUTE, Ines* (Benemerita Universidad Autonoma de México, Mexico)

Revealing and Contesting the Eco-Indigenous Rhetoric of Progressive Capitalism

The so-called progressive governments in Latin America have been strongly criticized for deepening extractivist practices that dispossess native peoples, destroy nature, and deny the socio-environmental consequences of a predatory capitalist model. In a few years, their model was evidenced as unsustainable, and several of these countries in their governments even turned to the right. Still, a new wave of progressive governments emerged on the continent; Andrés Manuel López Obrador (Mexico, 2018), Alberto Fernández (Argentina, 2019), Pedro Castillo (Perú, 2021), and Gabriel Boric (Chile, 2022) present themselves as 'democratic' candidates in opposition to authoritarian and right-wing governments. But would we witness the end of the "contradictions" of state progressivism or the re-emergence of extractivist authoritarianism as a national project?

Taking as a starting point the situation in Mexico, this paper interrogates the role of "left-wing" governments in sustaining capitalist accumulation. It scrutinizes how megaprojects, including tourism, energy, commercial and transportation plans, have been justified and promoted while being identified as threats to life itself. More specifically, it discusses how a form of multi-layered "green" and "inclusive" capitalism is maneuvering indigeneity to expand patterns of accumulation, renovate divisions, limit alternatives, and legitimate the destruction of nature. However, it also illustrates how native peoples contest this maneuver by placing life at the centre and creating spaces, relations, and practices that seek to transform the world.

DURANTE, Tommaso* (The University of Melbourne, Australia)

The Algorithm and the Making of the Global Imaginary

We live in a web-centric and highly mediatized society that is dominated by visual data production and gathering. In such a context, the 'algorithm figure'—a finite sequence of rigorous procedures used to solve a specific problem or to perform a computation— has become a concern in the academic context, as well as in popular media discourses. Yet, there is a dearth of research on the extent to which artificial intelligence, the use of algorithm in computer vision and in deep learning machine in particular, contributes to a shift in the symbolic and social construction of the *global imaginary* under present conditions. The research aims to investigate such a shift occurring in the *different materiality* of the World Wide Web, however not exclusively, by focusing on two deep-machine learning models able to generate digital images: GANs (Generative Adversarial Networks) from scratch and DALL-E from text. Concepts drawn from the perspectives of social phenomenology, artificial intelligence, and media theory are used to argue that algorithms are *sociotechnical constructions* able to affect, consciously and unconsciously, people's social imaginaries and ideologies at deep-subjective level. The presentation offers an empirical and conceptual discussion about social change by addressing the following research question: "To what extent algorithms as 'new' *epistemic figures of knowledge* assist to better understand the shift in the symbolic and social construction of the global imaginary in a context of computer vision, deep learning machine and data driven economy?" In understanding 'big data' as a *new capitalist mode of global operation* and by focusing on GANs and DALL-E machine learning neural models as a shift in 'algorithmic imaginary', the presentation concludes that algorithms are not the problem, we are the problem.

Decolonising Higher Education Institutions: Enabling Indigenous Australian Higher Education Youth to Define Their Social and Emotional Wellbeing.

Despite wellbeing being critical for an individual to live a happier and healthier life, and with higher education being a game changer, there is surprisingly a paucity of research which investigates how Indigenous Australian youth attending higher education institutions conceptualise and define their social and emotional wellbeing. Representing over half the Indigenous population, Indigenous youth in Australia are the future leaders of their communities and as such their voices and wellbeing needs are vital. This study's theoretical framework is underpinned by decolonising methodology whereby youth in this research had the agency to define their wellbeing needs and decolonise past research which ignored and silenced their voices and wellbeing in higher

education. This presentation will present on the following findings: 1) how Indigenous youth conceptualise their wellbeing; 2) the drivers of and barriers to Indigenous higher education youth wellbeing and, 3) potential strategies that youth perceive higher education institutions can implement to enhance their wellbeing. Notably, the shared findings will provide higher education institutions and future Sociological theory, research, and practice with new insights and directions.

Returning to Marseille: Sensing a Different Geo-Political Map of Citizenship and Belonging

Accepting Ian Chambers' (2008) call for an "uprooted geography" troubling the West's four-coloured maps of modernity and citizenship, this paper focuses on the postcolonial port city of Marseille on France's southern coast. In my argument, Marseille becomes a "different" model of Europeanness – one of utopian possibility while, contradictorily, of dystopic myth-making. This is a city, it seems, on the cusp between Europe, Asia and North Africa, its gaze primarily directed southwards to encompass the Mediterranean and the regions and nations at its edges. Meanwhile, Marseille's communities reflect a history of traffic of refugees from politically-volatile parts of Europe together with the flow of migrants from former French territories and colonies in Asia and Africa. My previous writing has focused on Marseille's port area, including the creeping signs of renovation in the city's oldest market and its sidestreets. With this current paper I propose a symbolic return, walking the city streets, to trace embedded narratives of sensation: sound, smell, taste, touch and memory. The critical question is: how do diverse populations, living in propinquity and in troubled times, manage the task of developing productive social and cultural relationships? How are these public/political relations mediated by sensation? Is Marseille still a utopia of sun and sea, as some of the earlier literary accounts suggest, and of "multicultural" harmony, as claimed by more recent public commentators? Alternatively, does Marseille continue to embody a dystopia of crime, poverty and crumbling building stock, on one hand, and glitzy overdevelopment, on the other? How does the "new Marseille" and its re-shaping of citizenship, identity and re-drawing of borders intimate (or not) cultural imaginaries of a "new", hybrid Europe – one of fluid boundaries and inclusiveness, experienced in bodily sensation, for this twenty-first century and beyond?

The Semiosis and the Market: What Peirce Can Learn to Economic Sociology

The importance of signs in the functioning of the contemporary economy has tended to be doubly underestimated by sociologists, by being restricted to the sphere of consumption on the one hand, and to linguistic signs on the other. Peirce's concepts, and in particular that which refers to the contextualized evolution of a sign (*semiosis*), can remedy this situation by enriching the sociology of markets. Coordination between buyers and sellers is based on a process of transmission and reception of different types of signs: some are stabilized and the interpretation "flows naturally" - these are the *conventions* identified by conventionalist sociologists and economists -, while others are more ambiguous and leave a great deal of room for indeterminacy. In the latter case, the concept of semiosis makes it possible to finely identify the techniques used by actors to buy or sell in situations of uncertainty. The fruitfulness of these Peircian categories has already led to many original works, in particular among pragmatist sociologists of public space and the city; one of the contributions of their research is to have highlighted the precariousness of the processes of signification and its dependence on the socio-material configuration of situations. These issues are not ignored by the contemporary sociology of markets, but could be better grasped by importing the concept of semiosis. After presenting Peirce's conceptual architecture, we will illustrate the interest of such an import from a case study centered on the role of stock market indices in the functioning of contemporary financial markets. By polarizing the attention of market participants, these indicators have acquired a semiotic power, that is, a capacity to influence the interpretation of buyers and sellers, which has so far passed under the radar of economic sociologists.

COVID-19, Media Representations and Dismal Health-Care in India: A Sociological Ananlysis

In 2020, when the routine activities of our everyday life took a back seat due to the sudden and massive outbreak of COVID-19 Pandemic, Indian health and public welfare sector had to struggle a lot to cope with the new challenge of 'increasing death' especially among the elderly. Newspaper reports presented the daily increase rate of covid-cases worldwide and nationally and targeted the elderly population as the most vulnerable group to be affected. Newspaper

denotes a presenting author. Abstracts are organized by first presenting author's last name.

headlines addressing linguistically the elderly with Co-morbidity as the most likely to get infection and die instilled in the elderly population a 'fear' of getting the disease, which was accentuated by further reports highlighting the unavailability of hospital beds, lack of proper treatments and medications and the inability to provide personal care. The regular, incessant reporting of infection and death evoked fear that they will die without having a treatment, which led them towards utter depression and fear-psychosis that often ended with their death. Moreover, the changing strategies on the part of respective administrative bodies often stating that young people should be given more medical focus and care over the elderly invoked in the elderly the feeling of being lonely, unimportant and ostracized. Such demoralizing linguistic expressions and sometimes the use of harsh language compelled the elderly to think of themselves as 'burdens' on the society. In addition, these people also often tended to forget about their pre-existing ailments, which ultimately undermined the status of their health in all respects. Given this backdrop, this paper aims to explore through the help of qualitative interviews of twenty Bengali elderly people (male and female) and some reports in popular Bengali newspapers how the language of these reports about covid not only projected the dismal scenario of health sector but also reinforced politicization of media representations.

TG04-JS-111.2

DUTTA, Chandrabali* (HIRALAL MAZUMDAR MEMORIAL COLLEGE FOR WOMEN, India)

Language, Risk and Protests: The Case of Cab and NRC in India

The concept of Risk in both private and public spheres as well as the fear of risk is constructed socially through everyday linguistic practices. The language used in print-media or more specifically in newspaper reports often produces newer expressions of 'risk'. In December 2019, the Government of India enacted the Citizenship Amendment Bill (CAB) followed by the introduction of National Register of Citizens (NRC), which not only pushed a large section of existing Indian citizens into the risk of being rejected as Indian citizens but also spread the spark of raising organized voices against the existing central government regarding such propositions. The television channels and newspaper reports pinpointed this issue using provocative language that the government is being considerate and tolerant to some religious and ethnic communities while being extremely non-cooperative and hostile to some others. Debates, talk shows in popular news dailies and tv programmes aimed to project directly the protests on roads and the language used in both print and digital media reached a point, where it reflected aggression, discrimination, intolerance and hostility that compelled most of the citizens to fear the risk of being 'unidentified and unregistered' and thus held in captive camps. This 'risk' was completely new and it was a production of the normative, structural social organization that is pro status-quo. The language of the political leaders, media channels and newspapers created a modernized version of iron cage with shackles of prejudices and hostilities all over. It was in true sense the development of a new risk society. In the light of this, the present paper aims to unearth through qualitative content analysis, how the language used in four popular newspaper's reporting regarding CAB and NRC (English and Bengali) produced a culture of fear and risk and thus disrupted social harmony.

DUTTA, Khushboo* (BBAU,lucknow, India)

Impact of Covid-19 on Sustainable Development Goals-3(health and well-being).

The Covid-19 pandemic had unprecedented effects on human development. According to UNDP, global human development, a combination of education, health, and living standards, could descend this year for the first time when measurements began. The pandemic abruptly disordered the application of the SDGs and, in some cases, reversed decades of growth. In collaboration with experts and international agencies, the Department of Economic and Social Affairs prepared, The Sustainable Development Goals Report 2020, which talks of tentative but inadequate growth and cautions about the impact of the coronavirus pandemic. COVID-19 threatens to reverse the progress of SDG-3, which aims to ensure good health and well-being for all. According to the report, 70 countries have paused childhood vaccination programs during the crisis. Many places have interrupted or neglected health services for cancer screening, family planning, or non-COVID-19 infectious diseases. Health service disruptions could reverse decades of improvement, warns the report, which could affect population health for years to come. This paper deals with the impacts of pandemics on SDGs, especially SDG-3.

DUTTA, Parishmita* (Tata Institute of Social Sciences, India)

Impacts of COVID-19 Pandemic in Prison Administration System: Mitigation Strategies of Indian States and Union Territories

Impacts of the COVID-19 Pandemic on Prison Administration System: Mitigation Strategies of Indian States and Union Territories

The novel coronavirus disease (COVID-19) originated in Wuhan, China, in December 2019 and rapidly spread over the globe creating a severe public health concern worldwide. The measures adopted to respond to the pandemic affected the regular schedules of the criminal justice system and expanded the opportunities for various crimes, adding additional challenges to India's prison system, including the prisons (Miller & Blumstein, 2020). The prisoners have become one of the most vulnerable groups to COVID-19 due to their close proximity and compartmentalisation which creates an obstacle for them to maintain social distancing and follow other medical protocols. According to the Prison Statistics India 2020, published by National Crime Record Bureau, Indian prisons are overcrowded, with an occupancy rate of 118 percent. Therefore, the ill-equipped prisons were overburdened with inmates that became centres for the infection of the contagious virus and confronted health and other relevant crisis. According to the data provided by Commonwealth Human Rights Initiative (CHRI), since May 2020, a total of 19,724 prisoners (at least 4 percent of prisoners and prison staff) tested positive and 22 died (Bansal & Sahni, 2021). The prison administration authorities of different states and union territories had to experience multiple challenges to prevent the contagion of the virus and in maintaining social distancing and hygiene in the prison settings. A content analysis approach would be employed to analyse the data collected from secondary sources (newspapers, magazines, research articles, and government reports). The paper attempts to answer the following central questions: a) what are the major challenges faced by the prison administration authorities during the time of the COVID-19 pandemic? b) what are the strategies adopted by different states and union territories of India to mitigate the challenges arising out of the covid 19 pandemic?

Beyond the Sacred - Profane Dichotomy? New Religious Movements and Their Concept of Wellness through Spirituality in South Asia

A substantial measure of the sociological literature on religion, draws its inspiration from the sacred-profane dichotomy, as elucidated by Emile Durkheim (1912), in his celebrated work, *The Elementary Forms of Religious Life*. Going by his definition of the sacred, the concept of "spirituality" is likely to be interpreted as something to be encompassed within it. However, a deeper interpretive engagement with the notion of spirituality calls for a rethinking of the sacred as an umbrella category, which seemingly includes everything that is not profane under its ambit.

While religion is considered to be an organized system of beliefs and practices, the concept of spirituality is seen to be rather flexible and inclusive by its proponents and is thereby more likely to be embraced by those who are uncomfortable with confining themselves within straitjacketed categories of organized religion. In this context, it has been observed that, most of the New Religious Movements (NRMs) in South Asia have embraced and focused more on the spiritual quotient, rather than on the religious one. Spiritual, in this sense, is seen as an equivalence of the secular by these NRMs, on account of the openness and inclusivity attributed to this concept, which is more individualistic by nature, as opposed to the collective character of religion. Through an analysis of primary data gathered through in-depth interviews with the office bearers, lay members, and beneficiaries of some of the popular NRMs in South Asia and their various programmes based on wellness, apart from their other activities, the proposed paper shall seek to interrogate into this equation between the spiritual and the sacred –profane complex, and how spirituality is often seen, not as antithetical to, but as complimentary to science, in the pursuit of wellness and inclusivity in the modern world.

Interrogating the Sikh Response to Environmental Degradation and Climate Change: A Case Study of the Ecosikh in Punjab

Development, in the mainstream perspective, has mostly been equated with economic progress, which is rooted in the discourse of anthropocentrism. The various paths to development, be it capitalist, socialist or mixed, have all been centered on the premise of the alleviation of human poverty through the exploitation of natural resources. Nature has been objectified as a resource, which needs to be harnessed for catering to human needs. This objectification has in turn resulted in the blatant destruction of nature, thereby leading to environmental degradation and climate change. The rise in the frequency of catastrophes, deteriorating air quality, famine and poverty, the increasingly receding glaciers due to global warming, which in turn has resulted in the rise in sea levels, etc., has made humanity rethink its take on development. With increasing consumerism, supporting a highly materialistic lifestyle, paving the

way for such destruction, an alternative perspective that supports sustainable development, which is quite manifestly enshrined in the Eastern religions, needs to be urgently revisited.

Amongst the various Eastern religions, Sikhism, a Bhakti movement in Punjab, founded by Guru Nanak in the 15th century, perceives environmental issues as a problem of human development and social justice. A close look at the Sikh activities in the environmental sphere reveals the towering influence of the Sikh concept of "seva". In this context, the proposed paper seeks to examine the Sikh response to climate change in the Indian state of Punjab. With the help of in-depth interviews with the office bearers and beneficiaries of the popular contemporary Sikh non-governmental organization, the EcoSikh, this paper shall attempt at analyzing as to how religion may be harnessed as a positive force for promoting sustainability and environmental justice, thereby providing an alternative solution to environmental degradation and climate change.

Prendre La Route, Entre Autonomies Et Responsabilités

L'automobile peut être appréhendée comme un costume, à certains égards, une seconde peau. Elle est une prothèse palliative, un outil — en tant qu'extension utile de soi — au sens de Leroi-Gourhan (1983). Le moteur relaie le corps et autorise le déplacement plus rapide et lointain que la marche et le vélo. Elle protège aussi des intempéries, contrairement à la moto. Plus encore, l'habitacle masque, enveloppe. A ce titre et à travers le discours de jeunes conducteurs et conductrices, cette communication vise à questionner l'appropriation de l'objet automobile, finalement assez peu investi par les sciences humaines. Parce qu'assurément, il est bien davantage qu'un simple moyen de transport.

Il existe différents degrés d'investissement de l'automobile. Certains n'y apportent que peu d'importance, tandis que d'autres lui vouent un véritable culte. Parfois, elle est presque une compagne ou un compagnon dans cette période transitoire qu'est le passage à l'âge adulte. Elle rappelle des souvenirs, comme les premières vacances sans les parents. Elle est un de ces premiers espaces à soi, reprend certaines caractéristiques de la chambre (Glevarec, 2009), et y ajoute le mouvement. De nombreuses discussions avec les jeunes au cours d'entretiens et les observations sur le sujet présentent aussi la voiture comme un précieux support identitaire. Outil de projection, de dissimulation, d'affirmation, elle est une nouvelle modalité de présentation. Elle se personnalise discrètement ou à l'extrême, s'investit à son image. Cependant, elle place parfois nombre de jeunes face à de nombreuses contraintes. L'expérience de la conduite automobile est donc plurielle : elle apparaît comme un matériel d'autonomie mais aussi de responsabilité. Elle est un pilier de l'indépendance, mais confronte aussi à de nouvelles réflexions.

DUXBURY, Scott* (University of North Carolina at Chapel Hill, USA)

A General Framework for Micro-Macro Analysis in Social Networks Research

This study introduces a general framework for investigating the effects of micro network processes on "macro" network statistics (i.e., node, subgraph, or global network statistics) when using statistical models for network structure. We define two quantities of interest. The micro effect on macro structure (MEMS) is the effect of a micro process (e.g., homophily) on a macro statistic (e.g., clustering). The average mediated micro effect (AMME) is the *indirect* effect of a micro process on a node, subgraph, or global outcome through its effect on a mediating macro variable. We introduce algorithms to estimate both quantities and their variances, parametrically and nonparametrically. The method is flexible and explicitly accommodates research designs where the micro process and outcome of interest are measured at different levels of analysis. It can thus be used for a wide range of research designs and modeling strategies. We further show that existing methods can be regarded as cases of our broader framework. We illustrate the utility of the method with an applied example using cross-sectional AddHealth data to examine the friendship selection mechanisms that indirectly shape adolescent school performance through their effect on network structure.

Embedded Risks: Network Trade Structure and Drug Purchasing Trajectories on a Darknet Drug Market

A contributing force to the global drug crisis is, on the one hand, an increase in polydrug use, where drug users regularly consume more than one substance, and, on the other, an increase in access to a diverse range of illegal drugs through online platforms. This study examines these intertwined trends by considering how network embeddedness in online drug markets can increase the diversity of drug purchasing. While prior research examines how personal networks influence substance use, we consider whether the network structure of online drug markets contributes to polydrug use by alleviating the risk and uncertainty associated with acquiring a diverse range of drugs. Drawing on unique transaction-level data on 16,847 illegal drug exchanges between 7,205 actors on a darknet drug market and using relational event models for dyadic event data, we find that buyers are more likely to purchase a new type of drug when the transaction is part of an indirect network referral. These results are robust when analyses include large-scale transactions ("drug hoarding") or are restricted to only small purchases likely intended for personal consumption. We discuss the implications of these results for future research on how embeddedness in drug markets can impact drug use trajectories and for understanding the role of online drug trade in the current global drug crisis.

DWIANTO, Raphaella* (Universitas Indonesia, Indonesia)

From 'God the Almighty' to 'Remember Mom's Words' : Negotiating Language during COVID-19 Pandemic

This paper observes the shift in the language chosen by the government of Indonesia in framing the pandemic from the early of 2020 to second half of 2022, in its efforts to gain people's trust and cooperation, through various government institutions and special task force. Tracing the shift in the language, this paper also looks at the response from the people, and the negotiation process between the government and the people in various stage during the pandemic. The COVID-19 pandemic emerged when the president of Indonesia and his new cabinet had not even been in the office for one year. In the earlier stage of the pandemic, the then minister of health (a radiology doctor) as the representative of the government in facing the pandemic used language pointing at faith towards God the Almighty as the most effective way to face the pandemic, stirring protests from the people including the media as it was considered non-scientific statement. When the Task Force was formed in July 2020 (led by a person once belonged to Indonesian Special Force Army) and the president appointed new minister of health (a person with career in big corporations) in December 2020, the government use the tagline of "remember what mom says" to communicate pandemic measures to the people, which could gain acceptance from the people, and subsequently had impact on various measures. This paper is based on secondary data from various sources, in the format of visual, narration (statements), and statistics. This paper argues that the shifting in language shows that the pandemic conditions allow a more equal space for negotiations between the government of Indonesia and its people.

A New Digital Peasantry?: Evaluating the Entrepreneurial Spirit of Indonesia's 'Millennial Farmers' Project

This paper explores the notion of repeasantization as it inadvertently manifests in Indonesia beneath the West Java's millennial farmers project and its pathway towards digitalization of agriculture. The ambitious project aims to create 1,000 new, young, farmers that would replace the older generation of peasants, through their apt to digital technologies, market access and bankability. We investigate the initial survey results of 2,240 candidates of millennial farmers, identifying their hopes and dreams of a rural peasantry, and positing that there might be a potential for a slipping off the project away from the intended entrepreneurial towards a new form of peasantry. We highlight the pitfall that this project may encounter in the future and the implication for a wider understanding of new generation farmers in Indonesia as well as globally.

Stories of Community Resilience: Seeing Beyond the Success and Failure of Community-Based Conservation in Indonesia

Community-based forest management and conservation practices in Indonesia have become subject to critics in regard to their varied impacts (or lack thereof) on conservation and changing livelihood. With a very wide spectrum of social and ecological contexts that underlie these different responses to the state and NGOs' intervention programs, this paper attempts

denotes a presenting author. Abstracts are organized by first presenting author's last name.

to go beyond the success and failure of community-based practices through a deeper look at stories of resilience in forest-dependent communities in Indonesia. We employed a mixed method of social survey analysis of 600 respondents, participatory rural appraisal (PRA), and visual ethnographic approaches in six locations of forest-dependent villages in two provinces, Jambi and Papua. This study identified patterns of social-ecological relationships (ecological characteristics, social structure, forest resource dependency, community livelihood) in the six villages. These patterns, in combination with the wider contexts (connectedness to regional markets, road infrastructure, and development programs), contributed to unique ways in how the communities built their resilience and livelihood, as well as implemented conservation practices, which do not necessarily align with existing intervention programs brought by the state and NGOs alike. Our findings provide a lessons-learned for future community-based conservation practices in Indonesia and elsewhere.

The Effects of Neoliberal Assumptions, Policies, and Practices on School Culture and Trust in School

Neoliberal policies and expectations have altered the form of educational accountability such that not only are the students evaluated, but also the teachers, school administrators, and the different educational systems in the nation state. In many developed nations school accountability has created a *"Standards-based School Accountability Movement."* Neo-liberalism stresses the "marketization" or "commodification" of social life and social institutions (Ball 2003). Consequently, the Neoliberal accountability movement sees the value of an educational system, being a commodity that can elevate the competitiveness of a nation and more locally the content of the ratings of schools and school systems. Social institutions are thus assessed in terms of their **effectiveness** (raising achievement based on standardized test scores) and their **efficiency** (reducing costs).

The accountability system fostered by neoliberalism calls for externally imposed standardized tests because they offer an easily understood, relatively inexpensive "bottom line" assessment of educational quality with accompanying micromanagement. Schools, school districts, teaching staffs that produce low student test scores are to be replaced and nations whose students score poorly on international standardized tests are to be ignored by multi-national corporations seeking competent labor forces. Pigozzi (2006) noted that countries with well-educated populations and high scores on standardized tests are likely to thrive, while those without such populations and test results tend to stagnate.

There are several unintended consequences of the Neoliberal accountability system, including pressures on all levels of school actors to cheat, to burn out, to quit school and consequently to diminish actual learning and teaching. The nature of interpersonal trust at all levels of school organization is challenged, and has created **a hierarchy of distrust**, that alters the very nature of school culture, modifies the function of schooling, and the interpersonal relations that foster quality education.

ISA-880.2

DWYER, Tom* (University of Campinas, Brazil)

Step by Step – ISA'S Last Quarter Century in Context

Platt's history of the first half century of ISA (1948-1997) sees ISA originating in a small group of representatives of national sociological associations (NAs), principally based in the North Atlantic. Crucially they were oriented by UNESCO's objectives related to the achievement of peace. Step by step, ISA recruited individual and collective members, held conferences, published and promoted sociology, and built a stable administrative structure.

The principal part of this paper will examine the last quarter of a Century of ISA. Firstly, chosen elements of Platt's historical account, will be updated. Subsequently, innovations and changes in relation to the earlier period will be examined, of special interest are ISA's institutional innovations: ISA Forums, publications, NA representation, competitions, laboratories etc. Many of these, and other wider changes associated with information technologies, cultural and economic globalisation, scientific progress, and demands for inclusion, contribute to opening up new spaces of social action and sociological practice. Material from interviews complements data gathered by other research techniques. An increasing number and diversity of NAs become members, individual membership fluctuates and unevenly diversifies. Those from Asia and poorer countries seek out roles in the association. Do identified dynamics reflect in ISA's contribution to making a discipline that is simultaneously locally relevant and international? Do they mask the continued strength of sociological views of the North Atlantic, or perhaps reflect an emerging vision of sociology's universality, or are they linked to factors unrelated to the movement of ideas? In seeking to answer such questions, tensions are identified. What appeared to have been ISA's inexorable expansion over the last 25 years now faces limits. How ISA deals with these tensions will shape the future of the discipline. In so doing will concessions to pragmatism, undermine the commitment to the realisation of UNESCO's objectives that motivated ISA's founders?

Sensing the Field: Exercising Sensory Ethnography As a Learning By Doing Approach in Graduate Fieldwork Training

This paper responds to the panel invitation to deliberate upon the craft of teaching and doing of sensory research. When working with graduate anthropology and sociology students in Ho Chi Minh City, Vietnam, my teaching practice aims to inspire, enable and transform disciplinary conventions through a learning by doing approach. Learning by doing as a pedagogical approach aims to enable transformative learning experiences in real-world and relevant contexts within and beyond the classroom using available resources and authentic interactions. Rather than generating classroom debates among participants about socially relevant and culturally embedded practices as normative disciplinary learning, I lead graduate seminars that engage with interdisciplinarity and multisensoriality as tools for developing each individual's fieldwork practice as a transformative learning journey. In my presentation I will reflect on three questions: In what ways can multisensoriality enable graduate students to develop practical awareness of field researcher and learner-teacher positionalities? In what ways can multisensoriality transform seminar curriculum design to meet the changing needs of field practice and field-based social relationships, including digital-sensory interfaces? In what ways can interdisciplinary ethnographic tools of embodied, mindful/thinking and sensory practices as a craft prepare and equip graduate students as a cohort and as individual practitioners before, during and after fieldwork experiences? The paper concludes with recommendations for a transformative sensory pedagogy.

EARL, Catherine* (RMIT Vietnam, Vietnam)

Writing Sensations: A Practice Based Approach to Unsettling Anthropology and Ethnographic Writing

This paper builds on my recent experiments in ethnographic writing that challenge conventional narrative based academic publications derived from field research. As a postcolonial project of decentering previously dominant or hierarchical power structures within the academic publishing mode of communication, this paper engages with recentering the senses and embodied experiences in academic knowledge production and dissemination. Through an innovative ethnographic writing method I developed, which uses broken sentences comprising mainly adjectival and verbal contextual cues, I am to take the reader on a multisensorial experiential journey through my field data and analysis. As a practicing social anthropologist committed to interdisciplinarity, I interpret the category of field data to include sensory experiences, learned embodied practices, memories and emotions. Like narratives and ethnographic poetry, my sensory writing method is a form of storytelling. Yet, my aim is to move beyond the visual, auditory and linear as dominant modes for data collection and research dissemination by offering a more balanced or decentralized multisensory engagement. In reading my ethnographic texts the reader experiences more sensations. The practical challenge I face in my writing is conveying multisensoriality through the written word. The paper explores the process of developing my writing sensation style and locates this method as a practice of sensory studies scholarship.

Troubling Disjunctures in the Everyday World of UN Environmental Policy Making

Over the past decade, the United Nations Framework Convention on Climate Change (UNFCCC) has attracted attention as the climate emergency has likewise become more a matter of public debate. However, the everyday world of policy making is fairly obscure to all except those who engage directly in this world. Furthermore, this paper argues that there are two fundamental disjunctures that can be opened up for examination through the application of an institutional ethnographic ontology. First, the everyday world of UN environmental policy making has very few connections to people's actual lives. This disjuncture can be characterised as a disconnect between the language

and content of policy making and the actual lived experience of people who suffer the consequences of environmental degradation. Secondly, though, the language and content of UN environmental policy making fails to account for root causes of environmental degradation. There is therefore a disjuncture between the language and substance of the policy making processes and the ruling relations that organise environmental degradation. Using the ontology of institutional ethnography, including data collected ethnographically at UN environmental negotiations related to climate, biological diversity and indigenous peoples, this paper analyses and critiques both disjunctures.

Multi-National Corporations and Caste: Experiences of Sanitation Workers from Chennai

States like Tamil Nadu, due to its anti-caste Dravidian history, have ensured proportionate representation of different caste groups through reservation in government jobs. This equality in representation, however, after the liberalization of the Indian economy in the 1990s, seems to be under threat due to increased entry of private corporations in almost all sectors including solid waste management.

Few scholars like Thorat, Mosse and others have specifically analyzed prevalence of caste discrimination in corporate sector. My study intends to understand the processes by which caste hierarchy is reinforced within Multi-National Corporations (MNCs). The study focuses on contract sanitation workers in MNCs. Given the historical nature of the caste system in Indian society, which according to B R Ambedkar is basically a 'division of labourers', certain caste groups like *Arunthathiyars* in Tamil Nadu are still forced to perform sanitation work.

The paper is based on the narratives of sanitation workers residing in various ghettos within Chennai, Tamil Nadu. The study reveals three ways in which MNCs reinforce caste hierarchy to employ cheap labour for sanitation work. First, the analysis of the recruitment process shows that there is an active role of different agencies in ensuring members of *Arunthathiyar* caste as sanitation workers. Second, with less possibility of socio-economic mobility, the caste and familial kinship networks within *Arunthathiyar*s also forces youth to primarily 'seek' sanitation work. Third, the division of labour within the Indian MNCs reflects caste hierarchy whereby sanitation work is performed mostly by *Arunthathiyar*s but the supervisors and managers are men from castes above them. In fact, there seems to be an existence of a 'caste pyramid' in MNCs. This study also observes 'gender compartmentalization' in sanitation work, where most sweepers are women but the garbage collectors provided with electronic vehicle are men.

The Privacy Circles Demonstrated in Student Reluctance to Activate Cameras during Remote Classes: The Self, the Collective and the Authority.

COVID-19 restrictions have dramatically affected human interactions, forcing digitally-mediated communication in many everyday contexts. While in certain contexts, this shift was (semi) voluntary, in some domains, such as at the workplace and at school, the choice of format, rules of conduct, and platform was made by the institution and compelled employees and students.

Around the world, educational institutions moved to remote, online teaching assisted by commercial video conferencing tools e.g., Zoom, Microsoft Teams etc. Among the various challenges that this new form of teaching has faced, one frustration stood out which was seemingly shared by teachers globally: Students' reluctance to activate their cameras during class.

Teachers' frustration is understood: Teaching in front of "black boxes" completely damages the teaching experience. However, students' concerns are also reasonable: These video conferencing surveillance tools have serious implications to participant privacy. The classes are often recorded, and participants' ability to control the primary and secondary use of their video footage is limited.

This study analyzed the written responses of 1964 students enrolled in eleven academic institutions in Israel to one open-ended question: "If you do not normally activate the camera during class, what needs to be done for you to feel comfortable participating in an online class with your camera activated?"

A mixed-method analysis first classified participant responses and tagged them by themes. Then, the themes were grouped into 5 distinct contextual-privacy-related reasonings (from personal privacy, focused on the self, through privacy considerations focusing on others, the self with respect to her peers, to focusing on the authority). The model of the five "privacy circles" was successfully assessed using Structural Equation Modeling (SEM). The paper discusses the results through the lenses of the privacy rights discourse and contextual and situational privacy approaches. Gender differences in relation to the various privacy reasonings are also discussed.

Developing Business Students' Criminological Imaginations: The Thrilling Tale of 1MDB

Destructive business practices are at the heart of the world's most intractable problems. Today's business students' social consciousness will construct the future, and helping them develop a criminological imagination of the crimes of the powerful, therefore, is an important act of resistance in a neoliberal world. This project compares how two different pedagogical approaches to learning about corporate crime impact the development of criminological imaginations in undergraduate business students. Students are given the choice between learning about the 1Malaysia Development Berhad (1MDB) scandal by reading a bestselling nonfiction book or through a combination of news articles, videos, and other sources. All students are then asked to respond to the same set of questions about the scandal, including distinguishing between the relative moral wrongdoing of different actors, reflecting on how the wrongdoing has impacted innocent people, and explaining their own views on what could prevent future scandals like 1MDB or the appropriate penalties for wrongdoers. Students' responses are then assessed according to the quality or sophistication of their moral reasoning and capacity to connect the wrongdoing to social causes and contexts that enable it. By comparing the scores of students who chose to read the book with those who chose to read or watch multiple different sources, the study will be able to assess whether moral reasoning and the criminological imagination is better developed by exposure to multiple different perspectives about the same circumstances or a more in-depth study from a single perspective. A key output of the paper is the development of a rubric designed to assess students' ability to demonstrate the criminological imagination, and it will also inform pedagogical practice – adding to literature on how to stimulate intellectual curiosity while maintaining academic rigour.

EDELMAN, Meredith* (Monash Business School, Australia)

Rethinking Responses to Corporate Wrongdoing

This paper uses the Purdue Pharma bankruptcy as a case study of corporate insolvency processes facilitating surprisingly substantive lay participation, despite limits on capacity to condemn underlying wrongdoing. The US system of chapter 11, designed to deal with corporate insolvency and lacking a purpose of vindicating wrongs, has become a forum for mass tort cases, which the process was not designed to handle. Bankruptcy is widely perceived as a means of avoiding responsibility, and the express purposes of the process – equitable treatment of creditors and the opportunity for a debtor to start fresh – do not contemplate the kind of justice victims of wrongdoing expect.

However, decision-making in chapter 11 is more responsive than it seems. Chapter 11 plans for allocating assets of debtor corporations are negotiated and voted on by stakeholders, with creditors playing a key decision-making role, including the right to vote on a plan. Unsecured creditors, including those whose claims are still unadjudicated, are represented by a committee, whose members are chosen from among their ranks and whose counsel is paid by the debtor. This committee plays a central role in negotiating the plan. Individual creditors have rights to vote on proposed plans. No plan can be confirmed without the vast majority voting to approve. Despite the shortcomings, recasting victims as creditors in a bankruptcy process allows for meaningful participation in decision-making. In addition to having their voices heard through the committee and independent, often *pro se*, submissions to the court, Purdue's victims became stakeholders in a multi-party negotiation. They had leverage, and were not simply recipients of justice dispensed by a judge or jury. This active lay participation is qualitatively different, and more in keeping with responsive law ideals, than processes which focus on providing lay persons with the opportunity to voice their views.

Wives' Role in Pioneering Classic British Community Studies: The Bethnal Green and Salford Diaries

In this paper we will offer insights into the role of the wives of male sociological researchers in pioneering post-war British community studies that provided a foundation for how the discipline of sociology conceived and enacted research investigations of social change in working class communities and families. The part that male sociologists' wives played in facilitating and generating foundational sociological understanding about community and family is a significant silence in the face of arguments that social research investigation was on the cusp of intellectual and methodological transition at the time.

Sociologists undertaking community studies often relocated to the research site, accompanied by any wives and children. Wives were co-opted into the academic endeavour, bridging between community and sociology

for their husbands' research through becoming embedded in the everyday life of the community under study in their gendered position as mothers of small children. Our analysis will draw on contemporaneous handwritten diaries, and later reflections on them, by the wives of two influential male sociologists during their location-specific studies of post-war social change in British community and family life. Phyllis Willmott and Pat Marsden each kept diaries while Peter Willmott (with Michael Young) and Dennis Marsden (solely) undertook their respective studies of Bethnal Green (July 1954-March 1955) and Salford (August-December 1963). The extent of the wives' role in enabling and informing the research is invisible in the accounts of studies such as Young and Willmott's renowned *Family and Kinship in East London*, which spawned many similar investigations, including Marsden's Salford Slum and Rehousing research. The Willmott and Marsden wives' diaries provide a differently located form of insight into the lived gendered dynamics at play in the local working-class communities that their sociologist husbands were studying and in their own lives as a bridge between community and social science

RC15-232.2

EDWARDS-GROSSI, Elodie* (IRISSO, Universite Paris Dauphine-PSL, France)

Race in the Clinic: On Antiracist Medicine and Psychiatry in the US Today

The paper analyzes how psychiatrists in the United States routinely use the notion of race with patients from various ethno-racial groups. It discusses whether the social preconceptions that they have about this notion influences their professional practice. The study is based on qualitative fieldwork conducted between 2015 and 2016 in California. Thirty semi-structured interviews with psychiatrists and psychiatry residents were recorded.

The study shows how psychiatrists use the notion of race in their therapeutic practice by defining it either as a social construct, a cultural variable, and/or a biological substrate (Morning, 2015). Do psychiatrists use specific drugs or dosages according to specific ethno-racial groups? How do they legitimize their differential practices and define them, paradoxically, as antiracist, or anti-discriminatory?

Fieldwork has made it possible to highlight certain paradoxes in an approach to care that is considered progressive and antiracist, while at the same time reviving fixed categories largely inherited from an essentialist thought system. The paper ultimately reveals that the psychiatrists' prerogatives are as much about 'efficient' patient care as they are about the regulation of access to careers in healthcare. Furthermore, the paper shows that psychiatrists' conducts are partially informed by the negative collective professional memories of psychiatry associated with past unethical medical practices, which, in turn, have generated mistrust in African American communities (Bronson and Nuriddin, 2014).

The Parental Night Shift: Gendered Inequalities in Night-Time Care in the Accounts of Finnish Parents.

This paper examines gendered inequalities in parenting in families with young children from the novel perspective of night-time care and the intimate, 'forgotten hours' between late evenings and early mornings. This 'parental night shift' is studied in the era of intensive parenting, in which the expectations placed on parents – especially mothers – have shifted dramatically over recent decades and parenting has become more emotionally absorbing, labour intensive, and expert-guided. Theoretically the study is based on family studies, gender research and sociology of sleep. We understood the parental night shift as a form of unpaid, gendered hidden care work. Our starting point is that the requirements of paid work and work life become part of intimate practices and negotiations of care at home, and therefore the paper also draws on the existing work-life and care research.

In the paper we analyse gendered inequalities in night-time care through the written narratives (n = 53) and interviews (n = 25) of Finnish parents of different gender, social class and work-life situation and living in various family configurations. The empirical data gathered in 2022 is analysed by applying discursive and narrative methods.

Our preliminary results suggest that night-time care is highly gendered phenomena and a burden often borne by mothers due to their primary carer roles that relate to embodied, cultural and affective, difficult to describe, reasonings. However, it also seems that parents' experiences on night-time care vary according to families social class, work-life demands and roles and

other factors. The study is of high-policy relevance as through its results the equal sharing of parenting and well-being of families can be promoted by making previously invisible night-time care visible to parents themselves, to professionals working with parents, work organisations and to society at large.

Informalizing Childcare during the Pandemic? Policies Towards Childcare during the First Wave of the COVID-19 Pandemic in Different Types of Care Arrangements

The lockdown of extra-familial childcare has been an important part of the major interventions of European governments against the spread of COVID-19 during the first wave of the pandemic. One of the consequences was that mainly women took over parental care responsibility, either on the basis of home-office work or leave from employment. It was therefore argued that gender relations have been "re-traditionalized" as a result from the measures to contain the pandemic. However, in the first wave of the COVID-19 pandemic, policies on childcare differed substantially between European countries regarding the duration of the lockdown of extra-familial childcare and regarding the introduction of Covid-19-related leave schemes for parents. Against this backdrop, the paper analyses: How far did policies towards childcare in the first wave of the COVID-19 pandemic differ between European welfare states? In how far do cultural ideas and path dependency of family policies contribute to explain these cross-national differences? The comparative empirical study of policies concerns Denmark, Germany, and England, which represent different types of care arrangements. It uses policy and media documents, quantitative data on childcare, women's employment, and cultural ideas, as well as secondary literature. We argue that the policy responses of different countries depended not only on the path of the pre-existing childcare policy but were also significantly influenced by the dominant cultural ideas about work–family relations, ideal forms of care provision, and women's employment. We find culture and childcare policy can relate to each other in an incoherent way within care arrangements.

A Tale from the Cold War: Ilari and the Social Sciences in Latin America (1966-1972)

While there is a rich literature on the effects of the Cold War in Latin American intellectual life, only recently scholars have begun to look closely to the history of sociology in the region through this framework. This paper joins this debate by focusing on the case of the Latin American Institute of International Relations (1966-1972), a transnational organization linked to the International Association for Cultural Freedom (IACF), the former Congress for Cultural Freedom (CCF). ILARI's main goal was to modernize the hard-line anti-communist message of the CCF by promoting a pluralist approach to cultural debates and by collaborating with the emergent community of social scientists in the region. The paper draws on ILARI's archival material to explore how the Institute engaged with left-wing Latin American sociologists who also championed scientific sociology. The main claim of the paper is that ILARI's strategy entangled with an emerging transnational agenda in the continent which combined science and political engagement. It also argues that a truly transnational history of sociology in Latin America must include an analysis of Cold War actors and networks that contributed to shape the discipline in the 1960s.

Technological Change, Work Organization and Rationalization in Professional Work – Insights from Germany

Changes in professional work, organizations and digital transformation processes in the workplace are mutually dependent. However, it is much less clear in what direction professionals' use of new technologies shapes their task profiles and work processes against diverse work organizational framework conditions. Our presentation puts the use of technologies in selected professions center stage, as we examine how the introduction of new technologies in the workplace shapes the rationalization of work in different work organizational characteristics in Germany. The analysis aims at contributing to a deeper understanding of processes of technological transformation in a highly formalized professional environment. Moreover, as one of the leading countries of technical development that also has witnessed upskilling rather than widespread technology-induced unemployment, Germany is an interesting case to study.

We combine the sociological socio-technical systems approach (Emery/ Trist 1969) with the economic task approach (Autor/Levy/Murnane 2003) to study the interactions and potential 'joint optimization' of technology, people and work organization in one framework. Using propensity-score matching models on representative survey data of employees in Germany in 2018 we estimate the effect of new technologies (manufacturing/process technology, computer programs, machines/plants) on task rationalization (routinization, standardization) and decompose the results along workplace organizational characteristics (e.g. autonomy, complexity, teamwork).

Our preliminary results indicate that not all technology introductions seem to affect professionals' task rationalization similarly. New computer programs, for instance, sometimes go along with standardized procedures and partly with more routine. Yet, the effects also depend on workplace organization. Providing greater distinction of technologies and differences along professions, our analyses add to a growing literature that explores the effects of technical and organizational change on (professional) work (e.g.: Lopez/Calapez 2021; Dhondt/Kraan/Bal 2021; Fernández-Macías/Bisello 2022).

The Body of Women As a Battlefield in the Islamic Republic: How a Feminist Movement Can Threaten an Authoritarian State

The recent (September 2022) movement in Iran which was ignited by the murder of a woman in Hijab Police custody, demonstrates the importance of controlling women and their bodies for the political project of the State of Islamic Republic of Iran [IRI]. Making an ideal society based on training the perfect human has been a desired goal by many modern totalitarian regimes. Nevertheless, the particularities of the IRI project make it an important and timely subject for a sociological study.

In hopes of training a religious elite class, the leaders of the 1979 Revolution founded Iran's Modern Religious Schools. These schools are therefore controlled spaces in which the utopian image of the "Proper Shia Woman", as desired by the IRI State, is portrayed and promoted. By exploring the narratives from conducting 19 in-depth interviews with their female graduates (and comparing those with 13 interviews of their male graduates), I identified four dimensions through which this image of the IRI's ideal woman is defined and enforced: 1. **the primary role of a woman** (being a 'proper' mother and wife); 2. limitations in their **presence in public** including, in their clothing, bodily movements, and voice 3. **social activities** (taking only jobs that men 'should' not do, including being a gynaecologist); and 4. **sexual behaviours and identity**.

These findings prove that the Islamisation project of IRI is a patriarchal project in which the existence of their 'non-ideal' women threatens the establishment. This, together with the expanse and intensity of the oppression enacted on women on streets, is a testimony that it is a fundamental pillar of this state project to repress women. Therefore, a feminist movement, as is right now rising in Iran with the outstanding chant of "woman, life, freedom," can be an effective resistance against this authoritarianism.

The Impact of COVID-19 Pandemic on Family Life in Asaba, Southern Nigeria

The advent of Covid-19 pandemic significantly impacted on family life, especially regarding relationships and sources of income among family members. Intermittently, the pandemic constituted a menace across the globe, as it restricted proximitous relationships even in the family. This restriction culminated in stifled social cohesion and reduced onsite work opportunities. However, it also created opportunities such as closeness among family members and higher rate of virtual jobs. This study aims to investigate the impact of COVID-19 on households in Asaba, Southern Nigeria. This study seeks to answer these research questions: How has the pandemic affected the domestic relations, social cohesion and income of households in Asaba? What measures will be adopted by the government regarding the family welfare, during a pandemic era and beyond? This study aims to adopt a qualitative design to explore the experiences of families, during the pandemic era in households located in Asaba. A total of 100 family members will be interviewed in 50 households in Oshimili South local government area (2 in each household), regarding the impact of the pandemic and their coping strategies. The rationale for the qualitative design is to obtain data that duly represents the perspectives and experiences of respondents and empirical comprehensive information on the impact of COVID-19 on family life. Data will be analysed using the thematic method. We expect that the respondents will experience risks such as domestic violence, loss of onsite jobs and opportunities such as closer relationships among family members and increased virtual jobs. Sufficient support to address the risks faced by families is expedient for an all-encompassing improved outcome during the pandemic era and beyond.

Tourism As Colonial Anti-Geopolitics? the Case of a 'Trail of Tears' Walking Trail in Sápmi, in Times of Reconciliation and Green Postcolonialism

Sápmi, the land of the Sami Nation in the Nordic Region has been colonized for several hundred years by the territorial states of Norway, Sweden, Finland and Russia. Its cultures, histories and epistemologies have been marginalized or eradicated on the one hand, or exoticized on the other. During the first half of the 20th Century, Sámi families were forced to migrate from Norway and northern Sweden to the middle of Sweden – a chapter in Swedish contemporary history that is almost unknown. Adding to that, in the postcolonial contemporary, Sápmi territory is continuously colonized and appropriated by intensified "black industry" (mining) and increasingly "green industry" (windfarms) interests. This happens, paradoxically, at the same time as the Swedish state have inaugurated a Truth Commission with the task of investigate historical act of abuse by the Swedish state.

The research question in this paper is to what degree a planned touristic walking trail, following the routes of the Sámi families that were forced to migrate from the most northern areas of Scandinavia southwards, can become a colonial anti-geopolitical manifestation. Could such a realized tourist trail in a powerful way engage in historical atrocities of the Swedish state as well as contemporary intensification of extractive capitalism without becoming another example of a commodified commercialization of indigenous cultures? The research question is addressed through an engagement in colonial anti-geopolitics, a research field within critical geopolitics, as well as a critical engagement in reconciliation tourism literature. The theoretical insights are then unfolded on an empirical example, the research project to present a 'Sámi Trail of Tears Walking Trail' that followed the forced migration of Sámi families from the region around Kiruna and Svappavaara in very north of Sweden to mid-Sweden regions around current cities like Östersund and even further south to Uppsala.

Tourism's Healing Power? the Case of a Possible Sápmi 'trail of Tears' Walking Trail As a Vehicle for Justice

Tourism is sometimes defined as a peace-enhancing force. When tourists visit other cultures, people interact across political, ethical, cultural and religious borders, with increased understanding as a consequence. Even if plenty of cases shows the contrary, this idealistic notion merits further scrutiny. In the research on reconciliation tourism the same idealistic notion exists, even if the encounter between indigenous cultures and postcolonial tourists is admitted to be an ethically complex affair. Benevolent intentions (increased social and cultural justice) always run the risk of becoming another example of increased power asymmetry and the hollowing-out of indigenous rights and empowerments. Benevolence can transmogrify into malevolence, corrupting reconciliation.

This paper addresses this benevolent/malevolent tension, arguing that it is topological rather than topographical/binary. This reasoning is fleshed-out through a case. In 2021 the Swedish state inaugurated a reconciliation process and a truth commission regarding the state's historical mistreatment of the Sámi population. A possible Sápmi 'Trail of Tears' Walking Trail – following the routes of the Sámi families that were forced to migrate from the very north of Sweden southwards – could then be a form of "healing tourism", mapping a path to reconciliation and rapproachement? Or?

Indications promise rapproachement through enacted stories of reconciliation in a Sámi tourism context (Kramvig & Förde 2020). However, it seems to be the indigenous population's responsibility. The tourism can remain a (postcolonial benevolent) tourist. This begs the question: if human rights is a precondition for righteous tourism, and if power imbalance and indigenous rights are considered crucial for the upholding of human rights, is righteous indigenous tourism an oxymoron? From our topological view on the benevolent/malevolent tension in the case of indigenous tourism (and in extension the wider relation/tension between tourism and human rights) the answer is 'yes'. This begs another question. What to do about it?

A Comeback for the 'American Soldier'?

Samuel Stouffer's influential four-volume work *The American Soldier* (1949) belongs to the canon of sociology. It is also said to constitute the root of modern opinion polling. More than half a million American soldiers were surveyed by Stouffer and his team. At the center of the interest stood attitudes, not the actual experiences of the soldiers. Which attitudes did the soldiers have towards their leaders, their work, their comrades in arms, and the society? Stouffer found the soldiers often giving counterintuitive, complex answers. One concept emanating from the research is 'relative deprivation'. The results led to many reforms in the American army.

Many with me have been curious about this oeuvre and I will now take the chance to get acquainted with Stouffer's American soldier. What is outdated, what can it still tell us about our society today, and what role might it have in the history of sociology?

Les Gilets Jaunes Et Les Quartiers Populaires, Quelles (dés) Articulations ?

Notre contribution vise à saisir les rapports qu'entretiennent les Gilets jaunes en France avec les populations issues de l'immigration postcoloniale, à la lumière des rapports sociaux de race qui structurent la lutte des Gilets jaunes.

Tout en nuançant l'idée d'une *absence* (Sayad, 1999) des catégories populaires racisées (Bacqué, 2019), nous parcourrons la manière dont les Gilets jaunes, issus majoritairement de milieux périurbains et ruraux, interprètent la mise à distance de leur mobilisation par les habitants des quartiers populaires. Cette première piste d'analyse s'articulera à un deuxième moment par lequel nous souhaitons démontrer, dans une perspective processuelle, les transformations dans le temps du mouvement des Gilets jaunes, qui ont modifié son rapport aux quartiers populaires. En particulier, l'expérience des violences policières (Kokoreff, 2021) à laquelle le mouvement a été confronté et qui a fait évoluer le rapport des Gilets jaunes aux racisés qui étaient, de longue date, la principale cible de ces violences (Fassin, 2015). Cette compréhension s'est exprimée par une volonté de faire « converger » les deux luttes en organisant des manifestations à partir des quartiers populaires. Ces rapprochements renvoient à une forme d'« *expérience politique commune* » (Brakni, 2019), à l'initiative de certaines habitants de ces quartiers populaires.

Nous avons administré N=260 questionnaires, fait de l'observation et effectué 45 entretiens avec les Gilets jaunes d'une ville de taille moyenne en Normandie. Ces croisements permettent de saisir la manière dont opère la race au sein d'un mouvement social inédit, à la fois comme absence, ou limitation, mais aussi comme possibilité d'extension de la contestation.

Decentralization in Morocco after the Arab Spring and the Realization of the Fundamental Rights of the Local Population: Stakes and Boundaries "the Region of Fes-Meknes, Model"

This paper addresses the problem of advanced regionalism and its role in the realization of basic rights of the local population. After the wave of the Arab Spring in Morocco, where the paper adopts a critical sociological approach, open to other scientific fields concerned local affairs, governance and development. A descriptive approach has been adopted, based on both quantitative and qualitative, for a better understanding of the phenomenon, on the one hand, and to interpretation it, on the other. The research in the Fez-Meknes region was conducted on a sampling of 300 participants for quantitative research, and consisting a sample of 25 members of local and regional councils for qualitative research, so that the "snowball" technique was adopted in the selection of the participants. While quantitative data were analyzed using analysis content, and the quantitative data were analyzed by SPSS technique. The study of the experience of regionalization in Morocco concluded that, it has faces many difficulties (political, administrative and financial); which was reflected in its roles in achieving community development, as the 2011 Constitution bet on. The results of the study also concluded that the decentralized measure has not been able to improve the conditions of local population. Consequently, advanced regionalism has not been able to achieve the basic rights of the local community as required, such as, education, health and housing rights.

Raise Your Dissent: Turkish Rap Music within the Popular Culture

Music is one of the most potent media instruments by which social relations are discovered and by which identities and subjectivities can be changed and supported. It has always been a way to reflect social power, particularly the subcultural music genres, such as rock and punk. Inevitably, the subcultural groups experience being "alienated" by the popular culture, and it results in the articulation of differences which distinguishes the group from the mainstream. The subcultural forms can become the channel for their expression of opposition. As one of the subcultural music genres, hip-hop and its cultural practices are closely linked to resistance and politics. In previous studies about the origin of Turkish rap music, the significance of the migration from Turkey to Germany in the 1960s was stated. Since Turkish migrants had social and economic difficulties in their new migrant life in Germany, second-generation young Turkish migrants used rap music as a way of expression to voice out the discrimination they were dealing with. This study examines how the resistance in Turkish rap music has transformed within the grip of popular culture. In this context, the formation of Turkish rap music will be discussed and analyzed through the analysis of in-depth interviews. The study aims to reveal the different aspects of resistance in Turkish rap music by referring to the individual and social components of this music. This study argues rap music does not have to be political and the assumption of the fact that "rap should be political" misses the vast possibility of opposition in rap. It does not mean that rap and hip-hop are not political; they have such character, but if we do not forget that hip-hop is a "culture", then it can be realized there is no one-size-fits-all in Turkish rap music.

African Refugee and Asylum Seeker Youth Grow Young Leadership

In Israel, African refugee and asylum seeker youth are trapped in an ongoing conflict between empowering and opposing forces. They are not Jewish, disconnected from their original culture, speak languages hardly represented in the local landscape, and face alienation, discrimination, prejudice, and economic difficulties while searching for a decent life.

In the reality of a weakened minority group, in a complex situation of maturation and rejection by the white majority group, the youths group succeeds in creating among the young children a sense of hope for change, development, and progress that will serve as an anchor of physical and mental stability and be a model for identification for the young children.

Through a social, linguistic, and educational lens, this qualitative-phenomenological study voices the authentic voices of twenty young Israeli volunteers working in an educational space where the African youths spend many hours seven days a week.

The study aims to deepen our understanding of the unique characteristics of the youth group and their significant role in the process of inclusion and social leadership of the Africans in Israel. The research tools are interviews and documents analyzed using the "Grounded theory" approach to formulating theoretical explanations for social phenomena.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The research findings reveal that the Israeli volunteers strive to grow an African, internal, young, outstanding, and strong leadership that influences the young children. Leadership whose contribution is essential to the educational framework, and without which, there will be no independent future for the younger generation. The adult youths are the ones who will be able to pull the young children after them, encourage their involvement in the community, enable an emotional personal dialogue to deal with exclusion and racism, and formulate a life course for success with the challenges of the future.

ELLEM, Bradon* (University of Sydney, Australia)

Resource Unions in Crisis

Why have some unions, which were once powerful in and beyond the workplaces where their members laboured, struggled to retain the leading position they once occupied in class relations and within the labour movement? This paper answers this question by addressing the lineages of four important unions in the resources sector over the last generation across a set of economically vital sites and industries in spatially isolated regions in Australia. Noting that several of these unions organise workers in the fossil fuel extraction, it argues the conventional ways of answering these sorts of question are too narrow, paying insufficient attention to the peculiarities of history and geography. The paper combines and critiques elements of varieties of capitalism, labour geography and power resource analysis to explain the importance and the trajectory of these unions over time – and what the decline of these unions means for current labour politics and strategy. While the focus is on Australia, it is suggested that by thinking afresh about what makes this country in some ways distinct, other scholars may look afresh at other national settings.

Disaster Preparedness Among Nurses in Iligan City, Northern Mindanao, Philippines

This research is a descriptive analysis of Iligan City nurses' perceived readiness to manage disaster situations. Globally, there is an increase in natural and human-induced disasters which requires the attention of health providers in mitigation and recovery. Nursing comprises the largest workforce and yet there is little research examining nurses' readiness for disaster. This research used a descriptive correlational method using a questionnaire which includes EPIQ to survey 271 hospital-based nurses in Iligan City. Findings revealed that most nurses are not confident in their abilities to respond to major disaster events. Self-regulation behavior among nurses shows willingness to assume the risk of involvement in a disaster situation. Healthcare climate shows a highly satisfactory experience. Recommendations include the involvement of nurses in planning, mitigation, response and recovery aspects of disasters.

Alienation, Racism, & Democracy for Palestine

The aim of this paper is to compare the racial and class colonial projects of the United States and Israel and how these projects have become exacerbated during the Covid-19 pandemic. Thus, this paper is interested in interrogating global systems of oppression insofar as the connections between the United States and Israel about their continued oppression of people of color. More specifically, this paper is interested in better understanding how people of color in the United States and Palestine face increased hostilities, violence, and other and new forms of oppression during the pandemic. How might we best sociologically, and critically explain what is going on? Part of the answer lies in the fact that Israel is a racialized social system and as such, the roots of white supremacy run deep in its society. In such systems, according to scholars such as Bonilla-Silva, white racism not only shapes the national discussion about the pandemic, but it also limits people's recognition of problems made apparent during the COVID-19 pandemic as structural. As oppressed racialized people around the world continue to be infected by coronavirus and die at disproportionate rates, we are reminded how global white supremacist capitalism deprive them of care. As racism scholar and political scientist Cedric Robinson noted, the modern world system of racial capitalism is dependent on imperialism, violence, and consistent racial and class forms of oppression to sort and subjugate people in ideological, mental and physical ways.

EMMANUEL, Blessing* (University of Georgia, United States)

Critical Analysis of Malinowski's Socio-Anthropological Perspective to 'Science' and 'Religion': Implications for 21st-Century Health Care Best Practices.

Despite the criticisms against his method and person, Bronislaw Malinowski in his ethnographic engagement inquired into rationality, reason, and the 'scientific' among a people that were regarded by scholars such as Levy-Bruhl as utterly religious and mystical. His *"Magic, Religion, and Science"* is a landmark account of interactions between science and religion in the field of socio-anthropology at its cradle. Although the dynamics of the interactions between religion and science have been conceptualized from different perspectives, theorized, inter alia, as conflicting (Draper 1874, White 1896; Brooke 1991, Evans and Evans 2008, Ecklund and Park 2009), reciprocal (Merton 1970), four-fold (Barbour 1997), and multidimensional (Starmark 1994); what is prevalent, despite this repertoire of perspectives, is the intrinsic interpretation and presentation of 'science' and 'religion' as monolithic constructs, with inflexible and stringent boundary lines, reflective of distinct *Weltanschauung*. Arguably, science and religion ought to be understood *sui generis* but not as independent or monolithic constructs immune to and from each other, to ultimately reflect the reality and complexity of human life across history. From the foregoing, this paper would critically analyze Malinowski's usage of 'religion' and 'science' in his observation of the 'Natives' of Trobriand Island. Summarily, Malinowski reported a dichotomy between what he considered 'religious' and what he regarded as 'logical cum scientific, which much to the natives represented two sides of the same coin. Where did the disconnect or dichotomy emerge? Was his observation of religion and science in this society a precise representation of the objective reality and worldview of the people? How have these interpretational importations impacted an understanding of a culture, a field of study, or human practice? The paper would engage a critical analysis of Malinowski's understanding of 'religion' and 'science', with conclusions paradigmatic of the relationship between religion and science in 21st-century healthcare best practices.

ENGUIX GRAU, Begonya* (Universitat Oberta de Catalunya, Spain)

Feminist Nationalism and Future Visions: The Case of Catalonia

In the present context of transnational rise of an anti-feminist right-wing populism and nationalism, this proposal explores how a feminist understanding of gender can resonate in national terms through the analysis of pro-independence far-left organisations in Catalonia. In particular, I will analyse the youth organisation Arran. Feminism and nationalism have often been presented as oppositional; nationalist struggles have been considered to further patriarchal regimes. But national construction can also be an opportunity to think of alternative feminist futures.

The proposal explores the role of gendered visions of the future in the struggle for independence among this organisation and the strategies that they use to shape these visions: I will particularly delve into material strategies (embodiment and use of very powerful visuals –posters and posts on social media), affective strategies (solidarity, protection and care) and discursive strategies (the indivisibility of social, gender and national struggles conceived in terms of independence, socialism and feminism). These strategies are always referred to a (better) future.

However, their proposals for a feminist and socialist future face tensions: they are limited by masculinist models of thinking and doing politics, antigender politics and alternative ideas about the strategic importance of class, gender and national oppressions. Their strategies for achieving national and gender emancipation expose the difficulties of their intersectional proposals that are presented as their way to counter authoritarian tendencies and individualist neoliberal subjectivities.

The proposal is based on ethnographic fieldwork (interviews and participation) and content and visual analysis.

Social Selectivity in Study Abroad from a Comparative Perspective: Impact of National Internationalization Strategies in Germany, Japan and the United States

As a consequence of the vast international educational expansion at the higher education levels, competition for the relatively scarcer coveted positions on the globalizing labor market intensified among highly educated individuals in many highly industrialized societies. Today, families with advantaged socioeconomic status not only invest in achieving a high level of education (e.g., university degree) to maintain their children's status advantage, but also increasingly focus their efforts on horizontal differences in educational attainment, i.e. universities or programs that promise higher returns. In this

regard, the gradual transformation and institutionalization of *'transnational human capital'* (THC) as valued cultural capital provides an opportunity for affluent families to pursue additional status-setting investment.

Studying abroad is believed to be most efficient to acquire THC and enhance individuals' career prospective.However, past international research indicates that the potential benefits of studying abroad are primarily reaped by advantaged strata, which implies that study abroad tends to foster the reproduction of social inequality. Unfortunately, comparative studies remain the exception, wherefore we do not know much about the outcomes of different strategies to enhance international student mobility for reducing inequality in access to study abroad. To narrow this research gap, we draw on national representative data for three societies pursuing very different national strategies to foster international student mobility, e.g. "ERASMUS+" in Germany, the "Japan Revitalization Strategy" in Japan, and the "AAC&U's LEAP Initiative" in the US.

Findings from multilevel logistic regressions indicate more success in reducing overall inequality in Germany, but that differences in the distribution of national resources to universities result in great variety study abroad uptake across universities in the United States and Japan. Results contribute to our understanding of recent developments in the linkage between inequality in study abroad and the effectivity of national education strategies to foster transnational human capital for all students.

Mobilizing Intangible Heritage for Resilience and Recovery : The Case of Tunisia and Nepal

The paper aims to assess an identified gap in frameworks for resilience and disaster recovery that do not include intangible heritage (IH) effectively in their strategies. The paper highlights the missing opportunities for using intangible heritage as a tool in the development of a recovery process that could be more socially responsive and sustainable. For the case study from Tunisia, intangible heritage can provide a source of peace within social turmoil for practitioners, while also being the target of national agendas. The analysis of the total sample puts in evidence of the existence of common themes that shows how important intangible heritage is for people to handle change and navigate their living environments. To propose a solution to this gap the research project set two objectives: a) to implement a scoping exercise to collect and rationalise evidence of the role of IH in post-disaster recovery, and (b) to initiate an international dialogue with disaster-affected communities, aid organisations, and authorities to gather experiences and learnings that highlight the relevance of IH in recent and ongoing disaster recovery processes. The study utilized qualitative research method and gathered data via focus group discussions and semi-structured interviews. The methodology was modified, due to the travel restrictions because of the Covid-19 pandemic, to include more online focus group discussions (3 in total with 18 participants). Face-to-face interviews went ahead with 12 from Tunis. The data collection was performed on a restricted capacity by the project's local partners – Blue Fish in Tunisia ,The study provided 'preliminary' outputs, summarizing the theme classification and the tabular final codebook assessed for each data case. The results were categorized by the sources of information: Heritage professionals, Tunisia case study, and Nepal case study.

Demonstrative Body: The Agency of a Filipino Devotee's Ritual Body at the Spectacle of the Black Nazarene's Traslación

This think piece explores the new phenomenology in the Filipino's religious healing experience that emphasizes the centrality of the corporeal body. Its genealogy is rooted in the Catholic Church's 'graduated' curation of the (saints) physical body from 'whole' to 'parts' to 'rituals'. The paper frames its interpretive lens on the larger religious healing ritual practices in the Philippines and grounds the empirical investigation in a local popular religious devotion movement - the *Traslación* of the Black Nazarene of the Quiapo Church. Complementation of key-informant interviews, teledocumentaries, and reports/studies facilitated the data collection. Theory-wise, the mettle of the authors 'demonstrative body model (DBM) is tested to evince new optics of the phenomenology of religious devotion over the popular (and more preferred) 'performance-based' theories. BDM puts prime on the agency-producing prospects of body 'movements' and

less on the audience-induced behavior of the 'action' paradigm. The 'embodied narrative' role of the healing ritual reinforces the enactivist affordances of such kinesiology.

The Disorientation of Democracy and Public Life: (Neo)Liberal Democratic Citizenship Education in the Twenty-First Century

As we enter the third decade of the twenty-first century, what contribution can the sociology of education make towards understanding how (neo)liberal democracies are shaping the civic engagement of their youngest citizens? Our response to this question is based upon a close investigation of the underlying assumptions and discursive positionings of the twenty-first century 'citizen,' as represented through civics education curricula at the national, provincial, and state level in five Anglo-American liberal democracies: Canada, the USA, Australia, England, and New Zealand. The common focus of scholarly work on civics education over the last two decades, with a few notable exceptions, has been how to promote and strengthen an ideal democratic and active citizen within curricula, without critical insight or analysis into how such curricula reproduces neoliberal ideologies nor how such ideology fundamentally challenges democracy (e.g. Saha & Print, 2010; Birdwell, Scott, & Horley, 2013; Andersson, 2019). By contrast, our paper uncovers the discursive construction of an individualized and undifferentiated 'good citizen' who is meant to self-govern in a meritocratic and cohesive society, engaging with the state only through formal systems and never in a manner that confronts state-driven injustices. We argue that this limited portrayal of citizenship effectively works towards detaching democratic politics from collective, emancipatory, or solidarity-based action and deliberation, what Wendy Brown (2019) defines as the *de-democratization of the political.* Furthermore, our analysis reveals that most of the civics documents analysed fail to discuss historical and structural dynamics that delimit the capacity of some youth for contributing to social change as 'active citizens'. Our goal with this analysis is to forge a reflexive capacity to unpack and challenge neoliberal visions rooted in conceptions of democracy and politics on offer through formal civics training, and contribute to the development of a thoughtful, skilled, and social justice oriented public.

Authoritarian Innovations in Labour Governance in Turkey

After its election in 2002, Turkey's Justice and Development Party (Adalet ve Kalkınma Partisi, AKP) government implemented a range of labour reforms as part of its integration into the European Union. Considered crucial for the development of trade union rights, these reforms were in fact a series of authoritarian innovations (cf. Curato and Fossati 2020) designed to shore up the AKP's control over the labour movement while simultaneously strengthening its social and political legitimacy at home and abroad. This strategy stayed in place until 2015, when the AKP government became more openly oppressive.

Drawing on fieldwork conducted between 2011 and 2016, this paper explores authoritarian innovations in labour governance implemented by the AKP government in the period between 2002 and 2015. It focuses on (a) changes made during the process of harmonization of its legal basis with the EU's membership requirements to the labour law and the law on strikes that transformed collective bargaining and unionization rules and (b) the government's use of official discourse and media coverage to promote and reinforce pro-AKP and non-contentious unions over left-wing unions. Through this discussion, it reveals how legal, political, social and technological changes under the AKP rule worked to restrict trade union rights and deepen the cleavages and rivalry in the trade union movement by strengthening the role of pro-government trade unions.

As the paper argues, in the Turkish case, the labour rights requirements associated with membership European Union membership process paradoxically reinforced the AKP's claims to power by legitimating strategies and instruments not previously in existence in the Turkish context that could be used to control independent trade unions.

Participatory Theatre As Research Method

This paper reflects on the uses of participatory theatre as a research method. Drawing on a range of research projects with migrant families over the past decade, it argues that participatory theatre methods offer an innovative way of engaging with research participants. These methods can contribute to debates in biographical research about the relationship between individuals, groups and society; the conditions - and challenges- for sharing

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

difficult experiences and addressing sensitive topics. The paper argues that participatory theatre methods offer a way of sharing individual experiences with other research participants and the researchers. They also offer a way of reflecting on these experiences as a group, identifying shared experiences and developing collective analyses of structural issues - such as racist and sexist experiences. The use of embodied methods allows participants to share taboo issues that may be difficult to verbalise, while the method of building a scene with other participants allows participants to reflect on their experiences, identify possibilities for individual and social action, while offering a way to sidestep well-worn narratives that construct migrants' lives as problematic or even offer their experiences as a spectacle of suffering. The paper suggests that participatory theatre methods can make a valuable contribution to biographical methodologies.

ERIKSON, Emily* (Yale University, USA)

Sociology As the Study of Second-Order Consequences

We all intuitively understand motivations and intentional actions. What is harder to understand are the second-order consequences of human behavior. Society is composed of interlocking and overlapping systems and agents that react to each other's behavior, leading to many secondary consequences for intentional actions. These outcomes include many of the most important social issues, including climate change, market expansion, increasing inequality, poverty, and others. Secondary consequences are difficult to predict and their causes are hard to identify. Sociology is one of the few sciences poised to shed light on the secondary consequences of social action. The relative advantages of using a rational choice or analytical sociology framework to advance research along these lines is considered here.

Older Residents in the Shadow of Welfare Policy: An Analysis of Swedish Housing Allowance from a Historical and Age Critical Perspective

This paper focuses on old people's housing situation through investigating social welfare issues regarding how efforts can facilitate for the elderly to stay in their own homes. More specifically, we analyze different designs of housing allowance in Sweden during the period 1936–2022.

Historically, three housing allowance systems can be discerned in Sweden: one for households with children, one for young households, and one for pensioners. At the rate of the transformation of the welfare state, the systems for housing allowance have been renegotiated and changed. Today, there are two types of allowance, namely "housing benefits" and "special housing benefits for retired people". Housing benefits can be granted to families with children and to young people without children and pension, while the special housing benefits are only granted to retired people over the age of 65.

By analyzing Swedish political documents and investigative reports, we describe and analyze the rhetoric used regarding age-related needs, and to what extent and how welfare political age-related priorities are manifested in discussions. Based on results, we discuss how age is legitimized as a basis for societal organization of welfare support and how this impact on the elderly's housing situation. Theoretically, the paper also contributes to the debate on how age is used in welfare policy and its significance to the elderly's housing.

Inclusion and Exclusion in Youth Sports – Case of Young Persons with Profound Intellectual Disabilities

Benefits of sports activities to youth are well known, and in national health, education and youth policies, youth are actively promoted to have sports hobbies. However, that is not the case with young people with needs for special support. Their position is not equal in general policy intents and objectives when promoting sports activities for young people, nor are they provided sufficient support, such as to encourage them to start with sports and join in youth sports communities or organize activities for them in sports societies and other leisure services.

Young people with needs for demanding support, such as those with profound intellectual disabilities, are practically invisible in youth sports. The nature of their leisure activities is dependent on the institutionalized practices of the disability service unit, such as daily activities and timetables in group homes, and many are completely dependent on the lifestyles of their families.

This presentation shows the current opportunities of young people with profound intellectual and multiple disabilities to do sports and physical activities in Finland. It is based on the results of 3-year academic research project seeking to find such practices that support their participation in youth sports activities and revealing such practices that exclude them from youth communities.

Multi-sited ethnography shows that possibilities to enhance physical activities of young people with profound disabilities would be various, if systematically promoted. For example, different arts-based methods offer imaginative ways to stimulate their physical abilities and physical activeness. However, as their possibilities are dependent on activities conducted at the institutions providing them services, such as special schools or day activity centers, these young people have the risk to remain isolated from other youth communities and thus have fewer opportunities for active participation.

Chronic Multigenerational Poverty: Psychosociogenetics' Perspectives

The chronic poor exist in almost all countries, regardless of the level of economic development of society. They form a special social group, with its own economic strategy and specific form of employment, its own culture, rules of conduct and traditions (Myrdal G., 1968; Scott J. C., 1976).

The psychosociogenetic approach and clinical sociology provide an opportunity to identify psychological and cultural mechanisms of the formation and reproduction of chronic multigenerational poverty in various social and regional contexts and in a changing reality of Covid-19.

The psychosociogenetics explores the phenomenon of family memory and family histories, which allows to state that individuals unconsciously reproduce behavior patterns that have been developing over several generations. An "ancestor syndrome" is being formed (Schutzenberger A., 1998). Traditional family models are inherited and manifested in various forms according to life scenario that has been developed through the history of family.

Destructive attitudes toward failure, a sense of social inferiority and guilt, hopelessness, etc. are inheritable, which leads to social degradation, assimilation of a new identity and a specific way of life, formation of a culture of poverty, and, as a result, intergenerational reproduction of poverty.

The construction and analysis of the genosociogram makes it possible for clinical sociologists to find out the links between family psychosocial traumas in the past, conflicts of an individual in the present, and to determine ways of changing an individual's life trajectory in the future. Therefore, clinical sociology is defined as the sociology of a subject who creates own history.

Psychosociogenetics as a field of clinical sociology can be promising both for further development of the theoretical concept of poverty and for applied intervention methods (e.g., family therapy practical programs) to reduce poverty, especially chronic multigenerational poverty.

Accused without Proofs: The Tale of Young Nigerian Children Branded As Witchcraft

There is a long-standing tradition among the people of southern part of Nigerian, particularly the Niger Delta region of Akwa-Ibom and Cross River states, where children are labeled as witches without verifiable proofs. These children, who are alleged to be witches, are either cut with sharp objects, tied to a tree, poisoned, drowned or buried alive as the case may be. These corporal punishments by members of their families and/or communities are taken in other to force the accused children to confess that they were responsible for the misfortunes that have befallen any of the family members. It is even more disturbing, that their biological parents are either complicit to their children accusation or they are helpless in salvaging their children from the wrath of their accusers. In several Nigerian communities, available reports have noted that local Pentecostal and Evangelical pastors have also accused innocent children of being witches, as they are said to make money through exorcism, by labeling these children as witches. Such is the tale of Nigerian children branded as witches.It is in view of this pathetic story that this study wants to interrogate some documentary reports of children who have been labeled as witches from the Niger Delta region of Nigeria where this practice is more prevalent. Therefore, our sources of data would be purely secondary information from newspaper reports and other documentaries. Content analysis will be our method of reviewing and discussing the selected reports and where necessary we shall highlight critical and striking comments from respondents or the victims. Our finding from this discussion will help us to suggest some useful recommendations.

Cultural Authoritarianism: The Case of Unmarried Young Female Adults in Nigeria.

In most Nigerian cultures, girls are prepared for marriage and motherhood because it is believed that one day the girl shall leave her parents to go and procreate her own family. Marriage and motherhood is one of the fundamental rites of passage for matured female adults in Nigeria. Therefore, it is expected that at the appropriate time the matured girl should get married eventually. However, when such a girl is steadily going beyond marriage age, it elicits comments and reactions from parents, significant others and insignificant others. Constrained and challenged by the expectations of cultural environment the girl may therefore go out of her way to get married to whoever comes her way all in a bid to meet up her parents expectations and satisfy the curiosity of her environment to get married. While others, who may not be lucky enough feel rejected and demoralized. Therefore, it is within this context of cultural authoritarianism that this paper seeks to examine the cultural imperatives of marriage and motherhood among the people of Edo State, south-South Nigeria. Our sample population shall comprise of elderly men and women of about 65 years and above; and young unmarried female adults. One fundamental question, among others, will guide the main thrust of this study shall be: must all young females get married at all cost? Purposive sampling and snowballing methods will be employed to reach out to these category of participants. Our instruments shall be in-depth interview. Content or thematic analysis will be used to analyze the data that shall be generated. Our findings from the analysis will be further discussed for theoretical and policy implications.

Keywords: marriage, motherhood, cultural authoritarianism, unmarried young girl,

Anticipatory Race-Related Stress & Depressive Symptoms Among U.S. Black Women: Are Psychosocial Resources Stress Buffers?

Background
In an era of police brutality and the Black Lives Matter movement, many Black Americans believe that racism is a mainstay of U.S. culture. Even if not experiencing racial threats or violence directly, racial tension can induce stress via anticipatory race-related stress (ARRS) which, in turn, may lead to poor mental health. Drawing from the biopsychosocial model of racism and stress theory, this study examines the association between ARRS and depressive symptoms among Black women, a group experiencing racial and gender marginalization. Second, we investigate whether psychosocial resources moderate the association between ARRS and depressive symptoms.

Data and Method
Data were from *Gendered Racism and Well-being Questionnaire*, collected between 2020 and 2021. The sample included 234 Black women attending a Southern Historically Black College in the U.S. *ARRS* was a 4-item scale with items like "I believe that most Black people will experience some form of racism in the future" (Utsey et al. 2012). Psychosocial resources included resilience, social support, mastery, and self-esteem. OLS regression was used and statistical interactions were conducted to assess moderation. Analyses adjusted for demographic characteristics.

Results
Higher anticipatory race-related stress was associated with depressive symptoms (β = 1.25, p<.01). Resilience (β = -6.24, p<.001), social support (β = -2.47, p<.001), mastery (β = -4.35, p<.001), and self-esteem (β = -7.73, p<.001) were inversely associated with depressive symptoms. Resilience (β = -1.03, p<.05) and mastery (β = -.63, p<.05) moderated the association between anticipatory race-related stress and depressive symptoms.

Conclusions
For Black women, anticipating race-related stress is harmful to mental health. High resilience and mastery, however, reduce the effect of anticipatory race-related stress on depressive symptoms. Building resilience and mastery among Black women may be effective coping strategies when they anticipate experiencing racism. However, dismantling structural racism is necessary to reduce perceptions of anticipating racism.

CALVO, Cristina (University of Salamanca, Spain)

Interactive Analytical Networks

This presentation deals with Network Coincidences Analysis (NCA), whose main objective is to discover a series of phenomena, opinions or characteristics that tend to appear together in a given field. Many statisticians pursue the illusion of finding the causes of phenomena from the information. However, one must be cautious because, unless the experimental method is rigorously applied, statistical tools are very limited in the study of causes and effects. For this reason, a series of analyses are proposed that do not aim to discover the "true" causes of the phenomena under study, but rather their patterns of concurrence in order to provide the researcher with possible suggestions as to how reality is structured. The first use that can be made of this analysis stems from the difficulty of working on questionnaires with multi-response questions. Another use of the reticular analysis of coincidences is content analysis. This analysis has also been used to analyse photographic documents, to see the evolution of retweets of a certain topic on the Twitter network and other topics related to big data. Reticular coincidence analysis aims to discover the patterns of concurrence of a series of events in a set of scenarios. It aims to discover how a number of features arranged in different units are distributed together in which they may or may not be present. Different degrees of concurrence can be distinguished. Moreover, a wide range of statistics can be used to estimate the degree of coincidence between two events: from mere frequency to more complex measures of distances, such as Haberman's or Ruselll's distance. However, the NCA is not only useful for presenting coincidences numerically with statistics, it is also capable of interactive graphical representation that can greatly help to better understand the distribution of coincidences of a multiple set of events.

Interactive Network Graphs Online to Analyze Surveys and Other Databases

Graphs have been employed not only to solve topographic problems and to represent social structures, but also to show the correlation between variables according to casual models. Path analysis and structural equations models are indeed well known by social scientists, but both were restricted to quantitative variables at their early stages. In this paper, we will propose a new way to display the connections between qualitative variables in a similar way to the correspondence analysis, but using another set of multivariate techniques, such as lineal and logistic regression, mixed with network analysis.

The NCA (Network Coincidence Analysis) is to be used for the exploratory analysis of survey data. For this purpose, nodes represent the different categories of the selected variables, while links symbolize the relationships between the different variables. One of the specific uses of this analysis technique involves the characterization by diverse sociodemographic variables of different response profiles. Besides correlation measures, the proposed analysis can estimate log-lineal models to study multivariate relationships including interactions

Furthermore, to increase the analytic power of these tools, they have interactive characteristics online, which include either the selection of the elements according to their size or attributes, and the filter of the most central and strongest links.

The first part of the paper deals with the statistical basis of these representations; the second proposes a web page to apply this analysis to your own data, and the third gives examples of their use in international comparative surveys, such as the World Values Survey and the European Social Survey.

Citizen-Social Science in Spain: A Second Order Observation

Citizen science is the process that engages the public in scientific research, and it is said that is a key factor in augmenting political and social impact. Through citizen science, anyone can participate in the different processes of scientific research. However, this form of scientific validation still has a long way to go, although co-design and participatory action research are beginning to be integrated into scientific discourse.

This framework seeks to analyze social phenomena from the perspective of the actors involved. It implies a range of participatory methodologies that involve the actors in the design and execution of research projects, whose results are useful for a community. It also promotes a link between professional and non-professional scientists that requires another type of interaction than the classic researcher-researched approach.

Citizen Science implies that the research community raises new questions and, in a kind of co-creation, develops a common research program. The different types of voluntary participants acquire new knowledge and skills, while helping, through different types of intervention to understand social reality. Citizen science makes it possible to integrate different approaches to the social fact with a transdisciplinary approach insofar as it integrates disciplinary knowledge but also practical knowledge from citizens.

This presentation explores the state of the art of citizen social science, particularly oriented to social intervention projects in Spain. It contrasts the existing frameworks with systemic, reflective perspective nad sociocybernetic concepts such as second-order observation, reflexivity and systemic change. Particularly attention is given to the challenges and dilemmas at a methodological level as citizen-science is principally inter and transdisciplinary, engaging different levels of practical and theoretical knowledge.

The Law and Gender Inequality in Contemporary Nigeria: Challenges and Prospects

The law is the enforceable body of rules that govern any society. Among the functions of law is the protection of human rights, sustenance of order, and maintenance of the peaceful co-existence of the citizens of a state. Against this backdrop, the law prohibits discrimination on all grounds on any person, group, tribe, or race. In Nigeria, Section 15 (2) of the 1999 Nigeria Constitution (as amended) prohibits all forms of discrimination against any citizen on all grounds including gender. Gender is the socially constructed meaning attached to being a male or female in the society. It relates to the way society organizes the understandings of the sexual differences between being a male or female. Gendering the male and female sexes leads to social exclusionary practices, which often affect the feminine gender negatively, limiting their access to both tangible and intangible societal resources. The law is expected to remedy this situation and bring a balance to the interests of all genders. This study investigated the relationship between the law and gender inequality in contemporary Nigeria, using secondary data sources. The sociological approach to law and the feminist perspective served as the theoretical underpinnings of the study. Findings reveal the influence of the socio-cultural context on the workings of the law. Patriarchy, politics and religion influence legislation, interpretation and enforcement of laws on gender discrimination. Thus, the law serves as a double edged sword. While the law has been used as an instrument for abrogating some discriminatory socio-cultural practices against women, it has equally been used as an instrument for perpetuating discriminatory practices against women. The study recommends among others the domestication of the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), yet to be domesticated since Nigeria ratified it thirty seven years ago.

Plying between the Secular and the Pious Communities: An Ethnographic Case Study on Muslim Young Women in Turkey

This ethnographic study focuses on how pious Muslim young women in Turkey interact, translate, and position themselves within the space they create as active participants by adopting emerging political positions that are authoritative, nationalistic, and conservative in nature, as well as how they consider their middle-class membership. The majority of research on the changes in the visibility of Muslim women in the public space in Turkey has focused on Muslim women as modest fashion consumers, as members of halal consumption culture, as reproducers of conventional gender codes, and as members of the holy family. Unlike the other studies, this study discusses Muslim religious women in Turkey not just as cultural consumers but also as contributors to cultural production. This paper examines how a group of pious Muslim women resisted the cultural codes of the religious community and negotiated with the culturally dominant secular community to increase their visibility in the social and cultural space during the last two decades in Turkey under the authoritarian AKP government. The emergence of pious Muslim women in the context of cultural production is seen as a danger by both religious and secular communities. This study examines how these women, who have the opportunity to engage in social life with their religious Muslim identity, desire to enlarge their own spaces by considering the limits of their freedom in light of their religious sensibilities as well as how they establish tactical relationships with religion, family, tradition, and secular spaces. Instead of being stuck in the narrow space of "in-between," I argue that these women expand their space of existence by swinging in a greater maneuver space by "pyling-between." This research was conducted as a part of the CHIEF (770464) project under the Horizon 2020 EU funding programme.

ESTANQUE, Elisio* (UNESP-Franca/SP, Brazil)

Middle Class and Identity Struggles in Brazil: A Case in Bahia

Brazilian "middle class" has always been a very controversial topic, both in political and sociological plans. Class analysis has been contributing to endless debates along the last two hundred years. But the discussion on racial and gender identity only in the last decades started to interconnect with class analysis and gain space in the field of sociology. W.E.B. Du Bois, Erik Olin Wright, Etienne Balibar, Michel Wiewiorka, Michael Burawoy and, in Brazil, António Sergio Guimarães, are some of the social scientists that we need to take in account to develop new approaches articulating those different traditions with current proposals on intersectional theory, from which we can design new lines of analysis on these issues.

In this presentation I want to discuss current trends in terms of inequalities and identity conflicts. In the first moment I want to approach economic inequalities showing some empirical results of social politics in two periods: along former PT period of government (2003-2015) and contrasting with Bolsonario government (2018-2022). In a second stage, I want to discuss around recent political combats and electoral disputs, showing speeches and proposals at stage around middle class life styles and political engagements

considering these social strata. And finaly I will analyse the meaning of identity struggles in Bahia state, analysing racial and anti-racial speeches in the context of this state and the city of Salvador in which racial debate and conflict is particular active, especially from the part of black movements.

FRANCISCO, Daniel Gameiro (University of Coimbra, Portugal)

Remaking Class Divisions and Territories: Space, Class Conflict and Consent in Two Portuguese Districts - Setúbal and Aveiro

After a so long period of abstract discussions around «*social class*» concept, how could it be reconceptualized and reshaped according to spatial structures and cultural patrimony? How do current changes in the industry and in the territory, affect the reconfiguration of the working class embedded in a given region? To what extent does technological innovation, work segmentation and digitization reconfigure class divisions? To what extent does class structuration lead to consent or resistance? What connections can we observe within local communities and their territorial dimension? We will analyze two different regions: one has a historical background of industrial concentration and working class traditions; the other shows more diffuse characteristics, smallholdings firms, informal work and small family farming. First, we depart from a sociographic framework of each case, and then try to systematize recent trends both in the labour market and territorial/ environmental dimensions, based on mixed methodologies (data bases, documental pieces, direct observation, interviews to local leaders, trade unions and associative activists, etc.), in order to build up new interpretations on social class divisions and collective action, conflicts and forms of consent. The study intends to follow up on past research and reflections in the light of current trends in social transformation and conflict in these two geographically distinct and contrasting regions. In the theoretical fields we intend to discuss and reconceptualize around possible interconnections between: on the one hand, class theories and collective action inspired by authors such as K. Polanyi, A. Touraine, E.O. Wright, E.P. Thompson, R. Castel, P. Bourdieu, D. Lockwood , D. Harvey, M. Burawoy, K. Doerre, etc.; on the other, we gather from approaches on the sociology of space and territory, like M. Aglietta, R. Boyer, N. Thrift, E. Balibar, B. Anderson, etc., seeking to analyze the referred two empirical cases of industrial districts.

Approaches to Localism and Multi-Level Governance in Transnational Solidarity Economy Movement Networks: A Comparative Analysis

The social, economic, and environmental externalities of industrial mass production and neoliberal approaches to globalization led to the multiplication of community-led initiatives based on non-capitalist forms of production (CLIs), aimed at promoting resilience from the ground up. Although often small in scale, low in resources and sparsely networked, these CLIs promote multidimensional approaches to protecting or rebuilding the fabric of life from the impact of market pressures, as they tend to treat environmental sustainability and the promotion of economic democracy as inherently linked.

These CLIs tend to have a localist approach to supply chains and policy processes. The goal is to capitalize upon local resources to arrest and reverse the loss of the capabilities necessary to form synergistic interrelationships among people and with nature. Still, multi-level governance, in the form of a strong connection with regional, national, and supranational levels of peer-to-peer collaboration, as well as policymaking, is recognised as needed to properly tackle the challenges faced by CLIs. "Solidarity economy" is a term used by scholars and practitioners to refer to emerging social movements that are organizing CLIs in webs of mutual recognition and support.

Based on fieldwork, this paper compares how the approaches to localism, adopted by the European hubs of three social movement networks aligned with "solidarity economy" principles, affect their approaches to multi-level governance, from the local to the European Union levels. The Global Ecovillage Network (GEN) and its urban and peri-urban "brainchild", the Transition Network (TN), share a bioregional approach to "solidarity economy" that focuses on de-linking productive activities from the carbon-based economy by making them sensitive to resource limits and ecologically enriching. The Intercontinental Network for the Promotion of Social Solidarity Economy (RIPESS), promotes an intersectional approach that focuses on furthering the practice and institutional recognition of economic self-organisation by marginalized groups and territories.

Social Mothers and the Professionalization of Motherhood in Brazil

Since the 16th century, care has come to be associated with difference, situations of vulnerability, and the figure of the feminine, greatly reinforced by the model of evangelization applied in the new territories. There was also an association of care with assistance, the voluntary and affective character, justifying a policy of care. Over time, care work acquired an emotional dimension to which a value would or would not be attributed. It was from the 19th century onwards that the association with love and attention to the sacred began to occur more strongly. When changes in the idea of family occur, the naturalization of the competence of care is observed as being feminine: the woman started to be seen as responsible for the reproducibility of life. Documents from the Economic Commission for Latin America (ECLAC) portray a regular view of governments in Latin America and the Caribbean that women would be better able to care for others. In recent decades, both right-wing and left-wing discourses have proposed a maternalist vision of women's rights. The right highlighted the role of mothers as natural guardians of the family, while the left demarcated their place as mothers who worked to preserve family subsistence. Thus, both reinforce a woman's identity designation based on social motherhood. It is in this context that the figure of social mothers starts to constitute the assistance policies for the reception of children and adolescents in Brazil, in 1987, through Law n° a Law 7.644. In this sense, this article will problematize the preponderant presence of "Mães Sociais" in the work of caring for children and adolescents. The methodology used included the holding of focus groups with social mothers who work in institutional care services in the Federal District of Brazil.

Academic Professionalism in the XXI Century: Processes of Change in Teachers' Practice

At the end of the 20th century, a reconfiguration of the teaching model in higher education based on scientific rationality began to be witnessed. This reconfiguration is based on the development of two processes with different rhythms. One, following the Bologna Process, is related to the rupture of the teaching paradigm focused on transmission and acquisition of existing knowledge, the other related to the intensification of development and diversification of the offer of digital pedagogical resources. These processes, especially the latter, have seen their dynamics accelerated as a response to challenges never faced in all educational systems in the world, leading to the generalized closure of universities. Consequently, platforms such as Zoom or Teams, among others, have become the main classrooms open to the world, forcing teachers to develop and assimilate, in a short space of time, adapted pedagogical practices capable of supporting a professional exercise based on the learning of a pedagogical-didactic know-how.

In this context this paper aims at discussing the transformation of university relations through the increasing use of technologies and its implications for teaching practice. The leading question is to what extent is the increased use of technologies introducing changes in teachers' professionalism?

The work addresses three different interventions held in Portugal between 2020 and 2022 related to teachers' professional development and teaching and learning processes: one interinstitutional joining several higher education institutions and the second institutional, both related to teachers' professional development; the third is a classroom intervention related to both dimensions. A survey will be made addressing teachers that participated in the first two interventions held in Portugal. Also, a questionnaire will be used with students who participated in the third experience.

The work is expected to find the processes of change in teachers' practices and the influence of pedagogical projects in students' achievements.

Prefiguring the Future of an Anti-Military Occupation Movement in Italy: A Case Study of Collaborative Research Production

Participatory methods applied to social movements highlight actors' motivations and outlooks to get them involved in activating collaborative understanding and knowledge production while reconfiguring the lines between activism and research. This paper proposes a reflection based on a case study of an anti-military occupation movement in Italy, characterized by radical action and resistance towards institutions. We first highlight how long-term ethnographic participant observation at meetings and protests is a fundamental precondition to nurture trust in antagonistic movements , which grounds later narrative interviews and co-production workshops. Secondly, we will present the results of the Future Lab Workshop rooted in a knowledge co-production perspective. We hybridized the workshop method by adopting the communication tool Metaplan®: a visualization technique that encourages

the creative mapping of new ideas and inspires participants to uncover hidden meanings in their actions by activating a learning environment that guides the group towards unexplored visions, facilitating a co-analysis process. The progressive discussion steps - visualized and reported on the board - document the advancement of new ideas, drawing a landscape of thoughts arising from the shared visions. This example of collaborative research helped activists and researchers to overcome specific exclusionary visions (antagonism for the movement and expected research findings for the researchers) by inspiring the enhancement of the workshops as a third space: a new and safer space for common knowledge production. From a methodological point of view, it also helps defeat objectifying, comfortable, disengaged, and parochial research visions and facilitates the creation of sociological forms of representation that are more cognizant and innovative in supporting the movements to explore new visions and new knowledge.

The Nation Could be a Queer Thing: Contestatory Forms of Homonationalism in the Philippines

Homonationalism, as dominantly theorized, usually refers to discourses that designate further superiority to western civilizations because of their supposedly progressive posturing in relation to queer rights. While it is critical to expose how the western empire instrumentalizes queerness as another arsenal to claim dominance in global politics, I submit that, in this conception, there is a tendency to naturalize the relationship between nationalism and imperial exceptionalism. That is, the "nationalism" in homonationalism usually means national pride rooted in western dominance. Such conception overlooks the practical deployment of nationalism in the global south for queer and emancipatory goals. While scholars concede that nationalism was a western invention, they also realized how it has been appropriated in former colonies to claim emancipation from both colonial and local elites. Proceeding from such conception of nationalism, I demonstrate how queer rights activists in the Philippines encrypt their struggles with nationalist frames to resist elite dominance. Drawing from my direct participant-observation of two election-related events chronicled in my ethnographic notes for my ongoing doctoral thesis, I illustrate how queer rights activists insist their place within the Philippine nation. As enunciated by activists themselves, these events were aimed at demonstrating resistance to a former macho regime and the authoritarian tendencies of the next one. Within this context, I conceptualize these events as terrains of homonationalism that resist elite dominance. Such conception hopefully contributes to the current discussion on homonationalism by foregrounding its radically queer potential to resist macho-authoritarian tendencies in the global south.

Relationships between Traditional and New Measures of Religious Belief and Practice in East Asia

Surveys around the world often ask about religion and related topics through a Western lens, with questions on religious service attendance or belief in God, for example. Such measures tend to capture the beliefs, belonging and behavior patterns typical of the Abrahamic faiths that historically have predominated in Europe and the surrounding regions. However, relying solely on these measures can lead us to miss key dimensions of religious or spiritual life in East Asian societies. This presentation uses data from a 2017 Pew Research Center survey in Japan, South Korea and Vietnam to explore different measures of religion – some traditionally Abrahamic, others designed with East Asia in mind – and to compare these measures with each other. (While Vietnam is often considered part of Southeast Asia, due to the strong Chinese influence on religion and spirituality in Vietnam throughout history it is included in this analysis.) This presentation also outlines Pew Research Center's ongoing religion research in the region.

A Feminist Social Reproduction Lens on Alienation

This paper argues that a socialist feminist lens is pivotal to explore the distinct dynamics and the deeply gendered and racialized nature of alienation in neoliberal capitalism. In the last decades, social reproduction feminist approaches have influentially illustrated that the capitalist market economy necessarily relies upon unwaged, often unpaid, informal forms of labor (i.e., domestic labor, care labor, etc.) that are unevenly performed by women. Social reproductive labor and nonmarket spheres/institutions that underpin the market economy are intensely exploited and systematically un(der)valued if not wholly rendered invisible by mainstream economic paradigms and the ruling elites. Yet the COVID pandemic has dramatically exposed the centrality of this form of labor for capital accumulation as well as the health of the communities, illustrating that what socialist feminist scholars call the "social reproductive contradictions of capitalism" fundamentally unfold through the household.

These considerations raise important questions about the nature of work, the "renewed centrality of the household", and the interconnections and contradictions that pivot contemporary capitalism. These involve questions about how to think about the shifting dynamics of alienation and facilitate new frameworks and analytical tools of analysis in this context. Against this background, some questions this paper seeks to address include: What are some potential limitations of Marx's traditional concept of alienation in exploring the centrality of social reproductive labor today? What does the alienation of social reproductive and domestic labor look like? How would a socialist feminist lens shed light on the novel forms of alienation that social reproductive labor is subject to today as the 'home' becomes a key sight of alienation? Mainly focusing on the notion of the 'essential worker' and Covid pandemic as a crisis of social reproduction, this paper interrogates the contemporary forms of estrangement and potential sites of resistance through a socialist feminist lens.

EZME GURLEK, Albeniz* (Ahi Evran University, Turkey)

Changing Demand for a City to Live in the Pandemic: Kırşehir and Istanbul As a Comparison of a Metropolis and a Country

This study aims to identify what kind of complaints the residents of different size cities have discovered about the city with the Covid-19 pandemic and what kind of city they want to live in after the pandemic experience and to offer solutions on how the current urban policies should be shaped after this measurement. In this mixed method research, a survey was conducted with the residents of Istanbul as a metropol and Kirsehir as a provincial city. The survey results were analyzed to reveal the changing city perception of the city residents in different scale urban areas after the pandemic. Also, semi-structured interviews were done with the help of open-ended questions with both city residents. As a result of these two data collection periods, it is seen in both cities that people started to criticize their living city more after experiencing Covid-19. When data is analyzed, it can be seen that urban citizens started to think about sustainable cities much more than in the past and thought more about the urban problems. Many people who used to want to live in a metropolitan area began to think that life in quieter and less crowded cities was safer. Consequently, regardless of the city scale, urban citizens noticed many urban issues with the pandemic, such as much more green, more parks, walkable public buildings, accessible urban services, urban justice for everyone, crowded public spaces and less urban loneliness.

Sulukule on a Journey from Preserving a Musical Heritage to Protecting a Place with Music: Auto-Ethographic Views

In this study, the author's experiences and memories about Sulukule have been turned into a narrative through auto-ethnography, which does not deny subjectivity and investigative influence. In the pursuit of memory and experience, the researcher tries to reveal both her own historicity and the traumatic transformation of the country. In this direction, the author's visits to Sulukule between Spring 2006 and Fall 2013 because an urban renewal project demolished the are and displaced people with their unique culture, field notes she took during her theses on this field (undergraduate graduate theses), the bond she has established with the place over the years, the data obtained during the follow-up process of this never-ending transformation area with her uneasiness about the fate of Sulukule residents has been brought together and themed by the author. Field notes are about Sulukule's past, pre-renewal, renewal process and post-renewal. The author's Sulukule experience and her sense of loss about the disappearance of this place are handled with an inner view. Then, the journey itself, which evolved from "preserving a place of musical heritage to protecting a place with music", realized in this approach, gained value. In this context, the processes experienced by being aware of Sulukule, being inside Sulukule and losing Sulukule are discussed from an auto-ethnographic view, and the extinction story of Sulukule, the most unique neighborhood of Istanbul culturally and musically, is revealed. However, this study was structured over the situations created by neoliberal urban policies as the major actor in the post-2000 Turkish urbanization, the victims and the disappeared in this process. In this context, the auto-ethnography in this study is a means of revealing the political beyond a personal writing. Fieldnotes, on the other hand, should be seen as a way of personally and politically revealing images of Sulukule as an experience.

L'éducation Dans Une Société Plurielle Education in a Plural Society

Titre complet = L'éducation dans une société plurielle: Genre et (in)différence
L'éducation reste dans la société plurielle aussi bien un enjeu pour répondre aux attentes du marché de travail, que conflit pour enseigner la différence et la diversité dans les sociétés plurielle, sans oublier qu'elle reste un défi pour promouvoir le "vivre ensemble".

Dans ce cadre, en prenant le cas du Maroc comme un exemple pour les pays du Moyen Orient de l'Afrique du Sud (MENA), nous allons procéder, selon une approche comparative, à l'analyse des institutions sociales chargées de l'apprentissage, en l'occurrence: les programmes scolaires (=l'éducation), d'un côté, et comment la culture, perçue de manière monolithique, se perpétue (=la socialisation), de l'autre; afin d'expliquer les paradoxes sous-jacents aux discours concernant le genre.

Le but est de démontrer que si la pluralité est reconnue, surtout au niveau des lois et du discours officiel, cette pluralité, qui repose sur le respect de la différence et la reconnaissance des droits individuels ..., n'est pas reconnue (voire tolérée). Elle est même construite comme exogène et menaçant la cohésion sociale et l'identité.

Notre propos va s'articuler autour ces axes, que nous voulons traiter en prenant le Maroc comme cas d'étude:

a. La pluralité entre la règle et la gouvernance

b. La pluralité dans le cursus scolaire[1] et le quotidien féminin

c. Le genre dans les politiques publiques éducatives et culturelles: en quête d'une citoyenneté féminine

[1]. Nous désignons par scolaire tous les cycles de l'enseignement (le primaire, le secondaire et le supérieur).

Attitudes Toward Religious Diversity in Australia

This paper provides a general and historical overview of the changing attitudes toward religious diversity in Australia. It draws on new research and published surveys, charting how some Australians are both becoming more accepting of some forms of diversity, while others are more suspicious of religious diversity. In particular we consider attitudes toward the view that Australia is a "Christian country" and the acceptance of religious diversity in education, public policy, and the growth of Isamophobia.

Navigating Violence in the Public Realm. the Interconnection between Hegemonic Ideology and Agency-Level Acceptance of Violence and Discrimination

The Universal Declaration of Human Rights (1948) imply that all humans have the right to safety in local and global societies, albeit public realm violence, gender inequality and racial discrimination are present in all environments. A nation-state's acceptance of violence and discrimination are habitual and accentuated by discriminative social norms to sustain preferential, often authoritarian hegemonic social order. The discourses of Bourdieu, Beck, Ardent, Bauman, and Galtung analysed the commonness of violence, acts often hidden within mundane everyday life. This paper discusses acts of violence and discrimination on societal and agency levels from the perspective of university students and political leaders in the normalisation of violence. The university student research shows that being and staying safe in the public realm is a challenging task that demands constant alertness and planning.

Left-behind or Left-Beyond: How Migration Regimes Engender Aging Return Prospects for Older Overseas Workers from the Philippines

Why can some older migrants retire from overseas wage-work, while others remain *left-beyond* working to support family left-behind? Although recognized as a growing, vulnerable population, older migrant workers remain understudied, with their prospects of exiting overseas employment commonly assumed as a matter of personal success in saving for retirement. This paper fills that gap by examining unequal overseas worker aging pathways that diverge by gender and migrant labor system. Reconciling these perspectives, this paper illustrates the interconnection between institutional and household decision-making contexts that co-produce aging return differences. Drawing on ethnographic fieldwork, longitudinal data, and interviews with longtime Filipino migrant workers, the comparison contrasts *then* connects later-in-life pathways and shows that older overseas worker couples coordinate who will age out of migrant wage-work, repatriate and receive remittance assistance. To generate support for an older worker retiring without formal access to decommodification provisions, overseas worker households split-up repatriation plans—designating one spouse as a *left-behind* retiree and the other as a *left-beyond* wage-earner, according to a migrant labor system's gendered-occupational hierarchy. Findings address aging outcomes as intersecting relations of gender, class and citizenship, advancing understanding of later-in-life exclusion, interdependence and in-group heterogeneity among older migrant workers.

FABROS, Alinaya Sybilla* (University of California Berkeley, USA)

The Left-Beyond: Failed Patriarchs, Empowered Women and the Labor Earmarking of Older Migrant Workers amid Elusive Retirement

This paper introduces the notion of the *left-beyond*, a concept proposed to accompany discussions on the "left-behind" developed in globalization, gender and migration scholarship to capture non-migrant subpopulations and the conditions governing those who remain in the origin-country, unable to participate in overseas employment. In contrast, my proposed concept of the *left-beyond* captures subpopulations who are kept in the global wage-labor market later-in-life and the conditions that shape their extended labor commodification. To develop this concept, I draw from the case of older migrant Filipino workers who are unable to exit after years of overseas work and the conditions that make retirement elusive, which studies attribute to the inability of low-wage overseas migrants, especially men, to obtain secure jobs, save up resources to exit the market, and gain access to institutional entitlements like pensions and health benefits that other workers accrue after extended service. Specifically, I focus on (1) the institutional contexts that exclude migrant workers from retirement benefits and settlement privileges and connect this with (2) the relational work taking place within migrant families as they decide whether an older migrant worker will remain in the overseas labor market or receive support for their retirement return. My goal in brokering this concept is to advance discussion on labor earmarking as a deliberate exercise carried out on the level of families as they negotiate who can retire from wage-labor employment, when and how; as well as at the level of states, markets and institutions, which design policies and programs that can exempt specific populations from remaining in the market as wage-workers. Framing the discussion on the left-beyond as a process of earmarking labor

for commodification (versus decommodification) bridges analysis of relational work with intersectional analysis of political-economic stratification based on gender, class, race, and (non)citizenship.

How Does Parents' Employment Uncertainty Affect Children Early Skills Development? Patterns and Mechanisms in France

Parental work trajectories are increasingly turbulent in European households. Employment uncertainty seems to have a negative impact on the psychophysical health of the workers, their spouses, and household stability. Less is known about its role for early childhood development. We use data from the longitudinal survey ELFE carried out in France by INED. ELFE is a nationally representative study that follows about 18.000 children from their birth in 2011. We use the first four waves, collected about every year. First, we investigate the link between household employment uncertainty (HEU) and children's i) cognitive skills, ii) soft skills, and iii) well-being, using OLS and Linear probability model. Second, following the family investment model (FMI) and the family stress model (FSM), we explore the mechanisms that mediate the association between persistent household employment uncertainty (PHEU) and children outcomes, using structural equation models in a counterfactual framework. The results suggest that employment uncertainty is associated with worse early cognitive skills development, particularly when it accumulates. First, when employment uncertainty concerns both parents, and second, when it persists over time and includes unemployment spells of one or both parents, HEU is associated to a decrease in cognitive skills of 0.3 SD. The mediation analysis suggests that PHEU has an indirect effect on cognitive outcomes via FIM variables, and on difficult behavior via FSM variables. If the children were all exposed to PHEU, cognitive skills would be lower on average by 0,03 SD via income mediation, and difficult behavior would be higher on average by 0,02 SD via the mediation of the FSM predictors. The results are in line with those of the scarring effect of unemployment. Gender seems to play a role. Maternal temporary work is negatively associated to language skills even when the father has a permanent job, and drives the mediation.

Comparative Analysis of Regional Gender Disparities

The analysis of gender (in)equality at the country level constitutes a fundamental information instrument to verify the trends of change over time in this social reality and the impact of gender policies. The European Institute for Gender Equality (EIGE) has fulfilled this function since 2013, giving rise to various interesting results on the evolution over time. But gender equality measurement is mainly limited to national level, not providing a complete overview of the territorial disparities on gender equality. In the context of the ReGEM project (Regional Gender Equality Measurement, an Erasmus+ Programme - Jean Monnet, https://regem.unige.it/) is an innovative project where we propose a regionalization of the most complete gender equality indicator: The Gender Equality Index (GEI) of the EIGE. We wanted to delve into this type of analysis by investigating at the regional level (NUTS2) to what extent differentiated behaviours can be observed within each country. We have chosen Italy, Spain and France, covering a total of 62 regions, as case studies to be able to observe what particularities emerge from a disaggregated territorial analysis, essential for the development of local gender policies. We construct a disaggregated measure as close as possible to the national level indicator produced by EIGE (RGEI) obtained from Eurostat in the form of micro-data. We carried out two types of analysis: the construction of the index and the analysis of the six main domains that define the measure: Work, Money, Time, Power, Knowledge and Health, with the aim of typifying the regions analysed. The analysis will provide relevant insights also on the role of national boundaries for gender equality when physical separators determine them (in particular, Spain/France and Italy/France). Internal disparities are also relevant, for instance, in Spain (North-East/South-West), France (North/South), Italy (North/South).

Social Mobility Under Mutual Index View. a Comparison between Early and Late Industrialized Countries.

We analyse the trends social mobility in early and late industrialized countries using data of International Social Survey Programme (IISP), in particular the Social Inequality module of 2019, which provide information about social origin. For that, we employ an innovative measure, the Mutual Information Index, which allows us to simultaneously observe and distinguish changes due both to the structural effect (margin dependent) and the internal

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

effect (margin-free). The former report the changes in class composition. More specifically, we will contrast the results of the traditional log-linear measures used most frequently in this field with those of the mutual information index. We apply the decomposition of the Mutual index proposed by Benn & Seiler (2019), which allows us to observe and distinguish between the two contributions. Whereas relative analysis show invariance in social mobility, our hypothesis is that when the structural change between fathers and offsprings are taking into account the late and early countries will be nearer in their social mobility. We sustain that this decomposition may enrich our view of social mobility without disregarding the traditional margin-free measures.

Museos Feministas: Discursos Críticos y Transformaciones En Las Prácticas Institucionales En Los Museos De Arte Del Siglo XXI

Tanto desde el ámbito teórico como desde los movimientos sociales las epistemologías feministas han incidido con fuerza en las instituciones del patrimonio, particularmente en los museos de arte. Autoras emblemáticas como Griselda Pollock (2013), abrieron el debate sobre el feminismo en las instituciones del arte como generador de diferencia, interrogando con ello los cánones del arte y develando con ello sus estructuras míticas y sus mecanismos excluyentes. Siguiendo el curso de esta discusión esta ponencia propone analizar acciones y prácticas institucionales en los museos a partir del análisis de exposiciones/acciones institucionales tales como "Archiva Chilena", del Centro de Arte Contemporáneo Nacional de Chile, "No soy tu Musa", del Museo de Bellas Artes de Chile y "Historias de la Sexualidad" del Museo de Arte de São Paulo de Brasil. A partir de estos casos observaremos los conflictos y tensiones que se producen cuando la diferencia femenina irrumpe en el museo a contracorriente de sus lógicas androcéntricas. Estas acciones tensionan de diferentes maneras la institución proponiendo nuevas maneras de reflexionar sobre el canon del arte, nuevas maneras de narrar historias, archivar memorias y construir patrimonios. Si bien estas acciones no poseen en sí mismas la potencia de transformar los museos instituciones feministas, su existencia es capaz de develar la estructura patriarcal que orienta las políticas de exhibición, selección y legitimación de estas instituciones, tensionando sus límites y provocando fisuras desde dentro, con miras a hacer de ellos espacios más inclusivos y democratizadores.

Social Movements, Global Marxism and Decolonial Perspectives

In this paper I argue that a systematic engagement with global Marxism and its relationship to anti-colonial movements and revolutionary struggles in the global South should be at the centre of decolonial perspectives. This would delink many ongoing decolonial debates from 'metaphorisation' (see Tuck and Yang 2012). A close examination of the history of anti-colonial and anti-imperial struggles reveals that Marxism and anti-colonial thought and practice are inseparable and therefore, the re-joining of Marxism and decolonisation debates is imperative. Marxism became the most prominent school of thought in inspiring revolutionary ideas throughout the global South, particularly in the second half of the twentieth century when nations were in search of alternatives to advances of imperialist and colonial forces. It created radical political imaginaries which rejected capitalism while emphasising an indigenous ideological heritage, values and traditions. In other words, rather than an all-embracing, totalizing Orthodox Marxism, Marxist thought proved sufficiently flexible to offer a framework and methodology to interpret local context. Nationalist sentiments went hand in hand with anti-capitalist and egalitarian objectives and provided an alternative to the Western model of modernization. In light of the current global political, economic and environmental crises, it is crucial to re-centre Marxist imaginaries.

The Dynamics of Security Management of Boko Haram Terrorism in Nigeria

The problem of insecurity, which used to be one of the lowest in the hierarchy of social problems facing Nigeria, seems to have assumed an alarming proportion since the end of the Nigerian civil war which ended in 1970. So high is the rate of insecurity in Nigeria now that every facet of Nigerian life has been badly affected. Fear and distrust of the other person loom large in the polity and these have bedeviled our developmental exploits as a country. The current state of insecurity has posed serious challenges and menace to Nigeria's macroeconomic environment. Not only has the country suffered colossal losses in terms of infrastructure, properties and human lives, her economic development has also experienced retardation. For any sustainable development, there must be security, which is not just an intrinsic aspect of development but an essential precondition for one. This study examines the challenges of the security management of Boko Haram terrorism in Borno

State, Nigeria. The aim is to determine how current approaches affect the management of Boko Haram's terrorism in the study area, and it's implication for security in the region. To achieve this, a sample of 325 officers using the Rao soft sample size calculator was drawn from the Borno State Police Command for the purpose of the questionnaire administration. In addition, a sample of 21 key stakeholders was drawn using purposive technique for the sake of interviews. Findings from the study revealed among others, that Boko Haram terrorist activities have continued to have adverse effects on the wellbeing of Borno state and Nigeria in general and the current management approach to the security crisis in the state is far from effective especially because of the near absence of community-based as well as international-driven partnership approaches.

Fuzzy Knowledge and Practice: The Case of Social Work Education

Expertise, as well as values of rationality, objectivity and efficiency symbolize core ideals for professional work. However, as professionals in human service organizations, social workers handle problems that are ambiguous, moral, and uncertain. In this presentation, I use the concept of *fuzziness* to analyze how social work students make sense of their professional role and expertise. I draw from an ethnographic study of a social work education in Sweden, in which I have followed a group of students in a larger class from the beginning to the fifth out of seven semesters.

I argue that social work students form a *fuzzy problem view*, which endorses the ambiguous character of social problems and contingency of social work practice. In addition, the fuzzy problem view focuses on the particularities of the specific situation at hand, and encourages a flexible and adaptive approach when interacting with clients. Hence, a fuzzy problem view contrasts to common ideas of professional knowledge that emphasize objectivity and formalization. In the presentation, I describe how social work students make sense of the fuzziness of their profession-specific knowledge and practice. I analyze how students reason about issues of knowledge and social work practice in relation to different organizational settings, as well as to clients and neighboring professional groups. As such, the study explores knowledge and its application in an ambiguous professional domain.

Union Power and Regional Governance

The capacities of unions to exercise power has long been debated (Wright, 2000). Recently, questions relating to union power and its exercise have acquired a renewed salience in relation to regions. These concerns become pressing as regions become the focus of government developmental and transitional concerns, as well as the sites of continued industrial activity. This focus also calls into question, the capabilities of unions to exercise their power at a regional level. The question is how unions can play a part, experiment so that they can impact on policies and practices at this level.

Experimentation can take an organizational and/or institutional form (Murray *et al*., 2020). Here, the focus is on the ways that regional relationships and processes are managed and navigated. They also raise the question of democratic legitimacy, about who is involved and when. Such processes can claim to be participatory in nature, but in practice often fall short of being genuinely so (Pape *et al*., 2016).

We report on two examples of union experimentation. We examine how unions may co-construct regional governance institutions in the Montreal aerospace industry and the ways regional union confederations engage with different levels of regional governance in two States in Australia: Victoria and Tasmania This examination highlights the necessity for unions to build new resources and capabilities to play a leading role in these processes.

Grassroots Gender Equality Interventions and DIY Music in Australia

Gender in/equality in the Australian music industry has been under increasing focus in the past decade. Grassroots activist movements such as #MeToo and Australian music industry offsider #MeNoMore have sought to reveal and publicise aspects of this industry that are experienced disproportionately by gender, such as exclusion, sexist practices and sexual harms.

Outside the mainstream music industry, the DIY (Do It Yourself) music scene presents itself as egalitarian, counter-culture and anti-establishment but is not immune from scrutiny. Claims that DIY scenes are inclusive and accessible make DIY music appear a perfect environment for gender equality to thrive, however this does not always occur in practice. So how do DIY music scenes differ from the mainstream when it comes to gender equality? How do they engage with and support it? What is being done to achieve it?

Through interviews and an anonymous online survey this research seeks to understand the goals and values of DIY music scenes in Australia, and the practices and structures that scaffold these. I also look concurrently at how DIY music agents view gender equality, and how they interact with grassroots gender-based interventions and activism. By talking with activists and instigators of gender equality initiatives in these scenes I will investigate the theories of change they employ, the cultural practices and approaches they use, the outcomes they seek, and their efficacy.

Future results will support the creation of a model of intervention most likely to facilitate a more gender-equal music industry. This will empower community members, policy makers, organisations and grassroots groups to provide spaces that facilitate gender equity, inclusion, and safer spaces.

The Future(s) of Work? Disparities Around Changing Job Conditions When Remote/Hybrid or Returning to Working at Work

The future of work is ambiguous at best. Despite widespread shifts to remote/hybrid work during the COVID-19 lockdown, there is a paucity of knowledge about changing job conditions in tandem with different work locales. Is the move to remote/hybrid work a disrupter or accentuator of existing norms and inequalities? Drawing on nationally representative, four-wave panel survey data (October 2020–April 2022) collected from U.S. workers who spent at least some time working from home since the pandemic onset, we examine effects of within-person changes in where respondents work on changes in job conditions. Estimates from fixed-effects models show that, compared with returning to working at work, ongoing remote and moving to hybrid work lead to greater reductions in psychological job demands for both women and men. Black and Hinospanic women moving back to the office experience the greatest reductions in decision latitude and schedule control. Only white workers see increased coworker support when returning to the office, with returning Black and Hinospanic men reporting a decline in coworker support. Family caregivers' job conditions do not improve whether remote/hybrid or returning to work. Qualitative data collected from Amazon Mechanic Turk illuminate mechanisms leading to salutary effects of remote work, but also the stress of combining jobs with family carework.

Individualization and Familyism: A Comparative Study of China and Sweden

This article makes a comparison between family social network in the individualist society of Sweden and the family-centered Chinese society. Using the ISSP 2017 data, regressions was done to investigate if individualization can enhance or suppress the supportive function of family social network. Result shows that the family social network in the family-centered China have in general stronger support for individual's subjective well-being. This article thus raises the point that individualization as a social trend, can have the by-effect of alienating the people. Furthermore, from the comparison of the two distinctive society, we see that culture can have a significant influence on the structure of social network, and thereby also effecting individual level factors such as subjective well-being.

Perceived Health Risk during the Covid Pandemic: A Sociological Approach

Perceived health risk is a major issue during the pandemic as it determines one's attitude towards health-related behavior such as wearing masks and observing pandemic restrictions. While psychology measure specific risks and try to deal with different type of perceived health risk separately, risk sociology oppose the idea of lifting risk out of its social backround. This article adopts the sociological approach by viewing covid 19 health risk as a holistic risk deriving from social structure. When it comes to covid, the pandemic alienates people, distancing them from each other in daily social interaction, as such ordinary actions is now a great health hazard. This alters the micro social structure around the individual, alienating them from the rest of the society and blocking them from their close friends and family. This article thus proposes that a major source of perceived health risk is the changes of social structure, especially

in individual's vicinity. To investigate this, the "Stress, Dealing with Stress, and Experiencing Changes in Social Life during the Covid-19 Pandemic" survey is used for correlation study of perceived health risk and changes in social capital during the pandemic. Preliminary data analysis shows positive correlation (p<0.001) between perceived health risk and decrease in social capital. What is more interesting, perceived health risk also positively correlates with increase in social capital during the pandemic (for example meeting volunteers and forming contact with neighbors). This means that no matter it is increase or decrease in social capital, such change in micro social structure always causes perceived health risk. This is well in line with the risk sociological perspective of view risk as structural, pointing out the need for further sociological attention on health risk during the pandemic and its consequences. further empirical and theoretical analysis in needed to solidify this result.

Doing Gendered "Exit:" Work, Care and the Moral Practices of Disabled Identities

Previous research on the exclusion of disabled identities from paid work tends to fixate them in a stable and undifferentiated category of "cared-for" subjects that implicitly approves the ethic of work as the exclusive source of their dignity and citizenship. Drawing on in-depth interviews with Myasthenia Gravis patients and their families, this paper imagines by contrast how disabled identities derive their sense of self-worth from cultural scripts otherwise than from the overbearing paradigm of work. The point of departure is often a subscription to the logic of interdependence that organizes the ethic of care, which enables our disabled participants to enforce the trope of reciprocity that transcends the conventional carer/cared-for dichotomy. However, the narratives of self-worth that encapsulate the alternative ethic of care nevertheless unravel how the inter-mediation between age, gender and ableism shapes the circumstantial (in)ability of our disabled participants to appropriate it as a moral technology of empowerment. By delimiting the possibilities of social membership for disabled identities, this paper embraces the ethic of care as an alternative to that of work but circumscribes it by bringing into relief its differential and contingent qualities.

Complex Households, a Challenge for the Study of Families through Census Data. Principles for the Construction of a Typology, the Example of French Polynesia.

Quantitative studies generally attempt to capture family structures *via* the statistical unit called the household. It is the reference unit of censuses and quantitative surveys throughout the world and its harmonization is promoted by United Nations publications. The study of household composition through census data relies on the identification of family nuclei: simple households are those containing one family nucleus or a single person, all other combinations of those are categorized as complex households. In contemporary Western societies, where they only represent a minority of households, this category is not detailed. However, where such forms of co-residence are more common, arises the need for a detailed partition of this very heterogeneous category. This communication aims at providing a method for detailing the categorization of complex households.

In this presentation we first discuss the criteria from the UN guidelines and the way the Indian census typology takes into account the variety of living arrangements, especially the different joint family household types. Secondly, we demonstrate how the French statistical census categories applied to a French overseas territory (French Polynesia) fail to satisfactorily describe local living arrangements: indeed, 42% of its population live in so-called "complex" households. We then decompose the household categories of French Polynesia's most recent census (2017) using automatic clustering techniques. And finally, taking into account the regional features of family organisation, we produce homogeneous and robust subcategories.

The resulting typology offers a detailed classification of households in French Polynesia and allows immediate comparison with the existing one. Importantly, it combines statistical analysis of census data with the identification of local specificities of family organization. Therefore, it makes the resulting categories suitable for use in guiding public action. Moreover, it addresses the initial demand from the local statistical office for a finer identification of the large proportion of complex households.

Gendered Politics: Hate Against Muslim Women in India

Muslim women are a part of the Indian population that reflects the exclusivity of this country's racial, ethnic culture. Since last few years there has been a pattern of hate campaigns filled with communal insults and disgraces and misogynist bullying targeting Muslims women in India. The Hijab ban has added to the hostility against the minority Muslim community. Students have been asked to remove hijab if they want to attend educational institutions. These Muslim students face communal insults and misogynist intimidation from radical Hindu right-wing groups in India. The bully bai and sully deal is another example of disgrace and hatred against Muslim women which has created political furor in the country. Preventing Muslim girls from entering educational premises has led to the polarization of the classroom and educational institutions. Such disputes that polarize society are an attempt to divide Indian society in the name of religion. The debate and discourse on the hijab has intensified with banning of hijab in educational institutions. Although xenophobic sentiment continues to be strongly ingrained this paper locates the political, socio-economic and legal position of Muslim women and examines the rise of prejudiced sentiment and action in India. The veto has led to a new wave of insurgence among Muslim women who in its place turn to covering and wearing the hijab in even greater numbers. Through this study we have interviewed 200 girl students plus 25 working women and try to understand their point of view. This research explores the rise of existing harassment and provocation directed at Muslim women. There is a need for restructuring in the legal mechanism to deal with the present situation and preserving equality, integrity and public order in educational institution.

FARID, Oneza* (Aqsa Women's Degree College, India)

Health Issues and Precarious Condition of Migrant Muslim Women Workers in the Informal Garment Sector of Bhiwandi, India.

The paper focuses on the health issues of the Muslim women workers in the informal garment industry of Bhiwandi city, a suburb of Mumbai city, which is known for its power-loom textile production and warehouses in India. The ready-made garment industry in Bhiwandi not only contributes to the economic development of India, but has created income opportunities for poor unskilled women, aiding their whole family. However, these benefits come at considerable cost to the women. These women work under precarious conditions of housing and labour. These women workers work without any social benefits such as pension, health protection or paid sick leave or protection of labour laws. They consistently toil for lower wages in insecure circumstances, including risk of sexual harassment. The lack of social protections has long-term impact on women. The collective work handled by them are stitching, embroidery, ironing, packing and lifting heavy loads which are repetitive, incessant and prolonged. Working for 10-12 hours non-stop without rest, absence of medical facilities leads to major health-related issues among the women workers. Health and safety does not easily cover informal women workers or their workplaces. Most of them suffer from diseases like Tuberculosis, Arthritis, abortion complexity, dermatitis, back pain, eye stain, malnutrition, respiratory problems, hepatitis (Jaundice), gastric pain, fatigue, fever, abdomen pain. The policy makers and other concern organizations should take required measures to ensure good health for the garment workers. It will help woman workers to be more productive and their contribution to the country will be greater. The paper also attempts to analyse how the work environment and gendered family role in this conservative society affect the health of the female industrial workers and how they tackle the health issues faced by them.

Back to Normality. Which One? Old and New Perspectives on Work in the Age of Crises

The reflection on working time and exploitation (also thanks to the digital technologies) is certainly not new, but perhaps certain forms of resistance, objection and desertion are. These concern both young people who refuse to participate in a generationally punitive and increasingly greedy and exploitative labor market, and the new phenomenon of the so-called "great resignations", all to be analyzed and understood, which seems to originate precisely from the stop imposed by the pandemic, that brought many workers to reconsider their work and life conditions. On one side there is now a large public debate on the "great resignations" as phenomenon, but on the other one actually it is necessary to understand it and who are its protagonists. The hypothesis of a rejection of working conditions and therefore of life is certainly one of the possible, but there is also to be considered a possible attempt to subvert the order of values imposed with practices that express objection and desertion from the system. The public discourse around the phenomenon will be analysed, as well as some *social* groups that gather under various labels referring to the phenomenon indicated.

The relationship between the pandemic as a moment of rupture will therefore be considered in the light of a growing demand for flexibility of the

labor supply that is probably in this case reworked in terms of reappropriation of spaces, life and autonomy. A sort of *boomerang* of flexibility that could prelude to an alternative to the current model.

FARINA, Fatima* (University of Urbino Carlo Bo, Italy)

We Are at War. How the Coronavirus Spread within the Gender Based Violence Society

This paper analyses the war metaphor's immediate and pervasive diffusion during the Covid19 pandemic in Italy and an international comparative key. Italy was the first country to be affected after China, the first to experiment with restrictive measures for the management of the health emergency, which were immediately accompanied by the proposal of war as an interpretative lens of the health state (consequently social, economic and political), through the protagonists of the public scene, becoming the horizon of political action.

The war in its inevitability and a-historicity, from the first moment available, has produced a restriction of public space and a re-proposition of the re-naturalisation of gendered roles (between male warfare and female welfare). The 'men of the nation' dominating the public scene have developed emergency measures that have effectively reduced social participation by gender, as well as an invisibilisation of the female presence. This produced significant effects on political representation, economic and labour participation, as well as on the management measures before and recovery ones now. The gap between myth (representation) and reality (consequences) is analysed here in an interpretative key of excess control over care between frontline and domestic invisibility. The analysis of the public discourse is focused on the identified four "myths of war": We are at war (there is no alternative), The market does not stop (economic primacy, consequences and contradictions of fact), The heroes (heroes and victims), The safe home place, The myth of post-war reconstruction (post-pandemic management). The relationship between the "weapons of control" used (in the public discourse) and its consequences (data, intervention measures) offers an opportunity to analyse the processes, taking place between exception and paradigm shift.

Solidarity, Belonging and Precarious Work in the Hospitality Industry

This paper explores relations of belonging and solidarity amongst precariously employed hospitality workers within the disciplinary requirements of the service labour process. While precarious workers are regarded as atomized and disempowered, this paper shows that hospitality labour requires workers to build informal but affectively intense relations with one another in order to produce the atmospheres and interactions that constitute the key product of their work. These relationships shape their capacity to negotiate their working conditions and survive crises such as those presented by the impact of COVID-19 on the hospitality industry, constituting modes of informal solidarity and belonging at work. However, these relationships and convivialities at work are also critical to labour processes within the industry and hence a source of value and profit for employers. The lines between the public and the private is blurred in these relations in ways that reflect valorisation processes within the service economy, which mobilise workers' subjectivities, aesthetics and capacities for relationality. Despite precarity, these workers form bonds of solidarity and belonging that support them in their labour, which are enacted and extracted in ways that produce value for the post-Fordist economy.

Unlearned Lessons of the Pandemic

The major disruption caused by the pandemic in the normal course of life at a global level generated a sense that lessons had to be drawn from the dual perspective of public health and social inequalities. Indeed the health crisis revealed the flaws of the former in most countries and the depth of the latter within and between countries. Correcting these issues would have implied major transformations of political and moral economies at both national and international levels. The lecture will examine what was uncovered by the pandemic and discuss how much of the earlier promises of change were held.

School and Well-Being: Education, Self-Determination and Adult-Imposed Aspirations

Schools, as diverse communities where children live much of their daily lives, are significant for their impact on children's well-being. The presentation explores the potentially contradictory expectations school poses for experiences of well-being, explained by the extent to which children's perspectives inform the logics of education at an institutional and pedagogical level.

Our presentation is based on multi-stage qualitative research with over 100 children in NSW, Australia. We frame our discussion around what children told us about their experiences of well-being at school, in terms of opportunities to pursue agency and competency, defined in our analysis as self-determination; and the requirements to prepare for a future, what we refer to as adult-imposed aspirations.

The children's discussion informs us that opportunities for self-determination can develop internalized competence, provide opportunities for meaningful social recognition, and that practical achievements and learning outcomes emerge from the process. On the other hand, adult-imposed aspirations as described by children, in a system of marketized education, impose expectations on children, associated with credentialism and instrumental rationality. These expectations emphasize a formal achievement orientation and pre-determined outcomes.

We conclude by arguing that both the opportunities and the expectations that characterize children's experiences of school, contribute strong demands on children in terms of the constitution of the self, and thus have contested implications for their sense of well-being.

FAURY, Felicien* (Paris Dauphine University, France)

Catholic Culture and National Identity Among Radical Right Voters in France

My contribution will focus on the role of religion in electoral behavior among voters of the French Rassemblement National (RN), Marine Le Pen's radical right party. It will explore how Catholicism (the dominant religion in France) is mobilized in the ordinary discourse of these voters as a driving force in the construction of their own national identity and as a mode of exclusion of "Others" considered as external to the national community. Various quantitative surveys have established that the majority of French RN voters are Catholic non-practicing believers. Drawing on a qualitative study made of in-depth interviews with RN voters (n = 42), my presentation will argue that religion still subjectively plays a role in their electoral choices, but as the expression of a national and cultural – more than religious strictly speaking – identity. Catholicism is significant for RN voters not as a marker of individual religious socialization nor as a set of religious beliefs, but as a 'thin' identity which can be subjectively mobilized as a mode of construction and expression of a national (and nationalistic) identity. When they talk about their religion, RN voters most often refer, in a positive way, to a strong national attachment, or, in a negative way, to Muslim religion, considered as a threat to 'French' traditions, lifestyles and values. On this last point, my empirical material shows that the target of theses discourses is not Islam *per se* (as a religious dogma), but a set of attitudes and practices attributed to French extra-European immigrants. The presentation will also be an opportunity to underline the specificities of the French context (with the importance of State secularism, or *laïcité*) and to shed light on the complex relationship between religion and radical right narratives in France.

Going Local, Going Mainstream? an Ethnography of Two Cities Governed By the French Rassemblement National

Populists Radical Right (PRR) parties' growth in contemporary democracies has met with increasing interest among political science scholars in recent years, also due to the process of partial access to mainstream and institutional power they are experiencing in several countries. However, this process has been studied mainly at the national level, approaching PRR parties almost exclusively as (supra) national, aggregated and homogeneous actors. For this reason, we know little about PRR experience of government at the local level: a major gap in the academic debate, also considering the relevant role played by territorial anchorage and local attachments for these formations. Focusing on the French Rassemblement National (RN) of Marine Le Pen, our paper contributes to the recent and emerging "localist turn" in the study of PPR (Chou, Moffitt, Busbridge, 2021) by analyzing RN governance at the municipal level. Our presentation is based on an innovative ethnographic and comparative study of

two middle-sized towns ruled since 2014 by the RN, both located in the South-East of France, a region characterized by an historical cultural rootedness for the party. More specifically, our paper draws on a) ethnographic observations of the local political and party life; b) 72 in-depth interviews with members of the RN municipal team, grassroots party militants and their main opponents. Summing the advantages of the ethnographic single case-study with the strength offered by a comparative gaze, our paper explores the intertwining of populism and localism and the ambivalent process of mainstreaming of the radical right at the local level. While subnational arenas are often assumed to play a role in the mainstreaming process of radical parties, we argue that "going local" does not necessarily imply, for PRR formations such as the RN, a de-ideologization of local governance.

Justification and Legitimacy of Police Violence: A Cultural Explanation

Scholars argued that the police on behalf of the state hold monopoly on the legitimate use of force being a legal authority within a geographically defined territory and/or public grant such use of force to police seeing them as normatively aligned with their values and expectations. While some scholars share their composite view of such legitimate use of force by including both dimensions of being legal authority, and normatively aligned. This paper, however, offers a cultural explanation of police violence. We argue culture provides police officers with a set of line of action (i.e. cultural toolkit) which they employ in specific situations. In such situations, they engage in violence as a situationally viable response, which they subsequently justify as part of meaning making. We further argue that certain conditions affect cultural tool kits of police officers towards justification and legitimacy of police violence. First, when political authorities interfere and encourage them towards the use of violence. Second, when police officers are themselves aware that police and courts are ineffective and corrupt in order to establish public order through effective and efficient procedural justice, they resort to violence as a more effective and immediate way to maintain public order. Third, in a society which suffers social inequality on a larger scale, where wealthy and socially influential people use police against poor and ordinary citizens to gain social control. We conclude by noting how this explanation can be used in future empirical research.

How Physical Therapy's Professional Boundaries Are Contested Following the Enactment of the Medical Professions Regulation Act in Israel?

Health-related professions' boundaries have been contested due to personnel shortages, technology, education, the constrained organization and growing regulation of health systems. The Medical Professions Regulation Act 2008 (hereinafter: the Law) is the legal basis for the professionalization of Physical Therapy (PT) in Israel. Since its sanctioning in 2009, regulations, additions, amendments, and temporary provisions were stipulated, further contesting the boundaries of the profession. This study aimed to identify the stakeholders, the issues, and the ways in which physical therapy professional boundaries are contested.

Methods: A qualitative, summative content-analysis was conducted. It included the analysis of constitutional and legal aspects of the Law as reflected in publicly available documents such as regulations and amendments, temporary provisions, legal deliberations, and disciplinary complaints – issued from 2008 till 2020. Peer debriefing sessions were held in order to develop the analysis scheme and to review the analysis of data.

Results: Various stakeholders challenged PT professional boundaries. They were affiliated with public and private organizations. Some boundaries contestants were identified with other health-allied professions (occupational therapists) and occupations. They were both from regulated (nurses) and non-regulated professions (chiropractors), as well as from the health and other arenas (sports-therapists). These stakeholders were found to question PT boundaries regarding areas of training and practice, professional jurisdiction and settings of practice. Legislators initiate and propose amendments to the Law focusing on minority population groups among their constituencies. Legal professionals are required to back these processes, thus shaping the interpretation of the Law.

Conclusion: Since its sanctioning, additional regulatory procedures have shaped the original Law. Stakeholders promoted changes in the Law due to competing social, economic, and ideological values and interests. These changes impact the structural aspect of the professionalization process, considered a core motive in the enactment of the Law and erode the boundaries of PT.

The Potential of Musical Shaping of Biographical Experiences - Methodological Challenges and Methodical Approach

How can music be made productive as data material within biographical research to complement or transcend traditional methods of biographical analysis? What makes it possible to consider and understand biographical experiences, which cannot be articulated with narrative and visual forms of representation, through the specific expression of music?

These questions will be discussed in the presentation of a case study from my dissertation project, which is dedicated to music from the Terezín concentration camp. In its special role as a concentration and transit camp, cultural and artistic activities were initially prohibited in Terezín, but later supported by the Jewish Self-Government in the context of "Free Time Activities" and finally, in order to present Terezín to an international public as a "Potemkin Village," demanded by the camp administration and used for propaganda purposes. Especially for the compositions written in concentration camps, the potential of music is of particular importance to refer, by means of symbolization processes, to experiences that were unspeakable in the context of the camp as well as incapable of being put into words.

The composer Viktor Ullmann, deported to the Terezín concentration camp in 1942, developed – like many other imprisoned artists – a great commitment to advancing his artistic production despite, or even because of the inhumane living conditions, and created a considerable number of musical works during his internment, including the opera "The Emperor of Atlantis, or Death's Refusal".

Based on this case study, a specifically developed sequential analysis method aligned with principles of hermeneutically grounded interpretive sociology is used to show, how music, as an access to extra-linguistic dimensions of meaning, can lend presence to experiences from the past through present listening, whereby these can be experienced and remembered in an aesthetic-bodily way.

The Reproduction of Professional Hierarchies in Today's Health Care Field

The reproduction of professional hierarchies in today's health care field
This paper explores the relationship between the different health care professions involved in the creation of today's health services and practices. The paper traces these relationships back through the early works of classical sociologists. One aim is critically to examine the contributions of sociologists interested in health care professions, from the Chicago interactionist and institutionalist traditions, including Everett. C. Hughes and Andrew Abbott, to French scholars such as Pierre Bourdieu's 'Logic of Practice' and Bruno Latour's 'Sociology of Science'.

Theoretically, the paper argues that although there is a clear and direct conceptual link from Hughes to Abbott, there is also a link between the theories of Abbott and Bourdieu, evident in concepts of "systems of professions and that of "champ". Less known, but also present, however, is the link from Hughes to Latour via their common inspiration from American pragmatism and the work of the Frenchman Gabriel Tarde.

Empirically, the paper explores the reproduction of the hierarchy between medical doctors and allied professions in today's healthcare services. We ask whether and in case why (or how) the medical profession still holds the *position* of being at the top of the health care hierarchy. Finally, the paper discusses how the theoretical perspectives described above may prove to be useful in analysing the reproduction of professional hierarchies in health care services today.

Decolonizing Reparation: Post-Disaster Recognition's Strategies Raised By Affected Communities

Drawing from recent disasters in the Brazilian mining sector, particularly those that occurred in Minas Gerais in 2015 and 2019, this paper aims to discuss the reparation process dynamics, stressing the way by which some propositions laid by affected populations were absorbed. Many of them were inscribed in concrete experiences of Independent Technical Advisory (ITA). Based on the documentary analysis of instruments elaborated in collaboration with the ITA chosen by the communities such as the Mariana Region Damage Matrix and the Protocol for Consultation of Peoples and Communities of Ancestral Religious Tradition of African Matrix of Region 2 of the Paraopeba River Basin, we seek to discuss both the controversies surrounding the management of the reparation process, its points of tension and contestation between corporate agents, state agents and affected communities, as well as the pragmatic innovations in absorbing – in a grassroots flow – different demands from vulnerable/subalternized collectivities. We focus on political disputes around the definition of formal categories, the scope of damages,

and the effort of ITA to singularize, nuance and particularize experiences that would otherwise be seen in a homogeneous way or worse: made invisible. We understand that these experiences portray a reaction to the hegemonic governance models of disasters, and they couple different local knowledges, advantaging perspectives of respect for traditional people's livelihoods and languages of valuation, such as indigenous, riverside, quilombola and peasant communities, implying in proposals innovative public policies to be exercised by the State. We suggest that both documents analyzed are expressions of successful actions for the construction of alternative models and instruments for post-disaster repair, which reaffirm not only the material needs of those populations, but move forward to strengthening the resistance of the affected communities, engaging decolonial perspectives, in order to value knowledge, practices, relationships and bonds of traditional peoples.

"SHE (OR HE) Wasn't Single". Hydroelectric Exploitation in Spain from a Gender Perspective

This paper presents a socio-anthropological interpretation, based on female perspectives, of the introduction process of electric industry in a region in the Pyrenean border, in the context of post-civil war Francoist Spain. In the decade of 1950s and 1960s, Enher - the Hydroelectric State company created by the Dictatorship- built ten dams in ten years, with a dramatic cost in ecological and human terms. The paper focuses on the testimony of three related women, who were hit by the process and who were also affected as workers their selves or as workers' relatives: Teresa is the daughter of one of the villages that were directly affected by the construction of the Escales reservoir and had whose family had to settle in Pont de Suert, the capital town of the region, where she worked in the company store; Natalia was born in another mountain little village that had also been indirectly affected by the construction of the reservoir and also had to emigrate to Pont de Suert with her parents and brother, where they opened a guesthouse and a butchery, and where she married later an employee of Enher, and followed him in his professional transfer to Mequinenza -the tenth and last dam built; Nuria settled in Pont de Suert accompanying his father, who had born in the Pyrenees and migrated to Lleida in his twenties, and who, taking advantage of the new economic boom of this mountain region, had decided to open a tailor's shop there. All three experienced the pros and cons of electrification, including population growth, the economic boom and the hardships of emigrants arriving from all over Spain living. In the conclusion we introduce questions of authoritarian development, geographical frontiers, extractivism and resistance.

FEIXA, Carles* (University Pompeu Fabra, Spain)

Transnational Gangs, Street Cultures and Mediation: The Life Stories of Three Latin Kings

This paper is an attempt to "transplant" (worth the redundancy) three concepts linked to transnational studies: "transnationalism from below" (Appadurai, 2001); "minor transnationalism" (Lionnet & Shih, 2005); and "subaltern transnationalism" (Spivak, 1988/2010; Piñuelas, 2017). For this we rely on the data and reflections resulting from fifteen years investigating transnational youth gangs, more specifically a street youth organization present on both sides of the Atlantic: the Latin Kings & Queens. Starting from the life stories of three leaders of this organization in the United States, Ecuador and Spain, we analyze how transnationalism affects the gang phenomenon at three levels. Firstly, as transnationalism "from above", as a circulation of visual imagery rooted in cinema, television series and YouTube videos; as a circulation of "zero tolerance" policies towards street youth groups, translated into police exchanges and the neoliberal penal state; and as a circulation of models of institutional racism that turn young migrants into precarious workers and scapegoats for "moral panic" campaigns. Secondly, as transnationalism "from below", as a circulation of symbols, identities and myths among the youth of a quasi-clandestine organization; as a feeling of brotherhood and mutual aid practices among the victims of globalization; and as an exchange of "knowledge of resistance" and "resilience" that allow the subaltern people to survive in a hostile environment. Last but not least, thirdly, as "multilateral transnationalism", as the circulation of intercultural experiences within and outside the group, which demonstrate the agency capacity of its members to lead a transnational life without dying in the attempt.

Activation Policies: Who Deserves to be Sanctioned? a Vignette Experiment of Possible Ethnic Discrimination Among Norwegian Street-Level Bureaucrats

In the sociological study of discrimination, experiments have seldom been used to study how street-level bureaucrats make their decisions. The context of decision-making is different in the state and in markets, but experimental methods can provide new knowledge of how perceptions of deservingness may potentially lead to discrimination in the state. Using a vignette experiment on Norwegian street-level bureaucrats (N = 645), we investigate if their perceptions of the recipients' ethnic background, separately from - as well as combined with - perceived "unfavorable" behavior, affect their decision to impose a time-limited termination of unemployment benefits due to non-compliance with activity requirements. The experiment showed that the propensity to terminate the benefit was significantly less for the recipient with an ethnic minority name, compared to the recipient with an ethnic majority name, as long as no background information of "unfavorable" behavior was provided. However, when information of "unfavorable" behavior was added to the vignette, the propensity to sanction the ethnic minority recipient strongly increased, while there was a slight decrease for the ethnic majority recipient. The results suggest that perceived deservingness-traits are crucial for understanding possible discrimination when street-level bureaucrats face ethnic minorities in the welfare state: Ethnic markers interact with markers of "deservingness". Theoretical and methodological implications when studying ethnic discrimination among street-level bureaucrats are discussed, as well as possible social policy implications.

Linking Ages in Academic Research: Making Material-Discoursive Age Boundaries through Studying Bodies and Spaces in Early and Late Adulthood

Age is a key marker that greatly influence how a person is treated in our societies. From a sociological perspective of un/doing age, age boundaries can be understood as practical accomplishments – not something people are or do, but something that is being done through material-discursive boundary-making practices. Academia contributes to these boundaries with its institutionalized separation of fields like childhood and ageing research.

The contribution challenges such academic age-boundaries by introducing a 'Linking Ages' framework. Such a framework provides a meta-perspective towards age as a category of difference in which theories, methodologies and findings from childhood, youth, adulthood and age studies are perspectivized and critically questioned. This implies empirically researching how different ages, life stages, and transitions are being 'done' in material-discursive boundary-making practices; how they differ in different life stages; and what this tells us about age as a category of social difference across the life course.

To showcase empirical examples of material-discursive boundary-making practices between ages, we present two qualitative projects: The first asks how bodies are made visible through changes of body boundaries and being 'othered' in public space in different life stages, such as midlife (e.g. pregnancy) and later adulthood (e.g. mobility restrictions). The second project focuses on how relocations in life-stage-specific forms of cohabitation (e.g. student accommodation and care homes) co-constitute age-boundaries. For each project we present findings from a scoping review of the state-of-the-art literature from the respective life-stage specific research fields. Through situational analysis mapping, we perspectivize the different theories, concepts and methods used in the literature, and identify and relate central themes like dis/ability or (lack of) agency.

Finally, we discuss how different life-stage specific research approaches towards the role of bodies and spaces (e.g. from gerontology our youth studies) contribute to the drawing of age-boundaries in academia and beyond.

A Scientometric Review of Big Data Technology in Disaster Management

Recently, the occurrence of disasters for example, COVID-19, flood, fire has seriously threatened social stability and the public security. With the rapid development of big data technology, it has more and more applied in disaster management. Thus, the research aims to analyze the status quo of big data in disaster management by conducting a bibliometric analysis of the scientific publications from Web of Science. The number of documents published, the most cited papers, and the productivity of country were analyzed by

Histcite™. The research focuses were determined by clustering keywords using VOSviewer. Total of 7,743 publications were searched and the most active institution was Chinese Acad Sci of big data technology in current studies, and the most productive author was Sood SK from National Institute of Technology Puducherry with thirteen articles. And COVID-19, artificial intelligence and internet of things, machine learning and deep learning, social media and Twitter, resilience and smart city were most frequent keywords related to disaster management. Further analysis found that as the global pandemic of COVID-19 occurred and continued, it was the key object in current research; as the same time, with the continuous occurrence of disasters, the new concept of urban development "resilient city" had gradually become the focus of the international community; besides, in the era of big data, social media, especially Twitter, had become a mainstream for the public to share information, so the related governance of online public opinion is also a noteworthy part of disaster management.

'Can We Just Take a Break?': The Methodological Merits and Ethical Labour of Creative Biographical Interviewing

Drawing on insights from the author's experience across three research projects on youth and the life course, this paper explores how sensory and creative techniques are useful tools in biographical interviewing, but how they also require specific forms of ethical labour. The first project was my doctoral research on British women's drinking biographies; the second was a large mixed methods project on the resonances of post-war youth transitions and mobilities for British women's later-life identities and experiences; and the third is ongoing research on how austerity policies are shaping the life-courses and futures of young people in devolved regions of the United Kingdom, Spain and Italy. In the first two projects, biographical interviews were interspersed with elicitation techniques to facilitate multi-sensory engagements with the past. In the third project, creative techniques are used to encourage imaginative encounters with expectations and hopes for the future. Across all projects, different forms of sensation (e.g. hearing, sight, touch) and creative practice (e.g. drawing, writing, photographing) are mobilised to reconstruct past selves or anticipate future ones.

The paper investigates the methodological merits of using elicitation and creative techniques in biographical interviews, focussing on how such techniques enable movement across time. Sensory and creative techniques can produce unique forms of affect and intersubjective ways of knowing, providing access to past and prospective selves that are otherwise difficult to conjure. Rehearsed scripts about the self may begin to unravel, generating space for new knowledge. Feeling and temporality become densely intertwined in biographical interviews; this, in turn, necessitates careful choreographing of the use of such techniques. The paper concludes by reflecting on the ethical labour involved in layering techniques into interviews in ways that avoid overwhelming or burdening participants.

FERLANDER, Sara* (Sodertorn University, Sweden)

Social Sustainability in Marginalised Suburban Areas

Social sustainability is frequently described as a vague and over-looked concept. On a more positive note, it is portrayed as an open, flexible, dynamic and context-dependent concept. Social sustainability has also been described as an umbrella term providing an important meeting-place for different actors. Although no generally agreed-upon definition, social sustainability is often defined as a quality of societies that is given when an extended set of human needs are satisfied.

This paper departs from a general research aim to explore how we can build more gender equal, inclusive and socially sustainable cities. The question to examine is: To what extent are the needs of young women in marginalised suburban areas – a group identified as generally excluded from urban development processes – considered and satisfied in the urban development of their housing areas? Combining Lefebvre's theoretical notions of 'the right to the city' and 'the construction of space' with an intersectional feminist approach, a comparison will be made of how urban space is conceived by the urban developers and how it is perceived and used by the young female residents.

The empirical material of the study was retrieved through ethnographic research conducted in Sweden using a variety of methods. The material includes 25 interviews with professionals working with urban development in three marginalised suburban areas of Stockholm. The developers' views on social sustainability will be analysed in relation to other closely connected concepts, such as gender equality, intersectionality and placemaking. The intention is to gain understanding of how professionals work with social sustainability in marginalised suburban areas, with a special focus on young female residents. In addition, interviews with 40 female residents in these areas (aged 15-30) will be analysed, focusing on how the young women perceive their areas and what needs they express in relation to them.

Nature-Related Alienation in the Business Class: Combining Social Representations and Collectivities Theory

Alienation from the natural aspects of human life has been the core of many works and research, especially in biosociology and sociology of culture, bringing behavioural aspects together with psychological matrices regarding human social life. Social alienation would be the epistemic distance between a referential mode of thinking and the current state of collectively shared symbolics, which in our case relates to Nature, Environment, and Sustainability. The relationship between Society and Nature has always been troubled, especially in the face of economic production and extraction of natural resources in parallel to the short, medium and long-term impacts these derive. Industrialists and some business sectors (herein the business class) have been the main target of criticism as the most prejudicial to the environment. It generates debates around the green economy, planetary boundaries, sustainability, and social-environmental responsibility. The main idea of this research, within sociology and psychosociology, is to assess nature-related alienation by summarizing the content of ecology-related social representations within the business class collectivity. Moreover, this research explores their capacity to be positively transformed regarding intrinsic elements of this collectivity. Thus, we shall not only analyze the level of novelty or traditional socio-ecological thinking in the business class' social representations but also explore this collectivity as an organized system, along with their inside functioning and informational flow. Hence, this work presents the methodological part in which we combine Social Representations Theory and Collectivities Theory to asses Nature-related Alienation in the Business class using a structured questionnaire.

The Unnatural Divide between Culture and Nature: A Unified Sociological Approach to Spinoza on Alienation Theory

Alienation appears in many forms throughout sociological literature. Nevertheless, classical and modern social theories have approached alienation in many different ways and usually as a 'consequence' of a set of patterns of social order. Two hundred years before Marx, Durkheim and Weber, by the XVII century, Baruch Spinoza proposed an innovative -and contradictory, at that time- perspective which combined the natural essence of individuals as animals with the rationality-based processes of human culture. One of the leaders of Enlightenment thinking, Spinoza, proposed limits to the Church's power and new ways of approaching democracy, community-building and good living. Therefore, the main argument herein is that Spinoza brings an interesting approach that re-attaches human knowledge to biology, bringing humans back to nature and pondering an entire discussion on the character of alienation as central to this unified sociological approach. This research analyses three of Spinoza's works: Ethics, Theological-Political Treatise, and On the Improvement of Understanding (or Treatise on the Emendation of the Intellect). From these works, one can picture that when individuals become culturally alienated, in a negative way, diversity fails to belong to a culture and, therefore, lacks as a constituent of the individuals' nature. Alienation is as natural as culture because it is intrinsic to rational animals such as humans. However, as a feature of all communities, this biocultural distancing can be negative since nature's components, such as diversity and community, are detached from commonsensical epistemology. These mindset frameworks have emerged upon individualism, competitiveness and interest-based interactions, which derived from a capitalistic, neoliberal form of thinking. The research aims to include ecology and rationality back to sociological thinking to reinsert the individual back to nature where he belongs. Within the sociology of knowledge, this alienation-centred review of Spinoza's works expects to provide a new perspective on eco-rationality.

Meta-Organizations and Bioeconomy in Brazilian Amazon

Despite its importance to the world, the Amazon is undergoing an increasingly alarming process of destruction (Lovejoy & Nobre, 2019), making it urgent to strengthen a standing forest economy that combines the sustainable use of biodiversity with income generation and the well-being of local populations (Abramovay, 2021). As collective action devices apt to face complex challenges (Berkowitz, 2018; Chaudhury et al., 2016), meta-organizations have been recognized as possible protagonists of an amazonian bioeconomy (Fernandes & Lopes, 2022), but there is a lack of knowledge about the performance of these organizations in such a context. Thus, we aim to understand how meta-organizations have been orchestrating businesses and productive chains of biodiversity in the Amazon. Based on the case of Origens Brasil, we analyzed materials from documents (reports and internal files), observations (in meetings and events), and interviews. Our analyses show that by promoting participative decisions, bringing communities, small and large companies closer, enabling a flow of information about inputs and production processes to the final consumers, and fostering a sense of collectivity among its members, meta-organizations can support not only the creation of innovative products and the insertion of community enterprises in highly competitive markets but also contribute to the valorization of ancestral knowledge and the reaffirmation of the ways of life of different forest peoples - indigenous, riverine and traditional communities. If, on the one hand, these findings corroborate the role of these organizations in facing grand challenges, on the other hand, they force to pay attention to the difficulties present in their trajectories, linked not only to territorial and contextual specificities but also to aspects such as the dependence on a single orchestrator and the scarcity of managerial knowledge about this particular kind of organization. This invites future research on the internal dynamics of meta-organizations present in the Amazon.

FERNANDEZ, Guillaume* (University of Geneva, Switzerland)

A Configurational Approach to Discourse Analysis

Discourse is a matter of choice in particular situations. But what are the factors and constituents of such decision? My poster proposes a conceptual and theoretical framework with methodological tools to develop how discourse produced in dyadic relations is to be considered and situated in the larger social configuration the interaction is embedded within. An integrated and comprehensive view is taken: social situations are expected to be ruled by a normative context, defined as the juncture of the chain of interdependences that structures the personal network of the discourse producer, and his or her life trajectory. In this approach, the determinants of discursive practices are not only constrained by the moment of production and isolated from broader influences. Indeed, the position the individual and the dyad have in the personal social network influences the discursive practices in a twofold manner: on the one hand, the network limits the access to linguistic resources available within it, and, on the other hand, the structure of the network influences the agency of the individual, by the social control inherent to particular network characteristics. As for the life trajectory, the spheres of socialization experienced throughout the life course also provide linguistic resources and norms of usage. Furthermore, life event transitions impact the structure and composition of the configuration, which make the language dynamic and evolutive. The presented framework therefore challenges the current understanding of language use in interaction and tries to conciliate the symbolic interactionism with the configurational view. Social network analysis (SNA) methods and the tools allowing the deep study of social ties, both in terms of structure and content, are mobilized. For the life trajectory operationalization, sequence analysis is the privileged methodology.

How Institutions Shape the System of Knowledge Production: A Comparative Approach on 'Institutional Quality'

This paper presents the preliminary results of a two-year project about the role of institutional arrangements in the organization, orientation and outcomes of an innovation system.

Institutional quality is defined as a set of social relations, ideological practices and organizational configurations present in major organizational fields of a given society. They intervene in the real functioning of institutions, in the adequacy to their formal goals, and in their outcomes. Based on previous research, we have focused on "meritocracy", "immunity to corruption", "absence of islands of power", "proactivity", "openness to new ideas" and "existence of external alliances" as central dimensions of institutional quality.

Our methodological assumption is that, in order to investigate such issues, institutions should be observed as complex social objects formed by culture and social relations, and that direct observation should be used. The project has studied 11 key institutions of a national innovation system (Spain): 2 funding agencies, 3 universities, 3 public research organizations, and 3 large technology centres.

We have treated each institution as a in-depth case study. The fieldwork for each case has been done with the help of specialized experts who had access and previous knowledge of a specific institution. We have used ethnographic observations, together with qualitative interviews and reviews of internal documents, legal texts and external assessments. An interpretive approach is used firstly to capture the dynamics and meanings around the theoretical dimensions. Then, a Qualitative Comparative Analysis is performed to provide explanations in terms of 'conditions' and 'outcomes'.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The results reflect how societal aspects of institutional quality affect modes of knowledge production of major institutions of an innovation system. In particular, we have found that meritocracy, absence of particularistic networks and proactivity are the main determinants for institutional adequacy and for the contributions to relevant types of knowledge.

El Empleo Típico Como Norma En Argentina: Discursos, Estadísticas y Normativas

En las últimas décadas han proliferado conceptos para denunciar en qué medida el trabajo actual se aleja del "empleo típico": empleo atípico, precario, inestable. Todos estas definiciones se construyen en oposición a aquel empleo típico, caracterizado por una relación asalariada, de tiempo completo, ligado a un único empleador y lugar de trabajo, y protegido por la legislación laboral y las instancias de negociación colectiva.

La propuesta de esta ponencia es analizar, en primer lugar, en qué medida este tipo de empleo fue una norma en la Argentina. Planteamos aquí que si bien no alcanzó a los trabajadores de todos los sectores, fue el ordenador de las demandas y la acción colectiva, de las aspiraciones de los trabajadores y del marco normativo que se encuentra vigente aún hoy. En segundo lugar, la ponencia aborda de qué manera este modelo de empleo típico se ha erosionado en tres dimensiones: como norma legal, identificando en qué medida el marco protectorio de mediados de siglo ha reducido su alcance e incluso se ha tornado ineficaz para regular ciertas relaciones laborales; como norma aspiracional, a partir de discursos críticos del empleo típico que plantean otras características deseables para los empleos del presente y el futuro; y como norma estadística, cuantificando el peso de relaciones laborales que no se corresponden con esa forma de empleo. El análisis combina la revisión bibliográfica con el análisis documental y la sistematización de estadísticas laborales.

Analysis of Digital Social Networks in the Third Sector: Case Study in Andalusia

The Third Sector is facing a digitization process that has accelerated and intensified in recent years as a result of the pandemic. The analysis of the digital social networks of the entities of the third sector table in Andalusia allows an approximation to the presence, use and relationship of the different individual organizations and collective platforms with each other. This case study focuses on the 100 most prominent entities in Andalusia and their presence on Facebook, Twitter, Instagram and TikTok, the use of the first three, and the interaction only on Twitter (using the Metricool and NodeXL tools). The first conclusions show an unequal presence and use according to the networks and a different interaction according to the networks and subnetworks or substructures, where cohesion is very weak in the Mesa or Cáritas and stronger in the Red Cross. The challenges of a presence and use in accordance with the networks and the language used by young people and reinforcing the scarce interaction-cohesion in digital social networks, highlights the absence of communication and professional plans, as well as the difficulty of developing cybercampaigns and cyberactions.

Digital Activism Around the World: Comparative, Intergenerational and Gender Analysis of Social and Political Activism.

Social and political activism is one of the pillars of a country's political culture and democratic health. The latest wave of the World Values Survey with a sample of 84,222 respondents in 56 countries, collects two sets of questions on political actions face-to-face and digitally. A typology of activism and two scales of face-to-face and digital activism (FUPAS and DUPAS) have been obtained. A democratic divide is found between those who participate and those who do not, and another digital divide between those who participate face-to-face (Donating to a group or campaign; Contacting a government official; Encouraging others to take action about political issues; Encouraging others to vote) and digitally (Searching information about politics and political events; Signing an electronic petition; Encouraging other people to take any form of political action; Organizing political activities, events, protests). Its impact has been evaluated by age, more active and more digital young people; by gender, less females face to face or digital activism; and by country, the most active and digital developed countries.

Digital Activism Masked. the Fridays for Future Movement and the "Global Day of Climate Action": Testing Social Function and Framing Typologies of Claims on Twitter

We aim to analyze the Fridays for Future (FFF) movement and their online mobilization around the Global Day of Climate Action on September 25th, 2020. New media are especially important when analyzing the collective action of young people and their participation in more recent and transnational social movements, such as the FFF (Chase-Dunn and Almeida, 2020; Walström et al., 2019). To do this, we collect tweets using the Twitter API with the keywords #climateStrike, #FridaysForFuture before and after the World Climate Action Day on 25.09.2020. Due to Covid-19 this event is a unique opportunity to study digital activism. The dataset includes 111,844 unique tweets and retweets from 47,892 unique users. We use two typologies based on social media activism (eg Raynauld et al., 2016; Boulianne et al., 2020) and framing literature (eg Wahlström, et al. 2013) to understand the main function of tweets —information, opinion, mobilization and blame— and frames —diagnosis, prognosis, motivational. We also analyze its relationship and test its automated-classification potential. To do so we manually coded a randomly selected sample of 950 tweets that are used as input for the automated-classification process (SVMs algorithm with balancing classification techniques).

We find that the Covid-19 pandemic appears not to have increased the mobilization function of tweets, as the frequencies of mobilization tweets were low. We also find a balanced diversity of framing tasks, with an important number of tweets that envisaged solution on legislation and policy changes. We find that both typologies are not independent. The automated data classification model performed well, especially across social function typology and the "other" category. This indicates that these tools could help researchers working with social media data to process the information across categories that are currently mainly processed manually.

Elevated Marginality: An Ethnographic Study of Everyday Life in a Tower Block in Colombo

This research study illustrates that urban development projects create disruption in everyday life-worlds of people. My study focusses on urban communities dispossessed from their homes in *waththas* (Sinhala term for informal settlements) to government owned, high-rise blocks in Colombo, Sri Lanka. My main research aim investigates processes, relationships and means which afford resettled residents to construct a sense of home during a time of global and local uncertainty. This paper examines the impact of Covid-19 and governance of urban marginality in Colombo. I use ethnographic research in the form of lived experience and participant observation, a household survey and in-depth interviews. My study investigates the formation and perpetuation of discourses regarding the urban poor who are viewed as "common citizens" or the "urban underclass" (Bayat, 2000, Wacquant, 2008). I argue that the creation of discourses regarding the "urban underclass" and promoting rhetoric of "world class, slum free cities" legitimises the dispossession of the urban poor from "prime land". I also illustrate that despite relocation in high-rise housing projects and attempts to create modern, upgraded living, the discourse of the underclass persists in public sentiment, media representations and research which increases marginalisation of the urban poor. As Wacquant (2008, 4-5) opines "marginalisation is a product of class logic which is redoubled by ethnonational origin and attenuated by state action". This paper demonstrates the excessive power and strategies exerted by the state to govern the urban poor during crisis situations i.e. the pandemic leading to the post-Covid-19 situation. My findings demonstrate however, that all urban communities do not experience Covid-19 in the same way, rather their social class, ethno-religious differences, gender, health status and mobility and access to social capital exacerbate their marginality in diverse ways.

FERNANDO, Avanka* (University of Sussex, United Kingdom)

High-Life in a High-Rise: An Ethnography of Everyday Life in a Post-Resettlement Housing Project in Colombo, Sri Lanka

This research study illustrates the impact of urban regeneration projects on people's notions of home. My study is located in a state-constructed resettlement housing scheme in Colombo, Sri Lanka. The case of Colombo is significant in the context of global urban development and regeneration projects and pivotal to understanding historical vicissitudes, geopolitical dynamics and contemporary social changes. My study investigates the processes, relationships and means which afford residents in an urban resettlement housing project in Colombo to construct a sense of home. I use an ethnographic research approach to examine lived experiences of residents in tower blocks of Colombo. While much research has been conducted regarding the disruption to people's lives due to displacement and resettlement, studies often infer that urban development projects turn people into passive beneficiaries, increasing their vulnerability. However, the central focus of my study deals with everyday life in an urban community and I draw on Lefebvre's (1968) and Harvey's (2008) ideas of the right to the city to investigate the dispossession of the urban poor from the city. My study observes people primarily in a post-resettlement stage and I argue that people's lives increase in precarity due to development policies located within larger structures of global capital and authoritarian, state led evictions. However, I extend this argument beyond narratives of victimhood to people's everyday resistance and resilience found within their disrupted spaces of home and examine their sense of agency in determining the direction of their lives. I argue that although people struggle and suffer they persist in rebuilding their homes and establishing a sense of belonging and community. Furthermore, my study examines different resources and forms of capital that people possess and mobilise in rebuilding home and the continuities and discontinuities of community formation.

FERRARA, Carmela* (University of Naples Federico II, Italy)
SORRENTINO, Concetta (freelance, Italy)

Women Held in a Men's Prison. Ethnography of the Trans Section of the Poggioreale Prison, in Naples, Italy

The Naples prison is the only one in southern Italy to host transgender inmates. The transgender women detained in Poggioreale are in a separate section from the rest of the prison population, along with the sex offenders. During their experience of deprivation of liberty, trans women in prison often have loving correspondence with other inmates via internal mail and they meet their lovers while they have their daily the "stroll". This research collected 4 diaries of transgender inmates who were asked to write a few diary pages daily for 4 weeks. On the first page of the diary there were suggestions for writing. The areas to be explored were: forced coexistence with the other companions; the relationship with the prison staff; self-care; the emotions they felt during the day, the events that were significant to them. From the analysis of the diaries, conflicts emerged on the basis of nationality, as, with the entry of a Brazilian compatriot, the friendship between an Italian woman and a Brazilian woman was compromised by the communication in Portuguese between the two inmates of the same Nationality. In the experience of the Italian woman, the change of cell represented a move and an opportunity to furnish what had become her home for her. The diaries shed light on the role of cooperation for life "inside"; each offers her own material resources and skills: a Senegalese seamstress sews dresses and curtains for her companions, a Brazilian lady prepares the Feijoada for everyone. The passing of time is experienced in a different way by each one. Thanks to "good behavior", some live waiting to leave, someone else commits further crimes in prison, delaying the release from prison more and more.

FERREIRA, Lina* (Universidade de São Paulo, Brazil)

The Covid-19 Pandemic and Collective Actions in Response to Impoverishment in Brazil

Among the various phenomena structured and restructured during the Covid-19 pandemic, what the Brazilian media called a wave of solidarity quickly stood out. It was reported messages in elevators that offered services to go to the market or pharmacy, especially for those who were considered a "risk group". There were also reports of concerts on balconies and a series of activities aimed at the well-being of people, that were based on the principle of solidarity. However, these reports did not reveal an important class dimension. Offering a trip to the market or living in a building with balconies are life possibilities that carry the marks of social class in Brazil. For a significant portion of the Brazilian population, the question was less about who would do the shopping and more about whether they would consume food. Although a lockdown policy has not been effectively implemented in Brazil, the periods of low circulation of people on the streets, directly affected the way of earning a living for the lower classes. It was in this scenario that we witnessed a wave of solidarity also in the neighborhoods and slums. In common to all of them was the principle of offering collective responses to risks and uncertainties, in

a scenario of overlapping crises, with low state intervention and accelerated impoverishment of families. The objective of this work is to systematize and categorize these multiple solidarity campaigns that have spread across Brazil as a response to the impoverishment of families. Based on documentary research, which has institutional reports, cataloging, reports, websites, and social networks as its source, this work aims to contribute to studies that are thinking about new forms of associativism in Brazil and the types of attachment mobilized by Brazilians in a crisis context.

Evaluación DEL Impacto Y La Gestión De LOS Riesgos EN LOS Servicios Sociales. Validación DEL Modelo a Través DEL Método Delphi

Nuestra sociedad atraviesa en la actualidad una serie de tensiones sin precedentes que afectan de manera importante a la ciudadanía. El sistema de servicios sociales no es ajeno a esta realidad y debe hacer frente a necesidades sociales más complejas que requieren un conocimiento exhaustivo del contexto en el que se producen. La generación de estrategias y metodologías capaces de prever, evaluar y prevenir estos riesgos sociales en cada contexto territorial es, en la actualidad, una pieza fundamental para mejorar la eficiencia, calidad y oportunidad de la prestación de estos servicios. En esta comunicación se propone un modelo de medición de riesgos, aplicado al caso de los servicios sociales, tomando como referencia el método HVCRA, más utilizado en inundaciones, sequías, zonas sensibles ante tempestades o huracanes, seísmos o consecuencias del cambio climático. En concreto, se presenta los resultados obtenidos de la validación de dicho modelo, a través del método Delphi, El procedimiento para llegar a un consenso por parte de las personas expertas se ha realizado en dos rondas de participación. En cada cuestionario se ha evaluado el grado de importancia de los indicadores en las dimensiones de vulnerabilidad, amenaza y resiliencia, extrayendo la media (importancia) y desviación típica (grado de acuerdo). Los resultados obtenidos en la primera ronda han permitido mejorar el modelo; con la segunda vuelta se han consolidado y revalidado los acuerdos y se ha planteado la propuesta definitiva del sistema de indicadores que conforman el modelo.

Beyond Borders: The Contribution of European Sociology to Approaching Migrations and Cultural Diversity

Sociology, recognised as social science, emerged and consolidated in Europe through the contribution of authors such as August Comte, Karl Marx, Émile Durkheim, Max Weber and Georg Simmel. Thoughts and concepts found solid ground in other world contexts where methodologies to approach social reality were refined, as in the United States of America. Many of the early days' sociological concepts and methods continue to be operative when we face an extremely complex and diverse world, facing uncertainty and a process where we see a new world order emerging. One of the biggest challenges we face today is the displacement of people due to wars and forced migration. There are clear moments in the history of Europe where we saw how we could be open to newcomers and envision diversity as social richness. Nonetheless, today we see how rising populist discourses exclude *the other* and suggest closing the borders to those who desire to make their living in the *old continent*. Those discourses threaten cultural diversity and European transcultural societies. Starting from solid tradition, sociologists in academia and outside academia have shown how cultural diversity and intercultural dialogue promote civic participation and improve democracy. Sociologists working in Europe reflect and analyse the importance of culturally diverse communities, not merely tolerating difference but assuming that difference is the basis for building and cultivating bridges in European democratic societies. A wide range of tools, including in the field of arts and cultural education, has been used by sociologists to work from those differences. The social impact of those initiatives has been the subject of research and intervention from researchers and practitioners of sociology. What can we learn from the knowledge produced in that field when face now such turbulences in Europe? Are we disseminating enough their social impact?

FERST, Thomas* (Swiss Military Academy, Switzerland)
SZVIRCSEV TRESCH, Tibor* (Swiss Military Academy at the ETH Zurich, Switzerland)

Abstract: Attitudes of Swiss Recruits Toward Conscription

As part of an international research project on "Conscription in International Comparison", recruit surveys were conducted in Estonia, Finland, Lithuania, Norway, Sweden and Switzerland. Between March 14 and 25, 2022 (ninth

and tenth recruit school week), data collection took place in Switzerland, with a total of N=1684 recruits from five different recruit schools being surveyed via an online survey. Using a questionnaire battery consisting of 14 items, the attitude of the surveyed recruits regarding military service and conscription was measured. The results show the following:

A majority of respondents is willing to defend Switzerland under all circumstances in the event of an attack and presupposes a military defense that functions imperatively for this purpose. In addition, the majority of respondents agree that conscription is an important element in guaranteeing security in Switzerland. A relative majority agree that the military is an integral part of society and that Swiss citizens are obliged to defend Switzerland with weapons. In addition, skills acquired prior to military service can be used during military service. Two out of five respondents believe that Switzerland could defend itself in the event of an attack and that extending compulsory military service to women would be the right thing to do. The views that there is a natural link between patriotism and conscription and that, as a result of conscription, there is a latent exchange of values between civil society and the armed forces are the least strongly agreed with.

RC01-29.1

FERST, Thomas* (Swiss Military Academy, Switzerland)

Abstract: Conscription in Switzerland: An Important Element in the Swiss Society

Switzerland continues to adhere to conscription and the militia system introduced in Switzerland in 1848, even after the end of the Cold War, the transformation of the Swiss Armed Forces and the trend towards the suspension of conscription in Europe. The 1989 and 2013 rejected military and conscription abolition initiatives are symbolic of Switzerland's direct-democratic system and illustrate the importance of the armed forces. While men would have to perform compulsory military service, women have been able to perform military service on a voluntary basis since 1995. The population supports the current military structure and form of recruitment. Demographic change, departures to civilian service and the declining social importance of the militia system in society, politics and the armed forces are challenging the military in terms of alimentation. As a result, the expansion of compulsory military service and the mandatory participation of women in the orientation day are currently under consideration. The population is open and positive to both plans. Both cases can only be implemented by means of a constitutional amendment. Due to the mandatory right of referendum, the final decision rests with the Swiss electorate.

Youth Food Literacy for Global Health and Ecology: Building Food System Awareness and Action

Youth in developing countries are largely expected to succumb to the worldwide trend of dietary deskilling already widespread in the industrialized countries, whereby nutritional knowledge anchored in local food systems is inexorably devalued. Mitigating interventions, such as food education, have historically taken a limited normative approach focused on nutrition, personal health, or preserving food culture. Although long-term (adult) outcomes of youth food education are difficult to measure, few historical initiatives have targeted more abstract goals such as creating virtuous food citizens. The evolving concept of 'food literacy', however, nominally aims to measure deeper food system awareness and valorize it, thereby mobilizing young people to independently elect novel, more sustainable dietary lifestyles. Not only does high food literacy have the potential to encourage individual efficacy, such as more economical consumption and waste minimization, but it may also lead higher-order engagement, such as ecological diets (veganism, Slow Food, organic, etc.) and food system activism. This study evaluates the nascent food literacy movement, which has minimally targeted food literacy education to improve health and individual food security, and questions whether the creation of political space for higher-order engagement in food literacy is also feasible. The study is based on subsidiary data (side interviews, follow-up discussions, and key informant interviews) that took place alongside food literacy benchmarks in Cambodia and Japan. I conclude that the food literacy ideal is encumbered by the conservative curriculum of home economics, with older generations (including teachers) favoring more conventional outcomes of food education, such as knowledge about nutrition and development of simple domestic and food preparation skills. There is a hesitance to render the neutral practicality of food and diet into a medium for critical learning about justice, animal rights, environmental problems, and public health.

FIELD, Hillary* (The University of Melbourne, Australia)

Exploring the Role of Specialist School Wellbeing Staff in Promoting Intersectional, Queer Student Inclusion.

Thesis Supervisors: Dr Ani Wierenga & Professor Lynn Gillam (OAM)

Background

Queer neurodiverse young people are an underserved, underrepresented and under-researched population. Yet, this intersectional population exists within school settings, globally. Specialist wellbeing staff (SWS) work with this particularly vulnerable population in the Australian school context but do so without best-practice guidelines and frameworks. This presents ethical and practical challenges for professionals and their communities.

Approach

This research sought to identify an ethical and practical approach to increasing visibility of a largely academically invisible adolescent population. Despite limitations related to the availability of literature in an emergent field of research, the author drew on a diverse pool of evidence-based resources. The research included policy analysis and the identification of appropriate conceptual frameworks and theories to guide a reflective analysis of the phenomena. Intersectionality, critical social theory and neurodiversity were used as key words and conceptual frames for the literature search, with a foundational grounding in constructivist epistemology.

Outcome

The author suggests that the goals of promoting protection and autonomy of queer and neurodiverse students seem to act as contradictory imperatives, especially in the specialist school environment. The author argues that although this framing is plausible at first glance within literature and practice, it is a false dichotomy. Both goals are valid, and both are achievable. This research identifies increasing intersectional visibility as an approach that meets both the protective and autonomy-promoting values of school wellbeing professionals.

Innovation & Significance

Grounded in a practical and theoretically informed understanding of the phenomena, the author's work provides a conceptual foundation for further community engagement and research. The research challenges myriad ableist notions including neurodiverse population de-sexualisation, offering practical pathways for education communities committed to the improvement of this intersectional population's health and wellbeing.

Dealing with the Past? a Critical Gender Perspective on Current Transitional Justice and Human Rights Policies in Post Conflict Contexts in Latin America: Pending Challenges and Questions

This presentation provides a critical overview of the gradual and complex incorporation of a gender perspective in transitional justice and human rights policies in post cofnclit contexts in in Latin America over the past four decades. It addresses the main milestones along with the pending challenges and vacuums regarding how to provide effective redress for gender-based violence perpetrated in contexts involving armed conflict and authoritarian regimes (with emphasis on Colombia, Peru and Argentina)-. To this end, the presentation includes specific case studies (elites, grassroots organizaciones, human rights and feminist organizations) that illustrate the tensions between the shortcomings and demands of survivors to achieve accountability, truth and reparations for gender-based violence. It also identifies changes and challegnes regarding current human rights discussion and debates in the political arena in post-authoritarian and post-conflict contexts in Latin America exposing how current policies dealing with past gender based political violence is actually a problem of the present.

Violence Against Academic Freedom in Latin America: Science and Educaiton at Risk?

The presentation will analyze the current trend of growing attacks against academic freedom and scholars in Colombia and Brazil as well as the responses given by universities in order to deal with such aggressions. Violence against academic freedom is not a new fact in Latin America, though it has acquired new forms and modalities. In the context of very fragile democracies, dictatorships, and armed conflicts in the 60s, 70s, 80s and 90s, universities, researchers, lecturers, and student movements were one of the main targets of attacks, human rights violations and political violence (Califa & Millán 2016; Sandoval López 2002; Acevedo Tarazona & Gómez Silva 2000). In the current Latin American context, attacks and restrictions against academic freedom are particularly serious in Colombia and Brazil. However, the seriousness of this situation to which they are exposed does not yet seem to have achieved much visibility. People working in academia are not usually perceived as a group at risk, as other civil society actors such as journalists, trade unionists, or human rights defenders clearly are. Similarly, there are no studies regarding how universities react and respond to protect their scholars, in which there seems to be no protocol for these cases. This research is an attempt to filling this gap

by giving account of a series of reactions which do not seem to be supportive of protection measures but that, on the contrary, can worsen the situation of those who are at risk.

FILARETI, Caterina* (University of Salento, Italy)

Digital Technologies Applied to Oncology

In recent decades, the National Health Service has gone through phases of change that have challenged established internal relational practices and styles of external representation, decisively affecting the relationship between the hospital and territorial institution and the person-user. The need has emerged for institutions to communicate with citizens, responding to criteria of transparency and market logic, and to ensure consistency between the quality of the service provided and its external representation, initiating complex reviews and reorganizations of internal communication processes (from the "Health Report", 2018). We can consider these dynamics as part of a broader social and cultural shift that sees a growing empowerment on the part of providers, called to a collective participation aimed at taking care of the person. The need for a Network organization stems from the complexity of healthcare needs, and one of the prerequisites for an Oncology Network to function is the activation of an organizational model. Digital technologies are now part of our daily lives, but it is with the Covid-19 pandemic that the need for radical innovation in the approach to health has arisen. The goal is to design a homogeneous pathway in which to take care of the cancer patient and his or her needs by offering effective and efficient responses. It is no longer just the increase in survival but, also, the clinical benefit for the patient in combining disease stability and good or at least acceptable quality of life. The aim is to experiment with autobiography as a space of care through the use of the Logbook as a tool for knowledge and support of patients, caregivers and health care workers through the design and implementation of an Application, for smart devices, as a tool for information-guidance-accompaniment of the oncology patient, his caregiver and social and health care workers.

A Sociology of Itinerancy: Donald Pierson and Its Importance for Studies of the Body in Brazil

Agreeing that "The past shapes the future", the present research aims to analyze the influence of Donald Pierson in the constitution of the sociology of the body in Brazil. We can consider Donald Pierson (1900-1995) an outsider sociologist, in the sense of Becker (2008), in addition to being a roaming sociologist, as he spent his life between Brazil and the United States, with some passages through Mexico and Europe. In the US, due to his professional activity, he moved quite often. However, we are interested in understanding how his work – notably "Negroes in Brazil" – constitutes a tribute to the studies of the black body in Brazil. For that, we developed a documentary and bibliographical research, of a qualitative nature, in different locci of investigation, in two countries. The first investitures comprised visits and research at the University of Chicago and University of Florida, Gainsville campus, both located in the USA. Subsequently, we carried out a complementary research at the Edgard Leunrouth Archive, located at the State University of Campinas, Brazil. The research findings show us that, despite being an outsider sociologist in both countries, Pierson produces a set of significant research on the relationship between man and society (environment) in Brazil, revealing notions of the body, namely, black body and influencing future studies, which, in one way or another, dialogue with his work. Notions such as race, physical attributes, gestures, social stratification and religious mediations in Bahia/Brazil are some of the important themes addressed by the author in "Negroes in Brazil".

RC54-JS-120.2

FILGUEIRA DE ALMEIDA, Dulce* (University of Brasilia, Brazil)

For the Humanization of Bodies: A Reflection from David Le Breton and Tim Ingold

This article aims to understand possible meanings of the notion of outsider human bodies in Brazil, based on some theoretical-methodological developments of David Le Breton's corporeality paradigm and the notion of "taking the other to seriously" by Tim Ingold. Considering two empirical cases, of an indigenous body and the situation of human bodies thrown into open ditches, we reflect on the meanings attributed and the way outsider bodies are treated during the pandemic of the Covid 19. We consider that the pandemic, insofar as it corresponds to a posture that advances according to individualistic policies of the body, which are mixed with a deep lack of interest in collective life, collaborates to reveal a face of the civilizing process that is barbarized in its meanders. More than a 'sanitary' response, we need a humanitarian response that can establish and establish more solidary relationships that go beyond the individual condition, considering the different corporeities and taking others – in the anthropological sense of the term – seriously.

"It's Expensive...Not Everyone Can Afford It...It's Unpleasant": Students' (un)Ethical Ideas of Marketised-Privatised Faith-Based Schooling in Australia

Increasingly shaped by neoliberal efforts upholding ideals of 'buy education', Australian faith-based independent schools are envisioned to provide a more responsive market, premised on competition to encourage student mobility. In this economically contested climate, such schools might be essentially driven by income rather than by preference, involving an adaptation to a new moral reasoning 'within the logic of competition'.

This session describes a study which draws from a larger mixed-method research project including focus groups and interviews with 84 stakeholders of one Australian faith-based community-- involving principals and presidents of faith-based school boards/councils, parents, students and teachers, as well as government school students and parents of students in government or private non faith-based schools. Specifically, the session takes a *virtue ethics* approach to bear on normative arguments about the way faith-based and government school students view contemporary faith-based schooling-- a space illuminating its ethical responsibility to foreground values of social consciousness in a nation where marketisation and privatisation are firmly embedded in the field of education. The session explores students' ethical 'understanding' of faith-based schooling and how it is shaped in a context promoting individualist representations of neoliberal subjectivity.

The presentation develops the argument that contemporary faith-based schooling is captured by students as a financial enterprise that (mis)aligns with just virtue, contests the virtue of self-improvement and illuminates the virtue of courage. The emphasis on fee/affordability programs and related consumeristic discourses is paradoxically creating socially unjust divides between the 'haves' and 'have-nots' in a system also seen as 'disconnected' from socially challenging issues-- seemingly reflecting a compromised engagement with ideals of improvement, arguably 'taken for granted'. It is (re)imagined though as a social vehicle that can initiate a courageous course of action intended to foreground an equitable and inclusive education for *all* in a society shaped by neoliberal philosophies.

Youth Unemployment and the School-to-Work Transition Phase: The Case of Italy and Pctos As an Education Policy Tool

Youth unemployment and precarious employment are considerably significant in Italy, trend further intensified by the Covid-19 pandemic. Among 15-24-year-olds, Italy has the highest unemployment rate in Europe after Spain at 22.6% and an inactivity rate of 73.8%. Moreover, several studies found strong connections between economic crises, job precariousness, and youth transition to the labor market. This paper aims to foster this debate by analyzing the implementation of an Italian education policy: Projects for Transversal Competences and Orientation (PCTOs), a mandatory teaching methodology introduced in 2019. This methodology offers high-school students a period of practical experience within an organization, educating and orienting them by promoting *on-the-job* training. We explore PCTO as a possible tool to tackle youth unemployment and favor the school-to-work transition phase in terms of skills transmission and employability. The research investigates the perspective of tutors in organizations and institutions involved in PCTO implementation, resorting to both qualitative and quantitative research techniques. Findings are drawn from a combination of a background research with 12 interviews to key

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

informants, an online survey administrated to tutors of organizations aimed to investigate 367 projects, and qualitative interviews with 15 tutors among survey respondents.

The research reveals discrepancies between the official objectives behind these projects and the needs of Italian businesses. Although PCTOs officially focus on orientation and soft skills, the organizations emphasize the gap between the students' outgoing skills and those required in the labor market. Furthermore, the school system lacks in effectively supporting students in their orientation and school-to-work transition phase. Research shows the need to improve the orientation role of PCTOs and emphasize technical and professional skills to increase youth employability. Finally, by showing best practices and weaknesses of this educational tool, the paper also provides policymakers with guidelines to maximize the effectiveness of similar youth policies.

Solidarity Failed: Organizing the Neighbourhood Ten Years after Gezi

In the years following the Gezi uprisings, many different neighbourhood solidarities emerged and then "mutated" into various forms of organization and mobilization in Turkey. In this talk, I will look at the predicament of neighbourhood-oriented pandemic solidarity groups that emerged responding to the social urgencies created by the COVID-19 pandemic in Turkey. I hope to open up a discussion concerning when and where this form and level of organization, gathered around the ideals of direct democracy, reciprocity, and solidarity, failed by rethinking pandemic solidarity networks established in the first wave of the pandemic, which understood local everyday space/scale and everyday life as a political ground. I focus on the social, cultural, and political contexts in which movements emerge and argue that such local movements cannot fulfil their potentials due to structural conditions. I put forward six dynamics paving the way of 'failure': the first two factors are related to the organizational forms, demands, and repertoires of solidarity networks (Politics of the scale of the neighbourhood and the omission of the gendered relations of the household), the other four are related to the emergence of populist authoritarian regimes and the socio-historical structuring of urban neighbourhoods and the entrenched culture of cooperation. These factors, related to the restructuring of the state and the formation of authoritarian populist regimes in the last decade, have been present since before the pandemic started. The ways in which the state has dealt with the consequences of lockdowns and social distancing seem to have reinforced the effects of these factors on the neighbourhood level. While the practices of solidarity include powerful practices and ideals set forth by our movements, I argue that they run the risk of being 'incorporated' by populist regimes and their opponents alike.

FIRDAUSI, Aabid* (Johns Hopkins University, United States)

War of Position in Global Garment Production Networks – the Case of the Asia Floor Wage Alliance

Global garment production networks are characterised by fundamental power asymmetries between lead firms (brands) in the global North and suppliers and workers in the global South. Brands present themselves as "buyers" of clothes even as they cause real harm to workers through their purchasing practices shaped by labour arbitrage. Though global anti-sweatshop activism has been studied extensively, this paper specifically focuses on how labour and its allies in the global South attempt to counter the "race to the bottom" engendered by capital.

I explore this question using a case study of the Asia Floor Wage Alliance (AFWA) – a transnational alliance of garment labour unions and labour NGOs – that emerged as an initiative to bargain for a regional floor wage in the garment industry to match the capital mobility within Asia. Using data from organisational documents and interviews with activists, I argue that compared to top-down corporate interventions and global North-based consumer-based movements, AFWA is a labour-centred initiative that counters both the hegemony of the doctrine of comparative advantage and the gendered and racialised devaluation of women workers of the global South.

Using the Gramscian concept of the war of position, I explore how AFWA articulates a feminist conception of a living wage, promotes freedom of association to tackle gender-based violence, and demands for regulation of supply chains by holding brands jointly liable. AFWA's transnational activism thus cuts across multiple binaries that have caused dilemmas for studies of labour movements – success/failure, exploitation/oppression, global/local, and theory/practice. The paper also explores the contradictions of such strategies – especially the tensions between different levels, the problems of scaling up and coordinating between different labour and regulatory regimes. By analysing the potential and limits of AFWA, the paper contributes to the larger debates on the possible futures of transnational activism.

Well-Being in Socio-Spatial Contexts: Intersectional Perspectives on Children's Experiences in out of-School Learning Settings

Although child well-being has developed into an internationally expanding, inter- and transdisciplinary field of research, the spatial dimension of well-being has long had secondary importance in research. Studies that take a socio-spatial perspective show that well-being and space cannot be isolated from each other. Against this background, we present preliminary results from a research project conducted in Germany (the WIKK*I project), which addresses children's experience of well-being in out of-school learning environments, applying a socio-spatial perspective. In Germany, there are only a few studies that use the concepts of child well-being research for analysing the significance of out of school learning environments for social participation and educational equality. The WIKKI project aims to contribute to this research gap through a comparative ethnographic study analysing children's perspectives and experiences of well-being in two different out-of-school-institutions in two different urban contexts. We investigate how supportive relationships and networks can be formed and strengthened taking into account physical-material and socio-cultural contexts and how, from an intersectional perspective, dimensions of inequality are inscribed in children´s experiences and notions of well-being. Our aim is to provide knowledge for concrete action at the professional and political level in urban and educational planning together with practitioners, municipal stakeholders and children.

In the presentation we reconstruct how experiences of agency, security and self in out-of-school learning environments (such as children's and youth leisure facilities and in the neighbourhood) are made relevant by the children. The analysis has a special focus on the relevance of characteristics of out-of-school learning environments for experiences of agency, security and self from children´s perspective and for their participation in educational processes and projects. We discuss the importance and relevance of out of school environments for participation in education as well as for reducing social barriers to education.

FISCHER-KOWALSKI, Marina* (Institute for Social Ecology, Austria)

Energy Transitions and Social Revolutions

According to our research, **social revolutions** are not randomly scattered in space and time, nor are they confined to a certain historical epoch. They are likely to occur under conditions of **shift in societies' metabolism**, in particular their sources of energy. According to our empirical study of 71 countries, for which we could reconstruct the energy metabolism across the past 5 centuries, 80% of all **revolutions** that **happened** in these countries occurred **in the "critical phase" of first access to fossil fuels**. We see good reason for this: the superior energy return on investment (EROI) of fossil fuels over traditional biomass, and the sheer additional quantity of energy becoming available, create new opportunities, shake up power structures and trigger fundamental socio-political transformation. In less than half of the countries this transformation has been achieved without social revolutions, but if revolutions occurred, the process of fossil energy uptake was accellerated. Overall, we could find no statistically significant relation between historical time and the pace of access to modern fuels. Among our sample of developing countries after World War II, many of them previous colonies, we find an even slower pace of transition to an industrial energy regime, which speaks against the availability of technological advances as such being the main driving force. Such insights link the study of politics and history to the study of **social metabolism** in a systematic way and are particularly thought provoking in the current situation where we require a withdrawal from fossil fuels towards "renewable" energy sources (most of them again land-based), and, **climate change** taken seriously, to a lower level of energy consumption.

FISCHER-NEUMANN, Marion* (University of Duisburg-Essen, Germany)

The Role of Older Siblings in the Educational Attainment of Children with and without Migration Background

In contrast to the parents, the influence of siblings on children's educational attainment has received less scholarly attention. Yet, sibling relationships

involve in contrast to parent-child relationships particular structural advantages for social influences (e.g., horizontality, longevity, intimacy). Furthermore, the relationship to siblings includes educationally relevant resources (e.g., educational competences) that can be transmitted during everyday interactions. In particular, older siblings are effective role models and surrogate parents, which may be particularly evident and relevant within migrant families, where they can potentially compensate for the disadvantages of parents in host-country-specific resources (e.g., lack of competence in the national language, inter-ethnic contacts).

Hypotheses are derived suggesting a positive influence of older siblings' educational attainment on child's educational acquisition in dependence on characteristics of the sibling constellation (e.g., age spacing, gender, biological relatedness) as well as on older siblings' cultural capital, both determining the quality of the between-sibling socialization.

Results of multilevel models for repeated observations of individuals nested within families in the German "Socio-Economic Panel" (SOEP 1984-2020) confirm that older siblings' educational attainment (maximum years of schooling) increases younger sibling's educational acquisition (years of schooling) over time net of other factors such as family social background. Two-way interaction analyses evince that the between sibling transmission effect is stronger in the case of close age spacing, smaller number of older siblings, mixed gender sibling constellations as well as biological older siblings and among non-migrant children. Further, the influence varies with higher frequencies of high-brow cultural participation of older siblings. Yet, all conditional older sibling mechanisms, except of high-brow cultural participation of older siblings and gender constellation, apply more among migrant families.

Thus, the paper elucidates that older sibling mechanisms and conditions such as close age spacing, small numbers of older siblings or biological relatedness are specifically crucial for educational acquisition of migrant children.

Beyond the Interview - Qualitative Methods for the Inclusion of RARE Disease Groups in Research

The characteristic physical, cognitive, and psychiatric features associated with rare and progressive neurological diseases such as Huntington's disease (HD) can hinder their research participation particularly in conventional qualitative methods (LaDonna & Ravenek, 2014) and may result in labelling them as hard to reach (Wexler, 2010). Two doctoral researchers, who are also both allied health professionals present and discuss their research approaches and strategies on how to better engage with this often-underrepresented research population (Audulv et al., 2014; Hoppitt et al., 2012).

Through the lens of ethnography and the use of multiple narrative sources, these approaches highlight the importance of a flexible method that tailors and adapts to the research participants unique needs. Establishing a researcher-researched relationship based on trust, thinking of methods as ethics, and drawing on professional knowledge are highlighted as core foundations to maintain research quality.

The reflective and practical accounts offered in this paper hopes to facilitate dialogues on the use of inclusive and creative qualitative approaches in people with complex disease symptoms, and to better encourage researchers to explore the scope of in-depth research data beyond interviews.

Counting Women's Deaths 'with' Male Violence and 'from' Male Violence: Lessons from the Pandemic Practices of Counting Deaths.

From January to June 2020 academics, advocates and media commentators became increasingly concerned with the impact that lockdowns/shelter in place/stay at home directives might have on women and children living with violence. So much so that Phumzile Mlambo-Ngcuka, Executive Director of UN Women named the gendered consequences of Covid-19 isolation restrictions as 'The Shadow Pandemic' (April 2020). A view shared by Action Aid (2020) who declared that the world was 'sleep walking into the shadow pandemic of global femicide'. However, Fassin (2021: 155) observed that rather than the pandemic itself being unprecedented 'it is the response to the pandemic that has been unprecedented' going on to comment on the consequences of these public health responses for 'missing lives and injured lives' (ibid 169). Indeed, in many countries people were presented with daily counts of the missing and injured in the form of 'deaths with' and 'deaths from' Covid-19. Such counts emphasised the fragility of human life in which the ability to 'colonise the future' (Giddens, 1991) became problematic for everyone. However, for women and children living with violence such fragility has always been mundane and ordinary – an everyday experience (Genn 1988). The coronavirus pandemic may or may not have increased femicide rates globally. It may still be too soon to count. However, in relation to counting such deaths there is much to be learned from the pandemic practices of counting 'with' and 'from' Covid-19.

This paper will explore the implications of these practices and their relevance and implications for understanding how to measure without 'disappearing the measured' (Merry 2016: 216); of counting women's deaths 'with' male violence and 'from' male violence.

'Core' or 'Administration'?: Navigating Teacher Workload Strategies

This paper addresses the changing conditions of teachers' work in New South Wales (NSW), Australia, one of the largest education systems in the world. Recently, the state Education Department has put forward plans to "free up time spent on low-value work so...teachers can focus on activities that improve student outcomes". Under the Quality Time (QTAP) initiative, the Department seeks to explicitly reduce administrative burdens that have contributed to the significant intensification and extensification of teachers' work. According to our large 2018 workload survey, and reflecting growing teacher workloads in many countries, NSW public school teachers work upwards of 55 hours per week, with 97% reporting an increase in administrative requirements in the five prior years. This situation was also amplified by COVID-19.

Given its intended focus on 'administration', QTAP's strategy to reduce teacher workload by providing lesson plans, texts and learning materials provoked a heated public response from many NSW teachers. Our research shows that, contra the proposed strategy, teachers want *more time,* not less, for "developing new units of work and/or teaching programs" with our research finding that teachers' most valued task is "planning and preparation of lessons".

Succeeding prior policy failure to reduce "red tape", QTAP's proposal raises questions about what is considered peripheral 'administration' and what is considered core 'teaching'. If some aspects of teachers' work is positioned as simply 'administration', this potentially sidelines work that teachers value as part of their professional identity, such as the creative and intellectual work of lesson planning. We examine this development through applying Carol Bacchi's policy analysis tool of 'What's the Problem Represented to Be?" to critique the policy rhetoric. We also draw on labour process theory to understand how the policy's response to work intensification potentially reduces autonomy, discretion and skill, and expands the scope for outsourcing and privatisation.

On Credible Sociological Model Building: Potential and Pitfalls of Empirically Realistic Agent-Based Models

Agent-based computational modeling (ABCM) plays a central role in Analytical Sociology. Analytical Sociology aims to explain social phenomena with precisely described and empirically realistic social mechanisms. Mechanistic explanations in AS target, in particular, complex micro-macro interactions in which individual behavior at the micro-level of society can bring about macro-outcomes individuals neither anticipate nor desire. ABCM research has provided multiple computational explanations of such phenomena, including social segregation, opinion polarization, or societal inequality. ABCM attracts analytical sociologists in particular because it combines the analytic precision of computational modelling with the flexibility to accommodate empirically realistic assumptions and calibrate models based on empirical information As such, ABCM promises to be a valuable tool for constructing credible theoretical explanations of complex social phenomena.

This paper will discuss how striving for empirically realistic ABCM can create a tension with another important aim for ABCM: full analytical comprehension of the link between model assumptions and model implications. Without the full comprehension of the dynamic processes generated by an ABCM, little has been gained if these dynamic processes resemble the social phenomena the researcher wants to explain. By means of a number of examples drawing on sociological applications of ABM to social segregation and opinion polarization, good practices are discussed for how empirical realism can be added to abstract and initially unrealistic models. It is argued that developing credible computational explanations of social phenomena requires a methodology of stepwise addition of empirical realism, combined with systematic development and computational testing of tentative explanations of the outcomes a computational model generates. While this is in many ways similar to experimental methodologies applied for explaining empirical phenomena, the key difference is that other than social reality, a computational model is fully transparent and fully under the control of the researcher, allowing for systematic analysis and experimentation with it.

Racist Disdain and Murderer-Emotion in the Video Clip of the National Socialist Underground

The video clip whose parts I wish to present constituted one of the main pieces of evidence in a five-year long court case (2013-2018) directed against a group of Neo-Nazis who, undetected, had been killing small businessmen with migrant background in big German cities between 2000 and 2006. They called themselves the National Socialist Underground (NSU). The video is said to have been produced by the NSU and is called variably the NSU-(murder)admission or the NSU-propaganda video. It has several versions. The full version is mostly in color and is over 16 minutes long. The main protagonist in the video is the Pink Panther. An off-voice comments the plot in rhymes. For lack of time I will focus only on two aspects: i) its two ways of portraying the murder victims, the humanizing and the de-humanizing, which, although they contrast, both communicate disdain and ii) the propagated murderer-emotion meant to entice the viewers to join the NSU - the elite of the Neo-Nazis, its "political soldiers". These research results could be achieved by a careful inspection of the images, the spoken word and the time each image was shown, calling for engagement with additional, external information sources.

A Brief History and Overview of Capacs Accreditation

CAPACS Chair, Dr. Michael Fleischer, and CAPACS Vice-Chair, Dr. Norma Winston present a brief history and overview of the Commission on the Accreditation of Programs in Applied and Clinical Sociology (CAPACS or the Commission), specifically in the context of global higher education accreditation; the increasing demand to accredit disciplinary and professional programs in the social and behavioral sciences as a process of external quality review; and the oversight of higher education accreditation commissions. Particular attention focuses on the creation of CAPACS in 1995 (originally known as the Commission on Applied and Clinical Sociology or CACS) as an independent accreditor of sociological practice programs covering all approaches and identities supported in the workplace and professional marketplace (e.g., applied sociology, clinical sociology, engaged public sociology, translational sociology, and forensic sociology, etc.); CAPACS's mission; and the Commission's *Accreditation Standards, Policies and Procedures,* and *Review Process Guidelines* for conducting traditional and virtual accreditation reviews in accordance with CHEA, USDE, and international guidance, including under declared public health (and other) emergencies such as the COVID-19 pandemic. Additional discussion addresses the information that is expected in programs' annual reports to the Commission following accreditation and reaccreditation, and the benefits of CAPACS accreditation for sociology departments, the discipline of Sociology, and the profession of sociological practice in an era of jurisdictional closure and state regulated professional practice.

State-Movement Relations in Comparative Perspective: Findings from the Deminova Project

State-movement relations in comparative perspective: Findings from the Deminova Project

In this presentation we will present some initial findings from the DEMINOVA project at Aarhus University (PI Cristina Flesher Fominaya) which attempts to excavate democratic imaginaries and innovation repertoires from pro-democracy movements in comparative perspective. In this panel we will focus on demands of the state by movements in the quest for "real or more democracy" as well as state/movement relations in the context of pro-democracy contestation. Some of the case examined will include Hong Kong, Taiwan, Chile, and Spain. If available in the data, we will also discuss strategies to avoid co-optation, particularly challenging when movement actors join institutions and parties.

FLEW, Terry* (The University of Sydney, Australia)

Mediated Trust: Ideas, Interests, Institutions, Futures

Questions of trust and mistrust have been identified as being central to contemporary societies. There is evidence globally of widespread and pervasive mistrust of political, media and business institutions worldwide, and declining trust in social and political institutions has been associated with populism and political polarisation (Norris & Ingelhart, 2019), public health misinformation (OECD, 2020; Wang et al., 2021) and citizen disengagement with public institutions. The UN Secretary-General, Antonio Guterres, has identified 'a malady of mistrust' as being as damaging to global societies as COVID and climate change (Guterres, 2021).

The program identifies communication as being central to trust. The centrality of communication to trust has been identified through frameworks such as the public sphere and communicative action (Habermas, 1974, 1984), theories of media influence (Gerbner, 1998), media framing (Entman, 1993; Entman & Usher, 2018), 'post-truth' (Harsin, 2018; Waisbord, 2018), affective news (Papacharissi, 2016), mediated populism (de Vreese et al., 2018), misinformation (Bruns et al., 2020; Livingston & Bennett, 2020), and moral panics (Bratich, 2020). At the same time, the relationships between communications and other fields of trust research have often been implicit rather than explicit (Flew, 2021b). It has often hinged around questions of trust and credibility in media, or what has been termed **mediated trust** (Bodo, 2021; Schafer, 2016; Stromback et al., 2020).

This paper will critically apply the concept of mediated trust to through the framework of the **'Three I's' of ideas, interests and institutions** developed in Flew, 2021. It will apply this framework in the context of two questions: the relevance of trust to the future sustainability of news media in the face of advertising revenue shifting to digital platforms, and the extent to which innovations in internal governance, as distinct from nation-state regulation, can act to enhance trust in leading global digital platforms.

TG10-848.2

FLORES-MÁRQUEZ, Dorismilda* (Universidad De La Salle Bajío, Mexico)

Being There or Not: Presence and Absence in Times of Algorithms

The study of digital practices implies the presence of actors in digital spaces, and usually these presences require the human will to be built, through the creation of accounts in platforms, the creation and consumption of content, the interactions with human and non-human actors. But, what about those actions that appear without having decided? What about those actions that leave traces even without the actors being aware of it? There is a gap about the absence and its implications in times of algorithms.

In this paper I explore the absence and presence in digital platforms, by drawing on two cases of absence that leave traces in digital platforms: the case of an actor who does not have accounts in socio-digital networks, but who is nevertheless traceable from other accounts; and the case of a route that left a trace when the phone was without signal. These cases allow me to display the theoretical, methodological, and practical challenges for social research. In this way, I discuss that from the production of presence (Gumbrecht, 2004) and technologies of life (Gómez-Cruz, 2022). I argue that in times of algorithms, the pervasiveness of digital technology in everyday life is such that absence can be read as a different form of presence. These changing dynamics require methodological imagination to approach them.

Temporal Risk Management in the Gig Economy: Agentic Responses to Uncertainty and Irregularity

The gig economy – also known as the 'platform' or 'sharing' economy, *inter alia* – has suffered numerous critiques in recent years, mainly having to do with worker rights, safety, and pay. However, its reputation has remained largely unscathed in relation to *time*, where gig platforms are thought to provide greater temporal agency to workers, who manage their own tasks, working locations, and hours. Drawing on qualitative research of a sample of local, 'home task' gig workers in Australia, this presentation explores whether the uncertain, irregular, and routinely risky nature of gig work enables or constrains workers' ability to 'make the most of their time'. While the risky nature of gig work evidently constrains workers' temporal agency, my research finds that gig workers agentically respond to and manage this risk in diverse and creative ways. As such, workers find ways to enjoy and feel in control over their work, even as they acknowledge the uncertainty, irregularity and risk they live with day-to-day.

(Said 1978; Judt 2002) that enriched the early-nineteenth rift between the North and the South with the West-East one (Rietbergen 2015). Currently, post-socialist studies are working on a cultural reinterpretation of states once subjugated to the soviet influence through a post-colonial approach (Kovačević 2008; Kideckel 2009). In fact, within a post-colonial perspective, Eurocentrism is the tendency of viewing an ethnic social standard as the only basis to evaluate judgments over other practices, perceiving it as superior (Joseph et al. 1990).

The research embraces this critical framework to dive into the information flows aggregated by Google News on the Russian-Ukrainian conflict, presenting an East-Eurasian perspective. The study follows three main questions. Aside from a European perspective which narrative and frames typify information warfare? Which media outlets emerged as preeminent about the issue? Is the European viewpoint dominant in post-socialist and Eurasian countries?

Countries undergoing analysis are Italy, Poland, Serbia, Georgia, and Turkey. Methodologically, the commercial determinants under control have been minimised (Ørmen 2016; Rogers 2013). The data collection started the day of the invasion for two weeks: applying a short burst model (Brügger 2011) suitable for sensational events (Hannak et al. 2013). Per a total of 2.400 news, headlines and leads (Van Dijk 1998) of the top five links (Pan et al. 2007) have been clustered into principal frames (Goffmann 1974) and topic categories (Ducci et al. 2021; Guo et al. 2022; Lombardi 2016). Then, trying to overcome a deterministic approach (Bentivegna and Boccia Artieri 2021; Nardi and O'Day 2000), a glimpse of the audience's behaviour about top recirculating news is offered through the Crowdtangle extension mapping re-sharing circles on Facebook public pages or groups (Giglietto et al. 2020).

FOLEY, Kristen* (Torrens University Australia, Australia)

A Hermeneutic Exploration of the Alcohol Marketplace and Lived Histories of Australian Midlife Women

This presentation will draw on the thinking, praxis and findings of my doctoral research exploring the commercial determinants of alcohol consumption for Australian women in midlife (45-64 years). I focused my attention on what I call the *alcohol marketplace* to extricate the complex agencies and structures which configure Australian women's alcohol consumption during midlife as 'heavy' in relation to health guidelines and consumption patterns of younger generations of Australian women.

I collate data collected with Australian women in midlife in different social classes during observational interviews in their homes (n=13 participants) with the labels of alcohol bottles (n=246 at writing) captured 2020-2022. These datasets were explored using ideas of flourishing, self-making, social class, gender, time and the lifecourse; further inflected by data analysis within two concurrent projects – repeat qualitative interviews about alcohol consumption with women in midlife (n=90 interviews) and women pre-midlife (n=31 interviews).

This interpretive work was anchored in hermeneutic discussion with two *Women's Thought Collectives* that I designed to oversee my doctoral work 2021-2023 (n=19 participants). These collectives comprised Australian women in midlife who played a dual role both observing the social world – contributing data – and in thinking with me about emerging ideas and logics that could develop a deeper understanding of women's alcohol consumption in our current historical moment.

I reflect on how the novel methodologies I developed for the in-home observations and thought collectives derived particular understandings of alcohol, social worlds, and emotions. In this presentation I will weave together concepts from relational sociology, feminist philosophy and contemporary hermeneutics to explore how alcohol as a social practice emerges from contextual histories, logics, possible selves – as well as their contests and intersections. I bring together the lives lived, voices, and views of the Thought Collectives to surmise 'where next' for sociological alcohol research.

Does Working from Home Mean Working All the Time? Technology-Enabled Work Intensification in the Legal Profession Post-COVID

Flexible working arrangements are an important part of reconciling family and other caring responsibilities, managing work-life balance, and promoting gender equality at work. Advances in digital technologies (e.g., smartphones, video conferencing, cloud sharing) have facilitated the uptake of flexible working in many professions, including the law, a process that was accelerated by the Covid-19 pandemic. While digital technologies have enabled greater flexibility around where, when, how lawyers work, they have also blurred – or even erased – the boundary between home and work, 'insidiously extending the hours of work and impinging on the realm of intimacy' (Thornton, 2016: 1). Drawing on interviews with 30 senior legal practitioners and an online survey of practicing solicitors in New South Wales (n=766), this paper examines men and women lawyers' experiences of technology-enabled flexibility during the Covid-19 pandemic and considers the long-term implications of technology-enabled flexibility for gender equality in the legal profession. We find that women lawyers were much more likely to report that hybrid and remote working had increased the intensity of their workloads and increased their

working hours. Consequently, we argue that, in order to reap the benefits of technology-enabled flexibility without detrimental consequences to women's careers, organisations need to carefully consider the workload demands placed on solicitors in a world where 24/7 connectivity and blurred boundaries are the new normal.

Farmers' Perception and Response to Climate Change across Agro-Ecological Zones in Conflict-Ridden Communities in Cameroon

The livelihood of rural communities in the West African state of Cameroon which is largely dictated by natural forces (rainfall, temperatures, and soil) is today threatened by climate change and armed conflict. This paper investigates the extent to which rural communities are aware of climate change, how their perceptions of changes across different agro-ecological zones have impacted farming practices, output, and lifestyles, on the one hand, and the extent to which local armed conflicts are confounding their efforts and adaptation abilities. The paper is based on a survey conducted among small farmers in selected localities within the forest and savanna ecological zones of the conflict-ridden Northwest and Southwest Cameroon. Attention is paid to farmers' gender, scale, and type of farming. Farmers' perception of/and response to climate change are analysed alongside local rainfall and temperature data, and mobilization for climate justice. Findings highlight the fact that farmers' perception generally corroborates local climatic data. Climatic instability has negatively affected farmers' output, food prices, standards of living, and food security. However, the vulnerability of the population varies across ecological zones, gender, and crop types. While these factors also account for differences in local response and adaptation to climate change, ongoing armed conflicts in these regions have further complicated opportunities for climate-driven agricultural innovations, inputs, and exchange of information among farmers. This situation underlines how conflict can derail local and gender adaptation efforts to climate change because societal challenges do not always occur in isolated sequence to be confronted individually. It thus, call for comprehensive public strategies that do not only mainstream gender into farmers' perceptions, and differences, into climate policy, but also consider Anglophone conflict as another priority for sustainable development in Cameroon.

The Epidemic of COVID 19 in Brazil: The PLACE of Mental Health Care

The trajectory of the epidemic in Brazil is something that deserves to be highlighted for its importance (more than 30 million infected, and about 600 thousand deaths), for the difficulties in facing it, due to its continental territory and population, and for the adversities arising from the fragility of public health policies. The health model advocated by SUS (*Sistema Único de Saúde* - Unified Health System) is recognized for its excellence in epidemic control and effective practices of universal assistance in vaccination campaigns. In fact, the country has successfully eradicated the main pathologies controllable by vaccination: poliomyelitis, measles, smallpox, are important examples. Likewise, the HIV-AIDS control and prevention policy is a world reference.

Manyr problems resulting from this pandemic are only now coming to light: the effects of the pandemic on people's mental health, whether due to complex processes of lack of interactions and the interruption of "normal life" for a prolonged period. The effects of these changes in sociability on people's mental health are not yet known. Several scholars have pointed out the longer-term effects of the action of covid 19 on human health, including those that directly impact mental health: because of social isolation, learning deficits, difficulties in socialization in children, panic syndromes, and states of depression in adults are the most cited. In this communication, we intend to discuss the effects of the covid 19 pandemic in Brazil, taking into consideration mainly the challenges faced by health professionals and educators in the construction of a practice of management and prevention of states of mental illness. I think it is very important to emphasize that the country, living in the horrors of denialism and dissemination of "fake news", finds a very hostile environment for dealing with this problem, which presents unprecedented challenges.

Brazil, Democracy, and Deepfakes: Overseeing the 2022 Elections

Deepfakes are audiovisual content using software capable of emulating real people's appearances and voices. They are a key component of disinformation spread on social media nowadays, as they allow people to create content from scratch with anyone saying anything they wish. These are different from cheap fake materials, which are manipulated media created with basic editing techniques. In September 2022, Brazil had its 200 years independence celebration accompanied by election campaigns. This year's election allows Brazilians to choose a new president and it is regarded to be crucial for Brazilian democracy given its very polarized scenario. Former president Luiz Inácio Lula da Silva (a left-wing and very popular former president of Brazil), along with Jair Messias Bolsonaro (current Brazilian president and far-right politician), are the two leading candidates. The use of deepfake technology during the 2022 campaign became clear when videos started to circulate and went viral. One of them showed journalist Renata Vasconcellos (an anchor from Brazil's biggest news program - Jornal Nacional) stating that Jair Messias Bolsonaro was the one who had the most voting intentions. As Luiz Inácio Lula da Silva was always the front runner of all voting intention polls, the video was quickly classified as a deepfake. Its intentions were clear: to cast doubt about the polls and the election results. Of course, this is not the only case in which deepfakes were used. In this presentation, we will analyze some of these cases, discussing the role this type of disinformation effort plays in a democracy such as Brazil.

Inter-Ethnic Partnering and Integration in Australia: A Qualitative Study

Successive waves of migrants have contributed to Australia's increasingly culturally diverse population. While most Australians support this diversity, there remain concerns about integration and the sharing of Australian values. Australia's migration history and geopolitical location provide a unique context to examine intermarriage and its significance for integration and social cohesion. Mixed marriages and relationships between members of different groups can function as a linking element in society and thereby promote integration and social cohesion. Using intermarriage or interethnic partnering as an indicator of integration, we draw on 180 in depth interviews with individuals or couples to examine the influences on mixed partnering that contributes to transformative socio-demographic changes and integration. We use customised census data to provide insights into patterns of intermarriage in Australia. Participants groups in the study include North African and Middle Eastern (Arabs and Lebanese), East Asian (Chinese), South Asian (Indian), Sub-Saharan African, Southern/Eastern European (Italian and Greek) and Anglo-European Australians. We focus on second or higher generation individuals in the prime partnering age of 20-45 years. This cohort is more likely to have experienced mixed marriage or relationships due to English language proficiency, economic, educational and special integration compared to first generation migrants. We present preliminary findings from the data relating to the life course of individuals including the social dimensions of family, religion and values.

Strategies for Tackling Gbv in the Workplace: The Iuf's Experiment with Global Agreements to Fight Sexual Harassment

Global Framework Agreements (GFAs) are a long-established mechanism through which the international labour movement has attempted to improve conditions for workers enmeshed in global supply chains. From IndustriALL's agreements with global apparel firms like H&M to Public Services International's agreement with French energy multinational Engie, GFAs are negotiated between the Global Union Federations (GUFs) and multinational corporations, most commonly headquartered in Europe.

The development of GFAs can be understood as an attempt by the GUFs to define the terrain of voluntaristic regulation on their own terms. While the content of GFAs varies, they generally affirm core labour standards including freedom of association and the right to collective bargaining. Some also support better working conditions and safety standards or, arguably, open space for ongoing union building and bargaining at global, national or local scales. For the most part, however, GFAs have been broad in their scope and not applied to specific labour policy and governance domains.

A notable exception to this generalisation is a series of global agreements negotiated by the IUF, which focus specifically on sexual harassment at work. The first of these was signed with food services multinational Sodexo, in 2011, and the most recent in 2021. Based on interview data and a detailed examination of these agreements and the processes surrounding their negotiation and implementation, this paper examines the motivations for and impact of these targeted agreements. Our analysis points to the institutional adaptation of global union-MNC agreement making, in particular a transition from general corporate commitments to respect labour standards and worker rights to targeted agreement making to address an urgent policy concern about the injustices of GBV at work.

Tweeting Against Workplace Violence and Harassment: The Global Unions' Use of Social Media in the Campaign for the Ratification of C190

In 2019, the ILO adopted the Violence and Harassment Convention (C190), the landmark convention that seeks to eliminate all forms of violence and harassment from the world of work. The long-standing public campaign against workplace violence and harassment did not begin when C190 was passed in 2019, or even a decade earlier, when the International Labour Conference (ILC) called for measures to end gender-based violence in the workplace. Nor did it end with the adoption of C190 in 2019, or even in 2021 when the convention came into force.

There is no doubt, however, that these milestones generated a new momentum, with feminists and labour activists pressuring governments around the world to ratify the convention. This paper examines one element of that campaign, namely attempts by members of the RatifyC190! coalition to convince sympathizers to amplify their demands by using the hashtags like #ratifyc190 in their social media posts. Using Twitter data from 2019–22, we assess the extent to which Twitter has served as a means to (a) spread awareness of the convention among union and non-union actors and (b) build online communities around the issue of workplace violence and harassment. We consider the implications of this case for a broader discussion of how the digital reach of the global unions can enhance efforts to address instances of workplace violence and harassment.

Charismatic Creatures: Lessons from Sociological Theory for Conservation

In the field of wildlife conservation, scholars and practitioners have developed the concept of "charismatic megafauna" or "charismatic species" to refer to those animal which attract the most attention from the public. The charismatic species concept has been helpful to those in the field of conservation, one way of thinking through the relationship between the public and conservation efforts.

However, while researchers generally agree that charismatic species do exist in popular culture there are important debates about the role these species should play in conservation efforts. Should those involved in conservation efforts—scientists, policy makers, zoos—emphasize charismatic creatures in order to attract public support? Or will focus on charismatic creatures draw attention away from the needs of other species and the complex ecological challenges that exist in the spaces between species?

All of these questions are essentially about the nature of charisma itself. To date, research on charismatic megafauna has been descriptive, involving polls and surveys in which respondents are asked to list or select charismatic animals. This literature is useful for identifying charismatic species, but does not suggest why certain species are charismatic or offer any conclusions about how this charismatic distinction implicates wider conservation efforts.

Two new sociological models of charisma may help demystify the concept of charismatic species. Each presents a unique account of how humans socially construct charismatic relationships with non-human species. The emotional resonance model suggests that charismatic species are the result of highly charged interactions, while the reputational management model suggests that certain species become charismatic because of the work of reputational entrepreneurs. This paper discusses the specific mechanisms identified by each model and outlines how they apply to the specific type of charisma associated with non-human animals.

FORDAHL, Clayton* (University of Memphis, Sociology Department, USA)

Climate Change and the Micro-Foundations of Social Order: Lessons from Historical Catastrophes

The micro-sociological tradition has maintained that social order can be produced and maintained through small-scale social interactions. Empirical research suggests that small talk is one form of order-generating mundane interaction. Talking about the weather, perhaps the most prototypical form of small talk, demonstrates how people use neutral subject matter to convey a sense of self and a shared definition of the situation. But what will happen to discussions about the weather in a future shaped by climate change? How will people talk about the weather when it ceases to be a neutral topic? To answer these questions, this article surveys cases of social interaction during four environmental catastrophes. Patterns of interaction are analyzed to develop a speculative account of weather talk in a future marked by increased frequency of extreme weather events. The article finds that small-scale social interaction can produce a sense of social order in some—but not all—types of environmental catastrophe. The ability of people to speak meaningfully about extreme weather events in a climate-altered future will depend on the extent to which these events continue to be seen as mysterious and unpredictable.

Employer Responses to Supply Chain Crises, Skills and the Use of Migrant Labour: Evidence from the UK Warehousing Sector

Recent shocks resulting from Covid 19, Brexit, Us-China trade, the energy crisis and the ongoing conflict in Ukraine have impacted significantly on supply chains. One particular area of focus has been on the role of labour, labour capacity and skills. Firms have long followed entrepreneurial capital into exploiting global supply design and have become over-reliant on China and other low-cost sourcing alternatives. Long supply chains and networks have become more complex yet these often operate with just-in-time delivery in which lean downstream operations close to markets prevail. Supporting upstream routes that can often be traced to China have become increasingly fragile and shown to be easily disrupted (Galbraith, 2021). Firms are increasingly looking at more local sourcing and shorter chains of production, requiring more labour and skills to be available locally. In sectors like logistics in the UK, such skills are in short supply, and post-Brexit migration policy has done little to address this.

This paper looks at the use of labour, and migrant workers specifically in the warehousing sector in the UK. It considers employers' strategies towards the use of labour (contract types, recruitment, skills development and training) in the context of widespread labour shortages in the sector, which have become more acute since COVID-19 and as a result of changes to the migration regime. The paper draws on analysis of an original survey of UK employers' labour strategies in 4 sectors including warehousing, alongside interviews with warehousing employers, workers and other stakeholders, research which is being conducted as part of the ESRC 'Limits' project. The paper highlights employer workforce strategies, and responses to shortages, including changes in the use of migrant labour. It also considers the role of training and skills within supply chains. The paper draws out the implications of the findings for worker collectivities and solidarities.

LGBT+ Life in and after 'Lockdown': Young People's Experiences during the COVID-19 Pandemic in England

In this paper we draw on longitudinal research with LGBT+ young people in one English location to explore how the covid-19 pandemic impacted on the lives of LGBT+ young people. Early periods of 'lockdown' involved school and college closures, and wider restrictions on how people could (not) socialise. Significantly, the LGBT+ youth service that all participants were involved with became an online service (rather than face-to-face). Although there was early awareness of negative impacts of the pandemic on LGBT+ young people (Barnardo's 2020, Batty 2020), research on this remains relatively limited, at least in the UK.

In our study, young people discussed what they found hard, such as missing friends, missing the routine of school, and fears about the 'threat' of the virus, but they also talked about what they liked about the enforced change in lifestyle. These included the benefits of 'escaping' unwelcome school-based experiences, strengthened (digitally-enabled) peer support, and the responsiveness of youth service provision they were in receipt of. We explore these experiences using data from short online self-completion surveys (36 respondents) and 39 participants involved in discussion groups and/or 1-1 interviews. In conclusion, we highlight the importance of access to support, but also show how LGBT+ young people's experiences of the pandemic, including periods of 'lockdown', were not wholly negative.

FORNOS KLEIN, Stefan* (Universidade de Brasília, Brazil)

Contributions By Lélia Gonzalez: Antiracism, Critique and Resistance

This presentation seeks to reflect upon the place of resistance in a conceptual-theoretical sense, hereto pointing out pitfalls in so called critical theory of society, based upon diagnosis brought forward specially by Max Horkheimer and Theodor W. Adorno, and arguing how the social theory of Lélia Gonzalez can contribute towards a wider and more critical understanding of resistance. By rooting my viewpoint in these two theoretical perspectives, conceived in very different historical and social contexts, I aim to address how they complement themselves and, as such, enhance the critical view on contemporary authoritarian manifestations. Notwithstanding the various changes taking place during the last decades, I presuppose that a number of key elements are constitutive of how the forms of repression and marginalization express themselves in capitalist societies, (re)producing an array of inequalities, foremost - though not exclusively - those of ethnic and racial kind. Nevertheless, critical theory, and specially its first generation, did not put racial struggles as a centerpiece of their analysis, although they evidently took into account forms of ethnic persecution. For her turn, as a marginalized and black intellectual writing foremost during the 1970s and 1980s, Lélia Gonzalez offers a relevant critical social theory, allowing us to deepen the reflections on the place of racial oppression to understand how capitalist dominance exerts itself. Hereto I shall account for her arguments surrounding the relation between active and passive forms of resistance in the context of slavery in Brazil. Hence, fostering resistance remains a vital trait for the social sciences' horizon of intellectual practice.

Peripheral Internationalization at a Crossroads: Trajectories and Agendas in the Brazilian Context

Internationalization has become an important trait of the contemporary scientific production, which resulted in the growth of institutional incentives – or rather pressure – towards it. In this process, academic life is often seen as an intrinsically internationalized environment, while it is actually the result of a myriad of social, political, and economic factors and disputes held local and globally.

Our paper proposes to examine several elements that structure internationalization in a peripheral academic context, looking at graduate professors of sociology in Brazil. Hereto we focus foremost on the roles and destinations of research stays abroad, deepening the reflection on the rationales that lead to these travels. We tentatively address patterns of internationalization, trying to understand if there are relations between the themes/objects of research and the decision to go abroad. This takes into consideration that centers and peripheries are relational and condition each other, thus leading us to observe the different dimensions and how the strategies of internalization present themselves. This allowed us to shed light on how the pressure to internationalize has been shaped and is shaping the most recent context of Brazilian sociology.

Our data show an established circulation of researchers, with the countries of destination concentrated in the Global North, especially the USA and West/Central Europe. What stood out is the clear predominance of certain forms of internationalization among institutions with more prestige, leaving open if the institutions' prestige allowed their professors to obtain better funding, or if attracting professors with deeper experiences contributed towards raising their prestige. Concerning the chosen themes and institutions, while circulating knowledge can contribute towards more diverse perspectives, this has been limited through the reproduction of the patterns pointed out above. Thus, our findings corroborate the notion that the simple traveling of researchers is not enough to prevent the peripheral condition.

Communication, Connectedness and Collegiality in Health Professionals' Use of Online Communities for Peer Interaction.

Online communities have emerged as sites for new forms of connectivity in health. Research to date has centred on how these digital health tools support patient peer interactions and professional-patient interactions. Our research instead focuses on how health professionals use online communities (including Facebook, Twitter, Instagram, LinkedIn, WhatsApp) to engage with their peers for education, information exchange, support, and social connection across different online platforms. Our study included an international sample of health professionals from medical, nursing and allied health disciplines including physiotherapy, psychology, speech pathology, and podiatry. The current project is the first to incorporate a mixed-method multidisciplinary and multiplatform study of online communities on an international scale to capture the evolving nature of health professional networks, interactions, and communication. Our participants detailed numerous aspects of their online community participation. This included reports of their use of multiple platforms and distinguishing different ways of presenting themselves and engaging with each platform.

Traditional intra- and inter-professional hierarchies were less evident in digital interactions leading to broad inter-professional networks of shared clinical interests. This was achieved through both the functionality of the digital technologies and the responsiveness of individuals to using these technologies. Self-presentation was also considered in these interactions as participants used symbols of membership, including their qualifications, and evidence-based content posting, in their communications. Differences were found in the extent to which participants were concerned about their personal privacy in their professional online profiles. Online connections also translated to collegial interactions and professional achievements including publication writing. These findings show how participation in online communities interlinks with offline professional interactions and provides benefits that may be inaccessible or unavailable in offline worlds. As digital communications become more common place, traditional professional networks are transformed, enabling connections with others with shared interests across hierarchical and geographical boundaries.

FORWARD, Pamela* (Whistleblowing Canada Research Society, Canada)

Organizational Culture and Whistleblowing: The Invisible Forces Driving Reprisals

Countries around the world consider whistleblowing a reliable warning system for corruption and regulatory failure because whistleblowers are usually employees who have in-depth knowledge of complex systems and organizations, often impenetrable and incomprehensible to outsiders.

Why then do whistleblowers, these harbingers of wrongdoing, suffer censure and reprisals? The search for an answer sparked this case study of a whistleblower's concerns regarding the regulatory agency Health Canada's process for assessing the safety of new drugs for marketing in 1996. The purpose was to describe, explain and explore to better understand how, and why this paradox occurs and continues, and, to explore the role of law and culture in the situation. The study highlights the impact of whistleblowing on the whistleblower, the organization, and ultimately the implications for public safety and government accountability still relevant today. Additionally, the study provides insights into the human and social processes involved, informs pathways to correction of the paradox and includes a contingency theory of reprisals which the presentation focuses on.

The methods used were process-tracing, in-depth interviews and data and document review.

The results suggested reprisals occurred due cultural dysfunction in Health Canada likely exacerbated by the impact of deregulation. Peculiar occurrences

in the courts and Parliamentary Standing Committees, both mechanisms democratic societies rely on to check organizational abuses of power, point to the need for further research in these areas.

The conclusion is a multi-faceted approach to addressing culture is needed to ensure whistleblower protection legislation can be effective and accountable, ethical organizations can flourish.

Theories and Methods in History of Francophone Sociology 2000-2020

Recent developments in the broader academic landscape- such emergence of global history, entangled histories, cosmopolitan thought zones, postcolonial perspectives,etc.- leads to a renewal of how the history of a discipline is imagined and written.A large variety of materials (ex. big data) is available electronically, which changes the working habits of the historian, At the same time, more conventional methods of the craft remain on the agenda. My paper combines theoretical and methodological reflections with empirical works on the Francophone histories, mainly France and Quebec, during the two last decades.

Between the Personal and the Political. the Analysis of the Strategies Undertaken By Women Facing Oppression Due to Tightening up the Abortion Regulations in Poland

This presentation analyzes the strategies undertaken by women facing oppression due to tightening up the abortion regulations in Poland. On 22 October 2020, during the pandemic, Constitutional Tribunal ruled that abortion due to "a high probability of severe and irreversible impairment of the fetus or an incurable life-threatening disease" is inconsistent with the Constitution. This ruling led to mass street protests in the following months, and hundreds of thousands of people demonstrated despite the pandemic restrictions. The ruling affects all women by interfering with the intimate sphere of their lives. Additionally, the worsening of perinatal care during the pandemic increased the atmosphere of fear.

During the demonstrations (between 27.12.2020 and 6.04. 2021), we carried out qualitative research – the IDIs on a sample of 25 women supporting the protests, representing three categories – women who:

(1) have not been making procreation decisions yet (on the threshold of early adulthood),
(2) were at the stage of making such decisions (between early and middle adulthood,
(3) did not make such decisions anymore (between middle and late adulthood).

The research analyzes the mechanisms of the interpenetration of the public and private spheres in the protesting women's experiences.

We reconstruct women's strategies for coping with the ruling's oppressive decision:

(1) intimate but repetitive on a social scale dealing with anxiety by constructing narrative hypothetical rescue scenarios (e.g., planning emigration, pointing at cultural, social, and financial capital enabling abortion abroad),
(2) participating in nationwide protests (the rebellion's community of humiliated women described in Castells's term of resistance identity),
(3) the withdrawal to a private sphere where women could regain agency (as the result of the protest's failure),
(4) engagement in grass-root feminist activities (e.g., supporting women's organizations and support nets).

In this context, we analyze the mechanisms of the rebellion's community's emergence, disintegration, and transformation.

Critical Analysis of the Mental Health Diagnosis Process from a Critical Sociocultural and Gender Perspective – on the Example of Eating Disorders in Men

This presentation analyzes mental disorders diagnosis from a critical sociocultural and gender perspective on the example of eating disorders in men. This example reflects the entanglement of mental disorders' concepts and

sociocultural gender schemas (the dialectic tension between the persistence of traditional gender patterns despite binary gender schemas blurring or vice versa).

The insufficient knowledge about eating disorders in the male population is explained by the low morbidity rate, resulting in the exclusion of men from epidemiological studies. Simultaneously, anorexia's incidence among men is rising, and the ratio between women and men has changed from 9:1 to 4:1 over the last 30 years. Moreover, the diagnostic criteria in the latest versions of DSM (5) and ICD (11) systems have partially changed (ex. secondary amenorrhea, attributed only to women, has been excluded from anorexia's diagnostic criteria). These changes, on the one hand, reflect increasing gender flexibility and, on the other hand, generate changes reflected by the epidemiological data.

The authors are sociologists and psychologists, and one of them is also a psychotherapist specializing in eating disorders treatment; and they prepared a model that includes the analyses of:
- the diagnostic criteria of eating disorders in the following versions of DSM and ICD, the critical aspects of functional and dimensional diagnosis from the perspective of gender bias and gender roles patterns transformations;
- the sociocultural schemas in diagnosticians that affect the perception of patients depending on their genders;
- the consequence of diagnosis on the patient's self-perception and social relations;

The authors carry out research (in the mixed methods approach) involving mental health specialists in Poland (psychologists, psychiatrists, psychotherapists). This research focuses on how the participants interpret the above factors. This presentation will discuss the research model, preliminary results, and early theoretical conclusions.

Movilizaciones En El Contexto De La Pandemia: El Uso De Las Redes Sociales Por Organizaciones De Trabajadoras Del Hogar En Brasil

La pandemia de Covid-19 llevó al necesario aislamiento social, dejando a algunas categorías de trabajadores más expuestas que otras a los riesgos de contaminación, como fue el caso, en Brasil, de las trabajadoras del hogar. En ese contexto, organizaciones de estas trabajadoras y movimientos sociales se movilizaron en las redes sociales para hacer campaña a favor de la categoría. Estas diferentes movilizaciones tenían como objetivo, en primer lugar, denunciar que muchas trabajadoras del hogar eran obligadas por sus empleadores a seguir trabajando incluso durante la cuarentena determinada por las autoridades públicas, además de que otras habían sido despedidas. En segundo lugar, estas movilizaciones exigían el permiso retribuido inmediato de estas trabajadoras, formales o informales, y la creación de un fondo de emergencia para las trabajadoras del hogar despedidas o imposibilitadas de trabajar por la crisis del Covid-19. El objetivo de este trabajo es examinar algunas de estas movilizaciones realizadas por la Federação Nacional das Trabalhadoras Domésticas (Fenatrad) – Federación Nacional de Trabajadoras del Hogar – en conjunto con movimientos sociales en el año 2020, como la campaña "Cuida a los que te cuidan" y lo "Manifiesto de las hijas e hijos de las trabajadoras del hogar", y analizar el uso de las redes sociales y su importancia para estas acciones. Para ello, metodológicamente, se monitoreó el desarrollo de estas campañas en redes sociales y se realizaron entrevistas a algunos de sus organizadores.

The Concept of Masses in Quijano, Marcuse and Portantiero

The concept of "masses" is central to many contemporary critical social theories, both from the "North" and from the "South". Among them, we want to highlight three simultaneous reflections made by the Peruvian Aníbal Quijano, the German Herbert Marcuse and the Argentinian Juan Carlos Portantiero, between the end of the 1960s and the 1970s. It is a period in which, from a generalized process of crisis, radicalization and political polarization, the masses acquire significant importance. In this context, each of these three theories focuses predominantly on a specific dimension of the social, that is, they address the concept within a specific "field of problematization". In the case of Quijano, it will be the economic dimension; in Marcuse's, the cultural; and in Portantiero's, the political.

In this presentation we will focus, then, on tracing three key elements within these reflections: a) the "vocabularies" and notions with which each author refers to the masses (such as crowds, popular classes, mass-media, marginal sectors, etc.); b) the dichotomies and conceptual "tensions" that emerge from it (for example, between reactionary and progressive masses, between mobilized masses or publics, between masses and elites, or between intellectuals and masses); and c) the descriptive, explanatory and/or normative "registers" that make up the tone of each theoretical proposal.

After analyzing in detail the perspectives of Quijano, Marcuse and Portantiero on the masses, we will lay out some comparative conclusions, exposing the similarities and differences between them, based on the three key elements mentioned above.

FRANCISCO, Warren* (University of the Philippines Diliman, Philippines)

The Role of Emotions in Social Movement Activities in the Philippines: The Case of the Cordillera Peoples Alliance

While relatively more recent scholarship has provided a more nuanced conceptualization of emotions in the context of social movements, there is still a lot of ground to cover – for instance, by 'bringing back' emotions to relatively 'older' perspectives, such as resource mobilization, political process theory, the framing perspective, and collective identity, among others. In this paper, I explore the roles emotions play as 'conduits of collective action and mobilisation' by facilitating/constraining the various activities of a social movement organization (SMO). By drawing on data collected through participant observation, in-depth interviews, and documentary analysis, this study examines the case of the Cordillera Peoples Alliance (CPA), an indigenous SMO in the Philippines, to illustrate the relationship between emotions and a SMO's activity— both latent and visible. In particular, I focus on the organization's formation, recruitment, its memebers' response to moral shocks and political opportunity structures, collective action frames, and affective loyalties and moral emotions formed through its 38-year history.

This paper suggests that violent acts by the movement's antagonists that trigger certain emotional responses among its members. Emotions from fear, anxiety, to sadness may serve as some form of 'deflection' whereby CPA members have become either immobilized or be taken over by these emotions compelling them to undergo some form of emotional management before engaging in any deliberate actions – individually and collectively. Such momentary acts could lead to 'double burden' with CPA members doing emotion work while simultaneously continuing their SMO work. Therefore, emotions can bridge societal events and organizational activities, as events can only be interpreted based on the members feelings, which in turn, influence organizational activities through possible actions that emotions can direct.

Preferences for Income Redistribution in Unequal Contexts: Changes in Latin America between 2008 and 2018

In a developing and highly unequal region like Latin America, it is crucial to understand the determinants that affect people's support for redistribution of resources from the state. A series of theories focused on self-interest have continuously established a negative link between people's income and their support for the reduction of inequalities through redistribution. Despite this, the evidence is scarce and sometimes contradictory while its study in Latin America is almost non-existent. Using data from the LAPOP Survey between 2008 and 2018, a longitudinal dimension is considered for the first time in the measurement of Latin American redistributive preferences, using hybrid multilevel regression models. In contrast to the evidence from studies conducted in other regions, the results reveal that in Latin America it is not possible to detect a clear association between income and redistributive preferences at specific times, but it is possible when changes occur in countries' levels of inequality and economic development. Likewise, other elements that consistently affect preferences are evident, such as educational level, political ideology, and confidence in the political system. In light of this evidence, comparisons are made with previous research findings in industrialized countries, challenging rationalist theories of justice and solidarity.

Affordable and Physical Food Access in the First-Food System: Persistent Challenges and Unanticipated Shocks for Infant Food Security

In February 2022, the Michigan-based Abbott Nutrition factory, a key infant formula producer, temporarily shuttered, instigating a crisis-level formula shortage in the United States (U.S.). News reports and online testimonials swiftly surfaced of empty formula shelves at grocery stores, panic buying/ stockpiling, and desperate families struggling to find formula. Because Canada imports 100% of its infant formula, it wasn't long before the U.S. shortage arrived there in its own fashion, primarily effecting specialty formulas for infants with allergies. The governments of both countries instituted measures to stabilize supply, and health authorities offered advice to families for how to navigate the crisis. The North American formula shortage brought on by food system frailty exacerbated the already existing and growing problem of poverty-induced *infant food insecurity*. This paper discusses infant food insecurity as a relatively overlooked aspect of food security vulnerabilities. It demonstrates how infants are at risk of food insecurity due to their unique

ways of eating, the limited and specialized food substances they consume, and insufficient economic and social protection for sustainable breastfeeding, and/or affordable, available, and safe infant food commodities. It brings together scholarship on food poverty's impact on infants' access to food (across different feeding practices) with that of recent and past first-food system threats related to commercial food systems (e.g., formula contamination in China, resulting supply shortages in Australia, supply disruptions during natural and climate disaster, and conflict) - highlighting their impact on families struggling to access critical nutrition for infants and lessons for developing emergency feeding pathways and long-term solutions for infant food security.

Unsettling the Heritage of Urbanity: Urbanism and Urban Space in (Post-)Pandemic Times

Soon after the COVID-19 shock and first lockdowns, debates about the "end of urbanism" (as we knew it) started in the field of urban studies. Scholars discussed the temporal effects of lockdowns, the substantial record of urban pathologies and shifts in urbanism discourse. The attempts to contain this highly infectious virus have seriously questioned the foundations of urbanism as a way of life. Since many aspects of pandemic social life have been routinized or suppressed by the desire and need of going back to (a new) normal, the accelerating accumulation of crises in globalized risk societies forced urban scholars to revaluate the hidden aspect of both urbanism as a way of life and urban space that are at the heart of the modern idea(l) of urbanity.

The aim of this paper is to discuss the heritage of urbanity in the light of the COVID19 pandemic. In the first step we briefly reconstruct the connection between the urban and urbanism as established in the normative concept of urbanity. In the second section we examine how this idea(l) has been challenged by the pandemic reality over the past years. We will demonstrate that the strategies to contain viral transmission reveal the (materialized) heritage of urban pathologies and inform skeptical urbanity discourses. In the third section we evaluate which aspects of the record of urban pathologies are commemorated or forgotten in urban space by whom. This allows us to critical reflect the heritage of urbanity as an idea(l), whose long-standing blind spots have become visible during the pandemic.

The Compound Nature of the COVID-19 Pandemic and Hurricane Response: A Study of Maternal-Child Health Following Hurricane Ida, Louisiana, USA.

Pregnant and lactating persons, new parents, and infants represent some of the most marginalized populations that require special consideration and time-sensitive care in emergencies, disasters, and pandemics. This presentation will provide a preliminary overview of data collected regarding the maternal experiences following Hurricane Ida. Hurricane Ida was a category 4 storm that made landfall in Louisiana, USA, in 2021. Using quantitative and systematic social media sampling methods, this study focused on evacuation/sheltering decisions, medical and childcare access, and decisions surrounding infant feeding. We also examined how the COVID-19 pandemic influenced hurricane experiences, including household risk perception, vaccine availability, and protective action decisions. Participants (n=131) were predominantly white (86%), had a 4-year-degree or higher (59%), and were from Louisiana or Mississippi. The respondents had infants of varying ages, the majority either newborn-to-two-months-old (15%) or 12 months or older (28%). Similarly, respondents had varying approaches to infant feeding, with 25% breastfeeding at the breast only, 20% bottle-fed with infant formula, and 39% fed their child solid or complementary foods. Results suggest that Hurricane Ida led to re-lived trauma from previous disasters, especially since the storm made landfall on the 16th anniversary of Hurricane Katrina. Mothers also reported how challenging it was to navigate both Hurricane Ida and the pandemic in tandem, including disruption of feeding routines, lack of safe play spaces due to wind and water damage, poor access to healthcare, and fear of affording necessities for their families. Policy implications for this research include new interventions and programs that would provide targeted maternal and infant health support during hurricane evacuations.

FRASER, Roni* (University of Delaware, USA)

Towards a Whole Community Approach during Disaster Response and Recovery: Understanding Stress and Mental Health Experiences of Volunteers Post-Disaster

Volunteerism strengthens community well-being by increasing social and civil participation, promoting the development of job and life skills, and providing necessary resources to neighbors in need. Volunteerism can also

result in positive mental health outcomes and well-being for volunteers by reducing isolation, encouraging positive social engagement, increasing mastery and self-esteem, and developing supportive relationships. Despite the positive nature between general volunteerism and mental health, disaster volunteers have higher levels of adverse mental health impacts than professional responders or disaster survivors stemming from volunteer-job-related role strain, traumatic environmental stressors, and a lack of organizational and peer support to employ coping resources effectively. Despite most of the literature on disaster volunteer mental health focusing on adverse outcomes, limited evidence suggests that the disaster environment may result in positive mental health outcomes for volunteers, also referred to as post-traumatic growth, closely resembling the positive relationship between other types of volunteering and mental well-being. This presentation will provide a preliminary overview of dissertation data collected during the following storms in the Fall of 2022 and Spring of 2023 in the United States of America. Using quantitative and systematic social media sampling methods combined with qualitative interview methodology with volunteers affiliated with a volunteer organization active in disaster (VOAD), this study focuses on whether volunteers experience positive or negative stress experiences during deployments and after their return home. This study will also focus on how volunteers navigate stress to understand better what mechanisms facilitate positive or negative mental health effects among volunteers. Policy implications from this research will better enhance interventions and programs that target volunteer mental health support during and post-disaster.

PAR to Train Teachers in Monitoring for School Self-Evaluation: The Research Experience at the Galileo Technical and Professional Pole

The paper shows a case of participatory evaluation carried out through participatory action-research (PAR), with the aim of monitoring the pedagogical activities carried out by the two schools of the Technical and Professional Pole in the 2020/2021 school year. The culture of school self-evaluation by the self-evaluation report (RAV) promoted by the National Evaluation System (DPR 80/2013) suggests schools to deepen some evaluation processes with integrative tools. The need to know strengths and criticalities that emerged at schooling in times of pandemic stimulate new studies. A monitoring group has been set up consisting of a researcher and six teachers, all fully involved in the realization of the research. For that reason it can be defined a PAR. The main aim is to evaluate the activities related to the 2020/2021 school year, with particular attention to the curvature activities carried out by the two schools in collaboration with the Italian Video Game Association (AIV). A mixed method research approach has been adopted for listening students, teachers, and experts. Since it aimed at listening to stakeholders, it can be defined as participatory evaluation. In order to achieve the triangulation of the different points of view, the monitoring group decided to involve 148 students from grade 9, 25 curricular teachers, 6 experts, of which 2 designers and 4 trainers. Students received a questionnaire of customer satisfaction; the most involved teachers did two focus groups, one per school; a semi-structured interview to designers and a mini focus group with experts who trained students had been conducted. A report has been done. This paper shows the phases of the PAR, the actors involved, the tools used and the main results. Particular attention has been done on the methodological aspects of sampling, the realization and administration of research tools and the effect on school self-evaluation literacy.

RC10-159.5

FREDDANO, Michela* (INVALSI (National Institute for the Evaluation of Educational System of Instruction and Training), Italy)

School Self-Evaluation Report (RAV) As a Tool of Action-Research: The Experience of an Italian Primary and Middle School for Improve the Educational Continuity

The paper deepens how the school self-evaluation report (RAV) can became a tool of action-research to improve school processes by showing a case study of action-science promoted in an Italian primary and middle school in the 2021/2022 school year. A short-term action-research has been conducted in an Italian primary and middle school to self-evaluate the topic of educational continuity between one school grade and another. The initial problem expressed by the client (the head teacher) to the researcher consists in strengthening the educational continuity between one school grade to another to contain the loss of students in the transition from primary school to secondary school and at the same time make the school more attractive. After an initial meeting with some key figures, a working group for school self-evaluation has been created, composed of 25 teachers who will be involved in various activities aimed at reflecting on the processes related to educational continuity, strengths, weaknesses and proposals for the future. Since in the context of self-evaluation, all Italian schools are required to fill in the

self-evaluation report (RAV) in which there is a specific area on the topic of educational continuity, the researcher decides to start from the self-evaluation of that school on that specific area.

In addition to the group of school self-evaluation, the action research involved parents who have been interviewed by the administration of a questionnaire for knowing their opinions on the school service quality, strengths and weaknesses. Therefore, a mixed method approach reconciled qualitative research tools, typical of action-research, and quantitative research tools.

The paper illustrates the phases of action-research (reception, participation and evaluation), the participants, the tools, and the main results in terms of individual, double and triple loop learning.

Author Meets Critic: Gender-Based Violence in Migration : Interdisciplinary, Feminist and Intersectional Approaches, London & New York : Palgrave Macmillan, 2022

We encourage questions and discussions on our new book. With contributions from a diverse array of international scholars, this edited volume offers a renewed understanding of gender-based violence (GBV) by examining its social and political dimensions in migration contexts. This book engages micro, meso, and macro levels of analysis by foregrounding a conceptualization of GBV that addresses both its interpersonal and structural causes. Chapters explore how GBV frameworks and migration management intersect, bringing to the forefront the specific inequalities these intersections produce for migrant women. Drawing upon several disciplines, the authors engage in co-writing a critical engagement which proposes an original understanding of how the concepts of intersectionality, vulnerability and precarity speak to each other from a feminist perspective.

Retaining Consumer Demand for Ethical and Sustainable Food Consumption: Lessons Learned from the Impacts of COVID-19 on Australian Alternative and Local Food Systems

COVID-19 pandemic, alongside other systems shocks, have highlighted the vulnerability of global and domestic food supply chains. Within Australia, Alternative and Local Food Systems (ALFS), witnessed a rapid spike in customer demand for alternative food provisioning during the early months of the pandemic, with many consumers shifting to ALFS for the first time. This includes alternatives to supermarkets, such as direct-to-consumer purchases, food hubs, food-box schemes, and cooperative-purchasing groups. Food networks that structure ALFS have also demonstrated their potential to contribute to consumers' practical knowledge of sustainable food systems and food system transformation. While consumer demand in the early stages of the pandemic could indicate further growth in ethical and sustainable consumption, there remains a need to understand the conditions and structures in which food networks operate, particularly during moments of crisis, and the role they play in scaling-up consumer commitment to ALFS and broader systems change. This paper explores how ALFS in the Australian alternative food landscape responded and adopted to the pandemic and consumer demand from 2020 through 2023. Using a combination of primary and secondary data combined with theories on ethical consumption, this paper examines the adaptive measures that emerged across a three-year timenospan, and documents the responses and measures applied by food network actors in shifting consumer intentions towards more ethical and sustainable based consumption practices.

FREEMAN, Camille* (University of Queensland, Australia)
SMITH, Kiah (U. Queensland, Australia)

Towards a Framework for Scaling-up Civic Food: Lessons from Coalition Building in Australia

The need for a food system transformation is the subject of growing concern. In response, civic food initiatives, networks, alliances, coalitions, and broader social movement actors are organising to find new pathways to address inequalities around producing, accessing and governing food in Australia. While an abundant literature exists on the need for grassroots food system reform, the process for achieving it is less understood from the perspective of multi-scalar coalition building. To address this, we use primary data collected from semi-structured interviews in Australia to examine the strengths and struggles associated with civic food coalitions' efforts at collectivising, collaborating, and planning, and the implications for scaling-up food movements to drive wider ecological and social change. Findings emphasise the need to focus on early stages of coalition formation, highlighting how poorly defined governance and organisational structures can negatively impede internal and external collaborative synergies. Findings also support claims that civic food coalitions

can be one pathway to transform the food system, as they serve as a catalyst to bring food-related issues to the forefront in building alliances across communities.

FREGIDOU-MALAMA, Maria* (Department of Business and Economic Studies, Faculty of Education and Business Studies, University of Gävle, Sweden)
SUNDSTRÖM, Agneta (Department of Business and Economic Studies, Faculty of Education and Business Studies, University of Gävle, Sweden)

Cooperative Identity and Corporate Social Responsibility: Regional Cooperatives in Sweden

This research analyzes how Cooperative Enterprises (CE) approach Corporate Social Responsibility (CSR) to meet demands from members, stakeholders, and local and global society. We used semi-structured interviews with managing directors, cooperative advisers and other employees to collect qualitative data in four regional consumer cooperative enterprises in Sweden. The findings show CEs need a dynamic use of Corporate Social Responsibility approaches in fulfilling democratic and social obligations to meet contextual requirements. The case shows that CSR activities are integrated in the CEs business and are expressed as having the members' best interests in mind. CEs respond to member demands, collaborate acting responsive to the needs of stakeholders, and transfer responsibilities by putting pressure on others to legitimate their business. The CEs integrated approach enrich the CSR discussion as the findings show that social concerns built on response, collaborations, and pressures, are dynamic in their nature and emerge by demanding flexible solutions. The research contributes to literature by offering an understanding of how CEs respond to new local and global context requirements, how the co-existence of social and economic motives inherent in the CE identity legitimate business, and how the complexity of CSR as practiced by the cooperatives requires collaborative sharing of responsibilities. We argue, the applied CSR constitutes a context-related, flexible, and dynamic concept tied to different stakeholders' pressures and expectations, and signifies part of the business operations of CEs.

From Successful to Unsuccessful Social Enterprise: Unitis a Social Cooperative in Sweden

This research explores Social Enterprises focusing on factors influencing the unsustainable development of the organizations. We apply semi structured interviews and a case study of the Social Cooperative Unitis established in 1998 intending to empower disabled people by setting up a handicraft cooperative managed democratically by the members. In Sweden, the public sector pays for the service a social work integrated cooperative is responsible for and delivers and cooperatives' managers must comply with different requirements from various institutions. Cooperatives are expected to conform with unique conditions and rules and regulations requiring special skills. This creates concern for cooperatives, specifically if adequate infrastructure support is missing. Our research shows that the main factors that affect the unsustainable development of a cooperative are lack of adequate infrastructure that supports the cooperative, the financial dependence of the enterprise on the public sector, the authority and the power of the public sector over a social cooperative business, and the particular management skills required for its operation. The research indicates, when the agreement and the cooperation between the social cooperative and the public sector breakdown and the financing of the public sector disappears, the cooperative enterprise goes bankrupt, and the organisation cannot survive. We argue that inadequate infrastructure support mechanisms, financial dependence on the public sector, and lack of own financial resources are the main factors contributing to unsustainable cooperative. We suggest that partnerships between cooperative enterprises and the public sector must be grounded on long-term financial agreements. Networking and information sharing with different stakeholders is imperative to make social enterprises visible and contribute to the sustainable development of this unique innovative type of organizations that practice democracy and empower people.

Experiencias De Precariedad Laboral y Sus Vínculos Con La Salud En Varones Adultos De Clase Popular Del Conurbano De Buenos Aires, Argentina

Las condiciones de trabajo, determinadas por fuerzas políticas, económicas y sociales, impactan en la salud de los trabajadores. Por su parte, las experiencias biográficas de trabajo precario están moldeadas por historias de exclusión y marginación que resultan en la acumulación de desventajas a lo largo del ciclo vital. En el contexto latinoamericano y nacional, el concepto de trabajo precario es multidimensional y abarca modalidades de inserción laboral caracterizadas por la inseguridad económica, la vulnerabilidad y la desprotección, que afectan negativamente la subjetividad y la calidad de vida de los trabajadores. En Argentina las características de la inserción laboral condicionan la cobertura de salud que se posee y el acceso a los servicios sanitarios. En esta ponencia analizamos los vínculos entre trabajos precarios y salud a partir de las experiencias laborales de un grupo de varones adultos de clase popular que viven en el conurbano bonaerense. Realizamos entrevistas cualitativas presenciales en 2019 (antes de la pandemia COVID-19) y entre abril y agosto de 2022, lo que nos permite en estas últimas recuperar experiencias de trabajo durante la pandemia. Los entrevistados tienen entre 25 y 67 años y sólo uno de ellos concluyó la escuela secundaria. Mostramos cómo los trabajos actuales y anteriores, mayormente manuales, y de muy baja calificación y con distintos rasgos de precariedad, los exponen a diversos riesgos psicofísicos, vulnerabilidades y privaciones materiales y temporales, resultando asimismo en restricciones para realizar prácticas de cuidado de la salud y limitando su calidad de vida en términos más amplios.

The Risks of Gambling Studies: A Critical Analysis

This paper considers the various 'risks of gambling studies', which is to say the different conceptualizations of *risk* that have been developed in the field. We first discuss the contemporary concept of risk, taking care to note the differences that risk scholars have drawn between two adjacent concepts, namely *uncertainty* and *harm*. Next, with reference to a larger project examining the use of the concept of risk in the context of gambling studies research into online or internet gambling, we discuss some of the different ways that risk has been used. Our presentation of this usage in this paper focuses on a sub-set of articles from our larger corpus, drawn in this case from the peer-reviewed journal, *International Gambling Studies*. A key characteristic of this research is its quantitative nature, involving the translation of lived experiences of risk into established and validated risk metrics. While important for determining the prevalence of certain risks in populations, what remains under-developed in or excluded from the field are vocaliztions of actual lived experiences of risk in the voices of those who have lived them. As a consequence, some dimensions of the phenomenon of risk remain unknown or under-appreciated.

Our methodological approach draws primarily from techniques associated with scoping reviews and rapid reviews. It is also informed by sociological approaches to discourse, particularly Foucaultian accounts of discourse, as well as thematic and grounded theoretic (e.g. Situational Analysis) accounts of discourse and discourse analysis.

Validating a New Measurement Instrument for Homonationalist Values through a Delphi Method

Sociology shows an increasing interest in traditionally peripheral issues such as sexual and ethnic diversity. Sociology of Gender emphasized the importance to study sexual and ethnic diversity intersectionally, that is considering these aspects together and not separately. In this scenario, the conceptual proposal of homonationalism becomes valuable for sociology.

Homonationalism describes a complex interaction between race or ethnicity and gender and sexual orientation. This proposal was translated into analysis of values, conceptualizing homonationalist values as the confluence of racism and tolerance with gays and lesbians. However, this measurement is far

from meeting the complexity of homonationalism. Therefore, we present a more complex dimensionalization of homonationalist values allowing the development of better measuring instruments.

Our three-dimensional instrument is validated by a Delphi Panel composed by 22 academics, professionals and activists improving our theoretical proposal. The first dimension refers the neo-orientalist construction of the West as gayfriendly opposed to the East as intolerant with sexual diversity and is constituted by three subdimensions: the exaltation of the West's inclusiveness, the opposition of Western and Eastern nation states and cultures, and the construction of an internal threat to Western gayfriendliness coming from Muslims and immigrants. The second dimension, a visible LGBT subject, is divided into two subdimensions, first characterizing the visibility and second the characteristics of the subject. The third dimension, homonationalist LGBT agenda, is based on two subdimensions: first, general political demands related to sexual and gender diversity and, second, political demands towards the LGBT movement and its parts. The whole proposal counts with 21 indicators associated with the different subdimensions.

This work contributes as it advances measurements related to intersectionality, provides an operationalization of the most subtle aspects of homonationalist values and presents a theoretically validated measurement instrument of homonationalist values which can be tested empirically.

El Impacto De La Pandemia En Las Desigualdades Socioeconómicas y De Género De Estudiantes Avanzadxs y Graduadxs Universitarixs Del Gran Buenos Aires.

La Argentina experimentó en años recientes un proceso de expansión del sistema universitario público, con la creación de nuevas universidades nacionales en territorios donde la oferta era inexistente o limitada. Varias de estas nuevas casas de altos estudios se crearon en el Gran Buenos Aires. Esto permitió la ampliación del ingreso a la universidad a grupos sociales que antes quedaban excluidos del nivel. No obstante, los recorridos académicos de estos/as jóvenes, primera generación en sus familias en acceder a la educación superior, presentan diversos desafíos, como así también los procesos de inserción profesional hacia el final de sus carreras. La pandemia, con la suspensión de clases presenciales y la adopción de la educación remota de emergencia durante 2 años, a lo que se sumó la crisis económica, profundizó estas dificultades, a la vez que generó otras nuevas. Cabe preguntarse, no obstante, como en toda crisis, si la pandemia no abrió también nuevas oportunidades para los/as jóvenes.

En esta ponencia, entonces, analizamos el impacto de la pandemia en las trayectorias universitarias y laborales de jóvenes estudiantes avanzados/as y graduados/as de dos nuevas universidades del Gran Buenos Aires, indagando los efectos de esta crisis en las desigualdades socio-económicas y de género.

Knowledge Co-Production between University Research Teams and High School Teachers: Educational Inclusion, Peace Building and Citizenship in Secondary Schools in Metropolitan Area of Buenos Aires and Medellin.

Secondary education has been the focus of numerous debates and research in recent decades in Latin America, following an increase in the years of compulsory schooling in several countries. Despite the efforts that public policies have made to effectively guarantee the right to education at this traditionally selective level, obstacles to the universalization of secondary education persist, which most profoundly affect schools in poor and segregated territories.

This paper discusses the case of an international collaborative research carried out by two teams of university researchers and secondary school teachers, one in the Metropolitan Area of Buenos Aires, Argentina and the other in Medellín, Colombia. The objective of the research was: to reconstruct and analyze, through their narratives, the experiences that teachers and students develop around educative inclusion, peacebuilding and citizenship in high schools that serve young people in situation of socio-territorial segregation, in the Metropolitan Area of Buenos Aires and in Medellín. The purpose was to reconstruct the different representations that school actors had of these three concepts, to generate knowledge about the institutional strategies developed on these issues and to identify problematic aspects to improve, in order to collaboratively design intervention proposals.

The university teams worked collaboratively with 4 schools, 2 from Argentina and 2 from Colombia. In each school, from 2 to 3 teachers joined the research group. They were trained to participate from the first phase of project formulation to the data analysis. The field work was carried out mainly through playful-creative and reflective workshops, on the one hand with teachers, on the other hand with students.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The paper reflects on the problems and achievements experienced in the collaborative research process. It also presents some of the main results obtained, both in terms of knowledge production and development of intervention strategies to improve the problematic aspects identified

Infamous Confessions: Perpetrators and Right-Wing Discourse in the 50th Anniversary of the Civic-Military Dictatorship in Uruguay (1973-2023)

This case study explores the post-transitional endurance and present "re-cycling" of authoritarian discourses of national security in Uruguay, five decades after the initial 1973 coup and over three and a half decades since the 1984 transition to democracy. Our centering in the analysis of politics of dictatorship narratives of perpetrator "confessions" by Uruguayan infamous torturers that have recently resurfaced show how the past is used to serve present political goals. These narratives of State Terrorism have become a civic space where historic battles for memory, truth and justice are deployed in current political debates. As such, they become strategic sites that reveal discursive strategies and long-term mechanisms of institutionalized impunity, silencing and social denial, key bases for the resurgent authoritarianism in recent years. These "confessions" banalizing crimes against humanity in the language of the National Security Doctrine are aimed at relativizing state-sponsored violations and contribute to ongoing political polarization. In addition, the use of these narratives and their reconstruction enables right wing actors to appropriate the language of human rights to justify and represent terrorism of State in the past in socially acceptable ways. These discursive strategies provide a lens for the study of authoritarian past and present political discourse and their complex cultural legacies. Our analysis shows these perpetrators' "confessions" as moments where right-wing discourses make visible cleavages and tensions of the authoritarian systemic machinery: How does it matter that these perpetrator "confessions" emerge publicly after decades of silence? What effects do these narratives have on public debates and practices about the authoritarian legacy? How are perpetrator narratives used to construct a collective narrative of a society's traumatic past that both betrays and "seals" impunity? We show how these systems and practices endure through the silencing, banalization, and "in/visibilization" supporting enduring authoritarian discourses, policies, methods, and practices.

FRITZ, Jan Marie* (Univ. of Cincinnati and Univ. of Johannesburg, United States)

Addressing the Mandatory Retirement of Older Adults

This presentation focuses on mandatory retirement, a rather hidden and unaddressed social justice issue. Mandatory retirement - sometimes referred to as forced, enforced, statutory or compulsory retirement - is the age at which persons who hold certain jobs or offices are required by business, custom or law to leave their work. While countries frequently discuss increasing concern about care for "the elderly," many of these same countries have mandatory retirement rules for older adults. People often seem surprised that older adults can be seen as less valued in some societies and do not connect this, at least in part, to whether there is an imposed "normative" structure of mandatory retirement. There does not seem to be recognition that mandatory retirement is a discriminatory act. The presentation covers the following topics: social justice and human rights; ageism and the history of mandatory retirement; the ISA Executive Committee's decision to oppose mandatory retirement and suggested actions for countries that wish to eliminate mandatory retirement.

Alice Stokes Paul and Clinical Sociology

This presentation discusses **Alice Stokes Paul** (1885-1977) and connects her work to the history of clinical sociology in the United States. Paul was a Quaker, a member of the Society of Friends. She attended Swathmore College, an institution founded in 1864 by Quakers, and, after graduating, received her M.A. in sociology (in 1907) from the University of Pennsylvania. In her final year at the University of Pennsylvania, she had the opportunity to travel, work and study in England where she was increasingly involved in women's suffrage activities. Because of her suffrage protest activities (first in England and later in the United States) she was periodically imprisoned.

Paul organized her first women's suffrage parade/protest march/procession in the U.S. (involving an estimated 5000-8000 participants) in Washington, D.C. in 1913, the day before President-elect Woodrow Wilson's inauguration. President Wilson finally announced there would be a bill about women's right to vote and suffrage (the 19th Amendment) and this was achieved in 1920. After the Amendment was ratified, Paul earned three law degrees (LL.B, LL.M., and D.C.L.).

Once suffrage was obtained, Paul focused on an Equal Rights Amendment (ERA), a constitutional guarantee of equality for women. Paul and Crystal Eastman drafted the original text and delivered it to Congress in 1923. In 1943 a new version, now known as the Alice Paul Amendment, was drafted: "Equality of rights under the law shall not be denied or abridged by the United States or by any state on account of sex." Almost 100 years since the amendment was first introduced, there is still movement in the U.S. to ratify the ERA.

Wellbeing across the Nonreligious Life Course

There is a longstanding line of research that finds religious people are happier and healthier than nonreligious people. And there is a whole cottage industry of scholars parsing out the different mechanisms through which religion is good for wellbeing – through providing certainty-filled beliefs, supportive social communities, routinization and ritual, and even financial assistance. However, a majority of this research treats the nonreligious as a homogeneous reference category, ignoring important differences among the nonreligious. This research also typically lacks any meaningful measures of nonreligious identity, belief, or behavior that might point to mechanisms through which nonreligion might contribute to wellbeing. In this study, we utilize a new survey that was constructed to better capture nonreligious beliefs and practices in the United States and we investigate the various mechanisms through which nonreligious promotes wellbeing. Drawing on measures of nonreligious identity, nonreligious group involvement, nonreligious social networks, and the nonreligious life course, we examine how these different factors predict self-reported health, happiness, and life satisfaction among the nonreligious and how the nonreligious compare to the religious when these factors are taken into account.

Challenges for University Systems in the Southern Cone: Public and Private Institutions Facing Diverging Social Expectations

Contrary to standardized views on the neoliberalization of universities as a homogeneous process, I am interested in discussing both the idea that public universities are not linked to relevant social and territorial sectors, and the assumption that private universities only deploy consumer relations. The first point is based on a series of research on university extension and the community work of university women in Argentina; the second on research carried out in Mercosur on the expansion of the private university sector, where we identify patterns of customization and territorial capillarization, but also a careful look at state regulations that control the offer and responsible expansion of the system from the private sector. From this point of view, public and private universities actively produce their legitimacy in a context of expanding social needs and problems, as well as the expectations of social sectors fragmented in terms of class and territory

FUENTES, Sebastian* (CONICET/FLACSO-UNTREF, Argentina)

Educational Inequalities and Teaching during the Pandemic at Secondary Level: An Analysis of "Innovative" Practices and the Construction of Inequalities in Argentina

Social and educational inequalities are a pre-pandemic starting point at the secondary level in Argentina. The suspension of school attendance by COVID 19 had an impact on them, deepening the pre-existing digital and educational gap. But school actors sought ways to remedy it, while actively redefining their roles and perceptions of school inequalities, as well as what they could do to improve or transform teaching conditions that had already been questioned before. Based on national (Argentina) and local research (City of Buenos Aires) conducted in 2021-2022, I present an analysis of how school actors -supervisors, principals, teachers and students- not only valued the pedagogical and social role of schools: they also deployed "innovation" strategies in teaching and learning, while perceiving social and school inequalities more strongly. This process can also be explained by the fact that educational policies and public discussion on the secondary level, prior to the pandemic, were being questioned and sought to be modified, especially in terms of teaching practices and conditions, teacher work, and the cultural and pedagogical proposal offered to young people.

FUENTES DIAZ, Antonio* (Benemérita Universidad Autónoma de Puebla, Mexico)

Las Armas De La Paz: El Efecto Pacificador De La Defensa Comunitaria En El Sur De México

En un polémico informe de 2013, la Comisión Nacional de Derechos Humanos (CNDH) anunciaba la presencia de grupos de autodefensa y de policía comunitaria en más de la mitad de los municipios del estado de Guerrero (CNDH, 2013). En el vecino Michoacán, la proporción era similar. Asimismo, diversas fuentes periodísticas estimaban, hacia finales del mismo año, entre 8 y 16 el número de entidades federativas afectadas por el surgimiento de estos grupos armados. Pese a su imprecisión, estas cifras daban cuenta, más allá de las especificidades locales, de la importancia que ha adquirido en México el fenómeno de la defensa comunitaria. Este último, a su vez, es indisociable, no solo de la crisis de seguridad que ha enfrentado el país a raíz de la llamada guerra al narcotráfico, sino también, en términos más generales, de una crisis de estatalidad para la regulación de la violencia.

¿A qué se debe este éxito de la defensa comunitaria? ¿Por qué las localidades organizan a grupos armados para asegurar su seguridad? Entre otros factores, planteamos que una de las principales razones por las que la defensa comunitaria ha tenido éxito en el México de la guerra al narcotráfico radica en la eficacia de su efecto pacificador, es decir, en su capacidad para reducir efectivamente los niveles de violencia.

Roles of Education in Social Mobility: A Unified Approach

Education plays two roles in social mobility. First, it plays the role of a mediator: the influence of individuals' social origin on their social destination is mediated by their education (Blau and Duncan 1967; Breen 2004; Breen and Karlson 2014; Goldthorpe 2014; Ishida *et al.* 1995). Put differently, social origin affects education, which in turn influences social destination. Second, it plays the role of an effect modifier. The effect of origin on destination may differ by level of education (Bloome *et al.* 2018; Brand and Xie 2010; Hout 1984, 1988; Karlson 2019; Pfeffer and Hertel 2015; Witteveen and Attewell 2020; Zhou 2019). A different perspective suggests that the impact of education on destination varies by origin (Goldthorpe and Jackson 2008). However, these two roles of education have rarely been analyzed or discussed together. This paper presents a method for decomposing the impact of the origin on the destination, which is mediated and/or modified by education, into four components (VanderWeele 2014; Wodtke and Zhou 2020). This decomposition allows us to discuss the roles of education in social mobility from a perspective that unifies mediation and modification. I demonstrate the decomposition using data from the Social Stratification and Mobility Surveys (SSM) conducted in Japan, where college is not a great equalizer (Fujihara and Ishida 2021). Regression with the residuals method indicates that the mediated or reference interactions were close to zero, as previous studies have suggested. Therefore, education plays the role of a mediator but not that of a modifier in social mobility in Japan. Moreover, the results indicate that the proportion mediated by university graduation is smaller than that calculated by the conventional regression model, suggesting that the role of education has been overestimated.

Changes in Professional Job Descriptions Due to Automation of Technology

Modern professional jobs often incorporate artificial intelligence (AI) and automated systems. Some of the specialized knowledge and skills that previously relied on professionals are being replaced by aging populations, declining workforces, and technological developments. Does the replacement of specialized knowledge and skills by machines and systems jeopardize the employment of professionals? If so, how will this manifest in the way they work? This study reports on the results of a qualitative survey of companies that use AI and automated systems to determine how professional work is being replaced, and how it is linked to work in multiple fields. The survey revealed the following four points. First, the introduction of new technologies does not eliminate the need for professionals, but professionals are faced with the need to be able to use these new technologies and knowledge. The work they perform is increasing, as technologies become faster. The younger generation is mainly acquiring new technology and knowledge, but the middle-aged and older generations are unable to use their previous experience, creating a dilemma between generations. Second, modern professionals are not only required to have expertise in one field, but also to have multiple advanced abilities. Third, when professionals use their expertise to make proposals to clients, less experienced professionals may use it to "replace authority" by presenting AI or other judgments to gain more trust than through their own decision-making alone. Fourth, in the translation industry, many women are engaged in foreign language translation work, in which their replacement by AI would affect their employment. In this report, we will discuss these issues, citing examples of how professionals in the fields of architecture, social welfare, and translation work in Japan.

The Role of Disaster Schema in Evacuation Decision-Making: Findings from Post-Disaster Social Surveys in Japan

Individual residents' protective actions are of utmost importance to cope with imminent natural hazards. In Japan, the local governments issue and disseminate various types of disaster warnings through multiple medias to induce such actions. In this information provider-receiver relationship, the governments attempt to "control" people's actions efficiently, and people are expected to act in accordance with the information issued. However, previous studies have repeatedly shown that the relationship between information reception and action implementation is not linear, and people do not homogeneously respond to disaster warnings. Sociological insights indicate that people seek for additional information as a process of redefining the situation (i.e., milling). Numerous empirical studies have demonstrated that such cognitive information processing results in action delay. This study focused on "disaster schema", which is individual's structured knowledge that orients them to recognize certain phenomena as disasters, as a key determinant of evacuation decision-making. By investigating the associations between disaster schema, information-seeking, and protective actions, we explored the role of disaster schema in either prolonging or shortening the situation-redefining processes. This study analyzed two datasets: 1) questionnaire survey for the Hita, Nakatsu, and Tsukumi cities residents who experienced Northern Kyushu Torrential Rain in July 2012, 2017 or 2017 Typhoon Talim (n=1,934) and 2) web survey for the 40 cities residents in Japan who experienced 2019 Typhoon Hagibis (n=1,397). The analysis by the first data showed that disaster schema, which were measured by disaster risk reduction literacy and past disaster experience, had the strongest positive effect on implementing protective actions. Furthermore, the analysis by the second data implied that those with well-developed disaster schema initiated faster evacuation than the others, and over half of them evacuated even before the governmental evacuation recommendation was issued. Based on these results, this study discussed an effective risk communication planning for faster protective actions.

FUJINE, Masayuki* (Kanto Gakuin University, Japan)

Challenging and Conformity to the Dominant Education System: A Case of Alternative Education Movements in Japan

Sociological studies documenting philosophies and practices of alternative education have pointed to the complexities of relations between neoliberal policies and alternative education. Some studies have shown that alternative education challenges the dominant perspective of the educational system driven by neoliberal policies. Others have revealed that alternative education operates as an exclusion of disadvantaged students from the mainstream education system. This presentation reveals the parallel relationship between alternative education and neoliberal policies through a survey in Japan, where neoliberal and neoconservative policies dominate. The data are drawn from ethnographic research at grassroots networks of alternative schools in an urban region in Japan to examine how the members and adherents frame their commit to the movements. The findings show that the members and adherents: regard discontent with their experience in mainstream school as a problem with the educational system that denies them the right to make decisions and a voice; explain the significance of making alternatives by participation and negotiation of people who are not accredited teachers or the government; justify the alternatives by emphasizing the necessity of considering ourselves and expressing own opinions when people think circumstances are wrong. I argue that these framings have the dual aspect of asserting the right of self-determination, and at the same time supporting cost-cutting in the public sector through self-help. This presentation concludes by pointing that the perceptions of members and adherents of alternative education movements provide the view of alternative education as discursive and contradictory resistance within the social system not outside.

Relations between the Global City and Regional Cities in Building Solidarity Among Local and Ethnic Residents: A Case Study of Tokyo and Hamamatsu

To deepen our understanding of global cities, this study examines the situation of a regional city located at a certain distance from Tokyo, the global city representing Japan. By comparing the city and Tokyo and considering their relationship, social issues relating to the collaboration and solidarity of local and ethnic residents in both cities will be highlighted.

Hamamatsu was selected as the subject of this study to achieve this purpose. Hamamatsu is about 260 kilometers southwest of Tokyo and has a population of about 800,000. The manufacturing industry is thriving there and mainly because of this, Hamamatsu has a large foreign population. Since the early 1990s, the city has accepted many factory workers from abroad. The largest group of foreign workers has been Brazilians, but in recent years there has been an increase in immigrants from countries such as the Philippines,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

China, and Vietnam, and the places of employment are diversifying. In addition, because of an increase in families who immigrated to Japan and second-generation immigrants born in Japan, language use, socioeconomic status, and identity of ethnic residents are becoming increasingly diverse. Under these circumstances, many collaborations have been started by local governments, private companies, NPOs, and immigrants themselves to support their social participation and social advancement. Among such collaborations, this study focuses on support for Japanese language acquisition, because various organizations offer Japanese language education services for ethnic residents in Hamamatsu. Although most such services are available free or at a low cost, there are still many ethnic residents who have low Japanese language proficiency and are not highly motivated to learn Japanese, according to recent surveys.

Based on these latest survey results, this study examines the hypothesis that Tokyo externalizes the costs of integrating ethnic residents by imposing the burden of Japanese language education on regional cities.

Can Rawls Explain People's Attitudes Toward the State's Role Under the COVID-19 Pandemic?

Facing the difficulty of the COVID-19 pandemic, economic activities were forced to stagnate. Not a few people suffered from financial hardship due to the pandemic. Accordingly, states across the world have provided people with economic assistance. However, there have been debates regarding the state's role of providing economic assistance. Some argue that the state's role was necessary, while others claim that the assistance by the state was too much. What explains the difference in people's attitudes toward this debate?

According to John Rawls, the "veil of ignorance" justifies the measures to decrease the influence of luck on success, such as income redistribution policy. Indeed, studies have shown that this logic explains why people support redistribution policy. Luck seems to play an essential role in whether one is influenced by the COVID-19 in terms of health, economy, and other aspects. Hence, the Rawls' logic is expected to affect whether people approve of the state's measures, such as economic subsidies during the COVID-19 pandemic.

The present paper examines if and to what extent the logic of Rawls applies to people's attitudes toward COVID-19 measures in East Asian countries. Utilizing survey data conducted in Japan, Korea, and China from January to March 2022, we analyze whether the differences in beliefs about the role of effort versus luck in life lead to the differences in people's attitudes toward the state's role under the COVID-19 pandemic. Are people who emphasize the role of luck more likely to support the state's role? Are there differences in the extent of Rawls' logic influence between the three countries? We try to answer these research questions.

Influence of Place Memories on People's Lives

This presentation intends to elucidate the current community activities of people who lost their land at the Kadena US military base in Okinawa, Japan, following World War II. The study conducts fieldwork and examines how such community activities help maintain the vitality of individuals.

Many US troops remained stationed in Okinawa, and much of the land was requisitioned in 1945, thereby making it difficult for former residents to return to their homes. In essence, they lost not only the land but also the community. In Okinawa, many groups (Kyoyukai) continue to conduct community activities outside the base.

Hillery G. (1955) pointed out that many commentators define communities using area, common ties, and social interactions. Despite the loss of one of its elements, the area and the people and their descendants continued social interactions and maintained ties while receiving military land rent from the Japanese government for common land. In addition, if funds are available, then communities build meeting places, continue to hold religious rituals and traditional events, pass on the history of the community, and continue to request the government for subsidies for this purpose.

Nearly 80 years have passed since the end of the war, and people in those days have reached more than 100 years old. As such, the generation of their children is aging, and members worry about the decline of the association. However, from this example, we can see how people are eager to maintain the community. The study also proves that even if the area is lost, the memory of place, social interactions, and community ties based on this memory will support members' lives. At the same time, the damage to communities due to war and the presence of bases is becoming evident.

"Gaman" and "Gacha": How Young People Deal with Social Inequality in Japan

In almost any country, it is common that young people are encouraged to pursue their own well-being and happiness. On the other hand, it is also common that they are expected to respect the norm and convention of their society. Pursuing personal happiness and respecting social norm are sometimes incompatible and which of them should be regarded more important differs from country to country. Here we can remember a phrase *The personal is political* which became popular in the student movement as well as the women's liberation movement developed initially in the United States in 1960s and 1970s and then around the world.

Pursuing personal happiness usually means, especially to young people, getting a better education and then a job which secures better income but it sometimes leads them to face challenges from social norms and social inequality. In Japan, education, especially higher education, often costs a plenty of money and the youth have no one else to rely on except their parents unless they turn to educational loan, and furthermore, they need parents' financial assistance for a satisfactory preparation to get higher education. In this sense, parents' economic level largely affects children's opportunity to get higher education, which may be observed universally around the world.

This paper aims to provide an observation on this kind of condition where the youth are situated in Japan. It will show a characteristic case regarding how a society treats its youth and what idea about self-help is seen behind the treatment. "Gaman" and "Gacha" are Japanese words which are used by the youth who find the inequality in getting good education and give us some insight about social equality.

Agglomeration/Dispersion of Used Car and Used Auto Parts Trade Industries By South Asian Migrant Entrepreneurs in Japan

The reuse and recycling business is an industry in which ethnic minorities have actively participated. A typical example is the metal recycling industry for permanent resident Koreans in Japan. The used car and used auto parts trade is another area where many migrants have entered. The number of dealers in this field is unknown, but multiple data show that migrants are the majority. South Asian migrant entrepreneurs, such as Pakistanis, Bangladeshis, Sri Lankans, and Afghans, are famous in this field.

The presenter has been conducting sociological research since 1998, focusing on Pakistanis, mainly based in Chiba, Japan. Since 2012, she has researched multi-ethnic networks in this field and has collected data on Sri Lankans and Afghans. It became clear that differences in agglomeration/dispersion were observed even among South Asian migrant entrepreneurs.

In the case of Pakistanis, there was a tendency to cluster in the Kanto region, especially Saitama, and to locate their business bases around several trading ports. At the same time, there was a tendency to disperse. In the case of Sri Lankans, there was a tendency to cluster in the Kanto region, especially Chiba, and to concentrate in the vicinity of trading ports. In addition, there is a tendency for ethnic groups to cluster in specific areas away from trading ports. In the case of Afghans, they tend to cluster in the Kanto region, especially Chiba. However, there is no significant concentration of business centers in the vicinity of trading ports. Furthermore, there is a tendency for ethnic groups to cluster in specific areas away from trading ports.

What are the reasons for these differences in the characteristics of agglomeration/dispersion? The presenter will discuss the mechanism differences based on the field survey results.

Mutual Support and the Influences of Playing Pokemon Go on Older People amid the COVID-19 Pandemic in Hong Kong

This paper investigates the role of technology in facilitating older people to maintain their mobile gaming network during the COVID-19 pandemic and the impacts of video-gaming on their wellbeing. Although Hong Kong did not impose strict social distancing measures throughout the course of pandemic, some leisure routines are discouraged, like chatting in a group in public spaces or having meal gathering. Also, the number of confirmed COVID cases also affected people's motivation to leave home. Thus, many people feel lonely, isolated, and result in deterioration of physical or mental health. Under this situation, this paper demonstrates the role of technologies in maintaining older people's leisure activities and its' impacts on their well-being during the pandemic. Drawing on observational and interview data with around 30 older people who have played Pokemon Go since 2016 in Hong Kong, this paper finds that these older adults dedicated lots of effort and time to figure out how to install unofficial fake location apps in order to play the game without physically present in different locations and use different social medias for chatting. They

do not have high digital literacy, but their strong mutual support equips and enhances their ability to play the game and interact with others in the virtual world. In other words, the technologies and mutual support are the key for keeping the gaming network. As the network did not breakdown, they would gather in the physical world when the situation is improved. This gaming network is important because the learning and gaming make them feel lesser lonely and get chances to share their feelings. More importantly, these older adults are not good at seeking information online. This network is a place for them to exchange information for preventing virus and check the accuracy of information they have.

Practices for Staffing Public Sector Positions in Poland. Resurgence of the Nomenclature System

This paper examines the actual practices for filling public sector positions in Poland with two turning points as foci: the systemic transformation after 1989, and the changes since the Law and Justice Party took power in 2015. Under Soviet Bloc real socialism, the system for filling key positions in the political, economic, and sociocultural administration of the country had depended upon communist party recommendations. This system – known as *nomenklatura* – resulted in an anti-meritocratic (and extralegal) monopolization of the public sector.

Yet an essential cornerstone for a democracy – to which Poland has aspired since 1989 – is the principle of meritocratic (in the classic sense) criteria in employment. It is argued, however, that, despite formal guarantees of access to public service employment on equal terms, the actual staffing of administrative positions in practice has hinged on political decisions made by successive ruling parties.

Still, after Law and Justice took power in 2015, personnel changes affected nearly all levels and areas of the state structure: government and self-government administrations, national agencies, publicly-held companies, mass media outlets, the police and military, prosecutors and justices, etc. Indeed, the turnover of personnel went significantly deeper, rooted in the aggressive *dobra zmiana* ("good change") ideology which has undercut a quarter century of work on constructing a state of law. The replacement of competitive procedures for public service appointments with political clientelism has eroded public institutions and undermined the very foundations of liberal democracy.

Based on analyses of source materials, press content, and in-depth interviews, this paper argues that, after over 30 years of professed democracy, the past 7 years under the Law and Justice party have restored pre-1989 patterns of a nomenclature system. Furthermore, the study examines the ways in which the nomenclature contributes to demobilizing political contestation and strengthening authoritarian tendencies.

GAGO, Verónica* (Universidad de Buenos Aires, Argentina)

Conceptualizing Neoliberalism after the Feminist Struggles

If neoliberalism now needs to ally itself with retrograde conservative forces – from white supremacy to religious fundamentalisms, from neocolonialism to the most unrelenting financial dispossession, as has been documented and theorized by Wendy Brown, Keeanga-Yamahtta Taylor, Silvia Federici, and Judith Butler, to cite just a few of the books that configure a map of readings nourishing a radical feminist perspective – it is because the destabilization of patriarchal and racist authorities threatens capital accumulation in the present moment. Once the factory and heteropatriarchal family are no longer able to maintain discipline (even as imaginaries of mass inclusion and stability), once securitarian control is challenged by transfeminist and ecological forms of managing interdependence in eras of existential precarity – which includes disputing public services and wage increases, housing, and debt relief –, the counter-offensive, understood as a fascist reaction intensifies. What kind of neoliberalism is taking form? In what sense a perspective from the Global South is key to understand its reconfigurations? This presentation will address these penetrating questions.

Comparative Focus Group Discussion Research: Dealing with Challenges of Field Work Reality

The focus group discussion method allows generating an interactive exchange between its participants, resulting in a collection of varied experiences, beliefs or ideas. The discussion resembles a real-life conversation about a selected topic where one's perspective is expressed in relation and/or reaction to the perspectives of others. This type of communicative interaction, therefore, was chosen as the most conducive for the HEUREC project which aimed to empirically capture the narratives of participants from nine countries (Finland, Germany, Greece, Latvia, Lithuania, Netherlands, Portugal, Slovakia and Spain) who were asked to discuss their understanding of reciprocity, fairness and cohesion in the European Union (overall, 27 focus groups).

Common challenges of conducting focus group discussions are participant selection (composition and accessibility), moderator's work (managing the dynamics of a group interaction) and processing and analyzing a voluminous corpus of data. In a comparative research setting, additional challenges emerge such as development of a focus group guide that would be comprehensible

across country cases; minimizing the risk of translation bias and/or the risk of moderator bias, and management of cross-country field work. Moreover, the unpredictable constraints related to the Covid-19 pandemic intertwined data collection in many recent research projects.

We present a methodological reflection on our comparative focus group research. We parallel (a) the solutions at the preparation stage aimed to ensure compatibility of field work among the country cases and comparability of the data with (b) the post-field work analysis (using maxQDA tools) of characteristics of discussions and transcripts. Comparing country cases and discussion groups (category of participants; online vs. face-to-face), we look at the parameters of the structure (e.g. length in time, in words; ratio of moderator/participant text) and content (e.g. topic coverage, richness of data) of focus groups. We share the methodological self-assessment and lessons learned as a guidance for other researchers.

"Forced" Choice of Remote Interviewing: A Pitfall or a Benefit for Data Collection?

The paper reflects upon the data collection process of a qualitative individual-interviews based research conducted in Lithuania between Autumn 2020-Summer 2021. The originally planned research design opted for a classical face-to-face interview format. The research aimed at understanding how social actors perceive and experience the phenomenon of trust. As a phenomenon and as a concept, trust is important but at the same time rather elusive. The topic of trust can be considered as sensitive and therefore, building a good rapport with research participants is requisite. Also, research design included specific interview facilitation techniques, among them a visual technique of trust maps. Therefore, face-to-face interviewing mode was presumed as the best methodological solution having the above reasons in mind.

However, outbreak of the Covid-19 pandemic preceded the planned field-work time in Spring 2020, eventually forcing the decision to re-adjust research design and conduct remote interviews. The hesitations related to this decision mirrored the reasons to firstly choose face-to-face mode: (a) How to efficiently implement visual technique during a remote interview? Is it possible at all? (b) How will remote interviewing affect rapport building? (c) How will the use of remote communication technology affect participants' comfort?

The research with remote interviews was successfully completed (overall, 28 interviews). There were some positive effects of remote interviewing on data collection process and data quality (e.g. accessibility of participants, logistics in terms of interview time and place, privacy of participants). However, remote interviewing also prevented full implementation of certain design elements, for example, verbalizing the visual technique had its challenges and even though it worked well enough in most cases, the experiences showed that it still would work better in face-to-face mode. The reflection is based on field work notes, interviewee comments during the interviews and their answers to a post-interview feedback questionnaire.

GAL-EZER, Miri* (Kinneret College on the Sea of Galilee, Israel)

Israel Democratic "Staatschmerz" Protestors Vs Illiberal State's Alt-Right "Legal" and Iliegal Violent Militias

Israel Democratic welfare-State, deteriorated after 1967 occupation of Palestinians territories into capitalist-state, and Likud right-wing governments expanded neoliberal nationalistic policies after 1977. Following Netanyahu horrible incitement campaign on PM Rabin 1995, (PM Rabin in Nazi SS uniform; PM Rabin in Arafat Palestinian Keffiyeh), settlers' Rabbis encouraged extreme-right student assassinate PM Rabin. Half year later, Netanyahu became PM after Shimon Peres defeated by false negative campaign, Israel converted to militaristic, authoritarian, illiberal democracy, deteriorating into fascist state.

While Treasury Minister (2003) Netanyahu ordered ongoing austerity shocks on state apparatuses. The Oligarchic Phase 2009, reside upon PM Netanyahu's brutal, austerity policies, as UK, US and many dictatorships. Thus, Israel welfare-state was settled on religious-messianic settlers, and impoverished Israeli working class, through annexed Palestinian lands, coercion by "legal" Israel Defense Force (IDF) acting illegally besides Israeli Police, Shin Bet, many sorts of Trump's "Very Fine Patriotic People" (Capitol Hill), "special units", "elite units", settlers Proud-Boys, Jewish-Supremacists, sorts of Oath-Keepers, etc.

Early on 2020, PM Netanyahu exploited pandemic instigating disastrous distraction, undercover of contagious dangerous pandemic, transferring it to authoritarian military-security-secret war, under Netanyahu supreme-commander, deepening and strengthening his state holding, spying Israeli citizens, monitoring movements and conversations by their mobile phones. Coercing Four general-elections 2019-2022, serve Netanyahu's corruption allegations court proceedings obstruction, destabilizing Israeli democracy, breaking protests against him, forcing political-curfews to 1 kilometer. Paradoxically citizens protested near home at cities, and bridges all-over Israel, 900,000, (10% population), world largest protests forced him stepping down. Nowadays, as opposition leader, Netanyahu dismantled Israel democratic government after one year, instigating fifth elections -1 November 2022.

Currently the 900,000 leaders, elderly professionals, their families, feel fear, grief, worry (schmerz) on state (staat)- democratic Israel "Staatsschmerz" as pariah state; Netanyahu sent his violent militia to beat them, they were bleeding on the bridges but were not deterred.

GAL-EZER, Miri* (Kinneret College on the Sea of Galilee, Israel)

Israelis' "Ukraine Weltschmerz" Disobedience Vs Alienated "Miga" Enclave on the "Wrong Side of History"

The WW3 Russia invasion to Ukraine is fascist murderous war which meets most fascism criteria: admirable single leader cult, WW2 fallen, golden age myth -imperial greatness; war as cleansing violence, orthodox church belief, myth of past, always against reason.

Thus, immediate decisive united response of EU leaders, citizens of democratic and authoritarian states, were shocked, felt world (welt) fear, grief, sympathy, and pain (schmerz) "Ukraine Weltschmerz" by Putin aggression, barbarian assault images, many innocent civilians suffering on European soil – evoking the WW2 trauma.

While democrat President Biden following Roosevelt 1940 policies, immediately allying UN, EU, UK and Commonwealth, Turkey and more; reviving and expanding NATO also to Pacific NATO etc.

However, we see enduring war on US democracy: Trump MAGA fascist mythic great imperial golden age, admiration cult, coup trial on Capitol Hill, authoritarian ruling, poisonous patriarchy, mythic religiosity, fake freedom, crimes against humanity of dead Americans cult: black people, other minorities, dead children, killing weaponry admiration, religiosity, women killed by unsafe abortions, or sentenced for 30 years, persecutions, rapes, murders and tortures in US, India, China, Yemen babies, etc. Death cult mythic religiosity had never been so dangerous, vulnerable citizens escape their countries, pledge support and defense for their life as UN refugees.

What about MIGA: Make Israel Great Again? The MAGA parallel mythic religious fascist death and destruction culture within Green Line Israel legal UN recognised borders lead by Netanyahu and its junta about 40 years? And 53 years illegal annexation, and crimes against humanity on Palestinians and their Occupied Territories?

The presentation focused on deep rupture between "Ukraine Weltschmerz" Israelis vs alienated MIGA-state, its alienated most Israelis feel "Schhmerz"-sadness, grief, sympathy only for Jews! These "Jewish Supremacists" back illegal expulsion of Christian-women, babies, children, elderly Ukrainian war genocide refugees, and block their arrival to Israel.

GALAN-CASTRO, Erick* (Consejo Nacional de Ciencia y Tecnología, Mexico)

Los Colectivos De Familiares De Desaparecidos y La Construcción De Paz En Veracruz. Oportunidades y Estrategias De Acción Colectiva.

Estudios realizados en torno a la movilización de familiares de desaparecidos en Veracruz han apuntado a analizar la forma en que dichos actores han logrado generar cambios a nivel institucional para construir mejores condiciones de acceso a la justicia (Villarreal, 2014; Zavaleta, 2018; Galán, 2018; 2021). Los cambios ocurridos a nivel electoral prometían a los familiares de desaparecidos un marco de oportunidades distinto, en el que los nuevos actores estatales en escena proponían una mejora en los procesos de impartición de justicia y pacificación del país a partir de un cambio en la estrategia para afrontar la violencia (Galán, 2021). Sin embargo, las condiciones de violencia e impunidad en el estado siguen siendo denunciadas por parte de dichos actores, y han hecho manifiesta su desconfianza en torno a las políticas de atención a víctimas y acceso a la justicia. Del lado de las autoridades gubernamentales, la tónica discursiva no es diferente: denuncian a los colectivos como grupos conservadores que no abonan en la puesta en marcha de la llamada *Cuarta Transformación*. ¿En qué forma los colectivos de familiares de desaparecidos buscan mantener su agenda política vigente, a pesar de las condiciones anteriormente expuestas?

En el presente trabajo parto de un análisis de experiencias de movilización mediante entrevistas a estos actores y un cruce de información con recursos hemerográficos. Los familiares de desaparecidos, en un marco de oportunidades políticas adverso por la descalificación y desconfianza de un gobierno conformado por actores que anteriormente habrían mostrado un mayor acercamiento y empatía hacia su causa, han tratado de generar un mayor fortalecimiento de sus lazos internos, a la vez que cuestionan la estrategia de seguridad de los gobiernos federal y estatal, basando su estrategia de construcción de paz en el fortalecimiento de comunidades emocionales (Robledo, 2017; Jimeno, Varela y Castillo, 2019).

Risk, Cosmopolitanism and Epistemologies of the South

Despite its diffusion across disciplines, Beck's theory of risk society has been fiercely criticised for its 'universalisation thesis', which would underestimate traditional inequalities and cleavages and conceal a Western/Euro-centric perspective. The debate in risk sociology has responded to these critics attempting to rethink the theory in order to enhance its capacity to highlight the intensification of social inequalities through processes of social production of risk. Drawing on Beck's cosmopolitanism, recent studies have moved away from a western perspective emphasising the utility of this concept to illuminate transnational patterns of governance and agency. However, few empirical and theoretical contributions work on the intersection of risk and de-colonization theories.

Moving from a decolonial perspective, our contribution takes a critical stance towards a sociological cosmopolitanism that tends not only to represent and reproduce Eurocentric institutions, values and epistemologies, but also to legitimize and reinforce their hegemony. In line with other authors, we aim to contrast this vision with a critical and dialogical cosmopolitanism based on 'diversality' (Mignolo, 2000) - rather than universality, open to diverse voices and contributions. In this direction, particularly promising is the suggestion of Santos (2018) for a 'sociology of emergences' capable of promoting counterhegemonic alter-globalization through 'epistemologies of the South'.

Can this approach widen and enrich risk sociology? Or is it a totally opposed perspective? What are the points of tension? What the opportunities for a productive dialogue? The contribution aims to address these questions and explore horizons of possibilities for new research.

GALINDO, Eryka* (Heidelberg University, Germany)

Human Coexistence with the Semiarid Region and Fights for Transformations in Food Systems: The Case of the Brazilian Semiarid Articulation (ASA)

Under the umbrella concept of food movements (Motta, 2021), a plethora of organizations' forms and activisms have been building, in various parts of the world, fights that are oriented towards the transformation of food systems (Friedmann and McMichael, 1989).

In Brazil, recent studies have highlighted efforts led by family and peasant farming movements (Grisa, Gazolla, & Schneider, 2010; Tanaka & Portilho, 2019), the alliances between agrarian and feminist movements (Aguiar, 2016; Siliprandi, 2015), and territorial defense struggles and self-determination of indigenous peoples and black rural communities (Santos, 2020). However, it is possible to recognize a broad spectrum of social movements and networks that join this struggle, despite their demands do not focus on issues that are conventionally associated with the right to food, such as water security. In this sense, the *Brazilian Semiarid Articulation* (ASA), which fights for water access for the populations of the semiarid region, stands out by its ideas on the coexistence with natural phenomena, such as drought, to guide actions aimed at guaranteeing access to agroecological food.

Thus, through the ASA's institutional documents, this paper analyses how the notion of conviviality with the semiarid region strengthens initiatives to transform food systems and combat inequalities. Aiming this objective, the political letters of the National Meetings of the ASA (EnconASA), held in 2002, 2003, 2004, 2006, 2010, and 2012, will be analyzed using qualitative data analysis tools such as MAXQDA.

Getting the Data Right: An Exploration of Activism across the Institution in the Implementation of a National Funding Model for Students with Disability

Institutional ethnographic (IE) research begins with people's experiences. This project explored the implementation of the Nationally Consistent Collection of Data on School Students with Disability (NCCD), the inaugural Australian Government funding policy for school students with disability. The NCCD requires all teachers in Australian schools to collect evidence of educational adjustments they provide for students with disability. This inquiry shows how the everyday/everynight work of teachers has been significantly reshaped by tasks such as documenting adjustments to teaching practices and collecting evidence student achievement. By beginning with the frontline work of teachers, it was possible to follow textual chains to map how the work of school leaders, policy officers and education consultants were coordinated by the production of evidence to meet government auditing requirements. The angst of "getting the data right" was connected to high-stakes funding

outcomes and orchestrated work and relationships. For example, policy officers found themselves auditing schools, where previously their everyday work had been characterised by mentoring school staff. In this presentation we report on how those in different areas of the institution made attempts to engage in activism, as well as report on the challenges and limitations imposed by institutional rule.

How to Deal with the Protean Chameleon? Participatory Methodological Options (and challenges) in Religious Social Movements and Community Empirical Research

Contemporary radicalization processes should be considered as a protean outcome coming from a multifactorial interaction between risk factors, access routes and triggering events involving the individual, the group and societal dimensions (Ayanian et al. 2018). At the same time, religious-oriented extremist social movements can be seen as threats driven by religious motivation and an ideological bond between international terrorism and episodes of violence in individual countries. Our work aims to discuss an epistemological proposal – based upon H2020 PARTICIPATION project Social lab methodology – implemented in the study of religious social movements aimed at preventing radicalization and violent extremism. The paper will present some methodological hints coming from a fieldwork conducted in 3 countries - Italy, Belgium, and the Netherlands. The research was focused on: narrative interviews with local religious leaders; focus groups with religious communities' representatives on the possible risk of polarization in the local context; Working groups with inter-religious dialogue networks, to elaborate a set of guidelines on how to prevent religious radicalisation and to promote inter-religious dialogue at the local level. Our work suggests that complex social challenges can be dealt with co-creative, participative methodologies because they offer a real-life environment within which social experiments can be carried out to focus on understanding and addressing issues which lie at the root of the problem identified (Hassan 2014). On the other side, the proposed approach requires significant efforts in terms of group-building and strengthen of social bonds between different subjects involved into the research process.

GRECO, Francesca (Prisma srl, Italy)

«a Concern for the Global North Is Only 'one' of the Problems of the Global South». Redefining International Volunteering for Development in a Syndemic Society

This paper aims to deepen volunteering and solidarity practices during the COVID-19 pandemic with the aim of investigating the solidaristic dimension of cosmopolitan socialisation (Cicchelli, 2018) by observing a particular typology of subjects: volunteers for development in third countries working abroad through Italian NGOs. More specifically, the research investigated how cosmopolitan solidarity practices impact on biographical paths of volunteers highlighting their biographical challenges and contradictions. In this way, it will be possible to observe if this unexpected social condition (the Covid-19 pandemic) impacts the biographies and personal life trajectories of volunteers for development by drawing data from a qualitative case study conducted with biographical interviews with international volunteers of 5 Italian NGOs working in Africa, Latin America and the Middle East.

First, we put cosmopolitan solidarity at the test of the pandemic highlighting how this concept can be a theoretical pivot through which operatively translate the inescapable necessity to re-think social processes sparked by the pandemic. After this, the framework of our research focusing on international volunteering for development through the analytical lens of cosmopolitan solidarity practices will be discussed. In addition, our work describes a methodology for the analysis of interviews, based on a mixed-method approach, which integrates statistical techniques of textual analysis with hermeneutic analysis in order to facilitate the work of the researcher and to offer a synthetic, structured and in-depth view of the information collected. Gathered data show how the global health emergency has affected and "bended" the experience and biographical path of volunteers with some contro-intuitive results.

Migration Policies and Governance in Latin America: Between Openness and Generosity, and Closure and Containment

Note: I'm sending the abstract in Spanish but I can participate in English too.
La región de América Latina y el Caribe (ALC) fue por mucho tiempo mayoritariamente expulsora de población. Sin embargo, con la emergencia de las caravanas migrantes provenientes de Centroamérica y el Caribe, y el

desplazamiento venezolano, se impusieron nuevos retos en la implementación de políticas migratorias. Las caravanas son nuevas formas de migrar, sin traficantes, auto-organizadas y desafiando muros, políticas de securitización y militarización del Norte y del Sur Global. La migración venezolana reciente constituye el mayor desplazamiento en la historia reciente de ALC. Entre 2016 y 2022, los migrantes venezolanos superaron los 6.8 millones (R4V, 2022), representando 20% de la población total de Venezuela, salida en menos de una década. Más de 80% se dirigió a otro país latinoamericano.

Mayoritariamente, los Estados de ALC poseen leyes de migración y asilo, con una orientación predominantemente garantista de derechos humanos. Sin embargo, sin experiencia, repentinamente comenzaron a transformar esas leyes en políticas migratorias.

Con base en análisis documental de la normatividad y más de 70 entrevistas a funcionarios públicos, ONGs y organizaciones internacionales (previas a la pandemia y durante ella) esta ponencia analiza los desafíos de inmigración e integración de migrantes en contextos latinoamericanos desiguales en la última década. Los principales resultados muestran una tendencia aperturista y positiva pero con medidas emergentes y de corto plazo, que permitieron recibir migrantes pero tuvieron enormes límites para su integración. También surgieron tendencias regresivas yuxtapuestas, como imposición de visados; burocracia excesiva y engorrosa; deportaciones y militarización de fronteras.

La llegada de la pandemia de la COVID-19 agudizó algunas tendencias previas, entre ellas, el debilitamiento del sistema de asilo (Mountz, De Lucas). Asimismo, exacerbó y justificó la naturalización de la excepcionalidad en la política migratoria que parece haber llegado para quedarse.

CBPR with Communities Affected By Racial Injustice: Reflections on Power and Privilege

For many Black and Afrodiasporic people, as well as for others affected by coloniality, knowledge production and the practice of Western academic research has never been neutral, objective or impartial. However, colonial violence is not in the past. As many scholars point out it is implicit in disciplines as diverse as sociology, medicine and ethnography (Smith, 2012; Chilisa et al., 2017).

Against this background, Community-based Participatory Research (CBPR) has become understood as a methodology that has the potential to redress the colonial legacy of Western academic research. CBPR has been designed to actively increase the participation of those who have previously been the objects of research but rarely the beneficiaries of its results in all aspects of the research process, to embrace diversity of knowledges and to promote cultural humility.

Although CBPR advances research agendas that are inclusive, it is grounded in relationships and structures, and influenced by power dynamics. It is thus vital for the collaborating partners, particularly for researchers working with oppressed communities, to critically examine the intersecting dimensions of power, privilege, and racism in order to avoid reinscribing these unconsciously.

This paper draws on examples from our current CBPR-project 'Community Perspectives on Racism in Health Care', carried out in the frame of the German National Discrimination and Racism Monitor (NaDiRa) in collaboration with partners from different racialized communities who were trained as peer researchers and supported to conduct CBPR-projects. Through these examples, we explore the opportunities and challenges of conducting CBPR, with a particular focus on the concept of 'cultural humility' – understood as commitment to lifelong learning and reflexivity on power and privilege – and its potential for establishing and maintaining authentic research relationships.

GANGAS, Spyros* (DEREE-The American College of Greece, Greece)

Beyond Abstract Universalism and Debilitating Relativism: Human Rights As Capabilities. Extending the Dialogue.

Sen's and Nussbaum's capability approach (CA) has informed discussions about human rights. While rethinking human rights through CA, particularly Nussbaum's central capabilities list (CCL) (life, bodily health and integrity, senses/imagination/thought, emotions, practical reason, affiliation, other species, play and political/material control over one's environment) has established such bridges (including Sen's critique of human rights criticism), this project of bridge-building between CA and human rights is sociologically relevant in a pressing sense: How can we locate human rights in a globalized world of growing interconnectedness but also of indeterminate complexity? How can myriad exclusions, authoritarianisms and sufferings be confronted by a non-hierarchical, non-patronizing and non-neocolonial human rights paradigm? Do human rights require the institutionalization of a world-state that would be solely responsible for the legitimacy conferred upon defining human rights and for monitoring their implementation? Do human rights masquerade instrumentalization processes of political power and geopolitical aggrandizement? In this paper I attempt to shed light to these questions and argue for extending the dialogue among CA, human rights and sociology. An

important pillar for a meaningful coordination of the three areas is natural law. While in many quarters of our discipline natural law discourses seem dated, the idea that certain rights are owed by all is intuitively and theoretically powerful and pragmatically functional. Thus, I briefly consider ways in which sociology revisits natural law (from Marxian reconstructions of natural law, Chernilo's work in sociological theory to Daniel Bell's manuscript on natural law and to post-structuralism only alleged ability to transcend it) and argue that CA is a powerful model for likening human rights to natural law: it is marked by a practical and conceptual agility that enables it to avoid being conflated with abstract universalism, protecting it also from relativist regressions, given its robust ethical core of human capabilities in their sociality.

GANGAS, Spyros* (DEREE-The American College of Greece, Greece)

Critical Theory's Unforgetfulness: Human Essentialism Reconstructed in the Capability Approach

In my recent book *Sociological Theory and the Capability Approach* (2020), I argued that the normative compass of sociological theory is in need of conceptual and practical reorientation. Given the multiple crises that Critical Theory (CT) has identified in the domains of neo-liberal dismantling of the social fabric, identity fundamentalisms, depletion of the environment and authoritarian reentries to system complexity, current sociological paradigms seem wanting in face of *interregnum* diagnoses of capitalism's implosive tendencies. In this paper, I argue that a promising path for CT renewal must engage Sen's and Nussbaum's capability approach (CA). Necessary steps for considering this proposed dialogue include: a) revisiting human essentialism (here I argue that some of Marx's most fruitful ideas can be gleaned from the essentialism of the multi-faceted (and unalienated) self and her fulfilled capabilities); b) such essentialism need not be interpreted abstractly (as Jaeggi's CT does); rather, in face of various diminutions of the self in alienated social relations (Honneth's problematic) what can surface through CA is a normative and pragmatic delineation of the capability deprivations in local, regional, national and global contexts; c) CA can operate as an immanent critique of that very individualism from within the liberal framework of theorizing the social; and d) as individualism is elevated by neoliberalism into a sovereign paradigm what also emerge are centrifugal identity fundamentalisms that play up a relativism of rights. This problem of incommensurability forces us to rethink the adjacent to it problem of coordination of identity-claims in ways that salvage the CT project of praxis, solidarity and emancipation. Helpful here are: 1) Sen's notion of 'comparative broadening'; and 2) Max Scheler's neglected anthropology of values and metaphysics of value-convergence can inform the pressing need of coordinating what appear to be intrinsically indeterminate zones of claims for freedom, justice and identity particularisms.

'Charity, Money and Respect': Women's Assertions and Negotiations through Multilevel Marketing in a Delhi Slum

In 2019, during the ethnographic fieldwork for my doctoral work to capture the heterogeneous nature of a slum settlement in Delhi, I came across middle-aged women who were recruited as distributors by multilevel marketing chains. It was interesting to see how multi-level marketing programmes are penetrating urban slums. This kind of marketing is purely based on networking and friendship channels and products are neither conventionally advertised nor are they sold at any retail shops. Srivastava (2010) calls this 'subaltern consumerism' i.e. how the urban poor engages in the consumerist activities of the city. These women used friends and family relationships to build their networks. According to one respondent, this work helped her earn three things: *Sewa* (charity as she was spreading the ideas of a healthy lifestyle)*, maan-samaan* (respect)*, aur paise* (money). Their aspirations for themselves and their family merits discussion as they offer interesting insights into the lives of urban poor women in the city and their pursuit of social mobility. In spite of some of them facing initial resistance from family members to take up paid employment, they were able to negotiate and assert themselves.

The proposed paper seeks to explore the lives of these women distributors. How do they get recruited? What are the stories they were told and what stories do they tell others to expand their network of distributors? What are their aspirations and how does the role of a distributor help them? Does it alter their subjectivities and selves? In a patriarchal setting that is characterized by restrictions on women's mobility and interactions how do they negotiate with those around them to carve a space for themselves? The larger theme of how these chains made their way into urban slums in neoliberal Delhi remains the backdrop against which these questions will be explored.

Employer tax optimization strategies and practices. An ethnographic eye from the solicitor job

This proposal focuses on owners' tax optimization practices. Employers, as private and public individuals, can adopt private and public strategies to optimize firm tax payments. They embody two roles at least: the one of the business owner (public taxpayer) and the one of the taxpayer (as any taxpayer, owner or not). Also, they can use a variety of consultants due to economic and legal contraints linked to their firm activities and due to private properties in link or not with their company. This proposal aims at describing and at analyzing the daily job of one specific "expert" or "consultant" which can be situated at the crossroad of public and private strategies and practices: the solicitor (notary). Economic and legal expert, legal public lawyer and private helper, a solicitor can be used for several reasons in any individual life (and death). From an ethnographic fieldwork based on daily direct observations and semi-directed interviews, this proposal will extract solicitor 's daily - or extraordinary - job done which can have as consequence to optimize, to decrease, to minimize, even to hide public tax from economic and legal strategies. The goal is to investigate boarders between public and private roles and tasks to optimize firm economic and legal obligations in practices. First, I will explain the part of tax optimization activities in the solicitor's daily job. Second, I will describe what is going on within and outside the solicitor's office to decrease (or to hide) tax obligations for private taxpayer or public owner. Third, from previous contributions of sociology of professions and economic sociology, I will propose a sociological category to understand the specificity of solicitors' tasks. I would conclude on ethnographic contributions to understand tax optimization strategies in practices.

Dynamics of Cultural Economy in Digital Society: The Info-Communication Creative Industrial Content Sectors in the Era of Artificial Intelligence and Robot

Cultural economy, digital transactions in the artwork, artificial intelligence (AI) and robots have challenged the cultural and creative industrial sectors. In the third decade of the twentieth century, cultural policy and administration are very important issues in creating cultural capital both locally and globally. Support sustainable systems of cultural economy is very important to create a cultural capital in the era of the digital transformation. According to the latest report of UNESCO in 2020, 62.1% of total global recorded music revenues came from streaming, and Video on Demand subscriptions are still rising. However, digitalization also risks exacerbating existing cultural economic systems, due to a digital economy, the concentration of platforms in a few countries and regions, and unsustainable remuneration models for creators and business models that do not favor the discoverability of diverse content. The info-communication creative industrial content sectors should concern of cultural economy and regulation processes in the global cultural markets. The most important and widely debated issues in the areas of culture economy are the protection of the cultural diversity, freedom of expression, digital transactions, public interest and ethical standards in the artificial intelligent era. This paper outlines the cultural economy, the artificial intelligence technology, the role of the info-communication creative industrial content sectors and the values of the model the Business Intelligence Culture, or B.I.C. It examines and analyzes: a) values of cultural production, 2) values of cultural process, 3) values of cultural transactions, and 4) values of public interest and ethics. It introduces a new socio-economic model to manage cultural values in global cultural markets.

A Study on Disaster Management Capacity of International Students at a Private University in Japan

Globally, multicultural coexistence is an inevitable trend in social development. In 2019, Japan's international students increased to their highest level, peaking at about 300,000. However, it is not just Japan's student numbers increasing—disasters are also becoming more frequent in Japan—exposing more international students to a high risk of natural hazards and disasters. Specifically, international students may have more exposure to unknown hazards. For instance, due to language barriers, different living habits, and limited access to disaster-specific information, they may have difficulty taking immediate actions to protect themselves in emergencies. Therefore, improving international students' capabilities to protect themselves in a disaster is an essential issue for Japanese society. The purpose of this study is to identify the problems in international students' disaster management capabilities. The study used the original questionnaire surveys and interview data collected at the time of the 2018 North Osaka earthquake to analyse and explore the ability of international students to react to a disaster. The survey results show that fewer international than Japanese students underwent disaster education

and evacuation drills. In addition, fewer international students have proper knowledge of earthquakes. Further, many international students do not take appropriate action. The survey results also show differences in respondents' disaster prevention capabilities based on international students' attributes. Furthermore, they reveal the need to enrich multilingual provision, reinforce information sharing, and strengthen education provided by the government and universities to international students. Moreover, this study discusses ways to improve international students' capacity to respond to disasters.

Professional Military Education in Slovenia: Painful Processes and Civil-Military Gap

Slovenia established its own standing armed forces after its independence in 1991. In the shortcomings lack of a professional officer corps, it was decided in the 1990s to introduce a convergent system for staffing the military - future officers must obtain a high school or university degree from civilian educational institutions, after which they are employed by the Slovenian Armed Forces (SAF) and receive military education and training at military schools. An important role in professional military education (PME) in Slovenia (including offering programmes, courses, lecturers, literature...) has always been played by Defence Studies, a study programme and research group at the Faculty of Social Sciences of the University of Ljubljana (FSS UL). The basic idea of cooperation between SAF and Defence Studies has always been that defence and security experts and scientific disciplines are studied, developed and researched in the Defence Studies programme (FSS UL), while military science and military training are provided by SAF's military schools. There are even cases of several successful education and training collaborations of Defence Studies FSS UL and SAF. Unfortunately, such a system of PME has never been fully accepted by some parts of SAF. Currently, there is no (official) cooperation between these institutions in education and training of military officers. Some future plans include joint civil-military programmes.

The presentation will introduce PME in Slovenia and discuss the problematic issues (mutual (mis)understanding, cultural and organisational gaps, holders of disciplines, etc.) and future possibilities for PME development and cooperation (joint programmes, revival of some former forms of civil-military cooperation, etc.).

American Public Radio Voice and Outsiders within

In this article, I consider how "outsiders within" -- people who hold historically marginalized identities that exist in elite spaces (Collins 1986)-- form a particular twoness in relation to their own voice and to white institutional space. I conceptualize voice performance as a site of both misrecognition and affective distortion between white and nonwhite social actors, and I consider the material and psychological toll it has on nonwhite speakers. To do so, I analyze how 70 public radio broadcasters of color understand their own voice performance within broadcasts, and how their relationship to voice has shifted through their interactions with existing public radio broadcasts, audience members, and coworkers. The iconic public radio voice has been indexed as mirroring the comforts and tastes of predominantly white, upper-middle class listener-members, which disciplines broadcasters' own performance, their affect, and their comfort on air. While some broadcasters react by self-policing their performance, others reject both overt and subtle directives to conform to a modal voice. Still others, those "outsiders within" whose voices match the network, are often made to question their own relationship to whiteness as external feedback marks their voice as unusual for their racial position. I argue that a racialized subjectivity in relation to one's voice is formed or further developed when nonwhite broadcasters speak on public radio, because of the interactions with the white world that this performance entails. My findings reveal that voice performance is a powerful site for interrogating the cultural construction of racial exclusion. Further, I argue that by attuning ourselves to the insights that nonwhite public radio broadcasters have gained through lived experience, the industry has the potential to shift the soundscape to reflect a greater diversity of American voices.

Formación De La Identidad Étnica-Cultural En Biografías De Jóvenes Mapuche. Análisis Desde La Perspectiva Del Trauma-Histórico Transgeneracional.

En este trabajo presentamos evidencia preliminar respecto de la influencia de aspectos asociados al trauma histórico transgeneracional en las biografías de cuatro jóvenes adscritos/as a la identidad étnica-cultural mapuche, procedentes de sectores mapuche rurales y que cursan estudios de enseñanza superior en

la ciudad de Temuco, región de la Araucanía, Chile. El análisis se centra en la comprensión de elementos vinculados a la formación/configuración identitaria que emergen desde sus propias narrativas biográficas. De manera específica se analiza la comunicación y traspaso de la historia familiar; y la valoración de la cultura mapuche. La aproximación metodológica corresponde a narrativas biográficas y un diseño de teoría fundamentada en versión constructivista. Los resultados muestran que las biografías de los y las jóvenes expresan de manera diferenciada tanto elementos de afectación, como formas de afrontamiento traspasadas de forma transgeneracional, asociadas al denominado trauma histórico-colonial. Estas dinámicas de interacción, intermedian la formación de la identidad étnica-cultural: En unos casos es el velamiento de la historia familiar, en tanto disuasión/disolución de la memoria, y en otros casos, la memoria es resignificada, actualizada, ejercitada y robustecida en espacios de interacción familiar, lo cual estaría en la base de las posibilidades de reflexionar sobre la pertenencia identitaria y la apropiación de lo mapuche. A su vez, emergen elementos vinculados a compromisos emocionales, en tanto promesas contraídas con los padres, familia extensa, y consigo mismos, que se traducen en expectativas y proyectos a futuro. Estas son fuente de tensión y cuestionamientos, que interpelan el proceso de formación profesional y el sí mismo. En el periodo de estudios, emergen de sus experiencias estrategias de mantención, persistencia y pasividad identitaria, en tanto formas de gestión de la vida entre contextos culturales diferenciados. Ello estaría en la base de las motivaciones y enunciados sobre la adscripción/no adscripción étnica-cultural mapuche.

GARCIA, Felipe* (Cultural Studies, University of São Paulo, Brazil)

MORETTO, Marcio* (Universidade de São Paulo, Brazil)

Counterpublics and Cancel Culture

Public sphere intends to be universally accessible, like a common space of free circulation that would allow the birth of links able to assimilate a plurality of ideas, publics and agencies that, in turn, would enable a plural and dynamic coexistence, with a wide and open access to a discursive arena, being an organizing principle of our political order (Habermas, 1990). However, the public sphere has shown to be a conformation of publics, although not isonomic, which allows plural experiences and connections at the same time that hinders a balanced dispute in public spaces, thus being an arena of exclusions, frequently disregarding some non-hegemonic or non-normative publics, inasmuch as public sphere idea designated a specific kind of discursive interaction (Fraser, 1990). So, when there is a confluence of hegemonic audiences with counter-publicity audiences, it is also a moment of discovering new interests, new languages, new forms of expressions and guidelines that this shock of the common arena manifests, revealing the existence of counterpublics (Fraser, 1990; Warner, 2002) and, with social media networks, phenomena such as cancel culture. This article aims to discuss cancel culture from counterpublic's perspectives, understanding this dynamic as a phenomenon of disputes.

The Idea of Authoritarianism in Brazilian Sociology: A Critical Review

Brazilian history sheds light on a myriad of authoritarian regimes, ideals, discourses and practices. To comprehend such phenomenons, Brazilian social sciences, in general, and sociologists, in particular, developed different theories for their analyzes. Some authors, like José Murilo de Carvalho, start from an institutionalist point of view and argue that authoritarian regimes shaped an authoritarian way of living, in a top-down model. Others, in a more culturalist approach, as Florestan Fernandes, for instance, argues that an authoritarian culture is the key to understanding the authoritarian regimes and their threat to democracy, in a more bottom-top model. In this paper, we proposed to map this discussion and analyze the different ideas of Authoritarianism in Brazilian sociology as well as their theoretical backgrounds, both national (e.g. Raimundo Faoro, Sérgio Buarque and Gilberto Freyre) and international (e.g. Max Weber, Karl Marx and Frankfurt School). Our scope focuses on the classical discussion of this idea, from 1960 to 1990, where "Authoritarianism" might appear as an native category, not necessarily an academic one. Therefore, analyzing their potentialities and limitations is crucial to produce an accurate (critical) review.

At the same time, with the recent rise of Brazilian authoritarianism in mind, with this paper we argue that mapping all these different perspectives can show how this new authoritarian wave is not necessarily a recent phenomenon. But, on the other hand, it is fundamental to understand that this past authoritarian structures are renewed and reestablished by actors and institutions, beyond mere systematic reproduction. With this systematic review of the literature produced on the subject, we seek to map the history of the idea of authoritarianism in Brazil and its forms of use in recent decades, and with that we hope to provide a more solid repertoire to apprehend the phenomenon today.

¿Afectan Las Políticas Urbanas a La Estabilidad Residencial? Evidencia Para España

Hay muchos factores que pueden reducir la estabilidad residencial en un barrio, pero la literatura científica sobre cómo las políticas públicas urbanas pueden afectar las preferencias residenciales de los ciudadanos de barrios vulnerables es escasa. Los efectos de estas pueden hacer que un barrio sea más habitable, pero también pueden tener efectos no deseados, haciendo que los ciudadanos con más recursos estén más dispuestos a abandonarlo, incentivando la movilidad residencial. También pueden cambiar los motivos de esta, mejorando algunos servicios, pero no otros. Utilizando datos de la Encuesta de Regeneración Urbana y Cohesión Social (RUCOSA), desarrollada para evaluar las políticas urbanas implementadas en Andalucía (España), tenemos la intención de analizar cómo esta ha afectado a las preferencias y motivos para la movilidad residencial en las zonas intervenidas, frente grupo de control de zonas donde no se han aplicado las políticas. Además, trataremos de ver si existe un factor individual diferencial entre la población más vulnerable y el resto de los ciudadanos y cómo se puede relacionar con el efecto contextual de las áreas intervenidas.

GARCIA, Yerko* (Pontifical Catholic University of Chile, Chile)

Un Acercamiento a La Diversidad De Procesos De Economización. El Caso De Las Economías Mapuche, En Los Proyectos De Intervención Territorial (ERNC y Forestales).

Este articulo busca problematizar el proceso por el cual la naturaleza y el territorio son reducidos a una forma de valorización económica, basada en la métrica del dinero. Este proceso se sofistica, actualiza y cristaliza por medio de toda una estructura logística de prácticas, procedimientos y dispositivos que permiten la intervención de los territorios, poniendo al centro modelos de desarrollo basados en la extracción de recursos (Gudynas, 2015), el bien común y la concepción de buena economía (Asdal, 2021).

Haciendo un zum a las formas en que estos modelos se internalizan en la red de prácticas territoriales, planteamos que este proceso es eminentemente controversial y en gran parte experimental. Específicamente, las diferentes dinámicas que configuran los procesos de economización de la naturaleza (Çalışkan & Callon, 2009; Shamir, 2008), producen toda una serie de fricciones que, al mismo tiempo, posibilitan o funcionan como soporte para, hacer emerger o visibilizar una pluralidad de procesos de economización y valorización de la naturaleza, el territorio e incluso la tecnología.

Esta diversidad de valorizaciones y economizaciones, como las provenientes de la cosmovisión, prácticas y conocimientos de las comunidades mapuche del sur de Chile; se tratan, no como "tradicionales" o ancladas a un pasado lejano, sino como todo un sofisticado proceso técnico-económico, que se produce y reproduce por medio de la relación, de equivocación y desacuerdo, con la naturaleza (de la Cadena, 2020; Viveiros de Castro, 2004), especialmente a nivel de economías comunitarias (Gibson-Graham,2008).

Para la idea de acercamiento a estas formas alternativas de economizar, considero algunos casos empíricos, basados en los vínculos que han tenido algunas comunidades mapuche con proyectos de intervención, como lo son los proyectos ERNC los cuales han tenido una explosión importante en el sur de Chile durante estos últimos años y los proyectos forestales los cuales han tenido importantes procesos conflictivos.

GARCIA ANDRADE, Adriana* (Universidad Autónoma Metropolitana, Mexico)

Emotional Bodies in Synchrony. Sociology in Dialogue with Social Neuroscience: A Review of the Literature in Social Neuroscience.

The presentation will address how Social Neuroscience has inquired about synchronization and its relation to emotional bodies in the past five years. The objective is to build on a possible collaboration between disciplines as other sociologists have proposed (e.g., Franks, Turner, TenHouten, von Scheve).

I used PubMed as a search tool to observe Social Neurosciences publications addressing the aforementioned process. Fifty research articles were found using the words "interpersonal synchronization" and "emotion" or "affective" or "empathy" in the title, keywords, or abstract from 2017 to 2021. These papers were analyzed using the following questions: How do bodies synchronize in interaction? What is the importance of emotion, shared emotion, or emotional

contagion in the process? How are emotions measured in the body or bodies? Furthermore, what are the surpluses of the synchronization process for the body/brain of the participants

The paper is based on the premise that Sociology and Social Neurosciences share interpersonal synchronization as a research problem, among others. Interpersonal synchronization is, in its simplest form, "a temporal alignment of periodical behaviors [of at least two persons]"(Cacioppo et al., 2014, p.842).

Synchronization between human bodies has been documented and researched in Sociology (Collins, 2005; von Scheve,2012; Jasper, 2011), physiological psychology (Kleinbub, 2017), and in the past thirty years, in social neuroscience (e.g., Caccioppo, 2020; Konvalinka, 2019; Feldman, 2016). Bodies in interaction may synchronize and share similar heart rates, similar brain waves, similar behavioral patterns, and similar emotions or emotional meanings. While Sociology has addressed synchronization and its social consequences, the biological processes and its emotional implications in the body/bodies have been underinvestigated.

In Social Neuroscience, one can find different methods for observing emotions in interaction, how bodies affect each other, and how synchronization can be a non-conscious or a conscious process. These findings may complement or enhance sociological explanations.

Calculating Risks: A Mechanism to Medicalize Physical (in)Activity

The purpose of this paper is to contribute to the understanding of the process by which individual behaviors and aspects of daily life related to levels of physical activity performed by people have been defined and problematized in the medical jurisdiction. I propose that calculating risks linked to health-disease processes can be identified as a mechanism to medicalize physical (in)activity. I used as coordinates of analysis the following sensitizing concepts (Blumer, 1969): a) medicalization understood as a process that can be presented at different levels: conceptual, institutional and interactional (Conrad, 1992), the analysis presented here focuses on the conceptual level; and b) mechanism (Hedström and Ylikoski, 2010) to make visible the way in which the participating agents, their properties, activities, and relationships produce the medicalization of physical (in)activity; c) calculating risks is understood as a statistical analysis where the probabilities of i) contracting noncommunicable diseases, ii) becoming incapacitated, iii) dying, iv) obtaining health benefits, or v) being overweight or obese are calculated in relation to the frequency, intensity, and duration with which certain people perform physical activities. I focused this study on a literature review where I explored the relationship between physical activity -specifically sports-, medicine and health. I examined scientific and gray literature and digital references, paying special attention to what, how, when and what consequences physical activities, including sports, are defined as a medical problem. The hypothetical explanation that raised from my analysis is as follows: if the calculation of the probabilities of contracting noncommunicable diseases, or becoming incapacitated, or dying, or being overweight or obese, or obtaining health benefits increase or decrease according to levels of physical activity that people perform; then, there are elements to define and problematize in a medical frame of reference behaviors and aspects of daily life related to people's physical activity levels.

GARCIA MARTIN, Joseba* (University of the Basque Country, Spain)

Catholic Movements, Neoconservatism and "Moral Panic." the Opposition to the Legalization of Euthanasia in Spain

The recent legalization of euthanasia in Spain has, unsurprisingly, encountered the fierce opposition of conservative groups inspired by Catholicism. The mobilization of this opposition, which took place in the public space since the initial debates in 2019, was abruptly interrupted by the COVID-19 pandemic. Rather than kill mobilization, however, COVID-related restrictions on mobility triggered the adaptation of the repertoire, shifting to the digital medium. They also generated the further tightening of the alliance between Catholic-inspired collectives and conservative or extreme right-wing parties, whose strategy has been closely linked to that of the Catholic Church — a key agent in spreading distrust towards the law. Since the initial debates, both offline and online, Catholic collectives and extreme right-wing parties have utilized belligerent language and overdramatized arguments to fight legalization, constantly underlining its potentially tragic consequences for society. However, in the post-pandemic context, these anti-euthanasia groups have lowered their level of exposure by integrating into a broader space of opposition currently waging a "cultural battle" against various "moral policies" (e.g. rights related to cultural diversity and the expansion of sexual and reproductive freedoms).

The objective of this paper is twofold. First, I identify the main conservative groups of Christian inspiration opposing the law, and outline their mobilizational repertoire and strategies. Second, I delve into their discourse of "moral panic," distinguishing three phases: 1) before the legislative process began; 2) during the process of debate and approval of the law amidst the pandemic; and 3) the post-pandemic scenario. The fieldwork, qualitative in nature, was carried out between 2018-2022. It is based on 25 in-depth interviews with anti-euthanasia activists, and on the analysis of secondary data, that is, internal documents of both conservative organizations and right-wing parties, and the official pronouncements of the Catholic Church.

MARQUEZ, Alejandro (UNAM, Mexico)

Factors That Affect the Perception of Citizenship and Community Partition of Young People Aged 15 to 17 in Mexico

Within the framework of modern democracies, the existence of a close link between education and the construction of democracy is considered, since it is assumed that an essential function of education, formal or informal, is to train the new generations in the knowledge, values and principles that shape democracy, as a form of government and citizen participation as a way to solve public affairs (Guevara, 1998; Hart, 1993). Therefore, it is through education that the new generations begin to form themselves as citizens, which implies the promotion of a political culture that stimulates civic and civilized participation within the framework of democracy (Guevara, 1998). Due to the above, the objective of this work is to provide an overview of the perception that young people from 15 to 17 years old have with respect to the total population in terms of democracy, their interest in the problems of the country and their participation aimed at solving some problems that directly affect their community. Likewise, it seeks to appreciate how these aspects are related to some factors related to the characteristics of the population: gender, schooling, school attendance, the economic income group to which they belong and their situation with respect to a series of social deprivations they suffer. The work is divided into four sections, this introduction, two main sections and a closing as final comments.

Formación Profesional y Ética En Post Pandemia En Estudiantes De Pueblos Originarios De Educación Superior

En esta ponencia se analiza analizan la formación profesional que los estudiantes de pueblo originario de educación media superior obtuvieron en tiempos de confinamiento. Para ello, es importante identificar aspectos de la ética profesional por parte de las instituciones.

La formación profesional recayó en la experiencia y pericia de los docentes frente a grupo, los cuales se reorganizaron y tuvieron que adaptar a la modalidad virtual. Por medio, de Tecnologías de la Información y Comunicación (TIC), se buscaron estrategias para el uso de las herramientas tecnológicas actuales, que fueron bridadas de forma pública o privada, y que, en ocasiones, las universidades adquirieron las licencias.

La TIC más usadas fueron Moodle, Zoom, Meeting, Skype, Google, Hangouts, Blackboard, e inclusive aplicaciones de comunicación telefónica grupal, fueron utilizadas como herramientas para continuar en el semestre y la impartición de los contenidos académicos. Por tanto, la práctica docente se modificó el acompañamiento, hasta aparecer un nuevo vocabulario y léxico didáctico.

En la pandemia del Covid-19, la educación superior vivió cambios drásticos en la forma de impartir docencia ante el cierre de las instalaciones de las universidades. La población estudiantil, regresaron a sus lugares de origen y se refugiaron en sus hogares. Ante tal situación la vida social se vio afectada, los individuos cambiaron sus hábitos cotidianos por un confinamiento y se adaptaron a realizar actividades, en muchos casos, de forma remota.

Human Trafficking Survivors in Spain: The Variables of Gender, Citizenship and Covid-19 Pandemic

During previous pandemics, the risk of human trafficking has increased (Worsnop, 2019). The Covid-19 economic crisis also intensified the risks of exploitation.

In order to denounce the circumstances of survivors in Spain, 14 interviews with professional and 19 in-depth interviews with survivors of sex trafficking were conducted. They were asked about several topics such as health, living circumstances during the lockdowns, economic situation, family and social net, gender inequalities, discrimination, access to rights and difficulties related to residence or work permit.

The main results founded related to social are: digital divide, lack of identification and police work or inspection, increased exposure to violence (gender violence in the domestic area or because of prostitution occupation), lack of social support in Spain. In relation to health, difficulty of medical care when there is no documentation, lack of COVID protection, stop sexual health check-ups and mental health problems (such as PTSD, Anxiety, Depression) were found. Regarding to economic impacts, it is being found that they suffered economic abuse after the trafficking situation because of the vulnerability, lack

    *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of a safe home in a population that moves frequently, difficulties in applying for economic aids, food insecurity, economic pressure due to family economic responsibilities and increased debts.

In conclusion, the pandemic has reinforced the economic vulnerability of the women survivors of sex trafficking in Spain. It is very difficult for them to escape from the spiral of socioeconomic vulnerability and prostitution.

Missing and Murdered Indigenous Women and Girls in Canada and Indigenous Women's Human Rights Activism

In 2015, the Inter-American Commission on Human Rights and the United Nations Committee on the Elimination of Discrimination against Women (CEDAW Committee) issued reports on the epidemic of missing and murdered Indigenous women and girls in Canada, describing it as a human rights crisis. Canadian politicians and media, activists, and academics (whether Indigenous or not) refer to this problem in these terms. Yet, this understanding of violence against Indigenous women and girls – and the attendant legal definitions of state responsibility that it invokes – is in fact relatively new. While scholars have pointed to the salience of Indigenous women's activism in constructing this violence as a social problem, the role of international human rights law here has remained underexplored. How have Indigenous activists used international human rights law to define the problem of violence against Indigenous women and girls? How and when did this form of Indigenous feminist activism start? What have been its main goals? What have been the responses of the Canadian state to it and its limits? These questions motivate this paper. The paper further draws on decolonial Indigenous perspectives on human rights.

Completed Fertility Among Latin American Immigrants and Their Descendants in Spain

Spain is an interesting country to study the fertility of Latin American immigrants (LAi) because 1) with 2.4 million Latin American immigrants residing in Spain (according to the 2011 Census), it is the main destination for LAi in Europe and 2) Spain is currently the third Organization for Economic Cooperation and Development country with the lowest TFR (Total Fertility Rate) and the second with the highest average age at first birth.

We use a database that links the 2011 Census with the Natural Movement of the Population records from 2011 to 2015 and apply Poisson regression models, the dependent variable being the number of children had. The sample is made up of women born between 1950 and 1969: 550.321 Spanish women, 18.469 first-generation LAi, 2.521 1.5 generation LAi, and 2.646 second-generation LAi.

Results show that first-generation LAi have a higher completed fertility than natives. However, 1.5 and second-generation immigrants have around 10% lower completed fertility than natives. These results hold when controlling for birth year and education level. We run the same models for each of the 19 Latin American countries individually. We find both variability in the results among countries and common patterns. Finally, we run a Poisson regression model of the total number of children had, by generation of immigrants and TFR in the country of origin and year of birth. This model allows us to analyze the effect that the TFR at origin has on the completed fertility of the three generations of immigrants. We find that among first-generation LAi, only those who were born in countries with TFR above 5 children per woman have a completed fertility in Spain that is 10% higher than that of native women. No effect of country-of-origin TFR is found in 1.5 and second-generation immigrants.

Care Work in Puerto Rico: Relevant Contributions and Proposals for Future Research

In this paper we summarized an article submitted to publication in 2022. The purpose of this presentation is to highlight relevant contributions on care work in Puerto Rico by historical periods. Also, to present proposals that include social policies to address the socioeconomic, labor, and emotional situation of caregivers, specifically in the post-pandemic context. In each period we emphasized the role of the state, feminist groups, women care workers, and other sectors. Between 1940 and 1980, Puerto Rico was one of the pioneer countries in Latin America and the Caribbean to study and publicly discuss care and domestic work. Beginning in the 1990s, with the advance of neoliberalism, the government considerably discontinued care services, transferring some to the private sector. There has been a setback in the approval and implementation of social policies to protect caregiving workers. This has negatively affected many women. We recommend that care work continue to be studied in Puerto Rico and other regions from diverse perspectives and methodologies, including Future Research, Sociology of Work, Work and Organizations Psychology, and Labor Studies. To address the conditions of care workers and the situation of care work, educational, labor, community, union, and social proposals are discussed. The projects, policies and alternatives implemented internationally must be evaluated. This evaluation includes initiatives from the Western and Eastern hemispheres. We propose that an interdisciplinary committee, with representation of caregivers, feminists, academics, government officials, and legislators, study and establish a plan to address the labor and social conditions of care workers in Puerto Rico, regardless of their immigration status.

Labor and Social Impact of COVID-19 on Women in the Global South

In this presentation we expose the labor and social impact of COVID-19 on women in the Global South. We carried out a documentary analysis of articles published in 2020 and 2021 on COVID-19 in the Global South. Women were one of the most affected social groups, evidencing structural and historical gender inequalities. Among the salient results, it stands out that women increased the time (in hours) dedicated to non-salaried care work (mainly to their relatives and patients). This generated work overload, job loss and setbacks in job classifications, affecting their labor trajectory. Despite of being on the front line of the COVID-19 infection, remunerated care work was poorly paid, made invisible, and lacked adequate labor protections. Women also experienced the highest rates of unemployment, financial crises, physical and emotional overload, mental deterioration, worse working conditions, poverty, dissatisfaction, economic dependence on partners, increased isolation, violence and femicide. The jobs available to young women were the most precarious. Young black women had the highest unemployment rates. Immigrants' participation in the informal sector was the highest, lacking economic aid, insurance, health services and being more exposed to the virus infection. They had to choose between working to retain their immigration status (citizenship or residence) or their health. For them, reporting situations of domestic violence was more difficult due to cultural and linguistic barriers, as well as the pandemic confinement. In addition, they were more exposed to job loss, some were forced to return to their countries.

Does Remote Social Work Increase Labor Conflicts? Evidence from Social Workers' Pandemic Experiences in France

The Covid-19 pandemic has led governments to take restrictive measures that severely limited social interactions. While the crisis has increased social vulnerabilities, how have these measures transformed the work of those whose job is to help others? Social work, which is based on interactions with various actors (recipients, other staff members, managers, funders, etc.), has faced major changes that have caused (or reinforced) conflicts in this sector.

This talk results from a collective research project, which documents the individuals' legal experiences during the pandemic, especially in the social care sector. 46 interviews were conducted with mostly female workers (educators, animators, case workers, psychologists...), in various organizations (NGOs, activist groups, public services), both in the Paris region and Brittany.

These social workers had to reorganize the way they interacted with people in need, in a constraigning and uncertain environment. While teleworking, they focused on the most vulnerable recepients, and invented new ways to give support at a distance. Due to the pandemic, they also had to take charge of unprecedented requests. Those who continued to work in the facilities were in charge of new tasks, such as disinfecting premises, checking people's compliance with health regulations, reorganizing interactions to comply with new rules. Care work continued, at the cost of overwork.

These workers have been quite aware of their social usefulness, while suffering from discredit. The pandemic has reactivated the insuffisant social and material recognition of these feminized jobs. The sudden work reorganization has generated tensions, with recipients, colleagues, managers, funders and even the government. Wage increases, "Covid bonuses", vaccines at work... the pandemic has drawn new conflictuality lines, relayed by trade unionists when they are present at workplace, while interacting with the structural discontent in the care sector, due to the implementation of managerial policies and to the lack of resources.

"Has Anyone Ever Innovated Responsibly?" Social Scientists' Participation in Responsible Co-Design of Digital Farming Tools

There is a robust body of literature on effective team science and knowledge integration in interdisciplinary collaborations for better convergence of expertise across social, natural sciences, and engineering. Team science imagines social sciences to offer a bridge between the natural sciences, science communication and public policy. However, social scientists involved in transdisciplinary technology design research projects can struggle to adequately avoid or remove tensions emerging between different epistemic communities. The basic premise of this paper is to discuss the challenges and opportunities for social scientists who are involved in multi-year transdisciplinary research projects in the context of responsible innovation of co-designed digital farming tools. We discuss challenges of integrating knowledge, perspectives, and approaches to technology development that bridges diverse expertise from within disciplines in academia and between farmers. For example, traditional natural science researcher often have trouble with research projects that are emergent and dependent on "subjects" for direction. In this paper we explore the overlap among these strategies for engaging the user populations in technology development as well as the significant differences in these emergent approaches to research. We invite conversation on developing more creative strategies for engaging end users in technologies, while supporting responsibility among transdisciplinary project team members

Reconfiguring Meanings and Possibilities through Digital Agriculture: Lesson for Innovation Dynamics

Viewing digital farming from a sociomaterial lens begins with the premise that technologies come to matter and generate possibilities and perils for people and the environment through enactment in everyday practices. Big agricultural data and algorithms, are for example, not only important for helping farmers decide about nutrient use, but also are an orchestrating center around which multiple aspects of productivity and sustainability converge. Here, I highlight the recent ontological turn in science and technology studies and information systems research to describe digital agriculture as a phenomenon—rather than a thing—held together through the drawing of materials and humans composed in particular arrangements. Through this ontological shift to new materialism, I am less interested in precisely representing the impact of objects (e.g. digital farming apps) on subjects (e.g. farmers / farm advisors) and vice-versa, but instead in describing the assemblages of non-human and human elements that co-constitute 'new' phenomenon, such as 'digitally aware farmers reading yield maps on their phones or tablets'. At the same time, these 'new' phenomenon emerging through the interaction between human and non-human elements in digital agriculture also produce certain uses of objects and positioning of subjects through formation of certain possibilities, knowledge, and identities, while excluding other ones. I use data from focus group discussions and interviews with a wide range of stakeholders across the digital agriculture value chain in the US, to show that the performativity of digital farming practice challenges and reconstitutes knowledge, farmer identities and relationships, and conception of power and control. To address these challenges, I provide some strategies through which innovation in digital agriculture can create possibilities for human and non-human agencies to act and respond to greater challenges of technological governance, while addressing socioenvironmental challenges of climate change, water quality, and soil health in the US.

Leisure and Tourism in India: A Study of Housewives of Marwar Region during COVID-19

Time is a phenomenon that is difficult to comprehend and manage. Leisure is taking time off from the everyday work to relax body and mind. Leisure is a basic need of human life. It is equally important for both men and women. In the patriarchal order, there is a huge difference in the leisure time and activities of men and women. Women have been treated as subordinated to men in every aspect of life. Traditionally, their place of work is confined to the household chores. In the case of housewives, the domestic work done by them is not paid work and hence there is no separate time for leisure. The process of globalization has popularized the concept of leisure through tourism especially among the newer generations. Religious tourism serves as a bridge between traditional and modern aspects of life and is very popular among the housewives. Religious tourism provides them a time off from the daily household chores and gives them a sense of happiness. The COVID-19 pandemic has affected their leisure time through tourism even more difficult. This paper will analyze the relations between leisure and religious tourism in relation to the housewives. It will also try to understand the changing nature of leisure activities undertaken by the housewives of two different generations during the religious tours before and during COVID-19 in the context of modernity. This paper will be qualitative in nature and will be based on primary and secondary sources.

Incorporating Cultural Heritage into Disaster Risk Reduction Policy

The inclusion of cultural heritage as a primary priority in the Sendai Framework for Disaster Risk Reduction for the first time demonstrates the growing significance of cultural heritage in disaster risk reduction on a global scale. However, in Australian national, state and territory emergency management policies cultural heritage is not readily recognised in its role in disaster risk reduction and resilience building. Nevertheless, instances exist throughout Australia of communities protecting, leading the restoration of or mourning the loss of cultural heritage in disasters. Examples are also evident of the cultural heritage sector, inclusive of art galleries, libraries, museums, and archives, that have been working with communities to build resilience and support communities during and after disasters. This presentation will discuss examples of cultural heritage involvement in disaster risk reduction and exam the inclusion of cultural heritage into disaster risk reduction policies.

Strategies to Enhance a Feminist Classroom: An Auto-Ethnography

This article reflects on my journey and pedagogical experiences as a student and later a feminist lecturer. Feminist pedagogues are promising approaches for social transformation in institutions of higher learning. I focused on my experiences, exploring the tensions that have shaped my praxis. I employed an auto-ethnographic approach to illustrate my experiences as I transitioned from being a female student to a female tutor and a female lecturer within institutions of higher learning in South Africa. In this paper, I explore mutual vulnerability and discomfort in a feminist classroom. Furthermore, I discuss how reflexive journaling, negotiating and listening can challenge conventional power relations in institutions of higher learning. The article recommends that feminist pedagogy can work towards solving potentially unequal relations and discriminatory learning environment. This can be done by disrupting normative power hierarchies in the classroom by allowing both lecturers and learners to negotiate the process of 'being listened to' and 'being heard' in the teaching and learning environments and thus creating room for plural voices and more inclusive learning spaces.

Cómo Avanzar Hacia Una Aplicación Global y Multicultural Del Sistema De Derechos Humanos: El Paradigma De La Libertad Religiosa y La Igualdad De Género

La Conferencia mundial sobre Derechos Humanos de Viena (1993) planteó la necesidad de armonizar la aplicación global de los derechos humanos, sobre la base de su universalidad, indivisibilidad e interdependencia, reconociendo el derecho a la diferencia en nuestras sociedades multiculturales.

Un paradigma de los conflictos en la interpretación del sistema de derechos humanos es el choque entre el derecho de libertad religiosa y el derecho a la igualdad de género, que aparecen a menudo en artificial antagonismo. Reconciliarlos parece ser un intento posmoderno de equilibrar la comprensión secular y religiosa del género por medio de un enfoque fragmentado, práctico y contextualizado, que puede resolver problemas específicos, pero difícilmente reconciliará concepciones diferentes.

La legislación contra la discriminación no puede vencer por sí sola la batalla contra la intolerancia y la desigualdad. El éxito se alcanza a través de un cambio de actitudes y comportamientos. Así, el objetivo de este estudio teórico es reflexionar sobre cómo establecer con éxito una relación constructiva entre derechos humanos aparentemente contrapuestos en nuestras sociedades multiculturales.

Conviene considerar formas de armonizar posiciones diversas que van más allá de las tácticas de resolución de conflictos. Algunos de estos medios consisten en centrarse en los problemas y necesidades reales de las mujeres; escucharlas y empoderarlas dentro de las comunidades religiosas. Abrirse a las lecturas que desde las tradiciones religiosas y culturales puedan enriquecer y completar el concepto de igualdad. Impulsar programas educativos en

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

derechos humanos para eliminar patrones de comportamiento que reflejen prejuicios sobre la inferioridad de la mujer; y eliminar los estereotipos religiosos que pueda sustentar el activismo de género.

Este análisis puede extrapolarse a otros conflictos entre derechos fundamentales, de modo que contribuya a una aplicación del sistema de derechos humanos plenamente respetuosa con la diversidad cultural cada vez más presente en nuestras sociedades.

GATTA, Arianna* (University of Queensland, Italy)

A Welfare for the Truly Needy? Targeting, Conditionality and Non-Take up of Welfare Among the Homeless in Italy

Homelessness remains an unresolved issue worldwide, even in countries with high per-capita GDP levels and the presence of historically established welfare states. This form of extreme poverty persists despite the existence of welfare payments meant to reach those considered "truly needy", such as means-tested targeted benefits. However tightly targeted benefits might be less accessible due to more stigma, bureaucratic complexity, and administrative errors. The accessibility of welfare payments and their potential for redistribution might have been further hindered by the upsurge of behavioral conditionality, especially for those most vulnerable. Thus, this work aims at answering the following research question: do tighter targeting and behavioral conditionality hinder the take up of welfare among the homeless?

I study this question through a probabilistic sample of 557 homeless interviewed in Rome (Italy) in March 2021. I focus on the take up of a Minimum Income Scheme (Reddito di Cittadinanza), the Covid-19 Emergency Payment (Reddito di Emergenza) and a Disability Benefit (Invalidità Civile). The relative importance of welfare stigma versus bureaucratic barriers was studied through two field experiments. I manipulated perceived complexity and appropriateness of applying for welfare and observed how this affected willingness to apply.

Results show that welfare conditionality in the form of strict administrative requirements and lack of information can significantly limit the opportunity to even attempt applying. The availability of a phone significantly predicts access to conditional welfare payments requiring contact with local social and employment services. Administrative errors and benefit sanctions are the main determinants of low take up, while psychological barriers, such as perception of stigma and bureaucratic complexity play a limited role. Ultimately, overly targeted and conditional welfare payments fail to reach those most disadvantaged, contributing to persistence of their condition of deprivation.

GATTU, Satyanarayana* (Osmania University, India)

Higher Education in India and Emerging Trends (A Sociological Study)

India is a second highly populated vast country in the World, which consists of numerous socio-economic, cultural and political problems. It is very difficult to frame a uniform policy for higher education, which has to reflect uniformity and universality in the pursuit of higher education to suit for the needs of national and international objectives.

Since independence, efforts have been made to impart the higher education by initiating numerous policies and programmes by establishing central and state universities under the guiding principles of UGC and AICT etc. Since the education comes under the concurrent list of central and state government frame the rules and state Universities face number of challenges. Hence, there is emerging crisis in the pursuit of higher education in all universities and in all the states. The rules and regulations of State and Central Universities with regards to their autonomy, financial support, content and quality of teaching and learning also varies.

This problem has been further widened after 1991 due to globalization policies and programmes. The State Universities are fast loosing their identities in competition to Central and Private Universities. Hence, multiple problems are emerging in the pursuit of higher education in all the State Universities in terms of quality and content of education, besides lack of teachers recruitment and required facilities which is the cause for deterioration of standards and intellectual apprehension.

This study aims at to explore the nature and content of higher education in the contemporary time and its consequent increasing problems. It based on secondary data, such as books, articles, reports and its content analysis with reference to the state of Telangana in South India.

GATTU, Satyanarayana* (Osmania University, India)

Social Transformation of Post-Independent Indian Society (The need for Second Freedom Struggle)

India attained freedom seventy five years ago and organizing its diamond jubilee celebrations. The traditional social-economic political structure of Indian Society did not change much as expected due to persistence of age old imbedded inequalities social structure since ages. The hierarchical Indian inequal society constructed based on religion, verna and caste. Despite highly advancement in science and technology and planned development programmes of the Governments, the society could not transform its basic nature and persists unabatedly nature. As such consequent crisis emerging on democratizing to construct just society. This has become a serious impeadment in the pursuit of democratic policies and programmes and for objective construction of just society. Though majority people belongs to Dalit, Bahujans that is about 80%, minority castes like Brahman, Bania, upper Sudras rule the nation.

People belongs to working castes or classes are yet to realize the freedom and lead a dignified life in all social spheres. The institutions of governance and justice are also in the grip of upper castes and classes and their functioning naturally maintain the status-quo. Hence, people belongs to working castes and classes increasingly feeling restlessness than ever before in all walks of life.

As such, there is a need for understanding the social transformation in post independent Indian Society and the need for second freedom struggle for the construction of a just and democratic society as visualized by Mahatma Gandhi.

It is a critical and explorative paper based on secondary data and its content analysis.

It is concluded that, India society needs to be a democratized for the objective justice for all through mass movement for transformation socio-economic, political sphere of Indian society.

GAUTAM, Prerna* (Tata Institute of Social Sciences, Mumbai, India, India)

Child Rights in Situations of Armed Conflict: The Case of Kashmir

The broad political framework of the Indian state is a welfare state; however, in conflict zones like Kashmir, the state transforms itself into a security state where the rhetoric of defending national security leads to grave violation of child rights. Despite children being one of the most vulnerable groups in situations of armed conflict, the state prioritized law and order over children's rights which explains the delay in bringing the juvenile justice system to Kashmir. The paper is based on the findings of empirical research conducted in Srinagar and Kupwara districts of Kashmir. The paper unfolds in four sections. The first section highlights how the protracted conflict creates a growing crisis of orphans in Kashmir. The breakdown of social order and social disarticulation impacted the traditional support structures for the care and protection of orphans and this along with discriminatory rehabilitation policies of the state led to the emergence of NGO-run orphanages in Kashmir. The second section gives insight into the survival strategies and coping mechanisms adopted by the orphanages and NGOs to address the risks and challenges posed in crisis situations such as curfews, prolonged lockdowns, communication blockades etc. The third section throws light on how experiences of social reintegration of care-leavers vary according to the nature of orphanhood, conflict experiences, gender and the type of institutional care experienced. The final section argues for the need for an overarching rehabilitation policy on conflict-affected children in areas of civil unrest which takes into account the multidimensional impact of conflict on children; which is non-discriminatory in its approach and does not exclude children whose parents were in non-state armed groups; and which adopts a non-punitive and restorative approach towards children involved in strife with the state.

Capitalism, Migration and Entrepreneurship in Nepal

Entrepreneurial activities are central to the evolution of capitalist societies because new businesses drive economic and employment growth. In capitalist societies, continued economic growth depends on the extent to which potential entrepreneurs can obtain and effectively utilize the social and economic resources they need. "Entrepreneur" and "entrepreneurship" constitute somewhat contested terms, especially outside of the community of scholars who regularly publish in entrepreneurship journals. Debates over the meaning of the terms became a regular feature of conference presentations and journal articles in the 1970s, as the field struggled for academic legitimacy. Among many, some of the debates reflected the field's attempt to distinguish the field of "entrepreneurship" from the field of "small business studies," which had been the traditional home of people studying business startups. Based on both qualitative and quantitative data gathered from both primary (interviews) and secondary (academic books, and journals including newspapers and social media) sources this paper argues that in many countries of the world many immigrants bring technological, managerial, and professional skills acquired in the homeland and they become in a better position than those groups without these assets to start a business. This framework explained immigrants' self-employment rates primarily on individualist grounds. Nepalese entrepreneurs of the new generation are also running their entrepreneurship with their individual human capital attained through education and training in their homeland and destination and social capital (social networks) and are also mostly migrants who brought professional skills and experiences from abroad, have social networks, and understanding the current culture of consumerism as argued by new economic sociology. However, entrepreneurship in Nepal is mostly focused on the service sector which is different from classical capitalist societies.

Ethnicity, Social Transformation and Changing Dalithood in Nepal

This paper explores social transformation taking place in Nepal in the last 30 years from the establishment of multiparty democracy in 1990. Transformation is described in terms of changes in various dimensions common to all sections of population, categorized as ethnicity, particularly focusing on Dalit and non-Dalit. However, Dalithood, as the relationship between dalit and non-dalit, which is at the core of contemporary ethnic debates in Nepal, is often discussed as if it is stable or unchanged forever. Based on macro data-national level survey data (1995-2022) and micro data-few qualitative interviews, this paper argues that there is remarkable change in dalithood over the period of 30 years. Some key individual and household level indicators of living standard clearly reflect the change taking place in dalithood as well at both micro and macro level. At macro level, remarkable changes can be observed in key indicators of individual and household dynamics; household size and material for the roof, economic status; remittance and poverty status, education; literacy rate and year of schooling, migration; rate of migration and inter-caste relations. These macro level indicators clearly show the higher level of mobility among dalits is contributing in the interaction and intermixing of dalits and non-dalits in workplace as well as other wider public places such as school, restaurant and feasts. The micro level individual-individual relations based close conversation and commensality proves the remarkable changes in the relationship between dalits and non-dalits at local level. It clearly indicates that the untouchability and discriminatory nature of dalithood prevailed in the past is changed into non-discriminatory and touchable nature dalithood at present reflecting the change in ethnicity as a whole.

Employees As Caregivers for Older Parents

By analysing survey data from Norway, the current study identifies variables that predict to what extent employees provide help and care to their old parents. Data were collected in 2022 among 4,416 employees in a nation-wide survey. Besides emotional support, help with the use of new digital technology was a particularly frequent form of help, an aspect that has drawn little attention in earlier research. Such help with using digital technology was strongly associated with assisting the parents to maintain contact with public agencies and health and social care services. Various forms of practical help were also relatively common, but few employees provided personal care to their parents. The analysis showed that numerous items on specific forms of help and care could be systemised into three separate types of help and care: administrative help (which included help with using digital technology), practical help, and personal care. More care was provided to mothers than to fathers. The parents' health, whether they lived alone, and living outside elderly institutions were the most substantial predictors of help and caregiving to parents. Except for assistance with the use of digital technology, senior employees (55+) provided more help and care than younger employees. In contrast, the gender of employees, their socio-economic status, working full or part-time seemed overall to have little effect on help and care provided to parents. Differences across industries were also overall small. We conclude that the transition to a digitalised society has altered daughters' and sons' role as care givers. Many of those 80 years or older have no or week digital competence. Our analysis suggests that children are particularly important for providing assistance to older people with the use of such technologies.

GAVIRIA, Sandra* (Université Le Havre Normandie, France)

Returning to the Nest in a Time of Pandemic

The purpose of this paper is to show the specificities of the return of young people to their parents in France at the time of confinement. The central question is to understand whether this moment represented a moment conducive to an evolution of family relations or whether it was part of the continuity of past relations.

Several questions are at the origin of this paper. How did the families experience the return during the confinement? What are the specifics compared to returns in normal times? Is there a link between the feeling at the time of return and at the time of departure?

The results are based on a qualitative survey of 53 interviews conducted with parents of young students who returned during confinement. A comparison will be made with young people who returned before the confinement. This is a fieldwork of a survey conducted with young students who returned to their parents' home in time before the pandemic.

It will be a question of showing the links between the departure and the return, of analyzing the family relations in this unprecedented, new and specific context and of understanding how the need for autonomy of the young people was set up in a context of sudden and unforeseen family recohabitation. The analysis of the feelings but also of the uses of the space will allow us to understand if the family relations were maintained in the continuity of the past or evolutions took place during this period.

The Perception of Abstract 'War' in Russia: The Psychometric Paradigm Approach

There are real risks of independent sociologists to study the Russian invasion of Ukraine from inside. One of the options is to use indirect measures and avoid statements that are regarded as criminal acts by Russian Criminal Code. Our study uses the "psychometric paradigm" methodology that is aimed at finding risk perception dimensions by analyzing judgments people make about risks (Slovic, 1987; 2000). "War" was one of the risks that were presented for survey participants before and during the invasion.

The first wave of the survey ("Before") was conducted in November, 2021. More than 1700 respondents were recruited via Yandex Toloka platform (a crowdsourcing platform similar to MTurk). We applied a split questionnaire design when each participant rates only 1/6 of all risks (see Bronfman & Cifuentes (2003) for similar design), so there were about 300 evaluations of the 'war' risk.

The second wave of the survey ("During") was conducted in September, 2022. More than 1000 respondents were recruited using the same method and the split questionnaire design.

My presentation will be focused on the shifts of the perception of abstract 'war' that occurred between these two waves. These shifts are analyzed using not only 8 "classical" psychometric scales that cover two main dimensions of risk perception ("dread" and "unknown" risk), but also 4 additional questions concerning the responsibility of some actor for preventing and compensating risk.

In addition I will show how the perception of war is related to sociodemographic characteristics (age, gender, income) and to attitudes towards the 'special military operation'.

GAVRILYUK, Tatiana* (University of Tyumen, Russian Federation)

Emotional Labor and Alienation of Frontline Service Workers: The Case of the Russian Food Service Industry

The research is focuses on the emotional nature of frontline service work in a food industry that forces employees to develop the tactics of alienation. Three public catering chains in Samara, Russian Federation, have been chosen as the subjects of the empirical study conducted in 2021.Within the framework of a case study method, from 6 to 8 people employed in working-class positions were interviewed in each organization. The open data (corporate websites, official and informal communities in social networks) was studied by means of content and discourse analysis. The findings have shown that resistance to dehumanization, instrumentalization, and de-identification of their personality in the work process becomes a key aspect of service workers' life experiences. Most often, it's not expressed in an organized form but manifests itself through alienation from the process and the result of labor, as well as from emotions. The so-called "negative consciousness" is being shaped, embodied in separating from the role being performed, detachment, emotional dissonance, a feeling of inauthenticity, and professional burnout. An analysis of three empirical cases demonstrates that the emotional repertoire, subjective meanings, solidarity practices, and professional identification processes largely depend on the micropolitics of interactions at a particular workplace, as well as managerial regimes. When strict managerial control take place, prejudice against employees and the absence of flexible agreements often become acceptable. A low level of alienation is observed when there are elements of empathic work and regular informal communication with customers. Besides, the research proved that clients and managers share common stereotypes about employee representation of physicality and material attributes of role performance, which support the reproduction of racial and gender segregation and therefore lead to an increase in alienation.

Young Frontline Service Workers in Russia: Class Contradictions and Striving for Wellbeing in Times of Change.

Along with industrial workers, the group of lower-level frontline service employees constitutes the new working class of a post-industrial society. The impact of societal changes on the specifics of service labor (digitalization, global restructuring of the division of labor, contingent work, persisting

　　***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

gender inequality, the consequences of the pandemic and the war conflict) substantially influences the wellbeing of this group of youth, improving their already disadvantaged position. This research aims to reveal the specifics of interactive service work in the conditions of the Russian poorly-regulated service labor market and its interrelations with such aspects of youth wellbeing as job satisfaction and value of work, positive class and professional identity, social justice assessment, trust in basic institutions, fears and tensions in planning for the future. Three public catering chains in Samara, Russian Federation, have been empirically researched in 2021 within the framework of a case study method, including 20 semi-formalized interviews with youth aged 16-35, the content and discourse analysis of open web data, and 2 focus groups. The research has shown the predominantly informal nature of employment; the total absence of trade unions; the complete or partial absence of social guarantees and mandatory payment; irregular working hours. The situation is exacerbated by the economic consequences of the pandemic. The loyal attitude of service workers to segregation and discriminatory practices rooted in everyday life indicates the absence of a pronounced antagonism between class cultures, blurs class boundaries and prevents the emergence of solidarity practices aimed to improve wellbeing. The value of service work is described by informants in terms of gaining independence, separation from parents, social capital acquisition; gaining endurance and stress resistance; respectful attitude to any kind of labor; development of patience, goodwill, responsibility, physical endurance, purposefulness, emotional intelligence, self-confidence, and communication skills.

GAWRON, Grzegorz* (University of Silesia in Katowice, Poland)

Co-Production Practices in Public Social Services during the COVID-19 Lockdown Period. the Example from Centers for Seniors Organized Under the Polish Government's Multiannual Program "Senior+".

The continuing COVID-19 pandemic has been affecting our health and other aspects of our lives – work, family life, and contact with others. Everyday functioning has changed completely. The threat of the pandemic has forced us to develop new everyday practices, including co-producing services in conditions of minimal direct contact. The speech aims to present co-production practices in public social services during the COVID-19 lockdown period. Older adults constitute a heterogeneous group, which explains the diversity of their life situations, needs, and attitudes in different situations, including lockdown COVID-19. Many studies have been published examining the impact of pandemic constraints on people's functioning. Their results depend on the studied region and age group (Wang et al. 2020; Krendl & Perry 2020; Kim & Jung 2021; Atzendorf & Gruber 2021). It is essential to better understand the unique experiences of older people during a pandemic so that governing bodies at the central and local levels of government can develop appropriate policies and services for the real needs of older people.

Therefore, the discussion is based on the results of nationwide research conducted in Poland among formal organizers and recipients of services in local centers for seniors organized under the government's multiannual program "Senior+" (772 centers for seniors throughout Poland and 19,000 beneficiaries). The main research questions for the author were: What co-production practices have been developed for the realization of services during the COVID-19 lockdown period? Which of these dominated and why? To what extent were new technologies useful? What were the results (gains and losses) that recipients of the services (older people) achieved during the COVID-19 lockdown period by realizing different forms of co-production? The variety of service practices during the COVID-19 lockdown period was the basis for the author proposing a typology of forms of services co-production.

Examining the Idea of 'Self'-Learning within Gendered Spaces

It is believed that in a democratic society education bridge all the inequalities and higher education is the means to attain upward mobility. But in India irrespective of the growth in the investment in the sector of education there has been a disparity in distribution of educational facilities between different social categories like caste, class, ethnicity, gender as well as between the rural and urban areas. Keeping this picture in mind the first Open University of the country was introduced. In the similar lines the State Open University of Assam was established with a vision to reach the unreached and generate an engaged and reflexive citizenship. The Open and Distance Learning (ODL) system is based on the philosophy of 'self-learning' independent of formal teaching whereby the pace and place of learning the materials provided needs to be 'self-monitored' and initiating a discussion requires to be pursued by a learner. This process requires exercising one's agency to create 'space for self'. In this paper, one intends to argue that while the ODL system, characterised by "openness and flexibility" asserts to provide access to higher education to the "unreached" at the door step and offers a "choice" to the learners to pursue their dreams, yet the question of "choice" and "space" in socially segregated society, needs to addressed critically. This exercise has become a necessity in the present context with the existing authoritarian regime aggressively promoting 'gender'

without interrogating the existing power dynamics that reproduce inequality. This study stems from one's experience as a teacher in an Open University intending to locate and reflect upon the gendered experiences of the female learners.

Transitioning to a just low carbon economy: a critical and interdisciplinary review of the role of the trade union movement

In this article, I provide a critical and interdisciplinary state-of-the-art review of the role of trade unions in transitioning to a just low carbon economy. In doing so, I seek to lay a foundation for generating a holistic understanding of the three key interconnected arenas in which trade unions are currently navigating the 'jobs versus environment' dilemma: internal union strategizing, climate policy-making and public debate. The article begins by discussing the key sociological theories and concepts that can help explain why old and new inequalities are created and reinforced during transitions. And how just transitions have become the latest battleground in the contested terrain between trade unions, employers and the State. The next part then examines and synthesizes the key thematic insights from three fields of research – industrial relations, environmental sociology and environmental labour studies – along the organisational, institutional, and societal dimensions of analysis. With that in mind, I suggest that scholars need to look more closely at discourses circulated through the media by trade unions in competition with other political actors. This requires expanding the theoretical and methodological repertoire of research to include social theories of discourse and critical discourse analysis as well as a greater range of empirical sources (e.g., media coverage, parliamentary records, and social media data).

The Pitfalls of Inequality. a Comparative Analysis of Green Purchasing Behavior in European Countries

In this study, we explored European cross-national differences in green purchasing behavior, focusing on the role of inequality. Previous studies have mainly approached these inequalities from an individual perspective. We examine the role of inequalities between (GDP) and within countries (GINI), and how this relates to their citizens' engagement in green purchasing behavior. Data from the Eurobarometer (2019) was used. Firstly, our study confirms the social gradient in green purchasing behavior; it is most common among people who are affluent and higher educated. It seems that people need certain economic and cultural resources to engage in green purchasing behavior. Our results suggest that this holds true on a country level. Economic inequalities between countries appear to affect their citizens' green purchasing behavior. Particularly, the GDP of a country was positively related to its citizens' green purchasing behavior. Moreover, our study shows that inequality relates to green purchasing behavior on a more fundamental level than (in)access to resources and wealth differences between countries. Green purchasing behavior appears to be less common in countries with high levels of income inequality. Additionally, the negative consequences of inequality seem greatest in rich countries. Finally, inequality seems to amplify social class differences; the income and educational gap widens with increased income inequality. In conclusion, we point out that a country's economic state influences its citizens' green purchasing behavior. While economic development matters, it is not sufficient. In line with previous studies, results suggest that inequality is corrosive and divisive. Inegalitarian countries perform worse on a range of health and social issues, which – based on our study –includes efforts to engage in green purchasing behavior.

GENOV, Nikolai* (Free University Berlin, Germany)

Individualization in Collectivist War

It is sociological common knowledge that collective entities wage wars. The profound change of conditions, content and effects of individualization under war conditions receives much less attention. Starting with the changed status of Crimea and continuing with the Russian Special Military Operation in Ukraine the processes brought about tremendous changes in all dimensions of individualization in the Ukraine and in the Russian Federation. What was and remains the major challenge to individualization under the conditions of war? No doubt, it was and remains the transition from the liberties of civil life to the restrictions on liberties due to the call-up. Actually, the crucial difference is the high level of existential security in civil life and the intensity of existential risks. Nevertheless, on both sides of the front line there are people who joined the battles voluntarily. They made the collectivist war an element of their own individualization. Against the background of the interplay of collectivist war and individualization a series of research questions arises: What is the extent the technological parameters of collectivist war provoke

strengthening or weakening of the incentives for individualization? How do the organizational characteristics of the collectivist war provoke strengthening or weakening of the individualization? How do the ideological characteristics of the collectivist war provoke strengthening or weakening of the conditions for individualization? The variety of the combined answers to the questions opens the way for establishing three modalities of relationship between collectivist war and individualization: 1. Mutual constructive impact between collectivist war and individualization; 2. No mutual impact between collectivist war and individualization; 3. Mutual destructive impacts between collectivist war and individualization. Empirical information will be obtained from international information sources.

General Practitioners in Front of Covid-19: Italy in European Comparative Perspective.

Background
Primary care has had a crucial role in managing Covid-19 pandemic, despite the differences in primary care models in Europe. Focusing on GPs number as key aspect in primary care services, this study is led by the following research questions: 1) Is the number of GPsper 100.000 inhabitants increased or decreased in the last 20 years in European countries? 2) Has the GPs number per 100.000 inhabitants in Italy been consistent with the rest of the EU countries trend?3) Is there any statistically significant correlation between the trend in GPs number and the Covid-19 mortality?
Methods
Comparative data of the number of GPs per 100,000 inhabitants, in 22 European countries is investigated, between 1995 and 2014 (the last available data), with a specific focus on Italian case study. Moreover a statistical correlation is investigated between GPs trend and Covid-19 mortality rate.
Results
Data shows that the number of family doctors over 100,000 inhabitants in European countries have increased over the last 20 years, except for Italy where it has strongly reduced. The correlation between GPs number trend and Covid-19 mortality rate shows an inverse statistically significant results: countries with an increasing number of GPs had a lower rate in Covid-19 mortality.
Conclusion
This study contributes to the debate on the key role of primary care and GPs in managing the pandemic, showing the unpreparedness of the Italian health system to face the emergency.

GENOVESI, Federico* (Ulster University, United Kingdom)

Solidarity Grassroots Football and Right to the City: How Solidarity to Refugees and People Seeking Asylum, and Resistance to the Commodification of Public Space Intersect in Italian Grassroots Football.

Following the 2007-2008 financial crisis, Italian left leaning social movements have experimented with ways to provide free access to sports. While this was initially mostly in the form of community gyms within self-managed social centres, grassroots football increasingly became a widely popular activity organised by social movement activists. In the aftermath of the so called 2015 "refugee crisis", grassroots football became a privileged way for left leaning social movements to engage with and provide solidarity to people seeking asylum.

In this paper, through a discussion of the practices and discourses adopted by the grassroots football project explored in my doctoral research, I will analyse how the Italian social centres' traditional fight for "the right to the city" (Harvey, 2008) intersects with practices and discourses in solidarity with people seeking asylum. In particular, I will firstly reflect on the role played by grassroots football in the local resistance to processes of gentrification. I will then explore how football was mobilised for engagement with, and to provide opportunities for leisure to, people seeking asylum. In this context, I will also discuss how participation in grassroots football provided participants with attachments to the local space. As such, a sense of "place-belonginess" (Antonsich, 2010) for people seeking asylum was fostered by involvement in the project. Finally, I will maintain that this localised sense of belonging was a key feature for resisting both commodification of public space and people seeking asylum's sense of liminality in the hosting country. From this perspective, solidarity to people seeking asylum is part of a wider political project of belonging, alternative to the nationalist-autochthonic one carried out by the rising right-wing parties in Italy.

The Curation of Affective Experiences of Nature- the Case of Two Far Right Groups

This paper looks at the way social movements may utilise affective experiences in 'natural' landscapes to further ideological and political goals. A series of outdoor events organised by two far right groups- the National Socialist Network (Australia) and Patriotic Alternative (UK) are investigated. It is argued that organisers create events in rural space which are curated to allow the enmeshing of affective experiences of nature with specific ideological framings of socioecological issues. This takes place at two levels. Firstly, the curation of the particular physical outdoor space in which participants attend, its discursive content and group bonding processes. Secondly the curation of group media representations of the events which seek to project an appealing image to supporters and sections of the general public.

Both groups in this study have similar far right, ethnonationalist ideologies but utilise affective outdoor experiences in different ways. The NSN utilises a martial and highly masculine approach with affective connections related to the conquering of land, reinforcing an extreme version of settler colonial dynamics in Australia. PA takes a different approach, emphasising their perceived harmonious 'indigenous' connection to the British rural landscape that is supposedly threatened by non-white migration. Both seek to naturalise their relationship to the landscape, one via racial dominance and the other via racial harmoniousness. Despite their differences, these constructed eco-social relations are seen as indicative of a 'natural order' which is under threat from multiculturalism and the 'other'. It is argued that these curatorial approaches aren't necessarily successful in creating the desired participant experiences and can be undermined by interventions from the state, opposing political forces and the social dynamics of the organisations themselves.

GEORGIEVA-STANKOVA, Nadezhda* (Trakia University, Bulgaria)

Discursive Dimensions of Media Representation of Roma Identity and the Ghetto in the Context of Covid-19

The Covid pandemic has had a serious impact on vulnerable social groups with the greatest concentration of racial or ethnic minorities. The Roma community remained more seriously affected than other communities (Ryder, Taba and Trehan, 2020), representing an intersection of ethnic and social-class factors, related to specific inequalities, some of which also determine existing health inequalities. The paper aims to deconstruct the discursive representation of Roma identity and the ghetto in popular Bulgarian print media in the context of the Covid pandemic. The social and health condition of the community is rarely defined and represented by members of the Roma community itself, but by various public authorities and institutions, such as medical expertise, state power and the media, involved in the construction of its image and the space occupied by it, reflecting different spheres of power and knowledge (Foucault, 1978). Methodologically, the research focuses on the online editions of two popular Bulgarian daily newspapers, "24 Hours" and "Telegraph" (for the period March 2020 - May 2022), which have the highest circulation and readership in Bulgaria in recent years. Certain common nodal points and issues related to the recontextualization of existing negative prejudices and stereotypes about Roma are analyzed in new local contexts, leading to media excesses and Romaphobic discourses, reinforcing the marginalization of the group and its social exclusion. Conclusions are drawn regarding their embodiment in state policies concerning the control of movement in Roma ghettos and the issuance of special measures about the regulation of the pandemic in general. On the other hand, emphasis is placed on the possibility of overcoming marginalization and stigmatization and the need for social protection and access to representation.

Social Movements in Times of Ecological Risk Social Implosion

Social movements are an important viewpoint from which to look at more general social trends and developments (Touraine, 1984). In present times many social movements and in particular those campaigning on climate change seem to speak to a situation of general implosion and ecological collapse, or what sometimes in France is described as "collapsologie". This paper will discuss how social movements such as Extinction Rebellion and Fridays for Future are thematising the risks of ecological and social collapse, their interpretation and narrative of such events and the way they attribute the fault to various culprits. The paper draws on research on social movement discourse online and offline, with a particular focus on views on the future and of solutions to the climate crisis. Using Alberto Melucci notion of social movements as prophetic phenomena (1989) and the notion of collective action frames (Snow and Benford, 1994) I will argue that the theme of social change is in this circumstances largely sifted through the notion of avoiding collapse and constructing means of protection and self-sustainment beyond the present

productivist paradigm and towards an imagined sustainable and self-sufficient society. Hence, studying the discourse of ecological movements provides with a way to make sense of possible scenarios to address climate change and to build more self-reliant and robut societies.

Video-Sharing and Social Movements: Imitation As the New Logic of Participation?

In the digital age social movements have been heavily shaped by the technologies they use, their affordances and logic of communication. The first wave of social movements was imbued with the logic of sharing that stood at the heart of social network platforms such as Facebook and Twitter. So what is happening with new social movements emerging in a different communication environment, amid a second wave of social media, dominated by video-sharing applications such as TikTok. My proposal in this paper is to explore the logic of imitation that is often associated with video-sharing applications and see how it reflected in the forms of participation and subjectivity mobilised by new social movements. Drawing on the forms of technological mimesi (Zulli and Zulli, 2022), available on video-sharing platforms social movements often invite participants to act out a given scene, following a certain script, to broadcast it to one's personal network of followers. The logic of imitation, I will argue, differs from the logic of sharing, because participants are not merely expected to amplify a message but rather at recreating and reinterpeting in their own ways. Further, this logic emphasises a different aesthetic and ethic to the logic of sharing, one in which a strong emphasis is laid on sincerity and authenticity (for how much often staged and constructed), and on proving one's individual worth and determination, as seen in the context of various internet challenges that have found in video-sharing sites, a particular conducive arena. Thus, the logic of imitation can provide us with an interesting entry-way to explore the changing way in which processes participation and belonging is developing in contemporary social movements and how it differs from social movements in previous technological waves.

GERRAND, Vivian* (Deakin University, Australia)

Understanding Processes of Radicalisation within Wellness Communities in an Age of Polarisation.

Adherents to conspiracy and extreme wellness movements are readily dismissed as unstable. Yet the motivations driving their trajectories of radicalisation are both highly complex and context-dependent, requiring detailed and critically empathetic analysis of the narratives, networks and nuances that inform their radicalisation pathways. In particular, the introduction of the QAnon conspiracy – a divisive social movement advocating resistance to so-called 'global elites', seen as manipulating populations for their own ends – into wellness communities through prominent lifestyle influencers has led some to radicalise on 'conspiritual' trajectories of militancy (Beres et al. 2020; Khalil 2020), including recruitment into violent extremism.

Complementing existing studies of (con)spirituality in Australia that consider the role of conspiracy theories in wellness circles through the prism of religion and spirituality (Halafoff et al. 2021; Ward and Voas 2011), this paper maps radicalisation trajectories towards militant forms of conspiracy thinking and wellness, identifying the ways in which the conducive environment of COVID-19 heightened vulnerabilities has intersected with the unique selling points of conspiracist groups, often with an agenda that leverages existing anxieties and hesitancy surrounding vaccines. Rather than viewing such radicalisation trajectories in isolation, or as exceptions, this chapter explores the ways in which (con)spiritualist narratives mobilise cherry-picked versions of spirituality and new religious movement (NRM) narratives to construct polarizing in- and out-group dynamics that bear similarities to those of religiously inspired or attributed extremist groups. To enhance understanding of how spiritually inspired or attributed forms of radicalisation to conspiracy-thinking have increased their reach and influence during the pandemic, this paper draws on in-depth interviews and qualitative ethnographic case studies.

Storytelling and the Arts As Tools in Disaster Education: Tohoku University's "Kataritsugi" and the Stories of 3.11

After the Great East Japan Earthquake, tsunami and nuclear disaster devastated large areas in the Tohoku region on March 11, 2011, passing on the memories of survivors as lessons learned from these so-called 3.11 disasters became a significant goal in disaster education. Several disaster archives and institutes were developed to collect and share data. However, people who are not already interested in disaster preparedness may not be aware of these resources. To tackle such access problems related to passive data sharing, Tohoku University's Disaster Digital Archive organizes the "Kataritsugi," an event which combines a variety of art forms with the practice of disaster storytelling (saigai kataribe katsudō). In the Kataritsugi, the actress Takeshita Keiko reads

short stories that are based on interviews with 3.11 survivors in a different disaster-affected municipality every year. Her readings are accompanied by musical performances and the stage is decorated with paintings that depict scenes from the disaster areas. In this paper, we introduce the results of a survey conducted from 2012-2019 as well as analyze the stories presented at the Kataritsugi until 2021 to discuss how conveying lessons learned from disasters emotionally through art affects the risk awareness of the audience. We found that despite some criticisms regarding the selection and combination of the art forms, most respondents to the survey found the event to be helpful in terms of disaster education and were so emotionally moved by the performances that they were not only reminded of what had occurred during and after the 3.11 disasters, but also deeply motivated to reflect on their own preparedness for future disasters and the significance of passing on such stories. We therefore hope that the benefits of artistic events such as the Kataritsugi will be considered to increase the outreach of knowledge distribution in risk education.

Three Years of Online Learning in the Universities in Bulgaria: Effects and Perspectives for the Future

The COVID 19 pandemic led to unprecedented changes in all social spheres. The education was one of the most affected areas, as in a very short period the educational institutions, including the universities should transfer the process online with almost no preparation and in some cases no additional resources or state/public support.

The online learning in Bulgarian Universities, introduced during the first lockdown in the spring of 2020 was considered as temporary measure in the beginning. However, it continued during the next two academic years. What looked as an emergency situation in the early spring of 2020 nowadays can be described as the dominant educational approach for the last three years in the Bulgarian universities with the potential to continue, as the pandemic is far from its end. This situation in Bulgarian higher education is in a way paradoxical, as the online education was seen as temporary even during its reintroductions in the last two academic years but nowadays there are more students in the university that have more experience with the online learning, than those who had studied on site.

Such long period of online education has its consequences on the process itself and respectively on its main actors: lectures and students. The main goal of the analysis is to describe the long term effects on the actors in the educational process in the universities and also to show the possible consequences in the future of the Bulgarian higher education and if this digitalization could continue in some form (apart from the pandemic).

The analysis is based on results of online survey made during the first three years of the pandemic with lecturers and students of different Bulgarian universities. A content analysis of media publications related to the topic is also included in the research.

Implementing Voluntary Workplace Gender Targets: A Case Study of Challenges and Opportunities in an Australian Transport Organisation

Legislative workplace gender quotas have been effective in various countries to increase the numerical representation of women in corporate boards and as non-executive directors. Research has demonstrated that businesses respond positively to legislative quotas if appropriate sanctions are in place. However, legislated quotas have not successfully influenced overall inequalities within organisations. Voluntary policy-based targets are an alternative approach in jurisdictions without legislated quotas and sanctions. These gender targets are ambitions set by organisations to increase women's numerical workforce representation. Gender targets are designed to apply to entire workforces, not only boards and non-executive directors. Although research has been undertaken examining the effectiveness of quotas, there is limited research examining the effectiveness of voluntary targets and how organisations might implement them.

This paper examines how voluntary policy-based gender targets might be set and implemented including challenges and opportunities raised in this approach. A case study method is adopted in a leading public organisation in the Australian transport sector that has set a fifty percent voluntary target to increase women's workforce participation. Workforce data analysis reveals setting one broad organisational target reinforces more gendered segregated divisions where larger numbers of women work in administrative and communication based professional roles and men dominate technical, engineering and leadership roles. Furthermore, the findings indicate targets are often regarded as contrary to core business operations and objectives and received limited priority in managers' performance goals. We propose linking targets to managers' operational key performance indicators (KPIs) as an effective mechanism to recruit more women and develop a positive culture among managers. We conclude voluntary targets in KPIs play a similar role

to sanctions in legislative quotas. Moreover, targets should be supported by micro-steps challenging the historically embedded male workplace culture and structures to overcome the "stigma of incompetence" that negatively impact on women's competency and confidence.

Trophy Hunting in the Himalaya: Conflict between State and Local People in Dhorpatan Hunting Reserve, Nepal

Dhorpatan Hunting Reserve (DHR) is the only hunting reserve in Nepal established in 1987 to meet the demands for controlled wildlife hunting. The DHR is located in the lap of the Dhaulagiri Himalaya range of western Nepal covering 1325 sq. km. of Baglung, Myagdi, and Rukum East districts. Every year in two seasons, more than a dozen of foreign hunters arrive here for the blue sheep trophy hunting and the Nepal government collects a good amount of fees from them since its establishment. Interestingly, the local people of Dhorpatan were properly not informed about who comes to blue sheep hunting, how, and why they come to hunt, or what exactly the hunting reserve does? However, after 29 years of its establishment, the government of Nepal established the Nepal Army camp in 2016, decided to declare the buffer zone area, and mobilize Army to maintain security in the reserve. The local people in the DHR-protected areas opposed the government's decision to the Army mobilization in the reserve because they believe that the decision is against the ILO convention 169, which gives indigenous local peoples primary rights over natural resources. As local people were accused, now Nepal Army as state authority has been controlling the right to use natural resources, and local people seem unhappy in their ancestral pastureland. Due to the local protest, the government has not been able to announce the buffer zone project. Therefore, the paper attempts to explore the causes and consequences of conflict between state authorities and local people in the DHR based on long-time observation as local citizens of the Dhorpatan area and purposefully selected key informant interviews.

SMITH, Jonathan F. (Australian Catholic University, Australia)

Women and Political Participation in Australia

Gender and representation in national politics has been a key issue in contemporary Australian society. While women in Australia have been allowed to vote and run for parliament since 1902, the nation has only ever had one female prime minister (Julia Gillard, 2010-2013). Furthermore, the total number of women in parliament has never reached parity with men. Over the last few years, allegations of sexual harassment and violence in the nation's parliament led to campaigns where thousands of Australians demanded a change to attitudes, behaviours, and political culture.

Within this context, this paper seeks to examine the factors that are presenting as barriers to young women running for public office in Australia. The paper highlights three key themes. First, it considers gender roles in Australian society and how they may impact on women being active in the political sphere. Second, the paper explores the parliamentary culture and how 'toxic masculinity' may be creating barriers to the political participation of women. Third, we examine how political knowledge may be contributing to women excluding themselves from political activity.

This paper focuses on the experiences of young people who participated in the Social Futures and Life Pathways Project. This longitudinal research project, which is also known as Our Lives, began in 2006. It has continually gathered data from a single age cohort of young Australians from the state of Queensland. The voices of these young people will not only highlight existing challenges, but also potential ways in which barriers may be dismantled.

Injunctions to Child Autonomy

Expectations of child autonomy have grown in recent decades. We cross here the results of several surveys we have realized between 2011 to now, about French preschool and about French families. We seek to grasp the new qualities expected in children in neoliberal context, and the ways in which the are educated. In the official texts of French preschool, autonomy is now an essential value. This autonomy has several dimensions; it is linked to the children's abilities to do one's own school work (without the adult having to

formulate injunctions), to a certain self-control of one's emotions, and to the ability to manage one's own physiological needs from the start of the preschool (2, 3 years old). These new values are linked to a neoliberal context in which we expect faster school performance from children and from preschool. The children who best manage to play this role come from middle ans upper classes. Our surveys in this environments show how the autonomous child is produced, from an early age. This may, for exemple, involve encouraging the child very early to dress, eat, go to learning activites, etc. Our ethnographic observations in the classrooms show that not all children are ready to play this role because of different and inequal initial socializations. All this suggests new forms of inequalities in childhood. We will cross the resultats of two books that we have produced: L'école maternelle de la performance enfantine (2020) [The preschool of child performance] and Sociologie des pédagogies alternatives (2022) [Sociology of alternative pedagogies].

Foodways of Package Tours in Contemporary Bengal: Situating 'Bengali Cuisine' in the Culinary Culture of Kundu Special

This paper is an ethno-historical account of the culinary practices characterizing tour packages in West Bengal. Through the documentation of the ways in which a leading private tour operator in contemporary West Bengal named *Kundu Special* conducts its tour packages with Bengali tourists, this paper shows how the gustatory practices of tour packages are intended to evoke a sense of familiarity associated with everyday life. *Kundu Special* is commonly believed to have pioneered the practice of conducting tour packages across India in late-colonial Bengal. Located at the methodological intersection of history and anthropology, this paper demonstrates the correlation between the ambivalent nature of colonial modernity in Bengal and the preponderance of 'quintessential' Bengali foodways in the package tours of *Kundu Special* since its inception in the late colonial period. The culinary culture typical of *Kundu Special* can be traced to the discursive construction of 'authentic Bengali cuisine' that was central to the politics of middle-class identity in colonial Bengal. Tracing the trajectory of the changing institutional arrangements of *Kundu Special* owing to broader socio-cultural transformations, this study shows how it has capitalized on the perceived cultural authenticity of 'Bengali cuisine' and its primacy in the everyday life of middle-class Bengalis. The indigenization of disparate food elements to construct 'Bengali cuisine' in the wake of Bengal's colonial encounter, however, is indicative of the constructedness of the idea of culinary authenticity. Taking package tours as shifting anthropological sites, this study documents the ways in which *Kundu Special* attempts to transport *Bangaliyana* or Bengaliness to unfamiliar locales outside Bengal through the creation of a seemingly 'authentic' Bengali culinary experience for middle-class Bengali tourists. This paper also examines the changes in the food culture fostered by *Kundu Special* corresponding to the changing contours of middle-class taste in contemporary Bengal.

GHOSH, Shamayeeta* (Jhargram Raj College (Girls' Wing), Affiliated to Vidyasagar University, India)

The Past and Present of Package Tours in West Bengal: An Ethno-Historical Documentation of Continuities and Paradoxes

Tourism is an institutionalized practice of temporary leisured mobility premised upon the separation between home and the world. The establishment of railways catalyzed the development of mass tourism in Europe and its colonies. The ideological origins of European tourism can be traced to the desacralization of natural landscapes facilitated by Romanticism and the emergence of 'leisure' owing to the metamorphosis of industrial society into its post-industrial incarnation. Contrarily, institutionalization of tourism in India was a colonial endeavour of commercializing the age-old practice of pilgrimage. The primacy of pilgrimage continued well into the post-independent era marked by the entry of private tour operators into the tourism scenario. Travel-as-leisure was a late entrant in the precincts of Indian tourism. With its focus on package tours, the most prevalent mode of travel since late-colonial period, this paper takes as its case *Kundu Special*, a private tour-operator in contemporary West Bengal that is believed to be the pioneer of package tours in pre-independent Bengal. Located at the methodological intersection of history and anthropology, this paper documents how *Kundu Special* appropriated the railways, a modernizing agent, as a means to foster the tradition of pilgrimage. Delineating the package tours of *Kundu Special* as mobile anthropological locations, this paper analyzes the way institutional arrangements of *Kundu Special* are designed to construct a bubble of familiar environment for Bengali tourists on their trips to unfamiliar locales. The transportation of *Bangaliyana* or Bengaliness to places outside Bengal is facilitated primarily through the creation of a seemingly quintessential Bengali culinary experience. This work strives to unearth the paradoxical relationships between tradition and modernity, the ideology of leisure and that of pilgrimage, and finally, familiarity and novelty, that are inherent within the practices constituting package tours and trace these back to the ambivalent nature of modernity in colonial Bengal.

What Shared Governance to School Development? the Valu.E for Schools' Case Study

The Valu.E for Schools (VFS) Project, implemented by INVALSI (National Institute for the Evaluation of the Education and Training System) aims to give indications to decision-makers regarding informal and formal networking between schools and partnership between schools and other institutions supporting school self-evaluation processes for improvement. As part of the National Operational Program 2014-2020 "For School - skills and learning environments", within which the VFS research intervention is inscribed, particular attention was paid to networking and partnership to promote and enhance school development processes, to encourage the decentralization of evaluation and improvement design skills, balancing centralized training with local ones, strengthening the capacity building of educational institutions (European Union, 2015). Networking and partnership in educative context are considered a promising lever for large scale reforms (Muijs, Ainscow and West, 2010, p. 7) more sustainable and equitable (Ainscow et al. 2012; Poliandri et al., 2022). According to European Commission, decision-makers should promote collaboration within and between schools: "*schools may also build bridges with wider communities including researcher to support school level learning and develop strategies for school development*" (European Commission, 2020:2). The VFS Project experiments a new governance model to support professional development of school staff. The project promoted new cooperation forms between public and private subjects, linking the central administration and peripheral educational agencies, stimulating collaboration through actions located in the contexts to which they belong, adapted to the needs of schools, capable of triggering bottom-up processes upwards of collective learning, socialization of knowledge (Cappello, 2015), empowerment of the people involved and sharing of the risk connected to innovation (Perrin, 2022). Some of results of the case study are presented, in relation to the different forms of collaboration activated: 1) by central administration; 2) between schools; 3) between people participating in the training.

The Russian Heim-Ins-Reich Policy: Historical Revisionism and Conquest War

This presentation is not just a literature review in the specific scientific realm of East European Studies. The Ad Hoc session was proposed and prepared while war in Europe takes place again. The aim of this presentation is, hence, to pick up and summarize the most important information, testimonies and analyses published in different European media on Russia and the war in Ukraine just before and after February 2022 with the goal to highlight the reasons behind this war. As a matter of fact, the Russian attack on Ukraine changed for ever the "perfect" world we believed we lived in. As one of the most renowned Ukrainian historians, Serhii Plokhy, Professor at Harvard, stated "on February 24, 2022, the world awoke in a new reality". The presentation goes, however, beyond the feeling of shock and embarrassment caused by the war in Ukraine, trying to show in as rational a way as possible the inevitability of this war and the naivety with which Europeans, especially Germans, have so far dealt with Russian irredentism and aggression.

Long Term Academic Impacts after Disaster

The longer term impacts of disasters on learning can sometimes be difficult to determine if students are young at the time of the disaster and their academic skills and pathways are still developing. This paper presents a study which tracked the academic outcomes of students as they progressed through 8 years of schooling following the major Black Saturday bushfires in Victoria, Australia in 2009. The data from standardised academic assessments in Australia were used to compare the outcomes for students attending government primary schools in rural communities of Victoria with varying levels of bushfire impact. The initial cohort included 33,690 students who in

2008 were enrolled in first year at a Victorian government primary school in a rural community and completed their standardized academic assessments in 2011 (Grade 3), 2013 (Grade 5), 2015 (Year 7) and 2017 (Year 9). The results showed that expected gains from Year 3 to Year 5 in reading and numeracy scores were reduced in students from schools with higher levels of bushfire impact. Further, the academic outcomes at Year 5, 7 and 9 for students who attended primary schools in areas highly impacted by the bushfires was lower than their peers for all subjects. Bronfenbrenner's socioecological framework was used to consider the multi-level influences on children's ongoing learning post disaster and opportunities for recovery support strategies including school-based psychosocial support programs, access to additional learning and vocational guidance.

Community Health Workers in Uganda and the Division of Labour: An Analysis of the Structural Barriers to the Genesis of an Occupation

The sociology of work and occupations is interested in how groups form collectively around notions of 'work', both paid and unpaid, and the social processes that facilitate or hinder their emergence as an occupation. There is a long tradition in the sociology of Western epistemologies of trying to understand taxonomies of work and occupations and how work is classified and used within the social structures of any given area, and these are often focused on highly developed/ capitalist economies. Less attention has been given to the low income settings of the Global South where occupations are shaped by wider structural forces. This paper uses the device of a case study that explores the factors that determine the genesis and shaping of an occupation within a specific group of workers, in this case, community health workers in Uganda, and seeks to make explicit the barriers and structural factors that may impede or facilitate their progress. We argue that the genesis of an occupation is a mobile and shifting process that recognises the potential agency that emerging occupational groups may exert to overcome barriers to their formation and recognition. Using Freidson's '*subjective economy*' we refer to the Chicago School theorists who understood the need for a recognition of both the social and cultural contexts and historical, organisational and economic roots of occupations. We aim to contribute toward a new global taxonomy of occupations that embraces a broader understanding of the ebb and flow of their emergence.

Unintentional Exposure to Political News on Facebook's Religious Pages during the 2022 Italian Election Campaign

Incidental exposure to news content has been longly debated in media studies (Berelson 1949; Esser et al. 2012). Digital media has revived the interest in the topic, because it makes it easier for users to be unintentionally exposed to politics (Tewksbury et al. 2001; Fletcher and Nielsen, 2018). However, most studies do not examine how incidental exposure occurs. With this paper, we aim to reduce the gap by analyzing networks of Facebook pages, groups and accounts ("entities") that occasionally but systematically share political news.

Applying established computational methodologies (Giglietto et al. 2020) we detected several Facebook networks quasi-simultaneously sharing political news during the 2022 Italian electoral campaign. Surprisingly, some were religious pages that from time to time published political news too, de facto exposing to political information subscribers supposedly following these accounts for reasons related to faith rather than politics.

To dig deeper into this phenomenon with potentially massive effects, we collected all the posts published by religious pages in Italy on Facebook and analyzed them by asking two research questions:

1. What is the extent and potential impact of the phenomenon? In particular, how large are the pages in terms of accounts and reach? What is the proportion of political posts and engagement over the total?

2. What is the logic behind the pages' activities? In particular, does the publishing of political news follow identifiable patterns in terms of political factions and themes that are given visibility?

By mapping an unprecedented phenomenon using computational methods on a large dataset of religious posts, this study provides an original contribution to the literature on incidental exposure, political communication, and digital religion.

The Language of Risk and Responsibility: The Case of the 2010 Chilean Earthquake.

The Language of Risk and Responsibility: the case of the 2010 Chilean Earthquake.

Under the modern framework of risk, disasters are no longer seen as problems where people are the unintended victims of destructive forces beyond ordinary human control. Today, the problem is reshaped into one in which into one where social, economic, and political conditions are responsible for society´s vulnerability to hazards, and where human actions and political decisions are crucial to mitigate impacts. This has enormous political consequences for governments since discussions of responsibility almost always follow catastrophic events. In this paper, I explore the case of the 2010 earthquake in central-south Chile that killed at least 525, affected 69% of Chile´s territory and more than 75% of its population, causing total damage of $30 billion USD, equivalent to 18% of the country´s GDP. The event became a turning point for the Chilean state, not only because of the destruction but also because of critical problems in terms of urban planning, technological failure, inadequate protocols, and misinformed human decisions. This led to a public discussion aimed on attributing responsibility for the disaster. Throughout this case, I argue that discussions about risk are inextricable from discourses about responsibility.

The Murder of Mhelody Bruno: Media, Violence, and Justice

In September 2019, Rian Toyer, a corporal in the Royal Australian Air Force, telephoned triple-0; his girlfriend Mhelody Bruno, a 25-year-old trans woman visiting Australia from the Philippines, was not breathing. Paramedics found her unresponsive, and she died the next day in hospital, without regaining consciousness. Toyer claimed that Mhelody had passed out following an act of consensual choking during sex, and the judge in his sentencing accepted this explanation, initially only sentencing Toyer to an Intensive Correction Order (which does not include prison time). Shortly afterwards he was forced to revise this as inapplicable to the crime, and Toyer was resentenced to 22 months in prison, with the judge expressing 'considerable regret' that he must do so.

This paper uses thematic and content analysis to examine media articles covering Bruno's murder and Toyer's sentencing in order to identify common themes in the cultural reception of murder and violence against trans women. Through a comprehensive examination of news articles covering the case (*N* = 20) and drawing on public discourses about intimate partner violence against women, this paper considers the media's impact on how calls for justice are made (or not made) in cases of such violence against trans women, as well as how such reporting constitutes its own act of structural violence. Several studies have found that trans women are at greater risk of intimate partner violence than non-trans women. This conference paper aims to understand how media can influence attitudes towards violence in trans women's sexual relationships.

Dionysus at Play: Exploring the Potential of Theatre Plays As Vehicle for Moral Burden-Sharing By Veterans in the Wake of Moral Injury.

Dionysus, the Greek God of theatre introduced the notion of the individual struggle against fate in Greek theatre, where drama was used as communal therapy as well as a way to reintegrate combat veterans in society after deployment. Plays such as Philoctetes give insight in not only the physical, but also the psychological injuries endured in the context of war, wherein mental and moral integrity is often at stake. As Verkamp (2006) mentions, the moral treatment of returning warriors has a long history of symbolic and ritualistic practice. Yet, structural contemporary practices as a way to communalize trauma for returning warriors do not exist, rendering the combat experience as psychological and individual, rather than (also) moral and communal.

Following the principles of practice theory, this article explores the dynamic between actors and public, as well as ways in which requests for recognition and attempts to communalize trauma are accepted, denied and ignored by focusing on one of the few theatre plays in the Dutch context where the moral experience of war is acted out by veterans, in dialogue with civilians. The theatre play revolves around the dialogue between a Dutchbat veteran and survivor of the Srebrenica genocide that share the stage as they play

themselves in an attempt to shed light on the construction of victimhood and perpetratorship, as well as attempts to question the moral responsibility for the Srebrenica genocide of the Dutch civilian population at large. This article combines insights from participant observation of the theatre play, the after talk with the audience, and semi structured interviews with the actors to explore in what ways the concepts or Moral Injury and recognition can be used to better understand relational aspects of trauma, as well as theatre and its potential as vehicle for moral burden-sharing and healing.

Sisyphus in Court: A Study of the Dynamic between the Dutch Police Organization and Their Personnel in Light of Requests for Recognition in the Wake of Trauma

The police is on the implementing end of the monopoly of violence held by the state. In their work as agents of the government they have to navigate the responsibility of enforcing the law, protecting citizens and acting in high stakes situations, hereby fulfilling a complex position in society. The combination of continuous exposure to seeing, using, and being on the receiving end violence, navigating between responsibility within their discretionary power as well as restrictions in their job, and dealing with morally challenging choices, can lead to trauma.

A recurring theme during interviews with police personnel that have experienced traumatic encounters at their job, is the dynamic between them and the police organization in the wake of trauma. The dynamic paints a puzzling picture of requests for recognition from their organization that are seldomly met. Instead, respondents describe vast amounts of paperwork, slow bureaucratic procedures, and a dynamic between the individual and the organization that turns increasingly sour, to the point of years of legal battle causing immense stress and sadness, leaving the respondents with an intense feeling of betrayal by the organization they once considered family. In some cases the interaction with the organization is described as more impactful than the incident leading to trauma, leading to respondents describing their interaction with the organization as morally injurious.

This article explores the ways in which the concepts of moral injury, bureaucratic violence and recognition can be helpful in finding new ways to understand the effects of traumatic encounters by police personnel that go beyond the individual experience, focusing on the organizational context of the aftermath, as well as the relational aspect of trauma. This research engages with this question by a narrative analysis of 11 semi structured interviews with police personnel who are in the process of medical discharge.

Authoritarian Innovations and Labour Governance in Myanmar's Reform Era

Drawing on the concept of authoritarian innovations, this paper analyses the differences between the USDP period, when a military-led government created space for democratic labour relations, and the NLD period, when a civilian-led government presided over the contraction of that space because of changes to union registration procedures and the failure of the dispute resolution system to address freedom of association violations.

A series of reforms initiated by the military-dominated Union Solidarity and Development Party (USDP) Government (2011–2015) in an attempt to rebuild international legitimacy and shore up its economy by reconnecting with global investors saw vast improvements in workers' democratic participation, labour rights, and collective representation. Supported by international actors including the International Labour Organization, a legal-institutional framework for industrial relations was established and trade unions legalised after a long period when neither existed. Although these institutions were flawed – a fact that became increasingly evident in the final years of the USDP government – they were nevertheless profound in their impact.

On the surface, the 2016 transition to a civilian-led National League for Democracy (NLD) government, with its commitment to discourses of democracy, responsible business practices and sustainable development, should have seen a consolidation of Myanmar's new industrial relations institutions. But this was not the case. The NLD government chose not to support Myanmar's nascent trade union movement, instead allowing employers and bureaucrats to act in ways that undermined labour rights and collective representation in the workplace – a pattern that continued until the military again seized full power in early 2021.

As the demonstrates, there is strong analytical benefit in distinguishing between authoritarianism as a system of government and authoritarian innovations in a particular governance field – in this case, labour governance – which do not rely on the presence of a particular regime type.

GILLAN, Michael* (M261 35 Stirling Highway, Australia)

The Global Unions and the Quest for a Living Wage

Initiatives to address the problem of a living wage reflect the motivations of the different actors that drive them and the 'institutional logics' that frame and condition actions in this domain. Unions and employers – but also global supply chain actors – have very different imperatives when it comes determining a living wage. Unions see low wages as being linked to social inequality, but also as a symptom of inadequate worker voice and representation in wage bargaining or wage determination processes. These concerns are reflected at the global level, for example, in the ITUC's claim that the 'world needs a pay rise' to compensate for labour's declining share of income within different countries. Not surprisingly, then, an important element of Global Unions' claims is their emphasis on the role of enabling measures that involve their national affiliates and other unions in wage-setting, either through multi-stakeholder arrangements or national and workplace collective bargaining mechanisms.

With Southeast Asia as its geographical focus, this paper examines global union interventions in relation to the living wage. Home to well over half a billion people, Southeast Asia is a labour-intensive manufacturing hub that sits at the heart of multiple Global Production Networks. It is also a region where authoritarian and hybrid regimes are the norm, and the influence of organised labour is at best patchy. As a consequence, it has been the target of multiple Global Union interventions, including several on the living wage. The paper argues, drawing on field-based research in multiple Southeast Asian countries, that the impact of these interventions has been limited in terms of their capacity to achieve concrete outcomes for workers.

GILLEARD, Chris* (UCL Division of Psychiatry, United Kingdom)

Rethinking the Social Construction of Old Age

The aim of this paper is to review the social constructionist view of age and ageing that emerged in the late 1970s and early 1980s and which has been highly influential in sociological accounts of ageing. Starting with a general consideration of social constructionism as an epistemological framing of the social world, the paper turns to its use in gerontology as a corrective to overly structural accounts of the nature of later life. Treating later life as a social reality, framed as a consequence of emerging symbolic struggles over identity has had a number of effects. Beneficially it has drawn attention to the salience of the social in fashioning age and ageing and thereby advancing a more reflexive sociology of later life. However, focusing on the social construction of old age does risk neglecting the importance of another social reality, that of corporeal decline and the fear of the body-to-come. This dark side is often minimised in accounts of the social construction of old age. For social constructionists the exclusive emphasis upon ageing as a 'social kind' and the denial (or bracketing) of its status as a 'natural kind' has lead to critiques of 'the absent body' in social gerontology. Treating age as a hybrid form, realised as the entanglement of both a natural and a human kind, is a difficult but necessary position to maintain. This task is important for the sociology of ageing as it seeks to address what it is that separates later life from other parts of the life course.

GILLET, Anne* (CNAM-LISE-CNRS, France)
TREMBLAY, Diane-Gabrielle (University of Quebec (Teluq), Canada)

Interculturel Work in the Sky. Rules, Relations and Cultures

In the air transport sector, one particularity of the work of flight attendants (hostesses, stewards, flight directors) is the international context.

International and intercultural dimensions concern I particular the aspect of relations with travellers (customers) in a context of relational exchanges on the plane, and the working and cooperative relations with other colleagues. The cultural diversity and the number of nationalities within the same crew, or the passengers, is more or less marked depending on the airlines and the destinations served (particularly for medium and long haul flights).

We mobilize several theoretical approaches to analyze the intercultural aspects of their work. Sociology of work is our main framework. Also, symbolic interactionism is one theoretical sources of analysis, with social and cultural anthropology, and international comparative approaches (functionalist, culturalist, societal).

The professional activity of the cabin crew is part of a framework of competences and structuring rules with precise tasks to be fulfilled, with professional exchanges between cabin crew and interactions with the passengers (Gillet, Tremblay, 2020). Exchanges between cabin crew and passengers are generally quite coded, but in certain specific situations, which need to be managed, cultural norms are expressed. Specific skills are then needed to avoid or manage conflicts.

Our results illustrate social regulations that take place in the face of the intercultural situations encountered, which also participate in the learning of ways of working, in an ever-changing intercultural professional context. Social and intercultural skills (listening, openness, empathy, understanding, caring, acceptance, inclusion, adaptation etc., verbal and non-verbal) are developed and determine the work behaviors of the cabin crew, the resolution of tensions or potential conflicts, among colleagues and/or with passengers.

Our communication is based on our analyses of data (qualitative, quantitative) collected from hostesses, stewards and flight directors, in several airlines (regular, low cost or charter) from several countries.

GILLIERON, Gwendolyn* (LinCS, Université de Strasbourg, Morocco)

Searching for Belonging. How Mixed Individuals Navigate Racism in Morocco and Switzerland.

Symbolic borders have a huge impact on the experiences of mixed individuals and how they construct their identities. Here, multiple dimensions become relevant such as skin colour, gender, national origin of the parents, processes of othering and/or social origin, to name a few.

Based on a recent study (2020) with young adults of binational origin I reflect on the different dynamics in Switzerland and Morocco. Although the two contexts seem to be very different (Switzerland is a democracy while Morocco is a constitutional monarchy and defines itself as an Islamic state, they differ according to their GDP and their geographical localization leading to different migration flows and thus different social hierarchies), I observed similar dynamics in the sense of belonging of the mixed individuals. Mixedness was conceptualized here starting from the origins of the parents: one parent is native, and the other parent migrated to Switzerland or to Morocco. Furthermore, other dimensions of mixedness such as gender, class, race or ethnicity were also taken into account in order to understand how individuals give sense to their mixedness.

By comparing the biographical narratives of the young adults, I address the following questions: What are the symbolic boundaries these individuals are confronted with? How do national discourses, racism but also biographical experiences influence their self-perception? How do they navigate through social attributions?

Applying an intersectional perspective, I present the different strategies mixed individuals have developed in the course of their life in order to stay actors of their biography. Four forms of balances between self-perception and social positioning emerged: 1) Trying to unite, 2) Becoming an expert, 3) Searching for alternative spaces of belonging, and 4) Establishing normality. These four strategies present creative ways of dealing with experiences of stigmatization, othering and exclusion in contexts where their mixedness is not socially recognized.

RC38-556.1

GILLIERON, Gwendolyn* (LinCS, Université de Strasbourg, Morocco)

'I'm Not a Problem!' – Negotiating between Concepts of Analysis and the Perspectives of the Participants.

In social interactions, attributions are inevitable, and this is also true for the interaction between the researcher and the participants. In my research on experiences of 'mixed' individuals, I looked for life stories of individuals of binational origin. The sample criteria 'binational origin' is based on theoretical assumptions but presents at the same time the danger to reproduce national, ethnic and cultural attributions and to perpetuate experiences of othering.

In the presentation I will discuss two encounters during my research in which individuals resisted my designation as 'mixed' and 'binational'. They refused having particular experiences to share with me as a researcher. I will show how in one case this led to the end of the research alliance and how in the other case the analysis of the very first resistance broadened the understanding of the biographical narrative in particular and the experiences of individuals of binational origin in general. This discussion will give insights into the co-construction of our research subject, into what resistance against our concepts and questions can tell us about our research field and how it may open up to new questions.

Revisiting Popular Theories of Sociology with an Interpretative Take on Computational Methods

From postulates formulated by the classics at the turn of the 19th century, to the emergence of sociology of sociology taking place in the early 1970s, sociologists have been seemingly obsessed with finding a general definition of sociology. However, these theories of sociology are often based on lived experience rather than collected data, not seldom focused on drawing boundaries between good and bad sociology, and, unfortunately, sometimes mix up "what sociology is" with "what sociology ought to be". Nevertheless, concepts found within these theories are some of the first disciplinary terms sociology students encounter and continue to form a central part of the jargon used by sociologists to speak about and conceptualize the history of their discipline on an everyday basis. In this presentation, I revisit some of the more famous theories of sociology and pose the question if they can be enhanced

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

by the context provided by empirical studies. The case used for this inquiry is the sociology dissertations defended at the Swedish universities over the last 70 years. The sociology dissertation constitute two corpora – one based on full-texts the other on abstracts – which are scrutinized with qualitative interpretations of models generated by computational text analysis methods. Thus, this is an invitation to consider tools developed during the 21st century within branches of natural language processing and machine learning when undertaking histories of sociology.

GINSBURG, Ruthie* (Beit Berl College, Israel)

Kites on Fire: Disobedience Objects on the Fence

In March 2018, as part of the Palestinian Great March of Return, incendiary kites and balloons flew over the barrier fence between Gaza and Israel initiating fire of agriculture fields and nature around the strip. The demonstrations near the fence continued almost for two years when most of them each Friday gathered peacefully. Israeli armed forces respond resulted in the killing of 214 Palestinians and wounding over 36,100. Marwan is one of the Palestinian youths who began spontaneously preparing kites and after balloons with helium with martial immersed in diesel and lubricant oil and tossing them to fly over the fence. While the kites and balloons set on fire over 2,250 acers there were no human casualties on the Israeli side. The Gazan kites enchanted the local and international publics as having a double feature: longing for freedom and the ability to cause random harm and destruction.

The presentation will focus on the kites as disobedience objects, which refers to objects that are art and designed, produced by protestors, grassroots, and social movements, making the objects objects of dissent (Flood & Gavin 2014). The role of emotions in the research will be brought through the connection between disobedience object and its political imagination and the kite as a toy and its marital imagination. By juxtaposing these two parts and through looking on the images of kites and balloons as part of the Palestinian struggle I wish to demonstrate the manifold of the object/scene (Ahmed 2009, Berlant 2022).

GIRARD, Christian* (The University of the South Pacific, Fiji)

Social Entrepreneurship and Social Business: Foundations for the 'Great Reset' or Canary in the Coal Mine?

Social entrepreneurship and social business have been growing in popularity, importance and recognition as innovative approaches to tackle societal issues and achieve social, environmental and economic impact (double or triple bottom line), producing 'social value' (Portales, 2019) or 'blended value' (Emerson, 2003). In its quest to make capitalism 'all inclusive, the 'Great Reset' builds on similar concepts, ideas, and goals and may fuel the interest for these areas and the lessons that have been drawn so far. While it is easy to see a 'goldrush' for 'best practices' in the field, it is key to recognize the diverse and scattered nature of social entrepreneurship, the importance of contexts, as well as the limitations, risks and potential pitfalls of such approaches. This presentation will explore the foundations and principles of social entrepreneurship and the links with social innovation, social change and sustainable development. Examples and case studies will be used to illustrate how certain approaches, organizations or projects have tried to address/ tackle social challenges and problems and to highlight the lessons that can be learned from these experiences, including in relation to the tensions between the different 'bottom-lines'. Questions will be raised as to the ability of such approaches to adequately tackle/contribute to tackle complex societal issues and social problems and the relevance and applicability of market 'solutions' in different spheres. The presentation will also discuss power, responsibility, and accountability in relation to achieving the common goods through private initiatives.

RC02-45.1

GIRON, Alicia* (Instituto de Investigaciones Económicas- UNAM, Mexico)

China Railway Construction, Chinese Finance Capital

China Railway Construction is synonymous of China's finance capital expansion. Countless projects led by this corporation are being developed around the world. In this presentation due to its importance, the different investments that are being carried out in various countries will be studied, not only their investments and the growth of corporate capital should be observed, but also the profitability and the growth of overdue portfolios of the different projects, and the impact on the political and social economic space, where they are located and their relationship with the process of China's internal accumulation. Focusing on one of the main companies such as China Railway Construction beyond studying the different projects in which it participates worldwide, we are interested in studying who its main financial partners are at an international level. The objective of this work is to demonstrate the expansion of these Chinese corporations, their main areas of investment and the institutional investors that participate inside these companies. One more element is that these big corporations along with the government of China are dominating globally under the call of the Belt Road Initiative for the past decade. Likewise, keep in mind the current situation

characterized by high inflation rates, restrictive monetary policies, high interest rates, war conflict and a call to action for climate change. On the world stage, China is seen as competing with the multilateral financial organizations whose birth was forged in the creation of the Bretton Woods monetary system at the international level. The growth of Chinese investments and loans granted in various investment projects in Africa, Latin America, Southeast Asia, and other countries can be approached from several angles.

Livelihoods, Migration, and Disruption Due to COVID-19

To prevent the spread of COVID-19, many areas implemented shelter-in-place periods and travel restrictions designed to reduced mobility and disease spread. Theoretically, resources, such as education and wealth, allow households to buffer against uncertainty and shocks: these resources act as cushions as well as access to alternatives when mobility was limited. But even after these local or regional restrictions on mobility were lifted, many countries retained strict regulations and prohibitions on immigration. These restrictions, which varied according to citizenship and/or COVID-19 infection and recovery status, delayed or completely prevented international border crossings. Because many livelihood strategies rely on remittances, we may expect that COVID-19 has disrupted the migration strategies of households engaging in migrant labor. We hypothesize that less well-resourced households were more likely to experience migration disruption and remittance loss compared to better-resourced households. In this paper, we explore how households were most impacted by COVID-19 migration disruptions using data from two regions: the Chitwan Valley in South Central Nepal and the state of Jalisco in rural central Mexico. Households in these regions commonly engage in labor migration as a livelihood strategy, and thus our data are ideal. The Family Migration and Early Life Outcomes (FAMELO) project interviewed approximately 2,000 households each in Nepal and Mexico in 2017 and then conducted a follow-up survey of the same households in 2020-2021. The 2021 survey assessed if, during shelter-in-place periods, households were unable to send migrants for work or school or if a household member was unable to return. In addition, surveys asked if remittance support changed during these periods. Analyses examine changes in migration, gender and family composition, and access to resources and well-being over time. The results are expected to increase our understanding of the vulnerabilities to wide scale disruption among migrant-sending households.

School Closures, Household Livelihood Loss and the Retreat from Educational Engagement

The coronavirus pandemic (i.e., COVID-19) has impacted health and well-being around the world over the course of the last three years. Mitigation strategies to curtail the spread of COVID-19 included school closures, travel restrictions, and other measures that directly impacted the life course transitions of adolescents and young adults. Interruptions brought about by these specific mitigation strategies, or other externally induced interruptions in access, may shape the educational trajectories for entire cohorts of young people around the world. This paper asks how such interruptions to schooling impacted educational engagement and educational expectations among children and adolescents in settings where access to education had been expanding prior to the pandemic. The analyses take advantage of comparable longitudinal data on youth in rural Nepal and youth in rural central Mexico from the Family Migration and Early Life Outcomes project (FAMELO). One wave of data was collected prior to pandemic related closures with approximately 3,000 young people in each setting. A follow-up wave of data collection occurred after widespread closures and travel restrictions in both settings. The analyses consider the role of household resources and social capital (i.e., parental education, parental educational expectations, and parental involvement) in mitigating the impacts of school closures on children's school engagement. Results suggest children's educational expectations were resilient in the face of school closures, but school attrition increased following these closures. Further, engagement in educational activities decreased when households' livelihoods were negatively impacted by related illness or closures and youth were less likely to view education as necessary for success following school closures. Such slowdowns in educational engagement are concerning if they reverse progress in educational attainment. These results are especially worrying for transitions from primary to secondary and post-secondary education in contexts where educational infrastructure does not yet reach all children.

Compositional Effects on Math Competences of Refugee Students in Germany

In 2021, more than 89.3 million people worldwide were forcefully displaced, a substantial number of refugees also found asylum in Europe. During 2013–2017, Germany accepted the most refugees in EU. Today, almost 1 million Ukrainian refugees arrived in Germany since February 2022. A large part of these refugees are minors. Since a large part of refugees intends to permanently reside in Germany, integration into the educational system of minors has become a major challenge in politics.

However, current research has already reported large deficits in educational achievement for refugees. An important driver for immigration related educational differentials are contextual factors. Children and youth from migrated families are more likely to learn in schools with a high share of immigrant students which negatively affects their achievements in most school subjects. Yet, it has not been studied whether refugee students face a such situation. In our study, we examine how immigrant and socioeconomic composition of classrooms affects achievement in mathematics and science of refugees and how these compositional effects can be explained. By using the IQB Trends in Student Achievement 2018, with representative data for all 9th grader students in Germany (n=44,882), we apply the largest assessment study in Germany.

Our analyses indicate much lower math competences of refugee students, corresponding to approximately up to two school years that refugees lack behind in this subject. Social composition of classrooms partly impacts math achievement differentials between refugees and non-immigrant students – especially the socioeconomic composition of the classroom was important for these competences.

In conclusion we observed that compositional effects partly mediate differences in math achievement of refugees and students without an immigrant background. Therefore, educational contexts, i.e. conditions of the learning environment, in particular the socioeconomic composition, are important for the educational integration of refugees.

Minorization Regimes and the Politics of Bordering

In this paper we develop the concept of "minorization", highlighting the role minorization processes play in regimes of protection and care, as well as detention and punishment, encountered by children in contexts of often violent mobility. Starting with the basic understanding that minorization refers to the bureaucratic, legal, and everyday ways in which young humans are categorized, infantilized, disciplined and subjugated simply because of their youth, here we are interested in theoretically and empirically elaborating this concept. By analyzing the ways in which it acts a key component for border regimes and the control of migrant children and their families, we consider how minorization processes have both transformed and persisted, despite multiple reforms and putatively positive changes in child rights and protection policies, legislation, and standards at national and international levels.

Drawing on our field work on child mobility in Mexico and the UK, we argue that minorization encourages us to think critically about the construction of categories such as "minor" and "best interest of the child", and how it continues to largely shape the ways in which we think and relate to "vulnerable" childhoods. We propose it as a multi-scalar concept that allows us to recognize the links between micro-interactions, bodies, politics, inequalities of power, and political economy from a perspective that brings childhood centrally into analyses of care regimes, border violences, and racial capitalism more broadly.

Money and Violence in Informal-Illegal Loans in the Popular Strata of São Paulo-Brazil

From an ethnographic research that activates little explored interfaces of economic and urban sociology, this study intends to answer the following question: what are the social, political and economic dynamics inscribed in the practice of loan sharking in the periphery of Latin America's largest city? Studies interested in the credit market tend to produce a structural approach to the economy, being mainly concerned with large crypts that circulate in global institutions through formal transactions. Works that analyze informal-illegal transactions in popular economies have not yet succeeded in understanding the specificities of the circulation of money as credit, nor how our social particularities - marked by intense multidimensional inequality - condition this credit. To fill these gaps, it is important to ethnographically deepen the informal-illegal loan system, a phenomenon so important of popular economies and so absent in economic sociology.

The histories of debts between loan sharks and their clients are the analytical unit of the research. Around this history, I test the following hypothesis: does the circulation of debt money trigger networks of protection, resource mobilization and clients that guarantee the functioning of loan sharking? The fieldwork was divided into three stages: a) access to notes recording the history of debts; b) ethnographic observation, focused on direct observation of operating routines and negotiations between loan sharks, customers and members of the networks and c) analysis of descriptive situations, debt trajectories and the networks of the loan sharks in question, obtained in qualitative interviews. I understand the networks that loan sharks establish as a web that supports relationships and enables alliances. The central feature of this form of organization, however, is local reciprocity that links relationships supported by mutual interests and that will produce the parameters that define the terms of negotiations between loan sharks and clients.

Undermining "Legitimate" Autocrats through the Analysis of Violence in the Global South

Autocracy has evolved as a concept in opposition to democracy; democracy as a political ideal was articulated during Western European modernity, by Western European elites to legitimate their undemocratic colonial interventions throughout the world. Political leaders that did not abide by modernized ideals were identified as 'auto'crats investing all the power in themselves, as opposed to 'demo'crats in the Global North who invested power in society at large. In addition, these autocrats who are almost always male, heteronormative, and often belonging to the racial majority are politically analyzed at the nation-state level alone -- social actors who centralize power at the local and communal levels are overlooked, as well as women. At the level of knowledge production in the public sphere, autocrats emerge in the Global North as a political anomaly, whereas they may reside 'naturally' in the Global South.

In our essay, we critically explore the relationship between autocrats, autocracy and violence in the Global South to destabilize existing naturalized and normalized assumptions in social science research. We anchor our critical sociological perspective in violence (Durkheim 1897), to challenge the naturalization and normalization of the heteronormative, Western European male as the iconic 'auto'crat, prevalent in mainstream social theory. Specifically, we use a variety of qualitative methods to highlight how social actors belonging to various spatial and temporal configurations within the Global South undermine underlying assumptions regarding gender, sexuality and the public sphere in the Global North. Using ethnographies (Black girls coming of age in the Jamaican context), interviews (women previously incarcerated for genocide in the Rwandan context), memoirs (of perpetrators of the Armenian genocide), and archival newspaper analysis (on the textual reproduction of American slavery), we aim to reinterpret how social actors centralize power through spatial configurations which rely on normative assumptions of gender, sexuality, and violence.

Covid 19 Pandemic and the Persons with Intellectual Disabilities in Assam

The scholarship on disability suggests that persons with intellectual disabilities must have equal access to opportunities in their physical, social, economic, and cultural environment as persons without disabilities. Many disability rights activists argue that persons with intellectual disabilities should see themselves as a minority group which would maintain their solidarity and argues for political empowerment. However, due to specific impairments, persons with intellectual disabilities experience social and cognitive incompetence and are often discouraged from participating in social processes. In third-world countries like India, persons with intellectual disabilities are often discouraged from participating in the social system. Their problems are further compounded by India's existing social divisions, such as class, caste, gender, and race. The Covid 19 pandemic has also affected this population group due to a lack of welfare-related services. In the case of women with intellectual disabilities, their issues are coupled with the socio-cultural valuation of disabled persons on the one hand and the social role of being a woman on the other. Both these factors influence how intellectual disability is constructed and shaped in society. With this backdrop, this paper aims to explore how the pandemic has affected this population in the rural Northeastern state of Assam and how parents have managed to overcome this complex situation. Based on the voices of persons with intellectual disabilities, this paper employs an ethnographic study using in-depth interviews and participant observation for data collection. This paper also argues that the problem is not that intellectual disability is represented differently in a different social context but requires an emancipatory approach and adequate theoretical representations to gain

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

insight into the experiences of persons with intellectual disabilities. The study will provide a holistic conception of intellectual disabilities by exploring the sociological theories on disability.

Barriers to Collaborative Housing: A Challenge Beyond Hacking the Planning System

The appetite and interest for collaborative housing has increased in Australia, with the planning systems in various jurisdictions making reforms to allow a formal version of this typology to flourish. Individuals with a common interest in sustainability and community are looking for ways to develop new housing projects as a way to share resources and lifestyles. Collaborative housing, often referred to in Australia as cohousing, with its balance of private and shared spaces, is an appealing typology. This paper looks at the challenges of allowing cohousing in one Australian case study, the Australian Capital Territory (ACT). Aspirations for a shared, more sustainable living experience are being hindered by existing ACT laws, with cohousing recently the focus of both a traditional planning policy reform and an experimental policy program, the Demonstration Housing Project. Whilst on the surface it appeared that the planning regulations were the only aspect that needed to be amended, the unique policy testing process of the Demonstration Housing Project found that the requirements of the National Construction Code and the Australian Capital Territory Building Code were equally as prohibitive. Issues around unit titling of a shared space also need to be resolved to allow new cohousing developments. Through policy analysis, grey literature review and semi-structured interviews with government representatives and cohousing groups, this paper seeks to understand why even after so much government focus on the cohousing typology, interested groups are still unable to develop cohousing projects across much of the Territory. Results reveal a government that does not fully understand the unique characteristics of cohousing and how this typology differs from other multiunit developments. The impacts of the formal policy review unexpectedly intersecting with the experimental policy program, where the government tries to 'hack' its own planning regulations, are also a key finding from this paper.

GOHN, Maria da Gloria* (CNPq- National Research Council, Brazil)

Activism in Brazil Today: In Defense of Rights and Democracy

The paper presents a picture, from 2020, of the struggle for rescue or obtaining, of systems of democratic controls in the context of dedemocratization of institutions and collective subjects in Brazil. Facts and narratives about the constant tension between acts of resistance and attacks on Brazilian democracy are presented. The search for legal controls is highlighted, which guarantee rights provided for, or to be acquired, in constitutional means. Two groups of collective actions are selected : peoples originating from indigenous nations, fighting for legal rights that guarantee their own existence; and groups of Afrodescendants and entities in actions of identity reaffirmations. The two groups are organized into movements, solidarity networks, collectives, and civil support institutions.

The *paper results* from a synthesis of issues discussed and analyzed in the first part of my book: "*Activism in Brazil: Social Movements, Collectives and Civil Social Organizations- how do they impact and why do they matter?* (Vozes Ed., 2022).

GOHN, Maria da Gloria* (University of Campinas, Brazil)

Urban Activism in Brazil Today: How Do Movements, Collectives and Civil Organizations in Solidarity Networks?

The aim of this paper is to analyze the changes that have occurred since 2013, in Brazil, in relation to urban activism, especially among young people. It is asked: what happened to urban social movements, and what new forms have emerged; how do youth collectives articulate with movements? And the networks of community civil association and solidarity that developed with the covid 19 pandemic, how do they relate to social movements? How the old urban social movements and their struggles for housing and public equipment worked throughout this period. What are the new configurations, impacts and legacy of the June 2013 protests on Brazilian urban activism? The paper initially presents a balance of central arguments in the main productions published in the last ten years regarding the new urban activism in Brazil. The following will be a mapping of urban collective actions from data files collected in the media and social networks, organized throughout this decade, always asking: what transformations, memories, novelties and new collective actions were created, what kind of new activism was developed in the urban? How have conflict and solidarity been expressed in the new urban movements?

GOLDBERG, Chad* (University of Wisconsin-Madison, United States)

Eros and Trumpism: A Marcusean Interpretation

An explanation for former US president Donald Trump's continuing political appeal is developed, drawing mainly on Herbert Marcuse's study *Eros and Civilization*. Trump does not represent the authority of a strong father-leader so much as filial rebellion. His rebellion against the father-rule, now transmuted into an impersonal "rigged system," permits and even encourages the explosive release of suppressed sexual and aggressive drives. However, this release does not constitute the liberation of Eros that Marcuse envisioned. Instead, Trumpism explodes suppressed sexuality within the institutions of the performance principle, gives sadistic expression to the sexual drive, conditions the abolition of sexual taboos on the creation of new objects of humiliation, and turns a collectivized sense of guilt "against those who do not belong to the whole, whose existence is its denial." In sum, Trumpism was a betrayed revolution from the beginning; what it really represents is the political utilization of sex and aggression to reinforce social domination.

DENOMME, William (Department of National Defence, Canada)

Defence Civilians: Integration in the Total Defence Workforce

Like most Western countries, Canada has integrated military and civilian workforces. The Department of National Defence (DND) and the Canadian Armed Forces (CAF), collectively referred to as the Defence Team, are comprised of military and civilian personnel who work closely together in a variety of contexts, including in headquarters, on bases, on missions, and in military academic institutions. Many civilians are supervised by military supervisors and managers and some civilians supervise military personnel. Although they often work closely together, military and civilian personnel differ from each other in important ways: most notably with respect to different personnel management systems as well as distinct cultures, reflecting the different histories values, roles, and polices of defence civilians and CAF members. These differences can result in unique challenges and opportunities, and impact organizational and operational effectiveness. Results of a survey study based on a stratified random sample of 3,036 DND defence civilians will be presented, focusing on the unique issues central to the partnership between civilian and military personnel in the DND/CAF, including quality of relations and communication, issues related to the effects of military supervision of civilian personnel (and vice versa), and effects of the military rotational cycle on civilian employees were examined. Findings will be discussed in relation to optimizing collaboration between civilian and military personnel in defence organizations.

YAMORI, Katsuya* (Disaster Reduction Systems, Disaster Prevention Research Institute, Kyoto University, Japan)

Disasters without Borders: The Coronavirus Pandemic, Global Climate Change and the Ascendancy of Gradual Onset Disasters

Throughout much of its history, the sociological study of human communities in disaster has been based on events that occur rapidly, are limited in geographic scope, and their management understood as phased stages of response, recovery, mitigation and preparedness. More recent literature has questioned these concepts, arguing that gradual onset phenomena like droughts, famines and epidemics merit consideration as disasters and that their exclusion has negative consequences for the communities impacted, public policy in terms of urgency and visibility and for the discipline itself as the analytical tools of sociological research are not brought to bear on these events. We agree that gradual onset disasters merit greater attention from social scientists and this paper addresses the two most significant ongoing disasters that are gradual in onset, global in scope and have caused profound impacts on lives, livelihoods, communities and the governments that must cope with their effects. These disasters are the coronavirus pandemic and global climate change, and though they differ in many respects, including temporally, we discuss them together in that both involve dimensions that challenge the prevailing definition of disaster. We begin with an examination of the foundational work in the sociological study of disaster that established a conceptual framework for future work and has guided the field throughout the latter part of the twentieth century and into the current period. Our focus is on several components of the existing framework for defining and studying disasters, which we term "borders." These borders are temporal, spatial, phasing and positioning, which, in our view, must be re-examined, and to some degree expanded or redefined to accommodate the full range of disasters to which our globalized world is vulnerable.

GOMES, Catherine* (RMIT University, Australia)

The Wellbeing Turn: A Necessary Consideration in International Student Mobility

When the COVID-19 pandemic hit in 2020, education institutions, international education stakeholders (e.g., education agents) as well as aspiring international students were faced with an unexpected global health emergency which halted any kind of international mobility. While migration and mobility scholars attempted to make sense of this global immobility, localized mobility restrictions to hinder the spread of COVID-19 were fundamentally reshaping the lived experiences, expectations and aspirations of international students themselves. While the pandemic in Australia heralded temporary hardships, restrictions and stresses, there are also fundamental long-term implications to international student mobility scholarship. Just as the growth in international student mobility has been driven by narratives of social and professional prestige through 'western' education, and possibilities of permanent migration (Baas 2019) into Australia, so new narratives around the lived experiences of international students informed by the restrictions on international and local mobilities are now shaping the future of the international student mobility; and on a broader scale, international education itself (Marginson 2020). These new narratives this paper argues should be around international student wellbeing. To find out how the COVID-19 global health crisis is bringing about a new paradigm in which to conceptualise and theorise international student mobility, this paper relies on a data gathered before and during the pandemic. These include interview data from 60 international students collected in 2013, survey results from 6,699 international students in 2015 and interview data from 17 international students collated from two separate projects from 2020 to 2021. This paper thus suggests that the COVID-19 global health crisis and its impact on not only the international student lived experience but on student expectations and aspirations, have fundamentally changed. Here this paper proposes that migration and mobility studies need to consider a 'wellbeing turn' as a necessary consideration in international student mobility research.

GOMES, Cristina* (FLACSO Mexico, Mexico)

Racism in Sweden and Latin America - Subtle or Explicit, It Hurts

This research considers how discriminatory and stigmatizing discourses about ethnic-race, gender, and social class (GRSC) are articulated and normalized in the media and the education system in Sweden and in Latin America.

Qualitative methods as interviews and focal groups were applied to explore the discourses of Afro-descendants and indigenous men and women in Sweden and Latin American countries, Brazil, and Mexico on how they experience racism, where and from whom racism is reproduced and normalized through discourses, attitudes, and practices, how the victims perceive, react, and interiorize unfair and aggressive treatments, and its intersections with gender, social class, and anti-migrant discrimination.

The strategy of the research aims to emphasizes the relevance of racism based on skin color and in indigenous language-culture as relevant factors crosscutting patriarchalism, poverty, migration and other social inequalities, as well as to discuss how racism is reproduced in specific contexts at school, work, and daily life: what are the different arguments of racist discourses, the most common racist attitudes and practices, and to analyze the patterns and peculiarities of racism in different historical and institutional landscape, adopting the Foucault's terms on the historical phases of the development of racism around the world.

Results: in Sweden Racism is hidden through the concept of ethnicity, and it manifests itself through the isolation and segregation of Africans and indigenous people since childhood, while in Brazil it is explicit, with violent attitudes and often hidden and denied in the form of jokes and with security forces adopting practices of extermination of both groups; in Mexico racism is hidden under jokes and nicknames, and also segregates black and indigenous people from childhood. Differences and levels of racism happen independently of laws and policies to criminalize it, and it is reproduced institutionally in different ways in each country.

GOMES, Lucas* (Universidade Federal do Paraná, Brazil)

L'extrême Droite Au Brésil: Les Proximités Et Les Differences Entre Les Bolsonarismes Et Les Lavajatismes

L'ascension de Jair Bolsonaro à la présidence de la république au Brésil en 2018 fut l'aboutissement, entre autres, d'un fort engagement anti-corruption qui a été nourrie principalement par l'exposition médiatique de l'opération Lava-Jato (lavage express) après 2014. Cette opération a eu comme conséquence, la création ou la fortification des groupes de droite et d'extrême droite qui ont fait des grandes manifestations de soutenance à l'opération et à ce qui est devenue son héros, le juge fédéral Sergio Moro.

Pendant les élections de 2018, la plupart de ces groupes ont fait campagne pour Bolsonaro et, après les élections, Sergio Moro a accepté l'invitation d'être son ministre. Ceci a signifié une certaine imbrication entre des mouvement qui soutenaient Bolsonaro (suivant appelé Bolsonariste) et des mouvements qui soutenaient l'opération Lava Jato (suivant appelé Lavajatiste). Néanmoins, cette relation harmonieuse a eu un nouveau tournant quand, dans le milieu de la pandémie, Sergio Moro a quitté le gouvernement avec un discourt très critique à Bolsonaro.

Le présent travail, résultat d'une enquête de terrain menée avec des groupes bolsonariste et lavajatiste dans les rues et dans les réseaux sociaux à la ville Curitiba, berceau de l'opération Lava Jato, cherche à comprendre les moments d'approche et de différenciations de ses groupes dans et après les élections de 2022.

RC54-JS-120.3

GOMES, Rui* (University of Coimbra, Centre for Social Studies, Portugal)

Body and Risks

Safety is a symptom of 18th-century biopower. Making death an object of unease, disciplinary power concerned itself with survival, with prolonging life and protecting public hygiene. Affiliated to new political technologies of the body, it extended its action to the whole population with regard to such issues as birth, fecundity, old age and the control of endemics. The issue of safety is an old one and cuts across various spheres of life – from the body to the environment, to road safety and financial risk – but now the responses have been anchored in prevention and in personal accountability for the control of risks and health. Over the last 25 years, prudential socialisation has created a mentality conducive to swift compliance with all the confinement measures following the COVID-19 pandemic. In many cases, these paved the way for the State's exceptional measures, which are typical of health authoritarianism and ultimately gave specialists extra power.

Alongside the safety brought about by new technologies, which reduce the fears that used to characterise corporeal existence, there has been an increase in the uncertainties related to the risks looming in the future. In addition to the statistics of the infected and the dead, there will be a curve for risk inequality: the poorer will have died more, minority ethnic groups will have been more seriously affected by mortality rates, the most vulnerable will have been the first to lose their jobs and fall below minimum subsistence levels.

The alternative is to establish participatory policies and care for others, valuing the National Health Service, public health and all social organisations that, through their intervention, recognise the asymmetric prevalence of health risks according to social groups and the living and working conditions provided to them, and promote solidarity towards the most vulnerable.

RC13-200.1

GOMES, Rui* (University of Coimbra, Centre for Social Studies, Portugal)

Confined Leisures

Those who experienced confinement during the COVID-19 pandemic report a strange sensation in which subjective time either accelerated or slowed down. As if in a fictional time capsule, where movements occur at unimaginable speeds without the travellers being physically aware of the fact. This spatio-temporal disconnect is paradoxical when we think about bodily leisure practices because we have gotten used to perceiving them as the archetype of movement and mobility. Some alternative forms of leisure adopted during this period, especially those involving remote exercise, the use of simulated forms of physical activity, or filling the slowness of time with e-sports, inverted the customary motor logic: movement was replaced by anxious stillness.

On the one hand, the speed of virtual contact with others, whether people, objects or symbols, suggests intensity; on the other hand, the paralysis of confinement produces dejection. The feeling of speed is no longer a feature of the moving body; it has moved to the screens of TV sets, smartphones and computer monitors. Leg speed has shifted to the visual-manual anxiety of keyboards.

The confinement created the conditions for the exacerbation of already existing tendencies, which entered the various fields of life as an extended form of simulacrum and hyper-reality.

The pandemic highlighted the two paths to leisure. The first is the immersion in hyper-reality that defines a material and mental condition of life in which the distinction between the real thing and its imitation is abolished.That which is geographically distant seems very familiar and that which is geographically close creates the illusion of strangeness.

The alternative path is the growing demand for the dazzling spaces of domesticated nature that were left out of the great confinement.

Competing Nationalisms: Venezuelans and Spanish-Speakers in Postcolonial Trinidad and Tobago

Within the most recent comparatively small movement of persons from Venezuela to Trinidad and Tobago in the southern Caribbean, inequalities cross-cut experiences and the trajectories of Venezuelan migrants. Varied public, institutional and state responses to this migration are also visible. In

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

this paper I focus on the less visible claims and designations of belonging and citizenship at the core of public statements and remarks about the increasingly visible 21st century Venezuelan presence in Trinidad and Tobago, particularly Trinidad. I conduct a textual analysis of various sources to discuss postcolonial nationalism and conceptions of Trinbagonian (Trinidad and Tobagonian) and Trinidadian nationhood in particular. There are gradients of migrant acceptability and therefore unacceptability within the framing of Anglophone nationhood and Trinbagonian multiculturalism. Classifications such as class, race, colour, and nationality shape how Spanish-speaking Venezuelan migrants are represented and discursively situated in the postcolonial present, demonstrating how othering functions on a continuum rather than as a clearly defined local/foreign dichotomy. Histories of colonial-era migration and integration under Spanish colonialism and a French plantocracy as well as pre-conquest indigenous multiculture are selectively incorporated within Trinbagonian nationhood, while there are few remaining actual Spanish speakers in Trinidad from 19th and 20th century migrations. All this is done within a context of the state's managed mobility (Mbembe 2018) — particularly important in the petro-state of Trinidad and Tobago which requires international labour, the criminalisation of vulnerable migrants and a two tier system of global migration that reproduces systemic brutality (Sassen 2014). I connect the material and symbolic in this presentation to interrogate these dimensions to citizenship.

Sporting Practices of Intellectual Workers: The Results of an Empirical Study

Sports socialization is an integral part of the socialization of modern man and provides the reproduction of the culture of leisure physical activity and competition. In the conditions of modern society the distribution of sports socialization is connected with the development of the social structure of society. With the scientific and technological development in the structure of capitalist society intellectuals begin to stand out. The social group of intelligentsia consists of hired intellectual workers - competent specialists with higher education, sometimes acting as a highly paid labor force. The basis for distinguishing the intelligentsia group is intellectual labor and the evolving need for this type of labor in modern society. Intellectuals as a group have formed a number of key features. These include: performance of hired intellectual labor, high value of spirituality and belief in the power of human thought, feelings and ideals, as well as, as a rule, creative professional activity. The intellectuals are characterized by various forms of leisure, but physical activity draws the leisure of intellectuals in a special way, because they need to compensate for the lack of motor activity, recreation and the removal of psychological tension, which is actualized with the course of the division of social labor. K. Marx noted that the wealth of society will be determined by measuring the free amount of time people will use to restore their physical and mental strength, to improve their knowledge and abilities for spiritual growth. . Sports socialization and the social phenomenon of sport act as a form of social relations that find their place in the lives of individuals.

GONCALVES, Ana* (Instituto Universitário de Lisboa, CRIA, Portugal)

Flashes of Lives: Photography As a Tool in Life and Family (hi) Stories

The use of visual tools may open up numerous analytical possibilities in auto/biographical research. As a result of the democratization of photographic practices, everyday life is saturated with countless images. Photographs are currently common personal artefacts, tangible or intangible, of self-representation and self-reflexivity, which allow the retrospective reconstruction of life events. Essentially, they matter not only because they show aspects of the lived experience but also because they make people talk about them. Often accounts of lives are organized around flashbacks inspired by real photos. On the other hand, it is also usual that verbal descriptions of visual records spontaneously appear in auto/biographical narratives. Perhaps it is not known if it is the sight that induces the speech or if it is the speech that guides the sight, but one can infer their mutual interference. All these issues will be discussed and illustrated through examples taken from a recent research project conducted in Lisbon, Portugal, based on the methodologies of life and family (hi)stories. In general, the results of this research point out that both modes of enunciation — the visual and the verbal — constitute parallel narratives that mutually reinforce or disregard each other at some points.

GONCALVES, Ana* (Instituto Universitário de Lisboa, CRIA, Portugal)

Placing Cultural Heritage and Inheritance into the Alley

Drawing upon long-term fieldwork conducted in Lisbon, Portugal, this presentation focuses on the ground-level and lived experience of cultural heritage. In particular, it explores how small-scale and locally based events may serve to deepen bonds of intimacy and ensure the intergenerational transmission of expressive forms of culture. One such event will be presented: The Rua Joaquina Party. To a greater or lesser extent, bound up with the socio-musical worlds of Fado, this alley party constitutes a relational setting that annually brings together a selective group of persons that jointly appreciates or performs music they value and engages beginners in musical pathways. The Rua Joaquina party is attended exclusively by the alley residents and their visitors, which thus makes it a sort of home territory, whereby the partygoers experience a relative level of relaxation and a sense of intimacy. It is possible and even likely that such close social connections unlock potential opportunities for creative cooperation between the attendees. But, above all, the event remains an intimate affair, where many of the people involved experience a broad sense of familiarity and cultivate, to a large extent, family-like connections with each other.

Satisfaction with in Vitro Fertilization Treatment: Patients' Experiences and Professionals' Perceptions

Background: This paper investigates patients' satisfaction with various aspects of fertility care and seeks to determine to what extent fertility specialists are able to assess patient satisfaction. Patients' experiences with in-vitro fertilization (IVF) services and facilities have been compiled and examined in order to discover whether patients' satisfaction is correlated to psychological factors and demographic, socio-economic, and health characteristics, and whether patients' satisfaction has an influence on the willingness to pay (WTP) for IVF treatment. Methods: The study was carried out on 204 patients and 19 fertility professionals from 8 public IVF units in Israel. Results: The study found that, overall, infertile patients are satisfied with the care they received. Several demographic variables (age; education; income; number of fertility treatments) and psychological factors ('Pessimism' and 'Activeness'), were found to be significantly correlated with patient satisfaction with IVF. The results yielded a negative correlation between the WTP for IVF treatment and the satisfaction with access to care and physical conditions. Conclusions: Patient satisfaction is an important component in the evaluation of fertility treatments as well as other medical interventions. Insights into the quality of care as seen from the patients' perspective may help healthcare staff better meet patients' needs, wishes, and priorities.

Valuing the Invaluable: Do Emotional Experiences during Fertility Treatments Affect the Willingness to Pay for Them?

Introduction: This paper extends the accepted economic method of valuation by taking psychological factors into consideration. Objective: The unique psychological factors of in-vitro fertilization (IVF) have been explored and examined in order to discover whether psychological variables are correlated to background factors: sociodemographic, satisfaction from IVF medical treatment, and health-related factors, and whether psychological variables have an influence on the willingness to pay (WTP) for IVF treatment. Another purpose of this paper is to investigate the moderating effects of satisfaction from IVF treatment on the relationship between the psychological variables and the willingness to pay (WTP) for IVF treatment. Method: The study was carried out on 204 patients from 8 public IVF units and provided data on their emotional response and their maximum WTP for IVF treatment. Results: Background factors were found to have a significant impact on IVF patients' emotional outcomes. Evidence was found for gender-based variances in psychological reactions related to infertility; however, WTP remained robust and was not influenced by psychological variables. The results show that satisfaction from treatment can be regarded as a moderating variable between the psychological variables and the willingness to pay (WTP) for IVF treatment. Conclusion: The research findings indicate that fertility problems affect the quality of life of women more adversely than of men, and women suffer more negative emotions as a result of infertility. A unique emotional response that seems to be an important outcome in the experience of infertility and that was demonstrated in our study is shame. The sociocultural environment affects emotional responses regarding WTP, while IVF patients' satisfaction with medical treatment may moderate the emotional effect of psychological factors on the WTP for IVF treatment.

Generational and Ethnic Differences in Fear of Victimization Among Guåhan Women

In social science literature, the proposition that fear of victimization is more prevalent among women is well-supported. Specifically younger women are more conscious of the misogynistic principles and practices in modern society. Various western institutions utilize messaging tactics that take advantage of women's vulnerability to victimization, oftentimes leading to the sexualization of women as "desirable objects." Younger age groups of women are more alert and aware of the need to taking extra precautions when they are out at night or doing things they enjoy. However, the excessive levels of fear among women can greatly impact their mental well-being, causing them to have feelings of stress, anxiety, and difficulty in decision-making. Moreover, advancements in technology utilized primarily by younger generations combined with the increased awareness of crime allow them to be more cautious of potential victimization, especially as they receive real-time news of current events. The younger generation of women is more vigilant about their safety, but it can reduce their quality of life by living fearfully in their surroundings.

Levels of fear among Guåhan women are not widely known, and there is even less available information about how possible generational and ethnic differences affect such fear. The conflict theory was applied to data gathered in 2021 from a survey, Guåhan Women's Study, to analyze levels of fear among women. The questions were measured using a Likert Scale and distributed to more than 200 female participants living in Guåhan. The study specifically examined the social control mechanism this fear has on women's behavior at night and when participating in things or activities they enjoy. This study's results indicated contrasting levels of fear of victimization across different generations of Pacific and Asian women who live in Guåhan, and the impact of this fear on their mental health.

The Role of California's Sanctuary Policies in the Formal Help-Seeking of Latina Immigrant Survivors of Intimate Partner Violence

The present paper describes the role of California's sanctuary policies in the decision of immigrant intimate partner violence (IPV) survivors to seek formal help for the violence they are experiencing. To explore the topic, the study used interviews with 12 women who identified as immigrants to the United States and IPV survivors. The interviews with immigrant IPV survivors were supplemented with 14 interviews of individuals who provide assistance, resources, or services to IPV survivors. Results indicate that there is a gap in knowledge of sanctuary policy between service providers and immigrant IPV survivors. Additionally, survivors seemed unsure of the sanctuary policy's ability to protect them from detention and deportation.

Las Desigualdades Digitales En Los Procesos De Socialización. Análisis Desde Una Perspectiva Generacional y Figuracionista

El siguiente trabajo parte de la consideración de la brecha digital como un elemento clave en la explicación de los procesos de retroalimentación de la desigualdad social en las sociedades modernas. Se propone un planteamiento del concepto de brecha digital ligado a la desigual capacidad de aprovechamiento útil de la tecnología y la minimización de los riesgos socioeconómicos y psicosociales de sus usos individuales y sociales, analizando cómo dichas diferencias se desarrollan a lo largo de los procesos de socialización y están basadas en las disposiciones "pre-tecnológicas" y las distintas formas de socialización figurativa. De este modo, se lleva a cabo un análisis biográfico a partir de entrevistas personales en población joven, buscando identificar el papel de las instituciones educativas, los efectos de la transmisión intergeneracional dentro de la familia y los procesos de socialización en los grupos de pares, tanto dentro como fuera del espacio virtual. Las hipótesis planteadas sostienen que la mediación activa de los centros educativos y la presencia de figuras paternas con información sobre las implicaciones de las nuevas tecnologías aportan mayores probabilidades de que se desarrollen itinerarios de socialización digital que supongan menores niveles de vulnerabilidad individual. Estos factores incrementan, a su vez, las posibilidades de desarrollar mayores capacidades para el aprovechamiento útil de estas tecnologías. No obstante, en línea con las hipótesis, dicha capacidad de aprovechamiento es definida desde los distintos campos sociales,

evolucionando en torno al desarrollo del hábitus, de tal modo que más allá de los aspectos ligados a la alfabetización digital no existen habilidades objetivas aprovechables independientes de dichos campos sociales. Los resultados apuntan a distintos aspectos a considerar desde el ámbito socioeducativo.

Re-Centering Resistance and the Tal'3at Movement: Lessons from Palestinian Feminist, Anticolonial, Emancipatory Mobilizations Against Gender-Based Violence(s)

While conducting fieldwork in the Occupied Palestinian Territories (OPT) and Palestinian refugee camps inside them, Palestinian feminist activists and researchers would often identify the main causes of their sufferings as a three-headed Cerberus: (1) the Israeli occupation, (2) patriarchy, and (3) the NGO system. Those three main oppressions are intertwined constituting the foundation upon which life for Palestinians (and more so for Palestinian women) turned almost unbearable. After the Oslo Accords, the OPT became more and more dependent on external aid, usually delivered through the different ramifications of the International Cooperation and Humanitarian systems. The NGOification of Palestine (Jad, 2003) has been described and denounced by a number of Palestinian activists and scholars as an imposed restructuring of women's activism through a Western agenda lens, and its main consequence is the continuous shrinking of Palestinian civil society.

This paper follows the surge and development of the movement Tal'3at: a feminist, anti-colonial, political movement that achieved mobilizations and repercussions all through the WANA region's main cities and Palestinian refugee camps. Tal'3at was born in September 2019 in response to a gender-based violence murder (the kind frequently described as an honor killing, although Tal'3at activists refuse the terminology), and pushed over hundreds of women to the streets to chant against patriarchy while centering Palestinian liberation and questioning the NGOs and researchers role and positionality in the struggle. On the 26th of September of 2019 Palestinian women of different backgrounds marched together all over the WANA region and beyond.

Through participant observation and analysis of social media connected to the Tala'3at movement, this research aims to hold a candle to its methodological and theoretical proposals, achievements, and shortcomings. The main objective is understanding and learning from the Tala'3at experience focusing on the anticolonial feminist critique of the International Cooperation and Humanitarian Aid system.

"the Dam Only Brought Us Bitterness". Extractivism, Authoritarian Development and the Conflict-Repression Nexus in Central America

This paper examines how extractivist projects and authoritarian development strategies have fostered the dynamic of political violence in Central America. For this I consider the dyad of repression and conflict as a form of contentious politics. Also I understand extractivism as a longstanding form of appropriation of nature that has defined the role peripheral territories in the capitalist global treadmill of production. And third, I consider authoritarian development as one potential pathway of integration of "national territories" and local spaces into the global economy, defined in the dispute for hegemony that involves the State, elites and subaltern actors in a given political process. I argue that structural pressures for extraction of resources add to the implementation of authoritarian strategies of development in shaping the contentious interaction of affected communities and repressive forces. Under these conditions, the conflict-repression nexus of extractivist projects unfolds in three moments. 1) Extractivist projects are implemented unilateraly employing repressive repertoires over communities, forced to displacement and dispossession. 2) According to existent organizational resources and ideological changes, communities respond, accommodate or mobilize against the attributed responsible authorities. 3) Authorities radicalize repression by intensifying the previously implemented repressive repertoires, extending the latter in space and intensifying the repressive strategies. The consequences of the latter could motivate an interactive cycle of mobilization, intercommunal conflicts and mass repressive violence. To understand this, I use archival material to reconstruct and compare the cases of the biggest hydroelectric projects in El Salvador (Cerrón Grande) and Guatemala (Chixoy) in the 1970's, a decade of rising authoritarianism. I analyze how the local and regional conflicts fostered by these projects enmeshed with larger contexts of collective violence. These historical experiences of extractivist contention anticipate current conflicts attached to the extraordinary demand of commodities and authoritarian turn in the Global South

Reflexiones De La Contabilidad Ambiental Desde El Desarrollo Sostenible y La Responsabilidad De La Empresa Reflections of Environmental Accounting from Sustainable Development and Corporate Responsibility

El presente trabajo tiene la finalidad de reflexionar en torno a la contabilidad ambiental en el marco del desarrollo sostenible desde una perspectiva crítica exponiendo un discurso construido desde la gran empresa y el Estado. El texto expone una ética disfrazada desde los modelos de gestión y la contabilidad ambiental construida a partir de una cosmovisión anclada en el capitalismo y sus axiomas. La búsqueda de la ganancia establece los medios de reproducción y prácticas organizacionales con base en la estandarización y certificación de las experiencias socialmente responsables, las cuales se han incrementado paulatinamente conforme ha permeado el concepto. De tal forma que, las organizaciones internacionales y especializadas han buscado regular el actuar de los gobiernos y de la empresa; sin embargo, se sigue manifestando una brecha importante entre el discurso y la práctica. La contabilidad ambiental nace y se propone como modelo de gestión que busca reducir el impacto de la toma de decisiones del gobierno con las cuentas nacionales ambientales y la contabilidad financiera y administrativa para la empresa en el deterioro del medio ambiente a través de la medición de los costos privados y sociales. Lo ambiental de la contabilidad queda limitado y supeditado a los intereses del modelo de desarrollo sostenible, donde el crecimiento económico y el mercado forjan su principal base y sustento. La ganancia y la acumulación sobre la conservación del medio natural. La prevención, mitigación y reparación del actuar de la empresa es sólo para seguir creando riqueza y beneficio tratando de enverdecer sus objetivos y prácticas, pero, sin un cambio de fondo.

Palabras clave: ética ambiental, empresa, desarrollo sostenible, capitalismo, discurso, gestión

A reflection on citizenship and therapeutic markets: Chileans with rare diseases and their journeys to access orphan drugs

During the last two decades, Chilean society has increasingly demanded better access to healthcare with financial protection and greater quality. This push influenced the implementation of Universal Health Coverage (UHC), which has been praised for highlighting patients' right to health and for addressing individuals' burden of disease. However, this state-led policy has raised concerns about the emergence of new uncertainties and risks, leaving some patients unprotected: those with low-prevalence conditions and those who need pharmaceutical treatments that lack evidence regarding its cost-effectiveness. These elements have created a healthcare context where only some individuals seem to be able to claim their rights.

Through the case of children living with Spinal Muscular Atrophy (SMA), a severe genetic rare disease, this paper explores the paths individuals without health coverage follow when attempting to claim their right to health (more specifically, to pharmaceuticals). Up to 2016, there were no pharmaceutical options to treat children with SMA, causing their early death before turning two. Currently, there are three orphan drugs approved to treat this condition, including the most expensive single-dose drug available in the market. If children receive the drug, they most certainly will not die, which means that finding a way to access the drug is a matter of life and death.

This paper explores the limits of citizenship for individuals who try to access high-cost drugs without financial protection. This raises questions related to patienthood and belonging, where the damaged biology of individuals becomes the ground for staking citizenship claims (Petryna 2004). What happens to those who are left unprotected after health reforms are implemented? What kind of patienthood and citizenship do they enact? Is there space for hope to emerge amidst illness and vulnerability?

The Experience of Digitalisation in a Feminised Industry: Retail Workers and the Future of Work

Digitalisation is said to mark a new phase of technological development in shifting the way work is organised, but processes of digitalisation have largely been examined in male-dominated industries like manufacturing and logistics. This paper explores how workers experience digitalisation and how managers justify digitalisation in the context of a female-dominated service industry, retail. Identified as paradigmatic of low-wage service sector employment in the 21st century, the retail sector is crucially important as one of the largest private sector employers in Australia and one of the most feminised industries. Prior research on digitalisation in retail has linked it to automation and job loss, changes to skills requirements, work intensification, precarity and surveillance. The potential gendered impact of these changes in retail has received relatively less scholarly attention. Gender is an important consideration when studying digitalisation given the occupational segregation in retail, with women dominating the frontline cashier work at risk of automation, and the potential for seemingly neutral technologies to impact people differently on the basis of gender.

This paper draws on a worker-centric mixed methods approach to answer the research questions, 'How is digitalisation conceptualised by senior stakeholders and workers in the retail industry, how is it experienced by workers, and are these conceptualisations and experiences gendered?' As part of a broader project on gender equality and the future of work, the paper combines data from interviews, a nationally representative survey of over 1000 retail workers and workplace observations. The paper draws on a combination of Labour Process Theory and a feminist Social Shaping of Technology approach to examine the impact of new digital technologies in the retail industry on workers and their responses to these technologies.

Climate Movements in Germany, India and Australia: Dynamics of Transition, Transformation and Emergency

Climate movements have emerged with increasing force as governments fail to address climate crisis. The institutional power of the fossil fuel sector is increasingly laid bare, negating the legitimacy of public power. At this juncture the capacity of climate movements drives effective climate policy and defines climate agency. Analysis of strategy for mobilisation, and for leverage, has become central. This paper addresses climate movements as movements against 'carbon democracy', beyond fossil capital. Three pathways are identified – 'climate transition', 'climate transformation' and 'climate emergency'. Implications for democratic change, and for wider society, are explored through comparative analysis of the practice of movements. Climate movement mobilisation is compared across three contrast cases, in Germany, India and Australia. The dominance of fossil capital in each of the cases is heavily contested, and increasingly so. At the same time, the contrasting contexts for this struggle, in post-industrial, post-colonial and extractivist states, produce divergent directions and outcomes. Dynamics of contestation across fields of climate contestation are mapped over time and across social contexts using survey and interview data. The paper draws-out common problems, directions and strategy to gain insights into emerging agendas beyond the hegemony of fossil capital.

Decarbonising Electricity: The Promise of Renewable Energy Regions in India, Germany and Australia

The transition from fossil fuels to decarbonised renewable energy is establishing new socio-ecological relations of energy, and is embedded in forms of structural change, social antagonism, collaboration and transformation. In progressing transition, questions of social legitimacy become integral. This paper reports on the cross-national 'Decarbonising Electricity' research collaboration which compares three regions in India, Germany and Australia: Brandenburg in Germany, Karnataka in India and the state of South Australia. All three sub-national regions have become heavily reliant on wind and solar power for electricity, and have become drivers for energy transition. The paper explores social transformations and contestations that this has entailed. It reports on ethnographic engagement in the three regions, along with interview data and analysis of regional political economy. The paper argues that these experiences, across contrasting post-colonial, post-industrial and extractivist contexts, hold insights for wider questions of energy transition and decarbonisation.

2. Grassroots Conservatism and Participatory Politics: Mobilisations Against the 'Perils of Progressivism' in Australian Schools.

This paper provides an historically grounded analysis of mobilisations of conservative grassroots groups that aim to challenge 'progressive' reforms in education and schooling in Australia. Based in a large empirical study of community organising for education reform in the 1970s and 1980s, we track the emergence and persistence of conservative groups formed to counter the so-called perils of progressivism: migrant rights, Indigenous rights, feminism, gay liberation and the emergence of 'progressive' school subjects.

The 1970s and 80s was a significant period of community ferment surrounding education across the globe, and was also a time when participatory politics, as an idea (and practice) took particular hold and shape. Groups seeking class, race, or gender justice, for example, were concerned both with remaking education systems *and* recasting democratic participation. In this paper we

describe the conservative actors and groups that cohabited with progressives in this space: the religious conservatives, morals crusaders, censorship advocates, anti-feminist groups as well as the reactionary educationalists. We found that the tactics, rationales, and forms of sociality of these groups were often concomitant with those of progressive and radical groups, despite their ideological basis running against democratic goals or sentiments and argue that the existence of 'participatory' conservative politics complicates the notion of 'participatory politics' in liberal democracies such as Australia.

In the 2000s, calls for *more* citizen engagement and participation in politics and policy processes continue to be championed as ways to interrupt anti-democratic, anti-diversity, neo-conservative and colonial interventions in education, but the tensions we found *within* notions and practices of participatory politics reveal deep fissures in the liberal democratic imaginary of 'participation' itself. We conclude by suggesting an alternative conceptualisation of participatory politics that extends work on 'publics' may assist in understandings of contemporary 'populist' activisms and resistances.

Cultural Politics: Disaffection and Imagination

Australian Prime Minister Scott Morrison opened the nation's 2022 election campaign by noting, "I get that people are tired of politics." We suggest citizen disaffection with democratic politics is a notable structure of feeling in 21st-century culture. Cultural politics – complexes of feeling, thinking and doing at individual, interpersonal and social scales – are not simple, spontaneous outpourings of feeling. They are shaped, historical, and often intentional, and form an important component of social imaginaries and political formations. The felt experience of disaffection may result from estrangement from other people, social formations, technical systems or ecologies, but might also be described in terms of transformations of organic flows into rifts within and between individuals, social groups, technologies and their users, environments and their inhabitants.

Disaffection and alternative modes of implicit or explicit affection fit into a wider cultural landscape. Political modernity has mobilised the cultural industries for a century or more to instil and reinforce these feelings, but culture is also the site of negotiated and contested reception of political messages. In the 21st century, driven by the accelerating role of information and artificial intelligence as economic and biopolitical resource, these sites of contestation include social media and their break-up of network communications into internet bubbles, and new assertions of nationalism in popular politics. Meanwhile anxiety about global futures, characterised by loss of political or economic control, has morphed from Cold War fear of atomic apocalypse to fears of climate change and economic catastrophe.

Departing from pessimistic accounts of cognitive mapping, we propose the imagination as the utopian dimension of any social imaginary. Like fantasy and nostalgia, imagination can power both connective and alienating emotions. By encouraging debate on the concept of imagination and imaginaries, we hope to open new terrain for cultural political analysis.

Still Together: Forms of Collectivity in Contemporary Youth Practices

Since the Toronto ISA congress in 2018, we have developed two edited collections reflecting on the marginality of "collectivity" in youth studies. This paper draws together the (fittingly collective) work our contributors have developed on this concept. The paper offers theorisations and hypotheses on the overlooked status of collective practices in contemporary youth cultures. We suggest the decades-long dominance of the individualisation thesis has made scholars less attuned to forms of collectivity. In the books – "Forms of Collective Engagement in Youth Transitions" (Brill, 2021) and "Youth Collectivities: Cultures and Objects" (Routledge, 2022) – we trace, with contributors, the vital practices of "being together" that have long constituted and continue to be integral to what most observers consider to be "youth culture" globally. We also suggest that some of the metaphorics used in the youth transitions and mobilities literature, again stemming from individualisation approaches, screen out all sorts of collective navigations of young adulthood. Rather than noting particularly deep-seated individualisation within youth practices, we argue that scholars have simply downplayed the continuing centrality of collectivity among young adults. In summarising this work between congresses, we will also open new avenues for youth studies to explore how collectivity structures young people's lives today, including across the digital and the non-traditionally political.

Social Media Use and Early Adolescents' Internalizing Symptoms: The Moderating Role of Family Functioning

Perhaps no other platform has changed the human experience in such a profound way in recent decades as social media. Social networking sites (SNS) specifically, has changed the ways in which we communicate, gather information, and foster and maintain relationships (Anderson & Jiang, 2018). The most notable examples include Facebook, Twitter, Instagram, and Snapchat. In keeping pace with its ever-changing landscape however, researchers must continuously re-examine social media's influence on today's youth. As such, there has been surmounting evidence illustrating the negative impact of SNS on various aspects of youth well-being, including those related to internalizing symptoms (Ohannessian, Fagle, & Salafia, 2021). Nonetheless, researchers have advocated for the positive effects of family functioning in mitigating the impact of adverse circumstances on adolescent outcomes (Jeynes, 2005). For example, increased positive family functioning is associated with greater emotional stability among adolescents (e.g. Kim et al., 2007).

Given the importance of positive family functioning in impacting adolescent outcomes, and the potential for social media use to negatively influence adolescents' mental health, family functioning may alleviate the negative effects of social media use on early adolescents' internalizing symptoms. Therefore, based on the premises of Bronfenbrenner's ecological systems theory, the present study utilized structural equation models to test the moderating effects of family functioning on the association between social media use and early adolescents' internalizing symptoms. Participants were N= 1,092 adolescents recruited for middle and high schools located in the Northeastern region of the United States. First, findings suggested that use of all four platforms directly influenced early adolescents' internalizing symptoms. Second, findings were such that family functioning moderated the association between social media use and early adolescents' internalizing symptoms: Facebook (b= -.40, p= .00), Twitter (b= -.60, p= .00), Instagram (b= -.34, p= .00), and Snapchat (b= -.31, p= .00). Implications warrant further discussion.

Disadvantaged, Marginalised and/or Disengaged Young People and the Politics of Participation and Voice

In youth policy and service delivery the idea of youth voice and participation is an uncontested 'good thing'. But *which youth voices? Who is heard and who is left out?* This paper addresses some of the challenges that come from listening to and trying to understand the concerns that many young people have about 'having a voice', and having that voice 'listened to' and 'acted upon' in spaces, and by people who can impact the circumstances that shape their lives.

This paper draws on the work of Mayssoun Sukarieh and Stuart Tannock (2014), and Soo Ah Kwon (2019) who have discussed the problematic character of young people's voices and participation in movements against such things as the climate crisis, war, and racism, and their encounters with the neo-Liberal, institutionalised promise of 'youth participation' through forums and conferences which seek to 'shape the conduct of youth into ideal global citizens'.

I will share the stories of three young people which were gathered in a place-based project in the Greater Geelong region (AUSTRALIA) titled: *COVID-19 and Disadvantaged Young People's Education and Employment Aspirations: A Longitudinal Study of Young People's Transitions in Geelong*. Using innovative, platform based, video capture technologies the project is conducting a series of video interviews with young people as we track their education, training and employment pathways in COVID 'normal' socio-ecologies that are profoundly shaped by historical and contemporary processes of disadvantage and marginalisation.

Referencing Gayatri Spivak's (2008) essay *Can the Subaltern Speak?* I will argue that these stories can illustrate some of the complex 'entanglements' that shape young people's participation - to consider how and why some disadvantaged, marginalised and/or disengaged young people appear to have no 'voice', and are denied access to participating in the processes that shape their oppression.

Collaborative Research with Social Movements

Collaborative research with social movements: University training practices to promote new forms and relationships between the community and academia.

For more than 15 years in the Master's Degree in Participation and Community Development at the University of the Basque Country, we have been developing academic practices that promote the use of transformative participatory methodologies based on Participatory Action Research. The training of the master covers the learning of the research methodology necessary to propose and develop applied social research, through participatory processes, including participatory techniques. In this way, we have been able to collaborate with different basque social movements that carry out socio-political experiences that involve different agents of civil society who come together to respond to collective problems and thus carry out democratizing practices that empower and help transform power relations between the rulers and the ruled. Through this work we have been able to foster links and coordination with entities outside the University, since we understand that it is essential for the University to be present in society and thus establish collaborative relationships with the different political and social agents that are part of the basque social movements. This type of contribution from the university to its immediate social context has a return both in terms of knowledge of the reality of the sociopolitical processes; and in educational terms, since it is also nourished of what has been learned working in these processes.

Innovation - What Is It Good for? the Case of Agricultural Drought Compensations in Poland

Events such as the wildfires in Australia and California, or floods in Pakistan, acutely demonstrate societal helplessness towards the devastating forces of nature accelerated by human actions. This presentation will focus on agricultural droughts in Poland, and the strategies undertaken by the Polish government to mitigate their negative consequences. The main finding is that Polish governmental agencies rely on compensation schemes for affected farmers in their approach towards agricultural droughts. Several issues with the compensation schemes, such as the lack of transparency and complicated application process will be highlighted. The presentation is based on an analysis of the governmental strategies towards drought compensations undertaken after 2015.

Since 2012 drought has been noted in Poland every year. The droughts have a negative impact on farmers' incomes, but also their well-being (see e.g. the works by Margaret Alston). Polish government grants the farmers the right to compensations while the application process has undergone a drastic change. Previously, applications were personally turned in by the farmers, who estimated the extent of the damages themselves and attached proof. After that, a team of experts could inspect the farms and make a decision.

The roles of officials and experts who used to assess the damages and went over the applications were taken over by an algorithm, that uses information from the farmers and data from the system for the monitoring of drought that collects data about bio-hydrological factors such as soil moisture and rainfall levels. The intent behind these changes was to improve the quality of the application process, to make it faster and easier to assess the size of damages and potential compensations.

The paper will argue that governmental compensation strategies are making it more difficult for farmers to obtain financial help; the innovation is not, therefore, beneficial for those who need help.

Children's Wellbeing during COVID-19 Pandemic: An Exploratory Study Among 10-12 Years Old School Children in Bangladesh

The study of subjective wellbeing has received increasing attention in social science research and policy in the wake of COVID-19 pandemic. However, there appears to be gaps in knowledge in terms of children's views on how the pandemic affected their lives during the pandemic especially in developing countries. This article fills out that research gap in the context of Bangladesh, which has around 64 million children and young people. The aim of this article is to examine the impact of the pandemic on children's subjective wellbeing in Bangladesh. Using a convenient sampling and a child friendly questionnaire, a survey is conducted among 1370 school children aged 10-12 years using both face to face (1060) interviews and online completion by children. Overall, children's level of worry (measured by an eleven-point scale, 0-10) regarding the impact of the pandemic on their lives was found to be very high. Children's level of worry in getting bad school marks was found to be the highest (mean score = 7.9), followed jointly by worry of the changes in student life and worry by the Coronavirus situation (both with the mean score of 7.2). Using pre-COVID-19 period as the benchmark, the study revealed the negative impact of the pandemic on children's wellbeing which was reflected in the reduction of their satisfaction on time spending (29% down), learning at school (40% down), relationship with friends (30% down), and the people who they live with (13% down) during the pandemic. These findings are discussed in the context of child wellbeing theories and previous empirical studies on wellbeing and pandemic. Suggestions for future research are also put forward.

Class, Gender and Community Identity at School: Girls' Style on Saraswati Puja in Assam

Saraswati Puja, a celebration of the Hindu goddess of learning, is organised in educational institutions in the eastern parts of India. Women and girls, dressed up in traditional attires of *sador mekhela* and *sarees*, can be seen visiting the puja pandals in schools. While normalisation of majoritarian religious symbols in educational institutions has been a matter of public debate and discussion in India, the gendered and classed modes of participation in these festivities by young girls have received relatively little attention. We draw on the field insights from a government school with a mixed-religious population in Assam and argue that the middle-class and caste- Hindu ideals of femininity underlie the normative ideas of appropriate dress within the school. While everyone is expected to follow the norms of appropriate dressing on the day of Saraswati Puja, the contradictory discourses of modesty, identity, and style put Muslim girls in more vulnerable positions than others. In this paper, we examine how young Muslim girls from lower classes negotiate the caste-Hindu middle-class norms of participating in the Puja by actively engaging in doing style along with friends and by staying away from the gaze of the teachers.

Schooling Aspirations and a Neighbourhood School in a North Indian City

In recent decades, private players have emerged as major providers of education in urban India. The popularity of private schools among the lower income groups is extensively reported and has received a mixed response in academic writing. Existing literature in the domain has often focused on the experiences of middle-classes located in the metropolitan centres of India. A more nuanced understanding of the spatial politics in urban India calls for a detailed examination of the social context of the urban poor and those belonging to the lower income groups located in non-metropolitan urban spaces. It is also important to unravel the processes through which they navigate the private educational market against the backdrop of the post reforms period in India. This paper sets out to explore the class and status dynamics of families associated with a private neighborhood school in the North Indian city of Banaras. The paper begins with a historical examination of the demarcation of urban space for the poor in the city of Banaras along lines of class, caste and occupation identified as a 'weavers' settlement'. It seeks to explore how families living in these areas seek to reconstitute their relation to schools through increased monetary and cultural investments with the hope of securing valued cultural resources for their childre. A closer examination of school choice, however, suggests how the realisation of such ends remains difficult.

Young Trans People's Experiences of Leisure and Mental Health: Belonging, Creativity, and Navigation

There is a lack of research on young trans people's everyday leisure and wellbeing. Therefore, this paper sets out to analyze how leisure, defined within a broad spatial context beyond sport and physical activity, is perceived and experienced by trans youth in relation to their mental health and wellbeing. We draw upon theoretical concepts of cisnormativity and bring a feminist trans geographical perspective to our analysis of sixteen interviews with young trans people (16-25 years old). Three themes have been constructed from the analysis. The first refers to how both queer- and non-queer-specific leisure spaces connect people with similar (and different) experiences regarding queer- and trans-identities and shows how these identities can shift in importance. The second highlights how creative spaces (e.g., theatre, cosplay) can offer opportunities to carve out a leisured space to explore different gender identity/ies and expressions that are often crucial and life changing. The final theme illustrates how leisure is avoided, postponed, waited for, and reclaimed by trans youth. Excluding mechanisms include transphobia and cisnormativity, as well as the lack of access to gender-confirming care which can be a prerequisite for engaging in leisure activities. Our analysis illustrates the complex connections between leisure and mental health among young people with trans experiences. Leisure can be a source of discomfort and distress but also of belongingness and affirmation of one's identity. Finding and accessing strengthening leisure spaces demands emotional investment, engagement, and navigation.

The Role of Social Norm, Attitudes and Cultural Preferences in Choosing Organic Food Items. Two Case Studies of High School Students in Austria

There has been a trend towards organic food consumption since the 1990s in the European Union. Concerns about one's personal or family health are stronger then altruistic concerns for the environmental or animal welfare when it comes to predicting shopping behaviour of organic food. This trend towards consuming organic food for one's own 'wellness' or 'wellbeing' has been further enhanced by the COVID pandemic as consumers look for healthier nutrition and are preparing more food at home.

At the same time, most European societies have experienced significant economic growth leading to improvements in education, modernisation, and increased choices in all aspects of daily life. With respect to social change, class and social strata have been increasingly replaced by lifestyle, cultural preferences and consumption choices.

Food consumption patterns have changed significantly, resulting from increased choices and changing demographics. But, so far, research has not yet sufficiently recognized adolescents' preferences towards organic food and the influence they are having on household food purchasing decisions. Two surveys (n=340, 2005 and n=565, 2018) were conducted in Austria to investigate urban and rural high school students shopping behaviour for organic products. While the two case studies, mainly for the time gap, cannot be compared directly, we explore similarities and differences in cultural preferences and consumption choices as indicators of social change. The Theory of Planned Behaviour, extended with socio-demographic, cultural preferences and knowledge variables is used as a theoretical framework. Key findings from both surveys include the influence of attitude, trust and subjective norm, particularly primary socialisation, on self-reported shopping behaviour of organic food. Socio-demographic variables and cultural preferences determine attitudes towards organic products and have an impact on self-reported shopping behaviour. Given the strong influence of primary socialisation, we confirm the importance of family units as incubators of social change at the micro level.

GOTTFRIED, Heidi* (Wayne State University, USA)

Beyond Old Divides: Care Migration in Regional Perspective

How countries mobilize the migrant workforce is shaped by politics and policies in regional contexts. Case studies of Germany and Japan allows us to compare the trajectories of two similar conservative gender regimes located in different world regions. Beyond old divides, we take stock of emergent supra-national (transregional) political institutions (e.g., the European Union) and proliferating regional trade agreements (ASEAN) that regulate cross-border labour flows. The increasing demand for low wage migrant labor, especially for rapidly aging countries, yields a stronger regional and global integration of social- and political-economies, and concomitantly a tighter intersection of inequalities along class, gender, and race/citizenship distinctions. Regional reorganisation of care, within the Asia-Pacific in the case of Japan, and the European Union for Germany, vary in important ways.

Inequalities in the Electoral Registration of the Non National EU Citizens Living in France

La transnationalisation des votes constitue un nouveau champ de recherche pour les études électorales. En la matière, l'espace politique européen offre un vaste terrain d'observation. En effet, dans la partie du Traité de Maastricht de 1993 consacrée à la citoyenneté de l'Union européenne, plusieurs droits politiques ont ainsi été accordés aux citoyens des États-membres, dont le droit de vote aux élections européennes et municipales dans l'État membre où ils résident, et ce dans les mêmes conditions que les ressortissants de cet Etat. Mais tandis que l'UE promeut une citoyenneté supranationale et que les migrations intra-européennes s'amplifient, peu de citoyens européens font aujourd'hui usage de ces droits. En France, seulement un quart d'entre eux ont fait la démarche de s'inscrire sur les listes électorales.

Cette recherche vise à identifier les facteurs sociaux et politiques explicatifs de la variabilité des niveaux d'inscription électorale des citoyens de l'UE non-nationaux résidant en France. Elle s'appuie d'une part sur les listes électorales transmises par les préfectures où figurent plusieurs informations sur chaque électeur, notamment sa nationalité. Elle mobilise également des données sociodémographiques issues du recensement pour chacune des 26 nationalités européennes présentes en France.

Les résultats montrent une hiérarchie importante des taux d'inscription sur les listes électorales selon les différentes nationalités. Schématiquement, on distingue trois groupes de citoyens européens selon leur région d'origine. Les citoyens issus des pays d'Europe du nord sont les mieux inscrits, suivis par les citoyens issus des pays méditerranéens, et enfin les citoyens issus des pays d'Europe centrale et orientale. Pour expliquer ces différences, l'analyse statistique fait toutefois apparaître le poids de nombreuses autres variables (durée de résidence en France, situation socio-économique, lieu de naissance, etc.). Ainsi, cette étude saisie l'exercice pratique de la citoyenneté au prisme de la grande diversité des profils et des situations migratoires des citoyens européens mobiles.

GOULD, Deborah* (University of California, Santa Cruz, USA)

Political Emotion, Political Horizons, and the Question of Composition in 2023

The coming into being of a political collectivity is both ordinary and not: it happens all the time but is never natural or inevitable, meaning "composition"—whether class-based or one that revolves around other dimensions of being and desiring—is a question rather than a given, always. Curious about shifts over time in what is seen as politically possible, desirable, and necessary, and how such imaginaries get tethered to different forms of political (in)action, this talk raises the question of composition through the lens of political emotion and with an eye to the 10th anniversary of the Gezi Park protests. Taking the Gezi uprising as an important moment in the global protest cycle that began with the Arab Spring, I explore the emergence of a new structure of feeling—from "there is no alternative" resignation to the felt contingency of now—and ask what it means for Left activism in the current moment. Along the way, I discuss the afterlives of social movements, the uses of history, and composition as always a something to be done

RC18-270.1

GOULD, Mark* (Haverford College, USA)

Fascism: Towards a General Sociological Theory

I explain the genesis of fascist movements, conceptualizing them as forms of patrimonialism (particularistic, personalistic political processes, even if bureaucratically grounded), as fundamentalisms (charismatic re-evocations of traditional, subterranean values, within the context of (incipient) modernity), and by characterizing them as forms of internal disorder (motivated violations of institutionalized norms) that proceed from within the state (i.e., where state actors violate institutionalized norms of authority) and are supported within the societal community/civil society (by significant portions of the political nation). If we think about fascism within a general theory that specifies societal universals, intendedly valid for all societies, we can explain individual cases, here the genesis Nazism and incipient fascism in contemporary USA. What some view as the descriptively different historical situations generating fascist movements are theoretically the same if conceptualized within a general theory of disorder. If we articulate our theory at the correct level of generalization, we can explain the wide variety of movements we may loosely characterize as fascist.

It is often noted that unlike some other types of revolutionary parties, fascist parties were not associated with a (set of) class(es). In one situation, they were supported by class A and in another by class B. For example, workers aligned to working class socialist or communist parties were less likely than members of other classes to support fascism during the 1930s. Contemporaneously, it may no longer be the case that workers are resistant to fascism. "Phenomena" like these suggest that we are unable to formulate successfully a general theory of fascism. In contrast, I argue that if we construct our explanation at the proper level of generality, different class positions in different societies may generate *the same* variables. If so, the construction of a general theory of fascism is possible when we orient ourselves correctly theoretically.

GOUTEUX, Mathilde* (Aix Marseille Univ, CNRS, LEST, Aix-en-Provence, France)

Literature Review on Meta-Organization and Grand Challenges

"Grand challenges" are complex socio-environmental issues, which solutions imply changes in societal behaviors, but also a reinvention in the modalities of collective action (George, Grenville, Joshi, Tihanyi, 2016). By their very nature, they require coordinated and sustained effort from multiple and diverse stakeholders toward a clearly articulated problem or goal.

Because of their complexity and interdependencies, grand challenges are unlikely to be solved through traditional forms of organization (Berkowitz & Grothe-Hammer,2022) and should be addressed through coordinated and collaborative effort. Tackling grand challenges is then also an organizational problem, that need to deploy inclusive and democratic processes to facilitate the cooperation between a diversity of stakeholders at a territorial level. Recent works have emphasized the multiple contributions of meta-organizations as one innovative mode of organization to tackle grand challenges and

denotes a presenting author. Abstracts are organized by first presenting author's last name.

sustainability issues (Berkowitz & Grothe-Hammer, 2022). Multistakeholder meta-organizations, because they are embedded in their territory, especially seem to be powerful tool to respond to these challenges (Berkowitz et al 2020).

A lot of questionings that are not fully covered by literature arise from this, including the type of governance system that meta-organizations can implement to ensure democratic processes and inclusion of a multiplicity of stakeholders to tackle grand challenges. The modalities of the territorial anchorage of meta-organization and the relationship with the organizations that are not part of it is also not often dealt with in the literature. This literature review aims to develop a dialogic discussion about literatures of multistakeholder meta-organization (MSMO) and transition studies to explore those questionings.

GOVENDER, Jayanathan* (University of KwaZulu-Natal, South Africa)

South Africa'S Double Failure: State and COVID-19

This is a short description of major events associated with the COVID-19 in South Africa. South Africa earned global praise for its historic anti-apartheid struggle and the establishment of a truly democratic state after 1994. In seemingly similar terms, the South African government's response to Covid-19 during March 2020 was praised and hailed as more efficient than several other countries of the world. However, astonishingly, by mid-2020 the 'feel-good bloom' was extinguished: first by government's mismanaged of the non-pharmaceutical interventions (lockdown); and second through the collapse of the economy.

This aim of the paper is to demonstrate the system of exploitation during the South African's government response to the Covid-19 crises, rendering it an antithesis of global humanitarian goals, as well as a public health policy failure. The approach of the paper is framed upon the public interest approach, i.e. the well-being of the general public *vis-à-vis* public health policy. The focus is on the contradiction and misfortune of rent seeking and corruption during the pandemic crises in South Africa. Data and the conclusion of the presentation is reliant upon South African political process; the public health policy guidelines of the World Health Organization; and scholarly documentation of the South African Covid-19 crises.

The paper holds that a return to public interest as *the* discourse of development is possible vis-à-vis inclusive and equitable public health policy.

GOVIND, Modho* (Jawaharlal Nehru University, India)

Determinants of Pro-Environment Behaviour of People in Urban India: An Application of the Extended Theory of Planned Behaviour

The growing volume of municipal solid waste and its dumping on landfill sites has become a serious environmental and health problem for people living in urban areas, particularly in developing countries. Today proper waste management services are considered vital not only for the governance of cities but also to ensure basic human rights, capitalize on economic opportunity and ensure ecological balance. Pro-environmental behaviour like source segregation of waste is recognized as the most efficient and economical way to achieve sustainable management of municipal solid waste. Such behaviour benefits the environment and may not benefit people personally. India, like most developing countries, despite having taken intense efforts to motivate people for source segregation, through *Swachha Bharat Abhiyan,* which started in 2014*,* has continued with the problem of low level of source separation practices. Separating waste at the source requires a behavioural change and a commitment on part of the individual to practising pro-environmental behaviour.

Based on a questionnaire survey of 400 residents in Delhi and Varanasi this paper investigates the determinants of source segregation and waste disposal behaviour of residents in urban India. We extend the theory of planned behaviour(TBP) to explain the effect of the environmental worldview and the perceived effectiveness of policy in shaping people's pro-environmental behaviour. Our study showed that perceived behavioural constraints, mistrust towards waste collection services and perception of others' behaviours directly influence people's waste segregation behaviour. The findings of the study provide insightful information for policymakers to design effective policies on source separation of waste and promotion of a circular economy,

Transfer of Knowledge from University to Industry in Post-Covid Era: A Study of Indian Biological Scientists in National and International Context

The increasing importance of universities in the production of new knowledge for economic competitiveness has put pressure on universities to engage with industries and contribute to the economic development of society. The need to translate research into products and to develop new enterprises are pushing the academicians to take up an entrepreneurial role along with

their traditional roles of teaching and research. Governments across the world have been promoting such changes by encouraging collaboration between universities and industries through incentives to researchers and by creating supporting structures. However, the MNCs ,which were collaborating with academia across the countries to access the knowledge capital to maintain their global competitiveness, are now facing new challenges in post covid era as the governments have started putting conditions on the exchange of knowledge. Based on structured interviews of different stakeholders in biological sciences, this paper seeks to analyse the role of government policies and programmes in shaping the pattern of university-industry collaboration and the different processes of transfer of knowledge and technology from universities to industries in national and international contexts. Our analysis showed that government policies and funding mechanisms are being realigned to address national issues and challenges. Although Indian scientists emphasised more international scientific collaboration and more open access to the global innovation system, the national policies emphasised strengthening the strategic sector by pooling the resources locally and globally. An innovation eco-system, with a focus on national priority, is being created to contribute to the global supply chain.

GOVINNAGE, Sunil* (Independent scholar, Australia)

Aragalaya: The Struggle of People in Sri Lanka

This paper aims to provide an outsider's perspective on a people's movement named ARAGALAYA in Sri Lanka. It emerged in April 2022 without formal political leadership and affiliation to any political party in Sri Lanka. Aragalaya is a Sinhala word meaning "struggle" in English and emerged against a nepotistic and ineffective government that failed to provide basic needs for the people in Sri Lanka. Aragalaya can also be described as peoples' uprise who rallied against the Rajapaksa government elected two and half years ago with the support of Sinhala-Buddhist voters. In November 2019, Gotabaya Rajapaksa, a former Defence Secretary, was elected with over 6.9 million votes and a five-year tenure mandate. Gotabaya's victory was followed by his elder brother Mahinda Rajapaksa who won the Parliamentary election held in 2020. However, after two-and-a-half years of tenure in the Executive President's job, Gotabaya had to abandon his job due to the political pressure of the Aragalaya. The riotous voice of the people against the Rajapaksa government also forced Prime Minister Mahinda Rajapaksa to step down from his job as the Prime Minister on May 9, 2022.

This paper concludes how Aragalaya may end Buddhist-nationalistic governments that have existed since 1956, paving a path by flushing out the current political system in Sri Lanka.

Impact of Covid-19 on Real Estate Professionals in the National Capital Region of India

In the last three decades of globalization, the Indian economy has expanded and the dynamics of the forces of globalization resulted in an impetus for the process of urbanization, The migration of the people in large numbers from the villages and small towns to the national capital region of India for work has enhanced the scope for the growth of real estate in the NCR. It has increased the demand for secured and well-designed houses/apartments in the region, The peripheral areas in the region have developed at a very fast rate and corporate builders have entered the business of real estate. These real estate hired a number of professionals like civil and electrical engineers, architects, and other professionals like lawyers to their firms. The demonetizing in 2017 and the crisis of Covid-19 have affected the real estate sector adversely in spite of the demand for houses as the purchasing power of the Indian middle class decreased due to the loss of their jobs, cuts in salaries, etc. Today real estate sector professionals are struggling for their survival or working on compromising terms and conditions. The present paper explores these issues among the real estate professionals in NCR of India

Challenges to Communicating the Undetectable Equals Untransmittable (U=U) HIV Prevention Message: Healthcare Provider Perspectives

"Undetectable equals Untransmittable", or U=U, is a public health message designed to reduce HIV stigma and help communicate the scientific consensus that HIV cannot be sexually transmitted when a person living with HIV has an undetectable viral load. Between October 2020-February 2021 we conducted 11 in-depth interviews and 3 focus groups with diverse HIV/STI service providers (nurses, public health workers, physicians, frontline providers, and sexual health educators) in Ontario, Canada (n = 18). Our objective was to understand how U=U was communicated to sexual health service users in healthcare interactions. Interview questions were embedded in a larger study focused on improving access to HIV/STI testing. Transcripts were transcribed verbatim and analysed following grounded theory. Most providers emphasized the significance of U=U as a biomedical advancement in HIV prevention but had some challenges communicating U=U in everyday practice. We discovered four interrelated barriers when communicating the U=U message: (1) *provider-perceived challenges with "zero risk" messaging* (e.g., wanting to "leave a margin" of HIV risk); (2) *service users not interested in receiving sexual health information* (e.g., in order to provide "client centered care" some providers do not share U=U messages if service users are only interested in HIV/STI testing or if other discussions must be prioritized); (3) *skepticism and HIV stigma from service users* (e.g., providers explained how the hesitancy of some service users accepting the U=U message was shaped by a legacy of HIV prevention messages and persistent HIV stigma); and (4) *need for more culturally appropriate resources* (e.g., communities other than sexual and gender minority men; non-English speaking service users; that account for broader legal context). We discuss ways to overcome barriers to communicating the U=U message as well as the limitations and potential unintended consequences of U=U framings in the context of unequal access to HIV prevention and treatment.

A Service System Strengthening Approach on to Promoting Service Delivery to Neet Youth in Underserved Communities

When focusing on the issue of reconnecting young people to learning and earning pathways, the needs of many young people are overlooked. In South Africa active labour market policies have focused on connecting young people to work opportunities without considering the barriers they may face to doing so. Issues such as income poverty, care responsibilities and mental health, off of which affect young peoples ability to take up learning and earning opportunities are seen to be the domain of welfare policy. However welfare interventions often reach only the most poor and vulnerable young people. As a result youth who are not living in the most vulnerable households, but nevertheless face several barriers to learning and earning are overlooked.

This understanding prompted the development of an intervention that sought to deliver a coaching program to youth in vulnerable communities, alongside facilitating a community of practice for service strengthening at the local level. The community of practice drew together several local service providers who could address the welfare, education, health and labour market needs of young people living in precarious situations. Drawing on a thematic analysis of interviews and focus groups with local level service providers in two vulnerable communities of South Africa we report on the challenges and successes of the approach as well as views of the participants on its value as a strategy for promoting integrated service delivery. We draw out the implications for embedding such collaborative approaches into policy thinking and implementation.

GRAMMARE, Magali* (CNRS/BETA University of Strasbourg, France)

Gendered Professions, Prestigious Professions: When Stereotypes Condition Career Choices

Despite social changes and the opening up of all professions to men and women, society continues to adhere to many stereotypes, and many professions are still considered to be feminine or masculine. In addition to gendered representations of occupations, there are also social representations linked to the social prestige associated with a profession. These two elements shape the study and professional choices of individuals. Based on this observation, the aim of this article is twofold: on the one hand, to study the representation of professions according to the degree of feminization and the degree of prestige; on the other hand, to measure the influence of the perceptions of professions on the individual choices of professional project. I use a questionnaire administered to secondary school pupils and students. The results obtained show a differentiated influence of stereotypes on career plans. It also appears that individuals tend to underrate the professions they consider 'feminine'.

GRANA, Ervin* (University of the Philippines Diliman, Philippines)

Visualizing Organizational Legitimacy: The Case of a Women-Led, Urban Poor Community Association in Barangay Tatalon, Philippines

Organizational sociology has progressed into a field that privileges bureaucratized organizations (e.g., firms, industries, and state-owned enterprises). Organizational sociologists have thus relied upon a stream of scholarship that excludes organizations that operate in the absence of formal rules, hierarchies, governing structures, and well-defined goals (e.g., people's organizations and community-based organizations in developing countries) to explicate a variety of organizational phenomena. My paper will address this gap by theorizing the relationship between care work and organizational legitimacy through the case of the Tatalon chapter of the *Pinagkaisang Lakas ng Mamayan* (People Power United), an urban poor, women-led community association waging an in-city housing campaign in the slum community of Barangay Tatalon, Quezon City, Philippines. In so doing, I will make use of data gathered through participant observation, and a visual methodology that bifurcates the concept of organizational legitimacy between its *objective* and *subjective* aspects. The former pertains to coercive pressures that constrain the legitimacy of an organization. The latter, in contrast, pertains to processes of legitimation and meaning-making. The visual methods that I am to utilize and introduce in what follows will address certain questions built upon either one of these aspects: (1) repeat photography (objective) – What issues constrain the legitimacy of urban poor, care-led community associations (e.g., demolitions, typhoons, floods, government directives, and social norms)? (2) photo voice (subjective) – how do leaders of urban poor, care-led community associations organize in response to these issues? And what organizing strategies do they utilize to garner legitimacy within (e.g., from community residents and other community associations) and beyond (e.g., from government officials and the general public) their community? The findings of this six-month research project will contribute to more inclusive theory-building in the field of organizational sociology, and prompt discussions on the relevance of visual methods in organizational research.

Bonapartismo En El Estado Brasileño: Un Estudio Sobre El Gobierno Del Presidente Jair Bolsonaro

Este trabajo tiene como objetivo establecer paralelismos entre el concepto de bonapartismo y el gobierno de Jair Bolsonaro. Elegido presidente de Brasil en 2018, su gobierno se vio atravesado por una grave crisis económica, política y de salud pública. El presidente pronunció discursos que conmocionaron a la opinión pública, dominando los titulares de los principales medios de comunicación del país, con un fuerte sesgo antidemocrático y negacionista. Investigaremos las prácticas de su gobierno a partir del análisis de los 20 principales discursos pronunciados por Bolsonaro que más han tenido el mayor efecto en Google Trends a lo largo de su administración. Otros discursos analizados corresponden a las declaraciones en la cadena nacional de radio y televisión y a los discursos en manifestaciones en apoyo al presidente, que reunieron multitudes vestidas de verde y amarillo en las principales capitales de Brasil. En la investigación de la relación entre bolsonarismo y bonapartismo, plantearemos las principales características de esta forma de Estado en la obra histórica de Marx. El bonapartismo bajo el sesgo marxista indica que si bien las clases burguesas son económicamente dominantes, son incapaces de acaparar el poder político del Estado, prefiriendo transferir el poder a un líder vago e impreciso que se confunde con el Estado mismo. A través de los discursos de Bolsonaro, perfilaremos las principales características que acercan el contexto brasileño actual al concepto de Estado bonapartista. Este análisis discursivo

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

dialogará con las obras de Dominique Maingueneau y Patrick Charaudeau, que relacionan sujetos con contextos históricos rodeados de poder e ideología. Entendemos el bonapartismo como un Estado basado en un sesgo autoritario que se presenta en el capitalismo bajo nuevos enfoques, manteniendo sus características esenciales que garantizan la dominación, el sometimiento de las clases populares y la reproducción de las clases dominantes.

Stigma As Structure of Disablement: Towards Collective Justice

Globally, women who experience violence and children born out of this violence face stigma from their communities as they are often bear the blame of their victimization. This mark excludes them from accessing basic needs and enjoying a full participation in life. Research on the stigma of violent victimization has focused on the individual outcomes of stigma and has emphasized the role of culture in creating and sustaining stigma and gender-based violence. Drawing from an analysis of gender-based violence discourses in transnational meetings adjacent to United Nations conferences, we argue that stigmatization acts as a core pillar of the structural and everyday practices of disablement of victims of violence and their children, especially those coming from historically marginalized groups, such as transwomen, Indigenous women, trafficked women, and ethnic minorities. Engaging with critical and postcolonial disability scholars, we theorize that the post-violence stigma acts as *a structure of disablement* for survivors and their children: stigma works as an organizing principle, in combination with other structures of domination, that materializes hierarchies of worthiness through resource allocation. The politics of disablement signal a commitment to materialist analyses of everyday life and center a critique of the ways in which processes of global capitalism and ongoing colonialism not only maim bodies and minds, but also assign meaning as 'subhuman' to those non-normative bodies and minds. This assignment creates, but also justifies, conditions of exclusion and precarity and thus further directs power towards dominant groups. Our theorization contributes to explaining processes of co-constitution between gendered and structural violence on a global level. Importantly, we aim to demonstrate that it allows for formulations of collective justice and reparations by the victims of such violence that are foreclosed in the dominant judicial and therapeutical approaches addressing the stigma of gender-based violence.

GRASSI, Edmondo* (San Raffaele University, Italy)

Artificial Intelligence and Ethical Changes

The pervasiveness of artificial intelligence has become an immanent reality in the structure of contemporary society. It is a device which, being able to influence and model some characteristics of the social individual, to know multiple aspects of it, to become a shadow assistant - as if to rise to the role of that unconscious part of thought and personality that emerges only in the flow of big data -, manifests a character of innovation and ultra-accelerated development compared to that of the subject and his ability to use: artificial intelligence has become indispensable element of a biotechnological system that is called to an ontological remodeling .

We are experiencing a revolution of which, since in a decade the communicative pillars of our civilization have been unhinged, in which technology has changed private habits, public practices, practices institutional, collective actions, asking questions of an ethical matrix.

Have you become omnipotent? Science is carrying out "impossible but real" enterprises with its technique, such as cloning, artificial uterus, biometric studies. Has omniscience been achieved only because every question that is asked to the devices is answered in a few tenths of a second? The online consultation has become the first action to dispel doubts. Has politics become the subject of finance and technology? Intelligent algorithms study and work in stock exchanges around the world or act for the surveillance and control of the person.

The emerging need to rethink an ethics that can become a morally regulatory tool for relations with the device, for the development of the person, for his dependence on the artifact, for an ethics that is also thought for the algorithm and the machine that hosts it. Its non-neutrality was the subject of a three-year qualitative research, followed by a monograph on the subject.

"Hands up, This Is Not a Concert". Mediation and Educational Policies on the Margins of the City of Milan

Starting from a three-year ethnographic research (2019-2022) focused on the topic of street groups within the European project entitled "Transgang: transnational Gangs as agents of mediation", my paper will present a specific mediation experience that took place with young people in conditions of vulnerability in the city of Milan (Italy). This mediation experience involved a rap crew formed mainly by "second generation" kids living in one of the biggest social housing neighbourhood of Milan and the Municipality, with the support of a non-governmental organisation linked to a Catholic parish priest. The mediation process was triggered by a particular episode: in April 2021, at the height of the pandemic, one of the rappers shot a video clip in the neighbourhood, gathering hundreds of young people. Someone called the police, who intervened with police cars and trucks. The boys threw objects; the police responded with tear gas. The incident triggered a considerable repressive reaction and incredible media exposure of the boys. The neighbourhood was described in dramatic tones and its youngest residents suddenly become a "problem" for the city. In this climate, the mayor himself decides to meet with two rappers from the crew. My paper will shed light on the evolution, scopes and limits of this process, and will highlight its connections with waves of moral panic and media narratives (sometimes fed by young people themselves) through which the city of Milan has defined and redefined its own ecology in a recent period of profound urban and social transformation.

Understanding Family Resilience during COVID-19: The Role of Spirituality and Religiosity

Family resilience is the ability of a family to overcome adverse situations. Highly stressful events like the irruption of the pandemic impact each person individually, but also the family relationships, family dynamics and family life. Families used several strategies to face adverse events. Religiosity and spirituality seem to play a critical role to handle difficult moments. In fact, according to Walsh, one of the nine key processes to develop family resilient is transcendence and spiritualty. However, although some studies suggested that extraordinary moments are associated with an eventual "return to religion", by accepting the situation as "God's will", or by increasing the number of spiritual exercises or prayers, little is known about the relationship between spiritualty and religiosity and family resilience.

Thus, the goal of the paper is threefold: to understand the relationship between religiosity and spirituality and family resilience during COVID-19; to examine how new practices and family dynamics contributes to family resilience; and to analyze the role of the religious communities in promoting new family practices and support that may lead to family resilience. In other to achieve these goals, we used a multimethod approach in Catalonia, which includes 23 interviews with family members (religious and non-religious), and 11 focus groups with member of different religions including Adventism, Bahá'í Faith, Buddhism, Islam, Jehovah's Witnesses, Mormonism, Roman Catholicism, and Sikhism. Finally, we conducted in-depth interviews with religious leaders and experts. The result of our study contributes to the advancement of the literature by examining the role of spirituality and religiosity on family resilience, by understand the indirect role (formal and informal) of religious communities on family resilience, and by exploring these relationships in Catalonia, where religion is highly diversified, using different voices (families, communities, and experts). We conclude by discussing how our results may advance theory, research, and practice.

From Prosumer to Activism: The Politicization of the Everyday in Latin American Pandemic Times

Activism in Latin American pandemic times has been characterized, mainly, by the creation of networks of solidarity and mutual aid from grassroots groups. Groups, in which prosumer communities – who were already present in the urban territory before the pandemic – have participated. This participation is due to a process of politicization of aspects of everyday life such as health and food. Throughout the pandemic we have been able to see how the prosumer

has become involved not only in mutual support activities, but also in becoming the links between grassroots solidarity groups and food activism groups, the latter having also existed before the pandemic. In this session I will discuss this process of politicization experienced by prosumer communities in Latin America, and their involvement in grassroots activism.

Using a Collaborative Online International Learning Approach to Apply Social Theories to Global Health and Development Issues

Conventional evidence-based public health research often imposes technical solutions that are both euro-centric and neo-colonial in nature. Attempts to address these health inequities ignore local context and knowledge. Within the emerging sociology of global health and development, a Collaborative Online International Learning (COIL) programme was developed to examine these issues through critical social theory lenses.

The programme was delivered by academic and early career researchers from the UK, Africa and the USA and provided an innovative pedagogical approach that connects students and faculty from different institutions and countries, promoting cross-cultural exchange, bi-directional learning and co-production. Using social theory, the aim was to critically challenge ideas, and explanatory speculations about where knowledge comes from, what knowledge, whose knowledge or hypothesis is being used, and how this structures the space of global health.

Undergraduate and postgraduate students globally, from six different institutions, attended. A mix of presentations, online content, group discussion and case studies gave students an understanding of how to challenge traditional assumptions around the production of the flow of knowledge within the global health and development arenas. Students worked with graduate-level peer researchers and co-tutors to critically appraise different modes of knowledge production/construction. Concepts of reverse knowledge innovation were used to encourage mutual learning.

Through the production of posters on a global health issue of their choice, they were able to explore the tensions between the social/structural vs individual determinants of health. Participants valued working across geospatial borders and the opportunity to work with other students with different experiences and knowledge of their own, and to be able to understand the value of applying social theory to global health. In this way, we enabled future researchers and academics to critically apply social theory to understand the mechanisms of social change when working with communities and valuing their knowledge.

GRAZIANO, Federica* (Università della Calabria, Italy)

Controlling the Poor

In the Usa and Western Europe, the changes in the main economic support policies include, since the 1980s, a restructuring of all social policies, marking an important shift from the idea of collective integration, typical of the Keynesian era, to the Neoliberal era of insertion and activation. This is based on conditionality, in which the social background disappears, and the individual is seen as responsible for his or her condition.

In this general context, our hypothesis is that the increase of control and sanction instruments in economic support policies (especially of minimum income) represent a tool aimed at reducing the demand for subsidies and, according with conditionality, disciplining beneficiaries.

The increase of controls and sanctions in social benefits in countries like UK and Usa has been investigated for several years and by several authors, offering rich insights from the perspective of disciplining the assisted. This analysis is less present in those countries where activation policies have been implemented in a more gradual manner, following mainly a system of social investment, based on the idea of self empowerment than on workfare. Precisely for this reason, we will study the context of France and Italy, countries with different and relatively less harsh control policies of beneficiaries.

We will analyse the OECD and European Commission reports and guidelines to investigate the change in the European context. Then we will study two social measures in French and Italian contexts, the Rdc (Reddito di cittadinanza) and the Rsa (Revenu de solidarité active). We will study the legislative framework and analysing the change in the civil, administrative, and criminal sanctions against those who commit social fraud or do not respect the conditionalities provided in exchange for the subsidy.

Māori and the Integrated Data Infrastructure: A Critical Review of the Literature and Suggestions to Realise Māori Data Aspirations

The Statistics New Zealand Integrated Data Infrastructure (IDI) is a collection of de-identified whole-population administrative datasets. Researchers are increasingly utilising the IDI to answer pressing social and policy research questions. Our work provides an overview of the IDI, associated issues for Māori (the Indigenous peoples of New Zealand), and steps to realise Māori data aspirations. We first introduce the IDI including what it is and how it developed. We then move to an overview of Māori Data Sovereignty. We then move to the main issues with the IDI for Māori including technical issues and problems with ethnic identifiers, deficit-framed work, community involvement, consent, social licence, further data linkage, offshore access, and barriers to access for Māori. We finish with a set of recommendations around how to improve the IDI for Māori, making sure that Māori can get the most out of administrative data for our communities. These include the need to build data researcher capacity and capability for Māori; work with hāpori Māori to increase utilisation; change accountability mechanisms, including greater co-governance of data; adequately fund alternatives; or potentially even abolishing the IDI and starting again.

The Māori Electorates: Exploring Māori Electoral Roll Choices in Our Own Words

The electoral system in New Zealand features seven reserved electorates for Māori (the Indigenous peoples). These electorates have long been the foundation for political movements and policy (re)gains. However, despite them being in existence since 1867, there has been very little research on these electorates from Māori perspectives. Māori have the choice between the Māori roll and the General roll, and while work has explored the demographic and geographic predictors of roll choice, it has not asked Māori to explain their roll choice in their own words. In this paper, I present the results of a qualitative online survey of 2,000 Māori and their reasons for choosing a roll. The themes found in the data include relational reasons for enrolling, that is, deciding based on what family members told them to do, and a lack of availability of resources and education to make an informed choice and learn about the rolls. Choosing the Māori roll was often viewed as enhancing tino rangatiratanga (Māori sovereignty) and facilitating effective Māori representation (agentic reasons). However, many reflect that they simply chose the Māori roll because they are Māori ("he Māori ahau"). Reasons for the general roll choice included discussion of making a strategic choice to most influence election results, and expressing tensions between choosing the Māori roll and exerting Māori influence in Whitestream politics. Some Māori expressed the view that the Māori electorates are "racist", "apartheid", and should not exist, reflecting right-wing discourse in Aotearoa. The discussion of the results will include lesson drawing for policy and international Indigenous contexts.

Evolution De L'opinion Publique Occidentale Sur Le Conflit Russo-Ukrainien Dans La Twittersphère

Lorsque des crises ou des événements catastrophiques surviennent, il y a une production importante de hashtags dans la plateforme numérique de Twitter, qui reflet le besoin, ressenti par les utilisateurs, de partager des informations, de suivre l'actualité et de la commenter, en utilisant un collecteur de sens, le hashtag, afin de ne pas disperser le flux d'informations. Cette étude vise à étudier la réaction de la twittersphère au débat public occidental concernant le conflit russo-ukrainien, en analysant la production et l'évolution des collecteurs de sens qui ont été produit dans les premières phases du conflit, une semaine avant et une semaine après l'invasion russe. Dans ce but, tous les messages en langue anglaise publiés dans la période considérée ont été collectés. Les hashtags contenus dans le 1,7 million de messages identifiés a été extraits et classé par catégorie et par date de publication. Les résultats montrent comment le débat public occidental s'est déroulé au cours de la période observée, en raison des quatre catégories identifiées (territoires, acteurs, raisons du conflit et instances) et de l'évolution de leur importance relative. Cette étude apporte une contribution significative à la littérature car, en plus de fournir un examen clair de la façon dont le débat public et l'opinion publique sont formulés à travers les chaines de communication en ligne, elle supporte également une discussion théorique sur l'utilisation des hashtags en examinant les thèmes d'intérêt.

Songs and Performance of Kurdish Identity

The Kurdish language, oral traditions (particularly stories and songs), and more "recently", written literature, have been central to the "construction" of a Kurdish cultural identity, supporting the claim for independence. In the contemporary world, the transmission of songs through modern media, cross over national boundaries, helping to give Kurdish people across the globe, a sense of common identity. Taking into consideration the importance of songs in contributing towards this sense of a distinctive cultural identity, we want to unveil issues of Kurdish everyday nationalism and identity through the use of songs for young adults. In this presentation we focus on the results of 7 focus-group conducted with university students (with ages between 18 and 29 years old), from the governorates of Sulimaini, Erbil, and Dohuk. We look particularly into the perceived significance of Kurdish songs: for feelings of Kurdish identity; when compared to the significance of foreign songs; and in terms of generational change. We argue that Kurdish songs play an important role on feelings of national identity for young people. Positive qualities—such as more in-depth meaning— associated, particularly, with Kurdish songs from older generations, can be contrasted with the "lack" of meanings and feelings created by foreign songs and contemporary Kurdish music, which are often seen as commercialized and objectifying women. This opposition between past/present, local/foreign can be understood in terms of a political resistance against the foreign presence and influence in the Kurdistan region and as an expression of an everyday life nationalism that, at a minimum, assumes the right of existence of Kurdish people, but that for many corresponds to a right of self-determination. Still, there are young people, that welcome foreign songs, in what can be interpreted as a "cosmopolitan" feeling of belonging, that places them as citizens of the world.

Hurricane Evacuation, Sheltering, and Re-Entry Decision-Making in the Context of COVID-19

In August 2020, Hurricane Laura made landfall as a Category 4 storm, heavily affecting the coastlines of Texas and Louisiana. At the same time, both areas were coping with a surge in COVID-19 cases absent a vaccine. For this study, we explored how emergency management stakeholders navigated evacuation, sheltering, and re-entry planning and decision-making during a dual hazard threat where hurricane risk reduction measures contradicted COVID-19 risk reduction measures. We conducted 35 semi-structured interviews with emergency management stakeholders in Texas and Louisiana in the spring of 2021. Participants were recruited using a purposive sampling strategy designed to identify agency representatives and other officials involved in Hurricane Laura response. We used thematic analysis to code and analyze the data.

Three themes emerged from the data. First, while the process for planning for hurricanes had to shift to an online approach, the plan for addressing hurricane season was largely unchanged from the perspective of most participants until days before impact when the decision was made to move to noncongregate sheltering. Second, emergency management stakeholders often described balancing the risks presented by COVID-19 and the hurricane as a series of trade-offs that they had to weigh, and households had to consider. Third, due to the shift to noncongregate sheltering and challenges presented by both COVID-19 and the hurricane, communicating with evacuees presented unanticipated challenges that required improvisation to address. Given the continued threat posed by COVID-19 and other respiratory illnesses, this study provides insights that emergency management stakeholders could apply to current and future planning and response efforts for hazards that require evacuation and sheltering.

Visual Research in the Philippines

How do Global South scholars, such as those from Philippines, catch up with the fast-paced developing ways of collecting, producing, and analyzing visual data and knowledge? This edited volume proposal aims to collate multi- and inter-disciplinary scholarly works that use visual and multisensory data to understand Philippine socio-cultural and political realities including gender and sexuality, religion, deviance, democratic participation, rurality, among others. Sources of visual and multisensory data should include older and new media and developing visual technologies such as drones, CCTVs, and dashcams. In the presentation, the editor will also discuss an overview of chapter contributions from sociologists, political scientists, social workers, anthropologists, and gender studies scholars. There will be twelve chapters in the volume – one for introduction, ten contributions, and last one for the conclusion. The book will underscore the integral role of visual methodologies in constructing, deconstructing and reconstructing knowledge in contemporary Philippines.

The editor is a sociologist focusing on agrarian change, gender studies, and family research in Philippines, Malaysia, and Singapore. She is currently based at the National University of Singapore.

GREGORY, Sheree* (Western Sydney University, Australia)

Rethinking the Role of Gender, Care and Work: A Case Study of Screen Industry Directors, Gender Equality Policy and Pathways Toward Change

The obstacles to gender equality in screen industry careers are a vexing problem for practitioners, industry stakeholders, and audiences, and are part of a neo-liberal political discourse where responsibility for a range of work and family issues is shifted to individuals. Whether it is the calling out of gender pay inequality, the flooding of sexual harassment allegations in the media, it is now well-documented that women −including women who experience a disability, identify as lesbian, from non-Anglo backgrounds, with caring demands− are critically underrepresented in positions of power, and in particular: directing careers in screen in Australia, and internationally. In November 2015, Screen Australia implemented a gender equality policy, and similarly, the United Kingdom and the United States implemented equality initiatives to address women's invisibility and in relation to caring, disability, sexuality, ethnicity and racial diversity.

In this paper, I argue that gender equality and the resilience of the figure of an 'ideal' screen director has a strong hold on the work, culture and organisational imagination in the screen industries. Moreover, the visibility of inequality issues in screen industries is a characteristic of this 'ideal' director, and reproduces inequitable power relations and divisions of labor. Equality and diversity policy and initiatives contribute to the destabilisation of the ideal of a normative 'man' screen director, citizen and worker unencumbered by caring and family demands. I demonstrate this argument by examining the obstacles to women's participation in screen directing, drawing upon qualitative research interviews with 13 emerging and established directors and stakeholders from screen, cultural and creative industries, and sector mapping in Australia, the United Kingdom and the United States. This paper contributes to a theoretical rethinking of the intersection of gender, care dimensions and working life practices, and pathways towards change in the context of female directors' careers in screen industries.

Succession Planning and the 'Glass Ceiling' in Australian Universities

Succession planning, gender inequality and diversity remain critical and intersecting issues for leadership in universities within Australian and internationally. Despite decades of progressive measures and initiatives, gender inequality and the 'glass ceiling' persist and limit women's access to

denotes a presenting author. Abstracts are organized by first presenting author's last name.

leadership and positions of power. Although succession planning in universities is relatively new, uneven, inconsistent, and limited, executive leaders and senior management continue to develop interest. More than this: inclusive leadership is critical for innovation and the future. Yet, the continued underrepresentation of women in leadership positions within the Australian and international higher education sector, remains a major concern. How university senior executive groups plan and manage their succession transitions, and what this tells us about gender inequality, power and networks in higher education, may offer insights and reflections into pathways toward change. This paper reviews succession planning across Australian universities and in relation to gender equality. Findings from qualitative interviews with 15 university executive or senior management leaders from the level of the Dean to Vice Chancellor and President, from a range of public and private institutions in higher education Australia, are examined utilising an analytical framework of feminist theory and Bourdieu's habitus, and concepts of uncertainty, cohesion and leadership social dynamics and networks. Findings identify three key emergent themes: 'Activist - Advocates' for gender equality within a succession planning process, 'Networks and Social Relations', and 'Career Events', as present in respondent perspectives and experiences. This paper argues for a rethink of the role of succession planning in universities, in relation to gender relations and inequality in society, and what this may offer for pathways toward long term change for advancing women's participation in university leadership.

GRETSCHISCHKIN, Felipe* (University of Sao Paulo, Brazil)

Politics As Protest: Decolonization and Praxis Around 1968

The relation between decolonization, political praxis, and critical theory has been extensively discussed in the last decade. Through the critical engagement with the category of progress or the theoretical *ouvre* of members of the Frankfurt School, the expansion and relation with other critical traditions or the engagement with the category of civil disobedience in order to put the political protest in new lenses, pressing political conflicts and theoretical debates have urged to think the relation between decolonization and Critical Theory forwardly.

This presentation aims for a different path, through an analysis of Oskar Negt's "Politik als Protest" and Hans-Jürgen Krahl's "Konstitution und Klassemkampf". Both books are different manifestations of a fragmented theoretical activity, aiming to intervene in a very turbulent political moment, the student movement in West Germany around 1968.

My interpretation is that both works can shed new light on the relation between praxis, politics, and the decolonization of critical theory, due to the highly known relation between the alliance between the students and the struggles for liberation in the Global South. In order to defy the so-called "authoritarian" aspects of late Capitalism, and the difficulties of the student movement to relate politically with the German Proletariat, the solidarity with struggles in the Global South was a major point of reflection in those texts.

In order to do so, my presentation will present the main guidelines of those two books, focusing on the role of protests in politics and their potential to alter and influence the public sphere of the time, and the attempts to raise the "political consciousness" through the solidarity with movements from the Global South. I aim to use those works and show their potential and limits to contribute to the aforementioned contemporary themes.

GRIERA, Mar* (Universitat Autònoma de Barcelona, Spain)

Healthy Lifestyles, Healing and Holistic Spirituality in Contemporary Times

The paper focuses on analysing the role of spirituality in shaping hesitancy, or resistance, towards biomedical technologies (vaccines, chemotherapy and hormonal therapy). Based on a mix-methods project, the paper explores the existence of a dense network of interactions between alternative medicine spaces, spiritual communities, wellness influencers and people in search for a healthier lifestyle. The research shows that holistic spirituality is increasingly playing a role in shaping individual attitudes, and practices, towards biomedical technologies, which is illustrative of broader processes of questioning science and technology from a spiritual anchorage. A questioning that comes together with the consolidation of a market of alternative healing providers and the growing popularization of "healthy lifestyles", which promote, and regulate, new forms of approaching and dealing with everyday life (from breastfeeding, to diets or medical supplements). In a (post)pandemic, the links between health and spirituality have taken on a new public relevance, and debates around vaccination have become symbolic spaces for the production of new relations between politics and spirituality. Considering both the case of chemotherapy and the opposition to vaccination allows us to glimpse the multiple implications of the interplay between health, spirituality and politic in contemporary times. In empirical terms, the project combines big data analysis of social media, and qualitative fieldwork.

Socially- Oriented Npos and Social Enterprises As Drivers of Denationalization in Social Services: Barriers and Opportunities

The 'golden age' of the welfare state is already in the past, and both in theory and in practice, it is drifting towards increasingly complex and mixed models, and ultimately towards welfare pluralism. Social enterprises and socially oriented NPOs (SO NPOs) are providers of social services. They interact in the same field and compete for government subsidies or grants. We use the example some of social services, we answer the following questions: how does the state withdraw from the provision of social services? What are the barriers and opportunities of this process? Our interpretation of these changes relies on a classical approach to the analysis of intersectoral interactions in social policy. Materials used for analysis include: current regulatory legal acts; statistical data; officials' speeches; research publications; and materials from NPO sites. SO NPOs and social entrepreneurship play an important role in the withdrawal of the state from social services, which accelerated in 2015 after the adoption of the new Federal Law on Social Services. In practice, the government often creates organizational and financial barriers to NPOs in an effort to maintain its monopoly in social services. Crowdfunding and grants can be viewed as a starting tool for the development of NPO and social business projects. Endowment funds could increase sustainability, but not all, even large NGOs, manage to create them. Other barriers are low awareness and level of public confidence; poorly developed mechanisms for the sale of products and services. Withdrawal of the state from social services through the active involvement of SO NPOs and social enterprises opens up opportunities for them to effectively compensate for the imperfection of state services, increase self-sufficiency and the self-employment of the population. Non-governmental providers of social services are changing the field of solving social problems, turning passive 'service recipients' into active agents.

Reconstructions of Different Understandings of Social Cohesion and the Experiences of Different Status Groups

Social cohesion is not only disputed in theoretical terms, also the understandings are different between diverse members of society. The talk aims to explore these subjective concepts empirically by reconstructing different understandings of social cohesion and by relating them to the biographical experiences of different status groups. The following questions are guiding: How is cohesion thematized or not thematized? Who means what by cohesion (e.g., consensus, trust, conformity, cooperation)? What kind of biographical, work-related, familial, or institutional experiences shape notions of cohesion? What explicit or implicit attitudes toward social cohesion do different status groups orient their practices to in different spheres of life? Assuming that there are both explicit and implicit forms of knowledge, we distinguish between talking explicitly about social cohesion and implicit orientations that equally guide the practices of the actors.

Our analysis is based on the first wave of the FGZ-Quali-Panel, which investigates practices of endangering or maintaining social cohesion on the basis of 90 biographical narrative interviews with different status groups. Since the interviewees narrate their life stories as well as their experiences with social cohesion according to their own relevance structures, it is possible to reconstruct different understandings, to embed them in the underlying experiences, and to differentiate between im- and explicit ways of reflecting social cohesion. By contrasting different status groups and previous cohesion-promoting or cohesion-threatening experiences, the question will be explored to what extent they can explain the different understandings of cohesion or to what extent social position or social career affect these orientations.

GRINBERG, Lev* (Ben Gurion University, Israel)

From Military Occupation to upgraded Apartheid, a path dependent eventful sociology of the Dynamic Zionist Colonizing Project

This lecture will focus on the dynamic features of the Israeli-Zionist colonizing project, taking it not as a stable structure, but as a matter of eventful sociology, a result of agency and contingent power relations that include the use of force, or violence, and are influenced by international processes and events. It will focus on the peculiarities of the Israeli-Palestinian case, following the expansion of the Israeli borders in 1967, which created a colonial regime,

exploiting Palestinian labor and a captive market. The settler expansion was in the first period relatively moderate, concentrating in emptied territories, East Jerusalem and Hebron. In reaction to the initial settler expansion arose locally organized resistance of the Palestinian civil society. The first Intifada (1989-1992) forced Israel to open the political space of Israel-Palestine for negotiations and mutual recognition, culminating in the interim Oslo agreement (1993), and the establishment of the Palestinian Authority. The agreement reflected a new balance of power however, it facilitated the expansion of colonial domination based on controlling the movement of Palestinians, thus enabling their segregation and increasing their internal political divisions. Parallel to this improved colonial domination started a more violent settler expansion, protected by the military. The attempt of the Palestinians to resist the new domination regime in the second Intifada (2000-2004) was used by the Israeli government to improve the tools of domination. The next step was imposing an even more harsh segregation and creating an effective hierarchy of three different regimes of discrimination, repression and subjugation: The Gaza Prison, the West Bank direct military domination, and East Jerusalem indirect rule separating them from the West Bank, inserting them in the Israeli polity with no citizen rights. This is an upgraded Apartheid regime, because it succeeds to effectively divide geographically and politically the Palestinians conquered in 1967.

GRIPPO, Andrea* (Guglielmo Marconi University, Italy)

No-Vax and Extreme Right. the Conspiracy Side of the Pandemic

In December 2021, the German Federal Office for the Protection of the Constitution stated that conspiracy theories are an almost universal phenomenon, which has a significant catalytic effect in delegitimising and rendering preventive and protective measures against Covid-19 ineffective. No-Vax, No-Lockdown, No-Vaccine Certificate movement (No-VLV) cannot be explained by a lack of information, especially in light of the significant public health initiatives and press coverage. In this research, it is hypothesised that the negative feedback from the receivers is mainly, but not only, related to the lack of trust in the source/sender, i.e. the authors of the communication. Trust in public authorities and public figures will be conceived as an explanatory variable of the phenomenon. Furthermore, the organisational and political convergence between No-VLV and extreme right organisations seems to play a pivotal role in the spread of the phenomenon. In Germany, No-VLV movement rallied under the banner of Querdenker ("lateral thinker"), which gathered thousands of protesters in the streets. Among them was also the main organisation of the extreme right social movement, the Alternative für Deutschland, which demonstrated side by side with Querdenker against the federal government's Corona measures. This paper aims to analyse the Querdenker movement and to investigate its relationship to: a) legitimacy and trust in public institutions; b) the extreme right social movement. Finally, with regard to the social movements' outcomes, it will be examined whether and how the spread of the Querdenker and the extreme right social movement influenced the spread of the unvaccinated population and the spread of Covid-19. The research questions will be answered through the triangulation of research methods: frame analysis of Querdenker and AfD; Protest Event Analysis; secondary data analysis on trust in public institutions.

RC36-535.2

GRONLUND, Veronica* (Gothenburg university, Sweden)

Alienated Love in Patriarchal, Consumer Capitalism

The first aim of the paper is to present an integrative theoretical approach on contemporary love, using the frameworks of Axel Honneth (1995) and Anna G. Jónasdóttir (1991). My second aim is to present a sketch of how the concept of alienation can be extended on and utilized within the fields of sociological and feminist love studies.

Within sociological love studies, critical approaches on contemporary love and intimacy emphasize that the modern person seems to face severe difficulties in their love life, i.e. that love has, more than ever, become a source of fragmentation, pain and even depression. In general, it is regarded that contemporary consumer capitalism causes this state of affairs. Feminist approaches, in turn, emphasize that contemporary love is a site of patriarchal power relations, where men's social agency is affirmed and enhanced at the expense of women's ditto.

Honneth argues that love is realized through mutual recognition of one another's basic needs and dependencies, and as such is a socially transcendent phenomenon which generates a positive relation-to-self through which one acts in the world. Jónasdóttir similarly argues that love is necessary for a positive self-hood and agency, however she emphasizes that love is a creative and transformative capacity which can be subject to relations of alienation in the process of its realization. Integrating these perspectives, I argue that love is a socially contradictory phenomenon, which can be experienced as both a source of social transcendence and alienation. Henceforth, I introduce the concept of *alienated love* in order to critically examine and describe contemporary love, and ask: which are the sources of transcendence, mutuality and transformation in love in contemporary, patriarchal consumer capitalism?

GROS, Alexis Emanuel* (Universidad de Buenos Aires, Argentina)

The Role of Doxa in Contemporary Critical Theory

Since the end of the 20th century, a structural transformation in the multi-paradigmatic field of critical theory is taking place. This shift concerns the way of approaching and evaluating doxa, i.e., the pre-theoretical point of view of lay actors. The "orthodox" model of social critique, present in the works of authors as different as Adorno, Althusser or Bourdieu, operates with a mostly skeptical and/or pejorative attitude towards doxic knowledge that ultimately goes back to Platonic epistemic paternalism. Due to both philosophical-theoretical and normative-political reasons, such a model has entered into crisis in the last three decades. This is evidenced by the recent emergence and consolidation of a myriad of anti-paternalistic and immanentist critical theories: pragmatic sociology of critique (Boltanski), recognition theory (Honneth), hermeneutic-communitarian social critique (Walzer), critical sociology of world-relations (Rosa), critical theory of life forms (Jaeggi) and critical phenomenology (Guenther), among many others. In spite of their undeniable differences, all these positions share a common feature: they strive to reconstruct and take seriously the perspective(s) of the pre-theoretical addressees of critique, placing special focus on their experiences of suffering and vulnerability, intuitions of justice and notions of the good life. The aim of my paper is to describe this structural transformation in current critical theory and to explain some of its main causes.

What Is Management and Organization Studies Made of? an Invitation to Recover the Multiplicities and the Interdependence within the Field in Face of the Grand Challenges and the Anthropocene

Informed by the paradigm and its incommensurability debate, in doing management and organization studies, we are commonly trained and encouraged to identify ourselves with one scientific paradigm, and to conduct our studies and research from this specific perspective. Nevertheless, during this journey, we tend to discover that things are not as simple as those scholars stated, mainly, in regard to contemporary themes as the Grand Challenges and the Anthropocene. Underpinned by Deleuzoguattarian philosophy and Actor-network theory, this essay aims to advocate for a different perspective that focusses on the tensions and the struggles that occur within and in relation to MOS as a field of knowledge. The call is for a less naïve perspective of the field and to realize how we are constantly fabricating new scientific sub-fields in a rhizomatic form, throughout nomad and aberrant movements. Thus, in this essay, I present the idea of nomad science and the sociology of translation to highlight that science, in general, and, MOS, in particular, are much more about ruptures and controversies. Following that, I present how these perspectives have been applied within the field and advocate that we should apply concepts such as rhizome, nomad science, aberrant movements and translation to rethink MOS and its future. The main argument is that, by applying those ideas, we are going to be able to identify much more collaboration, dependencies and interdisciplinarity among the divergent sub-fields and among MOS and other fields of knowledge.

Between Meta-Organization and Sub-Organization: Bureaucracies As Internal Reflectors of Complex Environments

Organizations come in different layers. Following an influential conceptualization of meta-organizations as formal organizations composed of other organizations (Ahrne and Brunsson 2005; Berkowitz et al. 2022), recent studies have advocated a more "normative approach" to the study of meta-organizations (Berkowitz and Bor 2018), asking how an engagement with the so-called "grand challenges" of management research (George et al. 2016) can be further enhanced by a focus on the role of governing meta-organizations (Berkowitz et al. 2020). An implicit assumption in this stream of research is that organizations are "particularly well positioned to address grand challenges" (Berkowitz and Grothe-Hammer 2022, p. 121) when engaging in (partial) meta-organizing (Berkowitz and Souchaud 2019). Organizations are thus thought to be particularly apt to establish new organizations above their own individual level. In our paper, we seek to complement this perspective with an additional focus which lends itself equally well to the study of meta-organizations: The level of sub-units or sub-organizations (Brunsson 1986). In contrast to earlier studies, we are not so much interested in whether sub- or meta-organizations facilitate hypocrisy (Brunsson 2002; Berkowitz et al. 2022), but rather in the "strategic Indeterminacy" (Luhmann 1972, p. 151) resulting from the creation of multiple organizational layers. This constellation is particularly pertinent in the social orders most frequently conceptualized as "boring organizations" (446) and yet not typically studied as meta-organizations: state bureaucracies. In spite of its origins in the study of bureaucracy (Luhmann 2021; Monteiro and Adler

2021), organizational scholarship still has much to gain from analyzing public administrations as a set of interrelated layers of meta- and sub-organizations. Against this background, we present a longitudinal, in-depth case study of the strategy development process in a municipal administration which was marked by a complex "layering" of organization in both sub- and meta-organizations (Grothe-Hammer et al. 2022).

Why Quality Matters? Researching the Military from Bottom to Top

Military research in general and critical military research in particular tend to focus on macro viewpoint and examine the social, economic and political processes and mechanisms, and the way they influence, construct and change the military and civil-military relationship. In recent years more and more researcher recognize the importance of micro research and focus on the agents' performance and their subjective experience and understanding the military and its connection to society.

The session aims to examine the part of individuals in constructing, maintaining and even challenging perceptions, images, practices and processes within the military. We invite scholars that use qualitative methods that highlight the contribution of micro perspective and examine the military from bottom to top, to participate in the session. Furthermore, the session wishes to emphasize the importance of critical military research. Focusing on the agent's viewpoint and performance reveals the probability of challenging military conceptions and images. Doing so discloses the fluidity and the potential change in the structure, mechanisms and social conceptions through individuals' performance. By emphasizing the active part of agents in creating, maintaining and challenging meaning and perceptions we will aim to underline the connection between micro and macro research and the importance of micro perspective analysis to military sociology.

The Anxious Middle-Class Parents? the Role of Parental Style and Children's Academic Performance on Chinese Parents' Mental Health

The over-parenting behaviour of middle class parents and its long term impact on child outcomes and parent's wellbeing have gained much attention these years. There is empirical evidence that middle class family can mobilize more resources during childrearing procedure and suffers less mental health problems compared to their non-middle-class counterparts. Meanwhile, the fear of falling under the challenging time drives middle class parents invest more time and resources on their children, which has been found to be the anxiety of intergenerational social mobility.

However, whether middle class parents suffer more pressure from childrearing than non-middle class parents still lacks empirical support; and to what extend their parenting style and children's outcomes can affect parental mental health still remains unexplored. Furthermore, previous studies on parents' wellbeing during childrearing in contemporary China treated middle-class parents as a single group, and ignored the heterogeneity within the social class.

In this study, I will explore the middle class parents' anxiety during childrearing procedure in contemporary China, and examine whether and to what extent parenting styles and children's academic performance can explain (or mediate) parents' mental health and whether and to what extent the mediation effect vary within different middle class groups. I use a national representative survey data China Family Panel Studies (CFPS) conducted in 2014 and find three preliminary results.

First, middle-class parents overall tend to have lower depression symptoms than non-middle class peers, and middle-class parents are more likely to conduct positive parenting styles and their children have better academic performance than those from non-middle class family. Second, within the middle class groups, marginalized middle class parents suffer higher depression than the core middle class parents. Third, positive parenting styles and children's higher academic scores can help reduce parents' depression.

The Young Generation As Blessing, Bridge, and Burden Bearer: Intergenerational Relations amidst Social Challenges-- Lessons from Asia

Asian societies are characterized by strong intergenerational norms and obligations rooted in their diverse cultural traditions and as well in modernization trajectories. Our contribution examines the negotiation and reconfigurations of generational hierarchies and solidarities within the families in these societies. Three theoretical-methodological guidelines are chosen: (1) We foreground the voices and contributions of young people in their structural, cultural and situational contexts; 2) we pursue a dynamic analysis of intergenerational relations in their constant revision and reconstitution in response to social challenges as Asian societies undergo multi-dimensional social transformations, of different constellations in each case; and 3) without reifying Asia as merely a geographic concept, we significantly broaden the scope of our studies to a rich collection of case countries in East, Southeast, South and Central Asia and their diasporas across the world.

Data basis: Our analysis is based on 16 case studies in different countries that were conducted and elaborated under the aforementioned guiding principles. We have compiled and edited and partly authored these studies in a book project with Emerald on childhood and youth in Asian societies and diaspora.

Results: While all the studies analyzed show that there is a high degree of reference to traditions of generational commitment, there are also attributed new, to a certain extent pragmatic meanings to such solidarities, especially vis-à-vis crises, e.g. large-scale internal and cross-border migration, life in the diaspora or as refugees. A striking finding is the high demands placed on young people and the demands young people place on themselves under this aspect of generational obligation: on their contribution to the family's survival, to the family's tradition, to the family's success. This goes along with young people's willingness to discipline themselves and make sacrifices.

Theorizing 'Silence' in Childhood Studies

While 'hearing the voices' of children has become a consensus in childhood sociology to break away from the adult-centrism in sociological canons, we are yet to map out *the conditions under which children's voices can be heard* as well as *the varying tones and volumes of children's voices*, especially in contexts where children are embedded in hierarchical social structures and relationships. I propose a theory of *silence* towards addressing the mentioned questions and their methodological implications.

I posit a multi-dimensional theory of *silence* in childhood research. First, from a socio-linguistic perspective, the articulateness and eloquence of children, hence their varying tones and volumes, are often intricately related to their family class backgrounds, in the sense of 'cultural capital' (Pierre Bourdieu), or 'class code' (Basil Bernstein). Secondly, with an inherent imperative to control narratives and censor dissent voices, authoritarian polities and politics tend to constrain spaces for independent expressions of opinions, which often starts with childhood socialization. Third, from a cultural perspective, 'silence' or 'shyness' could be regarded as positive attributes in societies with 'dense normative frames' (e.g. societies with Confucian legacies). In this case, *silence/silencing* is encouraged and incentivized, in a normalizing process, so as not to challenge or disrupt the underlying relational hierarchies along the lines of generation, age, gender, or their different combinations. Last, situational contingencies (e.g. disabilities, orphanage) exacerbate children's general status of dependency on adults or adult-led institutions, producing effects of *silencing* in children.

I argue that this theory of *silence* advances existing literature by transcending a dualist conceptualization of *voice* and *agency* in childhood sociology. Methodologically, this theory pushes researchers to develop contextualized social, political and cultural sensitivities and sensibilities towards neutralizing the power imbalances between the researcher(s) and the researched, uncovering the 'unspeakable' and 'unspoken' undertones and reflecting on research ethics.

Is Work Not Working Anymore? the Cultural Meaning of Work for Young Highly-Skilled Basic Income Recipients during the Pandemic in Italy

The idea of enjoying and deriving meaning from one's work is the heart of the post-fordist work ethic. But precariousness is the norm in Mediterranean economies, and work is insufficient to gain economic independence for many

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

young adults. Drawing from qualitative interviews with young high-skilled income support (Reddito di Cittadinanza - RDC) recipients in Italy, the research seeks to understand how work is framed by these young adults in a situation of deep economic uncertainty and underemployment.

Firstly, I focus on the contemporary experiences of youth in the labour market and on the meaning of work, starting from the concept of post-fordist work ethic. Secondly, after analysing the features of the conditional basic income policy RDC in relation to the pandemic, I describe the ways recipients experienced RDC and the reasons behind their requests. Even though they are one of the most exposed groups to vulnerability, young adults are rarely seen as a target for social policies in Italy. I analyse their life and working careers, delving into the role of the family of origin in influencing the choices. Last, I analyse the role of work for their identities. I consider what meaning work has for the planning of a good life, and how young recipients relate to the post-fordist work ethic when talking about work. I construct a typology considering their investment in work for self-realisation and happiness even when facing deep economic uncertainty. I conclude by discussing how the joint effect of the pandemic and structural job insecurity, skills mismatch and the unreliable promises of the work ethic seem to have opened a shift towards a different idea of work, that separates its role as a source of income and as a source of identity and self-fulfilment.

Big Pharma Corporatism and Vaccine Monopoly: Indian Struggle through the Pandemic

The world was caught unaware when the COVID pandemic broke out as there was neither a known medicine to cure it nor a vaccine to immunize the people to contain its spread. As a result of scientists working over-time world over, the major pharmaceutical companies could came out with several vaccines with varying degrees of efficacy in record time. But the challenge was to produce the billions of doses of vaccine required immediately. The vaccine production facilities with requisite capacity had disappeared over years owing to profit driven corporate consolidation in the pharma sector on the one hand and the neoliberal policies that ushered in the era of IPR based patent monopolies in medicine including preventive medicine so crucial for public health, on the other The spate of mergers and acquisitions among the vaccine-producers and the monopolistic control over the production of both vaccines and ancillary components appear to have had disastrous impact on the management and mitigation of the pandemic. These powerful drug monopolies were able negotiate for unreasonably higher rates for vaccine and meager discounts on purchases by the governments. Even more sinister was the unreasonable exemptions of liabilities and irrelevant conditions insisted for supply of vaccines to the more vulnerable weaker economies. Even India, widely acknowledged as the 'pharmacy of the world', had to face severe vaccine shortages owing to this monopolistic political economy of vaccine industry to immunize its 1.3 billon people. The Indian vaccine producers have been facing the problem of embargo on import of raw material required for vaccine production and export of vaccines. The paper seeks to ascertain and analyze these issues concerning the constraints on development, production and affordability of vaccine in India as a result of corporate monopolistic practices by pharma corporate and its impact on immunization program.

Spate of Merger and Acquisitions in Healthcare Industry: Implications for Medical Profession and Health Services in India

In the recent years as in the western countries the Bangalore city is witnessing the merger and acquiring of hospitals by the corporate companies. In the recent years in Bangalore city only Acquisition occurs in Apollo Hospital, Columbia Asia, Fortis, Manipal and Naryana Hrudayalaya are the examples of the merger and acquisition of hospital. The increase in the merger and possession of private clinics and hospitals by the corporate companies has made some positive and negative implications on the medical practice of this region and also on the consumers. Trend of acquisition is occurring with a rationale of providing efficient and cheaper health care facilities to the customers and also to have a medical practice with professional touch and modern health care facilities. In practice it is found that the customers are not getting the services as promised and the medical practitioners also losing their professional autonomy in their practice. Doctors' medical practice is slowly transforming into commercial activity. Service relationships are considered on the basis of performance targets which endangers professional autonomy. This is accompanied by the cost increase, medical malpractice and strain in the doctor patient relationship. Here the research question is the role of the government and the Indian Medical Association or the Medical practitioner in setting the profession to its ideal goal of serving the community and making it as a service oriented profession rather a commercial unit. The research suggests the government and the medical professional associations to offer concentration on the ongoing structural changes in the health care sector and on the implications on the medical practice.

Beneath Integration Lie Racism and Islamophobia: A French Situated Account

Rather than considering that integration may be the solution to racism and *a fortiori* to islamophobia, this presentation will argue that the rhetoric of integration in France, and beyond, fueled racist practices and discourses, allowed dismissive policies and opened the path for an enduring islamophobia that until today is sustaining hatred and suspicion against Muslims, be they French citizens from colonial descent, or newcomers reaching Europe through dangerous routes. More than half a century long, such dynamics relies on measuring the lack of integration as a proof of unwillingness to comply with rigidified standards and congealed values always referred to the higher position of France, in a word, its genius. Such decoy downplays the French coloniality that still permeates ordinary and extraordinary circumstances. In that respect, racism is all but subtle. To convince oneself, it suffices to consider France as the pioneering promoter of the "great replacement" trend and its worldwide horrendous translation from Christchurch to Pittsburgh, from Halle to El Paso. The normative implementation of integration constitutes the platform of this fatal ideology.

It is pursued and simultaneously denied through the debate on the use of the word islamophobia, considered until very recently as contentious if not inflammatory. And the other that provides justifications for demeaning the persons object of and fighting against islamophobia, submitting them to suspicion, and stripping them from fundamental rights by erecting a wall of "separatist" laws that divide and isolate Muslims from their fellow citizens. Gendering, sexualizing and racializing political subjects by reducing them to a sole religious identity, and their counterparts belonging to the so-called secular realm, are mighty tools geared towards the purpose of saving France's grandeur, at whatever cost. A task renewed often disclaimed but forcefully pursued across decades.

Narratives of the Future and Fertility Decision-Making in Uncertain Times. an Application to the COVID-19 Pandemic.

The sociological and demographic literatures have widely demonstrated that fertility decisions are shaped by individuals' previous life experiences and socioeconomic status – i.e., the "shadow of the past." However, rising uncertainty in contemporary societies necessitates an analytical framework that acknowledges the influence of the future in the fertility decision-making process. Based on the Narrative Framework, we argue that personal narratives of the future, and their constitutive elements of expectations and imaginaries – i.e., the "shadow of the future" – represent crucial drivers of fertility intentions under conditions of uncertainty. Our arguments are tested empirically by exploiting the exogenous uncertainty shock provided by the COVID-19 pandemic, and unique data we collected during the Italian lockdown. Results suggest that, because of COVID-induced uncertainty, subjective perceptions and personal narratives of the future – also shaped by media "shared narratives" – gained the upper hand over the shadow of the past in influencing fertility intentions. In addition, we provide evidence of a causal impact of shared narratives of the future on fertility intentions through an online experiment simulating a "real" exposure of the respondents to a new media narrative on the expected length of the emergency.

Welcoming the Other: Comparing Munich and Dublin Based Hosts' Biographic Narratives of Cosmopolitan Hospitality in Response to the Russian-Ukrainian War

Between 2010 and 2018, 36 countries worldwide recorded the immigration of over 200 thousand people, with 14 of these countries even exceeding one million immigrants, according to UN International Migration reports. More recently, Europe is experiencing the immigration of an estimated five million Ukrainians fleeing the war, during its biggest migration crisis yet. This puts governments across Europe under pressure to provide accommodations for Ukrainians without compromising the needs of existing residents. In response, people in Europe's metropolitan cities with competitive and precarious housing markets, like Munich and Dublin, started sharing their homes with Ukrainians. Contrasting this phenomenon with support and housing offered during previous European refugee crises raises the question of changes in current hosts' motivations, cosmopolitan outlooks, practices, and identities. Due to their socio-economic and demographic similarities, Munich and Dublin provide excellent comparative cases grounded in a real-world experiment that allows holding factors of population density, demographic stratification, and housing precarity constant. Thereby, enabling the isolation of life-course elements presented in 50 biographic narrative interviews of Munich- and Dublin-based

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

hosts leading up to the decision to share their homes. Moreover, the analysis of autobiographical narratives grounded in the cross-country comparison supports inductive inferences based on national differences in socio-political, historical, and geographic contexts on an individual's biographic narrative and life course. The results of this study provide insights into determinants of biographically constructed narratives that lead to the manifestation of cosmopolitan outlooks, practices, identities, and ethics of sharing, and impact academic theories of formation of cosmopolitan characteristics and attributes. Findings are also interesting to policy-makers seeking to foster and harness the positive effects of cosmopolitan ethics of sharing to alleviate bottlenecks in housing provision caused by unexpected migrations. Ultimately, ensuring that our rapidly growing cities are welcoming the other.

Pandemic, Labor Market and Gender in Brazil and Colombia

This paper explores how the pandemic crisis reconfigured pre-existing gender inequalities in the labor markets of Brazil and Colombia, based on information from household surveys for the metropolitan centers of those two countries. We have learned that the Covid-19 crisis deepened gender gaps in employment and expanded the flow of women to work "inactivity" or exclusive dedication to unpaid domestic care work, configuring a setback in the sexual division of work. At the same time, we also have found that the pandemic widened inequality among women due to its unequal effect on the different social classes. Highly qualified workers trained for remote work, in command positions, and/or employees with stable ties to the public sector have weathered the health crisis in very different conditions from those hired by families to work in homes in care tasks. The gap deepened during the economic reactivation of the last year when a greater feminization was observed in the most precarious occupations, especially in less qualified paid care work, in the context of great occupational heterogeneity. The paper highlights the importance of defining and making this economic sector of paid care visible for a new research agenda, allowing us to observe particular dimensions of the effects of the crisis. At the same time, the relevance of a comparative analysis is sustained to reveal the role of class, gender and race dimensions in the dynamics of different labor markets due to their institutional construction mode.

Historicizing Gezi Park Protests

The Gezi Park protests that erupted in spring 2013 brought along an increased interest in social movements and collective action in Turkey. The protests have been variously defined in the literature, while much focus has been placed on their novelty and spontaneity. While aspects of the Gezi Park protests were indeed spontaneous, this paper locates the protests in a broader context and history of social movements in Turkey. It argues that the series of events against the demolition of Gezi Park should be understood as a cycle of protest and that they should be analyzed in relation to earlier cycles to better understand the culture and agency of social movements in Turkey. In this regard, the paper suggests that the Turkish manifestations of the Global Justice Movement in the late 1990s and early 2000s served as precedents for the Gezi Park protests, by providing an organizational infrastructure, collective frames to be mobilized, and models for actions that could be adapted

Global Norms, Regional Discrimination: Administrators, the Public Mood, and German Asylum Decision-Making

Asylum policy-making in advanced democracies frequently faces the accusation that biased administrators or an adverse public mood lead to erroneous decisions. We examine in this article whether these two forms of prejudice affect the evaluation of asylum claims and whether a reduced workload and improved information counteracts the stereotyping of certain groups of applicants. Our analysis of a unique German refugee survey shows that discriminatory preferences of street-level bureaucrats in charge of the decision and an immigration-adverse public mood lower the chances for certain refugee groups to obtain protection. An increased workload and information gaps reinforce stereotyping against male or Muslim applicants in line with the statistical theory of discrimination. However, an improved information base on a claim's credibility does not reduce stereotyping in regions with a critical

public opinion towards immigration. The analysis demonstrates that extralegal considerations supersede the credibility of an asylum claim as the key decision-making criterion.

Language Policy and Status of the Endangered Languages in the Middle East

The subject of endangered languages has become increasingly popular recently. However, with many languages still disappearing worldwide, there are still considerable gaps in knowledge. In the Middle East, this gap is more noticeable. When we examine the language policies of the regional states, it is seen that the policies apply only to official languages. After the first World War, the lack of a desired peaceful environment in the region negatively affected the minority languages in the area. It has been observed that there has been insufficient work on the endangered language for years due to prolonged wars and political turmoil in the region. However, some languages have survived until today although they are not official and valid anywhere. The "Zazaki" language in Turkey is one the languages among these. This paper will discuss the policies of Middle Eastern countries against endangered languages and how traditional oral culture prevents languages from disappearing. The study will examine the Zazaki language in Turkey as a case study.

Sharply Heightened Mortality Among African American Women: BMI-Prone Genetic Variants and Socioeconomic Disadvantage

In this project, we examine whether individuals ages 50 and over, with more BMI-prone genetic alleles and socioeconomic disadvantage, would experience higher mortality using data from HRS. We focus on African American women because their obesity (BMI>30) prevalence (56.5%) is much higher than the already high prevalence among white American women (22.6%) and African American men (28.8%). Previous literature that examines obesity and mortality points squarely at SES-disadvantaged black women as the most vulnerable group. In this project, in addition to observed BMI, BMI-prone genetic alleles are used to predict mortality because observed BMI could change radically over life course and because an observed BMI could be an outcome rather than a cause. While observed BMI does not predict mortality, our analysis shows that African American women with more BMI-prone alleles experienced a mortality rate more than 100% higher than those with fewer such alleles. Among African American females ages 50 to 64, such increase is several folds. The gene-by-education-interaction analysis indicates that the negative effect of "genetic BMI" is sharply exacerbated by lack of education.

Socioeconomic and Genomic Roots of Verbal Ability

This project examines how the human genome and SES jointly and interactively shape verbal ability among youth in the U.S. The youth are aged 12-18 when the study starts. The project draws on findings from the latest GWAS as well as a rich set of longitudinal SES measures at individual, family and neighborhood levels from Add Health (N=7,194). Both SES and genome measures predict verbal ability well separately and jointly. More interestingly, the inclusion of both sets of predictors in the same model corrects for about 20% upward bias in the effect of the education PGS, and implies that about 20-30% of the effects of parental SES are not environmental, but parentally genomic. The three incremental R^2s that measure the relative contributions of the two PGSs, the genomic component in parental SES, and the environmental component in parental SES are estimated to be about 1.5%, 1.5% and 7.8%, respectively. The total environmental R^2 and the total genomic R^2 are, thus, 7.8% and 3%, respectively. These findings confirm the importance of SES environment and also pose challenges to traditional social science research. Not only does an individual's genome have an important direct influence on verbal ability, parental genomes also influence verbal ability through parental SES. The decades-long blueprint of including SES in a model and interpreting their effects as those of SES needs to be amended accordingly. A straightforward solution is to routinely collect DNA data for large social science studies granted that the primary purpose is to understand social and environmental influences.

Home on the Virtual and Physical Space: Negotiating Family Relationships at a Distance in a Triangular Structure

The great internal migration in China has forced more than 61 million children, referred to as liushou children by public media, to face long-term family separation from their migrant parents, which is seen as a social cost of economic reformations. Indeed, the rapid development of digital communication technologies (DCT) has led some technical optimists to believe that DCT can provide the social glue that enables these families to overcome the challenge of family fragmentation. Previous research has focused extensively on migrant mother's perspectives and explored the roles of DCT in re-building the identity of mother and achieving a sense of co-presence. Migration has generated new family structures, requiring these families to do family practices in both virtual and physical spaces. However, particular family members' voices, such as children and caregivers (often children's grandparents), have remained largely invisible. This paper recognizes Chinese liushou families as a triangular structure – migrant parents, liushou children and caregivers, and draws on ethnographic research to bring their viewpoints together to compare different family members' viewpoints on family practices in both virtual and physical spaces. The paper shows how family structure interplays with DCT to generate asymmetrical intimacy, including asymmetrical communications between migrant parents and their children and asymmetrical status of different family members in virtual and physical space; for example, grandparents are often excluded by online family practices due to digital divide, but migrant parents also often feel frustrated due to generational liaison in physical space between liushou children and their grandparents. This research considers the emerging complexity of family structure and family practices and reminds researchers to explore the impacts of DCT on different forms of intimacy in both virtual and physical spaces with a more multilayered perspective among Chinese liushou families.

GUO, Kaidong* (UCL, United Kingdom)

Life Around the Hukou System: Debt, Education and Unstable Childhood from a Framework of Slow Violence

In past decades, China's sequential economic reforms have led more than 137 million workers to migrate to coastal cities to earn a living. At the same time, residency restrictions caused by the household registration system (hukou) mean 61 million children, referred to as liushou children by public media and policies, are forced to stay in their hometowns while their parents migrate. Previous research mainly treats the hukou system as the main barrier to children's migration since it restricts migrant children from accessing public education in cities. In recent years, scholars have been optimistic about reformations of the hukou system, which increasingly enable migrant children to access public schools in cities. However, the more lasting impacts of the hukou system have tended to be overlooked by mainstream research. Drawing on ethnographic work involving participating in liushou children's everyday lives, in Sichuan Province in China, a typical sending area of migrant workers, this paper conceptualizes the hukou system as critical slow violence. It demonstrates the lasting and invisible impacts on every aspect of children's everyday lives and illustrates how hukou is not just about influencing children's right to enrol in public education in cities. The paper highlights three key impacts of the hukou system: 'living in debt', 'education as an illusive panacea', and 'children's unstable childhood' and how these are interwoven and generate an extensive network of challenges which puts Chinese liushou families under significant pressure.

What Matters More for Employees' Mental Health in Contemporary China: Job Quality or Job Quantity?

Overwork is increasingly prevalent in China. The trend toward long work hours reflects a normative change and a behavioral shift, which has become embedded in organizational practices, workplace cultures, and beliefs about what it means to be an ideal worker in contemporary China. Moreover, job quality, one crucial job characteristic, is also intrinsically linked to employees' mental health. However, previous studies about job characteristics and employees' health are lacking, especially between job quality and health. The study tries to answer which is more critical on employees' mental health, job quantity or quality. Adopting four waves (2012, 2014, 2016, 2018) of the China Labor-force Dynamic Survey (CLDS), the present study will explore the relationships between job quantity (work hours), job quality (earning, skills, work intensity, prospects, social environment, meaningfulness, etc.), and employees' general health and mental health problems. The study's first goal is to show the status quo of China's job quantity and quality, and the second goal is to demonstrate that job quality will positively affect employees' mental health. In contrast, job quantity will adversely affect employees' mental health. While employee job quantity is increasing, the job quality is unknown and needs further exploration, which is essential to understand China's labor market. The study is expected to confirm the positive relationship between job quantity and the frequency of employees' mental health problems. However, job quality, especially intrinsically meaningful work, positively affects employees' general health and will lower the frequency of mental health problems. In addition, the study will consider under-employment as well, where the study is expected to find that job quality will attenuate the adverse effects of under-employment on employees' mental health. These results will provide references for the policymakers to pay particular attention to job quality when addressing the dramatic increase in total hours of employment in China.

Happiness: Economics, Religiosity and Politics

Happiness remains one of the most cherished goals of human beings since ancient times. Whereas Aristotle considered eudemonia or flourishing the end of life, some modern scholars on the science of happiness find it elusive and a mission impossible. My paper seeks to explore the impact of neoliberalism and authoritarianism on happiness from the perspectives of economics, religiosity and politics by raising certain valid questions and paradoxes, such as the Easterlin paradox, that highlighted the point that more economic growth in certain advanced and developing countries has not led to more happiness. Rather, it has contributed to more unhappiness in many forms. Similarly, we find conflict of opinions on the issue whether religious minded people are supposed to be happier than the atheists or *vice versa*? Is it due to their civic engagement or deep faith in cardinal religious doctrines? Again, it is hard to say whether it would be a good option for the governments to measure well-being in terms of GNH (Gross National Happiness) than GDP (Gross National Product)? Moreover, it is time to ponder whether the state can make us happy or is it individuals' own responsibility? Can welfare benefits be seen as our inalienable right and entitlement or as political parties' generosity in the form of freebies announced at the time of elections? All such questions await honest answers and multi-disciplinary discussions. My paper seeks to analyse the relationship among happiness, economics, politics and religiosity in current times. The methodology adopted is analytical, comparative and empirical.

Cardiometabolic Health Disparities Among Sexual Minority Populations: Evidence Using National Linked Data Sources in a Context of Universal Coverage

Understanding and addressing the health and social factors that marginalize lesbian, gay, and bisexual (LGB) persons and other sexual and gender minority populations is challenged by methodological constraints in population-based research. Many of the factors connected to minority stressors and stigma associated with increased risk of adverse STI-related outcomes may be simultaneously associated with increased risk of type 2 diabetes and other cardiometabolic conditions. Yet, evidence on LGB status as a sociodemographic correlate of chronic illness is limited. Most studies among sexual minorities are based on non-probability samples or self-reported health outcomes. This study leverages new linked nationally representative survey and administrative datasets to estimate selection biases and health inequalities among LGB persons in Canada. Data from the 2008-2017 Canadian Community Health Survey were pooled and linked to inpatient records from the 2008/09-2017/18 Discharge Abstract Database and the geocoded Index of Remoteness for all communities. Descriptive and multiple logistic regression analyses were used to differentiate risk profiles, health status, and predictors of potentially avoidable cardiometabolic-related hospitalization by sexual identity status among Canadians aged 18-59. Survey data from 202,560 respondents identified 2.7% as LGB, 96.4% as heterosexual, and 0.9% without stated sexual identity. Among those reporting sexual identity, LGB individuals were significantly less likely to have a regular medical provider than heterosexuals (OR: 0.83; 95%CI: 0.74-0.95), after adjusting for sociodemographics, health status, and health behaviours. Among residents of rural/remote communities, LGB persons had a significantly higher risk of hospitalization than heterosexuals (OR: 4.23; 95%CI: 1.53-11.69). The findings reveal important unmet healthcare needs and a disproportionate hospital burden for cardiometabolic conditions among LGB persons, even in the Canadian context of universal coverage. Enhanced population-based research methods are needed to better assess sexual minority health disparities along the continuum of care to address the burden of diabetes and other cardiometabolic diseases.

Gender Occupational Segregation and Wage Gaps in the Policy Research Workforce: A Neglected Dimension to Developing Gender-Responsive Policies

Evidence of gendered challenges in the professional workforce persists in countries at all levels of development. However, research is limited among those who are essential to developing gender-responsive public policies, such as policy researchers. This national labour market analysis examines gender occupational segregation and wage gaps in the policy research workforce. Sourcing data from the latest Canadian population census, we apply linear regression and Oaxaca-Blinder decomposition to assess wage differentials by sex, traditional labour market measures (e.g., age, education, industrial sector), and social identity variables intersecting with gender (childcare, migrant status) among policy researchers aged 25-54. To support employment equity monitoring, we compare the gender composition and wage gap within and across eight policy research fields, grouped by the National Occupational Classification according to roughly equivalent duties, working conditions, and employment requirements. Results indicate the health and education policy research workforces were characterized by the highest degree of occupational gender segregation: 74% female each, compared to 61% for the total policy research workforce. Occupations in traditionally male-dominated fields (notably, the economics, natural and applied science, and business development fields) tended to offer higher levels of remuneration on average. Female policy researchers in health, education, and social applications earned an average of 88 cents for every dollar that a man earned. Gender wage differentials held as statistically significant in the multivariate analyses, after adjusting for other factors. The wage gap was wider among the better-paid, male-dominated economics policy researchers. Forty percent of the wage differential between women and men in the total policy research workforce remained unexplained statistically - a finding that is often attributed in the literature, at least in part, to (unmeasured and unmeasurable) gender discrimination. Policies are needed to address devaluation of female-dominated professions, including among those tasked themselves with conducting equity-informative policy research.

Heat Resistance: A Case Study of Platform Workers' 'AC Strike' in Kolkata and Hyderabad

Herein we examine platform workers' agentic response to resist and navigate the economic precarities that platform work entails. Using the case study of the 'AC strike' organised by Uber drivers in Kolkata and Hyderabad, we unpack the actions and processes through which platform workers (re) affirm their position as agentic actors 'despite precarity'. In drivers' narratives, the air-conditioner emerges as a contested technological artefact. The high temperatures in both these cities precipitate a universal demand for cooling in outdoor urban environments. While the platform promises air-conditioned rides to customers, 'arbitrary' platform operation rates coupled with rising fuel prices leave the drivers with no real financial gain, forcing them to turn off the air conditioners. We read this act as a reworking of the platform heuristics that determine fares. Through this strike, workers challenged the algorithmically decided fares and registered their demands for higher earnings.

The 'air conditioner' had become a troubled object much before this. Since the onset of the Covid-19 pandemic, air conditioners were banned in public transport vehicles in India to curb infection spread. As part of the organised campaign, this medicalised intervention was reimagined as an act of resistance by platform workers. Further, when combined with the soaring temperatures in both the cities, the campaign prompted reactions from customers. To circumvent this, workers sought to build new solidarities. Leveraging the shared experience with customers as urban citizens, the drivers conversed with customers during rides, convincing them to write to the platform on their behalf. This sociality, we argue, is an important tool deployed by workers to bridge the platform instituted asymmetries between drivers and customers. Such individual and collective agentic moments and the resulting successes of the campaign, however marginal, highlight the potentialities, possibilities, and new avenues of collaboration that coexist with(in) the structural constraints of platform work.

Right to Housing for Poor in Rural India: A Critical Evaluation of Pradhan Mantri Awaas Yojana – Gramin in Punjab (India)

More than 67% of the Indian population lives in villages and rural economy in India contributes around 46% of the national income. However, as cities are considered the hub of economic development, the focus of States have always been more on urban housing while rural housing projects gets comparatively less attention. The paper endeavors to understand the effectiveness of state led housing schemes in rural India with special focus on Pradhan Mantri Awaas Yojana (Gramin). The first section of the paper provides a brief overview of India's rural housing programmes in India. The second section present a critical reflection on the effectiveness of state-led housing programmes in rural Punjab. The performance of the scheme has been analyzed on various components such as: identification and selection of beneficiaries; beneficiaries from the vulnerable groups; construction of house; transfer of funds; convergence with other schemes; and grievance redressal mechanism. The concluding section draws some inferences for future policies and programmes for the housing for the poor in rural India. From the survey of 100 households who have been the beneficiary of the scheme, the authors identified certain gaps in the implementation of the scheme in the sampled district. Some of the gaps were: exclusion of two most vulnerable groups (physically challenged and landless households); lack of effective training programme for the officials; shortage of manpower; poor monitoring mechanism; and poor convergence with certain centrally sponsored scheme.

How Do Agri-Entrepreneurs Make Use of Digital Technologies? Case-Studies from India

India is going through prolonged agrarian crisis. It manifests in the form of declining incomes, rising costs of inputs, water stress, poor soil health, harmful pesticides, and massive outmigration from the countryside. While farming is becoming unsustainable for most smallholders, we are also witnessing a trend of startups in the agri-business sector. Most of these new entrants to agriculture are young, urban-educated, and tech-savvy entrepreneurs without any previous experience of farming or agri-business. They use artificial intelligence (AI), Internet of Things (IoT), and data science for innovations in growing technologies and agricultural advisory, and digital platforms for marketing new products. However, there is a lack of empirically grounded research on these start-ups. It is important to understand the social and self-identity of these agri-entrepreneurs, the way they leverage formal and informal institutions, and navigate through the entrepreneurial eco-system. This paper is a step in that direction. Based on in-depth case studies of three agri-entrepreneurs, it aims to answer the following questions: what the motivation behind venturing into agri-business was; how they acquire resources; what kinds of challenges they face and what strategies they adopt for overcoming those; and more importantly, how do they make use of digital technologies and tech innovations in their respective ventures? The paper brings useful insights to the emerging literature on agri-entrepreneurship, sustainability, and digital agriculture in developing countries context. The findings will help both scholars and policymakers in analyzing the social context of tech innovation in agri-business sector with special reference to digital technologies.

Migrant Experiences, Gender Relations, and 'Negotiated Agency': Conceptualising Precarity through and Beyond Labour

The dominant sociological literature on precarity has widely covered labour precarity and the precariat as a social class distinct in the 21st century. However, within this, the differentiated experiences of migrants, particularly women migrants remain under evaluated and their varied precarities of legal status, social relations (gender, race, class, and caste), and rights and entitlements along with labour relations and outcomes have been absent. In this paper, through the experiences of Indian migrant women in the United Arab Emirates (UAE), I will draw and expand on the precarity literature to understand the multiple and intersecting forms of vulnerabilities faced by migrant women. In the UAE in particular, migrants across income categories experience economic, legal, and social precarity due to severe limitations put on naturalisation and long-term residency. I show that these precarities are further accentuated within and across borders through the magnifying effects of global capitalism, state policies, gendered positionalities, formal and informal actors and intermediaries, and transnational migratory regimes. Correspondingly, I conceptualise and utilise the framework of 'negotiated agency' to assert that increased knowledge and familiarity of actors allows migrants to better understand risks and rewards while also navigating unequal power relations,

bureaucracies, and social networks to their advantage to counter precarity. In doing so, the paper aims to extend the literature on precarity to include migrants and women across income categories in Asian contexts. The findings of the paper are based on fieldwork conducted in UAE and India in 2017 (Masters' dissertation) and 2020-21 (PhD dissertation) with over 200 Indian migrant women, migration brokers, and Indian government representatives.

Gender Really Matters in Group Work: A Visibilization and Politicization Teaching Sequence / EL Género Importa EN EL Trabajo EN Grupo: UNA Secuencia Docente De Visibilización Y Politizacion

Incorporar la perspectiva de género y capacitar al alumnado para visibilizar las desigualdades de género es una oportunidad y una necesidad en la enseñanza en Ciencias Sociales. La construcción de una academia feminista solo podrá hacerse con la capacitación e implicación del alumnado de nuestras disciplinas. En esta tarea, la visibilización de las desigualdades en el aula partiendo de las experiencias personales del alumnado puede ayudar a generar prácticas corresponsables, necesarias en un contexto en el que el trabajo en grupo es cada vez más importante. Además, desvelar las desigualdades de género a través del trabajo cotidiano de los estudiantes puede ayudarles a comprender un elemento clave de la disciplina: que la política necesita ir más allá de las visiones privadas de los problemas sociales, para alcanzar soluciones colectivas. Apoyados en una investigación acción educativa desplegada en la Universidad del País Vasco en la que, a través de diversas técnicas (conformación de un grupo motor de alumnas, 5 grupos de discusión, 4 talleres de reflexión, 2 mapas corporales, un proceso de capacitación y talleres de prospectiva), hemos dado voz al alumnado mostrando cómo las alumnas asumen en el aula roles privados y reproductivos que aumentan su carga de trabajo y afectan negativamente a su evaluación. Apoyados en este diagnóstico hemos diseñado una secuencia didáctica que permite visibilizar las desigualdades de género en las relaciones de trabajo entre pares. La secuencia docente se apoya en tres dinámicas consecutivas (Phillps 66, redacción y defensa pública de una definición de política) destinadas a evidenciar y vivenciar en la primera sesión de una asignatura cómo el género importa y explica quién hace qué en el aula. Ello permite desplegar una secuencia formativa que capacita al alumnado un análisis político de desigualdades presentes en sus interacciones formativas, previamente interpretadas en clave privada.

GUSTAFSSON, Karin* (Örebro University, Sweden)

"Listen to the Science". the Climate Youth Movement's Trust in Science.

Following on climate activist Greta Thunberg's solo school strike for the climate outside the Swedish parliament in 2018, the youth movement *Fridays for Futures* (FFF) emerged into a global phenomenon. FFF has created a social space for youths who are worried about the climate crisis to get support from, be a part of, and contribute to a locally based global community of people. By getting organized, young people have created discursive positions and social spaces which offers them a voice in the clime debate and supports their identity development. FFF is not the only youth organization concerned with the climate crisis. Taking FFF's origin country Sweden as an example, *Fältbiologerna* [the Swedish Field Biologists] (founded 1947) is one of Sweden's oldest and still largest organizations that organize young people on environmental issues, and the Swedish section of *Extinction Rebellion Youth* (founded 2020) is one of the youngest and still among the smallest organizations that organize young people to engage in activism to create awareness of the climate crisis. Previous research has shown a great distrust among climate youths towards current political representatives, and the movement's message have primarily been directed at these politicians as well as at other adults with the demand that they should "listen to the science". However, there is less research done on the relation between the climate youths and science. By adopting a perspective of trust and distrust, this study explores and explains how the environmental youth movement in Sweden relate to climate change science, and how this relation creates a discursive context in which young people can participate in transforming the society for a better future as well as foster their one identity development. The study uses an approach of discourse analysis to examine social media content published by Fältbiologerna, FFF Sweden, and XRY Sweden.

GUSTAFSSON, Susanne* (Dalarna University, Sweden)

Jan's Life-History: Changing Faces of Managerial Masculinities and Consequences for Health

Life-history research method is used for gendered health analysis to reveals an old type of masculinity that faces difficulties when carrying out two sets of demands simultaneously, as a worker/manager and as a father/husband. The paper illuminates the historical transformation of masculinity and the consequences of this for health. I draw on the idea of the "changing faces of masculinity" to explore the dynamism and complexity of gendered health. An empirical case is used for its illustrative abilities Jan, a middle-level manager and father employed in the energy sector in Sweden, is the subject of this paper. The results reveal a face of masculinity conceived of in middle-level management as tacitly linked to the neoliberal doctrine. Over a couple of decades, the idea of "flexibility" was turned into a valuable characteristic that everyone was supposed to strive for. This resulted in increased workloads. Quite a few employees, and managers, find themselves working both day and night. This may explain why not having enough time to spend with children and family members is a recurring theme in the data. The author's research has revealed that the use of gender in health research is not sufficiently or critically questioned. This lack of critical questioning is a serious problem, especially since ways of doing gender affect health. Gender reproduction and gender transformation are interconnected, regardless of how they affect health. Simultaneously as Jan's masculinity was reproduced in response to workplace practices, Jan's family position was transformed—not totally but by a degree or two, and these degrees became significant for the family's health and well-being. By moving back and forth between varied events in Jan's life, it becomes possible to show that in a time of gender transformations power relations can be renegotiated, leading to consequences for health.

De La Trinchera AL Bienestar: Redes De Apoyo Mutuo Durante La COVID-19

En el contexto de la Covid-19 se observaron transformaciones significativas en las organizaciones de movimientos sociales, especializadas en dramatizar la contienda política. Ante las restricciones impuestas que impedían tomar las calles para escenificar y reclamar ante las autoridades las demandas sociales propias de cada lucha, las organizaciones de movimientos sociales orientaron su actividad hacia el bienestar local, 'congelando' sus metas iniciales y articulando nuevos mecanismos que les permitieran seguir estando al servicio de la sociedad. A esto respecto, aparecieron y se fortalecieron las redes de ayuda mutua, un fenómeno que ya se había observado en conflictos sociales anteriores, pero que ahora se convierten en agentes del bienestar local con un desempeño destacado.

En esta comunicación se presentan teóricamente las características que definen a las redes de ayuda mutua, así como las actividades y acciones a las que se orientan. Para esta tarea se ha realizado una aproximación a la literatura existente comparada con el caso de red de ayuda mutua RAMUCA de Sevilla. Esta red surgió durante los momentos más intensos de 2019 y su acción se prolongó durante 2020, entrando en una fase de latencia a partir de ese momento. El objetivo es mostrar cómo las redes de ayuda mutua potencian los mecanismos de resiliencia en las áreas urbanas más afectadas por los efectos de las crisis e impulsan el bienestar local a través de sus propias iniciativas ante la ausencia de las autoridades.

Social Media Lab. a Media Education and Citizenship Project

Los laboratorios de medios sociales, como espacios de experimentación socioeducativa, se han convertido en uno de los principales mecanismos de innovación en nuestros días. En este marco, los media labs surgen como un tipo de laboratorios centrados en la experimentación con tecnologías y medios de comunicación y evolucionan, con el desarrollo de la sociedad digital, hacia laboratorios de mediación ciudadana e innovación social.

Los media labs se construyen sobre el concepto de innovación social. Esta se define como el desarrollo y la implementación de nuevas ideas (productos, servicios y modelos) que satisfagan las necesidades de la comunidad y creen nuevas relaciones y colaboraciones sociales. La innovación social va más allá del emprendimiento social, atendiendo a las estrategias, tácticas y teorías de cambio, que activan la participación ciudadana en el desarrollo de soluciones compartidas.

Los media labs o laboratorios de medios han sido definidos como unidades para el descubrimiento e impulso de nuevas ideas. En las universidades abren espacios para la experimentación con tecnologías digitales. Los medialabs son espacios experimentales donde se busca deconstruir y criticar las maneras en que las tecnologías operan dentro de la sociedad.

El desarrollo de los media labs en el entorno universitario genera nuevas oportunidades para la innovación, incorporando el espíritu *hacker* dentro de instituciones en ocasiones centenarias. La transformación digital, la apertura

　　*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

y la implicación social adquiere una nueva dimensión poco frecuente en las instituciones de educación superior. La innovación que el media lab aporta se concreta en la materialización de los principios y formas aprendidos en el ámbito digital

Post-Pandemic University Access in Tenerife: Gender Inequalities

This article will analyze the differences between men and women in access to the University, comparing post-pandemic data (2021 and 2022) with data prior to the pandemic (2018-2019). To do this, the statistics provided by the University of La Laguna (Spain) regarding the university entrance exam that is carried out in the province of Santa Cruz de Tenerife (Canary Islands, Spain) will be used. Specifically, the marks of the subjects of Spanish Language and Mathematics for the selected years will be analyzed, reaching a total sample of 20,000 students. As a result of multivariate analysis (Correspondence Analysis), the profiles of men and women who have been most affected by the COVID-19 crisis will be observed. The results will show the possible gender inequalities from an intersectional point of view, which will undoubtedly affect the transitions from youth to adult life.

Towards the Institutionalization of Labor Protest? an Analysis of Collective Action By Platform Workers in Six Latin American Countries

The research on platform work in Latin America has grown hand in hand with the development of delivery platforms. One of the aspects that has caught the attention of scholars is the collective organization of platform workers. Despite the "individualizing" nature of platform work (Cini y Goldmann, 2022), these workers have been able to engage in different forms of collective action aiming at improving their labor conditions (Bessa et al, 2022). Due to the novel characteristics of this phenomenon, cross-national research is still scarce. In Latin America, scholars have barely studied in comparative perspective the factors that might explain cross-national differences in platform workers' collective action (Gutiérrez y Atzeni, 2022).

This article studies how platform workers' protests have developed in Latin America and how national industrial relations regimes shape such development. Using data from an ongoing investigation, we analyze protest events by platform workers in six Latin American countries (Argentina, Brazil, Chile, Colombia, Ecuador and Perú). Our data allows us to show that in nearly all countries protests peaked in 2020 and declined in 2021. Despite this similarity, our data suggest the existence of important cross-national differences regarding the frequency and type of collective action. In this article we explore the conditions that can account for these differences, focusing on institutional variables (e.g., extension of labor and migrant rights), labor market mechanisms (e.g., level of unemployment and informal labor), and differences in trade union organization (e.g., unionization rates). Our findings contribute to the literature on platform workers' protest by showing how labor regimes shape and are shaped by global phenomena such as the expansion of platform capitalism (Baglioni, 2018; Newsome, 2015).

Getting Undone Science Done to Make New Treatments Available: Entrepreneurial Organizers and Citizen Scientists

Based on a case study of mannitol and Parkinson's disease, this talk describes an entrepreneurial, citizen-science project to address "undone science" for new drug treatments. Preliminary lab research by credentialed scientists identified mannitol as potentially effective against Parkinson's, yet—as a natural substance—mannitol's products cannot be patented. Pharmaceutical companies were thus uninterested in researching mannitol's efficacy in treating Parkinson's, rendering it an "orphan drug", with the vital clinical testing left undone. We present findings from fieldwork and in-depth interviews with patients, physicians, scientists, and entrepreneurs (2017-2021). Situating our discussion within earlier traditions of treatment activism, we first describe an alternative, patient-designed, entrepreneurial approach to evaluating mannitol's value against Parkinson's, and extract from this account a model for using similar methods to address undone science for future "orphan" substances. We also trace how organizers' view of their project evolved: while originally intending it to *circumvent* or even *supplant* pharmaceutical

companies, they later came to view it as a *complement* to them. We next focus on the patient-participants, first describing their role in developing preliminary crowd-sourced research involving online patient questionnaires. This crowd-sourced study was intended to generate pressure on policymakers and the pharmaceutical industry to conduct formal clinical examination of mannitol's value against Parkinson's. We then explore how patient entrepreneurship creates different types of agency, and how patients attempted to enact such agency within the doctor-patient relationship. Overall, our work: 1)describes new forms of treatment activism; 2)applies the concept of undone science to the new area of orphan drugs; and 3)extends our own earlier work, by adding a new focus on the patient's experience.

Understanding Cryptocurrencies from the Perspective of Social Institutions

The global sociological literature conceptualizes cryptocurrencies as a financial practice and traces its sustenance to a distinctive subculture developed by an online community. Community members were predominantly white college-educated men self-employed in information technology and consulting services preferring pseudonyms to interact online, valuing their anonymity. They were found to have a high degree of social organization and structure (values, principles, norms, rules) distinct from those outside the online community. This literature typically focuses on what is done at an individual or online community level to maintain the social organization and structure for understanding cryptocurrencies.

In contrast, polls from cryptocurrency exchanges and media reports reveal that many urban Indians engage in various exchanges, including people from the upper, middle, and lower socioeconomic levels, women, and teenagers using their offline identities. This paper is based on an ongoing ethnography of cryptocurrency investors from the 'smart-city' Kochi in India since December 2021. In the Indian case, cryptocurrency involvement is directly influenced by how capital is circulated outside online communities. Hence, we examine Indian cryptocurrency engagements through the prism of social institutions (families, neighbourhoods, kinships, and financial institutions) using the social structures of accumulation approach by Alessandra Mezzadri. This approach demonstrates how people channel their resources, such as family funds, social capital, and educational capital, and how they structure or hybridize institutions innovatively to participate in cryptocurrencies.

We found that capital is brought into cryptocurrencies by channelizing it from family, neighbours, kinship and friends by presenting oneself as an entrepreneurial self and cryptocurrency as a self-employment opportunity. The younger generation of higher socioeconomic classes is attempting to accumulate wealth by investing in cryptocurrencies channelling their family funds and income from family firms. Middle and lower socioeconomic classes accumulate wealth by investing in cryptocurrencies, primarily by utilizing their social and educational capital and labour.

The Effect of Policy Naming on Climate and Environmental Policy Acceptance

The 'reasonable human' assumed in traditional economics makes choices that maximize their utility based on a stable and consistent preference system. However, humans have different preferences and do not make only rational decisions based on perfect information. Accordingly, behavioral economics is evaluated as a useful approach to studying human behavior and is being used in various fields. Therefore, this study raises the need for a behavioral economic approach in the process of establishing energy policies that directly affect people's daily lives among various climate and environmental policies and intends to support this through empirical analysis. In particular, this study analyzes the 'de-nuclear power' policy that has raised conflicts between stakeholders since the Moon Jae-In government was launched in South Korea. When President Moon ran for the 19th presidential election held in May 2017, he made a major pledge for the de-nuclear power policy. This means a policy that gradually reduces the proportion of nuclear power plants over 60 years rather than shutting down all nuclear power plants immediately. Nevertheless, some conservative media outlets report that Korea Electric Power Corporation's (KEPCO) deficit has become severe due to its de-nuclear power policy and that an increase in electricity rates is inevitable. For this reason, many people cite the de-nuclear power policy as one of the representative failure policies of the Moon Jae-In government. Although the de-nuclear power policy is actually promoted over a long period, this study judged that the cause of the negative evaluation lies in the policy naming and information delivery method and attempts to analyze it through a behavioral economic approach. In this process, the effect of the policy name on acceptability is analyzed by analyzing the difference in response when the policy content is the same, but the policy name is set differently as a 'nuclear phase-out' policy.

HABERSANG, Anja* (University of Kassel, Germany)

Tackling Terricide and Not (only) Climate Change – a Pluriversal Perspective on the Global and Multifaceted Crisis of Capitalist Modernity

This paper explores the imaginaries and practices of alternative futures in interrelation with global crises in conflicts related to the commodification of nature, land and resources. A case study of Indigenous movements in Argentina will reveal that it is time to (re)negotiate the "art of living" because for the participants, there are no distinctions between humans and the natural environment. Empirical data collected in 2019 shows that the forests, the rivers, and the mountains, as they are no separated entities, cannot be transformed into commodities to be sold. Such a relational perspective questions the hegemonic understanding of development that is based on an Anthropocene narrative that portrays humans as having the power to commodify nature, and perceives contemporary crises-ridden times as a crisis of human-nature relations. Something that is best exemplified when participants talk about terricide, their emic concept, instead of climate change. Terricide refers to the destruction of the three-dimensions which shape life and existence on earth: The tangible ecosystems, the people who inhabit them, and the energies that regulate life on earth and constitute the perceptible or spiritual ecosystems. With such a conceptualisation, the Indigenous activists propose a relational perspective for tackling the global and multifaceted crisis of capitalist modernity because terricide results from humans not feeling and acting as part of a "sacred circle of life". Something that puts life on earth increasingly under threat. The circle metaphor reveals a relational perspective, where all living beings are connected and interrelated, including non-human subjectivities, which are also considered as living and sacred beings. Thus, the Indigenous movements in focus here propose the reconstruction of human-nature relationality in order to make futures anew and *otherwise* in terms of pluriversal worlds that are fairer, freer and more sustainably balanced.

Why Pew Research Center Is Changing Our Approach to Measuring Religion in China and the Big Impact This Will Have on Our Description of the Global Religious Landscape

About a decade ago, Pew Research Center released a series of reports describing religious affiliation around the world. Religious affiliation is a concept that fits awkwardly in the spiritual landscape of East Asia. In China, our estimates were based on a unique survey that hasn't been repeated – the 2007 Spiritual Life of Chinese Residents Survey. We drew creatively on a variety of identity and practice measures in this survey to get what seemed like the best indicators of affinity with major religious traditions. In this presentation, we will explain why we are now shifting our estimates to rely on measures from the Chinese General Social Survey and the large impact this will have, particularly on our global count of people who are Buddhist and religiously unaffiliated. We will discuss trends in China and evidence about the pervasiveness of traditional beliefs and customs not captured by religious affiliation measures. We discuss special challenges related to measuring Christians and folk religion adherents.

Longitudinal Trends in Perceived Financial and Labour Market Insecurity Among Gig-Workers in the United States during the COVID-19 Pandemic.

Gig workers represent a small but growing share of total employment in the United States. Gig work comes with few labour protections which often

coincides with precariousness and financial uncertainty. The result for many gig workers has been insecurity in employment and earnings, loss of benefits, and unstable career paths. These concerns become especially acute in times of crisis, where financial insecurity can escalate. The COVID-19 pandemic drastically altered the gig economy. The pandemic increased the visibility of gig-workers, particular those in the food delivery sector, as many people began to rely more on such services. To investigate perceived financial and labour market insecurity among gig workers, we harness longitudinal data from 32 waves of The Understanding America Study (UAS) of approximately 9,500 respondents representing the entire United States. The survey collected information on individuals whose primary occupation was in the gig economy from March 2020 to September 2022, representing over 200,000 data points. The resulting data allows us to explore perceptions of financial and labour market insecurity over the course of the pandemic. Initial findings indicate that employment in the gig economy causally leads to a perceived increase in financial and economic insecurity, when compared to non gig economy work. This research contributes to knowledge of how gig workers navigate the pandemic, specifically with regards to their perception of potential unemployment and money loss. The pandemic has ushered in an extreme case where perceived financial insecurity was heightened for gig workers.

Support for Democracy in USA, Canada and UK

The main objective of this paper is to analyze the concept of 'Political Support for Democracy' in the USA, Canada and the United Kingdom. The paper will analyze the structure and temporal development of the support for democracy in USA, UK and Canada in the last 20 years. The database for the proposed paper is the World Values Survey, which have been conducted in several waves in all 3 states. The time points of the WVS for USA are the years 1999, 2006, 2011 and 2017. The time points for Canada of the WVS are 2000, 2006 and 2020. The time points for the United Kingdom are 1998, 2017 and 2022. The topic of this article is part of the current scholarly debate about the concept of "political support for democracy." The conceptual framework of this article is based on the concept of political support that was first formulated by David Easton (1975) and further developed by Pippa Norris (1999), Hans-Dieter Klingemann (1999), and Russell J. Dalton (2004), on the one hand, and the concept of a "realist" form of political support, presented by Richard Rose, William T. Mishler, and Christian W. Haerpfer (1998), on the other. One of the leading authors in this field is Russell J. Dalton, who focuses on political support for democracy in general and on political support for democracy in advanced industrial countries in particular (Dalton, 2004). The concept in the tradition of Easton, Norris, and Dalton distinguishes between "objects of political support," on the one hand, and "levels of support," on the other.

Islamophobia in Muslim Majority Societies: Global Entanglements in a Postcolonial World

I contests that Islamophobia can be explained based on a majority-minority relation and suggests that power is the central feature for understanding Islamophobia or anti-Muslim racism. I propose to understand Islamophobia in Muslim societies from different angles: world system approach, postcolonial and decolonial perspective, racism and Orientalism, and especially self-orientalization of the political elites. In many Muslim countries, state institutions and governments are pushing legislation to discriminate against (politically opposing) Muslims, with large parts of the (dominant/powerful) society supporting these acts. In some cases, authoritarian regimes even legitimize anti-Muslim policies with reference to an Islamic discourse, hence revealing the complexity of epistemic racism in an Islamicate context. Including the colonial heritage and questions of Western notions of secularism that came with the colonization project helps in better understanding 'Muslim Islamophobia.' I draw on Islamophobia as a way of regulating and disciplining Muslims, thus framing Islamophobia as political. The concept of Islamophobia as a form of racialized governmentality that aims at undermining a distinct (oppositional) Muslim identity is discussed in regard to the larger question of nation-state building processes and secularity in Muslim societies.

Profession: Academic

In this paper I want to reflect on what it means to think social science as an academic profession today. In particular I want to dwell on the difficulties of the notion of 'professional knowledge' and the relation it has with authoritative knowledge. Is all authoritative knowledge infused with the desire to subjugate?

Does the notion of 'professional social scientific knowledge' still mean anything or should we give up on it? How can we answer these questions in the face of feminist, queer, post-colonial and ecological critique?

Diversity or Anomie? Does Contemporary Art Reflect Diversity or Anomie in Societies Marked By Changes and Crisis?

Here I look at the development of art in times of changes and crisis; due to the technological development, economical growth, transparent social media as well as the breakdown of norms, economical crisis, political crisis and social inequalities. According to Durkheim, anomie appears in personal and public crisis; such as societies marked by war, political upheavals and economical regression, but it may also appear in times of sudden wealth. For example; during the last decades Norway has gained "sudden wealth" while developing into a wealthy oil-state and welfare society, marked by democracy, high social security, gender equality and inclusion of minority groups, as well as emphasizing human rights, freedom of expression and sustainable development. Yet the Norwegian society is also marked by features of anomie; with a breakdown of norms, and new social problems, for example growing depression among youths. Do features of anomie in the society influence the development of art? Parallel to the economic growth in Norway, the expressions of visual art have also changed. The emphasize on basic skills in visual art, for example within drawing, seems to be abandoned by young artists and marginalized in higher art education, in favour of conceptual ways of creating art; which in the long term may lead to a decline of basic art skills. (In comparison, higher music education still keep their emphasize on basic music skills). Indeed, conceptual art has long traditions, particularly as expressions of art activism, which is still the case for many conceptual artists today. Therefore I try to reveal; to which extent do the multiple expressions of visual art today signal social diversity, and to which extent do they reflect features of anomie in societies marked by changes or crisis? How are the recent and ongoing crises; migration, pandemics and warfare reflected in contemporary art?

Sincere or Cynical? Analyzing the Public Discourse on Four Controversial Art Projects in Light of Goffman

Here I present a case study on four controversial Norwegian art projects financed by local or state government, and analyze their accompanying public discourse in light of Goffmans theory on the presentation of self from 1959. 1) An art exhibition with the art of a contemporary Norwegian artist & Munch, arranged at the Munch Museum in Oslo in 2015. The exhibition was accused by critics and visitors for being unethical and speculative, as well as promoting pedophilia. 2) A series of art projects led by a Norwegian artist in North-Korea (and Norway) during 2013-17, which was criticized in the media for being unethical and exploiting North-Korean youths. 3) Three monumental paintings created by a Norwegian artist commissioned to decorate the lobby in the building of two state government departments in Oslo in 2013. As the paintings were cancelled due to their motifs that were claimed to become a burden for employees, this was heavily criticized in the media for being art censorship. 4) Proposal for a memorial monument for Utøya island, created by a Swedish artist in 2013 to honor the victims of the terror attack against the youth camp at Utøya island in Norway in 2011. The monument was criticized in the media for several reasons, in particular because neighbors who contributed voluntarily in the rescuing of youths during the terror attack were not included in the planning and implementation process, and who also claimed that the monument would lead to re-traumatization of their experiences. I try to reveal why these cases became so controversial and led to such exceptional media critiques, and particularly how the responsible actors described the art projects and responded to the critique. Did they contribute to increase or decline the critique by appearing trustworthy or doubtful, or in terms of Goffman; sincere or cynical?

EL Impacto De Cambios Climáticos EN La Reserva De Desarrollo Sostenible De Praia Do Aventureiro (ISLA GRANDE, BRASIL)

La Reserva de Desarrollo Sostenible Aventureiro está ubicada en la parte sur de Isla Grande, RJ (Angra do Reis). Hay una comunidad caiçara en la isla, parte de la cual se concentra en Praia do Aventureiro. La relevancia de este tema se refiere al hecho de que es una de las áreas de Mata Atlántica más preservadas del país.

La isla Grande ha estado bajo la presión del mercado inmobiliario durante algunas décadas y más recientemente esta amenaza se ha intensificado. Además, los cambios climáticos amenazan el medio ambiente y las comunidades caiçaras de la región. Los saberes tradicionales son afectados pelos cambios climáticos, así como hay riesgos de desastres naturales. En abril de 2022 una fuerte lluvia destruyó cinco casas y dejó once en peligro de derrumbe em Aventureiro. En comunidades vecinas hubo tres muertos. El

   *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

objetivo de la investigación es estudiar el impacto de cambios climáticos sobre esta unidad de conservación y su población. La metodología de investigación se basa en un estudio de caso sobre la Reserva de Desarrollo Sostenible Aventureiro y la comunidad caiçara que allí reside. Se realizaron cuestionarios y entrevistas, además de observación participante entre 2019-2022 en las reuniones del consejo y en el cotidiano de la comunidad.

El marco teórico de la investigación parte del concepto de ecología de saberes de Boaventura de Sousa Santos y del concepto de conflicto socioambiental de Henri Acserald. Al mismo tiempo que es amenazada por cambios climáticos, la comunidad Aventureiro se organiza a través de la asociación y del consejo de reserva para luchar por el derecho a reconstruir sus casas y permanecer en su territorio tradicional.

Parque Estadual De Ibitipoca (Minas Gerais, Brasil) y Su Privatización: Conflictos y Resistencias

El Parque Estatal Ibitipoca es un área de protección integral ubicada en el municipio de Lima Duarte, Estado de Minas Gerais, Brasil. Está a tres kilómetros del distrito de Conceição do Ibitipoca, cuya principal fuente de recursos es el turismo atraído por el parque.

La justificación de la investigación surge de la necesidad de preservar el medio ambiente del Parque para las generaciones presentes y futuras. Además de la importancia de compatibilizar la protección del medio ambiente con la generación de empleos e ingresos para la población local, a través del desarrollo sostenible. Sin embargo, el Parque Estatal Ibitipoca forma parte de una lista de unidades de conservación en el país que serán otorgadas al sector privado para la exploración de la actividad turística. Esta posibilidad ha sido debatida en sede judicial, tras la interposición de una acción civil pública por parte del Ministerio Público.

El objeto de esta investigación son por tanto los conflictos socioambientales ocurridos en el Parque Estadual Ibitipoca y sus alrededores, especialmente con el proceso de privatización de el area protegida.

La metodología de esta investigación es cualitativa a través de entrevistas a gestores y consejeros del Parque Estatal, análisis de documentos, además de observación no participante.

La privatización del Parque Estadual de Ibitipoca no es un fenómeno aislado sino una política neoliberal que pretende privatizar diversas unidades de conservación en el país, posibilitando el avance del capital en las áreas ambientalmente más preservadas de Brasil.

Professional Identities and Market-Centered Childcare Policies: Can Japanese Registered Nursery Teachers Evade the Professionalization Trap?

In the transition from the state provision to the marketization of childcare, existing qualifications or requirements for childcare practitioners may become a barrier to market entry for both the demand and supply sides of the labor force. The state often readjusts conditions that enable the formation of a market-compatible childcare workforce. That is, the redefinition of childcare workers as a profession. Taking the childcare reform in Japan as a case study, this report examines the process toward market-compatible professionalization through two conflicting strategies: professionalization and counter-professionalization, focusing on the tensions among states, markets (corporate providers), and occupational groups (registered nursery teachers, family childcare providers).

The Japanese public childcare system was established in 1947 under the Child Welfare Law, and the female "nursery teacher" with educational requirements and training was legally positioned as the eligible profession for childcare institutions under the public childcare system. Although the professionalization of nursery teachers was achieved through legislation, they faced poor working conditions due to restrained budgets and low social status based on traditional female roles. The situation destabilized their professional identity and drove them toward the endless pursuit of the "true" professional status. Subsequently, in 2015, with the introduction of the new childcare support system as a welfare reform, the state incorporated a quasi-market logic into childcare. It led to a diversification of childcare practitioners that was not publicly allowed under the previous public system, and formed hierarchies among childcare practitioners as a workforce under the system. Focusing on the dynamics between micro professional identities and market-centered policies securing a large female labor force with low costs and some quality assurance, I explore the professionalization trap into which nursery teachers fell at the intersection between professionalization and counter-professionalization in the marketization process.

HAGIWARA, Kumiko* (St. Andrew's University, Japan)

The Effect of Marketization on Childcare Union in Japan: State Suppression of the Care Movement or Step Toward a New Upsurge?

In the restructuring of the welfare state, market mechanism and contracts have been key concepts in the production and provision of care since the 1980s. An unequal care structure in terms of access, social and economic evaluation, and the distribution of care responsibility has emerged from the process of marketization, which requires a highly political and democratic response. In this context, trade unions are important actors in the so-called care movement which is the nexus of workplaces, households, and local communities.

This report explores the impact of the state-led marketization of childcare in Japan on trade union activities, where there has been a shift from the public provision of childcare to provision through a quasi-market. There has been an ongoing debate over reforming the public childcare system since the early 2000s in Japan, which led to the introduction of the new Child Care Support System in 2015, consequently expanding care provision quantitatively through the entry of for-profit firms and market mechanisms. In the process, public daycare centers have been restructured and downsized to create conditions for corporate childcare. The number of public daycare centers, which once accounted for about 60% of total daycare centers, has been reduced to about 30% in 2020. Historically, the All Japan Prefectural and Municipal Workers' Union (Jichiro) organizes the largest number of nursery teachers and daycare center staff; however, it is now witnessing a decline in union members. Research on leaders and shop stewards of public daycare centers has revealed that the labor conditions of nursery teachers deteriorated due to the marketization policy and constrained the union's human and time resources. I argue that the state indirectly suppresses the union through the marketization of social services and I explore the potentiality of the new union drive as an actor in the care movement.

Transnational Networks, World Works Councils and Global Framework Agreements: Interdependencies and Dynamics of Action for Transnational Labour Regulation in Multinational Companies

(for sub-theme: Transnational Social Dialogue and Collective Action in a World of Resurgent Authoritarianism)

Over the past decades, the question as whether and to what extent transnational forms of labour regulation might be able to represent a countervailing power to globally-operating companies has been an increasing concern of both research and practice. Although numerous studies have analysed different instruments of transnational labour regulation – for example Global Framework Agreements and European or World Works Councils–, evidence on how these different instruments are interlinked still remains rather unexplored. Against this backdrop and based on a comparison of three case studies of multinational companies, we investigate how different approaches to transnational labour regulation emerged from the action taken by actors in MNCs and how those developments shaped the dynamics of subsequent action. We concentrate on three regulatory approaches (Global Framework Agreements, World Works Councils, and transnational trade union networks) and analyze how these have emerged and in which way they are intertwined with each other. Our paper highlights the evolving interdependencies between various approaches to transnational labour regulation and underlines that those interconnections and the dynamics of processes can only be properly understood when seen in terms of social action taken by actors. Such a perspective enhances our understanding of how social and labour rights as well as democratic participation in multinational companies and along global value chains might be enhanced.

Revival of Family and Personal Relations with Free Time during Imposed Lockdown: A Study Conducted in Metro City

Covid era proved that social interaction is a soul of human society, when people were striving to talk and greet each other. Imposed lockdown restricted people to home forced them to really understand the value of support and importance of human interaction. This period was huge challenge to each one, as mental health was put on test. Many lost their dear ones and others lost their

jobs. Level of anxiety was at high and there were only virtual relations available at that time. People were in distress and were in dilemma to cope up with this situation. Social distancing underlined the value of personal relations with in the family and community. It was changing phase of interaction and relations for the society where personal dialogue was on the verge of end due to the strong upsurge of internet and virtual world. For almost two years whole world realizes the importance of inter-relations and its support in each one's life. On the account of all negative impact of pandemic, some substantial changes in personal relations can be noticed. With all norms of social distancing, urge of human relations was believed by people. It is true that there were few incidents reported of domestic violence and stressful relationships, on the other hand many found the opportunity to revive their relations in this free time. The study conducted in Indian metro city 'Aurangabad' in Maharashtra province of India shows that people tried to revive the relationships within the family and in the community. Huge amount of free time and stress mounted in the lockdown compelled people to think and revive their relations with dear ones. It is kind of revival of relationships for the need of stress management, happiness and co existence.

Religious Nationalism and Anti-Cosmopolitan Terror

Religious nationalism is on the rise globally, as is its capacity to inflict violence – both direct and structural – on 'others'. This is evident in a number of contexts, including in Russia under Putin and in India under Modi. Concurrently, there have been a number of acts of terrorism committed as outcries against multiculturalism and as calls for racial purity, such as by Breivik in Norway and Tarrant in New Zealand. There have also been campaigns to strengthen religious freedom in Australia, and attacks on women's and LGBTI+ rights in the USA. This presentation, drawing on cosmopolitan theories, argues that these are interrelated phenomena and that it is crucial to understand the role of religion in both enabling and resisting this anti-cosmopolitan terror.

HALAFOFF, Anna* (Deakin University, Australia)

Spirituality, Wellbeing and Risks

Contemporary studies of religion and society have focused mainly on religious diversity and the non-religious, with spirituality typically not taken as seriously by scholars, or in political spheres. Drawing on data arising from two recent Australian Research Council funded studies, this presentation examines spirituality's associations with personal and planetary wellbeing and risks of dis/misinformation and harms. It argues that there is a need to move beyond the binary of the religious and non-religious, and to include an emphasis on diverse worldviews – spiritual, religious and non-religious – in scholarship, policies and curriculum to better reflect the lived reality of Gen Z Australians.

I Organize Everything Around the House! Quantitative Analysis of Gender Inequalities in Mental Load in Croatian Households

Mental load has only recently been recognized as a relevant social phenomenon and is gaining importance and research interest mostly in sociological research conducted outside Europe. The term is known also as mental or cognitive labour/housework or household management and it describes the invisible work involved in running a household and family. Daminger (2019) describes it as the responsibility of "anticipating needs, identifying options for meeting them, making decisions and monitoring progress", while Dean et al. (2021) argue that argue that the mental load is the combination of the cognitive labor of family life and the emotional labor associated with this work. This type of invisible housework is performed mostly by women, and is in particular prevalent among working mothers on whose well-being has negative consequences, especially in the circumstances of the Covid-19 pandemic. The neglect of mental load research leads to an underestimation of the gender gap in the private sphere. In this paper we present a brief conceptual overview of mental load in the household and the preliminary results of the quantitative research of couples dynamic in Croatia, whose main objective was to determine the forms, prevalence and gender inequalities in performing mental work in households in Croatian society. Out of 74 measured mental load activities, we will focus on the ones with the largest gender gap and present the multivariate model that explains this gender gap using indicators of socioeconomic status of partners, index of gender inequality in intimate relationship, gender discrimination in primary socialization and the influence of traditional vs. egalitarian gender

roles during upbringing. Our results contribute to better understanding of perpetuating patterns of gender inequalities in the private sphere to the disadvantage of women and indicate potential ways to reduce them.

HALIMATUSA'DIYAH, Iim* (UIN Syarif Hidayatullah Jakarta, Indonesia)

Escaping from Environmental Catastrophes: 'Climate Refugees' and Gendered Dimension of Mobility Justice in Indonesia

Mobilities are often considered crucial adaptation strategies in responding to climate change. Therefore, large-scale population mobility that may take place due to climate change has been a global growing concern. However, climate mobilities are not always in massive forms, they might be indirect and small-scale. Importantly, the right to mobility might vary across differently positioned individuals and is dependent on socio-economic and political factors. Additionally, unequal power relationships and intersectional factors such as gender, class, race/ethnicity, and religion might shape mobility injustices. Drawing from the experiences of vulnerable populations in coastal areas of Indonesia, this study aims to investigate the gendered dimension of the multi-faceted relationship between climate change, and mobility justice. This study particularly seeks to explore the personal experiences of women affected by tidal floods in Indonesia to understand how they perceived and managed the effect of climate change and the extent to which climate change has contributed to their vulnerability or resilience, their differing capabilities for mobility, and their access to socio-economic rights.

Limitless Digital Gender-Sexual Violences: The Threat to Girls and Women of Emerging, Advanced, Technologies

The existing range of digital or cyber violences of many and various kinds, often employing access to the internet, is well studied. However, over last few decades have seen a remarkable increase in the accessibility and capabilities of technologies using artificial intelligence and machine learning, robotics, augmented reality, and virtual and mixed reality technologies, with increasing steps toward combining these in what is termed synthetic realities. But whilst these emerging and advanced technologies bring benefits such as enhanced user experiences, communications, interactions, accessibility, performance, resource saving, and many others, they have also been deployed in ways that harm others. In this paper we provide a critical narrative review of existing interdisciplinary literature to highlight the ways in which such rapidly developing technologies have been, are used, and could be used, in gender-sexual violences of girls and women. We discuss the limits and limitlessness of digital gender-sexual violences in terms of access, space, time, the body, and violences, considering the ramifications for girls and women. These diverse forms of technologically-enhanced digital gender-sexual violences constitute both overt and covert acts of violence, to both known others and those not known, operating in the contemporary virtual public realm(s) - thus reformulating both notions of the public realm(s) and the place and form of violences in the public realm(s). In this paper, we consider the theoretical and practical implications of these reformulations of violences, technologies and contemporary public realms, drawing on both established 'classical' sociological theory and emerging approaches, such as material-discursive and sociomaterialist analyses, new materialism, and transnational feminist theories. These analyses have clear implications for the promotion of interventions in technology design and development, law enforcement, policy-making, legislation, and indeed the role social activism and interdisciplinary research activity can play.

Taking Back Control: Brexit As a Vehicle for Transnational Far-Right Mainstreaming Online

Social media are frequently implicated in the global mobilisation of the far-right, but in a field dominated by 'big data' and content analysis, there is a lack of qualitative evidence into individuals' actual experiences of using social media to engage with this form of politics and what these mean to them. Meanwhile, sociological research has not adequately investigated the role of social media in support for 'Brexit', a major flashpoint for racism and right-wing populism in the last decade. This paper examines online engagement with Brexit based on two waves of in-depth interviews and month-long observations with 15 non-digital-native Facebook users. These individuals had become heavily engaged in far-right causes relatively recently, with the issue of Brexit – and particularly perceived threats to the implementation of the referendum result – a significant catalyst for this. Their accounts revealed some of the ways in which Brexit provided a vehicle for the mainstreaming of transnational far-right sentiment in Britain. Alongside common nativist, culturally racist and Islamophobic

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tropes, participants simultaneously drew on illiberal right narratives, far-right conspiracy theories and glorifications of violence once thought to belong to the extremist fringe. They employed these narratives in coherent and incoherent combination, relating them to their quotidian experiences, and usually with only a superficial understanding of the conspiracy theories involved. Facebook was not only a platform for transnational dissemination of extreme narratives. The value participants placed on Facebook as a weapon in a pivotal battle to reclaim control over liberal social and political change also points to the key facilitating role of social media technologies for newly engaging individuals in far-right issues. The transnational far-right has clearly benefited from a critical conjuncture between the popularisation of social media, long-simmering objections to diversity agendas, and the discursive opportunities provided by mainstream Euroscepticism and a 'democratic' referendum result.

HALLEY, Jeffrey* (The University of Texas at San Antonio, USA)

Dada and the Experience of Shock: Culture and Everyday Life

The use of shock by Dada artists is crucial for understanding both their work and its socio-historical significance. This presentation analyzes four cases of evening cabaret performances (soirees) presented by the Dadaists in Zurich and Paris, from 1916-1919, drawn from primary and secondary sources. The Dadaists used noise poems and constructed visual collages or film montages, antagonistic juxtapositions of things that ostensibly did not belong together, the result of which was shock. My thesis is that, by elucidating the concept of shock, mutual recognition and self-recognition, which are typically discussed in their external and categorical features, can be analyzed as processes displaying the crucial aspect of action which Sartre referred to as "interiority." Dada and the Dada soirees present a set of cases for developing the concept and exploring its most immediate implications for understanding the experiential aspects of social processes.

Shock, in the literature on Dada, has two referents: 1) an intrinsic feature of each work -- performance or artifact -- that allows it to be received as an instance of Dada; 2) a feature of reception concerning specific effects of certain performative gestures -- vulgar, demonstrative, confrontational, scatological -- on specific audiences. The former places Dada within the history of reception of art. The latter focuses on the character of an intervention in which the receiving subjectivity is placed in crisis. The second referent is the significant one. It posits both the artwork and its reception as active, processual, and internally relational rather than static, and external in its relations. It directs analysis toward the interior of the performance encounter, towards an investigation of the relationship between expression and structure, towards an "event" (Iser). Emphasizing process de-emphasizes the social movement aspect of Dada, and highlights that counter-hegemony is built into the details of the sociality of everyday life.

The Development of Care Policies and the Gender Wage Gap in Korea

This study investigates the effect of care policies on the gender wage gap. Care policies are social policies formalizing care, such as childcare and long-term care. It also creates time for care by minimizing career breaks. These policies are intended to reduce the gender wage gap by promoting women in the labor market. However, the counter-argument is that care policies paradoxically widen the gender wage gap because leave policies encourage women to exit the labor market (even if for a short period). Care policies also lead to a rapidly increasing number of low-paid care workers, mostly women. To investigate this competing hypothesis, this research focuses on South Korea, where various care policies have rapidly expanded since 2005. Employed workers' data from the Korean Labor and Income Panel Study were used, and the Oaxaca-Blinder decomposition method was applied with unconditional quantile regression. The three primary conclusions of the research analysis are: First, the motherhood employment penalty was reduced while the universal childcare policies were expanded. From 2005, the gender disparity of employed workers in the number of preschool-age children gradually diminished. This convergence contributed to reducing the gender wage gap. Second, formal care workers increased with the expansion of care services, aggravating occupational gender segregation and the gender wage gap. However, the effect of care workers on the gender wage gap is not the same for all wage distributions. While the increase in care workers widens the gender wage gap for higher-wage workers, it reduces the discrepancies for the lowest decile workers. Third, women are paid less because these 'benefits' compensate for the non-monetary aspects of their labor. However, the results show that the compensating differentials only explain the gender in the lower wage distributions. For upper wage distributions, care-friendly work reduces the gender wage gap.

The Interplay between Family Structure and Income Inequality: Consequences of Unequal Chances of Marriage and Childbirth in Korea

This study investigates the recent changes in the family structure of young adults and its contributions to income distribution in Korea. The marriage and fertility rates have declined dramatically in the last three decades. Between 1996 and 2021, the fertility rate dropped to 0.808 from 1.574. The crude marriage rates also declined by 3.8 from 9.4 in the same period. This study examines whether this dramatic decline in marriage and childbirth is equally distributed among income groups and how this change has affected income distribution among young adults ages 25-45. First, using nationally representative data collected by Statistics Korea - "the Household Income and expenditure survey" and "Survey of Household Finances and Living Conditions" - it explores the trend of family structure by income groups and assortative mating in terms of labor income from 1996 to 2020. Then, this study estimates the contribution of family structure by calculating hypothetical income distribution using reweighting method (DiNardo et al., 1996) and the rank-preserving exchange method (Burtless, 1999). The result shows that the relationship between income, marriage, and childbirth has strengthened in the recent decade. Association of couple's income has been developed especially for families with children under 8. Although precedent studies argue that marriage weakened overall income inequality since women in vulnerable families are more likely to participate in the labor market in Korea (Ku et al., 2018), this study shows that the marriage effect could be reversed in the current younger population. This result also suggests that expanding universal public transfer policies for families with children in Korea might reinforce income inequality as childbirth and marriage are selected by high earners.

Bhutanese Refugees of Nepali Origin: Navigating Nationality and Citizenship in an Unequal World

Bhutanese refugees in the United States are of Nepali ancestry. They are known as "Bhutanese refugees of Nepali origin and/or Nepali-speaking Bhutanese refugees." In terms of national identity and citizenship, Bhutanese refugees of Nepali origin have a unique political history. The migration and immigration processes of Nepalis to Bhutan in the nineteenth century, and again from Bhutan to Nepal and India in thetwentieth century, tell a unique story of labor migration, conflict and displacement, and complex nationality and citizenship status. In 2007, the Nepal government worked with the United Nations High Commissioner for Refugees (UNHCR) and other international communities to create a third-country resettlement program for the Nepali Bhutanese refugees. Subsequently, the Bhutanese refugees have migrated/immigrated to various states in the U.S. with their families. They obtained refugee status twice in their lives: first in their own ancestral motherland of Nepal, and secondly in the U.S. This paper examines the lived realities of Bhutanese refugees in relation to their complex political history, fragmented nationality, and citizenship. The paper draws upon my ongoing collaborative research project on Bhutanese refugees of Nepali origin in two US cities—Salt Lake City and Seattle. This paper focuses on two main themes: (1) Political Economy, Nationality, and Citizenship; and (2) Refugee Resettlement and Challenges. The paper examines the following questions: What is the political history of Bhutanese refugees? How has their becoming refugees twice shaped their identity, citizenship, and sense of belonging? How do their dual Bhutanese and Nepali identities manifest? What are the social, cultural, and economic dimensions of immigration/migration/resettlement? How do they navigate their socio-economic and political lives in the U.S.? What are their challenges and struggles?

How Is Inequality Accumulating?: Decomposing Differences in Educational Attainment By Categorical Variables into Each Educational Transition in Japan

This study applies a model that decomposes the differences in the distribution of final educational attainment by social background into the differences in the allocation of each educational stage transitions and analyzes the stratification in the process of educational attainment in Japan.

Buis(2017) used Mare's sequential logit model, known as the transition approach, to show the gap in final educational achievement by a weighted sum of effects for each school stage transition. In that model, which linked the inequality of educational distribution and allocation, it was assumed to deal with continuous variables (such as SES and years of education), leaving the decomposition of effects for categorical variables as a challenge.

In this study, we take Buis's formulation further and show that the effects of categorical variables such as parental occupational status also can be used

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

to decompose differences in the distribution of final educational attainment into the weighted sum of the effect of inequality in allocation. We also present an example analysis of the application of that model to survey data in Japan.

The results of the empirical analysis show that, for males, both distribution and allocation inequality between classes is decreasing, but the allocation inequality at the stage of entering college remains. For women, the large disparities in junior college have disappeared, while the distributional disparities in the college-entrance stage have widened, raising the total amount of distributional inequality and showing an aspect of re-inequalization.

Bridging National Surveys Under COVID-19 Era: Re-Inventing a New Agenda on Comparative Family Research in International Sociology

Until today, there have been clear boundaries between international and national surveys. The former assumes a survey based on more standardized indicators across national contexts, whereas the latter presumes questionnaires that reflect the realities of each society and culture. There was also a disjuncture between international and national sociologies and those research communities. However, the various surveys conducted in different countries on the COVID-19 pandemic can reveal how each society and people experienced it, and coped with this global social problem in different social circumstances. In this regard, the COVID-19 surveys conducted worldwide, particularly on family life, provided a valuable opportunity to compare social values and cultural norms in different countries through a global comparative study. By selecting datasets from several national surveys in several countries on the transformation of family life during the COVID-19 pandemic (e.g., countries from different continents or regions), this presentation aims to produce new comparative research through the investigation of each set of questionnaires, as discussive texts represent the ideological norms and family values particularly introduced to the national family policy of each nation. Additionally, by adopting datasets on the impact of COVID-19 on the family as a common experience of global society, this presentation, in collaboration with a global research network, expects to establish a certain degree of data accuracy regarding the development of this meta-analysis of comparative national surveys on the family and state in international sociology.

Does Divorce Deprive Fathers from Caring after Their Child? Shared Parenting of Separated Family and Fatherhood in Contemporary Japan

Due to rising questions regarding the gendered division of labor, *vis-à-vis* facing similar low-birth rates to neighboring Asian countries, caring fathers have been drawing great attention in Japan. The government, for example, has introduced so-called *ikumen* (e.g., *iku* means caring in Japanese) policy, encouraging the revision of the gendered division of labor in association with the notorious working culture. However, while they aim for both parents to engage with child care simultaneously, regardless of gender differences, it is questioned to what extent the policy includes diverse family matters, such as divorced couples. At the jurisdictional level, current Japanese family law exclusively stipulates solo-custody granting after divorce, which discourages may ex-spouses to carry out distance shared parenting. In particular, non-custodial fathers have reported losing the chance of performing care as a father after separation, regardless of their aspirations. Under such circumstances, this presentation first argues how the policy practice of the encouragement of caring fathers, or *ikumen* in contemporary Japan, is discursively and normatively situated on the premise of the heteronormative family, consequently foreclosing the increased will among fathers to care after their child in various patterns of the contemporary Japanese family (i.e. solo-parent families, or stepfamilies). Then, according to the large-scale survey on non-custodial separated parents by the presenter, it attempts to describe how those separated fathers, while considering a sense of "caring masculinity" in the Asian context, expect to be caring fathers in their alienation from shared parenting. Eventually, this presentation scrutinizes how the Japanese policy discourse of caring fathers excludes fathers in divorced families.

A Religious Urban Festival, Inequality, and Resistance: What Happens When Order Cease to be Implemented in Tehran, Iran

In the public imagination of those outside Iran, the country is associated with uncanny and brut theocracy— and to a certain extent, rightly so. In recent years, the grotesque level of oppression, the expansion of social media that allows ordinary citizens to voice dissidence about their everyday life dominated by an intrusive political machine, and the mass migration of students who brought their local issues to international academic stages have shed —though still very dim— light on life in Iran as a problematic.

Yet, the little heed paid to Iran is mainly channelled through the gaze of the middle-upper class, while lower-income citizens are left without a means to echo their severe suffering of a very restricted life. Poverty as a status, the inequality enmeshed with it, and the stigma it begets bulwark one's ability to speak out; however, for this deprivation, the State finds a vast leeway to edge itself onto the lives of those who have little. Taking a leaf out of the neoliberal lexicon, the political apparatus in Iran had segregated the impoverished into declining neighbourhoods, policed their whereabouts, and debilitated their agency to control their affairs while veneers such neoliberal policies with religious jargon essential to an Islamic republic. Hence, urban marginalisation processes largely confine how an urban poor expresses herself and appropriates the city.

Nevertheless, wherever there is power exertion, there would be resistance. In an urban ethnography as part of my PhD study, I documented how such groups resist and lay claim to their surrounding urban space amidst a religious ceremony, during which the urban order cease to be implemented. In this article, I will try to show how an urban festival is repurposed by dwellers of a relegated urban geography in Tehran to express themselves and live momentarily outside the state's tight clutch.

Masjid Ball: The Influence of Mosque-Based Physical Activity Programs on the Physical Cultural Practices of Young Muslim Women

The values mediating exclusionary practices in Western sporting environments posit religiosity and physical activity as opposite principles, forcing many Muslim women to choose between faith or play (Knez et al., 2012). Religious institutions like mosques are essential structures that link Muslims to their communities, making them valuable when designing lifestyle interventions (Banerjee et al., 2017). The study used a space-based racial analysis to explore how six young Muslim women experienced mosque-based women's-only sports programs, the relationships that form in such settings, and the physical cultures being practiced. The results demonstrate the significance of studying faith as a racializing identity within sport science, and gendered Islamophobia's role in influencing Muslim women's sporting participation. The findings also highlight how sporting exclusion is mediated through agentic processes of creating and negotiating safe sporting spaces by transforming faith spaces, and the relationships Muslim women develop with themselves, and their communities through faith-focused physical activity.

Beyond the Human Rights Approach: Migrants with Diverse Sogie Navigating Structural Oppression

Migrants are not a homogenous group – gender, age, race, ethnicity, nationality are some of the characteristics that can influence how individuals and groups experience migration. While there is growing recognition that gender is not binary, migrants are often only identified as being (cisgendered) men or women in most studies and data sets, hence little is still known about the motivations or experiences of migrants with diverse SOGIE, with even less information available on the discrimination, violence and harassment that they may experience. Our research aims to fill this gap by providing a critical analysis of migrants with diverse SOGIE experiences.

Funded by the Canadian Social Sciences and Humanities Research Council (SSHRC), our research focuses on migrants with diverse SOGIE in two contexts: Canada and Lebanon. Our findings show that in both countries migrants with diverse SOGIE face intersecting forms of oppression tied to their migration status (xenophobia), racial identity (racism), sexual orientation (homophobia), and gender identity and expression (transphobia) that impact their access to healthcare, housing, work, etc. We show that the human rights framework which is often put forward to overcome these structural intersecting barriers is poorly suited and, in some cases, even perpetuates the forms of oppression that burden migrants with diverse SOGIE. Hence, our findings suggest adopting an intersectional, decolonial and tailored approached adapted to the local context and that is based on the expertise of local activists and community sector organizations. Migrants with diverse SOGIE in Canada and Lebanon present similar experiences and interests, but also vast differences in terms of their cultural, social, historical, and material conditions. More specifically, focusing on the experiences of migrants with diverse SOGIE in these two countries demonstrates the fluidity and even counter-productivity of insisting on binary oppositions between categories such as migrants/nationals, citizens/non-citizens, North/South, etc.

Work and Care Decision Making across Genders and Generations: The Case of Grandparent Childcare

The rise in dual earner households and barriers to accessing formal early childhood education and care (ECEC) markets is seeing more parents of young children draw on intergenerational support in the form of grandparent childcare. Research suggests that childcare by grandparents *boosts* labour market participation among parents and can *reduce* grandparents' labour market participation. Hence, increasing the workforce participation of mothers with dependent children has the potential to draw other women – older women – out of paid work, creating more gender inequality in the distribution of paid and unpaid work, and failing to deliver net increases in women's employment overall.

Recognising the interdependencies across the generations in families' work/care decisions is essential for understanding the gendered distribution of work and care and its implications for the wellbeing of parents and grandparents. However, we lack a cross-generational perspective on family childcare decision-making in both the policy domain and in the scholarly literature. This is a significant gap if, as the widespread use of grandparent childcare suggests, family decisions about work and childcare are not confined to the nuclear family but involve *negotiations between the two generations.* Drawing on the concept of linked lives, this paper will present emerging findings from i. interviews with care dyads comprised of parents and grandparents, and ii. work/care grids that catalogue both generations' time spent in work and care in a typical week. It provides new insights into how parents and grandparents share childcare responsibilities, how they negotiate decisions about the distribution of work and childcare, and the factors shaping those decisions, such as the availability of other ECEC options, financial circumstances, health and wellbeing of family members, and geographical proximity. The paper sheds new light on the gendered dynamics of work and care across intergenerational relationships.

Human Rights Situation in South Korea: Results from National Social Surveys

Having experienced military dictatorship and authoritarian rule for three decades since 1960s, Korean people are very conscious about human rights issues. National Human Rights Commission established in 2001 started annual national social survey on human rights issues in 2019. Analyzing data from the annual survey between 2019 and 2022, this paper reports Korean people's values and opinions concerning human rights as well as their experiences of human right violation and discrimination. International comparison shows that Korean human rights situation has improved during the last two decades. What people feel, think, and experience about human rights differ largely by generation and gender.

Ulrich Beck and the Diverging Pathways of the COVID-19 Governance

According to Ulrich Beck the driving force of modernity has achieved unprecedented abundance and welfare. However, a global risk society has emerged as an unintended byproduct of such success of modernity. Consequently, as an example, whether COVID-19 governance moves in the direction toward authoritarian nationalistic development or in the direction toward more democratic participatory development is uncertain, and the final outcome depends on various historical, social, and political conditions. In this situation, combining a conceptual model derived from Beck concerning the relationships among major variables of authoritarian change and an empirical study based on citizens survey carried in 2021 over 30 global cities, this study starts from the observation that 1) as the COVID-19 pandemic spread rapidly to the world, the governments of individual countries implement powerful state-centered /nation first policy responses for the protection of their people's lives and public health, 2) The ripple effects of these chain decisions lead to a great upheaval of international order such as border closures along with full social isolation, including self-quarantine of citizens; 3) As a result, such trends of economic crisis are intensified as domestic/international shrinkage in production and increasing unemployment; 4) The human rights situation is generally deteriorated, including threats to the right to live of the socially disadvantaged groups and the reduction of basic civil freedoms.

On the other hand, this study maintains that although the general tendency of risk governance moves in the direction strengthening authoritarian control, different trajectories are in principle possible. South Korea may be an example. Based on the analysis of the factors that give rise to the diverging pathways of the COVID-19 pandemic governance, this study attempts to explore how we can promote a more democratic and participatory governance against chauvinistic and populist pressures.

Work Schedule Patterns and Health over Thirty Years of Working Lives in the United States: NLSY79 Cohort

Pursuing a healthy and happy life is undeniably a universal goal for human beings. As work constitutes a central part of an individual's life and people tend to define themselves by their career or job, our working lives hold a critical key to our happiness and health. Using the National Longitudinal Survey of Youth-1979 cohort (N = 7,273) in the United States and building upon the cumulative advantages and disadvantages theory with a lifecourse perspective, this paper examines two research questions. First, how might social positions be associated with work schedule patterns starting from age 22 to age 48/49? Second, how are work schedule patterns, together with social position, associated with our health well-being at age 50? Results indicate five general work schedule patterns among the NLSY79 youths: mostly standard hours, only standard hours, mostly or only nonstandard hours, mostly or only not working, and mixed work statuses. Importantly, gender, race-ethnicity, education, marital status, and parenthood were significantly associated with different work schedule patterns. Results further indicate that engaging in work schedule patterns that were anything but mostly or only standard hours, having low education (e.g., high school or below), and being a single parent together were associated with poorer health outcomes measured by SF-12 physical and mental functions and clinical-risk depressive symptoms. These results speak volumes to how cumulative advantages and disadvantages throughout a lifetime may shape not only our opportunities and constraints brought about by our work but also our long-term well-being.

Noncompliance Behavior during the Covid-19 in China

We mapped the spatial and temporal patterns of noncompliant behavior in China between the year of 2019 and 2020. Since there is no detail crime data available in China, we collected all the "police briefings" posted by the police department on social media. We first identified all the county, prefecture, provincial and the central government's police agencies' account on Weibo, and then collected all their police briefings from January 1st 2019 to December 31 2020. We manually coded the briefings in a training set of the data, and then used the supervised-machine learning method to code all the data and generated one database regarding the noncompliance activities. Overall, there were less crime/deviant activities in 2020 compared with 2019, but there was an increasing of cyber-related crime like cyber/tele-fraud. Covid-19 related deviant activities emerged as a new type of noncompliance behavior, and the detentions were the primary method for the covid-19 related violations.

Socially Possible Worlds: Grounding Normative Statements Beyond Ontological Actualism

Sociological theorists have played a role developing approaches to both diagnose and resist predominant social injustices, social harms, and the retrenchment of the welfare state. In the field of the sociology of medicine, normative claims are regularly found in the framing of research questions and in the discussion of key findings about health care provision and the coordination of resources and activities. While these normative statements and knowledge claims about what should be the case circulate, imagining a more just world, there is a missing metatheoretical grounding of these claims. I argue that this is due to the field's commitments to ontological actualism, which should be replaced by an ontological possibilism in order to make coherent statements about the possibility of change in the social world, including health care. The fundamental premise of actualism is "everything that exists is actual," which entails that there is nothing empirically apprehensible that is not actual (cf. Menzel 2018). What makes actualism interesting for metatheoretical consideration are the issues raised when its ontology comes up against normative claims. This paper takes up the kinds of recommendations and prescriptive claims that tend to follow sociological analysis about how health institutions should be organized or what people should do. I take on the science and technology studies approach in particular to address an incoherence between ontological and normative commitments. Building on a shared project with Ronjon Paul Datta (UWindsor), this paper argues that

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

actualism poses serious dilemmas for the emancipatory possibilities of critical sociology. I will challenge those committed to actualism on the grounds that it is possible to do social science about socially possible worlds through empirical work. I aim to provide a programmatic statement on how and why sociological theory should adopt ontological possibilist commitments in the sociology of health and medicine.

Parental Absence during Childhood and Intergenerational Income Mobility in China

In the past decades, China has witnessed a declining prevalence of two-parent families and a rising income persistence across generations. Does family structure shape how economic (dis)advantages pass from parents to children? This study uses the China Family Panel Studies (CFPS) 2010 to test whether parental absence moderate the intergenerational income persistence in China. We make three main contributions to extend the current understanding on the family structure axis of stratification in transitional societies. First, we evaluate intergenerational income mobility with both symmetric correlational summary and asymmetries in upward and downward mobility. Second, we examine the family structure in a dynamic way, by measuring the status and duration of parental absence in two critical period during childhood: before 3 years old and between 4 to 12 years old. Finally, we utilise the unique data characteristics of CFPS to address the sample truncation problem due to temporary migration and separate residence, to achieve more accurate national estimation of the income persistence. Among the 6,519 parent-child pairs (with mean age 31 for children and 57 for parents), there are 11% (before 3) and 16% (4 to 12 years) with at least one parent being absent for more than one month. The intergenerational income elasticity is significantly stronger for families with parental absence, especially when the absence happened when children were younger than 3. Further analyses suggest this difference is probably driven by the facts that children raised in intact families are more likely to experience upward income mobility, while children who experienced parental absence in early childhood are more likely to inherit economic disadvantage from their parents. We conclude with discussion on the differences of the role played by family structure between China and Western societies.

HANIA, WU* (Department of Sociology, Fudan University, China)

Revisiting the Tunnel Effect: Economic Growth, Income Inequality and the Subjective Well-Being Among the Chinese Population (2005-2017)

The "tunnel effect" hypothesis proposed by Albert O. Hirschman suggested that the expectation for future upward mobility would buffer and even reverse the negative impacts of the soaring income inequality on people's subjective well-being in the course of economic development (Hirschman and Rothchild, 1973). This paper clarifies the theoretical connotations of tunnel effect from three perspectives: (1) dimension of inequality, tunnel effect should refer to inequality relating to social comparison at micro level instead of normal inequality indicated by Gini coefficient at macro level; (2) heterogeneity of effects, tunnel effect should work stronger for those who were falling behind and who were facing more uncertainty; and (3) dynamic trend, the strength of tunnel effect should change along with certain socioeconomic conditions. Multi-level analyses based on the pooled data from 9 waves of the Chinese General Social Survey 2005-2017, as well as contextual income information from the statistical yearbooks of the corresponding year suggest the following findings: (1) tunnel effect does exist in China, as we observe that the reference income (defined by the mean income of other people living in same province and work in same industry and ownership) has a significantly positive impacts on individual's happiness after controlling for individuals' own income; (2) tunnel effect is stronger for people who are under 40 years and report the bottom 20% income; (3) tunnel effect was strong during the period of 2005-2008, but shrank remarkably even to insignificant after that time point, and this temporal heterogeneity may due to the economic slowdown, rising income inequality, declining social connection and increasing prevalence of meritocratic beliefs. We conclude by discussing the implication of the ceasing premium of tunnel effect for people's well-being in the new era characterized with slow-down economic growth and deepening inequality in China.

HANVIN, Renae* (Resilient Ready, Australia)

Saving Lives and Livelihoods: Lessons Learned from the NSW Business Community

Businesses are the forgotten sector in the disaster landscape. And yet local businesses are hubs for community connections, communication and information sharing. Most recently, the Australian business community has also demonstrated the integral role it plays in safeguarding livelihoods and harnessing social capital in times of crisis.

The business community has also revealed its vulnerability amid compounding disasters. Business closures and job losses continue to have major social and economic impacts on communities with reduced access to services, disrupted livelihoods and compounding flow on effects.

Data states 40% of small businesses do not survive major disasters with on average 80% closing within two years if they do not reopen in the first five days post-impact. Small businesses are also predominantly owned and operated by women contributing to a gendered impact on livelihoods.

Social enterprise, Resilient Ready has rolled out the innovative 'Biz Community Toolkit'. This toolkit approaches capability building through peer-to-peer micro learning and features local case studies and learning extensions. The tool gives an insight into the capabilities of small business owners by capturing data relating to lived experience. The foundations of resilience are explored through the lens of understanding risk, sustainable change and doing disasters differently.

The learnings from this capability mapping are timely with increasing and compounding disasters impacting both vulnerable businesses and their communities.

Renae Hanvin will speak to the importance of embedding and empowering risk reduction capabilities, so building disaster preparedness becomes 'business as usual':

- Key statistical insights discovered through the 'Biz Community Toolkit'.

- Translating national policy into actionable steps that build long term capabilities, knowledge and connections.

- The benefit of business community networks and community resilience.

This presentation will challenge attendees to consider the integral role businesses play in developing a holistic approach to resilience, and how we can safeguard livelihoods among business communities.

RC31-453.5

HAO, Pu* (Hong Kong Baptist University, Hong Kong)

Landholdings and the Immobility of Rural Citizens in China

The conventional view of China's internal migration posits that the migration and social mobility of rural citizens are driven by urban jobs. Drawing on a national household survey dataset, this paper explores how the mobility choices of Chinese rural citizens are determined by individual and familial endowments at the sending end, including their physical wellbeing, basic education, family livelihoods and landholdings. The results confirm that good health, adequate educational attainment and non-local family livelihoods increase the propensities of out-migration while a lack of these endowments likely bars rural citizens from migration. The possession of rural land and other local resources, in contrast, tends to deter migration to urban destinations. Being the largest asset for most rural citizens in China, landholdings in the countryside function as a selection mechanism to sort rural citizens into various localities and social classes, propelling trans-regional class formation and reproduction. In response to the trend, the paper calls for policy intervention to enhance the wellbeing and life chances of the geographically and socially immobile members of the rural community.

HARB, Jenna* (Australian National University, Australia)

Contradictions of Localization in (Transnational) Crisis Response: The Case of Lebanon

Depicted as remedying the racist and colonizing effects of disaster response, localization initiatives seek to address the exclusion of local actors from funding, coordination, and partnerships. Local actors (e.g., non-governmental organizations, community groups) have indispensable social knowledge and community relations that are required to meet emergency needs more effectively and equitably. This presentation draws upon a multi-sited ethnography of humanitarian adaptations to overlapping crises in Lebanon to empirically explore how localization materializes power relations that contradict its aims. I argue that, although well-meaning, localization unintentionally reifies the domination of local aid groups by Western-European actors and transnational institutions. Three findings trouble linear narratives of localization, suggesting the need to question the assumptions and structural constraints of localization in the sector. First, in practice, it can amount to what scholars describe as 'predatory inclusion.' Efforts to involve locals in humanitarian projects undermines local autonomy and leadership, which fortifies power asymmetries that favor transnational interventionists. Second, the selection of local partners is highly preferential by sorting and ranking local actors. In preferring ones that are like INGOs and encouraging local actors to 'delocalize' and 'professionalize' themselves, hierarchies between local groups are enshrined. Third, capacity building is often self-serving in disproportionately benefitting out-of-state agencies and catering to transnational understandings of what constitutes (in)capacity. These dynamics collectively assimilate locals to

the transnational humanitarian system rather than addressing much needed structural change that meaningfully includes locals. By reckoning with the inequities of insincerely 'joining forces,' it is possible to consider transformative and locally-led practices attuned to social justice.

HARDY, Antoine* (UMR5116 - CNRS Centre Emile-Durkheim, France)

Numbers and Power Struggle in Academia

With this empirical paper, I will present results from an ongoing PhD dissertation in political science. My fieldwork is a group of French scientists having developed a carbon tracker to estimate the carbon footprint of the French research lab to change current academic practices in the name of "environmental urgency" (Labos 1point5, 2019). From an STS and sociology of quantification perspective, I see quantification as a social process (Desrosières, 1993 ; Martin, 2020 : Mennicken and Salais (eds.), 2022) and metrics as "highly contested symbols" (Christin, 2020). For this paper, I want to address the following question: to what extent numbers produced through this process of "carbon footprinting" are able or not to challenge the dominant normative vision of academic productivism? Among 42 interviews so far, I especially conducted 21 semi-structured interviews with researchers and technical staff, mainly from life science, using the carbon tracker in their labs. I identify five "sites of political and social struggles" (Bowker and Star, 1999): mobility in academia, beliefs in value-free science, inequality in ability to change daily routine work, myth of the "endless frontier" (Sarewitz, 1996), and ambivalence in role-set (Merton, 1976). Finally, this paper will address the link between power asymmetry in contemporary academia and climate change.

HARRASS, Driss* (Ryukoku University Criminology Research Center, Japan)

Understanding the Ongoing Get Tough Movement Regarding Juvenile Justice Practice in France and Japan – Tracking a Common Direction of Change

The phenomenon of juvenile delinquency has become particularly politicized in the last two decades in many so-called democratic countries. Japan and France are no exception and the penal treatment of minors has been the object of several reform movements which question the protective model of these two systems through a "toughening" of the procedures for judging and treating acts of delinquency committed by non-adults. This presentation intends to analyze these reforms with regard to the phenomena of juvenile delinquency - looking at the function of institutions and the social and political contexts of Japan and France.

I will present the results of textual research carried out across France and Japan, which will try to comment on the following:

1. How legitimate these reforms have been by considering the structure of policy and practice before these changes, through a historical analysis, I will consider the welfare values of these two systems and try to explain the needless of their reduction in priority.

2. I will explain how and why the French and Japanese people came to focus on political issues related to juvenile delinquency and will try to clarify the political mechanisms that preceded the reforms; situating this in the different socio-political contexts. Doing so, I identify the mechanisms of penal populism as a main driving force behind the reforms in France and Japan.

3. I will explain the forms of toughening that have taken place in the two countries and the impact this has had on the treatment of juvenile offenders. I will put particular focus on the similarities and differences of these reforms regarding the social and political background of both countries.

Finally, my analysis will present a hypothesis - that an overlapping ideology exists across these two countries that acts as the driving force behind these changes in practice and policy.

HARRIS, Jasmine* (University of Texas at San Antonio, United States)

Doing Historical Sociology: When Am I a Part of the Story?

Historical sociology seeks to understand how society developed over time, where researchers are concerned with how social structures and cultures begin, change, and reproduce. But locating, collecting, and analyzing archival data to establish such understandings is multi-faceted, both from disciplinary perspectives and methodological approaches. The role of the principal investigator for historical sociology research is thus varied. But where do we fit into the story? How much of the work of creating knowledge in historical sociology should be told from the point of view of the researcher? What does

that add to our understanding of the research? As Patricia Hill Collins reminds us in *Black Feminist Thought*, there is a unique value in the researcher's role and the research process when there are shared minoritized identities. This paper uses the experiences of a Black woman sociologist developing the historical sociology project, "A Passing Love: The Life and Times of Ellen Love and Other Stories of White Passing at America's Most Elite Schools," to explore the process of doing historical sociology from a Black Feminist Epistemology. It argues that reflexivity and auto-ethnographic data collection in the historical sociology research process allow for examining how and why archival data is so challenging to collect on social phenomena among minoritized communities that are not well documented, like white-passing through the Civil Rights Movements. Most importantly, the author advocates for bringing researchers' voices to the forefront as a necessity for moving historical sociology forward in alignment with the movement of the larger discipline.

HARRIS, Laura* (University of Southampton, United Kingdom)

Curating Windows, Creating Cultures: A Place-Based Analysis of a New Curatorial Trend

This paper develops on previous work by the author investigating the relationship between the built environment and meaning-making at cultural institutions. It does so through a focus on cultural institutions' windows. Windows are critical points of contact between different domains of meaning, exposing the agendas and assumptions that circulate in physically-proximate but culturally-distinct places. This paper focuses on an emerging phenomenon: the use of cultural institutions' windows as a location for artistic interventions, not least as a way to secure audiences in "covid-secure" ways. Two urban case studies will be given: a play performed through windows to an audience gathered outside (MAC, Belfest, 2021); a commissioned visual artwork created directly on art gallery windows (Fruitmarket Gallery, Edinburgh, 2021). The argument will run that these window-based initiatives are informed by tourism-adjacent pushes to brand a place as "creative," and rely on the idea that the value and meaning of creative practices can travel, unaffected, through the built environment. These case studies lead to a sociological analysis of how art and place are mutually constitutive. The paper concludes that these new attempts to use windows as a way to break down the barriers between places of artistic meaning-making and their neighbours in fact reveal much about the ways in which meaning is sliced up in the contemporary city.

HARTL, Jakob* (University of Halle-Wittenberg, Germany)

Storming the Capital. Power, Domination, and (Mis-)Recognition

Recent developments, not least the Covid-19 pandemic, put the state back in the driver's seat and on the sociologists' tables. Yet, understanding differences in the publics' responses to the policy measures enacted by and within different nation states demands a sound theorising of state power as epistemic power.

In this paper, I develop a synthesis of Bourdieu's theories on state (2014) and territory (2007), based on the idea of a central bank of forms of capital and the devaluation of territories in the course of unifying them into a (nation) state, with three forms of domination – violence, knowledge, charisma – as put forward by Graeber and Wengrow (2021). This serves as a basis for a re-examination of Mann's idea of infrastructural power (1984), which I extend to Marshall's ideas (1952) to demark new conflict lines in state-citizen relationships and to understand the dialectic nature of penetrative state power and state granted citizens' rights.

More recent readings of Bourdieu (e.g. Atkinson 2016) argue for an understanding of capitals as forms of or depending on recognition. This is inherently coercive, either overtly as violence or covertly via state institutions, especially educational, with the latter's simultaneously integrative and alienating function. Thus, knowledge becomes (state) power, whereas misrecognition of this capital appears as freedom – even if to the detriment of e.g. people's health in a pandemic or the peaceful transition of power after an election. This is even more pressing in the light of a coinciding of infrastructural and despotic biopolitical power, which for the better part of the 20th century has been legally restrained, at least in Western democracies.

Time Is a Great Healer? Social Cohesion over the Course of the Covid-19 Pandemic

Research in various scientific fields dealt with the relationship between the global Covid-19 pandemic and social cohesion. Whereas in the early weeks of the pandemic social cohesion was identified as a driver of infections (Thomas et al 2022), this effect reversed its direction as soon as measures for containing the disease were enacted. Simultaneously, the relationship between social cohesion and the development of the pandemic appeared increasingly diverse:

denotes a presenting author. Abstracts are organized by first presenting author's last name.

lockdowns, mask mandates and quarantine measures negatively impacted social cohesion (cf. Borkowska & Laurence 2021); then again, social cohesion fostered adherence to imposed measures and acceptance of the vaccine (Lalot et al 2021).

Little research however established a sound link between the progression of the pandemic and currents in cohesion, not least due to a lack of longitudinal data. The proposed paper tackles this by combining original panel data (collected in twelve villages, towns, and cities) with local administrative data on the 7-day incidence and the progress of the vaccination rollout (RKI 2022). The first wave of the panel study (n=12,493) was conducted in four federal states in Germany in early 2021, right at the initiation of the inoculation campaign whereas the second wave will be carried out in January 2023. Both waves include a composite indicator on social cohesion, based on the three dimensions identification, trust, and collective efficacy (Chan/To/Chan 2006; Sackmann/Rees/Hartl forthcoming). Correlations between Covid incidences around the time of survey and the aggregate measure of social cohesion indicate a positive link between cohesion and the willingness to adhere to relevant means to stop the infection on local level. In the final paper, we seek to bolster these findings with data on inoculation, and show, whether social cohesion (trust, identification, collective efficacy), increased or decreased over the course of the pandemic, and its effects on the societal recovery from Covid-19.

Food Technopolitical Innovation and the Geographies of Inequality

The environmental impact of livestock farming challenges human-animal relations. In this context, cell-cultured meat, or meat made in the lab, emerges as a technopolitical innovation to multispecies entanglements, promising solutions to some of the most devastating impacts of food protein production. We conceive of synthetic protein production as a promissory assemblage, which means that cultured meat includes a set of uncertainties which, paradoxically, nurture the industry's promissory lure. While it could deliver some positive impacts, we wish to highlight other, far less calculated risks, such as the mobilization of new food supply chains across the world and the creation of new inequalities. These new geographies also create new entanglements and inequalities between Global North and Global South as suppliers and consumers of these new products. To reduce the negative environmental impact of carbon-intensive industrial livestock farming, alternative proteins might transform those production chains, and particularly re-locate them to those countries where the technology is more advanced. This has been the case in the development of cell cultured meat, a high tech innovation process, the advancement and regulation of which is centered in Europe, USA, and Israel. In this respect, then, the meat "revolution" can actually reproduce "durable" (Tilly, 1998) inequalities. Our contribution is based on expert interviews with scientists, food designers, investors and politicians, as well as visual analysis of synthetic food products' promotion. Looking at cell-cultured meat as a "cluster of promises" (Berlant, 2011), we side with attempts within STS to imagine an alternative techno-scientific future for meat production and consumption.

From Scarcity Memories Towards Alternative Futures: Intergenerational Dialogues in the Global South

The act of eating, besides nutrition, is an act of imagination as it involves memories, social realities perceptions, and people's aspirations for a better future. In the context of Climate Change, food production is pointed out as a resource intensive industry connecting Global South countries as important producers and emerging markets. Animal products, especially meat, are in the spotlight in the context of Sustainable Diets due to their high emission of greenhouse gases and water footprint. However, it is also important to discuss the role of meat consumption from a sociological perspective as it embodies different narratives and meanings in different generations. While the young generation can bring the perspective of meat's negative environmental impact, the older generation relates it to memories of deprivation and class mobility as well as dreams of achieving a better life. This intergenerational encounter can result in conflict, but it also carries the potential of mutually influencing and multiplying new food consumption practices. Therefore, first-hand ethnographic data was collected from young consumers who negotiated between personal values and family narratives around their household meat consumption in Shanghai, China and in São Paulo, Brazil. These students recognized that in addition to the information they brought to their family, other factors exert more significant influence, such as their experiences of food deprivation, their views of what a "better life" consists, and their experience of social mobility. In the experience of the encounter between contrasting worldviews and the resistance of breaking the connection (because they are part of the family), the subjects of different generations are faced with the challenge of recognizing themselves in their values, privileges,

and intersectionalities. Food consumption and the new role of Sustainability require an intercultural, intergenerational, and global debate in order to build an inclusive and just path towards Social Change.

The Struggle of Thai Massage Parlor Owners in Japan Under COVID 19

In this presentation, the author will show how the Thai immigrant women in Japan have been coping with the difficulties under the COVID 19. Especially, the focus will be on the way in which a mutual support by the Thai community together with the support from the Japanese civil society has been offering basic human needs for Thai immigrants in need without a proper public assistance.

The influx of Thai female migrants to Japan has begun since the late 1980s and the number of Thai women in Japan reached 35000 in 2021. Within 35000 women, quite a few numbers of them are self-employed, especially as an owner of Traditional Thai massage parlor.

These massage parlors should be formally registered, but not so much different from the business in informal sector in terms of the vulnerability. In general, covid 19 severely hit the service industry in Japan, and the service industry including such Thai massage parlors has a huge number of female non-regular employees. And there is no special scheme which targets such vulnerable workers in Japan, no public institutions provide any official support for Thai massage parlor owners.

In this situation, the outreach project which aims to visit the Thai massage parlors with food supplies has been started by one Thai-speaking Japanese NGO worker. The project is well involving the members of Thai community and the Thai monk living in the same area. Involvement of the Thai monk has made this project encouraging for other Thai community members who are well off to join.

As above, this presentation will illustrate Thai women's situation as a case study to show what kind of resources the invisible, vulnerable immigrants can use to survive COVID 19 in Japan.

Youth Action for Climate Crisis Protection: Fridays for Future, Global and Japan

Fridays for Future, a network of young people working on climate change issues, is still active despite the COVID-19 pandemic. In Glasgow, UK, during the UN Climate Change Conference (COP26) in November 2021, about 100,000 people marched to demand more aggressive action to combat the climate crisis. In mid-September 2019, this campaign succeeded in mobilizing more than 7.6 million young people globally, which is the world record for the number of participants in a street campaign. We can evaluate that this is the most successful collective action worldwide. We may wonder why these campaigns have been so successful. However, in spite of this global success, in Japan involvement in these activities has been small and slow compared to the rapid upsurge elsewhere. Why have these campaigns in Japan been so limited in terms of the number of participants mobilized, cities where street campaigns have been held, and influence on the media and within government, at both the national and local level? This article offers some answers to these questions from the perspective of social movements, focusing on cultural framing, mobilizing resources, and the structure of political opportunities.

Japanese youth groups use the name *Fridays for Future* in English with no translation. It would be very difficult to express and nobody has come up with a good counterpart phrase in Japanese. Similarly, there is no person who is a symbolic icon like Greta. Generally, in Japan, young people are silent, cynical, or indifferent. Japan's social movements are weak in terms of funding, human resources, organizational foundations, and the involvement of experts. In terms of the structure of political opportunity, youth groups have not yet succeeded in finding an effective political route to push aggressive climate policy. There is no specific political program or agenda following the street protests.

New Professionals and the Organizational Making of the Individual. Universities As Model Case.

Various new professionals are engaged in modern universities. Among these are knowledge transfer and corporate relations officers, leadership and development officers, personal integrity officers, educational developers, and curriculum designers. Any of these job titles represents the growing coterie of new professionals who serve to excel others – faculty and early career scientists included – in their roles and identities by upgrading individual capabilities and jettisoning short-comings. A characteristic feature of these new professionals is their role in relation to both individuals and organizations. New professionals

measure and evaluate individuals and their contributions to the organization. At the same time, they consult, advise, and tutor them and care about their well-being. In so doing, new organizational professionals aim not just to upgrade the capacity and performance of the university, but also to improve the performance and capability of individuals.

In our presentation we shed light on the interplay of the spread of new professionals on the one hand and the profusion of new scientific roles and identities on the other. Drawing on the insights of institutional theory, we first introduce the concept of the modern individual and relate it to the characteristics of contemporary organizations. In a second step we shed light on new professionals in universities and illustrate how they intervene in core activities of universities. In a third step, we discuss how new professionals evaluate and intervene in the context of teaching, research, and societal impact, and what role specific formats and standards play in this context. Finally, we reflect upon the making of the academic individual by new professionals as supporters of a standards-based, multidimensional good-enough mentality that contrasts sharply with the traditional meritocratic ideal of academia.

Legal Need in Australia: Towards a Shared Definition and Conceptual Understanding

The law is part of our everyday life, embedded in and regulating commercial interactions, personal relationships, health, employment, housing, and our dealings with the government. Yet, the Australian justice system is increasingly unaffordable to non-wealthy people. Australian governments fund the legal assistance sector to meet the legal needs of the most disadvantaged and marginalized. However, definitions of legal need are contested and confused within the literature. Current research offers only partial accounts of legal need. It does little to explain the mechanisms of legal need's production in the context of structural inequality, its interaction with disadvantage, or its cumulative and complex impacts on people's lives. Services want more knowledge to target services and advocacy in an environment of funding scarcity and to inform more appropriate service delivery models responsive to clients' complex needs. Existing research does not offer a robust pathway to a methodology for measuring or predicting unmet legal needs in communities.

This paper reports on the first stage of a three-year study to better conceptualize legal need across its social, political, legal and health dimensions and explain why some individuals and communities develop legal needs and others do not. The project involved 24 semi-structured in-depth interviews with sector employees purposely selected for their diversity of experience within varied organizational types and occupations. The object was to gain insights into how the sector currently understands legal need.

The findings are presented along four interrelated conceptual themes: 1) top-level definitions of legal need; 2) a preliminary conceptual framework synthesizing understandings of legal need within the sector; 3) the intersection of legal need and other socioeconomic problems within an individual's life; 4) the structural components of legal need, including the relationship of legal need with marginalization, disadvantage, administrative and legal systems, and the law itself.

HASTINGS, Catherine* (Macquarie University, Australia)

Why Do Some Highly Disadvantaged Australian Families Become Homeless and Others Do Not? Resources in the Context of Disadvantage, Housing and Welfare

Homeless families include children, for whom the experience of homelessness and extreme poverty can have long-term negative impacts over the life course. This paper proposes a resource-orientated causal explanation of the mechanisms of family homelessness in Australia. Given the critical role of poverty in housing insecurity, the model explains why some families living in extreme poverty and disadvantage become homeless and others do not. It suggests the structures, contexts and mechanisms that could explain this occurrence.

The research is positioned within a critical realist approach to theoretical causal explanation and influenced by social theory conceiving forms of homelessness as an extreme placement on a continuum of disadvantage. Interdisciplinary literature and psychologist Hobfoll's Conservation of Resources theory inform and support the interpretation of empirical data analysis and development of the theoretical model. The presentation of the model is the focus of the paper. A brief overview of findings from the literature and quantitative analysis of three datasets, including the longitudinal survey Journeys Home, will be used to establish the evidence base for the model.

In summary, this research shows that for families living in disadvantage in Australia, the current welfare and housing contexts are the most important conditions for family homelessness. Families use their resources to mitigate challenges to their housing security, but manifestations of disadvantage constrain their capacity to act. Disadvantage limits their accumulation of resources and contributes to an acceleration of resource loss. In the Australian context, an acute lack of affordable housing and the disconnect between the amount of welfare payments and the income required to secure private rental accommodation severely impacts a family's capacity to navigate crises and avoid homelessness. The causal model also highlights the importance of social and human capital and psychological reserves in the resource mix available to families.

Hate Speech and Internalisation of International Human Rights: A Case Study of the Social Movement Against Racism and Anti-Hate Speech Law in Japan

The rise of xenophobic campaigns against minorities in Japan has drawn both domestic and international criticism. Responding to the recommendations of the UN human rights treaty bodies, Japan enacted its first anti-hate speech law in 2016. To resolve the puzzle of this 'teethless' but effective soft-law, this study examines how international human rights norms are internalised in the development and implementation process of anti-hate legislation, based on the theory of the socialisation of international legal norms, transnational legal processes, and "vernacularization" (Merry 2006, Levitt and Merry 2009) of international human rights: namely, how international law works on the ground with a social acceptance, appropriation and local adoption of globally generated ideas and strategies. This paper analyses the pros and cons of the anti-hate speech law: despite the extremely narrow definition of hate speech which excludes many minorities from the scope of the protection and no-punishment against hate speech to "strike a balance" with the right to free speech, the law has some ripple effects on anti-racism local movements and stricter regulations in municipalities. In the analysis, this paper highlights the role of strategic litigations against hate speech, which contributes to the development of the law, rules and norms against racism and hate speech. Based on interviews with various actors including ethnic minorities in Japan, government officials, lawyers, and activists, this study describes the dynamic process of the anti-hate speech movement in Japan, in which litigation is not a conservative strategy dominated by elites, but is rather a cooperative process comprising of lawyers, civil society, local communities and international human rights bodies, where the goals of the social movement are complemented by individual litigation. This study also proposes a broader framework to understand strategic litigation by focusing on the interaction between domestic and international human rights advocacy.

Unfavorable VISA Status and Intersecting Acculturation Factors Linked to Depression

Visa status and acculturation are important constructs for understanding depression among immigrants. Using segmented assimilation theory and the fourfold assimilation model and data from the 2003 New Immigrant Survey, we examined the association between visa status and acculturation with depression status among immigrants residing in the United States. Visa status was operationalized as favorable (employment, unlimited family, and diversity visa holders) and unfavorable (limited family, refugee, other, and legalized visa holder). Acculturation was measured as English language proficiency and diet change. Depression was assessed as the presence of depressive symptoms or symptoms suppressed by antidepressants. Logistic regression results showed that immigrants with unfavorable visa statuses have higher levels of depression compared to favorable visa holders. However, when after adjusting for English language proficiency, the visa situation largely lost its significance. We also found that lower English language proficiency was associated with higher levels of depression among unfavorable visa holders compared to favorable visa holders. Also, higher dietary acculturation was associated with a higher level of depression among limited family, refugees, diversity, and other visa holders. In addition, we found that although acculturation as English language proficiency did not vary by visa status, acculturation as diet change did. Different visa categories appeared to have unique patterns of association with depression depending on their acculturation level and type. The study underscores the importance of visa type and acculturation for immigrants' health. Since both visa status and acculturation are important in determining mental health outcomes among immigrants, when developing migration policies, it is necessary to keep in mind the effects of these policies on the health of immigrants. Further studies using more recent and longitudinal data are warranted.

Under the Same Sky: Introductory Notes for Life-Imprisoned Kurdish Literature in Turkey

This paper is an attempt to make generation(s) of life-imprisoned Kurdish literature visible, through exhibiting that the literary works of life-imprisoned generations uncover the very nature of Turkey's state policies –i.e. systemic violence with impunity- at play, and highlight the existence of a robust line of struggle and resistance against such policies.

Life-imprisoned Kurdish literature, here, stands for the works of four generations born and raised in four consecutive decades (from 1960s to 1990s). By and large, the authors from these generations joined the Kurdish liberation movement in their teenage years, and after a brief period of political activity, were arrested and sentenced to disproportionately long years in prison –i.e. participation in political activities are sentenced to life-imprisonment or its equivalent, and being in contact with 'participants' are punished with less (12.5 to 22.5 years).

We have traced more than 150 published authors (writing in Turkish or Kurdish). It is safe to assume that this number is the tip of an iceberg, implying the high frequency of life sentence and its equivalents for generations of Kurds, and marking that mass imprisonment functions as a generation-cide.

Yet, life-imprisoned Kurdish literature serves as a means against this very generation-cide. The subject of the works of these authors is not limited to prison conditions, but they are narratives based on memoirs, lived experiences of peoples, or oral historical data compiled in prison conditions. As exemplified in the paper, these works also recover links between generations, transfer information about lived experience of peoples through generations, and create a space for the younger generations to compare the world they live in with another. While they are far from being political propaganda, through a critical lens, recover and reconstruct individual and collective memory, and become an inspiring and creative example of resistance and struggle.

"Fear of Missing Real Life": From Parental Regulation to Youth's Self-Control of Screen Time

Youth and digital technologies are seamlessly intertwined and for young people digital devices and the relationship with them is very commonplace. Youth are seen as a digital generation or digital natives with a Mannheimian "fresh contact" with their social and environmental setting – unlike their parents. At the same time, however, there seems to be a lot of suspicion and concern among parents about their children's digital relationship and usage. Reflecting this, the concept of "screen time" has risen regularly in recent years, especially in the moral debate on the use of media by young people, and it refers to the time spent on various display devices, often without making any distinction between activities.

In this presentation, we look at the adult concern raised by the use of digital media by 15-years-old young people by focusing on how they recognize and react to this concern about screen time, on the one hand, by telling about the adult control they experience and, on the other, by thinking how the time spent on "screens" means that something more "real" and "important" is missed. In the presentation, we bring out how young people seems to recognize the moral hierarchy between spending time on digital devices or doing something else and how they have developed a fairly conscious relationship to the use of certain digital technologies, especially smartphone with applications focused on social media, as something to be monitored, measured, and limited: usage and its significance are downplayed and anxiety is felt about use that is perceived excessive.

The presentation is based on both the quantitative and qualitative data collected in the research project "Capturing Digital Social Inequality – Young Digi-Natives' Asymmetrical Agencies within Socio-Technical Imperatives and Imaginaries" (DEQUAL) (2020–2024).

A Rationale for Community-Driven Antiracist Initiatives during Global Health Crises: Lessons from COVID-19

Global health emergencies are fertile ground for racism and xenophobia, both of which been observed on a global scale since the onset of COVID-19. Additionally, the pandemic has highlighted how social exclusion and various forms of health inequity disproportionately affect ethnically and religiously diverse communities during global health emergencies. This highlights the syndemic nature of COVID-19, whereby already vulnerable groups face heightened marginalization during times of social and/or economic upheaval. The needs of these communities, however, have been largely omitted from COVID-19 planning and policy measures in Australia, and limited scholarly attention has focused on community perspectives - particularly as they relate to addressing pandemic-related racism as a symptom of Australia's longstanding, systemic problem of racism and xenophobia. In this presentation, I discuss the findings arising from semi-structured interviews with multicultural service providers and community leaders in Melbourne, Australia. These expert stakeholders offered their perspectives on how researchers, policymakers, and communication professionals can work with ethnically and religiously diverse communities to develop strategies for engaging in culturally-informed and collaborative antiracism initiatives. Analyzed through a Systemic Racism lens (Feagin & Elias, 2013), these interviews illuminate how pandemic-related racism in Australia reflects a longstanding pattern of racialised exclusion with direct impacts on the physical, mental and emotional wellbeing of multicultural communities, thus offering further support for the concept of racism as a social determinant of health. My findings also highlight the importance of ongoing collaboration with multicultural communities in antiracism research, policy and advocacy efforts. I conclude that approaches that center the expertise of ethnically and religiously diverse communities in the development of antiracist initiatives are urgently needed to effectively respond to future global health communication crises in an informed, inclusive, and culturally sensitive manner.

Making Sex Boring: Organising Relationships through Standardisation

Standards and standardisation emerge in numerous and unexpected areas. Yet, and perhaps least explored are the ways that standardisation emerges in sexual relationships. The purpose of this study is to explore standardisation as it appears in the categories of relationship status in government paperworks: the categorisation and standardisation to recognise sexual relations. This novel research attends to the ways that people become governmentalised as they attempt to enter social welfare care. Application forms are required to gain assistance and therefore, as an applicant selects boxes and completes the required information, their independent ways of living must conform to the standardised boxes to define them. The study methodologically explores unemployment application forms from the European Union with special attention to relationship status. These were collected and correlated to determine the scope of practice and is followed by a case-study examination of an individual form and the standards that underpin its category or relationship. The findings expose the tension from the individual application, relationship categories governmentalising lived experience into acceptable categories for eligibility of care. This study is illustrative of the many ways that application forms and the categories present on them can be explored to reveal sites where individuals must submit to mechanism of organisational standards.

Influence of Children's Leaving Home on Parental Attitudes: The Case of Japan

Most research on leaving the parental home of youth has focused on the occurrence and timing of the leaving home and the impact of their parent's socioeconomic status. On the other hand, previous studies paid less attention to the changes in parental attitudes and socioeconomic status accompanying a children's leaving home.

In this study, we use Japanese panel data to examine the effects of children's leaving home on parents' life and marital satisfaction, subjective evaluation of wealth, and equivalent family income.

Our first hypothesis is that children's leaving the parental home affects parental attitudes or socioeconomic status after children's leaving home. The second hypothesis is that those parents' changes associated with children's leaving home depend on the parental socioeconomic status.

We use the Japanese Life Course Panel Surveys (JLPS), a longitudinal study initially conducted in 2007 by the Institute of Social Science at the University of Tokyo. The sample consists of men and women aged 20-40 living in Japan as of December 2006, and follow-up surveys have been conducted annually since 2007. In this analysis, we use data from the 1st wave to the 15th wave (2007-2021).

We employ the first-differenced model with respondents' outcomes as dependent variables and the presence of children cohabitating with respondents as independent variables controlling their socioeconomic status. We set the parameters to distinguish between cohabitation and separation directions for parents and children.

The result shows that children's leaving home negatively affects fathers' marital satisfaction rather than mothers' satisfaction. However, it does not

denotes a presenting author. Abstracts are organized by first presenting author's last name.

affect the parents' subjective evaluation of wealth. Regarding differences in the impact of children's leaving home by parental socioeconomic status, parents of lower socioeconomic status were more strongly negatively affected.

How Engineers Account for Their Professional Identities

The field of safety science has long taken as truth that accidents are organisational in their origins, meaning that rather than taking the actions of an individual worker on the front line as the cause of a failure, we look instead to the organisational systems and context, and the leadership of senior personnel. Following this, the field has a strong focus on systems of workplace surveillance in the sense of a focus on rules, reporting, and compliance, organisational identity (under the banner of "safety culture"), and organisational learning. Within this focus on systems of organisational socialisation, which aim to guard against major failures, the professionals involved in the design and oversight of complex sociotechnical systems appear "docile", with their rights, duties, and capabilities obscured. Based on an analysis of the accounts of professional backgrounds of 97 gas sector workers, most of whom were engineers, we examine the messiness involved in organisational socialisation in the context of a professional group who are involved in project-based work, who are geographically mobile, work with different technologies, work between organisations in the case of consultancies, hold different positions responsible for changing activities, and have careers that nospan decades. We suggest that it is the performance of "the work" over long temporal scales that makes people. The structures matter, in that organisations put effort into guiding the behaviour of their employees through incentive programs, workplace training, and organisational hierarchies, but for workers it is first and foremost what they do in their working lives, in changing organisational, interpersonal, geographical, and technological contexts, that forms their professional selves.

'Looking Good, Being Good, and Doing Good'. Moral Governance and the New Responsibilised Music Festival.

Music festivals have become a ubiquitous aspect of music economies and wider cultural processes of participation and regeneration. On the one hand they are framed as authentic spaces for community, connection and celebration. On the other, they are now at the centre of various tensions within questions about the environment, social inclusion, migration, commodification, and digitisation. In this context, this paper draws upon frameworks from governmentality literatures, and especially the concept of responsibilisation, to reframe understandings of the possibilities, strategies and tasks of the contemporary music festival. While this is an established literature, demands on festivals to become responsible in a wider range of ways suggests a reinvigoration of the usefulness of the governmentality approach. Responsibilisation has been extensively applied in studies of neoliberal agency, typically at the level of the individual, here we argue that the concept can be used to explain how festivals now operate as sites required to re-enchant not just the neoliberalisation of the sphere of music production but community more broadly. Drawing on the cases of three festivals in Britain and Denmark and data from interviews with organisers, we explore how and why the music festival is now required to have an emblematic role in 'addressing' a wide range of social, environmental, political and cultural issues. Whereas classical literatures on festivals emphasised liminality, boundary-crossing and freedom, contemporary literature has yet to coherently address festivals as a 'new' working surface for critiquing sociocultural and political issues and imagining alternative futures. Our analysis illustrates the processes and pressures that impel the music festival to adopt forms of embodied, material, enterprising and ethical significance to fulfil an emergent social and political role.

Place-Making, Conflicts, and Borderland Lives in Northeast India

Place-making, Conflicts, and Borderland Lives in Northeast India
Drawing on ethnographic research in the *Dollungmukh-Mingmang* foothill areas bordering the Assam and Arunachal Pradesh states, this paper attempts to situate the border-making experience of the indigenous people in the foothills of North-eastern frontiers of India. The significance of this foothill space lies in its geographical positionality—between the hills of Arunachal Pradesh and the Brahmaputra valley of Assam and the presence of a loosely demarcated and highly contested domestic border between both the states which plays a key role in everyday lived experiences in the foothills. Historicising this space leads to the understanding of it as a geography of radical transformations from the pre-colonial 'point of contract' between two contrasting polities to colonial tea plantation zones to a modern day 'borderscape'. The colonial intervention

engineered the socio-spatial separation between hill and valley which has been carried over by the post-colonial state as well and these foothills are now epicentres of subnational border skirmishes. Further, the construction of a 70 kms long PMGSY roads has been the centre of contention in the *Dollungmukh- Mingmang* foothill areas. It's construction has been triggering claims and counterclaims over access to village commons in a disputed zone which sometime results into violent inter-village clashes between villages of both the sides as well as with the authorities. Hence, this paper focuses on the way such infrastructural interventions produce different territorial effect in terms of everyday experiences of bordering—aspirations, solidarity, resistance and vulnerabilities. Engaging with the concept of 'borderscape', this paper tries to understand borders as sites of struggle which opens a new space for a new kind of political subjectivities by bringing out the agentive response of the borderland people.
Keywords: borderland, foothills, Northeast, place-making

Constructing India's Northeast: A Study of Politics of Identity

Northeast India is the easternmost region of the country. It is a frontier region that shares nearly ninety-nine percent of its borders with neighbouring countries. Northeast India was a colonial construct and it continues to be one by having a historically difficult relationship with the Indian nation-state. Although India's Northeast is a land of diverse cultures, certain issues have paralyzed the land. The Northeastern people have to face an identity crisis in their own country. They are in their agonized search for an identity of their own. The pivotal sense of the binary relationship of 'center' and margin, self and other, superior and inferior, dominant and dominated, upper and lower between mainstream India and Northeast India have been rampant in the region and 'mainland' India since the time of independence. So the question arises, how is identity constructed in Northeast India? Why Northeast face an identity crisis? Is this because it is far away from the 'mainland'? Why are the Northeastern people always looked down upon as 'others'? What makes the people from Northeast India so alienated from the 'mainstream'? This paper aims to study the politics of identity in India's Northeast. The primary argument here is to examine the politics of identity as portrayed in anthologies. For this study three anthologies have been selected, including *The Oxford Anthology of Writings from North-East India* (2011), *Dancing Earth: An Anthology of Poetry from North-East India* (2009), and *Anthology of Contemporary Poetry from the Northeast* (2003). This paper attempts to look at the issue of identity from a postcolonial perspective and will involve textual analysis. The methodology allows us to look at the marginalization of the Northeastern states and the 'othering' of the Northeastern people. The people from the Northeast demand that they should be treated as equal citizens of the country.

Authoritarian Masculinism: Globalizing, Mainstreamed, Contradictory, Converging, Banal, Autotelic?

Depending on location, authoritarian masculinism is not new, but very close, a part of violent empire and normalized history. What seems newer is the globalizing and mainstreaming of authoritarian masculinism, and its contradictory combining of rigidity and fluidity, along with simultaneous harnessing of various resources: direct violence, violation, and threat, both individual and institutional; organizational, managerial and financial power, through the state and economic corporations; and cultural power, especially via digital technologies and misogyny online. In each case, the means of production of authoritarianism, and thus destruction, have developed and are developing at rapid pace and with greater potential, and through tendencies towards convergence of politics, economy, culture, even entertainment. These tendencies may be coupled with personal 'charismatic' masculine power, and religious, mystical or national imaginaries. They can be seen most clearly in authoritarian 'world leaders' and their associates, authoritarian political parties including within what are considered liberal democracies, and more or less organized and supportive groupings and movements in 'civil' society. In this session, I discuss these processes and their implications for banal authoritarian masculinism, with bravado, denial of vulnerability, and anti-democratic preferences trickling down. Trickle-down economics does not seem to work, but 'trickle-down authoritarian masculinism' seems more effective, legitimating violations, and violences, of different kinds, begetting violences, and masculinist wallowing and vengefulness.

Feminist Knowledge Production through Building Transnational Feminist Academic Organising: The Case of RINGS

RINGS (International **R**esearch Network of **In**stitutions of Advanced **G**ender **S**tudies) was initiated in 2012 and formally founded in 2014, growing from 19 founding institutions concentrated in Europe to now more than 70 institutions in all world regions and reflecting geopolitical diversity. Instead of individual membership, RINGS is open to gender studies (broadly interpreted) research groups, units, centres, universities, and other institutions. The organisation engages in many activities. These include annual conferences and national reports, transnational research collaboration and development, feminist research practices and mechanisms, safe spaces of support and exchange, support for threatened institutions (with neoliberal and right-wing threats, including not only member institutions), as well as democratic development. RINGS is an institutional structure operating globally against gender inequality in the social sciences and beyond with expanding and disrupting North-South divides. The presenters have all been co-chairs over the life of the organisation.

In this presentation, we reflect sociologically and self-critically on the character of the organisation, its form, membership, development, contradictions, change and challenges. Amongst the many relevant issues, we address three of the most salient for this session. First, there is the question of how RINGS stands at the interface of feminist scholarship, feminist organising, and feminist activism, as part of knowledge production under feminist lenses. We evaluate what this means for transnational inequalities and differences while challenging knowledge production. Second, the institutionalisation of feminist knowledge production in and around RINGS is an important and at times contradictory process. Although the principle of institutional (not individual) membership has been central throughout, continuing features have been the involvement of scholars at different career stages, along with contradictory impacts on the institutionalisation of feminist knowledge production. Third, (trans)disciplinarity figures strongly in terms of interrelations of gender studies as a 'post-disciplinary discipline' (Lykke), the social sciences, and beyond.

HEATH, Melanie* (McMaster University, Canada)

Forbidden Intimacies: Polygamies at the Limits of Western Tolerance

This book is published by Stanford University Press, 2023

In the past thirty years, polygamy has become a flashpoint of conflict as Western governments attempt to regulate certain cultural and religious practices that challenge seemingly central principles of family and justice. In *Forbidden Intimacies*, Melanie Heath comparatively investigates the regulation of polygamy in the United States, Canada, France, and Mayotte. Drawing on a wealth of ethnographic and archival sources, Heath uncovers the ways in which intimacies framed as "other" and "offensive" serve to define the very limits of Western tolerance.

These regulation efforts, counterintuitively, allow the flourishing of polygamies on the ground. The case studies illustrate a continuum of justice, in which some groups, like white fundamentalist Mormons in the U.S., organize to fight against the prohibition of their families' existence, whereas African migrants in France face racialized discrimination in addition to rigid migration policies. The matrix of legal and social contexts, informed by gender, race, sexuality, and class, shapes the everyday experiences of these relationships. Heath uses the term "labyrinthine love" to conceptualize the complex ways individuals negotiate different kinds of relationships, ranging from romantic to coercive.

What unites these families is the secrecy in which they must operate. As government intervention erodes their abilities to secure housing, welfare, work, and even protection from abuse, Heath exposes the huge variety of intimacies, and the power they hold to challenge heteronormative, Western ideals of love.

HEATH, Melanie* (McMaster University, Canada)

White Masculinity Redeemed: Religious Fundamentalism in Authoritarian Times

In North America, the politics of resentment among white men has been simmering for years, erupting in full force in the last few. The Capitol Insurrection in the United States on January 6, 2021, united a majority of insurrectionists who were predominantly white men, fueled in their rage by hypermasculine groups like the Proud Boys, Oath Keepers, and the 1st Amendment Praetorian. Such extreme groups have roots in other religious men's movements such as the Promise Keepers that loomed large at the turn of the 21st century. In Canada, the "freedom convoy," which began in January 2022 in Ottawa, also brought together a majority of white men to showcase masculinity and toughness to fight against the "feminine" Liberal government of Justin Trudeau. The reasoning of these insurrections are laced with Christian ideals of redeemed masculinity. Whiteness and masculinity circulate to enable white women leaders who draw on traditional values to support hegemonic ideals of leadership and patriarchy. Marine Le Pen in France is a charismatic woman politician who has performed hegemonic masculinity without being punished by supporters for doing so, drawing on conservative religious belief about men's leadership in society while also leading her party. In this talk, I discuss the ways that religious fundamentalism is enabling whiteness and masculinity in much of Europe and North America to take hold in contradictory ways that enable authoritarianism to flourish.

HEDLUND, Erik* (Drottning Kristinas Vag 37, Sweden)

From What to How Building up Civil-Military Collaboration Skills through Training and Practice

After the end of the Cold War, a belief in eternal peace emerged in Sweden, and many other countries, with the result that military defense in Sweden was greatly reduced and civil defense was completely dismantled. As a result of Russia's invasion of Georgia, 2008 and the annexation of Crimea in 2014, the Government changed its view of the security political situation and decided to start rebuilding Sweden's total defense, consisting of both military and civil defense. The aim of total defense is to develop the readiness and capability for crisis management and war through collaboration between both civilian and military actors. Research shows that there are a number of shortcomings in the ability to act jointly in crises. Training and exercises are carried out with the aim of developing the ability to collaborate. Against this background, the present research project aims to study how civil and military actors at the regional level manage to build skills and capacity for civil-military collaboration through training and practice.The study's theoretical framework is team learning and constructive alignment. The study includes participative observations and interviews. Preliminary results show that the aims of the training and exercises are to increase the ability to collaborate, but mainly lead to learning *what* should be done and not *how* it should be done.

Keywords: civil-military collaboration, training and exercises, team learning, constructive alignment

GROSSMANN, Katrin (University of Applied Sciences Erfurt, Germany)

How Emotions Impact the Research Process and Its Outcomes. the Example of Researching Nationalist, Regressive Movements in Peripheralized Places.

Since the Emotional Turn in the social sciences, emotions have increasingly been a subject of interest in research. For decades, feminist researchers in particular have emphasised the ethical responsibility and importance of reflexivity in the research process that this entails (see Holland 2007). It is all the more surprising that the emotional experience of the researcher itself still receives very little attention in research practice, even though it has obvious implications for the research process, such as how we move in the field, how we ask and interpret certain statements, and last but not least how we deal with our emotions that arise and how these experiences impact future research (see Hubbard et al. 2001).

A special challenge seems to be research on nationalist, authoritarian actors and regressive movements, investigated in marginalized and peripheralized contexts. A certain degree of empathy is the basis of any interview situation. But what does this mean for research in anti-democratic contexts? While marginality usually evokes sympathy and agency of social scientists, with heuristics at hand explaining the production of marginality, stigma and the like, researchers working on this topic are confronted with actors their practices and values, we feel alien and even hostile to. This impacts the research process in a number of ways. During interviews, the own political positionality is undeniably present and influences any communicative situation. Negative emotions like anger, rejection, even disgust mix into the communication on both sides. Further, established ways of interviewing are called into question by the fact that we as scientists and science itself are questioned by the field.

The presentation draws from focus groups with researchers and own research experiences in the field. We will highlight the interwovenness of emotions, own political positionality and activity, as well as normative and analytical perspectives.

Recording the Digital Present, Shaping Digital Futures: How People Relate to Their Ageing Digital Traces

In 2010, danah boyd characterised online communication as being "persistent-by-default, ephemeral-when-necessary". While this may be true in the short term, in the long term we find that hyperlinks steadily rot, human and machine errors mean data are lost, and platforms and online services are deemed unprofitable or unsustainable and shut down. Recognising the vulnerability of online material, libraries and other actors have been working against the tendency of digital traces to become unavailable by archiving and republishing selected online materials in web archives. Their shared goal is to create and make available a permanent record of the digital present.

The shifting dynamics of digital traces—their circulation, removal, archiving, and redistribution—raises critical questions for sociology: How do people respond to having their digital traces archived and republished? What is the role of these "ageing" digital traces in shaping individual and social memory? And how do these "digital pasts" reshape the "digital present" for different social actors? Drawing on interviews with former bloggers whose old blogs have been archived by Australian libraries, this paper details how the meanings associated with the digital past are produced at the intersection of institutional histories and processes and the lived experiences and affective encounters of ordinary people. For these bloggers, the capture of their digital traces by an archiving institution fosters a sense of belonging to a much older and larger collective culture. Archiving therefore changes not only the temporal orientation of online material, but its social meaning and people's imagined connection with others—a connection that fostered and sustained through ideas of trust and legitimacy in the archiving institution. As such, this paper shows how diverse social actors come into contact through a shared desire to remember and be remembered, and how the imaginaries they coproduce shape the meanings of these future archives.

Dancing for Intimacy – Transformation of Relationships in Old Age

Old age has traditionally been associated with the loss of intimate relationships and loneliness. However, new research indicates that intimacy and relationships among older people have been changing in late modernity. The dance floor, we argue, is one important arena where some of these new kinds of relationships are enacted. The aim of this study is to explore intimacy and intimate relationships in the case of couple-dance among older people. Drawing on interviews with 29 older people in Sweden, we show how emotional bonds arise among "dance friends", bonds which are only tied to the context of the dance floor. We also show the importance of momentary intimate encounters in dance interaction. We argue that couple dancing offers intimacy for its own sake, rather than as a way to form or maintain long-term relationships. In this way, couple dancing provides intimacy beyond long-term obligations and points to a richness of intimate relationships in old age.

Military Deployment during Covid-19: Implications for Security Sector Governance and Civil Oversight

In times of crisis, states run a risk of executive dominance and executives are often quick to resort to the use of the security sector to address an array of challenges. This risk also emerged during the global Covid-19 pandemic where states used the security sector, notably the military and police, in various ways to respond to the pandemic. These included the deployment of the military in public order duties, and health and logistical support across the globe, resulting in varied outcomes ranging from positive humanitarian contributions to misconduct and brutality that led to the death of citizens in some cases. This study reviews the utilisation of the security sector in different countries during the first year of the Covid-19 outbreak as well as the effectiveness of concomitant accountability measures, notably that of parliamentary oversight. The study finds that the initial lockdowns in the countries reviewed constrained parliamentary activity, resulting in a lack of adequate oversight of the security sector when it was most needed. While this improved over time to varying degrees, there was often a limited depth of inquiry into the Covid-19 deployments in terms of their mandate, and were found guilty of human rights violations. This study looks at how these factors affected civil oversight and accountability of the military, especially in cases of extraordinary deployments, and the associated risk of executive dominance.

HEINECKEN, Lindy* (Stellenbosch University, South Africa)

South Africa: Domestic Operations and the Military Response to the COVID-19 Pandemic

This study looks at the challenges and concerns raised by the ever-expanding domestic deployments, and more specifically, throughout the nationwide lockdown during the Covid-19 pandemic in South Africa. The aim is to show that the extensive deployment of the military in domestic roles raises several questions about the operational capacity, preparedness and readiness that affect the functioning, status, and legitimacy of the military. Beyond this, the Covid-19 deployment highlighted that the adversarial mindset of soldiers can have negative consequences for the armed forces, especially where the soldiers interact with the civilian population. As seen in the South African case, the failure to ensure that military personnel behave in a disciplined and professional harmed the legitimacy and trust of the populace in the military, and ultimately government. The challenge the SANDF now faces, with the increase in deployment in domestic deployments is how to balance its various roles and to determine "which 'enemy' or 'destabilising entity' will inform their future internal deployment doctrine. First, the SANDF must get this right and second in terms of its deployment in domestic operations. Secondly, to cultivate a military and organizational culture that enables them to perform these missions without abusing the security and human rights of citizens.

Surveys and Big Data: Closing the Gap?

Identifying training trends and new training requirements on the employment market at an early point in time is crucial to put this information to use for regulatory work and training research. For this purpose, we monitor and analyze structures and trends in individual occupations, fields of activity, industrial sectors, companies and continuing vocational training offerings. However, the rapid development of technologies on the one hand challenges the response time for this, and on the other hand leads to the need to response in even shorter time.

However, most of the questions mentioned above are currently answered with classical social science methods. For example, we use questionnaires and studies to analyze the prestige or perception of trainings and jobs (for example "BIBB-BAuA-Erwerbstätigenbefragung"). In addition, we have extended data on advanced trainings, labor market monitoring, and training rules. On the other hand, several, largely unstructured, data sources are with multiple big data-attributes (variety, velocity, veracity, volume) are available: Job advertisements, Social Media Data, etc. This data is unstructured, it reverses the question-to-answer relationship, and it is not representative because a population is neither known nor definable. However, the mass of data opens up new possibilities for analysis, but are often not ready to be included in data-science workflows.

In this paper we will discuss, how the gap between big data and traditional data can be closed. As an example, we will use these mentioned structured and unstructured data. This must be done in an interdisciplinary manner between social sciences and computer science. While velocity and volume of data will be shown to be no show-stoppers, the variety and veracity of data are still challenging. Besides, the FAIRification of data is key within the field of public outreach and social coordination of scientific research.

HELVE, Helena* (Tampere University, Finland)

Hermeneutic-Phenomenological Research on Young People´s Individual Experiences of the COVID-19 Pandemic and Their Thoughts about Future

The study analyzes the individual experiences of young people with the COVID-19 pandemic, describing them with own youth spoken language, and interpreting the essential contents of the meanings hermeneutic-phenomenologically. In the spring of 2021, I interviewed a total of ten (5 women and 5 men) young seasonal workers from 19 to 27 years old in Finnish Lappish ski resorts. Dialogical interviews on young people's coronavirus experiences and their implications for the transitions from education to employment and future orientations were semi-structured, partly discussions of topics related to their future orientation in education, work and transition to adulthood combined with their implications. The main topics of discussions were related to the effects of COVID-19 on the young person´s own life. The young people in the study had experienced more optimism than pessimism in their time in Lapland. Of course, the pandemic has changed their normal life, but it has also given them time to think and plan the future more realistically. The basic themes that cut across the entire material were: 1) The small impact of the pandemic on the young person's own life. 2) The uncertainty of life and uncertain future and 3) the experienced loneliness, which can provide for youth to confront their true selves. The implications of these results will be discussed

in this presentation, which also critically considers the applicability of the hermeneutic-phenomenological methodology in youth research and discusses about ethical points of the study of young people in exceptional contexts.

HEMATHILAKA, Janaka* (Janathakshan, Sri Lanka)

Strengthening Mobilization of Private and Sub-National Domestic Investments in Sri Lanka for the 2030 Agenda

The government of Sri Lanka, in 2015, responded proactively to the 2030 Agenda as the first country in the Asia-Pacific Region to establish a Cabinet Ministry for Sustainable Development. The government's approach to implementing SDGs is seriously weakened by low awareness and capacity at the provincial and local government level and engagement as well as not having a proper monitoring and reporting mechanism, localizing and decentralizing implementation and developing a financing architecture to attract both foreign and domestic financing. Absence of a robust national monitoring, evaluation, follow up and review mechanism, insufficient official statistics, lack of space for private sector and civil society organizations to engage in planning and implementation of SDGs, are other key challenges for successful implementation of SDGs in Sri Lanka.

Accordingly, different local and international organizations made efforts to support the government to establish partnership of localized SDGs through their projects. This paper presents findings of action research implemented by "Janathakshan" (local not-for-profit organization) with relevant stakeholders.

Its main objective was to build transformational capacities and facilitate engagement of private sector and subnational governments to align their investments towards the implementing the 2030 agenda in Sri Lanka.

The project has made a considerable contribution to improving the knowledge on SDGs among provincial and local governments in three selected locations and some other areas through capacity-building programs. It has also supported strengthening links between national, provincial and local governments leveraging localizing and decentralizing efforts of the government. The project developed a "Domestic Resource Mobilisation Frame-work" widely accepted by stakeholders. It provides an overarching framework to national, subnational and private sector stakeholders to align their investments with the 2030 Agenda.

'We Don't Need No Education': Human Capital Formation and Social Immobility in Industrialising Coventry, 1790-1850

We explore the interaction between human capital and social mobility in industrialising Coventry (ca. 1790-1850) using a novel linked longitudinal dataset. The dataset was constructed by linking detailed school admission records in local archives to parish vital statistics, marriage certificates, and the censuses. Instrumentalising the strict age cut-off operated by our charity school, we deploy a quasi-experimental research design to ascertain the causal relationship between human capital and social mobility. In adulthood, those boys rejected because they were (marginally) too old demonstrated lower levels of human capital than those accepted to the school, as measured by their ability to accurately recall their age and sign a marriage certificate.

However, this human capital advantage failed to yield occupational mobility. Upon graduation, the school organised apprenticeships. We explore whether the accepted and rejected boys were apprenticed to different trades or to higher-quality masters; in neither regard do the two groups differ significantly.

We argue that social mobility is not simply the result of the sum of educational inputs, but a product of the complex interaction of education with local labour markets and socio-political institutions. For context, we compare the market for apprenticeships with that of London. In Coventry, we argue that a restrictive labour market and rent-yielding welfare and political institutions acted to effectively impede occupational social mobility.

Freeman status in Coventry was uniquely awarded to those completing apprenticeships. A 'greenbelt' of land to which freemen held access rights constricted the growth of the city and consequently restricted the diversification of its economy, which remained largely limited to weaving and watchmaking, yet enclosure was politically challenging. Further, charitable funds and political rights held out to freemen acted to limit occupational mobility: the guaranteed political rents available for inherited occupational continuity were more attractive than the opportunities associated with occupational and geographic mobility.

HENRICKS, Kasey* (University of Tennessee at Knoxville, USA)

TABOADA, Diego (University of Tennessee at Knoxville, USA)

A City so Cold: Winter Parking on the Streets of Segrenomics

Four out of every five vehicles towed in Chicago for snow-related parking violations were seized on days of no recorded accumulation. Leveraging multiple sources of public data over a five-year nospan (2012-2017), we use a series of negative binomial regression models to show how those parked in predominantly Latinx neighborhoods are mostly like have their cars impounded for snow-related violations on non-snow days while controlling for a host of other factors. Meanwhile, those cars towed from predominantly Black spaces are more likely to go unclaimed and sold at scrap value. In a sharing economy of precarity, where companies like Lyft and Uber may offer the only job opportunities available, the dispossession of someone's car can devastate a person's livelihood. Who buys these cars? The same clout-connected company that has gradually assumed the City's towing and impoundment services since 1989. United Road Towing landed an exclusive contract only nine days after the company's creation, and its ascendence into Chicago's political scene stood, in part, upon a white racial imaginary that linked supposed parking violations to threats to public safety and property values. Through a series of euphemistically named private-public partnerships with other municipals modeled after the Chicago experiment, United Road Towing has become among the largest towing companies in the world. "City So Cold" is an inquiry that parses the relationship between racial capitalism and spatial production by historicizing Chicago's first attempt at privatization, theorizing how racialized hardship results from the draining of neighborhood resources, and quantifying which segregated communities are subject to these new sites of extraction – all within the world of winter parking regulations.

TG10-JS-140.1

HENRICKS, Kasey* (University of Tennessee at Knoxville, USA)

ORTIZ, Ruben (Center for Policing Equity, USA)

The Irrelevance of Innocence: Ethnoracial Context, Occupational Differences in Policing, and Tickets Issued in Error

"The Irrelevance of Innocence" is a case study of Chicago that focuses on parking tickets that are written under false pretenses. We leverage multiple data sets against one another to demonstrate that more than one in eight tickets over a six-year nospan were written under conditions when restrictions did not apply. Then, we situate these findings within a multilevel framework to answer three questions: (1) Are errored tickets more likely to be issued in neighborhoods with higher proportions of Black or Latinx residents? (2) Are errored tickets more likely to be issued by patrol officers as opposed to parking enforcement officers? and (3) Does ethnoracial composition moderate the relationship between ticketing authorities and errored tickets? The implications of our findings (1) quantitatively trouble the ontological assumptions of data that are defined from a policing standpoint and (2) underscore an adjudicative process that routinely sanctions drivers without cause -- all within a ticket-processing technology adopted through a private-public partnership that was designed to alleviate these errors in the first place.

Academics Together and Challenged to Survive the Crisis and the Health Crisis

The context of the pandemic, the social revolt in Chile and the pressure to respond to work impacted the subjectivity of some academics, modified the perception of working conditions and narrowed the distance between public and private life.

This paper is the result of participant observation in the university context during the context of the Pandemic and social revolt in Chile. The purpose of this study was to know the contents that form the arguments in the tension "responding to the demands of work versus being overwhelmed by the demands of everyday life".

Evidence is presented on the acceptance of control practices to respond to the demands imposed by university managerialism in Chile and the acceptance of such practices in the face of the fear of losing jobs in contexts of uncertainty due to the pandemic.

The findings reveal processes of subjectivation that made it possible to question the alienating experiences and the alienating experiences that they reproduced while facing those same alienating forces that prevented them from overcoming them. This generated tensions between personal desires and the capacity for action in contexts of crisis, generating experiences of anguish between what the academics wanted to do and what they could do in contexts of work and life uncertainty.

Settler Colonialism's Code of the Streets: Street Violence, Street Gangs, and Supporting the Indigenous Body As Violent

Colonization has utilized violence in specific ways to control, surveil, remove, and kill Indigenous peoples in the advancement to control resources. Through this agenda, Indigenous bodies and actions have been constructed as violent, wherein violence itself becomes a valid tool to be used against Indigenous

peoples. Violence has been enacted overtly, covertly, and through physical and political means. For colonization to occur and colonialism to maintain itself into its present form of settler colonialism, Indigenous peoples have had to be constructed in relation to the colonizer, but in a way that the colonizer is promoted as civil, moral, and holds a position of authority, wherein their lives are valued to be worth living. In doing so, the process of colonization to present day settler colonialism in Canada, specific codes have been created to maintain authority over Indigenous life. To examine this process, this paper focuses on spaces of Indigenous street gangs to highlight how Indigenous street gangs and their members are a floating signifier, which cannot be easily defined, but is understood within specific ways, and holds power for the state to enact violence onto Indigenous peoples for the perceived violence associated to both gangs and Indigenous peoples. Focus will be paid to specific cases where Indigenous males were murdered and the narrative in the community was that it was under the guise of 'protecting' settler spaces. Therefore, settler colonialism has come to construct localized street codes that provide the state and settler actors the ability to continue to validate violence onto Indigenous peoples that they would not allow onto themselves, under the guise of protection.

Mentalities and Cross-Generational Strategies of Maintaining the Social Status of Middle Class Families

Our research project focuses on middle-class families and their status maintenance across generations. We intended to explore complementary perspectives on individual and linked lives and to identify family mentalities and cross-generational status maintenance strategies. By interviewing three generations, we placed a special focus on intergenerational ties and the conditions under which mentalities, resources, and strategies are passed on or modified.

We conducted narrative family interviews and interviewed three to eight family members of three generations between August 2018 and August 2021. Middle classes are defined by their historical segments; the project accordingly focused on three occupational fields: Professions in quasi-governmental fields like medical doctors (bourgeoisie), self-employed skilled craftspeople (old middle class), and university graduates in technical fields like engineers (new middle class). People of the second generation who work in one of the three professional fields served as anchor for recruiting further family members. The narrative interview technique facilitated the collection of respondents' own stories about their experiences and the examination of how they assign meaning to them. We combined the verbal data collection with graphic elicitation of biographies and family relationships by means of timelines and genograms (visual data collection). Therefore, we have an embedded qualitative multimethod design. The analysis is guided by a reconstructive approach and identified five different types of status maintenance.

Our talk will primarily focus on these five different types of status maintenance and explain their characteristics. Furthermore, we will show, how our multimethod approach helps us to analyze intergenerationally-related biographies as well as intergenerational relationships.

HERMOSURA, Aira Kristine* (University of Guam, Guam)

Diabetes and Cultural Lifestyles of Micronesian Ethnicities in Guam

Diabetes is one of the top leading causes of death in Guam, which has an ethnically diverse population of indigenous Chamorros, other Micronesians, Asian communities, and other ethnicities. Unfortunately, diabetes has no cure, and the prevalence rate of diabetic patients in Guam continues to rise. This research study examines Chamorro and Chuukese ethnic groups in Guam diagnosed with diabetes, pre-diabetes, or family history of diabetes and their lifestyle associated with culture. The study seeks to determine if the correlation between ethnicity and lifestyle has a negative or positive impact on the experiences with diabetes in Guam. This study also assesses the possible effects of other social issues that may contribute to the lifestyle of Chamorros and Chuukese living with or without diabetes. Since diabetes has no cure and a relatively large portion of Guam's population suffers from diabetes, assessing the lifestyle behaviors and cultural factors of Chamorros and Chuukese is essential for awareness and prevention. The methodology consists of two-semi standard interviews and 40 empirical surveys, utilizing SPSS to analyze data. Both qualitative and quantitative data were examined to determine the relationships between lifestyle and cultural factors and diabetes.

Institutional Catalysts and Citizen Participation: The Case of the Historic Center's Fiduciary Fund in Mexico City

This paper examines the role state actors can play as institutional catalysts (Bhatta 2006) able to bring together and multiply the effects of otherwise fragmented and, in several cases, demobilized or weak social actors. Such an institutional catalyst was present in Mexico City's *Centro Histórico* (Historic Center) and absent in a comparable area of the city, *Roma Condesa*, and ended up making state-society relations and policy outcomes more fruitful in the former in spite of being an area with less favorable conditions. Building upon the literature on state-society synergy (Evans 1997), and invited participation (Cornwall and Coelho 2006), the paper examines the conditions under which state actors can level the playing field among otherwise unequal players in the process of defining, implementing, and monitoring urban (and other types of) public policies. Particularly during the second half of the 2000s, formerly demobilized and fragmented communities in Centro Histórico had significant levels of success in co-producing public policy with the local state as their (more limited) resources were pooled together and/or expanded upon through the work of an institutional catalyst such as the area's fiduciary fund (*Fideicomiso del Centro Histórico*). Moreover, the progressive faction leading the institution at the time built upon the political practices and ideas of previous social movements in the city and, by so doing, managed to (at least temporarily) prevent the displacement of the urban poor from the city's historic center.

The Dominican Feminist Movement's Fight for Abortion Rights through Las Causales

The Dominican Republic is one of the very few countries in the world that have a total ban on abortion. This situation prevents women from interrupting their pregnancies, even under extraordinary circumstances. The paper examines the tactics the Dominican feminist movement has employed for more than 20 years to challenge the extensive influence of the Catholic Church, Protestant groups, and other conservative organizations, which directly oppose women's right to choose. These tactics include: (a) focusing on three extreme situations or "*causales*" where the majority of the population agrees that abortion should not be penalized; (b) emphasizing that the unsafe ways in which abortion is currently practiced disproportionally affect poor and Afro-descendent women, and (c) highlighting the secular character of the Dominican State. Following Alain Touraine and Manuel Castells' framework, this paper examines the Dominican feminist movement's goal, identity, and adversaries. The paper argues that the Dominican feminist movement has shown extremely high resilience, creativity, and international networking in part because of its small size compared to its peers in the region.

Loneliness, Social Support and Mental Health Among Older Adults without Cognitive Impairment Living in Nursing Homes: A Cross-Sectional Survey Study

Background. Loneliness increases the risk of having worse physical and mental health, and affects individual well-being and community life. Loneliness is made up of multiple aspects and each person experiences it differently. Yet, we have a limited understanding of the meaning that older adults give to the feeling of loneliness and how they cope with those issues. The scarce research about this topic from a sociological perspective is centered on community-dwelling older people, and there is almost nothing about older adults living in long-term care facilities.

Objective. The objective of this work is to analyze the relationship between the feeling of loneliness and some indicators of physical and mental health of older adults living in long-term care facilities.

Methods. We conducted a cross-sectional study that included a survey with a sample of 390 older adults living in 25 long-term care homes in Andalusia (Spain). We used two inclusion criteria: a) obtain 24+ points in the Mini-Mental State Examination, and b) do not have any diagnosed or evident cognitive impairment. The questionnaire included feeling of loneliness (6-item de Jong Gierveld scale), depressive and anxiety symptoms (PHQ-4 – PHQ-2 & GAD-2),

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

self-perceived health status, and the Multidimensional Scale of Perceived Social Support, and sociodemographic control variables, including the relationship with their family.

Preliminary results. The sample mean age was 83.2 years old. In total, 63% experienced loneliness (emotional loneliness=73%; social loneliness=45%). 55% declared depressive symptoms, and 44% declared anxiety symptoms. Regarding health status, 60% declared it was bad or very bad. We found a preliminary inverse relationship between social support and the feeling of loneliness. Being married, higher level of education, better health, and stronger family links were protective factors against loneliness. Association between these variables and mental health scales was less clear. *Detailed results would be presented at the conference.*

Complaint-Oriented "Services": Shelters As Tools of Criminalizing Homelessness

This article examines the dynamic relationship between the street and shelter. Drawing on participant observation alongside police officers, social workers, and homeless men and women residing on the streets and shelters of San Francisco, this explains how the expansion of shelter and welfare provisions supports and directs the increased criminalization of homelessness in public space in two steps. First, I document how police repression increases immediately following the opening of new shelters in the neighborhoods in which they open. Second, I reveal how shelter beds are used as a privileged and increasingly necessary tool of the police to arrest, cite, and confiscate property of the unhoused, albeit in the guise of sanitary and public health initiatives. The article concludes by considering how shelters increasingly function as complaint-oriented "services," aimed at addressing the interests of residents, businesses, and politicians, rather than the needs of those unhoused.

HERRING, Christopher* (UCLA, United States)

"Prescribing Housing to Treat COVID-19: Towards a Sociology of Housing in the Time of Pandemic"

The first decades of the 21st century have presented a series of crises that have exposed housing as source of inequality under late capitalism, as well as a key site of policy intervention in recovery. From 9/11, the Katrina floods, Chicago's heatwave, the 2008 financial crisis, and Hurricane Sandy urban sociologists and housing scholars have shown how housing both explains the disparate social, economic, and health impacts of disasters and how housing policy can mitigate or aggravate preexisting inequalities. Building on this existing scholarship this essay considers recent housing policy 12 interventions to address the COVID-19 pandemic in US cities. Drawing on a case-study of the city of San Francisco and the state of California, the first part of the essay examines the unique challenges of viral spread that intersect with the home: requirements of shelter-in-place, selfisolation, quarantine, as well as the dangers of congregate living in settings such as homeless shelters, jails, nursing homes, immigrant detention centers, and SROs. The second part reviews the unparalleled policy reactions by cities, states, and federal government to keep people housed through mortgage, rent, and eviction relief. The essay concludes considering how these prescriptions of housing in a time of crisis might provide lessons for a more just and progressive housing policy in settled times.

Women's Bodies Resisting Against the Gendering of Science and Technology after the Islamic Revolution of Iran (1980s)

Although Ayatollah Khomeini had promised that his "Islam made women equal with men",[1] the Islamization of science and education in the aftermath of 1979 revolution showed otherwise. The closure of universities from 1980 to 1983 provided an opportunity for the Headquarters of the Cultural Revolution (HCR), the first S&T policy body established in the Islamic regime, to apply discriminatory practices on both science and women's bodies. The HCR's patriarchal vision manifested itself into two sets of policies and practices; one directed towards shaping and restricting spatial and physical appearance of women, such as enforcing the Hijab in universities and dividing classrooms into male and female sections; the other was disciplinary policies, such as banning women from entering particular fields (e.g. engineering and agriculture), or opening certain disciplines exclusively for women (e.g. midwifery and nursing). In other words, the gendering of science and technology in the early 1980s took the form of both "prohibition" and "provision" policies, a fact that has been mostly overlooked by Western scholarship. Neither of these sets of policies were tolerated passively by women both as students and professors. Contrary to the established view, focusing on the state's enforcement of gendering policies in science and technology, I will show the women's agency in those struggles for equity and equality which has been relatively successful. Reviewing the historical background of anti-women policies, I will argue that Islamization of science and technology in Iran was built upon a quasi-scientific stereotype about women's bodies and its "physiological features." Ironically enough, the

Islamic Republic justified its gendering policies in science and technology, not based on theological argumentation, but by the abuse of very same science which it tries to Islamize.

Balancing Economic, Social and Ecological Imperatives in Facing Multiple Challenges in Sri Lanka

During the period from the second world war up to the late 1970's, welfare state model became appealing to many countries outside Europe including many post-colonial societies as a way of making economic development more inclusive and equitable. Sri Lanka, a former British colony, was also influenced by progressive social policy discourses even before independence in 1948. This led to the adoption of a mixed development model in the 1950's aimed at striking a balance between economic growth and social welfare.

However, the above situation changed when the protectionist, welfare-state model gave way to a liberal, open economic model in the late 1970's under the influence of neo-liberal ideas spreading at the time. While the role of the state was curtailed, private capital began to play a dominant role in both the economy and social sectors. When urban centers began to grow due to rural -urban migration, private health, education and transport services also expanded there. Moreover, decreasing rates of taxation reduced state revenue leading to declining public investment in social welfare and public services. These developments led to greater income inequality, rural-urban disparities, increasing casualization of employment, polarization between private and public services, etc.

It is against the above backdrop that the low -income groups became more vulnerable to internal and external shocks like Covid19, climate change induced disasters, increasing cost of imports and today's unprecedented economic crisis in Sri Lanka.

Above discussion shows that the country has to find a mix of public policies that can balance economic, social and ecological imperatives. Yet, what is also needed is substantial improvement of governance to create an environment conducive for evidence -based policy making. Sri Lanka's widespread public agitations also point in the same direction.

Inclusive Development, Sustainability and Democracy: Illusive Goals in the Context of Neo-Liberalism, Populism and Resurgent Authoritarianism in Sri Lanka

Many ex-colonial countries and territories that emerged as independent states after WW2 adopted protectionist development policies under the influence of resurgent nationalism. Yet, due to growing endogenous and exogenous pressures since the late 1970's, many countries embraced neo-liberal economic policies to varying extents and opened their economies to attract foreign capital (Plant, R.2012). The new economic and other opportunities created by the above policies not only led to economic growth but produced many changes in the social, political and cultural landscape, often resulting in unprecedented inequalities (Hettige, 1996), increased mobility of people within and across countries, new social and political movements and a more contentious and divisive socio-political environment (Hettige & Gerharz,2015). These developments also gave rise to new authoritarian tendencies among the emergent political and economic elites to contain increasing political dissent among marginalized segments of society, in particular, disaffected youth and minorities, at times leading violent conflicts accompanied by brutal state repression.

Sri Lanka's socio-political trajectory from its independence from the British colonial rule in 1948 to the present is a case that fits well with the pattern of change outlined above. In fact, the country moved on beyond early authoritarian tendencies in the 1980's to embrace a form of political populism that has increasingly combined violent, ethno-nationalism, a system of pervasive patron-client politics and an increasing concentration of power and resources in the hands of illiberal, rent-seeking politico-economic elites drawn from diverse backgrounds (Hettige &Mayer, 2000), Subedi & Hettige,2022). The present economic crisis in Sri Lanka is largely the culmination of the developments outlined above. This paper provides an analysis of social and economic change over several decades leading to the present crisis.

RADFORD, David (University of South Australia, Australia)

"Because of My Age, I Keep Getting Rejected, Because I'm Too Old to Work There" Unpacking the Complexity of the Lives of Older Hazara Afghani Humanitarian Migrants in a Small Australian Rural Township

The refugee and migrant status alone does not determine the experience of the new settlers nor their social inclusion and belonging. Their experiences intersect with other factors such the visa status, family situation and relationship status, as well as the age. This paper considers how intersectionality can help us understand and recognise the complexity of the experiences, recognize multiple and fluid identities that are context dependent.

The field work was done with the Hazara humanitarian migrants settling in a small regional township of Leeton, NSW, Australia. It showed how different identities intersect to create disadvantages, as well as privileges for some Hazara humanitarian migrants. It was evident in unpacking how the age and life stage determine relative positions of the Hazara in the community. It also shows the levels of disadvantage they face in accessing the equitable opportunities in a new community. Older Hazara refugees were more likely to compromise their health and potential educational goals in favour of their multiple roles and responsibilities for providing for families. Furthermore, due to language barriers, lack of understanding of the system, difficulty accessing resources, and particularly the small size and seasonality of the local labour market, they are more likely to be exploited by employers.

Dual-Earner Parents' Synchronized Working Arrangement during the COVID-19 Pandemic: A Recurrent Event Analysis

Since the onset of the pandemic, dual-earner households with dependent children have encountered numerous troublesome challenges transforming their daily lives, such as altered work-life balance, disorganized childcare, and at-home schooling. In the meantime, alternative modes of work have gained popularity to the extent that telecommuting has become an inseparable part of the global working culture. Under such circumstances, parents have had to constantly adapt their paid and unpaid work arrangements. In this study, we explore possible synchronization between working parents in their selected work setting, i.e., working from home (WFH) versus working at the workplace (WAW) and identify possible factors moderating the synchronization process.

We use the Familydemic Harmonized Dataset, resulting from an international collaborative study that collects relevant information on work-family related topics during the COVID-19 pandemic. The data includes nationally representative samples of parents of dependent children from Canada, Germany, Italy, Poland, Sweden, and the United States. Based on monthly longitudinal data on working arrangements of respondents' and their partners', we generated event history data stretching from March 2020 to May 2021on both parents' exits from a particular working arrangement, i.e., WFH or WAW. To allow for individual-specific heterogeneity, we perform logistic random effects (RE) regressions for each work arrangement, providing appropriate tests to compare RE estimates of matching events with regular pooled OLS ones.

Our empirical results indicate that parents are inclined to synchronize their working arrangements during the Covid-19 pandemic. However, such synchronization is moderated by family and work characteristics. For instance, partners with older children are less likely to adopt a synchronization strategy. Synchronized exits from WFH seem to be more prevalent among cohabiting couples. Parents' occupations seem to be a significant source of heterogeneity in their synchronization behavior. Moreover, the more extended the working arrangement spell, the less likely individuals exit that particular arrangement.

Australia's News Media Bargaining Code: A Case Study in Digital Platform Sovereignty

On 17 February 2021, Facebook restricted the posting and sharing of news on its platform in Australia, a tactic in its campaign to avoid being regulated under Australia's News Media Bargaining Code. 'Accidentally' swept up in the news restriction were many government health and emergency services pages, while at the same time, Facebook committed itself to providing relevant health information to Australian users. This was a clear incursion into the government's role as the provider of official health information, and one of several such moments of tension surrounding state sovereignty demonstrated by digital platforms in this case study. This paper presents the findings of a detailed study of platform discourse in response to the News Media Bargaining Code, which requires Google and Facebook to negotiate payments with news publishers for news content appearing on the platforms. Following

a Foucauldian discourse analysis, and drawing on theoretical frameworks from Bratton and Chun, the analysis allows for close examination of how language and infrastructure were deployed in support of functional platform sovereignty. The paper demonstrates how Facebook and Google wielded their infrastructural power to directly challenge state power and position themselves as alternative sources of official information and regulation, while positioning the government as technologically and legislatively inept. Platform discourse and infrastructure such as the graphic user interface are key sites of ideological battle, and this case study highlights how Facebook and Google used their responses to the News Media Bargaining Code to not only threaten Australian sovereignty, but to issue threats to governments globally.

A Change from below...from Above? Engaging Consumers As Knowers in Hospital Leadership, Governance and Monitoring

Frontline workers in hospitals have commonly been conceptualised in institutional ethnographies as staff working face-to-face with patients and their families. Yet an army of people do 'behind the scenes' work in hospitals in attempts to shape these encounters for 'quality improvement'. This includes Clinical Governance advisors, hospital executives and consumer representatives increasing invited to 'sit' on committee meetings. What happens when we shift our attention to the 'change work' undertaken by these 'behind the scenes' workers navigating complex institutional process everyday interactions in their quest for a more socially just and culturally safe healthcare system. Individual people in hospital leadership positions can be committed to 'doing things differently' but at times may be unsure how to do this, have their attention pulled elsewhere or may not have the support of their peers. This might lead leadership to invite external groups, such as researchers, to provide 'expert advice' on how to proceed. Can consumers be positioned as knowers of solutions to problematic institutional practices? Or is their knowledge dismissed before they enter the hospital doors? Is it possible to engage in 'mutually beneficial partnerships' between hospital staff and consumer representatives to make transformative change in the way hospitals are governed and 'safety and quality' is monitored? What happens when people trouble the rhetoric of 'patient-centred care' and question who determines what it means for healthcare to be safe and of quality. Conversely, can executives challenge existing ruling relations they are so heavily invested in for transformative change? How do we reach that delicate balance of achieving buy-in 'from above' while also ensuring accountability and navigating the tensions of inherent in 'biting the hand that feeds you' when doing activism work. Or does everyone's work just get co-opted by the same politico-administrative regimes?

Institutional Ethnography (IE) As a Sociology with Indigenous Peoples

Dorothy E. Smith characterizes institutional ethnography (IE) as a sociology *for* rather than *about* people. Authors of this paper are both non-Indigenous white settler women. Together we address questions of IE research practice that arise in investigations of colonial ruling relations.

- What elements of IE are compatible with its take-up as a sociology *with* as well as *for* Indigenous peoples?

- How might non-Indigenous researchers partner with or be led by Indigenous peoples in IE projects?

- Can non-Indigenous institutional ethnographers presume to adopt the IE analytic standpoint of Indigenous peoples?

- How might non-Indigenous institutional ethnographers approach positionality and reflexivity in their investigations of colonial ruling relations?

- How can developing an awareness of Indigenous ways of knowing support non-Indigenous institutional ethnographers in their inquiries into the social organization of knowledge, without cultural appropriation?

- What methodological strategies and tactics might non-Indigenous institutional ethnographers incorporate in their research practice to evade colonial institutional capture?

In addressing the questions above, we offer points for reflection. Our goal is to encourage non-Indigenous institutional ethnographers not to reproduce colonising social relations in research with Indigenous peoples. We acknowledge we are all caught up in colonial ruling relations in our everyday lives in different ways yet, collectively, we have a responsibility to actively oppose and work against their reproduction.

Embodied Archives of Down Syndrome: Making Cultural Histories

Our research is located in the context of people with Down syndrome, conceived as a subaltern group, historically erased from the social gaze and denied access to legitimised social practices, including creative spaces. We ask how dance as creative practice can reframe and represent Down syndrome: for audiences, performers, families and communities. Dance can position people with Down syndrome as authors of their own narrative and it is unique in being an embodied record of cultural history that is written by and for people with Down syndrome. Our collaborative, work-in-progress creative practice/social change research between the Down syndrome dance community and researchers from sociology and digital media documents the creative practices of dancers with Down syndrome as valuable archives of cultural history and experience. We draw from dance ethnography that includes the use of motion capture technologies to produce motion-sculptures that depict the unique movement signatures of the dancers. We argue that these 'body histories' created through digitally mapping movements of dancers with Down syndrome are significant forms of public pedagogy that present audiences/viewers with unique cultural perspectives. We use the term 'public pedagogy' to refer to publicly accessible text, space or place that effects change. We draw from critical disability studies to argue that dominant ableist assumptions suggest that people with Down syndrome are less valuable and less 'human' than people without Down syndrome. This social imaginary of Down syndrome is assumed with little or no encounter with people with Down syndrome or understanding of what this way of being might be. Under the spectre of prenatal testing regimes that target Down syndrome and create a marketised decimation of this form of human bodily diversity, challenging the increasing marginalisation has become urgent.

La Industria Creativa Como Una Alternativa Para Las Representaciones Culturales, Colectivas e Inclusivas.

El término economía naranja (industria creativa) ha tomado fuerza social. Para el estado de Guanajuato, la adopción de esta actividad representa una oportunidad para generar empleos y lograr un desarrollo sostenible, porque involucra el trabajo de colectivos vulnerables. La industria creativa se enfoca hacia diferentes formas culturales como: la producción, reproducción, promoción o comercialización de ideas, que se transforman en bienes o servicios culturales y creativos. Aunado a esto, la economía naranja ha demostrado ser flexible al detonar la inclusión de varios rubros productivos como el turismo, publicidad, cine, o la gastronomía. A partir de su nacimiento en 2013, esta forma de economía representa retos y áreas de mejora para poder propiciar de forma correcta su aplicación. El objetivo de la investigación es exponer las dimensiones bajo las cuales funciona la economía naranja, y analizar sus beneficios. La investigación es cualitativa, descriptiva, de fuentes secundarias, y longitudinal para el periodo 2013-2022. Parte de los referentes históricos que existen y realiza el análisis completo de la situación cultural actual en el estado de Guanajuato. Lo anterior, por ser una sede cultural relevante en el país, y es el entorno ideal para implementar la economía naranja, por la pluriculturalidad presente en la región bajío. Algunos hallazgos son: falta de financiamiento para emprendimientos creativos, la ausencia de políticas de fomento y falta de colaboración en el sector. La aplicación de la industria naranja se encuentra en vías de desarrollo, los retos que esto representa son la ausencia de fomento en las políticas que permitan el conocimiento y divulgación del talento. Así también la polarización entre lo formal y lo informal. Los puntos resaltados son consecuencia de la temprana etapa en la que está la economía naranja. La inspiración social y la innovación, son elementos que subyacen en el desarrollo de esta actividad.

The History of Authoritarianism Repertoire in Brazilian Academic Debate (1970-2000)

The second half of the 20th century was marked by democratization processes in countries considered "advanced", the deepening of the welfare state and the expansion of a language of rights. However, even in the midst of democratization processes, it is possible to observe both the persistence and the updating of authoritarian practices and arrangements, especially in the countries of the global south. An example of this is the emergence of several political platforms supported by punitive discourses. In Brazil, since the 1970s, the social sciences have discussed the permanence of authoritarianism and the role of punishment in Brazilian society, with authors such as Guillermo O'donnell, Florestan Fernandes, Paulo Sérgio Pinheiro, José Murilo de Carvalho and others, who call attention to the historical roots that contributed to the consolidation of authoritarianism through inequalities, in its most diverse incidences, from the colonial era and the modes of domination, with emphasis on the large estates, the long slave system, the accentuated patrimonialism, and the high concentration of income. The notion of authoritarianism acquired broad meanings in the academy, in the media, on political platforms and in public speech itself. Bearing this in mind, we intend to map, in the social sciences, the course of the discussion on authoritarianism in Brazil, aiming to better understand it as an analytical resource. Therefore, the paper will be structured in two parts: I. systematic review of the literature produced on the subject was carried out at the main national academic event in the area: the Social Sciences Research Meeting (ANPOCS) and the Brazilian Society of Sociology (SBS), during 1970s and 2000s, a key moment of democratic transition in Brazil; II. the search for discussions on the topic in the main Brazilian journals in the area.

Ordering Responsibility: Making a Shared Approach to Biosecurity Workable in Australia

Shared responsibility is an increasingly prominent approach to managing biosecurity risk in countries such as Australia, Aotearoa/New Zealand and the United Kingdom. Much of the social science literature to date has focused on the challenges in sharing responsibility at different scales of governance, or the tensions between broadening of responsibility and efforts to harmonise biosecurity practices. However, limited attention has so far been given to how stakeholders involved in biosecurity policy and practice make sense of shared responsibility, and the ways that these beliefs and values inform action on biosecurity. Drawing from 89 semi-structured interviews conducted with Australian federal, state, and regional biosecurity stakeholders, the paper applies theoretical work on modes of ordering to address this issue. An ordering approach is helpful in teasing out the different stories told by participants on what shared responsibility means in practice, and how these stories are organised and performed in materials such as policies, guidelines, and regulations. Through our analysis, we argue that a shared responsibility approach in Australia is characterised by four different modes of ordering: shared responsibility as (a) distributed roles and responsibilities, (b) cost-sharing, (c) compliance and regulation, and (d) moral duty or obligation. We examine how these modes of ordering relate to and co-exist with one another, which are the most durable forms of ordering, and the implications for managing biosecurity risk. In concluding, we contend that efforts by government to promote a more uniform understanding of shared responsibility are likely to be counterproductive. Making shared responsibility for managing biosecurity risk workable across diverse groups of stakeholders will be more effective by adopting a flexible approach that recognises, works with, and works across the four modes of ordering identified in our research.

HIGGS, Paul* (University College London, United Kingdom)

Sociological Theorising in the Sociology of Ageing;

This presentation argues that the sociology of ageing has not developed a clearly sociological approach to ageing and old age. Generally, the sub-

    *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

discipline of sociology has historically operated as an extension of the field of social gerontology, dominated by social and health policy and the promotion of older people's interests. More recently the emergence of critical gerontology and cultural gerontology have not created a distinct sociology of ageing. Many have tried to provide a sociological account of ageing and old age. The work of Matilda White Riley is one important figure who sought to bring a sociological lens to the life course. However, this has not created a viable sociology qua sociology.

The changes to ageing and old age currently occurring across the world have set new tasks for a sociology of ageing and challenge much of its classical theoretical canon. A particular need is to think through the use of sociological theory to avoid it being little more than the application of particular theorists to the 'problem' of old age. Equally, there needs to be a focus on approaches that draw on different aspects of the sociological imagination. As it stands much sociological thinking about later life falls into either neo-Marxist accounts of the relationship between ageing and capitalism, or is an adaption of the 'cultural turn' concentrating on discourse, performativity or symbolic representation. While not without value these positions do not help sociologists to fully understand the structuring and agentic dimensions of later life. Reductionisms and essentialisms abound, only brought together by the advocacy politics of social gerontology. A better start might be to observe Weber's vision of the need for a fact-value split regarding the study of ageing. That must start from the position that ageing – or rather, later life - needs its own sociological lens.

HIGUCHI, Ayumi* (University of Fukuoka, Japan)

Change in Meaning of "Organization"

Organizations, both private enterprises and public institutions, have been built around a core of full-time employees. Today, however, there is a shift toward a combination of various forms of employment in terms of work-life balance and cost reduction. Individuals and professionals not in full-time employment, such as independent contractors, are increasingly becoming involved in the organization's management. The mobility of organizational members is a broad phenomenon that is related not only to the professional managers or consultants, but also to the increase in gig work with the background of IT technology.

In addition, companies are increasingly encouraged to collaborate with other organizations at an early stage to speed up the development of new technologies and products, rather than completing the development by themselves, as conceptualized as "open innovation". In this type of management, transparency and openness of organizational boundaries are said to be important. Under such circumstances, how to observe organizational behavior and organizations as a unit, has become a difficult question.

From the perspective of autopoietic systems theory, it is a situation in which the organizational boundary itself are becoming more diverse and multilayered as it incorporates a variety of actors and activities. Organizations operate in a way that integrates such diverse and multilayered boundaries, and sometimes transform themselves through organizational decisions. Such a way of management is socially accepted and is shifted.

In this contemporary context, the word "organization" itself is undergoing a transformation. Some researchers, such as Karl Weick, argue that there is no such thing as an organization, but only the verb "organizing" exist. While others, such as Niklas Luhmann, incorporated the dynamic nature of organizations into their theories through autopoietic systems theory. This presentation will examine the transformation of the term "organization" while focusing on the boundaries of organizations.

Seven Sampling Strategies for Seven Countries: Successful Flexibility in an International Study on Vaccine Hesitancy during the Covid-19 Pandemic

The topic of vaccine hesitancy had increasingly entered the public debate well before Covid-19 pandemic. However, during the global crisis, the public vaccination debate has intensified. These developments have inevitably impacted on academic research in this contested area. Drawing on evidence from the recruitment of approximately 200 vaccine-hesitant parents in seven European countries under the framework of the EU funded VAX-TRUST project, this article critically discusses the main methodological challenges and opportunities concerning qualitative research on vaccine hesitancy during

Covid-19. While the research was designed before the pandemic, we reflect on our experience of conducting fieldwork during the public health crisis. We argue first that the intensified public debate around Covid-19 vaccination increased the challenges associated with recruiting vaccine-hesitant parents. This may be a result of a strengthening of doubts about vaccines, or reduced faith in science or funded research. Secondly, the public debate about Covid-19 also increased the apparent stigmatization of parents who delayed or question childhood vaccination. This may have led to reticence in taking part in research on this topic. Taken together, these factors represent challenges for empirical research in this arena. However, these challenges also demanded innovations in how we approached sampling and recruitment. For example, we were required to transition to online interviews or a hybrid model, and to take into account culturally sensitive strategies of recruitment. We conclude by arguing that the impact of Covid-19 pandemic for similar projects can be twofold; first, epistemological, related to the increased sensitivity for the vaccination topic; and second, logistic and practical, related to accessing the field, including the impact of practical measures like social distancing. Overall, the study benefited from our ability to be flexible in the operationalization of our research design, and to collaborate on sharing the benefits of seven sampling strategies for seven distinct countries.

Infrastructures of Care: Fixing 'Glitches' in Mental Health, AOD, and Housing Services

Time spent within mental health inpatient units and/or AOD residential rehabilitation services disrupt individual housing pathways and social relations in diverse ways. This paper draws from Lauren Berlant's recent discussion of 'infrastructure' and 'the commons' to critically examine the housing support provided to people exiting these spaces. We ground this discussion in qualitative interview data exploring housing trajectories for individuals exiting institutional spaces. Interviews were conducted with service providers and individuals with lived experience of support in residential care settings in Australia. Care within these services can be understood as a sociotechnical assemblage – what Berlant calls a "patterning of social form" – that organises housing pathways, modes of social recovery, and social conditions for the achievement of a *liveable life*. We argue that the siloing of mental healthcare, AOD, and housing services into separate but loosely connected systems produces an infrastructural 'glitch', a breakdown in the psycho-social and socio-technical assemblages of care. We suggest, following Berlant, that this glitch can be viewed as an opportunity to bridge the gap between complex psychosocial and socio-material assemblages of care and locates housing support as an essential infrastructure of care and recovery. Such a shift overturns conventional assumptions of linear service pathways and recovery common within current housing, mental health, and AOD policy and service provision. To improve housing pathways and promote social recovery we present a reformulation of care and housing services through the social justice lens of 'the commons.' The concept of the commons calls for the development of transformational infrastructures that recognise difference and facilitate affective attachments to the world. Revisioning practices of care to include housing and related support has the potential to improve housing outcomes and social recovery by offering new ways of thinking about the social infrastructures needed to achieve these critical goals.

Investigating Children's Digital Lives: Three Studies Using Visual Research in Canada

This paper offers two unique contributions to our understandings of the literature around children and technology: 1) exploring children's digital lives and learning in-school and at-home, and 2) drawing on visual data from three studies to compare and contrast how such data can be fruitful for widening understandings of research in the sociology of education. We seek to understand children's use of digital technology as a form of capital (Bourdieu, 2011) to advance their own learning. While research notes that middle-class families often provide educational advantages for their children (Calarco, 2018; Lareau, 2011), other scholars suggest that children can also draw on personal resources (both tangible and intangible) to create learning opportunities and advantages for themselves (Calarco, 2018; Chin & Phillips, 2004; Hillier & Aurini, 2018). Additionally, children are quite adept at picking up digital skills and often become co-learners in the learning process involving digital technologies (Rizk & Hillier, 2021, 2022), yet there is little research that considers how children themselves are utilizing digital technology and the roles of families and schools in this process. To understand this gap, we use three unique data sets: 1) 35 photo-interviews with children (ages 5-8) examining the use of technology; 2) 11 video recordings of grade 3-8 classrooms using robotics and other digital technologies; and 3) photo diaries examining technology as a tool for learning among children (ages 8-12) in schools and homes (data collection currently in progress). In analyzing these data, we seek to answer the questions: How are children using technology as a learning tool? What is the role of families

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and schools in this process? This will provide new insights into how to better leverage digital technology to support 21st century learning, while also providing an examination of the methodological possibilities using visual data.

HIPPERTT, Rebeca* (Universidade Federal de São Paulo, Brazil)

The Virtual Dimension in Naqoyqatsi: Impacts on Contemporaneity

Naqoyqatsi: Life as War (2002), the last film in the Qatsi trilogy, is an American "non-verbal" documentary produced from recorded images of everyday life. It was developed by director Godfrey Reggio, with a soundtrack composed by Philip Glass. In summary, it is possible to say that *Naqoyqatsi* focuses on the world of communication and the new digital technologies in articulation with war. To this end, through film analysis, considering that the film evokes aspects of the medium through which it emerges, the objective is to analyze aspects of the virtual dimension of society. It identifies how the film evokes aspects of a digital technological society, pointing out the way in which the digital/virtual becomes a fundamental element in the constitution of social phenomena. It is also described what the film "anticipates" about contemporary society, and it is indicated that while power relations reside in this dimension of the virtual, it is itself, therefore, that also enables forms of emancipation. The methodology used in this research is film analysis, opting for some methodological strategies proposed by historian Pierre Sorlin (1985): the way in which films "represent" organization and social relations; and the implicit and consistent relationships between what is exterior and what is being displayed. The Qatsi trilogy and other audiovisual materials of the same style have their own interesting analysis tool for sociology, which makes a particular "speak" in an unexpected and new way. Finally, it is reiterated that the virtual is a fundamental component of contemporary society and identifying its effects through the technical and expressive resources that cinema mobilizes is one of the social scientist's tasks.

Managerialist Trends and the Role of the Performance Evaluation of Social Welfare Plans in Local Governments in Japan.

In the past three decades, Japan has seen the growing influence of managerialism in the central and local government administrations of social welfare (i.e., personal social services) as well as in the administration of social welfare agencies, with the implementation of marketizing, privatizing, and decentralizing reforms in its social welfare system. These managerialist trends entered a new phase in the latter half of the 2010s, as the cross-ministerial performance management system using key performance indicators (KPIs) was introduced in the central government, and the performance evaluation of local governments' social welfare plans (for aged care, disability services, and "community welfare") was rendered obligatory by the revisions of the relevant laws.

This study aims to examine how, under these circumstances, the progress in managerialization has affected local governments' social welfare administration and how the latter have responded to the challenges posed by this progress, considering the comparison with similar trends in Britain in the 2000s. For this purpose, after a brief overview of the progress in the managerialization of social welfare in the past three decades in Japan, this study analyzes the survey data of local governments' social welfare planning conducted in 2021 and 2022, and the planning documents of local governments to examine how the performance indicators have been introduced and utilized in policymaking in social welfare. Finally, this study discusses the future prospects for the managerialization of social welfare in Japan.

Actions and Visions of Care in a Post-Pandemic World?

Actions and visions of care in a post-pandemic world?
The pandemic has confirmed the importance of carework in addition to "health work", and in France, many difficulties have been identified in the organization of this work, whether it be the lack of means of protection for careproviders, in medico-social establishments or at home, as well as the restriction of the freedom of care recipients (Laugier, Molinier and Paperman, 2020; Fillion, 2020). A French survey in progress on care workers at home or in institutions, as well as on people engaged in voluntary carework in working-class neighborhoods, shows the difficulties in having the care needs heard, which have increased with the pandemic and have been undermined by the partial or more lasting breaks in ties generated by the various confinements. However, these workers are engaged in actions that allow for the connection

of disjointed fragments of society, and as such, they do a job of linkage and mobilizing public authorities and local actors that is difficult to achieve without their intermediary. Whether for volunteer care work in vulnerable areas or for paid work in particularly degraded conditions, new mobilizations and actions have emerged: beyond their common commitment, differences in positioning appear, which we will seek to capture through the perspective of the different forms of care work.

Women and Digital Media - a Study of Korean Web Dramas and Their Audiences

Digital environment in Korea has been widely discussed in recent years and the country's diverse digital media contents are spreading worldwide. According to a 2014 report by the Ministry of Culture, Sports and Tourism of Korea, one of the '10 trends for 2014' was 'snack culture', which describes people's tendency to enjoy entertainment or information packaged into short durations. Due to changes in lifestyle and the popularization of mobile media, short contents that are like bite-size pieces of snacks are widely created and consumed. Especially for younger generations who are busy studying and working, these digital contents are a part of their daily life. Along with webtoons, web novels, and other digital contents, web dramas (short drama series) are a popular type of streaming content. Web dramas are characterized by low budgets and a high degree of freedom in content, which allow creators to narrow down the target audience compared with TV dramas. While web dramas tend to have advertising elements, they often convey messages that strongly empathize with the target audiences through showing familiar episodes in everyday life. I will focus on narrative of web dramas whose target audience is mainly young working women. The presentation will take a gender perspective while focusing on the social context and cultural background of web drama production in Korea. Also, I will discuss forms of community and intimacy in digital media practices created by the media industry and imagined by mobile audiences called Generation MZ by analyzing how Korean web dramas are produced and consumed.

HIREMATH, Sumanth* (Rani Channamma University, Belagavi, India)

Empowering Women through Entrepreneurship: Seclusion to Inclusion

Women have a predominant role to play in a country's socio-economic development. Though India is a fast developing nation, it still regards men as the bread earners of the family. However, the evolved role of Indian women has emerged as an economic force that policymakers cannot afford to ignore. Empowerment of women in India is a major issue relating to social justice and gender equality. Women entrepreneurship empowers women to move from the position of marginalisation to increased mobility and reduced traditional seclusion. It paves the way toward self-sufficiency and poverty alleviation for women. According to World Bank, investing more in the business of women rather in men leads to greater development of a nation (Sable V., 2021).

The study uses both primary and secondary sources for data collection. The target group for the study is women entrepreneurs in organised and unorganised sectors confined to Karnataka State, India. The paper discusses the challenges faced in starting and managing women enterprises and the extent of difference entrepreneurship makes in their empowerment.

In the path of entrepreneurship, whether in the organised or unorganised sector, women face a lot of constraints. Substantial steps taken by the Indian Government in creating an affable atmosphere for women entrepreneurs and the development of women entrepreneurship haven't reached the expected goals. The manacles of conservative ideologies and traditional customs, which confine women to household activities, need to be curbed down. Creating familial understanding, work & social life balancing, and membership in local self-governing bodies may help women entrepreneurs to progress.

HIRSCH ADLER, Anita Cecilia* (Colonia Letran Valle, Mexico)

Conflicts Expressed By Graduate Academics in Mexican Universities about Their Work Conditions

We took into consideration a review of specialised literature from seven published articles and the answers offered by 34 graduate academics of the National Autonomous University of México, obtained by interviews, about the open question: How can the university contribute to improve the academic work of the graduate professors? The multiple answers obtained are about:

the pressure to perform multiple functions and to attend the fulfillment of indicators and administrative tasks; the search to find financial support for their students and for their research projects, and to teach a certain number of subjects which restricts the time devoted to research. Also the differentiated conditions between full-time, interim and subject professors, those of greater and lesser antiquity; those with the highest and lowest productivity, and with respect to the university entities and disciplines in which they work. They also expressed the limited possibility of making decisions, which they considered a conflict between the administration and the academy. Other aspects are about the necessity to generate support to their multiple activities, such as helping students with other types of professionals and the requirement to have specialized administrative teams to deal with diverse situations, especially regarding students and academics. What they propose is the importance to review the actual model or organization of the universities and that the institutions should attend the following issues: find solutions to diverse bureaucratic-administrative problems, improve work conditions, take into account the questioning of the merit systems, promote support for teaching and for students, facilitate communication, develop the processes of evaluation, and foment the maturity of the collegiate bodies and actualize the general policies of the graduate studies.

Postgraduate Academics from a Mexican University and Their Vision of the Covid-19 Pandemic

Postgraduate academics from a Mexican university and their vision of the Covid-19 pandemic. As part of the Applied Ethics and Education research carried out at the National Autonomous University of Mexico, the following question was chosen: How has the COVID-19 pandemic affected your performance as a researcher? And what strategies did you develop to continue your academic work? The objective was to understand the perception that postgraduate academics have about the consequences that Covid-19 generated with respect to their work. A descriptive qualitative research was carried out and an intentional sample of 291 participants was used. To obtain the information, a questionnaire was built for the research project, transmitted through Google Forms. Two activities were carried out: a review of specialized literature on this thematic field, which revolves around the consequences on academic work, and emotional and health problems, and the empirical part, which is based in the responses of the postgraduate academics, who were classified into three central aspects: positive or neutral effects, problems generated by the pandemic, and strategies that were proposed to face the negative situations. In relation to the positive or neutral vision, the results were about the opportunity to generate more research projects and publications and the possibility to change the organization of their work; About the several problems generated by the pandemic the empirical categories are: Interaction problems with other academics and students; Barriers to the use of laboratories, scientific equipment, libraries, archives and sources of information; Poor performance, job changes and time dislocation; Emotional and health problems; Affectation with respect to experimental and field work, and Administrative and financial problems. The strategies to continue with their academic work were: Modification of research projects; New dynamics of interaction; Time management; Training Processes; The pandemic and its effects as a study porpoise; and Alternative strategies.

The Development and Transformation of the Refugee Policies: The Case of Japan

It is said that Japan is the one of the most severe countries for refugees and asylum seekers and the number of refugees is very small compared with the other developed countries. How did Japanese Government control refugee flows and integration processes via refugee policies in recent years? The purpose of this presentation is to analyze the development and transformation of the Japanese refugee policies in recent years, focusing the several measures introduced by Japanese Government. Based on my field work data carried out in Japan, the public documents, media resources and so on, the following points will be shown.

Firstly, since the number of asylum seekers who were locked up in the detention center and were not expelled to their countries was increasing, Japanese Government tried to outsource the protection and monitoring responsibilities to the refugee support NGOs. By this measure, Japanese Government tried to press the responsibilities to civil society and shifted off the criticism toward itself. Secondly, Japanese Government permitted asylum seekers who had enough capacities to work in labor market, especially in the understaffed industry, to apply for the legal status as labor migrants. By this measure, only some refugees who could work were relief but the others such as children and elderly people were not. Thirdly, facing the refugee crisis in recent years such as Burma/Myanmar, Afghanistan, Ukraine, Japanese Government introduced more segmentation of their protection, which granted the legal status based on not the international refugee convention but the state discretion. Fourthly, Japanese Government tried to limit the number of asylum

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

application to reduce the bogus asylum seekers. According to the above measures, Japanese refugee policies have built more severe environment for refugees and asylum seekers.

The Secular Religion of Political Discourse in Finland

In the last twenty years or so, much ink has been spilled over the 'return of religion' to the public sphere even in largely secularised countries such as those in Western Europe. This could be characterised as a paradox in the European context: On the one hand, it is clear that religious institutions have lost much of their social power and individuals' commitment to religious belief and practice are on the wane. Yet, on the other hand, the public visibility of religion makes indifference difficult for Europeans, who debate the presence of large Muslim minorities, the Christian roots of European 'civilisation', and so on. Many have claimed that this visibility challenges traditional views of secularisation, even to the extent that we now supposedly live in a 'post-secular' society. But does visibility equal vitality? This paper attempts an answer by examining political discourse in Finland. The project 'Religious Legitimation of Politics and Political Legitimation of Religion (LegitRel)' has analysed all speeches made by Finnish parliamentarians between 2010 and 2020 in order to map the presence of religion in Finnish political discourse. This paper first analyses the difference between discourse about religion (religion as a topic in political speech) and religious discourse (politics legitimated with religion). Second, it focuses on the instances of religious discourse and assesses how effective such discourse is. In conclusion, the paper argues that despite the increased visibility of religion, Finnish political discourse remains overwhelmingly secular in the sense that religion does not fit the 'matrix of intelligibility' of Finnish politics.

Top-Down or Bottom-up? Intellectual Organization of Scientific Knowledge through Disciplines and Topics

Topic modeling is an algorithmic procedure that represent documents as probabilistic mixtures of latent topics and words. DiMaggio et al. (2013) argue that this approach has important affinities with the central concepts in the sociology of culture. Namely, the mixtures of topics and words are congruent with the notion of the relationality of meaning and account for contextual polysemy. They are also compatible with the concept of heteroglossia, which maintains that texts contain multiplicity of voices. Finally, through the measure of prevalence, topic models lend themselves to the analysis of interpretative frames. Drawing on the topic models of academic literature, we relate topics with the concept of academic disciplines (Abbott 2001). We show, with examples drawn from comprehensive repositories of research publications and doctoral theses, that topic models reproduce the structure of disciplines remarkably well and provide a more accurate map of the intellectual organization of science. Unlike the disciplines that drive sharp wedges into the body of scientific knowledge through their top-down categorical character, topic models have an advantage in their ability to capture intellectual mixtures on a continuous scale from the bottom-up. Moreover, they cover the full spectrum of academic genres, including books and book chapters, which are typically omitted from citation analyses (Hicks 2004). However, we would be amiss to to underestimate the role of institutionalized disciplines in the organization of science. The homology between the spaces of topics and disciplines may very well reflect the later's ability to shape scientific knowledge. Instead of privileging one approach to mapping the intellectual organization of science over another, we argue that the most promising line of inquiry is to follow their interactions and use topic models to improve our understanding of the hierarchy of disciplines as well as their mutual and internal differentiation.

Poverty, Suicide and COVID-19**

Poverty is pervasive in Africa made worse by COVID-19. Approximately 460 million Africans live below the poverty datum line (Statista, 2022). COVID-19 impacted on the standard of living and quality of life, behavior and social interaction. The impact on mental health has been validated by the proliferating suicide rate among South African youth. Intersecting factors of poverty, unemployment, isolation and poor mental health support have made the context of South African youth dire.

The impact on declining education, social injustice, crime and poor state support has penetrated rural and urban regions without prejudice. Clinical sociologist are mandated to this dire social condition to understand and

develop change models to mitigate risk to youth and improve their well-being. Therefore, this paper provides an overview of youth poverty, suicide and COVID-19 in South Africa, moreover, the findings provide guidelines that offer a starting point for addressing social problems among the youth. Successful reduction of poverty will have a positive impact on mental health among youth in Africa.

Customary Law and Women: Current Concerns and Future Possibilities in Northeast India

The Indian constitution grants legitimacy to customary law by taking into consideration, the autonomy of tribal societies. A major concern in customary law and plural societies, is the question of entrenched gender issues associated with tradition as law. This is additionally complicated by codification and attempts at codification of customary law in Northeast India as it further cements existing biases against women. The paper is centered around gendered implications of customary law and in particular, Mizo customary law. Customary law is silent on issues related to crimes against women and continue to deny space to tribal women in major seats of power, specifically land and administration. Tribal women's claim to inheritance is often rejected as tribal societies have a paternalistic attitude towards land and inheritance assumes a sense of birthright that is denied to women. Women's negotiation for space with regards to their basic rights including inheritance rights, marriage, divorce, and child custody under customary law can be examined under the backdrop of the debate on personal laws and constitutional morality. The paper attempts to employ the "woman question" as a method to critically examine Mizo customary law. It also includes an analysis of court rulings and judgements under customary jurisprudence. The disenfranchisement of Mizo women, to a large extent, is a result of the deep-rooted patriarchal elements of Mizo customary law in conjunction with religious beliefs, which warrants a critical analysis. The research is based on the lived experiences of tribal women and their continuing battle to gain space in a society that vastly excludes them in the decision-making process. Attention is also drawn to the need for inclusion of traditional understandings of law in debates on legal reform.

Vietnamese Migrants in Australia: Downward Social Mobility, Class Identity, and Belonging

Transnational migration is commonly considered as a strategy for upward mobility by both working class labourers and the middle classes from the Global South. However, many middle-class professionals struggle to find jobs matching their skills and aspirations at the destination because their foreign credentials are devalued, and their cultural capital is deemed inadequate or incompatible by prospective employers. Drawing from 53 life histories of Vietnamese in Australia, I explore how middle-class migrants experience downward social mobility and the implications this has for their class identity and sense of belonging. With an analytical focus on space, place, and temporalities, I highlight the fluidity and situatedness of the notion of middleclassness as migrants negotiate the disjuncture between neoliberal migration regimes and South-North inequalities.

Harm Reduction As Care? Providing Eldercare for People with Substance Abuse and Complex Needs

Care as harm reduction? - Providing eldercare for older people with substance abuse and complex needs

An increasing degree of people age with substance abuse and complex needs. Perceptions about that people stop drinking as they get older exists, however research shows that older people continue to drink alcohol even into the oldest age and have a higher consumption compared with earlier generations. With the increasing consumption of alcohol among older adults follows an increasing degree of people with substance abuse problems, mental health problems, age-related health problems, dementia and cognitive impairments as well as social problems. In low threshold living facilities, also known as "wet" eldercare, people with substance abuse are provided care with a "for life" approach. The goal of care is not sobriety but harm reduction. The aim of this article is to explore the concept of care and analyze how it is being used as harm reduction in specialist care arrangements towards older people with substance abuse and complex needs. The study is based on site-visits, observations and qualitative interviews with 11 residents and 16 staff members at 5 Danish specialist eldercare facilities. Central themes were identified using qualitative content analysis. The analysis shows that the staff use different forms of care aspects as well as other methods to prevent self-

neglect and reducing harm among residents. However, the staff is constant balancing between the residents right to self-determination with the risk of becoming passive spectators as well as contribute to and facilitate destructive lifestyles among a vulnerable population.

HOF, Helena* (University of Zurich / Max Planck Institute for the Study of Religious and Ethnic Diversity, Switzerland)

Foreign Entrepreneurs' 'Urban Transnationalism': Rooted in the Urban Space, Growing Businesses in the Digital Space

This presentation comparatively examines the meso and micro level influence of foreign startup founders on their host cities Singapore and Tokyo. The immigration history and inclusion of foreigners in Singapore and Tokyo vary considerably. Singapore is an immigrant city-state whereas Tokyo, as the capital city of Japan, has only recently recognized the rising numbers of foreigners as (im)migrants. Nevertheless, the comparative perspective unearths more similarities than differences and hopes to spark theoretical discussions about non-ethnically based migrant communities in increasingly diverse urban spaces.

The presentation bases its arguments on qualitative data collected in Singapore and Tokyo since 2021. It sheds light on the foreign founders' multiethnic entrepreneurial networks, which arise from their business activities and have spillover effects on these migrants' social inclusion in ethnically diverse communities of the host cities. However, migrants' entrepreneurial ventures started or were still in their infancy at a time when the COVID-19 pandemic struck. As such, the entrepreneurs struggled with closing state borders, their own precarious legal status on timely limited work visa, or the sudden unavailability of a previously mobile skilled workforce. This situation drives many to the offshoring of labor, if not entire business entities, enabled by digitalization and AI. Professionally, some entrepreneurs shift their minds towards business opportunities overseas, which emerge through migrants' densely woven transnational networks. These networks are constantly evolving, both digitally but also through migrants' everyday encounters with ethnically and culturally diverse people in their cities of residence. As a consequence, the entrepreneurs' social lives, too, become increasingly entangled with local developments and people, making them social contributors to their communities of residence, albeit on a liminal status – one that is characterized by these migrants' constant consideration of re-migration to one of the destinations where their transnational networks are thick and business opportunities promising.

»Should I Stay or Should I Go?« Prevalence and Predictors of Spatial Mobility Among Youth in the Transition to Vocational Education and Training in Germany

Youths' spatial mobility is an important means of solving region-specific matching problems in training and labor markets (Matthes & Ulrich, 2018). Furthermore, it is associated with higher monetary returns to individuals and is therefore a source of social inequality (Lemistre & Moreau, 2009). While aggregate data analyses show substantial spatial mobility among students in vocational education and training (VET) (Jost et al., 2019), research on its determinants is scarce. Prevailing neoclassical theories view job- or training-related spatial mobility as cost-benefit decisions (Cadwallader, 1989). Extending this perspective, we integrate theoretical approaches that understand individuals' mobility potential to result from agentic motivation and structural constraints (Haldimann et al., 2021; Kaufmann et al., 2004; Windzio, 2008) and analyze the role of individual occupational orientations, social ties, and regional opportunity structures for spatial mobility among students entering VET.

Our study is based on longitudinal data from the German National Education Panel Study, which we combined with georeferenced data (NUTS-3) on school location. We used information on young peoples' school and VET location to map spatial mobility and distinguish spatial mobility within and between functional regional labor markets (Kosfeld & Werner, 2012). At the descriptive level, our results show that spatial mobility is widespread among young people entering VET: 16% are mobile within and 23% between regional labor markets. Multinomial logistic regression models show that youths' occupational orientations (status aspirations; search duration), social ties to friends, and regional opportunity structure (commuter balance; share of the aspired occupational segment) are crucial for youths' spatial mobility. Notably, the regional opportunity structure turned out to be an important driver of whether youths start VET in their home region or become mobile. The results imply the importance of mobility-promoting measures to support youths' access and successful transition into VET and reduce regional mismatches in the VET market.

WG06-792.3

HOGSBRO, Kjeld* (Aalborg University, Department of Sociology and Social Work, Denmark)

IE and Governmentality Studies of Power

This presentation focus on the differences and similarities between governmentality studies and IE studies in the last two decades when both traditions have gained a considerable influence within sociology. Governmentality studies focus in general on the discourses of governance and the way global discourses like New Public Management has been implemented in different national and local context involving different actors on different levels. In many instances, IE studies have had the same focus and in some instances IE studies have focused more on discourses than kept the traditional focus on procedures.

Thus, it is obvious to look at similarities and differences between the two traditions with respect to epistemological premises, theoretical references (implicitly or explicitly expressed or discussed) as well as methodological design and procedures.

The question arises if the two traditions are obviously overlapping and just kept apart by a kind of bubble organization of sociological research or supply each other as a focus on two different aspects of social power structures or represent two different approaches which must be kept separated. Do they have significant different goals, ethical premises, and practical ambitions as 'sociological practice' or do they have common ambitions for making a difference in a world of oppression and inequality.

RC49-686.1

HOGSBRO, Kjeld* (Aalborg University, Department of Sociology and Social Work, Denmark)

Towards a Sociology of Mental Disease

In the last two decades, the common international reference for understanding mental disease has been the vulnerability model stipulating that mental illnesses occur as a product of biological, psychological, and social factors influencing the individual human being during its birth, childhood, and later social relations. This has been supplemented by the ICF model for understanding disability, or in general different forms of diseases, as an interrelation between body functions and structures, activities, and participation, which on the other hand is influenced by personal factors as well as environmental factors. Both models are descriptive models, which does not privilege any specific theoretical approach, nor do they emphasize any specific balance between the influence of the different factors in the models.

So, what does characterize the social factors in both models? What has been the sociological contributions to understanding the genesis of mental illness as well as interrelation between disease and social environment or context?

The presentation will focus on schizophrenia, autism and ADHD, and the sociological theories, which have been applied to these forms of diseases since the 1950ies. Those theories are typically related two public movements in a specific historical context, but at the same time they might as well deliver important theoretical elements and empirical findings showing at least a direction for a sociology of mental disease defining both the social influence on its development and the social situation of people with mental illnesses in a competitive society.

HOLLERAN, Samuel (University of Melbourne, Australia)

9/11 Steel: Distributed Memorialization

Steel has become the de facto material to memorialize 9/11. In this presentation, we show how the vast majority of steel from the World Trade Center (200,000 tons) was recycled abroad but what remained was sacralized and made into local memorials. Using newspaper reports and materials obtained from a Freedom of Information request, the article analyzes how dispersed memorialization honored first responders across the United States (and abroad) enlarging both the geography of trauma and responsibility to remember.

We connect the Port Authority of New York and New Jersey's curation, gifting, and transportation of 9/11 steel to a form of mourning with military antecedents as well as the deliberate focus on strength, masculinity, and participation in the War on Terror. Using close analysis of the delivery and ceremonial placement of the steel objects we show how 9/11 was remembered using DIY art techniques and local institutions in places far away from the tragedy. In particular, we examine how an urban tragedy in the center of US finance was reimagined as something universal and affecting working class first responders. The local memorialization democratized the process of 'sacred steel' distribution while also tightly controlling what could be done with salvaged metal in order to make sure that relics remained communal, rather than personalized, objects. Last, we reflect on how this distribution process contrasts with the heated debates over the future of the WTC site in Lower Manhattan. In doing this we connect 'participatory' memorialization after 9/11 to other world areas and attempts to decentralize memorials after tragedies.

Pandemics and Geoarbitrage: Digital Nomadism before and after COVID-19

Digital Nomads (those working for higher wages in developed countries but living in less expensive locations, most often in the Global South) are known for their ability to practice geoarbitrage: they search for a lower cost of living while working remotely. Many in this group have merged economic ideas about mobility with cultural beliefs around the value of uprootedness as a means to live independently and appreciate experiences over possessions. This article, drawing from 900 social media observations and 25 long format interviews, shows how the coronavirus pandemic challenged core practices of digital nomads because of lockdowns and border closures. The pandemic made some in this group reconsider their relationship with their home countries. For some Nomads, it fostered a greater appreciation of welfare state services: such as high-quality medical care, unemployment benefits, and vaccine access, but this was not always the case. A number of informants were relieved to return to their wealthy home countries in a moment of crisis, but others—using a more Libertarian understanding of their own position as independent purchasers of social services—resented the state 'calling them back' during the pandemic. Last, the paper considers whether digital nomadism will become more attractive with the growing acceptance of remote work and what ramifications this could have for destinations in the Global South that are already experiencing 'transnational gentrification.'

Leisure, Memorialisation, and the Cemetery-Park Overlap in Australian Cities

In Australian cities, historic cemeteries that were once located at the urban fringe are now dead centre. To accommodate growth, many have been relocated or pared down; making way for surface-level infrastructure and parkland. This presentation draws on an ongoing project examining cemetery design and the tension between memorialisation, urban ecology, and recreation. It focuses on the attempts of community groups to 'activate' burial grounds, both cemeteries still in use and Pioneer Memorial Parks, deconsecrated cemeteries where headstones have been removed but human remains linger belowground.

This presentation will focus on six active cemeteries and cemeteries-turned-parks in Melbourne, Sydney, Adelaide, and Perth; drawing on interviews with community advocates, cemetery managers, and environmental specialists. Cemeteries and parks created in the 19th century display an emergent sense of public hygiene, mental and physical. The former shifted the dead from dense churchyards, where miasmic fumes were thought to pollute surrounding properties, while the latter sought to provide 'light and air' to a consumptive city; camaraderie; and therapeutic 'headspace' before that concept existed. Both play into an imported green imaginary climatically unsuited to most of Australia.

This project builds on land use and planning data, anthropological investigations of burial culture, and urban ecology scholarship to better understand the relationship between former cemeteries and surrounding communities, particularly in the ways cemetery 'activation' intersects with race, class, and indigeneity. It probes the subterranean geography of burial grounds and how changes to these sites come into conflict with the 'prerogatives of the surface,' for example: protecting property values, and shielding communities that are thought to have more 'traditional values.' On a granular level, this project analyses the zones within cemeteries set aside for park-like activities, often well away from documented burials, a salient distinction that illuminates the difference between 'underground' and 'underfoot.'

How to Continue the War without Having Lived It? Patterns of Engagement and Participation of Young Republicans in Northern Ireland

In a democratic post-war period, how can young activist prolong a civil war that they have not experienced? In a context of changing forms of commitment, which no longer involve violence for the most part, how can we explain the continuity of individual trajectories characterised by the reactivation of recourse to armed struggle when this has disappeared from the social movement's repertoire of action? Conversely, how do other young activists, also born in the post-war period, adhere to and participate in the construction of a democratic peace process? Through what mechanisms can they claim a filiation with the armed struggle as they participate in the transformation of the social movement beyond violence? In Northern Ireland, the Brexit negotiations have made these questions central due to fears of a return to armed conflict resulting from a possible shift of the 'ceasefire babies' towards violence. This proposal will question the youth learning and participation in a democracy through the issue of inclusion or exclusion of clandestine violence within the post-peace agreement repertoire of action operated by actors claiming a filiation with a war they did not experience. To analyse this renewal of activist generations, the proposal would be focused on the forms of engagement of young Republicans in the 2000s and 2010s. Two hypotheses will be developed: activists belonging to these two generations share identical involvement predispositions but the form taken by it (violent or peaceful) is determined by insertion in a particular activist network; despite this important difference, their activist careers – in Becker sense – follow a similar structure due to the post-peace agreement context. To demonstrate this process, I will mobilise interviews and observations conducted with young activists belonging to various (violent) republican organisations in Northern Ireland.

Social Affiliation Accounts for Intercultural Differences of Social Status Effects on Psychological Well-Being: A Comparative Study of Japan, Germany, and the United States

A positive relationship between socioeconomic status (SES) and well-being has been widely documented for all industrialized countries, including outcomes such as longevity, child mortality, happiness, and life satisfaction (Cutler et al., 2012; Marmot, 2003; Tan et al., 2020). Prior research indicated cultural differences between Japan and the US in the effects of SES on well-being depending on how SES was measured. The present research builds on these findings by comparing four indicators of SES, in their effect on psychological well-being in an intercultural comparison of three structurally comparable yet culturally diverse nations: Japan, Germany, and the US ($N = 2,155$).

To measure SES, we include two objective status indicators (income and education), as well as two indicators of subjectively perceived SES, namely subjective SES and personal relative deprivation (PRD). Furthermore, we explore a potential explanatory variable accounting for cultural differences: feeling connected to the social whole (social affiliation).

Cross-culturally, PRD and subjective SES independently predicted well-being, whereas income and education were negligible predictors. Subjective SES was the predominant predictor in Japan compared to the US and Germany, whereas PRD was the predominant predictor in the US compared to Germany and, to a lesser extent, Japan. This was largely accounted for by culture-specific links of social status with social affiliation—the extent to which people feel connected to society as a whole. In Japan, social affiliation is more strongly linked to subjective rank, whereas in the US to justice-related affect, while Germany lies in between. Our findings indicate that social affiliation should be investigated further as an explanatory variable in social status effects on psychological well-being, both within and between countries.

The Impact of College Education in the Humanities and Social Sciences on Job Skills and Social Attitudes after Graduation: The Case of Japan

There has long been controversy over whether education enhances job-useful skills or merely provides screening. It has been regarded that Japanese universities in the humanities and social sciences (HSS) are typical of the latter. This is because Japan has a pronounced hierarchy of selectivity in the universities' admission process, and knowledge of the discipline one studied at university is considered unimportant in the process of the globally unique blanket recruiting practices of new graduates. Based on this recognition, the Japanese government considers university education in the HSS to be irrelevant to economic growth, and seeks to expand and favor natural sciences.

This study aims to counter this trend by showing that, in fact, the knowledge acquired in each of the disciplines included in the HSS has an inherent impact on enhancing the skills needed for post-graduation work. The data to be used are original survey data conducted from 2019 to 2021 that followed students in their final year of study at a Japanese university in the 10 academic fields of HSS until after graduation. The survey asks about the degree of mastery of the subject's prior academic discipline. Structural equation modeling is used to analyze the relationship between their mastery and general skills during college and job skills after graduation. The results show that the level of mastery of the discipline itself enhances job skills directly.

More interestingly, discipline mastery in the HSS had a decreasing effect on neoliberalism-affirming social attitude. This effect varied by discipline, and was found in sociology.

These results suggest that a university education in the HSS can have a socializing effect not only in terms of skill development but also in terms of consciousness.

In this presentation, the results of the data analysis will be presented in detail, including the results of the interview survey.

Are We Playing Chicken Little with the Accounting Profession? a Dilemma of Employability of (non)Professional Thinking Graduates; Is This an Apparent Failure to Embed Professionalism and Professional Skills throughout the Curriculum?

A distinguishing mark of the accountancy profession is its "acceptance of the responsibility to act in the public interest" and to maintain the 'highest level of professional ethical behaviour by all members' (APES 110 Code of Conduct). Both concepts are critical for professional work as suggested within the sociology literature. However, two global players in professional accounting practice have been heavily fined for unethical behaviour by their professionally qualified accountants (KPMG $50 million in 2019 and EY $100 million in 2022). Ethical breaches or not acting in the public interest have been observed in other professional groups, for instance, medicine, nursing, dentistry, and law. The sociology literature on the professions acknowledges that *education* is a key driver of professional standards and the esoteric educational knowledge/ skills requirements for professional practice and membership of professional associations. Recent research posits that higher education is moving away from delivering concentrated hard-core disciplinary knowledge to that of *building transferrable professional competencies*, albeit without destroying a robust technical curriculum. This requires a scaffolded inter-twining of the sought-after transferrable professional competencies and technical knowledge throughout the curriculum.

Two independent cross-sectional surveys have been conflated and the results suggest that this is not being achieved in higher education programs. The first survey draws from over 6,000 professional accountants' views from across nine countries, and the second survey draws from over 3,000 students' perceptions across seven disciplines of an Australian university. The findings are presented through an *interpretative socio-cultural lens* via-a-vis a *neo-Weberian* approach which indicates that professionalism within higher education curriculum appears to be more *lip service* rather than achieving professional thinking graduates. These findings indicate a dichotomous dilemma, which to some degree, is supported by recent evidence of an increasing trend in the United Kingdom's Big 4 seeking graduates from other disciplines and teaching accounting post-employment themselves.

RC52-716.1

HONORE-MORRIS, Duncan* (S P Jain School of Global Management, Australia)

Unshackling the Iron Cage through Perennial Gales of Creative Destruction: Can the Accounting Profession Survive As a Social Institution?

The sociology literature indicates significant dynamic trends of change are impacting on professions and professionalisation. For instance, cultural shifts associated with the mistrust of experts, neo-liberal societal forces, radical reflexivity among consumers, ethical misbehaviour, failures in fiduciary responsibilities, the distrust of expert knowledge, post-modern scepticism, internet (dis)knowledge, impersonal market forces, and aggressive predatory behaviour between professions and/or professional associations. Much of the sociology literature on professions and professionalisation acknowledges that professions must adapt to survive societal drivers of change. Internally and externally, the accounting profession is facing wide-spread criticism of its educational curriculum, the sausage machine approach to education, the (un) professional graduates being produced, the failure to act in the public interest, unethical behaviour in professional practice, significant loss of graduate positions due to the inroads of rapidly changing technology, and significant declining (dis)engagement of members with their professional bodies. Conflating such ubiquitous pressures with the social and ethical dilemmas witnessed signifies a profession that is struggling to adapt.

Using a *neo-Weberian* sociological conceptual framework, the accounting profession has been appraised using a futurist 10–15-year lens, vis-à-vis a cross-sectional survey of over 6,000 professional accountants across five continents and nine countries in various roles on the *Division of Labour* continuum. The results are presented through an *interpretative socio-cultural lens* which advocates that the accounting profession is deteriorating as a *social institution* and needs insightful reflection and radical reforms across both its educational and professional leadership domains to ensure the very survival of the profession as a *social institution*.

HOOKWAY, Nicholas* (University of Tasmania, Australia)

'As Close to Perfection As Possible': Roger Federer As Late Modern Moral Hero

In 2022, global tennis star Roger Federer retired after a stellar career prompting mass fan and celebrity adulation on social media. Federer's global popularity and appeal is unparalleled in tennis and he is one of the world's most adored sporting celebrities. Federer is revered for his virtues both on and off the court, celebrated for the sublime way he plays but also for embodying values of humility, respect and grace. How can we understand the Federer phenomenon sociologically? Is Federer a kind of secular god – a much-needed contemporary moral hero in dark moral times? Or more critically is Federer an empty consumer signifier who's popularity is linked to the creation of a media brand and image which ultimately stood for nothing? Drawing upon moral and social theory on character, craft and meaning-making, this paper is an attempt to think sociologically about Federer as a contemporary sport hero. The paper argues that while Federer's celebrity is linked to his normativity and embodiment of neoliberal values, his cultural and social resonance is distinctly aesthetic, moral and existential.

HORTON, Joanna* (University of Queensland, Australia)

Civil Society Power and Participation in the UN Food Systems Summit

Over the past few decades, the shift in global and domestic governance models from multilateralism (whereby states hold decision-making power) to multistakeholderism (open to a wide range of non-state actors) has seen a further entrenchment of corporate power in food governance settings. While there is an extensive literature exploring this process of 'corporate capture', less scholarly work has explored the strategies and experiences of civil society food movements in a multistakeholder food governance context. This paper draws on participatory research with Australian civic food networks (CFNs) to explore their engagement with the recent UN Food Systems Summit (UNFSS) – the first UN Summit to explicitly adopt a multistakeholder model. Although most CFNs understood their own normative ideals for food systems transformation as separate from – and even conflicting with – those of the UNFSS, their responses to the Summit were varied. Some joined the global boycott against what they perceived as a fundamentally illegitimate process with a high risk of co-optation, but others saw the UNFSS as affording various strategic or symbolic opportunities to 'reclaim' the agenda for food systems transformation. Drawing on Clapp and Fuchs' (2009) theory of power in agri-food governance, as well as Gaventa's (2005) 'power cube' concept, I ask: how can CFN responses to the UNFSS be understood as (various) ways of claiming, building, and exercising civil society power in food governance settings? At a broader level, as the corporate-friendly multistakeholder model continues to proliferate, I argue for the importance of understanding civil society capacity to exercise power and shape food systems 'from below', and the dynamics, opportunities, and tensions thereof.

HOSODA, Miwako* (Seisa University, Japan)

COVID-19 Beyond the Metaphor of War

With the COVID-19 disaster raging around the world, we see a discourse that speaks in metaphors of "war". For example, national and international politicians claim that they are "at war" with the coronavirus and that we are now at war. The media also praise intensive care units (ICUs) and emergency rooms (ERs) as "war zones" where doctors, nurses, and other "soldiers" are fighting a desperate battle.

While it is not uncommon for responses to illness to cloak themselves in metaphors of "war" and "struggle," this is highly problematic. While underestimating the actual war, the "wartime" chanting risks turning what was a medical preventive measure into a means of social control. This is especially true at a time of division and strife in many parts of the world. The virus has no intention of killing us. We need to stop decorating illness with metaphors and see it as a "disease" that can affect anyone.

If we tear away the metaphor of "war" from COVID-19, we can see how people are trying to build their daily lives with ingenuity and perseverance in the midst of a pandemic crisis. Sharing such a perspective is what is required in this era of "With Corona," which will be a long and drawn-out process.

HOSODA, Miwako* (Seisa University, Japan)

Digitizing Peer Support Activities of People with Illnesses and/or Disabilities

When people become ill or disabled, they not only experience inconvenience in their daily lives due to physical disability, but also low self-esteem and self-stigma. Peer support by people with the same illness or disability is known to help people with these illnesses or disabilities to rebuild their lives, seek advice, and find a place to belong. However, it has been pointed out that patients may have difficulty gathering together at a same place and expressing their true feelings in face-to-face peer support. Therefore, this study examined whether the digitalization of peer support can overcome these challenges. We asked three groups of patients with physical paralysis, aphasia, and other disabilities to interact as anonymous avatars in a virtual reality space, and investigated how they felt about the interaction. The results showed that they felt free to communicate with each other, free from physical restraints and real-world

oppression. As a result, they felt a greater sense of self-esteem and enjoyment. From these results, the benefit of digitizing the peer support activities of the patient groups was recognized.

However, several challenges were also found. First, there are technical difficulties for patients to enter and investigate virtual reality spaces on a computer. Second, the way people interact and interact in the virtual reality space varies from person to person. Finally, there is the issue of what to do with the costs when the grant money ends in the future, although the fees for the use of the virtual space as a research project are now coming from a grant. I would like to discuss with the participants the difficulties and solutions in digitizing peer support in the future.

A Study on the Identification of Factors for Promoting Employees' Participation in Networking Groups in Japan

This study proposes to identify the factors that have effects upon promotion of employees' participation in networking groups. In reference to previous research on Employee Resource Groups, we will examine the social identity of employees as problem-solving entities and the kind of conditions relating to the network formation within the company.

Due to COVID-19 pandemic, working styles have significantly changed and thus it is expected that behavioral patterns of working people have also changed dramatically, particularly in their close-knit groups. However, little attention has been paid for empirically addressing such issues.

Today, the internal and external ties that Japanese employees have established are reported to be weaker than those of other developed countries. Forty percent of the working population do not have such connections, and this does not help them to solve problems for advancing their careers or improving their work-life balance. However, time availability and collaboration with IT are noted to increase the employees' relationships which facilitate empathy and problem solving (Recruit Works Institute, 2020).

In Japan's post COVID-19 pandemic, employees' lives have gradually changed, as they experience remote work and comply with overtime regulations. ESG management attracts attention, and the central and local governments are becoming actively involved in internal support measures due to diversity promotion and increasing concern about work-life balance issues.

We begin to organize the research frame by reviewing social identity studies on employee participation in network groups, those are ERG studies outside of Japan. In particular, we will focus on problem-solving behaviors related to family-related difficulties which they face. Let us report whether these are addressed through the use of individual internal or external services, internal groups, or external affinity groups via on-line and off-line. Based on current research, we will report on the specific context of Japanese employees' participation in networking .

GILLS, Barry (University of Helsinki, Finland)

Redefining Value: Toward a Normative Value Theory As an Integrative Platform for Transformative Praxes

Existential threats to human civilization and planetary life are fast increasing, and so are the calls for more forceful responses that require greater commonality across diverse transformative movement. The number of organizations that work across a vast terrain of plural post-capital initiatives has been increasing. However, in our overstretched post-metanarrative era, what is terribly missing is coherent conceptual platforms to underpin these transversalist urges for sustainable convergence and integration. Elsewhere ("*Pluriversality and beyond*", 2022), we argued for the necessity for transformative praxis of going beyond temporary pragmatic alliances and loose network building. There, by drawing on the idea of commons and commoning, and reflecting on the main characteristics of the current global civilizational crisis, we proposed a four-fold framework (the *commonist* framework) for creating integrative assemblages of alternative-futures-making initiatives. In this paper, by drawing on that framework, we argue that constructing a normative theory of *value, in order* to redefine our relationship with *capital* and reinterpret its alternatives, can provide movements embodying the forces of pluriverse with a new conceptual platform to overcome unnecessary and debilitating, ideological and praxiological divisions. The paper delineates the principles of this *commonist normative value theory* and highlights its synergizing power, discussing cases such as the chasm between Marxist revivalism and post-Marxian revisionism on the matters of productive and reproductive labor. We draw on some empirical findings in the Australian context to exhibit the existing potentialities, on the ground, for this proposition.

HOSSEN, M. Anwar* (University of Dhaka, Bangladesh)

Decolonizing Democracy for Environmental Sustainability in Bangladesh

Democracy is supposed to respect the voices of local people related to their understanding of riverine natural resources for community livelihood. As a democratic country, the government in Bangladesh is supposed to recognize these voices to ensure the democratic principles of inclusion, participation, and representation. However, the current practices of democratic government in Bangladesh is dominated by the Western perspective of free market and economic growth under the neoliberal development programs such as Sustainable Development Goals (SDGs). The agencies of the western countries such as USAID and international financial organizations such as the World Bank work actively to establish this perspective in Bangladesh. Almost every water development program such as Flood Action Plan (FAP) have been establishing focuses more on this economic growth perspective and care lesser for local understanding of riverine system and natural resources for community livelihood. The government emphasizes more on the success such as total embankment size in kilometers and economic growth, and fails to address the growing concerns over environmental degradation. Under the circumstances, this paper would like to explore a research question: what are the roles of democracy and democratic government in Bangladesh on environmental sustainability? Content analyses of social inequality, environmental degradation, natural resource depletion, and displacement will be the main basis in responding this question. The findings of the paper argue that political leaders work as development project entrepreneurs for individual interests and care lesser for their democratic mandates such as representation of local voices. This individual interests in the government system promote economic growth which causes exclusion, social inequality, environmental degradation, natural resources depletion, and displacement. Only the decolonized democracy from the western perspective of free market and economic growth can be helpful for promoting community voices in the government system to ensure environmental sustainability.

Intergroup Communication, Identity and Transcultural Construction of Fan Community -- Empirical Research Based on the Fan Community of Dimash

Driven by the tide of social networking, fans from different cultural backgrounds have used Facebook, Twitter, Weibo and other online social platforms to carry out various forms of virtual communication, thus developing a fan community bearing the value of transcultural communication. This study takes kazakh singer Dimash's fan community as the object of analysis, and uses the mixed research method of "questionnaire survey + participatory observation" to try to explore the formation mechanism of transcultural fan community from the perspective of the relationship between intergroup communication and identity. The results show that, on the one hand, cultural variability, intergroup contact and communication adjustment factors all have significant influence on the formation of fans' transcultural identity. On the other hand, the survey data shows that the identity of individual fans is differentiated ("transcultural identity" or "ethnic identity"), .and fans will use different language symbols and behavioral labels to convey their own identity tendencies. This study believes that as one of the new media channels for the international communication of Chinese culture, how to reshape the "local" of the transcultural fan community and make its virtual community form harmonious and unified will be the theoretical and practical direction worth expanding in the future fan research field.

The Sociology of Quantification: Against a Consolidated Research Program

Our time is characterized by an extraordinarily will to quantify, measure, and standardize social life. From a few contributions in early 2000 (Espeland 1998, Desrosieres 1998 and Sætnan 2010) there is now a growing number of studies within quantification and numerization (e.g. Mennicken and Espeland 2019, Bartl et.al. 2019, Berman & Hirschman 2018). A sociology of quantification could serve as an academic resource for both theorizing and empirical research across

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

research fields, to make the researchers able to observe and compare the social mechanics of quantification processes and how they change our societies from within. Yet, despite the arguable importance of the sociology of quantification, "sociology of quantification" has not turned into the research authority that it could be. We suggest that this is due to the nature of the empirical objects themselves, which are often infrastructural, embedded, and contradictory in nature. This paper presents results form a literature study consisting of a broad scoping review, with a screening (N=6600) of published articles to be characterized as "quantification studies" (N=350); and a comparative in-depth analysis (N=appx. 100) of the use of quantification perspectives within three dominant research fields in the review; that is health, education, and public administration. We ask the following questions for our analyses: What do they study, when they say they study quantification? What is the role of the 'sociology of quantification' in the studies? And how does the application of the perspective(s) vary across the three research fields? Important voices within sociology of quantification argue for a consolidation of the field into a research program, but our findings suggest that a main strength of the tradition is the extraordinarily relevance *across* research schools – thus supporting a need for a growing interdisciplinary adaptability, yet, while keeping its core.

JOSEPH, Pam (University of Sydney, Australia)

Spirit of Place: Communities Acting in Disasters

This paper operationalises complexity thinking in the context of disasters. It draws on empirical and theoretical work undertaken over the past five years with communities impacted by disasters across NSW and Victoria. These communities have experienced storms, floods, bushfires and of course Covid. Despite these disasters we have witnessed communities connect in surprising ways and even thrive in the face of risky environments. Commonly, community action aims to strengthen networks, self-organising systems, resources, communication, localised information, inclusion and decision making. A deep-seated sense of belonging in physical and social environments is evident in many communities. This spirit of place creates space for hope and creativity through emergence and the disproportionate impacts of small change. Our research documents the emergence of new way of relating, new forms of organising, and new ways of understanding how to care for Country. These new forms can be at the street, neighbourhood, or regional level. Our research also repeatedly demonstrates the ripple-effect of small change across large institutional contexts. We argue that complexity thinking provides a useful strategy for countering command and control rhetoric and politics in the context of disasters.

Choices Under the Intertwining of Multiple Professionals: An Institutional Ethnographic Analysis of the Participation in Decision-Making of People with Psychosocial Disabilities

The concept of recovery became popular after the consumer movement in the 1970s. People with psychosocial disabilities, like others, expect to have "normal" social life, but social barriers in everyday life are difficult to overcome. In Taiwan, the Act to Implement the Convention on the Rights of Persons with Disabilities was passed in 2014. Even though many laws have been amended, there is no concrete and feasible service model in practice. According to the Mental Health Act, the community mental health rehabilitation is for the purpose of assisting patients to adapt to social life gradually. Professionals from different fields/disciplines form a mental health service team to work with people with psychosocial disabilities, who should be the center in the team. However, in practice, people with psychosocial disabilities seldom participate in the decision-making process and the decisions were usually affected or done by staffs and family members.

This study utilizes institutional ethnography to explore ruling relations of mental health service and the decision-making of persons with psychosocial disabilities under multiple professionals and institutional logic. The experiences of decision-making participation are collected through observations, interviews, and documentary analysis, to map social relations in the community mental health rehabilitation center. Finally, I will compare the findings with the contents of human rights conventions to understand what rights of persons with psychosocial disabilities are being practiced in Taiwan's mental health practice and what difficulties they are facing.

Revamping the PPE Supply Chain: The Taiwanese State's Response to the COVID-19 Pandemic

This paper examines the Taiwanese state's capacity to withstand the COVID-19 crisis through a case study of its provision of PPE supplies during the initial outbreak. The quick provision of PPE supplies contributed to Taiwan's success in crisis management.

At the beginning of the outbreak, Taiwan faced an acute shortage of PPE supplies. The PPE industry was very small and had minimal production but managed to ramp up production to provide quality approved medical-grade masks for the entire population within two months. How was this done? Unlike other countries that opted to buy, with resultant reliance on imports (the market solution), the Taiwanese state opted to produce PPEs. But instead of hierarchical government intervention in the face of a PPE market failure, the state deployed the alternative of a decentralized network through which the development of a localized PPE supply chain was induced by tapping into Taiwan's decentralized production system, coordinating and orchestrating cross-cutting networks of industries, and getting firms to enter the PPE industry and turn out PPE supplies quickly. The dynamics involved the state mitigating potential network failure with consensus and capability building to enhance collaboration among the actors and induce democratic buy-in participation. Collective institutions, such as industry associations and public research institutes, served as the critical links between the state and the decentralized network of firms.

The findings suggest that the capabilities to withstand the crisis stemmed from the specific configurations of the state-society linkages, based on the long-term preparedness of the state in coordinating a decentralized economy, as illustrated in the PPE production. This paper addresses the possibilities of democratic network governance, contrary to either the perception of an obedient authoritarian top-down Asian culture or allowing a market roll-out solution to account for crisis production resilience.

Indigenous Student-Teacher and Learning for Sustainability: Cultural Diversity and Educational Equity

Teacher education has an important role in the achievement of the *Sustainable Development Goals* (SDGs) to meet cultural diversity and equity education. The study was conducted in a cultural education course at higher education. The author applied the culturally responsive teaching to inspire indigenous student-teachers to be aware of the value of indigenous knowledge in the practice the SDGs. It is expected that the indigenous student-teachers can integrate their traditional knowledge and SDGs in their final project. The author invited two indigenous student-teachers to discuss and criticize the contents and activities of the course after the class per week; a total of 16 discussions were took in one semester. The study eyed on the impact on indigenous student-teachers' awareness of the connections of SDG 4 *Quality Education* and SDG 11 *Sustainable Cities & Communities* and their cultures. The results of the study showed that indigenous student-teachers argued 4.3 *affordable education*, 4.7 *appreciation of cultural diversity and of culture's contribution to sustainable development,* and 11.4 *strengthen the efforts to protect and safeguard the world's cultural and natural heritage* are the serious issues in need of improvement. Indigenous student-teachers indicate that educational equity can be reached when the society recognizes and appreciates the indigenous knowledge and cultures. It is suggested that integrating indigenous knowledges into subjects' contents for promoting all students to accept cultural diversity and its contribution.

The Transition to Adulthood of Two Generations Under Two Regimes in China

With more people receiving higher education, the restructuring of the labor market, employment becoming more flexible, and changing attitudes toward marriage nowadays, young Chinese (under the market economy regime) face enormous difficulties in becoming independent compared to their parents (under the planned economy regime). These changes prolonged the process of the Chinese youth to become independent adults, and deepened their dependence on their parents economically and emotionally at the same time.

Therefore, this article aims to examine how social institutions and socioeconomic structures regulate the transition to adulthood for young people in China, focusing on the following two points. 1) Clarifying how the "transition to adulthood" in China's market economy occurs and what problems it entails. 2) Understanding how parents cope with the prolonged period of parental dependence of their children and how the impact of parental influence on the "transition to adulthood" has changed. The 1980th birth cohort and 1960th birth cohort are used to represent young people in different regimes and could also be seen as parent-child generations.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Using data from China Family Panel Studies (CFPS) and The Chinese Longitudinal Healthy Longevity Survey (CLHLS), I conduct a mixed-method analysis to study the complexity and heterogeneity of the "transition to adulthood." I first use social sequence analysis to clarify the transition trends between the two birth cohorts. Next, I conduct interviews with 35 informants to learn of their transition experiences. Doing so will help us better understand the reality of the transitional process to adulthood of the young Chinese today.

The Effect of Tropical Cyclone-Induced Multiple Hazards on Economic Production

Macro-economic assessments of tropical cyclone (TC) impacts lack an analysis of the TC's cascading multiple hazards, which can resolve both complex societal impact channels and anthropogenically forced changes. Here, using a national panel of regional economic output for 31 provinces in China over the past 20 years, we show that TC precipitation has a quadratic effect on economic production, in addition to interacting with seasonal temperature variability. Besides, economic outcomes are reduced by increases in the intensity of TC winds and storm tides, and also respond to the interactions between TC wind density and seasonal variability. Furthermore, low-income regions are hindered by TC precipitation and most sectors exhibit an inverted U-shape relationship with the hazard, complementing previous work that emphasized the beneficial effects of additional total annual rainfall in low-income and solely agriculture-dependent economies. By simultaneously assessing the TC precipitation, winds and storm tides at multiple timescales and the effects on different sectors, we uncover channels through which TC conditions can affect the economy. These results suggest that TC-induced multiple hazards will have favourable and unfavourable economic consequences, depending on the multiple integrated scenarios of TCs, and require further assessment by those who wish to evaluate the costs of anthropogenic climate change.

Being Chinese: Moving Beyond the Dichotomy of China and the Occident

Sociological theories produced in China, as well as sociological theories of China, rarely systematically examine the impact of the relationship between China and the West (*Occident*). In matters of knowledge production, asymmetric, on-way flows of knowledge are commonplace in the theorisations of various Chinese social phenomena. Studies of Chinese sexuality have routinely reduced China to a site of data collection. In China, theories of sexuality produced in the *Occident* are often applied unreflexively by both Western and Chinese scholars. Such biases are usually underpinned by a cluster of oppositions, such as structure and agency, East and West. In this paper, I aim to expose and move beyond such biases. Combining Chen Xiaomei's notion of *Chinese Occidentalism discourses* with Pierre Bourdieu's concept of *symbolic capital*, I examine the significance of the *Occident* in narrating and theorising Chinese identity by Chinese peoples. Drawing on qualitative data collected in Shanghai, I argue that through their imaginings of the *Occident*, both the Chinese government and everyday social agents negotiate, define, and seek to impose their version of what is meant to be Chinese. *Chinese Occidentalism discourses*, seen in this way, are a form of *symbolic capital* embodied by different social agents in the social *field* of opinions. The concept of *symbolic capital* offers an analytical lens through which the connections and tensions between China and the West can be elucidated. *Chinese Occidentalism discourses*, I argue, can be used as a productive and necessary methodology that theories Chinese social phenomena *in relation to* the West, without reducing these phenomena to either completely *Othered* experiences, or mere appendages of the reigning Western perceptions.

Confessions of the 'leftover Women': An Analysis of Family Life in Contemporary China

The Report on Chinese Marriage and Family 2022 recently noted that only 12 million marriages were registered in China in 2020, a 48.5% decrease from 2013. Despite the multi-children policy, there also has been a steady decrease in birth rate in the past decade. It is important to ask, how has the transformation(s) in familial relations, if any, conditioned the decline in marriage and birth rate in contemporary Chinese society? The aim of this paper is to illuminate the nuances in the contingent definition of family life and familial relations, and thus, to elucidate the phenomenon of flights from marriage and parenthood in contemporary China. The paper uses Pierre Bourdieu's theoretical approach to sketch a map of the family as a *field*. Drawing on qualitative data collected in 2019 in Shanghai, China, I argue that the family *field*, contrary to the common belief in its declining importance, is a site of struggles between *orthodoxy* and *heterodoxy*. The importance of being married and becoming parents in a timely manner is a taken for granted necessity, an *orthodox* perception of what it means to be an honourable and virtuous Chinese person in the contemporary

context. Yet the family *field* is also central to the struggle against such *orthodox* social rhythm. As exemplified by the 'leftover women' phenomenon, flight from marriage and parenthood allows individuals to negotiate and (re)define the meaning of family and identity. It enables them to struggle against the *orthodoxy* of a woman's life as a daughter, wife, and mother. Seen in this way, the decline in marriage and birth rate shows that family is a *field* of contestation and fluidity in contemporary China.

The Revolting "Blue Gay": Sexualized Nationalism, Emerging National Others, and an Alternative to the Homonationalistic Construction in Contemporary Taiwan

Heated debates concerning the legalization of same-sex marriage in the past years has led to the emergence of a new identity category called "blue gay" in contemporary Taiwan, referring to LGBT individuals who ally with the Nationalist Party, whose symbolic color is blue. Due to the Nationalist Party's general opposition against the legalization of same-sex marriage, the "blue gay" is depreciated as incomprehensible, shameful, and even abominable in LGBT communities for standing with a political party which excludes LGBT equality and human rights from its main political agenda. A popular nationalistic discourse of Taiwan as a modern, democratic, sovereign and internationally-recognized nation-state, to which respect and embrace of LGBT equality and human right are key, also contributes to the symbolic meaning of the "blue gay" as everything opposite to the modern imagination of Taiwan's sovereign nationhood. Certainly it is too narrow and reductive a view to fully grasp how people's sexual and national identities are entwined, especially in Taiwan, an island which has been through multiple colonization in history. Yet, the emerging "blue gay" elucidates a critical sexualization of nationalistic discourses in contemporary Taiwan as LGBT politics and human rights now become a criterion to the differentiation of national self from national others. Using homonationalism as a theoretical framework, this research explores how the convergence of LGBT politics and a modern and sovereign nationhood of Taiwan intervenes in and even regulates LGBT identity formation in everyday life. With a focus on how class, ethnicity, age and political inclinations influence LGBT subjects' sense of national and sexual belonging, this research highlights the complexity of mutual constitution of sexual, gender and national identification, seeking to explore an alternative to the always already binary homonationalistic construction of sexualized national subject/others the popular discourse of "blue gay" signifies.

Geopolitics, Gender and Cross-Strait Marriage: Recent Taiwanese Female Marriage Migrants in China

Official statistics in Taiwan show that more than a decade ago, the majority of cross-strait marriages were between mainland Chinese women and Taiwanese men. In recent years, however, the situation has reversed, with an increase in the number of Taiwanese women marrying mainland Chinese men. In contrast, the number of mainland Chinese women marrying Taiwanese men has dropped by half in the past decade. Such a trend can be attributed to the growing frequency of cross-strait tourism and the rising number of young Taiwanese studying and working in China. When discussing cross-strait marriages of mainland Chinese women married to Taiwanese men in existing studies, the concept of 'spatial hypergamy' is mainly used to define the marriage trajectories and strategies of migrant women. However, through in-depth interviews with Taiwanese wives who have married in mainland China over recent years, this study finds that a marry-up/marry-down paradox often characterises their cross-border marriages. This contradiction relates to the dynamic relationship between geopolitical and economic developments across the Taiwan Strait during the past decades and how different generations perceive and view the changes in effect. This study, therefore, examines how Taiwanese wives married to Chinese husbands respond to geopolitical changes in their intimate relationships and how they perceive their cross-border marriages concerning their social status and economic interests, in a context where economic ties between China and Taiwan are becoming closer but political relations are getting increasingly tense. The cases in this study show that for Taiwanese wives, their choice of cross-strait marriage is not based solely on material considerations such as the financial security it can provide. Other sorts of desires may also play a role, ranging from the longing to experience a different world, to the pursuit of love and an ideal partner, or to the possibility of realising a personal career.

The Digital Transformation of Labor Process in Taiwan's Mold Manufacturing and Plastic Injection Industry

In the past ten years, concepts such as Industry 4.0 and smart manufacturing have aroused active discussions, and Many governments and industry stakeholders have proposed many relevant policies and visions. This study attempts to regard Industry 4.0 as a continuation of the industrial digitalization, and attempts to take Taiwan's mold manufacturing and plastic injection industry as a case. From 1990 to the late, the industry has successively introduced three digital technologies, including CAD/CAM, mold flow analysis, and management assistance technology, which triggered the digital transformation of the industry's production practices. I found that, albeit with a slight time lag, its labor control system has also changed in response to this digital transformation. In chronological order, it's labor control system of can be roughly divided into three periods: the first period is the responsible autonomy built around the craftsmanship of skilled workers, and this period still continued after the introduction of CAD/CAM a period of time. However, after the mold flow analysis was widely used in the industry, It's labor control system turned into decentralized technical control and limited bureaucratic control. Later, after the gradual introduction of management assistance technology, although the bureaucratic control was still limited, the technical control among different processes gradually tended to be integrated. On the whole, in the transformation of this labor control system, we can find that the traditional skilled workers such as gradually withdraw from the core of power in the production relationship, while engineers with relevant knowledge of digital technology gradually occupy the core of power.

Debt, Loan and National Development in 21st Century Argentina: Fiscal Social Contract Approach

Since the neoliberal turn, Latin America have prioritized the fiscal prudency and macroeconomic stability in the development agenda. However, "development on debt" still a common feature for many countries, Argentina is among the few tops in bad fiscal governance.

The objective of the paper is to explore the relation between debt, conditional lending, and National Development in the 21 century Argentina. The paper adopts an institutional analysis approach to scrutinize the 2001, 2008 and 2014 financial crisis under De la Raúl, Kirchner and Macri Administrations along with right to left regime shift.

The paper supposes to deal with financial crisis, the government would choose to resort international loan from MDBs, and the latter would be subject to "conditional lending". The State government would eventually compromise (or not) and resort the austerity policies to exchange for the loan, policies such as cut-off salary and social warfare. In despite of either way to choose, it would be risky to trigger the state-society tension or violate the social contract.

The paper attempts to understand how government manage financial crisis. The objective of the paper is to compare how left-wing and right-wing regime manage the conditional lending and adjust economic and social policies accordingly, and to understand the political social process of such decision-making process and its major concern. In methodology, the paper uses state-society relation approach and attempts to explore how governments handle crisis.

Eventually, the paper concludes that there are two types of "fiscal social contract" in accordance with regime types to resolve the crisis, which has been built up since Peron regime and their counter forces. This is to say, the fiscal social contract in Argentine is bonded with political support and configurated by vulnerable democratic accountability. This may be the feasible explanation to explain Argentine's fiscal policies and loan behavior.

Class Inequalities and Climate Disaster

Climate change and disasters impact human societies at a record high speed. More than 89 million people worldwide were forcibly displaced in 2021, among which more than 53 million people were internally displaced, a 70 per cent increase from 2020. Scientists observe a high confidence level in climate change impacts on mental health. However, the evidence for assessment of the mental health impacts remains insufficient. As a result, resources for disaster recovery and climate change mitigation continue to deprioritize mental health which directly diminishes people's quality of life. Lack of research in mental health disparities in environmental disasters also creates gap in understanding the anthropogenic nature of climate issues. My project remedies this gap by analyzing the experiences of the survivors from a recent mega-fire in the United States and the historic development of the place where the disaster occurred. In this qualitative study, I focus on the survivors' biographies, their evacuation and recovery processes, and coping strategies for mental health. In addition, I

follow the survivors for two years and observe changes in their life, with a focus on their decisions for mental health. In this presentation, I show how class inequalities affect survivors' mental health and why it is important to extend environmental justice framework to the rural working poor. I offer critiques on capitalism and environmental suffering and discuss policy recommendations to mitigate disaster and climate change induced trauma.

Organisational Structure of a Chinese Hospital: Microcosm of a Hybrid Polity

Motivated by a neo-institutionalist approach, this research applies ethnographic methods and interviews to investigate to what extent neoliberalism influences the organisation of healthcare in China. It is a case study of an urban flagship hospital in southern China.

Henderson and Cohen's work in the 1980s is a key reference point for this project. It was an ethnography of the organisational and power structure of a hospital workplace in China. An update to their work is overdue because China's social institutions and social relations have witnessed profound transformations over the years. This research reviews China's transformation towards a neoliberal polity (which is a peculiar hybridity with the collision and convergence of market values, neoliberal governance, authoritarian rules, and entrenched, state-led socialism) through the prisms of the healthcare sector and a flagship hospital.

The study first delves into the power structures of the main actors in the hospital – leaders, administrators, health professionals, and patients. The power structure is inscribed in the leadership and decision-making structures, autonomy, and the power dynamics between interest groups. Then, the study investigates how the three sets of institutional logics inform the shaping of the power structures in the hospital. These institutional logics include traditional Chinese culture, socialism, and market liberalisation. The way these logics and values shape the organisation of the hospital reflects that Chinese society is a convergence of multiple institutional logics.

Preliminary data analysis indicates that instead of eradicating one another, traditional Chinese culture, socialism, and market liberalisation are successfully amalgamated in Chinese society. Market liberalisation brings new values and practices to healthcare institutions and medical practice while traditional cultural values and socialism persist. Further investigation would focus on the inter-relationships between different institutional logics that shape the organisation of the flagship hospital and what it tells us about the hybrid polity of China.

The 'Deferrer' Role: Female Health Professionals' Positioning in a Chinese Hospital

There is a lack of female representation in leadership positions in Chinese hospitals. Potential forms of such gender imbalances include: a lack of females in senior positions at clinical departments and in the broader hospital management; the exclusion of females in prestigious specialisms that have greater status within the hospital; a larger percentage of female employees in junior and supporting positions.

What are the cultural and ideologist factors that lead to female health professionals' deferrer role? The study embeds in China's transformation towards a neoliberal polity, which is a peculiar hybridity with the collision and convergence of market values, neoliberal governance, authoritarian rules, state-led socialism, and traditional Confucian values.

This research unpacks how these institutional legacies intersect and bring about female professionals' inferior status in Chinese hospitals. It also reveals opportunities for women to break through the 'deferrer' role in the hospital - the communist institution's increasing recognition of female contribution through reward and affirmative policies; the impact of Marxian egalitarian ideals under which women are perceived as 'the leading architects and representatives of medical morality'; nudges towards changes in gender expectations on females' characteristics as well as social expectations on the distribution of family duties.

The study is based on an ethnographical case study of a flagship hospital in southern China. This rare fieldwork opportunity provides first-hand testimony and evidence of the positioning of female health professionals in clinical practices in a Chinese hospital. The fieldwork was carried out when the nation was fighting against the pandemic. It offers a vivid account of how the hospital was mobilised by the country while giving special attention to women health professionals' roles during the process. Data collection methods include non-participant observations, in-depth interviews, and collection of primary sources.

Caring for the Homeless, Caring for Oneself: Innovative Practices and Reflexivity of New-Type Workers for the Homeless in Taipei

The issue of the homeless has been a long-lasting, hardly tackled problem in modern cities. In democratizing Taiwan, a well-funded, neoliberal social welfare regime for serving the homeless has been developed. However the homeless problem is not solved, and more derivative problems, such as re-stigmatizing the marginal group, emerge. Recently, this Taiwan society has changed its ways of perceiving and treating homeless people. Workers in several new organizations in civil society are one of the major forces facilitating the transformation. This study based on participant observation and in-depth interviews reveals that how they provide service to the homeless in the light of Annemarie Mol's concept, the logic of care as opposed to logic of choice. Rather than quitting the relationship after the homeless choose not to accept the service, these workers continue their interaction and communication either to amend services or to see deeper-yet-long-ignored needs of the homeless. The working process proceeds in ways of going back and forth between the homeless' opinion and revising work strategies of work. Moreover, the process involves the homeless person himself, and other homeless fellows for shared doctoring, instead of in traditional linear and worker-dominated ways. Homeless people are encouraged to voice out, and their stories are not only treated to discover personal problem or to collect more donation for the organization, but utilized as means of social dialogue in public sphere for the purposes of changing the traditional way of understanding the homeless and subverting its stigma. These practice of caring not only facilitate better quality of living among the homeless they serve, help the workers reflect on their relationships with colleagues and family members, but also construct raidical momentum of transforming how Taiwanese perceive and treat this marginal group.

Transnational Religion and Limited Party-Statehood: Reexamining the State-Church Relationship of the Presbyterian Church through Surveillance Documents

During the martial law in Taiwan, the authoritarian regime, the Kuomintang (KMT) state, infiltrated into the society comprehensively and controlled the population on the island successfully. The obvious exception in its governance was the Presbyterian Church of Taiwan (PCT), which kept voicing out its dissident opinions and taking disobedient actions. Why and how could this happen? The author uses surveillance documents from state intelligence agencies to explain why the powerful authoritarian state failed to govern the religious group, which later became important forces in Taiwan's democratization and emergence of civil society. This study takes the factor of international environment seriously, particularly Taiwan's alliance with "the Free world" during the Cold War, thus utilizing the approach of "area of limited statehood" to examine analysis of state-church relationships. In general, state-church interactions unfolded in three phases: first, the party-state tried to isolate the PCT from foreign influences in order to purify the church politically. Second, the state tried to infiltrate and surveil the PCT after the church made a controversial policy decision in 1977. Third, the state felt increasing international pressure (especially from Washington) even though it was covertly trying to influence a PCT election to establish a state-friendly church leadership. The author argues that KMT various attempts to control the relationship hardly succeeded, and that the primary reason was a transnational Presbyterian Church network operating at a time when the party-state needed Cold War support from the West. The PCT's intense interactions with transnational networks, particularly the World Council of Churches, inspired the PCT to question the legitimacy of the authoritarian state and tied the hands of the Party-state. Eventually, the PCT became an area of limited Party-Statehood, later in the late 1980s, serving as a key, resourceful supporter and a talent pool for the emergence of Taiwanese democratization and nationalism.

Relational Mobility and Entrepreneurship

While entrepreneurship is booming in some societies, it is nearly inanimate in others. This paper hypothesizes that such lopsided patterns of entrepreneurial activity are shaped by *relational mobility*, the extent to which a society offers individuals the freedom and possibility to form and terminate interpersonal relationships. Drawing upon social capital theory, we argue that societies high in relational mobility will facilitate the flow of business information and will augment and diversify commercial resources embedded in social relations. As a result, capital barriers to establish set-ups in these contexts will be mitigated, and individual's propensity for entrepreneurship will be correspondingly increased. We further suggest that relationally mobile societies will benefit potential women entrepreneurs, who are often characterized as having more impediments to accessing business resources. To test these predictions, we analyze large-scale data from 842,628 individuals across 32 countries over the nospan of eleven years. In line with our theoretical argument, individuals in societies with higher relational mobility are more likely to start a new business, and a smaller gender gap in entrepreneurship exists in these regions. These findings underscore the role of relational mobility in accessing social capital. Implications for social capital theory, inequality research, and economic sociology in general are discussed.

Study on the Adjustment of Health Code Apps in the Compound Context of High-Temperatures, COVID-19, Raging Wildfires: Case from Chongqing, China

How to integrate public policy and government technology to better respond to public demands in risk situation, it is an important issue of emergency management. With rapid speed, wide of infections, and difficulty in prevention and control of COVID-19 pandemic, governments were quick to use the red, yellow, and green three-colored health code apps in response to the COVID-19 pandemic as a way to for patients screening, disease investigation, and travel restriction. However, since July 2022, continuous extreme high temperatures, raging wildfires, and multiple districts of COVID-19 pandemic in Chongqing, which made the adjustment of health code apps face many problems. In this case, how did the health code apps responds to environmental needs and public needs? What were the key factors affecting the adjustment of health code apps? This study used the web crawler technology to track Sina MicroBlog data on July 1-Sptember 10, 2022, in Chongqing, and collected the health code polices at the same. Big data, text mining were used to describe the characteristics of the health code apps adjustment, and analyze the factors significantly influencing the adaptation and adjustment of health code apps. Results of this study reported that: (1) although in the complex environment of high-temperatures, raging wildfire and disease pandemic, the tendency of the health code apps adjustment has not changed significantly. The health code apps adjustment was affected by public opinion, and the degree of influence was related to the intensity of public opinion. (2) The public services such as the convenience of community life, cross regional recognition, and accessibility of license handling affecting the public attention. (3) According to the public attention, the adaptation and adjustment of health code apps showed the linear dynamic characteristic of "input-conversion output-feedback". (4) The update of the health code apps did not deflect the public attention.

Beerscape in Taipei: From Commerical to Craft

Taiwan implemented a beer monopoly system after the end of World War II, and it was not until 2000 that private brewing was opened. After 2010, there was a trend of craft beer in the Taiwan market. These independent breweries brewed local flavors from local crops such as fruit, tea, and spices. However, due to regulations, breweries must be located in industrial areas, so that brewers cannot attract consumers with brewery tours, and can only introduce beer flavors to consumers in bars, markets and other spaces. By analyzing the transformation of Taipei's beerscape, this article will discuss how the craft beer movement affects the definition of local flavors in the beer market. This article will also point out that, in a market dominated by commercial beer in the past, food dominated the beer landscape, but in a craft beer landscape, beer flavor is at the heart of the dominant taste practice.

The Gendered Burden of Reproduction in the "New Fertility Era": A Study of in Vitro Fertilisation (IVF) Journeys in China

The past decade has seen China's "New Era" – an ideological concept tied to Xi Jinping – with a resurgent of Confucian culture in political discourse such as the family-state. Particularly, the frequent changing fertility policies since Xi governed China have prefaced the post-one-child era – characterised by many tensions and ambivalence in the realm of reproduction - which I describe as the "new fertility era". To promote more births, the state adopts a top-down nationalist call — "having children is both a familial and national matter", and reproduction has been incorporated into the mission of the rejuvenation of the Chinese nation. However, there seems to be a gap between this top-down nationalist and pro-natalist propaganda and the bottom-up public discourse on fertility anxiety. As the population policy shifting towards pro-natalism profoundly influences individuals' and families' reproductive decision-making, people express great anxiety about their practical difficulties of having children on the Internet.

In this paper, I concentrate on the reproductive decision-making of women who seek in vitro fertilisation (IVF) treatment in China. Based on the ethnography in Beijing, China, I document how women's difficult IVF journeys through the bewildering and disappointing world of IVF throw them back on their families for support, but mainly leave them to sort out all the difficulties and challenges on their own. I argue that the "cost" of the disconnect between supposed family values and the state's determination to improve fertility rates – both of which are belied by the difficulties women face in securing effective IVF treatment – is a "gendered" burden, to the extent it is largely born by women. I further suggest that the "tangle of forces" they face and the "fertility shocks" they encounter, internalise, negotiate and struggle with, tell a very different story to the state's nationalist propaganda for pro-natalism.

Not All Emissions Are Created Equal: Multidimensionality in Nations' Greenhouse Gas Emissions and the Affluence/Emissions Nexus

Environmental sociologists have extensively studied the economic development/emissions relationship at the cross-national level, primarily using aggregate emission measures that cannot adequately distinguish different structural components of nations' emissions. However, economic development might not evenly affect these emissions components. This study proposes an alternative framework of *Multidimensional Emissions Profile*, which situates nations' contributions to global emissions into four distinct components: (1) emissions generated by domestic production serving domestic consumers; (2) emissions embodied in imports; (3) emissions embodied in exports; and (4) direct emissions of consumer activities. Using this framework, input-output data, and dynamic panel regression analysis, I analyze the heterogeneity in relationships between national affluence and the four emissions components for 34 high-income nations. I compare both the short-run (i.e., immediate) effects and long-run (i.e., cumulative) effects of affluence on the four emissions components from 1995 to 2015. For both types of effects, the relationships differ across the four emissions components in magnitude, direction, and in how the relationships change at different levels of affluence. As these high-income nations grow even wealthier, affluence is gradually decoupled from emissions generated by domestic production serving domestic consumers, yet, it remains positively associated with the other three emissions components in different ways. Moreover, how the long-run effects of affluence are distributed over time also varies across the four emissions components. The findings highlight an important direction for climate mitigation research and policy considerations: how can the decoupling between affluence and the emissions by domestic production for domestic consumers be replicated for the other three emissions components? Moreover, this study calls for the theoretical debate on economic development/emissions relationships to better consider the nuanced multidimensionality in such relationships. Additionally, the study demonstrates the utility of the *Multidimensional Emissions Profile* framework for future research on human drivers of emissions.

Division of Household Labor and Married Couple's Subjective Well-Being in China

Although adequate studies have investigated the within-couple inequality of household labor division and its determining factors, few pay attention to its consequences. Drawing upon couple-level data from Chinese Family Panel Studies (CFPS), this study employs the two-way fixed-effects model to explore how the within-couple household labor division affects wife's and husband's subjective well-being in China. The author constructs two sets of variables to measure household labor division: the amount of housework by husband and wife, and the proportion of housework each role undertakes. The analysis shows differential effects by husband and wife. For husbands, the effect on

the subjective well-being is linear. Consistent with the prediction of classic economic theory, larger amount or a higher proportion of household work one undertakes lead to lower well-being. For wives, however, the effect is nonlinear. There is an inverted U-shaped relationship between their housework amount and their subjective well-being. The quadratic relationship is also found in the proportion of housework they take on and their well-being. Moreover, the share of housework that can maximize women's well-being (the turning point of the curve) exceeds half, which indicates that wives somehow favor unequal household labor division in which women undertake more of the unpaid household labor. Further analysis also shows the heterogeneous effects among wives with agricultural and nonagricultural hukou and that well-being of wives with nonagricultural hukou decreases as their housework amount increases in a linear fashion, instead of a non-linear one. The results can be explained by two antithetical gender ideologies: the traditional intrahousehold gender role expectation and the rising waves of feminism and gender equality, which exert great influence on how individuals, particularly women, perceive the gendered division of domestic labor.

Intergenerational Mobility and Perception of Social Justice in China

With the development of market-oriented reform in China, inequality and injustice have become important social problems, and citizens' perceptions of justice have attracted considerable academic attention. While adequate studies have investigated mobility effects on micro-level perceived distributive justice, few has explored how mobility affects the way individuals look upon injustice of the entire social system. Drawing upon the data from Chinese General Social Survey(2015), this study employs the diagonal reference model(DRM) to analyze the impact of intergenerational mobility on individual's perception of social justice in two aspects: the effects of origin and destination class and the net mobility effect. In this study, the author constructs a hierarchical stratification structure consisting of farmer class, manual worker class and non-manual class based on the EGP11 scheme. The results show that perceived social justice varies across the three classes. The classic acculturation and status maximization hypotheses are denied, impact of origin class is significantly greater than that of destination class on individual's perceived social justice, which indicates that primary socialization plays a more important role in shaping individuals' perception of justice. More importantly, unlike the prediction of social comparison theory, which has been sufficiently supported by empirical research on micro-level perceived justice, upward mobility has an independent negative effect on perceived social justice, and the long-distance mobility from farmer class to non-manual class is the main contributor of this effect. With system justification theory as the study's theoretical framework, the findings show that upward intergenerational mobility can weaken the motives of individuals from lower class to justify the social system.

Analysis of Rare Disease Patient Organizations (RDPOs) in China and Influencing Factors of Fundraising Amount: An Organizational Cross-Sectional Study

Patient organizations have mushroomed in China over the past decades, and so have rare disease patient organizations (RDPOs). Under the influence of state power in a non-neoliberal context of contemporary China, patient organizations in China can be understood as an extension of the government welfare system, making them constitute a unique structure of funding sources different from the US and European counterparts. However, this has not received enough academic attention to RDPOs in China. By conducting a questionnaire-based survey among key persons in their respective rare disease patient organizations (RDPOs), the objective of the study is to quantitatively give an overview of organizational characteristics, staff members, fundraising sources, funding amount and its influencing factors, filling the gap of lacking data of RDPOs and advancing the understanding of the current situation of RDPOs in China. Information on a total of 73 RDPOs was collected. The findings suggest that a great majority of RDPOs in China did not have stable funding sources, where internal members' donations, enterprise donations, and private donations constituted major components of them. Moreover, an ordinal logistic regression analysis was performed and found that professionalization and media exposure were positively associated with fundraising amount. Other findings include a low registration rate of them in the civil affair department and

a high proportion of staff being patients or family members with rare diseases, which is a unique characteristic compared with non-profit organizations in other areas. The paper argues that RDPOs in China were faced with a lack of social support, funding sources and professionalization, making hardship for them to develop sustainably, and that more importance and attention should be attached to RDPOs by the public and government.

Witness to Harm: Tracing the Ruling Relations in Fitness to Practice Hearings

Witness to Harm, Holding to Account is a mixed-method study of witness' experiences of Fitness to Practice (FtP) proceedings in the UK. There are 13 regulators in the UK that seek to ensure over 1.5m health and social care professionals practise safely and act appropriately in accordance with professional standards. If professionals fail to meet standards, and concerns are raised by patients or service users, professionals may face a FtP investigation and formal hearing. Our research is primarily concerned with the experience of witnesses in hearings who have experienced harm themselves, or have had a family member harmed.

This paper will present emerging findings from one strand of this study which comprises ethnography of FtP hearings. Hearings are mainly held in public and follow an adversarial system that involves cross-examination of witnesses. Our (ongoing) fieldwork has covered 13 FtP hearings held in public across 8 regulators, April-September 2022, and will be supplemented by interviews with witnesses and others involved in those hearings once cases have closed and appeal periods concluded.

Informed by Institutional Ethnography, we take the standpoint of the witness to ask of our data: what work do witnesses do in FtP hearings? How does their work contribute towards the production of a single determination of multiple accounts of events recounted during the hearing? We will draw on Ahmed's (2021) work on complaint and on Fricker's (2007) work on epistemic injustice to analyse how witness testimonies and interpretations are instrumentalised. We intend to discuss the costs to, and consequences of, doing this work for witnesses. We aspire to use our findings to contribute to improvements in FtP hearings for witnesses in future, however we are concerned about finding opportunities for such improvements in processes which appears (to date) to reproduce the ruling relations between regulators, professionals and patients/servicer users.

HUGHSON, Taylor* (University of Cambridge, United Kingdom)

Producing New Kinds of Teachers in England 2008-2020: Tracing Knowledge Production and Elite Actor Networks in the Reform of Teacher Certification

In 2008 in England, Initial Teacher Education (ITE) requirements asked teachers to embrace learner "diversity" and recognise "developmental, social, religious, ethnic, cultural and linguistic" differences. However, by 2019, reference to these terms disappeared, replaced instead by a focus on "memory", "knowledge", "retrieval practice" and "high expectations for all". This paper understands ITE primarily as a political project, and asks why the understanding of teachers encoded in ITT and other teacher certification requirements has changed so drastically in England in recent years. To address this, it offers a critical discourse analysis of key policy documents, combined with a critical realist mapping of elite actors involved in the reform of teacher certification, based on 22 interviews with such actors.

This paper ultimately argues that teacher certification reform over this period is driven by a Conservative Party government project with two main strands. The first involves a turn away from multiculturalism and towards an assimilationist politics. The second is an ongoing and intensified commitment to neoliberalised meritocracy, with teachers increasingly tasked with adding 'economic value' to the nation by improving student performance. Key shifts in knowledge production and dissemination are shown to undergird this change, including the significant decline in importance of academics and bureaucrats, and the rise in prominence of NGOs, 'Edublogers' and the Education Endowment Foundation (EEF), a government-funded charity. These shifts ultimately allow the state to offer a changed understanding of 'the good teacher' as one both committed to building a more 'homogenous' nation, and better able to develop economically-productive citizens. This presentation will conclude by asking critical questions about these reforms, suggesting that a greater range of actors need to be brought into teacher policy making if we are to develop teachers who are fully ready to deal with the diverse and complex schools they operate within.

How Leisure Is Being Swallowed up By Authoritarianism

Leisure is an important part of human existence and life, the carrier of physical and spiritual home, and the earliest source of social and cultural phenomena. Aristotle believes that "leisure is the center around which all things surround. More than 100 years ago, Engels said: "The free and comprehensive development of people is the spirit of the new era in the future".

Unfortunately, in the more than 200 years since the industrial society, the damage done to the earth due to human excesses is driving the human condition to the brink of extinction. The resurgence of authoritarianism is one of the biggest killers. Today, technological power, financial capital, and consumerism are important variants of authoritarianism, but they have an extremely hidden side, often tempting people with "abundance", "satisfaction", "happiness", and "development". People not only "give up resistance", but even feel great about "freedom" and "happiness" they get, but the bottom line and boundaries of human nature have been greatly broken.

Based on such a background, as a scholar of leisure sociology, we have to rethink what is the essence of leisure. How does the power of technology, financial capital, and consumerism control our leisure behavior? How to understand the prophecy of the unbearable consequences of the "worship of work"? Then, how to turn leisure into the endogenous force of people's "to be becoming" and "socialization"? Those issues will be the focus of this paper.

HÜLLE, Sebastian* (Institute for Employment Research (IAB), Germany)

Maximizing Linkage and Panel Consent Using Repeated Queries with Varying Framings

Maximizing panel consent is most important for panels that do not allow for refreshment samples. Additionally, many studies need to maximize linkage consent which can minimize linkage consent bias. These challenges are addressed by the innovative design of a new panel study that uses repeated requests with varying framings to maximize linkage and panel consent.

It is an evaluation study of two employment programs (§16e and §16i SGB-II) for long-term unemployed in Germany. The two independent samples of the first wave comprise 16,792 telephone interviews. Panel consent was asked up to three times and linkage consent was asked up to four times within the fieldwork of wave 1. The first linkage request was at the very beginning before the questionnaire starts. The 16e-panel has two experimental groups differing randomly in the framing of requests. The design also comprises conversion procedures after the interview via postcard and phone.

The amount of linkage non-consent identified with the first linkage request was reduced with the repeated requests by 53% for the 16e-panel. The total linkage consent rate for the 16e-panel is 98%, for the 16i-panel with its mandatory linkage it is 100% for completed interviews and 97% for partial interviews. The amount of panel non-consent was reduced by about 57%. The overall panel consent rate is 97%. The article also addresses the predictors of why people do not consent or change their mind to consent after repeated requests.

To conclude, repeated requests can reduce refusals regarding linkage and panel consent to a substantial degree within one panel wave. This encompasses asking for the (even mandatory) linkage at the very beginning of an interview. This article contributes to the state of research by providing applications and evidence on how linkage and panel consent can be maximized to improve data quality in linked panel surveys.

Familial Loss in the Early Stages of the Life Course and the Biological Aging of U.S. Adults

The mechanisms underlying the link between early life loss, poor health, and mortality are unclear. Loss may affect health through the decline of social and financial resources. These loss-related disadvantages may then initiate a host of risk factors for poor health. In addition, the psychological stress imposed by loss may directly alter the immune, cardiometabolic, and

inflammatory pathways in the body. All of these potential mechanisms are known to impact biological aging. Yet, few studies have tested whether loss in either childhood or young adulthood is associated with DNA methylation markers of aging. To fill this gap, we utilized prospectively collected data from the National Longitudinal Study of Adolescent to Adult Health and new epigenetic data collected at Wave V to test the hypothesis that interpersonal loss leads to DNA methylation aging. We examined both childhood and young adulthood familial loss as well as the number of losses on several epigenetic aging clocks measured when the Add Health cohort was average age 38. We estimated linear regression models using the survey package in R. Models were corrected for unequal selection probability and clustering of individuals within primary sampling units. Six models were estimated for each of the four epigenetic clocks: Horvath, GrimAge, PhenoAge, and Dunedin Pace of Aging. We found that loss, including parental loss and the number of losses, were associated with robust differences in epigenetic aging and the pace of aging. Of note, familial loss in young adulthood appeared to be more strongly predictive of epigenetic aging, independent of childhood losses. These results indicate that loss has long-lasting and profound associations with biological aging, even before adults reach middle age. Our findings suggest that epigenetic aging may represent a mechanism linking interpersonal loss in the early portion of the life course with morbidity and mortality risk.

Addressing Settler Colonialism within Genocide Education in North American Post-Secondary Educational Institutions

Genocide studies in colonial higher education systems in North America need to be further unsettled. A part of this is often a lack of meaningful integration of certain cases of genocide, where primary genocides such as the Holocaust, the Rwandan genocide and the Armenian genocide are often the focus of genocide education, and long-term settler colonial genocidal structures, particularly Indigenous genocides, do not receive the same level of recognition. This research aims to better understand how settler colonialism might be addressed in the context of genocide education in tertiary educational institutions. Through seeking to better understand unsettling genocide education, additional goals to analyze the current possibilities and limitations of this education within North American post-secondary educational institutions are made. The motivation for examining these problems may include increased responsibility of perpetrators, centering the voices and stories of survivors and endurers of genocide through their own ways of knowing, the transformation of genocidal institutions and increasing solidarity if possible. Using a place-based approach, this research particularly focuses on how Indigenous genocide in North America is taught in post-secondary institutions. By analyzing syllabi and genocide institute foci and programs, a primary analysis will be made of the current state of settler colonialism characterizing genocide education. These results will be compared with secondary sources on the experiences of students and faculty who have participated in classes and institutes concerning genocide studies. This research does not seek to be prescriptive, but to be critical of the roles of settlers in colonialism and for centering the voices of Indigenous Peoples for increased solidarity.

HUMPHRYS, Elizabeth* (University of Technology Sydney, Australia)

Climate Change: Work Health and Safety, Green Jobs, and Just Transitions

Climate change — and the necessary transformation of production and work — is a profound challenge for labour, industry, and government. Almost half of the global population is now exposed to high heat episodes, including more than one billion workers. In 2019 the ILO estimated a productivity loss equivalent to 80 million full-time jobs by 2030, or more than 2 percent of total working hours worldwide. Projections also place most of Australia's land mass in the moderate to high-risk category for occupational heat stress, and some parts of the country at extreme risk. High heat increases the rate of workplace injuries, and in the most severe cases can lead to death. The move from a fossil fuel dependency to green jobs also presents challenges at the national, regional, and individual level, requiring planning for just transitions. This paper examines recent research on these issues in relation to Australia, and considers what has been revealed by the COVID-19 pandemic, the 2019-2020 Black Summer bushfires, and the 2022 floods about how ready the nation is for climate change impacts on work and workers.

LGBTQ+ Older Adults' Perceptions and Experiences of Aging

There is a growing body of research that has considered the health and social experiences of older LGBTQ+ adults over the life course. Building on

this research, our study examined older Canadian LGBTQ+ persons' everyday experiences of social inclusion and exclusion. Thirty LGBTQ+ persons aged 65 to 84 (average age of 71) were each interviewed twice either in person, by telephone, or by Facetime or Skype for between 2.5 and six hours (total of 113 interview hours). Our sample included 15 participants who identified as female and 15 as male, including five transgender women and one transgender man. There was diversity in the participants' sexual orientation, ethnicity, race, education, income, partner status, and health and functional abilities.

In this paper, we focus on our participants' specific thoughts, feelings, and experiences of growing older as an LGBTQ+ person. Drawing on age relations and queer theory, the data pertaining to this broad category were analyzed thematically resulting in three overarching themes. 'The aging process has taken a toll' refers to participants' experiences of social, physical, cognitive, and financial losses. 'I know a lot more... and I'm part of a community' refers to participants' perceptions that aging has resulted in many positive changes, including gains in freedom, personal wisdom and self-confidence, and social connections and a sense of belonging. 'There's very little that meets any of the needs of those of us who are older' refers to participants' identification of the specific and unique needs of older LGBTQ+ persons, including those related to physical and mental health, meaningful occupations, social connections, and safe spaces. We discuss the policy and practice implications of our findings for the fostering of health, well-being, and social inclusion amongst this often-marginalized population.

Rumours(Gujob) and Misinformation in the Era of Information Society: A Case of Bangladesh Society

Bangladesh, one of Asia's fastest growing internet user countries, with more than 112 million active internet users and more than fifty million social media (Facebook) subscribers. Although myth, rumour (Gujob), and misinformation (MRM) have been part of Bangladeshi society since the country's independence in 1971, in recent years, with the development of the information society (IS) and the rise of digital news platforms and social networking sites, a slew of MRM cases (political, religious, health, crime, and so on) have been reported and continue to be reported due to less efficient communication infrastructures and a growing number of digitally illiterate citizens. People have tremendous capacity to cause chaos, uncertainty, and insecurity owing to the same instruments that empower them. Misinformation, disinformation, conspiracy theories, rumours, hate speech, and other types of misinformation are becoming common on such digital platforms. Thematic analysis based on secondary data sources revealed that netizens desire the news media to verify the validity of shared materials, despite the fact that online portal-based news platforms stated that fact checking is not their duty and is beyond their capabilities. In addition, voluntary fact checkers in Bangladesh lack enough infrastructure support, and in consequences, MRM fuels social and communal strife, resulting in fatalities, property losses, and community cohesion. This paper explored various actions performed by various agencies to combat MRM in Bangladesh's landscape. Several strategies have been proposed for reducing online MRM, which would aid academics, policymakers, and the general public in maintaining social cohesion and avoiding communal violence.

The Impact of Crises on the Hegemony of Nuclear Power Elite in Finland: A Neo-Gramscian Approach

We explore the impact of outside crises on the discursive strategies and the hegemony of the nuclear elite in Finland. We use the Neo-Gramscian approach to power to scrutinise how crises as turning points and sudden events make energy elite-groups react and reformulate their discursive strategies and techno-scientific promises and how outside events might be intense enough to overturn established nuclear energy solutions. The Neo-Gramscian approach has contributed to the theorising of power in energy social science. It pays attention to elite power, incumbency, hegemony and different forms of power. We are also interested in techno-scientific promises on nuclear energy futures. Techno-scientific promises are generally meant to legitimise, reduce insecurity, guide actions and steer investments and are central to fulfilling energy goals of the elite groups.

We focus on three crises related to nuclear energy that occurred in Finland, which planned to build a new nuclear energy power plant in the 2010s in Pyhäjoki. The first crisis refers to the Fukushima nuclear accident in 2011. As a consequence, the German energy company E.On abandoned the project, which forced Finland to change the builder for Russian-state-run energy company Rosatom. The second crisis took place after Russia occupied Crimea in April 2014; however, the Finnish Parliament approved the decision-in-principle later that same year. Russia's hostile invasion of Ukraine in February 2022 (the third crisis) led to the termination of the project.

Based on the case study data, we show how the nuclear energy elite needed to reinforce and adjust its techno-scientific promises to new circumstances due

　denotes a presenting author. Abstracts are organized by first presenting author's last name.

to sudden outside events. The first and second crises presupposed discursive legitimation by the nuclear elite. The third crisis caused intense moral shock in the form of transformative experiences in the elite group, which ended the future of large nuclear power plants in Finland.

Research Funding Organisations As Change Agents for Equality, Diversity and Inclusion: European Perspectives

Research funding organisations (RFOs) are key R&D stakeholders in knowledge production and in development of research careers. How do these organisations address gender and other inequalities in their policies and practices? To what extent do they act as change agents towards equality and diversity with an impact on the whole sector? During recent decades, many national research funding organisations have increasingly become engaged in policies promoting gender equality, diversity, and inclusion. Some RFOs are also collaborating increasingly in this area, both nationally and regionally, establishing collaborative networks. An important driver here has been the European Research Area (ERA), in which gender equality is one of priorities. However, the developments in this respect across Europe are complex and uneven, with advanced and ambitious policies established in some national contexts, on the one hand, and very limited and restricted engagements in some others, on the other hand.

We compare the developments in national RFOs in five European national contexts, which vary in their research intensity and gender regimes: Austria, Ireland, Poland, Slovak Republic, and Sweden. We highlight advances and challenges in engagement of national RFOs with gender equality, diversity and inclusion, analyse the contextual factors driving development, and ask to what extent do the RFOs integrate intersectional approaches in their policies. The empirical material draws on policy document analysis and qualitative interview and observation research in GRANTeD (Grant Allocation Disparities from a Gender Perspective), a research project funded (2019-2023) by the EU Horizon2020 framework.

HWANG, Eunha* (Korea university, Republic of Korea)

How the Memories about Home Environment Shapes School Drop-out Adolescents' Depression: The Moderating Effects of Supportive Relational Experiences

This research examines the effect of life events concerning parental memories on the depression of 'School drop-out' adolescents in South Korea. Despite a continuous increase of school drop-out adolescents in South Korea, there has been little research about them. Many explore the determinants of school drop-out desicion but do not examine the long effect of adolescents' life memories(life events) with parents. Compared to School-Included adolescents, School drop-out adolescents lack social relational advantage and so it increases the possibility of mental difficulty. Considering the importance of "Guides(Mentor)" affecting children and adolescent from previous researches(Beier, Rosenfeld, Spitalny, Zansky, and Bontempo 2000; Lee and Kim 2009; Lareau 2015..), I also tested the moderating effect of supportive experiences related to (1) family and friends, (2) institution. For these purporse, I used 2013 Korean data about school drop-out youth by National Youth Policy Institute. Conducting regression analysis, the results are as follows; first, School drop-out adolscents' depression was partly explained by life events with parents. Second, there was not found any significant moderating effects of supportive experiences. Adolescents' life memories with parents were so enormous that any support could not work more significantly than them. These Findings give us some implications concerning the current educational policies showing tendency to focus on the 'School-Included' children. Further research should be done more on considering 'School drop-out' adolescents' life with the perspective of life course.

HYDE, Martin* (Swansea University, United Kingdom)

Ageing in a Global Context: New Spatial Dynamics of Later Life

The Covid-19 pandemic demonstrated the globally interconnected nature of contemporary life in the most alarming way. Yet, despite advances in geographic and environmental gerontology, globalization remains relatively under-theorised and under-researched within gerontology. This presentation aims to redress this by critically examining the ways in which globalization and ageing interact and the challenges and opportunities that globalization presents for older people. This is important, not simply because a more integrated approach to globalization is necessary, but because the effects of globalization have destabilized many of the assumptions and policies around later life. Although population ageing is seen as a global phenomenon, there are differences in the timing, speed and level of population ageing as well as the in the spatial distribution of older populations and the ageing of the older population itself. Furthermore, older people are increasingly caught up in global flows in a number of ways, e.g. as tourists or migrants, by zooming with friends and family around the world and as recipients of care provided by a globalised workforce. These transformations not only represent a radical re-ordering of the spatial and social modes of living for older people but also pose a challenge to the 'methodological nationalism' of much gerontological research. Drawing on evidence from a wide range of countries I aim to show that social gerontology needs to develop new ways of thinking that allow for the complex interplay of different spatial logics and demonstrate the importance of the changing nature of space to understand what it means to age in locations configured by the intersections between global, regional and national spaces.

Differentiated Factory Regimes: Transformations of Labour and Workplace Politics in the Italian Shipbuilding Industry

This proposal discusses the preliminary results of an ongoing research study focusing on labour process transformations in the shipbuilding industry and how these affect the composition and management of the workforce, factory regimes and workers' voices. The research is based on empirical evidence from the case of Fincantieri, collected through interviews with workers, trade unions and managers in the shipyards of Marghera (Venice) and Monfalcone (Gorizia).

For years, Fincantieri has been pursuing an organisational rationalisation through the outsourcing and construction of complex sub-contracting chains. These organisational changes lead to a strong segmentation of employees' working and contractual conditions and weaken the power of workers and trade unions. One of the most important transformations stimulated by corporate restructuring is the change in the technical and social composition of the workforce. Different wage, protection, and social reproduction regimes apply simultaneously to the different groups and, with them, different ways of managing the workforce. In addition, the internal change in the technical composition of direct employees and the outsourcing of a large part of blue-collar work to subcontractors were identified by experts as the main causes of the erosion of power and the qualitative transformation of union representation.

Starting from this framework, our research purpose is to investigate how the workforce management system is reorganised and, secondly, what reactions of consent, adaptation or resistance - on the part of the workers involved - are provoked by this peculiar organisation of work and workplace politics. Our results indicate how the workforce management strategies in the Italian shipyards are based on the internal and simultaneous overlapping of different factory regimes (hegemonic, despotic and hegemonic despotism) that have led to new forms of hierarchy and stratification, ultimately hindering solidarity processes.

The Obesity and Diabetes Narrative on Twitter

Health is identified and recognized as mirroring the state of well-being of an individual and a society. Since WHO's first definition in 1946, there have been several evolutions of the concept of health itself over time. In the new information age (Castells, 1996), the concept of digital health is emerging, understood as the use of information and communication technologies in medicine to manage disease, health risks and promote well-being (Mathews etl al, 2019; Rieke etl al, 2020; Kostkova, 2015). In this scenario, health technologies hold great promise for developing digital health skills and improving health outcomes for patients with chronic diseases. Indeed, contemporary societies have over the years undergone the epidemiological transition (Omran, 1971) that has seen infectious-predominant diseases turn into chronic-degenerative diseases. Today, for people at risk of obesity and diabetes 2 it is possible to talk about prevention, drastically reducing the chance of getting sick and avoiding risk factors such as unhealthy lifestyles, obesity and sedentary lifestyle (in Italy, overweight Italians are almost 22 million, 6 million obese, 3.5 million diabetics). Social media provide an open forum for communication between individuals and, the aim of this paper is to explore the issues and evolution of the debate on obesity and diabetes, while also assessing the quality of information circulating on Twitter and the behavior and information needs of the users involved.

La Experiencia De La Dictadura y Los Avances De La Nueva Política Urbana En Chile

La configuración de la nueva agenda urbana, con énfasis en el desarrollo urbano integral y sostenible, propuesta en Habitat III, y su posibilidad de implementación en las ciudades chilenas requiere analizarse en línea con los alcances de la Política Nacional de Desarrollo Urbano (PNDU), vigente desde 2014, pero también con experiencias previas: las PNDU oficialmente dictadas en 1979 y 1985, en dictadura, y en los intentos de formulación de una nueva Política, impulsados por los gobiernos democráticos entre 1993 y 2009 (MINVU, 2012).

El golpe de Estado de 1973, reorientó las políticas urbanas al desmontarse el aparato de la planificación central, con un consiguiente avance hacia una mayor desregulación en la que el Estado se limitó a entregar lineamientos de políticas territoriales más generales (De Mattos, 2001). Con la PNDU de 1979 "... las políticas urbanas fueron radicalmente transformadas a favor de esquemas de liberalización, privatización y fortalecimiento de los derechos de propiedad (...) dejando el crecimiento urbano sujeto a criterios de rentabilidad en los mercados" (Ferrando, 2008). Así, la dictadura marcó un antes y un después en la consolidación del rol subsidiario del Estado, pasando el privado a ser un agente protagónico del desarrollo urbano (Román, 2021). Analizar ambos contextos políticos permite explicar las posibilidades de implementar la nueva agenda urbana considerando la experiencia del neoliberalismo y de la desregulación desde el comienzo de la transición democrática (Figueroa, 1990; Poduje, 2006; De Mattos, 2008).

Bajo la consideración de que la ruptura del régimen político perpetuó un modelo en términos urbanos, entre dictadura y democracia (Valencia, 2006), esta ponencia busca, desde la perspectiva de la sociología histórica, situar las actuales reflexiones sobre la planificación urbano territorial y sus alcances con los nuevos principios y objetivos que guían los destinos de las ciudades y poblados, de acuerdo a la "nueva política urbana".

IBARRA, Macarena* (Pontificia Universidad Católica de Chile, Chile)

LINK, Felipe (Pontificia Univ Catolica Chile, Chile)

Planning for Post-Pandemic Neighborhoods of Metropolitan Cities. the Case of Santiago De Chile.

A recent study led in the context of COVID-19 (ANID, 2020) shows that the sanitary crisis has particularly affected vulnerable neighborhoods, increasing the social and spatial inequalities (Link et al., 2021). During the pandemic, urban living was radically changed displaying new routines related to the use and perception of the public space, and different practices and strategies of urban coexistence, showing a new perspective of community resilience. The extensive period of lockdowns (more than eight months) and the strong social distancing measures, together with the extended curfew implemented since the social revolt in October 2019, added more uncertainty to the daily routines.

As a result of this research, we have built an indicator that shows the relevance of social and territorial conditions to face the pandemic. In addition, we have collected primary data from a survey of 400 people and fifteen focus groups from representative neighborhoods of the Metropolitan Area of Santiago.

This paper aims to discuss to what extent the pandemic recovery is going to lead to a "new" normality. It suggests that urban planners must consider several lessons, such as the effects that the COVID-19 crisis had in the territories and how it impacted the urban dimension, to manage future public policies. Finally, the findings show that both housing and neighborhood can shape new social networks during pandemics, building diverse communities and reinforcing the role of their location. In this new scenario, which are the challenges that experts need to consider while restarting the new urban life, knowing the inequalities that the sanitary crisis evidenced?

Education-for-Immigration, Language and the Orchestration of the Migrant Habitus: Exploring the Narratives of International Graduates in Denmark and New Zealand

In this paper, I provide a meta-analysis of Bourdieu's notion of the habitus, drawing from extant works that employed this concept and Bourdieu's later works. I argue that the habitus is to be categorised as 'acquired' and 'generated' based on temporal and spatial configurations. This meta-analysis provides the grounds for the articulation of the migrant habitus, which I describe as a set of socially constituted dispositions that shape the migrant as one who has yet to sync with the social and cultural settings of a particular place, giving rise to a sense of alienation, life stuck in transition and a hyper-awareness of a condition of otherness. I proceed to show how this sort of habitus in its declarative and non-declarative states is elicited in the narratives of educational migrants in Denmark. For although, possessing Denmark's institutionalized cultural capital, international graduates in Denmark are inadvertently confronted with encounters that foregrounds their (limited) competence in Danish language, illuminating their 'otherness', orchestrating 'migrantness', and stimulating dispositions of the not-yet-berthed. I contrast the experiences of Denmark's international graduates with those of New Zealand. I contend that linguistic-policy-coherence for educational migration would help abate the orchestration of the migrant habitus for international graduates who are invited to settle in their host country post-study.

Race, Racialisation and Whiteness in Australian Youth Sociology

In this paper, we consider how youth sociology in multicultural settler-colonial contexts like Australia can engage with a race critical approach that moves beyond recognition or inclusion of 'difference'. In Australian youth studies, race and ethnicity are usually understood as social identities attached to non-white youth. Less explored is racialisation: the mechanisms by which race is made meaningful in the first place, as a way of knowing and regulating youth, and the production of hegemonic whiteness; a process in which knowledge structures about youth are frequently engaged. The value of focusing on racialisation is that it is 'a means of redirecting the conventional gaze of race relations sociology away from the characteristics and actions of those defined racially' (Murji and Solomos, 2005:16), and instead towards processes of race thinking and race-making that fundamentally shape all young people's lives.

The project of investigating racialised knowledge production and power is integral to critical reflection on what the sociology of youth is today, as the 'WENA' hegemon (Western Europe, North America, Australia [Cooper et al, 2019]) that has claimed the centre of youth studies still struggles to interrogate the on-going colonial and racialising logics which underpin the field's construction and representation of youth. In this presentation we consider how youth sociologists in places like Australia might excavate and make visible the whiteness at the core of many foundational concepts in youth studies. We discuss current concepts and agendas in the field (e.g. the enterprising self, mobilities, the role of inheritance in youth transitions), to ask how research can better tackle the configuration of race within such concepts, pay heed to their racialising effects, and disrupt the claims to normativity they make about some young people's lives over others (Moreton-Robinson 2004).

CHamoru Attitudes on Native Language and Culture

For some individuals who identify as CHamoru, speaking the native tongue is not part of their daily lives while others are able to do so fluently. This paper explores the attitudes, presence of the CHamoru language, and identity CHamorus have in contemporary times. Since attitudes toward learning the native language have shifted overtime, this study examines the possibility that shifting attitudes are correlated with accessibility. Furthermore, the study draws its findings from a survey consisting of twenty respondents and two interviews. The application of theory is used to explain why the participants might consider (or not) their language as part of their identity, and how its presence affects their daily lives. Limitations and suggestions for future research are also discussed.

Social Capital in Cross-Cultural Settings: Case of International Students in the Philippines

International students in the Philippines encounter the same challenges settling in the host country and host university, just like other international students elsewhere. But, the motivation of international students to go to the Philippines influences them to establish bridging capital more than just bonding capital. From Bochner et al.'s functional model of friendship networks, a network with host nationals is maximized by international students to achieve their goals as soon as possible. Their motivation pushes them to acculturate fast and utilize all forms of social capital available, which is visible in many cases of international students in the Philippines. Overall, this study looks into social capital in cross-cultural context. Specifically, this paper argues that the presence of social capital can shape the educational experiences of international students in the Philippines. Mobilization of such capital could vary depending on the motivation of students to study in the Philippines and the degree of acculturation they invest in forging social relationships with the locals. Social capital in cross cultural context then requires the repression of "othering" to build the trust necessary in social capital mobilization.

Uncovering the Dark Side: Social Capital and Political Beliefs in Filipino Families

It is typical for family members to have some degree of social and political values in common. Youth's involvement in political discussions with family members plays a significant component in their political socialization process. Family has always been considered as a primary source of social capital. The benefits it provides extend to acquisition of other forms of capital, from economic, to cultural. But discussion of the underside of social capital, which includes exclusion and cohesion, remains to be underexplored. This is particularly true when politics is the point of discussion, especially in a time of election. Using Bourdieu and Coleman's concepts of social capital, this paper seeks to describe the dynamics between members of a family and characterize how the individual members' political stance affects the amount of social capital they acquire through the family as an institution. The data used in this study is a combined quantitative and qualitative data from a survey and narratives from survey respondents who agreed to be interview. Parents encourage their children to reason out loud and intelligently, making them use their imagination and helping them become better at making judgments. This guidance is critical because this is where they develop their beliefs and choices. Whether their stand is one with their family, or if they have their own, or if the family suddenly becomes dysfunctional because of differing beliefs, is part of the process that will test the stability of the family as an institution. This paper argues that this is highly observable in Filipino families. Further, this paper argues that the need for social capital pushes individual members of a family to conform to a collective political stance rather than subscribe to personal political beliefs.

What Factors Decrease Satisfaction with Romantic Relationships: Focusing on Mismatch Related to Gender Roles in Japan

This presentation will clarify the factors which lessen the degree of satisfaction with romantic relationships and provide an explanation of the youth's distancing from romantic relationships in Japan.

Like other East Asian countries, Japan is experiencing a decline of fertility rates, and according to Iwasawa (2015), about 90% of the decline could be explained by the decline of marriage rates. Furthermore, government statistics show that the ratio of unmarried adults who are in a relationship has declined since 2005. Thus, in Japan, the decline of the ratio of youth in romantic relationships plays a large role in the decline of marriage and fertility rates.

So what are the factors that lead to the decline of the ratio of youth in romantic relationships? This study will focus on gender role perceptions in Japan, which are more fixed than in many other Asian countries. In Japan, more women than before are willing to pursue their professional careers. However, men's expectations on their partners and perceptions of their own roles have not changed much, which may facilitate a mismatch in mutual expectations, thus causing dissatisfaction with the relationship.

From this theoretical perspective, this presentation will show the results of a quantitative analysis of a national survey in Japan in which the presenter took part. To explain the variance of the satisfaction with romantic relationships, explanatory variables such as the aspects considered when choosing her/his partner (including the partner's recognition of the respondent's abilities, relationship with parents, socioeconomic status, etc.), the respondent's conception of gender roles, the length of relationship, age, work status, educational achievement were used. The results are generally consistent with the hypothesis, showing differences in the main effects of partner's recognition of the respondent's abilities on satisfaction by the respondents' gender.

The Logic of Dementia Prevention in Contemporary Japanese Society and Its Rise and Fall

In this presentation, I will examine the rise and fall of the trend of dementia prevention in Japanese society based on text data from newspapers and other sources and the content of the prevention discussed therein.In an aged society, dementia is viewed as a problem: both as a burden on society and a difficulty in the lives of individuals.

In developed countries, much emphasis has been placed on properly understanding the disease based on a biomedical model. This trend continues today in the form of the elucidation of the pathogenic mechanisms of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Alzheimer's disease and the development of therapeutic drugs, which has underscored the importance of the early detection of dementia and preventive measures for individuals.

In Japan, dementia prevention emphasized by policy in 2019 was criticized by people with dementia and their families, who argued that it is important to "living well with dementia" and "prepare for the disease." In this sense, the logic of prevention can sometimes be seen as an obstacle to living with dementia and people with dementia. In contrast, as a global trend, the concept of dementia prevention has come to include not only the prevention of degenerative diseases of the cranial nerves but also the prevention of chronic diseases and lifestyle modification. Therefore, it is expected that the content related to dementia prevention is diverse, and its relationship with coexistence and inclusion is not uniform.

Based on the above problematics, using a database of newspaper articles, I will collect articles on dementia prevention published in Japanese newspapers over the past 50 years or so and categorize them, focusing on the content and logic of prevention. Then, the trends by era, characteristics of the changes in meaning, and relevance to the other concepts related to dementia inclusion, such as "preparedness" and "coexistence" will be analyzed.

Comparison of Memorial Museums after the Great East Japan Earthquake and Tsunami of 2011

The Great East Japan Earthquake and Tsunami of 2011 caused great damages. Various memorial museums were set up in the affected prefectures (Iwate, Miyagi and Fukushima). There are variations in their exhibition.

The Museum next to the former Okawa Elementary School remain is criticized in its short content by some deceased families of the students who lost their lives in the tsunami.

This paper considers an ideal state of memorial museum in the case of the Great East Japan Earthquake and Tsunami of 2011.

Japanese Lawyers from 2010 to 2020: In Comparison to Chicago Lawyers

This paper considers the state of Japanese lawyers from 2010 to 2020 by using raw data of the Actual Conditions Survey on the Economic Base of Lawyer Business by the Japan Federation of Bar Associations.

During this period, the number of Japanese lawyers became about 1.5 times larger (from 28,789 to 42,164). This exponential increase seems to have diverse effects for the lawyer business.

The analysis is conducted regarding the career, workplace, income and others by referring to the Chicago Lawyers survey of 1975 and 1995.

The research result will shed light on the change of lawyer business in Japan in the decade and the differences between lawyers in Chicago and Tokyo.

Recommending Equity in Inequal Institutions: Japan's Experiences of Policy Recommendation for Integrating Gender Perspectives to the Disaster Management Policies

This paper examines how disaster social science can contribute to formulate policies that can actually be implemented and achieve the intended outcome, using policies to integrate gender perspectives into disaster prevention, response and recovery in Japan as a theme.

In the 2011 Great East Japan Disaster, many women took up activities to meet the needs of affected women, while social science research with gender perspectives were conducted. Utilizing the collection of good practices and policy recommendations based on these women's experiences and research results, the national government newly integrated the perspective of gender equity into policies of disaster prevention, response, and recovery.

However, when local governments introduced the new policies, some policy measures were not implemented, and even if they are implemented, there have been gaps between policy goals and outcomes. For example, after the 2016 Kumamoto Earthquake, some affected local governments did not promote participation nor responded to women's needs in shelter management, even though the revised guidelines included these measures. In Shizuoka Prefecture, where another gigantic earthquake is expected, due to political pressure from local stakeholders and discretionary actions and arbitrary interpretations of administrative officials, the new policy intention of women's participation was watered down when developing community-based disaster management organizations. The local institutions of disaster management themselves are highly gendered and most decision-makers are men.

Deriving data from interviews with local government officials and community disaster managers in Shizuoka and other prefectures, this paper illustrates how recommended policies and good practices were deliberately selected and policy intentions were changed and diluted by multi-layered decision-makers. This paper emphasizes that in order to contribute meaningfully to

build equitable and sustainable society, the disaster social scientists must be sensitive and ready to deal with the inequal institutional cultures and structures within which their recommendations are situated.

Women and Community Disaster Resilience in Post-3.11 Japan

This paper examines how newly developed women's leadership in disaster management has improved to build resilience in communities, as well as how women leaders themselves have been influenced through their engagement with communities. The data were obtained through interviews and a questionnaire survey with members of the community-based disaster management organizations (CDMOs) in the affected areas of the 2011 Great East Japan Disaster, and in Shizuoka Prefecture where another gigantic earthquake is expected to occur.

In the Great East Japan Disaster, a considerable number of women, many of whom were direct victims, took up activities to meet the needs of affected women, children, and other vulnerable people. Based on their hard-won lessons, new policies were introduced to develop female leadership in preparation for the next disaster. However, even in high disaster risk areas such as Shizuoka, despite women's strong willingness to attend the training, it has remained difficult for them to work for CDMOs, which were highly gendered and almost exclusively managed by retired men.

Nevertheless, this paper finds that both women and communities are slowly but surely changing. More women now regard wider local disaster risk as issues to make their own decisions, not just requiring 'unique needs of women.' The number of female committee members is increasing. More women committee members are satisfied with their performance, and where women are nominated leaders, gendered roles are improved. And more people in community trust women as their disaster managers.

These changes add new strength for the communities which are suffering from aging of the actors and distanced attitudes among younger generations, through increasing actors with diversified ideas and networks. To increase disaster resilience more, it is necessary to make the structure of CDMOs flexible to allow the participation of trained women, and to match-make trained women leaders and the communities.

The Nigerian Youth and the Endsars Protests: Implications for Participatory Policing and Innovative Democracy in Nigeria

The ENDSARS protests of October 2020 among other protests in Nigeria were triggered by dissatisfaction with the government and then against police brutality and violation of human rights. The protests led to the disbandment of the Special Anti-Robbery Squad (SARS) and the undertaking of certain reforms by the government. The protests and the subsequent reforms of the police suggested that the youth in Nigeria have awaken from their political slumber and ready to participate more in governance through the vehicle of participatory policing and demand for accountability. The paper was aimed at examining the implications of the ENDSARS protests for participatory policing and democratic innovation in Nigeria. This was done through reliable and credible data on citizens' perception of police reform in Nigeria as well as an audit of government initiatives towards reforming the police. The study utilized a mixed methods sequential research design to collect data from residents in the 36 states and the Federal Capital Territory (Abuja). The quantitative data were collected through multi-stage and stratified sampling techniques in selecting households and respondents for the survey while the qualitative data used purposive sampling targeting key and relevant stakeholders in the field of policing and human rights in Nigeria. More than half of the participants especially the youths reported that the protests elicited some form of consciousness among the youths, which could be harnessed to enhance more participation in governance, especially in the demand for accountability. Although the movement lacked organizational acumen in that the protests were hijacked by hoodlums at some point, the efficacy of the protests to hold the government responsible was indubitable. The paper discussed the implications of the protests for political participation in Nigeria by the youth who constitute a significant proportion of the population.

ILHARCO, Fernando* (Catholic University of Portugal, Portugal)

The Grounding and Self-Referential Character of Communication - the Cases of Social Stability and Social Change

This paper tries to develop a fundamental account of a self-referential system of communication that grounds human societies. We aim to show that our model can appropriately describe central aspects of society, both in the cases of stability and change. We will apply our model to the social sub-systems

of mass media, the legal system, and economic competition, highlighting their self-referential mechanisms and relevant power implications. These social subsystems' distinctions include news, illegalities, and losses or anomalous profits.

Revealing the above distinctions, framing a power system, communication favors either stabilization or change in society. In a context of stability, our model suggests, for example, that the more illegalities today, the fewer illegalities tomorrow; in a context of change, the more and more illegalities today, the more likely it is that the meaning of that distinction will change. The more distinctions in the subsystems, the better society evolves as a whole; that is, the more likely it is to survive. We submit that this self-referential logic can be applied to all subsystems of society.

The bodies of theory on which our work mostly relies are Luhmann's (1927–1998) account of society and communication (*Die Gesellschaft der Gesellschaft* (1997); Heidegger's (1889–1976) phenomenology of humanness (*Sein und Zeit* (1927); and Maturana (1928–) and Varela's (1946–2001) theory of autopoiesis. All these authors reject the subject/object dichotomy, arguing that human recursion and reflexivity make it impossible. Luhmann abandoned the notion of the subject, replacing it with an autopoietic system. Heidegger quitted the notion of 'man', replacing it with a verb, a mode of being he named *Dasein,* being-there, considering self-referentiality at the core of human existence*.*

Pushing for a coming together of the self-referential streams of early Heidegger and systems theory, we submit that self-referentiality is a fundamental systemic feature of human societies.

On How We Can Measure Intersectional Disadvantage at Old Age

Intersectional disadvantage at old age refers to categories of people that hold more disadvantaged positions in the same time and their intersection places them at a higher risk and social exclusion than when their position is taken into account on each category separately. Such categories may be represented by being at old age, being a woman, without living with a partner, with low education and low digital skills. Intersectionality aims at considering how characteristics can be mixed in order to capture the reality of social exclusion and difficulties people may posses. In terms of the methodological approach, using interaction terms or creating a factorial analysis within a structural equation model may represent ways of accounting for intersectionality in quantitative ways. Moreover, considering a formative factor provides a way of creating a type of index, whereas considering a reflective factor may conduct towards considering measurement errors in the variables that compose the intersectional disadvantage, such as age, gender, education, and so on, that go to a discussion of types of age (e.g. felt, formal, or social), more than two genders, informal education, and so on. All these approaches can be further used to predict outputs. The theoretical approach in this case is very much connected to the methodological approach for revealing intersectional disadvantage at old age, as well as the complexity of real life by means of quantitative research. This innovative approach of considering hardship in later life may represent a step forward in accounting for intersectionality in quantitative research.

The Connection between Intersectional Disadvantage and Health in Later Life

Intersectional disadvantage in old age may interfere with access to resources for an independent living. Even if older people experience limitations due to health issues, with adequate resources they can continue with their life normally. The aim of this paper is to understand to what extent intersectional disadvantage influences their health, adding digital skills to the standard indicators of intersectional disadvantage. We use SHARE data, wave 8 and we employ factorial formative analysis for accounting for the intersectional disadvantage factor within a structural equation model comparing between all countries included. Based on this innovative methodology for accounting for intersectionality in a quantitative way, we develop an analysis incorporating digital skills as an intersectional characteristic especially important for the older people. Results show that intersectional disadvantage measured with the series of intersectional characteristics analyzed (i.e. a low level of education, poor digital skills, being a woman, not living with a partner, being over 75 years of age) interfere with an independent life in old age. Our analysis highlights the relationship between intersectional disadvantage and health status, while pointing out to the importance of addressing this type of combination

of hardship in later age through adequate policy. We consider digital skills a source of intersectional disadvantage for health that should be relevant to look at extensively provided the extent of digitalization that has happened recently.

¿Cómo Perciben Las Mujeres Su Papel En La Sociedad? Retos De Futuro De Las Mujeres Del Sur De Europa

Los cambios en los roles sociales de la mujer es uno de los elementos claves para explicar las profundas transformaciones que ha tenido la sociedad española en las últimas décadas. En España la "segunda transición demográfica" se produjo con retraso. Sin embargo, este retraso junto con la intensidad con la que se han producido algunas transformaciones en el cambio del papel de la mujer en la sociedad confiere una especificidad al caso español cuando se analizan los procesos sociales desde una perspectiva de género (Tobío et al., 2010).

Esta transformación de la mujer española ha sido extensiva a todo su territorio, independientemente del nivel de desarrollo de sus distintas regiones. Especialmente interesante es el caso del Sur de España. Las mujeres de la región de Andalucía, que a finales del siglo pasado tenía una situación de desventaja estructural respecto a otras regiones del país, han tenido una profunda e intensa transformación de valores culturales y familiares respecto a generaciones anteriores (Ayuso, 2021).

La presente comunicación tiene como objetivo, mediante una revisión exhaustiva de fuentes estadísticas e indicadores sociales, comparar las representaciones y percepciones subjetivas de las españolas y las andaluzas con las de mujeres de otros países y regiones de la UE-25, en especial del sur de Europa, en las principales dimensiones de la vida social: el rol en la crianza y los cuidados, el empleo, la conciliación, los valores sobre la igualdad de género, la satisfacción con la vida, etc.

Esta comparación se establecerá en varios niveles de análisis. Por un lado, se analizará a las mujeres españolas en el contexto europeo, prestando especial interés a otras sociedades del Sur de Europa y b) mujeres andaluzas en comparación con las de otras regiones del sur de Europa, para analizar sus especificidades con respecto a otras regiones similares.

The Liminality of Subculture Spaces: Uncertainty, Community and New Social Divides in Post-Covid Tokyo

Tokyo is a city that, in the pre-Covid-19 era, was globally recognized as metropolis of fine dining, high-end fashion and fascinating subcultures, making it a global hub in many regards. However, covid-19 has provoked large-scale changes in the everyday life people live. As the city is emerging (perhaps only temporary) from the pandemic, this paper critically engages into a discussion about the role and future of subcultural places in the city. Due to ongoing developments, especially subcultural places (e.g. karaoke bars, manga cafes, independent cinemas/mini theaters in Japan) have faced rejection, closure and bankruptcy. In this paper we focus on the urban typology of the arcade halls, originating in the eponymous shopping streets. Arcade halls quickly gained a questionable reputation and reached their peak popularity during their so-called "Golden Age" in the late 1970s in Japan. Since then, arcade halls have experienced a steady decline in popularity, one after the other closing down or transforming into more family-friendly space. Thus, we clearly have to question how equal (especially in regards to accessibility, visibility and public wellbeing) these spaces are. Based on extensive fieldwork findings focusing on to different cases studies located in central Tokyo, we argue that arcade halls serve a variety of purposes and are crucial to secure the representation of different vulnerable

groups, especially in times of crisis. Concluding we argue that they have the means to bring different members of the community together, enabling ritualized random encounters which are necessary to allow the development of alternative visions and creativity across borders. Recognizing them as 'liminal places' offers them the potential to become the vehicle of different intellectual, artistic, cultural, economic, and political discourses and allows policy makers to support the creation of creative and innovative milieus instead of hyper-controlled places, often seen in the post-covid-19 world.

INGHAM, Jurate* (Vytautas Magnus University, Lithuania)

Protest Mobilization and Innovative Repertoires of Collective Action: A Case of Šančiai Neighbourhood

The climate crisis and COVID-19 has brought changes to the priorities of the local communities and increased their concern with the quality of the urban environment and recreational opportunities to residents. Urban green spaces are important landscapes that provide spaces for physical activity, social interaction and may accelerate local community building. However, urban planning process often is characterized by formal citizen participation and the needs of local residents in relation to green spaces are often not taken into account.

The focus of the study is protest mobilization and repertoires of collective actions against the decision of local government to build a road at the expense of green spaces in the Šančiai neigbourhood. Based on in-depth interviews and participant observation, the study draws conclusion that the relationship between space, action, and residents' biographies is an important factor in constructing a collective identity. Protest mobilization in the Šančiai neighbourhood was successful, because of a cohesive collective identity, ability of mobilizing structures to create networks of activists outside the neigbourhood and innovative repertoires of collective action.

Disaster Fatigue

Within local community organisations on Australia's East Coast managers and leaders are in crisis. The at risk and vulnerable communities they serve face a cascading disaster situation. After the Black Summer's fires, COVID-19 pandemic and extensive east coast flooding, both communities and their leaders are reeling from physical, mental, and resource exhaustion. To investigate community disaster fatigue and its impact on community leaders, we conducted a case study in the Blue Mountains of NSW. We interviewed 13 local leaders from various community groups, including local Non-Government Organisations, wilderness and environmental groups, and clubs. In this presentation we explore how community disaster fatigue manifests in local communities and amongst their leadership and the issues that arise as a result. We analysed the interviews using a framework of defeatism, deterioration and lack of planning; weakening mental health and wellbeing; and corrosion of economic entrepreneurialism and decline in social capital. We found that community disaster fatigue is indicated on a collective level by the breakdown or absence of community resilience. For community leaders, disaster fatigue has the potential to destabilise a group or organisation's endeavours to assist recovery, sometimes to the point of no return. To move forward out of a cascading disaster situation requires foresight and prior planning with an eye to preventing the collapse of public health, social and economic community structures and the maintenance of community leadership's capacity to assist.

INGHAM, Valerie* (Charles Sturt University, Australia)
NEWTON, Kris (Mountains Community Resource Network, Australia)

Resilient Villages

In Australia there is a focus on 'community engagement' in local disaster planning – however, government bodies and emergency service agencies tend to interpret community engagement as 'consultation' rather than going the next step and incorporating the community into actual disaster management oversight. In other words, disaster planning and preparedness is something the community is consulted about, but not in charge of. This is an issue, as it means control over the pace of recovery and resilience development is taken out of community agency. We argue that the resourcing from governments needs to change from a top down, fly-in/fly-out approach – which in the main addresses physical infrastructure risk and repair and immediate relief efforts – to funding individual communities to 'do' resilience and recovery in a way that has community buy-in, and thus generates plans and actions that reflect the needs of each unique community.

To operationalise an alternative approach, we developed the *Resilient Villages* pilot project. *Resilient Village* activity may be encouraged by community leaders, but in reality the outcomes depend heavily on the participation of community volunteers at the grass-roots. The aim is to assist individual communities assume responsibility for their own resilience-building activities and recovery processes. The *Resilient Villages* pilot demonstrates the invaluable and key central position of a community in building its own preparedness, psychosocial disaster resilience and unique approach to disaster recovery. This is not new news in other countries (e.g., with the Settlement Houses structure), however in NSW, local communities face a constant struggle to be resourced and at the very least, integrated into formal disaster planning. This presentation will outline the approach taken (community-led Resilience Actions Plans) and conclude with a vignette of at least one *Resilient Village*.

The Gendered Construction of "Bureaucratic Truths". Life Stories of Nigerian Migrants in Front of the Asylum Commissions in Italy

This paper deals with institutional discourses of migrants by presenting the outcome of a study which is grounded on the integration of two projects: the ongoing Horizon2020 "Ithaca- Interconnecting Histories and Archives for Migrant Agency: Entangled Narratives Across Europe and the Mediterranean Region", and a PhD thesis on Nigerian trafficking carried out at the University of Milan (2018-2022). The study analyses the interaction practices between migrants involved in the trafficking of person seeking political asylum and the Ministry of Interior's territorial commissions for the recognition of international protection in Italy. Starting from a critique of the "victim paradigm", it focuses on the narrative processes underlying the life stories that Nigerian migrants provide to commissions, confronting with those emerging from biographical interviews. From the analysis of t territorial commission acts, it emerges that the status of "victim", which is crucial for obtaining the humanitarian protection, is gendered constructed. This gives evidence of the so-called "sexual humanitarianism", namely the process according to which specific groups of migrants are depicted - more than others as "vulnerable" because of their involvement in the prostitution market. During the hearings, women are asked for a detailed autobiographical story, stimulated by precise questions aimed at providing a coherent, consistent and chronological logic of narratives. This is not the case for men, whose narratives are often "unsolicited stories". Thus, women involved in trafficking are perceived and constructed as subjects entitled to claim protection rights by virtue of an alleged higher vulnerability, unlike men.

From biographical interviews a different narration, comes up: not only trafficked men might be involved in prostitution but also experience torture and sexual violence. However, demonstrating this vulnerability condition is difficult in the absence of physical signs that prove a "bureaucratic truth" consistent with the predominant humanitarian paradigm.

Political and Economic Power: Foreign Investment Dependence

Transnational capitalists and corporations today are becoming overwhelmingly influential in many global issues, including the accumulation of world wealth, the promotion of global inequality, the formation of political decisions, and more. It is argued that economic and political-military power are increasingly merging in the long-run history, and newly emerging economic and political-military interactions make it difficult to capture the true picture of global inequality. One of the contending views in this context is that whether the nation-states are increasingly marginalized and transnational corporations' control is gradually surpassing beyond the regulations of nation-states or not.

To better understand the issue, this paper utilizes the relational information of corporate headquarters and their subsidiaries in the world economy. The corporate control is measured based on both real and financial components of corporate control, including the ratio of subsidiaries ownership by parent companies, the number of subsidiaries, the number of employees in foreign subsidiaries, and assets.

This study utilizes the panel regression analysis with multilevel analysis, and the model of this study regresses the change in economic growth (Gross Domestic Product per capita) on the variables of corporate control measured at firm-level, the dollar value FDI, and world-systems position of developed and less-developed countries at several time points between 1993 and 2015. The goal of the study is to examine the firm-level and general-level FDI impact on cross-national variation in economic growth, in particular, for developing countries.

A Matter of (In)Congruence: Attitudes Toward Women's Voluntary Childlessness and Their Relation to Occupational Sex Segregation

Research on attitudes toward childlessness has yet to conclusively establish why more egalitarian attitudes are found among women than men. We explore the drivers behind this gender gap by addressing the role of occupational sex segregation on attitudes toward women's voluntary childlessness. We argue that the differing allocation of men and women to sex-typed occupations carries gender-specific pressures toward gender congruence which are likely to shape the perceived costs of motherhood, and hence attitudes toward female voluntary childlessness, differently. We test this argument by drawing on European Social Survey data for more than 20 European countries, finding that women's more favorable attitudes are explained by their gender incongruence with respect to their occupational domain and attainment. Voluntary childlessness is more acceptable to women in male-dominated occupations, especially when they hold high-status positions. In these cases, women are most likely to be expected to perform like men to succeed in their job role, making motherhood less salient for their identity and more costly for their career. These findings contribute to the understanding of the mechanisms that underpin stereotypical gendered expectations in society as they address how attitudes toward female voluntary childlessness are related to structural gender inequalities in the work system.

Perceived Gender Discrimination and the "Violence Continuum": Enabling or Contrasting Factor? a Study of the European Workplace

Gender-based harassment and violence remain a large problem in the workplaces of many countries. Global social movements, like "Mee-too", have increased the visibility of this issue and have revealed women's strong awareness of the necessity of denouncing and fighting workplace harassment and violence far beyond what can be contained within legal parameters. Revisiting the feminist foundational work by Kelly (1988) and Mackinnon (1979), the article draws on the notion of sexual violence as a continuum by applying it in the context of work, where harassment can be seen as a case of discrimination based on sex, and proposes that women's perceptions of discrimination may also be critical in assessing risks and developing policy in such context, moving the focus beyond organizational aspects which have been more widely studied. The article uses data from the European Working Conditions Survey (2010-2015) for more than 20 European countries to analyze the consequences of female workers' perception of a discriminatory working environment on their likelihood of experiencing sexual harassment, sexual violence or multiple forms of violence according to having perceptions of discrimination either from discrimination for gender reasons uniquely, or for gender reasons at the intersection of other aspects of inequality (age, race, class, etc.). Results show that perceiving gender discrimination increases the likelihood of being exposed to sexual harassment, but especially so for women who perceive that they are discriminated against also on the basis of other intersectional aspects, who are also more likely to experience sexual violence alone as well as multiple forms of violence. These findings support existing perspectives, but also raise important policy implications for female workers' safety in light of current workplace trends. They refine insights into how individual perceptions of discrimination can be considered an indicator of hostile working environments and can hence contribute to inform prevention programmes.

Youth Transition and Social Security: A Comparative Study of Japan, Germany, Norway, Switzerland, and the UK

Our presentation aims at understanding the new "youth problem" in Japan from an international comparative perspective. Since 1990s, youth transition to adulthood has been problematised in Japan as well as other advanced countries. Country specific school-to-work transition contexts differ between countries and impact social transitions and linked lives such as leaving home, coupling, and becoming a parent in specific ways. In doing so we investigate two aspects. First, we examine if Japanese school-to-work transition contexts and their impact on social transitions differ from select European countries - Germany (DE), Norway (NO), Switzerland (CH), and the UK. Second, we cast light on how country-specific contexts - with special focus on youth policy/security - impact youth transitions and respective risks.

We use individual-level national survey data to reconstruct youth transitions within two biographical windows (early and late 20s) and to examine how country-specific context impact youth transitions and policies cushion respective risks.

Our results indicate that youth transitions in Japan have a particular pattern compared to the European countries in focus: Leaving-home starts relatively late, coupling and parenting earlier, and transitions are more compressed compared to the European countries. The comparative study further indicates that labour market participation and status in Japan affect transitions of young people – particularly for male – much stronger compared to the European countries. In contrast, the particularities of the European countries are:

DE: early leaving-home, but other transitions including school-to-work are later and prolonged.

CH: early leaving-home and school-to-work transition, late family formation / parenting

NO: early leaving-home, with some prolonged transitions, many young people complete earlier.

UK: timing of leaving is medium, but many males and females cohabit and parent earlier, especially females.

By putting the Japanese case in the centre of analysis, we provide a new perspective in the field of youth transition research.

Different and Together: The Hope of Social Love.

In the Western cultural tradition, we have three concepts to describe love: Plato's eros, Aristotle's philia and Christian agape. Friedrich Nietzsche expresses the challenge that love poses to modern society, simultaneously avoiding the risks inherent in love: how the equal can be distinct. Friends are two ships, two vessels, each one keeps its course, but constantly distant and close each other, without ever getting confused. On this base can be addressed a critical remark both to Plato's eros, and Aristotle's philia: on one hand, since eros is the instinct to recompose the original one, it presents the risk to delete difference; on the other hand, since philia presupposes an *inter pares* relationship, among equals, it can represent a limit for the emancipation and the demand for distinction of subjects.

Valuing this Nietzsche's perspective, it is possible to think of a new concept of love, which draws on the heritage of the recent reflection of the critical theory of French and German tradition. Both those social recent critical theoretical streams have included the discourse on love: the German revision of the critical theory carried out by Axel Honneth, particularly in his struggle for recognition, and the French "sociology of critical capacity".

Starting from this contemporary critical tradition, the concept of social love has been defined by two semantic dimensions:

1. the overabundance: that is giving more than the situation demands, that breaks shared expectations and overcomes any antecedent with the action;

2. the priority of others' benefit: that is doing good to others.

Along an empirically founded reflection, we arrive at setting the conditions of the *communitas* in which the intersubjective bonds of co-belonging do not confuse and do not identify. The subjects who love combine difference and identity, they are with the other that is their common: one, two and the common.

Investigating the Social Dimension of Love in Individuals and Institutions with Secondary Data: The World Love Index

It is usually thought that love is ineffable or cannot be investigated except with arts and qualitative approaches. Instead, our research takes up the challenge of studying love using statistical tools. In particular, we wanted to study social love (SL), defining it "an action, relationship or social interaction in which the subjects overcome (in giving, in receiving, in not doing or in renouncing) all their antecedents, and therefore they offer more than what the situation requires with the intent of giving benefits". After having collective qualitative analysis and case studies on the topic, we therefore decided to built a transnational index with the aim not only to make visible that SL is present in people and institutions worldwide, but also to compare types and levels of SL in different countries. This is linked to the "beyond GDP" debate, which aims to overcome a GDP as the only measure of people's well-being in the world,

multiplying data sources and different measures. On this base, we built a new transnational index, named World Love Index. The index summarizes data on SL attitudes and behaviors of persons and institutions in 55 countries. In particular we used both individual datasets from transnational surveys (Gallup World Poll and World Values Survey), and ecological datasets (Humanitarian Protection Index of the United Nations High Commissioner for Refugees and the Red List Index, of biodiversity). The paper will discuss how we identified suitable indicators to represent the concept of SL and its peculiar dimensions, such as overabundance (e.g. time offered for volunteering) and care for others and for the world (e.g. engagement for poverty and environment). Finally, the global results will be shown, and limits and potential of the World Love Index will be discussed.

Screen Time and Development of Internalizing and Externalizing Problems Among Romanian Urban Highschoolers

During the last years we noticed an increase of screen time for adolescents while questions about its effects on the development of psychological and social problems are starting to be addressed. We hypothesized that increased screen time is associated with the development f internalizing and externalizing symptoms. We investigated this association on a sample of 2497 highschoolers recruited from one big city in southern Romania. They filled in a series of items focusing on screen time average exposure, display of depression and anxiety symptoms, involvement in aggressive and delinquent behavior and family context. The linear regression model showed that, after controlling for individual and family variables, more screen time exposure is associated to heighten depression and anxiety symptoms and more involvement into aggressive behavior. These findings contribute to the research in this new area of interest and may inform development of prevention and supportive programs for adolescents and their families by adding evidence for clarifying the relationship.

Identitarianism Malgré Lui: Europeanness and Anti-Immigration Movement in Turkey

Despite being partially located in the continent, being part of Europe is the pillar of modern Turkish identity. The Republic of Turkey was founded in 1923 as a secular, European nation-state that dictated a total rupture with the Arabic and Persian influences of the Ottoman Empire. The lukewarm reception of the Turkey's Europeanness claim by its Western counterparts, along with its common roots with Eastern cultures, drove Turkey into a never-ending identity crisis that often entails an overemphasis of Europeanness. During Islamist Recep Tayyip Erdoğan's period as the country's leader, the secular Republic as an institution witnessed an illiberal and conservative shift that is often met with contempt from the country's secular population. Erdoğan's immigration policy that welcomed Syrian refugees based on religious similarities was perceived by some as a further effort towards the country's "Islamisation." Even though the immigrants were hosted as part of a deal between Turkey and the European Union, the arrival of over three million Syrians in Turkey was perceived by some seculars to be a scheme to drive the country away from Europe and towards the Middle East. These anti-immigration feelings were expressed mostly on Twitter, the platform of choice for dissident Turkish seculars, under hashtags like "Syrians to Syria." As a result, an online-driven far-right party was founded with the slogan "we will ship them back to Syria."

The paper aims to analyse the anti-immigrant expressions on Twitter using Social Network Analysis, positioning users within the network based on the hashtags and keywords they used on immigration. The study will discuss the role of Turkey's Europeanness debate in the anti-immigrant expressions, and also compare the anti-Eastern, anti-Arab expressions with the "Western exclusivity of Europe" argument of European Identitarian movements, even though Turkey is not accepted as Europe by the Identitarians.

Military Deployment in Times of Crises: The Namibian Experience with COVID-19 Pandemic

This paper examines the roles that the Namibia Defence Force (NDF) played during COVID-19 outbreak in Namibia. In doing this, the paper highlights and discusses the history of the NDF and legal instruments that established and guide its domestic as well as international deployments. The method of document analysis is utilized to gather and analyze relevant data. This entails a

systematic process to study, collect, appraise, question, and analyze published materials in order to draw out meaning, gain deeper insight and produce empirical knowledge around military deployment in times of crises. The paper compared NDF's previous domestic military deployments with the COVID-19 deployment with the aim of underscoring the scope and criticality of COVID-19 pandemic. Emphasis is placed on the roles assigned and carried out by the NDF in support of civil authority, and the nature of civil-military relations in Namibia. The paper found that NDF's domestic deployments produce mixed results which do very little to enhance its public image. Thus, its positive impact on crime prevention and enforcement of COVID-19 regulations is erased by reported cases of human rights abuses. Notwithstanding, COVID-19 deployment provided an opportunity for the institution to learn a number of lessons which can help it in future deployments. The paper concludes by highlighting and discussing the various specific lessons learned by the NDF in particular and the Namibian society in general.

IRWIN, Darrell* (University of Connecticut, USA)

'Assertive' Foreign Policy Narratives in South China Seas Disputes

In September, 2022, "assertive" diplomacy contributed to concerns about a heightened great power competition in Asia. That month, the United States' Secretary of Defense met with the defense ministers of the Philippines and Japan. A response from the Chinese Deputy Foreign Minister was that the Peoples' Republic of China is engaged in a "diplomatic struggle" with the United States in the South China Sea. A sociological analysis encompassing the 'assertive' narratives found in the international relations between small states, regional powers like the Philippines, Japan and Vietnam, and the world's 'great powers' are described (Johnston, 2013). The Philippines' adoption of a more "assertive" foreign policy came in 2016 after prevailing in a lawsuit over the Chinese violation of the UN Convention on the Law of the Seas (UNCLOS) in a dispute over South China Seas territorial waters. However, reliance on the economic ties to the 'great powers' unduly influences geo-strategic positions of these regional powers. According to US diplomats, China's core economic interests continue to disrupt the overall stability in the region, disregard international maritime law, ignore international rules-based order and increasingly assert itself over other countries sharing the South China Seas. China contends it will take greater initiative, as with the Belt Road Initiative, to beneficially partner with these regional powers and the United States seeks to contain China.

An analysis, provided to try to understand why the "great powers' act the way they do, focuses on foreign policy strategies and diplomatic narratives from a region witnessing a great-powers competition, where territorial boundaries are potentially shifting and where missteps are costly for all involved.

Racial Justice and the New U.S. Labor Militancy

Demands for racial justice in the US have been given new life by a confluence of recent events. The Black Lives Matter movement and white supremacist counter-movements, racist political rhetoric and actions flowing from the Trump administration, and continuing history of police violence against Black citizens (including the vicious and highly publicized murder of George Floyd in 2020), have fueled a heightened sense of racial consciousness. In the context of long declining union strength and strike activity, recent years have also seen a surprising uptick in labor militancy. Situating our analysis in the sociological literature on social movement spillover, we ask: First, to what extent and where have racial justice movement demands penetrated recent labor militancy? Second, what key organizational and collective action mechanisms did workers use to animate racial justice demands?

We employ data on worker demands animating both strikes and worker protest actions for calendar years 2021 and 2022 collected by the Cornell University ILR Labor Action Tracker. Evidence indicates several key patterns: (a) racial justice demands did, indeed, drive some labor militancy during this period but perhaps not as widely as one might have expected; (b) racial justice demands were voiced in both strikes and worker protest actions launched by unions and alt-labor organizations; (c) alt-labor organizations provided more active mechanisms than unions for carrying these demands; but (d) cross-temporal interdependency analysis reveals that strike actions drove worker protests in the short-run more than the reverse. We contrast these patterns with those of civil rights movement spillover on labor militancy in the post-WWII decades and discuss implications of our findings for maintaining militant energy for moving racial justice and labor movements forward.

Men and Care Work: Insights from Co-Resident Fathers in Dual Income Households in the Western Cape

Much attention has been directed to fathers and fathering over the past 20–30 years. This focus is especially relevant in countries such as South Africa where many children do not live with their biological fathers, but instead with their grandparents, uncles, brothers, or mothers' new partners. Thus, most South African children do not live in "fatherless homes", but where other male kin reside. However, these types of substitute fathers are not sufficiently involved in childcare. In addition, other dimensions of fatherhood that have been underdeveloped in the literature, such as social fathers and fathering, father involvement, and caregiving, need further research. This study explores how co-resident fathers in the Western Cape care for the children in their households as well as how care is constructed and performed by them. The research draws on the work of Shahra Razavi and Parvati Raghuram, who conceptualise domestic care as emanating from state, market, private and community provisions referred to as the care diamond. The study aims to use a qualitative approach in the form of semi-structured interviews and non-participant observation with a sample comprising 20 participants and five households. The data that will be obtained from the interviews will be transcribed verbatim. The resulting transcripts and observation notes will be coded using ATLAS.ti (version 9) and analysed using thematic analysis. The current study argues for fathers' care interactions with children can contribute to a broader societal appreciation of care and to global research on fatherhood by adding voices from the African continent care.

ISHIBASHI, Aguru* (Senshu University, Japan)

Four-Generations Mobility in Japan: The Effects of the Middle Generations' Multiple Traits

Introduction: Multigenerational studies aim to assess family-based inequality's persistence and mechanism. Four generational analysis helps test the effect of durable resources instead of direct contact as a possible mechanism. This is because ancestors before grandparents are less likely to survive with children jointly. However, a research gap in the previous studies is a possible overestimation of the great-grandparents' effects due to using only one status measure of the middle generations. To fill this gap, we examine four generational mobility in Japan, considering education as an additional status measure to occupation. Japan is the most likely case to found ancestor effects because Japan has a patrilineal inheritance system; namely, family characteristics such as a house and property have been passed on from generation to generation. If control for the middle generations' multiple traits moderates the ancestor's effect, the same results might apply to other societies with the same inheritance system.

Methods: Our data are derived from the 1955 Japanese Social Stratification and Social Mobility Survey. The analytic sample consists of 412 cases of the respondent's eldest son, aged 19 and over. We focus on the paternal lineage to examine the effect of durable resources. Two models of ordinary least squares regression of the occupation prestige score of the respondent's eldest son to that of his great-grandfather are conducted: (1) controlling for the middle generations' occupation, and (2) controlling for the middle generations' occupation and education.

Results: Great-grandfather's occupation has a significantly positive effect on the children's occupation even after controlling for the middle generations' occupation. However, Great-grandfather's occupation has no significant impact on children after controlling for the middle generations' education and occupation.

Conclusion: Sufficient control for the middle generations' traits erases the great-grandfather's effect. Previous studies might overestimate the great-grandparents' effect. Durable resources might not be essential for multigenerational effects.

ISHIDA, Hiroshi* (University of Tokyo, Japan)

Educational Reproduction and Mobility across Multiple Generations in Japan

Sociologists have long been interested in the reproduction of socio-economic advantages and disadvantages across generations. However, the bulk of the studies on this topic focus on two generations. Although we learned a great deal about the persistence of inequality within the nuclear family, more emphasis should be placed on connections beyond parent and child especially those involving multiple generations. In order to address the issue of reproduction across multiple generations, we need data which capture information across multiple generations. This study uses a survey of people about parent-child relationship. The respondents of aged 60 to 69 were asked to report their relationships with their parental generation and their children's generation. Socio-economic characteristics including education, occupation, and living standard of both parents and children are obtained. This study focuses on educational attainment of respondents, their parents, and their children and examine the pattern of educational reproduction/mobility across three generations.

Major findings are summarized below. First, the distribution of education changed dramatically across three generations reflecting the rapid expansion of the educational system in the 20th and 21st century Japan. In order to evaluate the educational association across generations, we must control for the difference in educational distributions and employ log-linear and log-multiplicative models. Second, the pattern of educational association is basically the same in successive generations. Educational homogamy is observed at the bottom and the top of educational distribution both between parent and child generations and between grandparent and parent generations. Third, the extent of educational association is slightly stronger for the parent-child association than the grandparent-parent association. Fourth, the educational association between grandparent and child after controlling for the association between parent and child and between grandparent and parent appears to be weak. In other words, the impact of grand parent on child without going through parent is negligible.

ISHIDA, Hiroshi* (University of Tokyo, Japan)

Long-Term Impact of Childhood Experience on Life Satisfaction during Adulthood

Early childhood experiences can have a long-lasting impact on people throughout their life course. One of those experiences which may have negative consequences even in adult life is the bullying experience at school. We investigate whether school bullying experience influences life satisfaction during adulthood and how intervening factors including education, marriage, socio-economic status, and social networks mediate the relationship between school bullying and life satisfaction. We use data from the Japanese Life Course Panel Survey (waves 1 through 14) which is nationally representative samples of young (aged 20 to 34) and middle-aged (aged 35 to 40) people in 2007 and follows them up every year since 2007. The treatment variable is bullying experience at school. The outcome variable is satisfaction in life which is asked every year in the survey. The mediating variables are the respondent's educational attainment, employment, economic standing, marriage (divorce/widow), and social networks. These variables are time-varying except for education. We introduce social background variables (parental education, books at home, homeownership, economic standing, and illness/disorder at age 18) as confounding variables. We use the random effects model and decompose the effect of school bullying on life satisfaction into direct and indirect components. The results of our analyses show that being bullied at school has negative impact on life satisfaction after controlling for all other variables. Bullying experience in childhood has long-lasting impact on subjective well-being in adult life. The association between bullying experience and life satisfaction is in part mediated by intervening variables. School bullying experience leads to declined prospect of finding a marriage partner and establishing supportive social networks which in turn affect life satisfaction. However, the remaining half of the association is direct without going through mediating factors.

LAURENCE, James (Economic and Social Research Institute, Ireland)

Co-Ethnic Neighborhood Quality and the Educational Opportutnities: Upper Secondary Education Enrolment in Japan

Japan is a unique new immigrant destination because while the entire system is egalitarian compared to other societies, its educational system excludes immigrant children primarily due to the language barrier. Subsequently, we aim to scrutinize the following two questions of (1) whether co-ethnic neighborhood quality affects children's opportunities for upper secondary education (high school enrolment) in Japan and, if so, (2) whether that effect varies across nationalities as an indicator of ethnicity. Grounded on the premise that the co-ethnic neighborhood effect depends on adaptation to the Japanese educational context, we utilize national census data in 2010 and employ a fixed-effect regression model to control the unobserved neighborhood effect. The random and fixed effect models support the positive effects of co-ethnic neighborhood qualities, including the percentages of highly educated residents, employed residents, and residents who have lived in the neighborhood since birth, even after considering children's socioeconomic backgrounds and unobserved neighborhood heterogeneity. We also found that these effects vary across children's nationalities. In this respect, the effects of co-ethnic neighborhood qualities are more salient among South American and Southeast immigrant children than in East Asian groups that are more embedded in Japanese society. For the immigrant children that are not familiar with the Japanese language, the strongest barrier against social integration in Japan, it is paramount to gain information and social support from their co-ethnic neighbors, who are nearby significant others. In the meantime, it is unexpected that we do not find the co-ethnic neighborhood quality effect on Filipino children's high school enrolment.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

One possible speculation is that Filipino (female) adults may not be role models for the status attainment because their socioeconomic backdrops do not pay off well due to their gender inequality.

Cares to Lessen Solitary Communities and Loneliness in Japan

This presentation demonstrates the importance of creating innovative spaces and connections by the citizen community practices and cares to overcome one of Japan's most serious social inequalities today, the growing solitary communities and populations. Although we live in a digitally connected society, phenomenon of disconnection is quietly but certainly deepening.

It will be presented that in many farming, mountain, and fishing villages in Japan, depopulation has led to a decrease in population and a disconnect from the common goods. In urban areas, the number of unknown neighbors has increased, as has the number of unstable young and elderly people living alone and lack interaction in the communities. Many of the communities itself is isolated from the world. Japan is cited as one of the countries with the most solitary communities and populations in the world today.

Extremely little interaction with others is considered a growing health problem, and it is serious in that it is less visible than the other health problems, such as smoking and drinking. It is a result of social transformation due to remarkable progress of urbanization, digitalization and most recently important COVID-19 pandemic and its effects.

Through multiple case study and qualitative analysis of local mental health networks of Tokyo among other cities in Japan, this study aims to captures the essence of connection and fragmentation of people in modern society. How can it be defined and solved through citizen community practices and cares? What are the crucial and missing points from the past measures and other comparable societies for improvement? What human nature can we observe through this research process and results?

Some of the key findings here will provide chances of debate not only of the case in Japanese community issues but other regions of similar cases in dealing this social inequality phenomenon.

How to Recognize Innate Disposition of Care Workers

How to recognize innate disposition of care workers

Compared to other countries, paid domestic care workers in Japan has stable employment under the Long-Term Care Insurance Law and the Law for Comprehensive Support for Persons with Disabilities. Even under these circumstances, however, the social status of care workers is relatively low and wages are suppressed. One reason for this, as J. Twigg pointed out, is that it is believed that nice care workers are nice because they are nice. That is, the belief is commonly held that they are able to care appropriately without training because of their innate disposition. Hence, the professional skills of care workers gained through training are not properly valued, and increases in status and wages are deterred. In this presentation, I will discuss the results of a study on how care workers perceive their innate dispositions. The methods employed were semi-structured interviews and focus group interviews conducted with care workers who support severely disabled people in Japan. The main findings are as follows. First, care workers tended to attribute their successful caregiving to their own dispositions. Second, having such a disposition helps them to demarcate themselves from other colleagues who do not care well and maintain their self-esteem. Third, care workers who believe they can care well because of their disposition are reluctant to give advice to colleagues who do not care well, because they think dispositions are innate and not teachable. Thus, how to treat dispositions to make care work more decent is a difficult question. While it supports their self-esteem in the face of marginalized situation, it also prevents them from relying on their professional skills to take collective action to improve their status. When improving their working conditions, we need to reflect their nuanced perspectives on both innate disposition and professional skills.

ISHIMWE, Gisele* (Western Sydney University, Australia)

Settlement Experiences and Pentecostalism Among Black African Young Adults in Australia

The last 3 decades have seen an increased number of black African migrants in Australia. This increase has sparked public discourse around this groups' ability to integrate into the Australia society. In 2018, the then Minister for Immigration and Boarder protection, Peter Dutton made the following comments in an article in The Guardian, "If people [black Africans] are not prepared to integrate….then they don't belong in Australian society (Karp 2018)." His comments reflected the nature of the conditional citizenship that Africans hold. Their belonging is constantly being contested based on behaviour. This can particularly be challenging for young adults often involved in the process of self-making while also searching for spaces of belonging post migration.

My PhD study aims to explore how such experiences of discrimination and exclusion have shaped and influenced young people's engagement in Pentecostal churches. I argue that while black African young adults may continue to struggle for their place in the Australian mainstream society, wrestling with negative public perceptions, experiences of discrimination and racism, Pentecostal churches can facilitate a sense of belonging that can ease settlement challenges. My study will adopt qualitative methods such as participant observation, interviews, and creative methods of critical race theory such as auto-biographies to closely investigate settlement experiences of Pentecostal black African young adults and the role played by their church communities when it comes to their identify formation and finding their sense of belonging in a local African Pentecostal church based in Greater Western Sydney, Australia.

Ultimately, my study aims to add to the growing body of literature on Pentecostal black African young adults in Australia while also contributing to better policy efforts focused on improved social outcomes for this group.

ISHIMWE, Gisele* (Western Sydney University, Australia)

Unsettling Integration Experiences of African Refugee Youth in Perth, WA.

In the last three decades we have seen an influx of black African migrants in Australia. This increase has led to a racial moral panic and sparked public discourse around this groups' ability to integrate into the Australian society. These perceptions have 'problematized' and 'othered' Black African youth (Mapedzahama and Kwansah-Aidoo (2013: 61). This has further complicated the precarious lives of resettling African refugee youth who are often negotiating migration settlement challenges such as trauma, discrimination, financial insecurity, education and occupation challenges. My study aimed to investigate resettlement experiences of African youth in Perth to further understand how they negotiate belonging in the midst of experiences of exclusion and settlement challenges. In this qualitative study, I conducted 30–45 minutes one-on-one interviews with 16 participants between the ages of 18-30 from different African backgrounds. This study demonstrated the changing nature of young people's sense of belonging and some the spaces and communities that facilitate this and the key factors that shape this shift. This study's findings help us further understand the experiences of African refugee youth and thus can shape better policies and best practice when supporting resettling refugee youth.

This Space Is Not Built for People like Us: Exploring the Textual Relations of Students with Disabilities in Higher Education

This paper presents the everyday textual relations of students with disabilities in a Nigerian university. Using institutional ethnography as a method of inquiry, it takes the standpoints of students with disabilities as an entry point in understanding how these students' daily and nightly experiences are mediated textually within the institutional discourse of access, equity, and inclusion. While challenging the assumptions of the institutional power matrices of who, why and how inclusion should be done in a postcolonial higher education context, I consider the 'work' that students as *street-level bureaucrats* in their rights do in engendering their inclusion and participation in an institution undergoing transformational challenges. Through a textual analysis of documents collected during my six-month ethnographic fieldwork in a Nigerian university, I illustrate the experiential knowledge of how students think, plan, and feel about using texts to meet their daily demands as stakeholders in the university. Second, I present a *work-text-work* sequence of the inclusion process using some selected cases of students' textual struggles to activate institutional logics of action. The findings suture the intersections and complementarities of different informants' understanding of how their social, political, and textual relations coordinate their work. Finally, I identify the points of 'disjuncture' between the actualities of students' experiences and intentions of protocols and policies in including and accommodating students with disabilities in a higher institution.

ISIK, Sevket* (Anadolu University, Turkey)

The Active Role of Sports in the Struggle of Stigmatized Individuals Against Discrimination

The main problem of the study is how sports emerges as a strategy for coping with a problem in the lives of individuals who are stigmatized for different reasons in the society. In their daily lives, individuals are stigmatized and exposed to discrimination due to their various characteristics. Despite this discrimination, they managed to create a field for themselves with sports.

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Thus, sport has become a 'normalization' mechanism for individuals. This parallels Axel Honneth's assertion that identity is something dynamic rather than preformed. The purpose of this text, which is part of a larger research, is about how sports can function in the face of social inequalities. The findings in the open, axial and selective coding stages of the research carried out with the Grounded Theory methodology will be examined from a holistic perspective and the possibilities of social exclusion and inclusion will be discussed. As a result, philosophical background of discrimination will be tried to be seen, with Honneth's 'Theory of Recognition'. Ultimately, it is to reveal how social exclusion, marginalization and, on the contrary, acceptance and normalization are possible with sports, depending on the sample of the study.

Curry Nationalism: The Emergence of Indian (South Asian) Cuisine in China

Food and culinary culture have a long history of being presented as part of national identity although scholarly literature reveals that various food items have traveled from one region to another, been adopted as local ingredients and served on diners' plates catering to local tastes. With the increased accumulation of disposable income, the emerging middle class in China has started to consume food and culinary delicacies from various foreign cultures, i.e. Japanese, Korean, Italian, etc. Although Indian (South Asian) cuisine is less sought after, curries are becoming increasingly popular among younger members of the middle class. This research investigates the perception and experience of Indian cuisine among university students in Zhuhai, a coastal city in China's Southern Guangdong province. Based on a questionnaire survey, a face-to face interview, and a case study on a restaurant operating under an Indian (South Asian) logo, this study finds that curry has been perceived exclusively as an Indian food item and echoes India's national identity. Although curry is served on Japanese, Thai and Korean food menus with various colours, flavours and tastes, the majority of respondents linked curry to Indian identity. Curry is also one of the major items from Indian culture that is appreciated by these Chinese nationals. Restaurant operators are capitalizing on the trend, maximizing profits, selling curry nationalism as Indian identity albeit in ambivalence. This paper argues that despite the historic and contemporary political differences, territorial claims, etc. the growing popularity of curry dishes as Indian food may help bridge the cultural connectivity between China and India (South Asia), and reduce the differences and prejudices in the political views held among ordinary citizens.

Bangladesh at Fifty: Changes and Challenges on Population and Development

Bangladesh turned 50 in 2021 having made remarkable progress in population and development, such as reducing total fertility and maternal mortality, boosting contraceptive prevalence, reducing infant and child mortality, increasing life expectancy at birth, and enhancing gender parity in schooling, women's empowerment, and overall development. This paper explores the past and determines the drivers of population change and development challenges, the current situation, and future trends and issues up to 2041—the year benchmarked for the country to attain 'developed' status. The study uses censuses, national-level surveys, population projections, and UN and World Bank data. Reducing total fertility, curbing child marriage, addressing adolescent motherhood and their unmet need for family planning, reducing high maternal mortality ratios, the double burden of diseases and malnutrition, addressing population ageing, high youth unemployment, low female labor force participation, and increased climate change vulnerabilities are critical challenges. The demographic dividend needs urgent action. To reach the SDGs by 2030, the country must eliminate unmet contraception needs, preventable maternal deaths, and gender-based violence, and harmful practices, including child marriages.

Prevalence of COVID-19 Vaccine Hesitancy in South Asia: A Systematic Review and Meta-Analysis

Background There is a need for vaccination uptake and coverage in susceptible populations through effective vaccination campaigns to address the COVID-19 pandemic in South Asian countries. We aimed to measure the pooled proportion of COVID-19 vaccine hesitancy in this regard .

Methods Research articles published between January 1, 2020, to December 31, 2021, were searched through Medline, PubMed, Cochrane, Google Scholar, and the WHO COVID-19 database. The Joanna Briggs Institute tool for prevalence studies assessed the data quality. We performed a meta-regression test and a sensitive analysis among the studies and used the Der-Simonian-Laird random-effects model to measure the pooled effect estimates. Subgroup analyses were performed concerning vaccine hesitancy, countries, study population, study level, and the time since the first outbreak of the pandemic.

Findings A total of 45 studies out of 589 published articles across the eight countries in South Asia were included. The pooled proportion of COVID-19 vaccine hesitancy was 26.9% (95% CI 22.4-31.3, I^2 = 99.57%). It was higher in Afghanistan (37%), Pakistan (33.2%), and Bangladesh (29%); among the general population (29.1%); at community levels (28.2%); the duration of time of 1-12 months since the first outbreak in each country (28%).

Conclusions Vaccine hesitancy exists in South Asia with different rates among countries, sub-groups of the population, communities, study- levels, duration of time since the first outbreak, and study population. Therefore, enhancing public awareness of vaccination and vaccine hesitancy is required.

Culture, Class, Distinction in Japan

Culture, Class, Distinction (Bennett et al. 2009) innovates Bourdieu's sociological method of taking relational thinking of culture and inequality and makes a significant intellectual contribution to the sociology of art and culture and class analysis. Five of us translated this work into Japanese and published the Japanese translation in 2017. *Fields, Capitals, Habitus: Australian Culture, Inequalities and Social Divisions* (Bennett et al. 2021) can be called an Australian version of *Culture, Class, Distinction*, but there are theoretical and methodological developments from the latter.

We analyse the relationship between culture and inequality in contemporary Japan from a theoretical and empirical sociological perspective, in terms of 'culture-caused inequality' and 'inequality in access to culture. In other words, it addresses two types of issues: i) what is culture-caused inequality, and ii) what is the unequal distribution of cultural resources. In order to study these issues, the cultural capital concept is theoretically developed as a theory of social differentiation. A postal survey and an interview survey are conducted in the Kanto region in Japan. The data collected in the survey will be analysed using a mixed research method that uses the characteristics of multiple correspondence analysis. This study captures the relationship between culture and inequality by applying the cultural capital concept but does not aim to find a proxy variable for cultural capital. Instead, the primary aim of the research is to elucidate cultural capital as a component of one of the principles of social differentiation, and the causal relationship between culture and inequality is also in scope.

Social Knowledge and Understanding: A Critique of the Native Point of View

Lévi-Strauss's structuralism, intersecting anthropology, and philosophy, left a solid trajectory in the history of ideas and culture and became history. On the other hand, from the perspective of their intersections, there is also a problem that structuralism has left behind. That is to "grasp the native's point of view". Others are distant or alien to you, whether you are a philosopher or a researcher. What does it mean to understand such others, and how is understanding possible? Such questions are old and new, at the intersection of anthropology and philosophy, and have been overlooked by structuralism. This presentation examines the transformation and development of this "grasp the native's point of view" before and after the structuralism. This presentation discusses the arguments of Malinowski, Geertz, Weber, Descola, Bourdieu and Sayad on the knowledge of the Other and reflexivity. We began by considering the acquisition of 'nativist perspectives', confirming that there is no necessity to construct such a concept. Descola's 'anthropology

of nativism' is excellent in questioning the premise of modern dualism, which divides humans and non-humans into two almost impenetrable ontological realms. However, it lacks the perspective to question the subject of perception. Bourdieu's and Sayad's attempts to make the problem of acquiring a 'nativist perspective' disappear and allow for the adoption of reflexivity in sociology and anthropology.

Islamic Education in Russian Regions: A Tool for Youth De(radicalization)?

After the collapse of the Soviet Union, the processes of re-Islamization began in the Islamic regions of Russia, which, among other things, was facilitated by influence from the Middle East. One of its manifestations was the increased demand for Islamic education among young people. However, in Russia this area is still poorly institutionalized and practically not regulated, and the activities of Islamic educational institutions remain in the "gray zone". In this regard, the existence of Islamic educational institutions, on the one hand, could satisfy the demand for Islamic education from young people. On the other hand, remaining outside the framework of the general educational space of Russia, Islamic education in the North Caucasus may entail challenges to socio-political stability in the region and globally through the risks of the spread of radicalism. I came to the conclusion that in the context of the problems and challenges of the Islamic education system in Russia, two dimensions can be distinguished. First, there is a need for integration of Russian Islamic education into the global educational system. As for the long-term prospects, in this case it would be possible to refer to the experience of the world's leading religious educational centers, first of all, Al-Azhar, and build the branding of the Islamic education system according to their model and with reference to them.

Terrorist Activity in the Sahel Countries: The Impact of the Arab Spring and the Experience of Deradicalization

We examine the impact of the events of the Arab Spring on the increase in terrorist activity in the Sahel countries. For decades, this region has been one of the most unstable in Africa and the "Afriasian" zone of instability. However, in the 2010s, the Sahel experienced the strongest increase in terrorist activity: by 2015, the number of terrorist attacks here had increased by more than 7 times compared to 2010. The purpose of this paper is to identify the mechanisms of influence of the Arab Spring on the growth of terrorist activity in the Sahel, as well as to analyze the mechanisms of deradicalization. The analysis carried out showed that there are several trajectories through which the events of the Arab Spring intensified terrorist activity in the Sahel. Thus, the collapse of state structures in Libya during the Arab Spring became a trigger for the activation of the Tuareg and Islamist factors in Mali and Niger. In Burkina Faso, the revolutionaries managed to completely repeat the plot of the Arab revolutions of 2011 and overthrow the regime of Blaise Compaore. And if Compaora managed to restrain the growth of radicalization largely by building informal ties with terrorist organizations, then after his overthrow, the country, which was very prosperous in terms of terrorism, faced an unprecedented increase in terrorist activity.

Sports and Social Inequality – School As Social Agent in the Decisions of Women to Pursue a Career in Sports

A career in sports is unique in that it requires a commitment at a very young in age. This study investigates the role school plays in reducing social inequality when choosing sports as a career. We focus on the decisions of young female athletes to pursue a career in sports. We examine the supportive role the family, school and coaches play in women deciding to pursue a sports career in an environment of structural discrimination.

In a society with structural discrimination concerning career choice, where women are expected to choose careers "for women" (e.g. nurse or teacher) while men have no such expectations, much importance lies in understanding the factors that may help reduce such social inequality.

We conducted a quantitative study that surveyed 444 young male and female athletes, ages 18 and up. The results show that differences exist between genders regarding schools supporting further pursuits in sports. Specifically, support from school turned out to be a more significant factor for women versus men in deciding whether to pursue a professional sports career, reinforcing the structural discrimination present in matters pertaining to career pursuits. Our findings indicate a systemic issue, and we recommend that policymakers collaborate with schools to support decisions by young female athletes to pursue a career in sports.

Wives As Teachers and Husbands As Students: Japanese Couples' Transitions to Parenthood

The present research examines the practices that wives prepare their husbands for parenthood. Our respondents were couples living in Japan whose wives were one to three months away from having their first children. We interviewed 44 couples separately between July, 2020 and January, 2021, and additional 4 couples were interviewed in the end of 2021 and the beginning of 2022 to see whether the pandemic affected their transitions. Of 48 couples, three couples were international with husbands from overseas. Using the social resilience perspective as our framework, we used the grounded theory methods to analyze the transcribed data.

Despite the fact that both wives and husbands experience the transition to parenthood for the first time, couples constructed the ideas that wives are more knowledgeable and skilled in parenting compared to their husbands because 1) the husbands' transition to parenthood is delayed compared to wives', 2) husbands show the signs of (in)competency, 3) wives work in care industry, and 4) a pre-conceived notion about men's lack of participation in parenting is widespread in Japan. These factors contribute to assigning wives to teacher roles and husbands to student roles. To prepare husbands for parenting, wives used various strategies to invite and educate their husbands. Some wives communicated their expectations verbally, while others used indirect methods such as parenting classes, parenting books and this research interviews. Wives' educating acts occur when they intend to go back to work after parental leave and/or there is a gap between the wives' expectations about how much their husbands should contribute to housework and childrearing, and the husbands' signs of (in)competency. As wives have more enthusiasms for work and the gap between the wives' expectations and the husbands' signs of (in)competency widens, wives escalate their strategies from inviting to educating.

A Prerequisite for Digital Citizenship: Health Problems Associated with the Problematic Internet Use

In March 2020, most schools throughout Japan were suddenly closed to prevent Covid-19 infection, and children and students suddenly spent more time at home. Schools were expected to offer online instructions, but only few of them did so (5% according to a survey in April 2020). The "GIGA School Program" by the Japanese Government to distribute schoolchildren PCs and tablets was promoted in the wake of the Epidemic, resulting in a further increase in the Internet use among young people. It has been pointed out that children's prolonged use of the Internet may have many negative effects, including a tendency toward so-called "Internet addiction" or "Gaming Disorder."

In order to foster digital citizenship, children and students need to learn not only the correct way to disseminate digital information, but also how to avoid the problematic Internet use. To find out how much and for what purposes schoolchildren spent time online and what health problems they felt, we conducted a large-scale survey from December 2021 to January 2022. The numbers of valid responses are 10,639 for elementary schoolchildren, 9,304 for junior high school students, and 7,643 for senior high school students among 10 prefectures.

This paper attempts to reveal what risks they are exposed to due to the problematic Internet use. While risks of the Internet addiction have become rather well-known in recent years, the risks to health except for the addiction, such as effects on binocular vision, sleep rhythms or mental health, have not received enough attention. For digital citizenship education, we cannot put off teaching young people how to avoid these risks and how to make a healthy relationship with digital technology.

Survival of the Privileged White Minority in the Black Majority Caribbean: How Whiteness Is Reinforced and Enforced

In recent years, many studies have examined "whiteness" from various angles in various geographical, cultural, social, political, historical and economic settings. These studies have provided insightful knowledge that many "kinds" of whiteness exists all over the world, and whiteness indeed is a shifting concept.

This study sheds light on the voices of the white minority in the black majority Trinidad and Tobago. This minority are descendants of the families of European immigrants who have resided in the Caribbean for more than three generations. It therefore excludes expatriates, vacationers, and recent immigrants from South America and Syria/Lebanon, because their historical

and social experiences on the twin islands are different from those of the earlier white population. White people now occupy only 0.6% of the total population of the islands, and they are synonymous with power and wealth.

From 2005 to 2020, face-to-face interviews were conducted in Trinidad and Tobago with adult participants who consider themselves white, and who are considered white by other whites. The narratives of these European-descended whites confirm that they maneuver themselves strategically to establish relationships with the non-white others in such ways to survive peacefully in a black majority society. At the same time, they claim that the reverse racism and racial harassment received from the non-white majority reinforces their awareness of being white and enforces their unity as whites. Moreover, the older generations acknowledge that their whiteness allows them to be socially privileged, and have demonstrated discomfort with the idea of racial mixing. The younger generations however deny their privilege verbally and are open to the idea of having racially mixed offspring, although sometimes conditionally- if it is out-of-wedlock.

IVANOV, Dmitry* (St. Petersburg state university, Russian Federation)

Herbert Marcuse's Dialectic of Modernity in the Perspective of Post-Virtualization

The dialectical pattern 'system – anti-system outsiders – new form of sociality' which can be revealed in Marcuse's theorizing line 'Reason – Eros – Post-technological rationality' is relevant model of Modernity dynamic. By the end of the 20th century the concept of post-technological rationality became affirmative discourse for the system of postindustrial capitalism. Now, Marcusean dialectical pattern can explain virtualization of society and its consequences. Virtualization as a replacement of things and real actions by images and communications was the anti-system tendency at the end of the 20th century when digital technologies enthusiasts created virtual networks escaping control of reified institutions. But now that 'Great Escape' of cyberpunks, hackers, pirates, and copyleft activists has been absorbed by the system as digital technologies usage became social routine and the newest form of social control. Social life is alienated into virtual realities arising on the digital networking platforms exploiting human interactions.

The current cycle of Modernity dialectic is negation of virtualization by turn to 'new materiality' and then its negation in post-virtualization as a rise of augmented social reality. Dialectical negation now is driven by movements representing the new utopia: authenticity revolt against virtuality. The newest forms of commodification and protest in urban spaces are converging and making social life an existence full of cyber-physical experience. Different social realities are mutually penetrated and take form of augmented reality integrating physical and digital, material and symbolic, modern and 'postmodern' components of human life. The next phase of dialectical theorizing can be driven by the contradiction between this 'Augmented Modernity' emerging in the super-urban areas and the 'Exhausted Modernity' in small cities and rural communities which are losing material, symbolic, and human resources 'washed away' by flows directed towards centers of post-virtualization. This paper presents the research supported by Russian Science Foundation (project #21-18-00125).

Caring after Separation: Russian Fathers Doing Shared Parenting

Shared custody arrangements for children has increasingly become a part of the separation legislation of many countries in recent years. This trend has predominantly been observed in Western contexts, being seen by some as a strategic achievement of fathers' rights groups or a path to gender equality, by others. However, little is known about non-Western contexts. I address this by shifting the attention toward the Russian context, where shared custody is neither culturally encouraged, nor legally recognized, and present the experiences of separated fathers who nonetheless chose to practice shared care arrangements. I use in-depth interviews with separated fathers, collected in 2022 in Russia as part of a larger PhD project devoted to the comparison of separated fatherhood in Russia and Australia. Thematic narrative analysis (Riessman, 2008) is used to understand lived experiences and rationales of separated fathers who are committed to shared care in the country where parenthood is still underlined by the ideology of gender difference, and motherhood is institutionally supported and legally protected, while fatherhood is equated with breadwinning. Disentwining the practices of shared custody from the Western context that they tend to be interpreted within, allows for an exploration of the ways equal parenting can be practised in the contexts of different gendered cultures, discourses and governmentality.

Back to 'Settler': Challenges to Canadian Multiculturalism after Genocide

Over the last ten years, the once-humble image of Canadians as nice people, known in popular culture for international peacekeeping missions and excessively apologizing, is changing. Between 2008 and 2015, the Truth and Reconciliation Commission of Canada undertook a campaign to bear witness to the stories of over 6,500 survivors of Indian Residential Schools, concluding with a surprising verdict for many non-Indigenous Canadians that residential schools were a "cultural genocide." In the years since, Indigenous peoples' struggles – once-racialized and attributed to personal failings – are being recognized as the experiences of survivors and intergenerational survivors of genocide. This process is challenging the previously positive identity of being Canadian, as non-Indigenous people step into identities as "settlers" to show recognition of and remorse for genocide. This paper draws on an ethnographic case study and fifty interviews with the creators, participants and audience members of *šxʷʔamʼət (home)*, an interactive theatre play about reconciliation and the legacy of residential schools that was performed in Vancouver and in 23 communities across Western Canada in 2018. Through its interactive format *šxʷʔamʼət (home)* provides us with a unique opportunity to see how non-Indigenous people adopt the identities of settlers and intergenerational settlers, including the unexpected threat this poses to long-standing narratives of Canadian multiculturalism and tolerance.

Degrees of Unfreedom: Foreign-Born University Graduate Labor Market Outcomes in Australia, Sweden, and the United States

Foreign-born individuals without citizenship often face tremendous hurdles when seeking employment within receiving societies. Scholarship on immigrant employment suggests that credentials gained in the receiving society can increase the likelihood of obtaining employment. However, the literature on immigrant employment is less conclusive about the dynamics of higher education (such as differences by degree type, region of residence during time of study and shortly thereafter, etc.) deemed of critical importance when assessing employment prospects for native-born individuals. Three societies with fairly distinct employment and migration regimes, Australia, Sweden, and the United States, have all recently made changes to visa categories with the stated aim of improving employment for international university students who would otherwise be required to leave the receiving society. We propose using the Australian Census and Temporary Entrants Integrated Dataset (ACTEID), Swedish registry data, and the United States Census Bureau's National Survey of College Graduates (NSCG) to assess labor market outcomes for international college graduates for 2013, 2015, 2017, and 2019. In particular, we are interested in whether internal regional differences within each country have an effect on: 1) the likelihood of obtaining employment after graduation; 2) the total amount of time necessary to gain employment after graduation; and 3) differences in 1) and 2) across degree/field type.

Dividing Lines: The Role of Minority Status on Labor Market Outcomes in Latin America and Sub-Saharan Africa

Research into labor market inequality and discrimination faced by workers with minoritized identities is dominated by examples from a small number of high-income countries in the Global North. This presents several problems when seeking to export these findings to medium- and low-income countries in the Global South. Perhaps the most pressing concern is that the terms of what it means to be a minority can vary quite drastically across the North/South divide. Latin America and Sub-Saharan Africa represent two distinctly different minority contexts within the Global South: whereas indigeneity represents the most salient minority identity across much of the Americas, the tendency towards ethnic fractionalization looms large in creating minorities in Sub-Saharan Africa. This proposed research seeks to quantify inequality between majority native-born workers, ethnic/indigenous minority group native-born workers, and foreign-born workers across both time and space. We use IPUMS International (cleaned and standardized national Census) and OECD data from 1990, 2000, 2010 to compare outcomes in both Latin America and Sub-Saharan Africa to those more commonly quantified in the Global

North. Furthermore, this research will merge two distinct streams of literature: Ethnic Fractionalization/Polarization literature seeking to quantify the level of disharmony between racial/ethnic groups in a given country and Immigrant/Minority Labor Market Segregation literature that assesses the degree of marginalization faced by non-majority group members within domestic labor markets.

IWADATE, Yutaka* (Bunkyo Gakuin University, Japan)

Small Traces of Disaster Experiences: Reading "the Tono Volunteer Diary"

"The Tono Volunteer Diary" contains descriptions of events in tsunami-devastated areas—including the details of relief activities in these areas and the emotions felt by volunteers who participated in those activities—that were written by visitors to the Tono Union Volunteer Center（TUVC）. TUVC is a support base for the disaster volunteers who went to Sanriku—an area devastated by Tsunami on the March 11, 2011, called "Great East Japan Earthquake". This space was developed at a community center in Tono City, and was an effort of Kyosei Union Iwate, an individual affiliated labor union based in Kitakami city in the inland region of Iwate prefecture.

Several number of people who came to the Center from Iwate prefecture, Tokyo, Kyoto, Osaka, and overseas, left notes about their experiences in two notebooks that were laid out inside the Center. Turning the pages, a reader can find many fragmentary words and sentences about huge debris, rotten sanma fish, the conditions of the wounded, etc. One volunteer from Kyoto wrote that the journey from there to Sanriku nospanned 1,000 km, and that he "saw breathtaking scenes that made impressions on my mind.", with handwritten pictures in the notebooks. These are the footprints of the volunteers who went to the Sanriku coastal area—a document of their relief experience.

How did these volunteers engage in relief action in this tsunami-devastated area? What did they witness and encounter there? Reading the diary will offer valuable hints to answer these questions. Based on field study of TUVC since 2011, this paper will consider disaster experiences of relief volunteers, and reflect on such kind of diary as biographical method.

Long-Term Transformation of Women's Life Course in Japan: Findings of Quantitative Sociological Research

This paper aims to explain the long-term transformation of Japanese women's life course, using the results of quantitative analyses. The large-scale work history data has been obtained by representative surveys such as Social Stratification and Mobility Surveys. It is now possible to analyze the life course of women born from 1916 to 1980. First, his paper introduces the methods of constructing the age-based life course data and presenting the visualized results of analyses. In order to confirm changes in women's life course, it is important to compare the visualized patterns among birth cohorts. Three turning points are crucial in the history of Japanese women's education, occupation and family formation: the wartime regime in the early 1940s, the oil crisis period in the mid-1970s and the lost-decade in the mid-1990s. This paper starts to clarify the effects of social changes in the mid-1970s. It is shown that the well-known M-shaped pattern of Japanese women's labor force participation was formed during that period. Then, during the lost-decade, the period from the early 1990s to the early 2000s, the work life patterns of women in their 20s and early 30s of age has changed from the 1971-75 birth cohort. This paper shows that the overall patterns of Japanese women' life course tend to differentiate into many separate paths. Lastly, this paper focuses on the impacts of the wartime regime on women's life course. The results reveal that life course patterns of the 1921-25 birth cohort from the late teens to the early 20s were affected by the wartime labor demands. The prototype of life pattern for women in their early 20s emerged among female middle school graduates during the wartime in Japan. This paper argues that the prototype has an enduring effect on women's life patterns of the subsequent birth cohorts.

IWAI, Noriko* (JGSS Research Center, Osaka University of Commerce, Japan)

SHISHIDO, Kuniaki (Osaka University of Commerce, Japan)

Has Japan's Resilience Enhanced through Repeated Disasters? Based on Japanese General Social Surveys (JGSS) and a Survey Conducted in Coastal Areas Affected By the Great East Japan Earthquake

Japan has frequently suffered from large-scale natural disasters. Since 1954, Japan experienced 72 massive disasters (31 earthquakes, 18 heavy rainfall, 10 typhoons etc.) including the Great Hanshin-Awaji Earthquake in 1995 and the Great East Japan Earthquake, which caused the Accident at the Fukushima Daiichi Nuclear Power Plant in 2011. Japan ranked 28th in the World Risk Index; while the proportion of the population exposed to natural disasters is 44%, the

third highest among 193 countries, the risk ranking is not as high. It is because other factors, such as capacities to cope with disasters and prevention of infectious disease are high in Japan.

Using the Japanese General Social Surveys and the Survey on Attitudes towards Reconstruction after the Great East Japan Earthquake, this study presents Japanese perceptions on the risk of encountering natural disasters, the proportion of those who had experienced them, and how they prepare for future disasters as an individual, family member and community members.

One-third of the JGSS respondents experienced some kind of damage; whether this be human, buildings or property related. After 2010, the proportion of disaster affected people increased sharply throughout Japan. Disaster experiences enhance preparation for evacuation. On the other hand, the proportion of those who think that people in their residential community are collaboratively able to cope with natural disaster has gradually decreased from 68% in 2012 to 60% in 2022; it might be because the scale and frequency of recent disasters came to exceed their community capacities to cope. Among the respondents suffered from earthquake and tsunami in Tohoku (excluding nuclear accident evacuees), more than 70% feel that they return to normal life to some extent. While the decommissioning the Fukushima Nuclear Power Plant is far from completed, people who agree to nuclear power sharply increased after the Russian invasion of Ukraine.

IWATA, Koh* (1-1-4-510 Higashi-Mikunigaoka, Japan)

Collapse of the "Friends Bubble": Transformation of Friendship and Media Usage in Japanese Youth

The purpose of this report is to use the quantitative data obtained from the nationwide surveys to clarify the relationship between a 20-year change in friendship in Japan and media usage. In particular, we will examine a remarkable weakness in the expansion tendency of friendships, which can be said to be the collapse of the "friends bubble".

In Japan, there have been many discussions on the relationship between media usage and friendship. The use of mobile phones and the Internet has been criticized for increasing the number of friends while reducing face-to-face contact and diluting relationships. However, many of the results of large-scale surveys do not support this dilution, but notice a usage of the relationships according to the situation (Asano 1999, Tsuji 1999). In addition, it has been pointed out that the use of mobile phones and the selective orientation in friendships are related (Matsuda 2000).

Ogawa (2021) considers that the recent phenomenon of "connection and loneliness", can not be fully captured by customarily regarding dilution and selectivity as mutually exclusive. Based on the discussions on friendships " disembedding" (shift from external standards such as blood, and locality, to internal standards) (Shibata 2010), he points out that "reembedding" is happening due to the anxiety associated with the construction of internal standards.

Based on this discussion, we will examine how media use, such as smartphones, is related to friendship.

A remarkable weakness in the expansion of friendships can be pointed out from the result of these surveys. This tendency can be interpreted as a "reembedding" (return to external standards). However, the " multiplicity of friendships", assumed in selective relationships, is not always lost, and requires a more detailed consideration from the perspective of transformation of friendships due to " disembedding".

"You Can be Eco-Friendly but Not at Your Own Expense" - Underlying the Fundamental Factors of Private-Sphere Pro-Environmental Behaviour in 5 European Countries.

"Save the planet" is a common slogan used to motivate people to initiate the transformation towards a more sustainable world. It appeals to humans to make a change through individual and community actions. Over the past 25 years, the topic of environmental protection and pro-environmental behaviour has been widely debated by scientists (Gifford, 2014; Clot et al., 2022), and recently it has also been called a "Greta Thunberg Effect" to show the new form of environmental activism (Sabherwal et al., 2021).

This paper focuses on pro-environmental behaviour (PEB), an individual-level effort to mitigate human activities' environmental impact (Stern, 2000, 2005; Chen et al., 2017).

We use Computer Assisted Web Interview across the five countries of Europe: Greece, Poland, Portugal, Sweden and the United Kingdom (N=2502) to analyze private individual's behaviour, defined as a self-perceived declaration to contribute to environmental conservation. Our results indicate that attitudinal and value-related factors are more significant than demographics. Also, the main barriers to pro-environmental behaviour and environmental citizenship (agency) are a lack of knowledge and ecological awareness.

Besides quantitative data from cross-country analysis, we present the qualitative study from focus group interviews (conducted in Poland) to understand better what influences PEB and the lay people's dilemmas due to the complex and multiply factored nature of PEB decisions. Qualitative

and quantitative research provides a more in-depth analysis of people's daily habits. It implies, among others, the need to foster pro-environmental behaviour with better education targeted to work on sustainability education, values and attitudes towards nature.

Scholastic Dreams: How Does Disaster Damage Impact Educational Aspirations and Outcomes Among Post-Tsunami Youth in Indonesia?

Little is known about how exposure to a major disaster affects educational aspirations both immediately and over the longer term. Less is known about whether these changes affect educational outcomes. This paper leverages uniquely rich longitudinal survey data from the Study of the Tsunami Aftermath and Recovery (STAR) to examine how exposure to damage from the Indian Ocean tsunami of 2004 impacts educational aspirations and attainment of children post-disaster. We found that these children held very high educational aspirations, especially compared to the prevailing post-secondary education rates. Damage exposures at the household and community levels affect children's educational aspirations differently: damage at the household level had a negative effect on aspirations that persisted over time, whereas the community-level damage effects tended to dissipate over time. Reconstruction and recovery likely played a large role in diminishing the negative effects of tsunami damage on aspirations. We also found that previously reported aspirations had a large effect on determining eventual educational attainment, and this effect persisted above and beyond socioeconomic status and damage exposure. Ultimately, exposure to disaster damage did not create a new line of stratification in terms of education aspirations and attainment. These findings contribute important insights to broader discussions on educational aspirations across the life course and children's resilience post-disaster.

New Insight into the Quality of the within-Household Respondent Selection Methods in Cross-National Surveys. Findings from the European Social Survey (ESS), 2002-2020

Most face-to-face cross-national surveys use sampling designs involving the selection of households, either from a list of addresses/households or via area probability sampling with field enumeration, followed by an interviewer-administered within-household selection of target respondents. Two sampling methods for selecting individuals within households were frequently applied in cross-national surveys: the Kish grid and birthday procedures. Kish grid selection is expected to result in higher quality, yet its requirement to compile a complete household inventory of all eligible units may increase refusals. For birthday methods interviewer only ask which household member fulfills the birthday rule, which is expected to result in lower refusals but at the cost of depreciated sample quality due to greater opportunities for interviewers or respondents to interfere with the selection. Besides, the Rizzo method (in combination with the Kish grid or birthday procedure) was recently implemented in the ESS. This procedure avoids collecting information about the household members for households with no more than two eligible units.

This presentation aims to analyze the impact of within-household selection on two outcomes related to sample quality, i.e., refusal rates and selection bias. We analyzed almost 250 national surveys from all rounds of the ESS. Based on survey documentation, we split refusals into refusals during the respondent selection process and refusals provided by the target respondent after the successful selection. Our findings confirmed that the necessity of listing all eligible units is intrusive for household members, as we found that procedures avoiding this step result in lower refusals before the target respondents were sampled. However, there was no difference between the selection procedures in refusals by respondents after successful selection. We also confirmed that the Kish grid and the Rizzo method with the Kish component provide higher-quality samples despite boosting refusals before or during the selection.

JABKOWSKI, Piotr* (Faculty of Sociology, Adam Mickiewicz University, Poznan, Poland)

Obstacles in Conducting Valuable Analysis Based on Data from Multiple Sources. a Case Study of Methodological and Technical Challenges in Multilevel Cross-National Analyses on Attitudes Toward the Environment

Ex-post data harmonization usually involves a wide array of procedures that integrate diverse survey data sets into one meta-base and promises to incorporate information mitigating time-series or country-coverage lapses. We hoped for similar benefits when merging data from two surveys of established quality with other survey data and administrative records.

Methods & Data: Our presentation is based on data from the 2017 wave of the European Values Study (EVS) and World Values Survey (WVS), which covered 81 countries. When conducting multilevel cross-national analyses focused on the impact of the ideological orientation of political parties close to the respondents on attitudes toward climate politics, we realized that the necessity to include measures corresponding to different levels of our analyses (i.e., respondents, political parties, and countries), demands going beyond data provided by the EVS and WVS. Thus, we incorporated two external sources of data: (1) the Global Party Survey 2019 describing political parties and (2) World Bank Data on cross-country differences in the GDP per capita.

Results: We faced many obstacles from the specificity of external data we tried to merge with the EVS and WVS databases. These challenges included not only technical limitations but also methodological complications resulting from the different quality of multiple sources of external data and its inconsistency with survey data, e.g., resulting from under- or over-coverage of political parties included in the EVS/WVS 2017 and GPS 2019, and time gaps in the Word Bank Data.

Lesson learned: Our analyses demonstrate that even though we failed to produce data of supreme quality and full comparability, merging different data sources provides promise for going much deeper through analyses based on multiple different sources rather than relying on data from a single cross-national project designed to be comparable.

JACKSON, Pamela Irving* (Rhode Island College, United States)

Storming the Capital: Hate Crimes, Far-Right Domestic Terrorism, and Democratic Backsliding in the U.S., Canada and Europe

This paper examines evidence of the influence of lax hate crime law enforcement in escalating right-wing extremist violence and weakening supports for democratic institutions in the U.S., Canada, and Europe. Previous work (cf. Koehler, 2016, 2017; Kruglanski, Webber and Koehler, 2021; Miller-Idriss, 2020; Perliger 2020; Belew, 2018; Applebaum, 2020) focuses on only part of this progression with limited international contrasts. Official data on hate crimes in individual European states, the U.S., and Canada indicate that most hate crimes are not recorded or prosecuted. Open-source data provides more complete information (cf. Gruenewald, 2022). Yet evidence suggests that strong criminal justice protections for minority populations and immigrants are necessary to suppress far-right extremist groups and mass casualty attacks and to protect liberal democracy. Examples from liberal democratic countries as well as some recognized as illiberal--such as Hungary, Poland, Czechia, and Slovakia--support the iceberg model of political extremism and underscore the significance of hate crimes in providing the conditions for far-right extremist domestic terrorism and democratic backsliding. Hate crimes stimulate factionalism, key to weakening liberal democracy (cf. Walter, 2022). In the United States, for example, the Congressional Research Office (CRS) (2021) points out the frequent overlap between hate crimes and domestic violent extremism. The National Consortium for the Study of Terrorism and Responses to Terrorism (START, November 12, 2020a) explains that the dehumanization of groups targeted by hate crimes and the "disjointed legal and bureaucratic responses" to them facilitate the escalation of white supremacist violence to mass casualty attacks. This examination of the roots and goals of far-right extremist insurgencies and attacks on elected officials in liberal democracies challenges the prevailing practice of ignoring hate crimes as inconsequential for the stability of democracy.

What Drives Support for Authoritarian Populist Parties in Eastern and Central Europe?

Recent scholarship underscores that authoritarian populist parties stoke the majority's sense of personal grievance by denigrating minority protections as discriminatory to natives and portraying minority crime as imminent. We include measures of personal grievance in an expanded model of voter support for authoritarian parties that builds on the work of Norris and Inglehart (2019). We then test the expanded model in nine east-central European countries (Bulgaria, Croatia, Czechia, Hungary, Latvia, Lithuania, Poland, Slovenia, and Slovakia) with data from nine waves of the European Social Survey (2002-2018). Results for this region differ from previous examination of right-wing voters in western Europe, supporting Schafer's (2021) argument that "populism differs across countries or regions". Unlike their counterparts in western Europe, for east-central European voters, sense of being in a group that is discriminated against does not predict an authoritarian populist vote in the multivariate findings. Eastern and central Europeans who hold anti-immigration attitudes and mistrust global governance are more likely to be supporters of authoritarian parties, as expected. But again in contrast to previously reported results for western Europe (cf. Doerschler and Jackson, 2019), right-wing voters in east-central Europe are more (not less) likely to trust national governance. National governments in eastern and central European states may have burnished their appeal to voters with significant income supports, like Family 500+ in Poland (cf. Muis, Brils and Gaidyte, 2021). Holding right-wing values, greater religiosity and opposition to homosexuality predict the right-wing vote in this region, as does support for welfare chauvinism in the total sample. We examined predictors of the far-right vote in individual states and found both general support for the regional findings and some areas of unique difference.

The Well-Being Pandemic: Outline of a Contested Terrain and Research Agenda

Within a post-Global Financial Crisis (GFC) and Covid pandemic world, wellbeing has emerged as a central, if not defining, feature of contemporary social life. Yet, despite its global significance nospanning the political, social and economic spectrum, there is a remarkable lack of agreement regarding the conceptualisation, definition or operationalisation of wellbeing. Ultimately, what we do know is that by virtue of its intersection with politics, economics, health, education, and consumer lifestyle – wellbeing is now a key concept within an ever-expanding network of discourses and policies linked to power, resources and responsibility. This presentation explores the contested terrain of wellbeing by examining it in relation to emerging politics, complexities and contradictions. More specifically, the essay: (1) briefly describes the historical origins and development of wellbeing; (2) discusses how it has been reconceptualised within the context of neoliberalism; and, (3) outlines a research agenda offering three ways to investigate wellbeing including: (a) as a wicked problem; (b) as part of the process of 'wellbeing washing' within state and other institutional structures and policies; and, (c) in relation to alternative futures, which might encourage us to re-imagine or jettison the term altogether.

When the Burden Lifts: The Effect of School and Day Care Re-Openings on Parents' Employment and Life Satisfaction

At the onset of the pandemic around the globe, governments decided to close schools and day care facilities to slow down the spread of the virus. Increased childcare duties of parents have been the most prominent explanation of the observed strong decrease of parent's employment and life satisfaction, in particular for mothers. However, school and day care closures have been implemented alongside several other containment measures. For example, in March 2020 in Germany, the government shut down nonessential shops, bars and restaurants, required employers to allow for remote work, and closed most public institutions. These containment measures might be also particularly relevant for parents if work and daily chores became more stressful. Hence, we aim to shed more light on the specific role of school and day-care closures for parents. We use the temporal variability of school and day care re-openings in different German federal states (Bundesländer) that allows us to single out the effect of care duties. In our empirical analyses, we use data from the German IAB-HOPP study which is unique in providing repeated monthly measures of employment, working hours and life satisfaction at the onset of the pandemic. We merge the survey data with data on exact dates of school and day care openings that allow us to measure the immediate effect on working hours and life satisfaction two weeks later. Using a difference-in-differences (DD) and difference-in-difference-in-differences (DDD) approach, our results reveal a positive effect of an earlier and more far-reaching reopening of schools and day care facilities on parents' working hours. With regard to life satisfaction, a positive effect of re-openings can be observed for mothers only. Our results contribute to previous research that concluded closures to be burdensome for parents by providing sound empirical and quantified evidence on the effects of re-openings.

Is There Equity in Multiculturalism? Racism in the Work Environment -Nursing As an Example

Anti- Racism names, analyses and is a framework to dismantle systemic and institutionalized forms of racism within a Multicultural society. Canada values multiculturalism which exists in a federal act 1988) but within nursing in Ontario, Staff nurses are a class within the hierarchy of the nursing profession. As a structure, the profession of nursing is a formal system. Canada, despite the changes to its social characteristics and with the Multicultural Act (1988), and the Charter (1982) has paid little attention to social inclusion. The marker of colour is also a way to keep a group subordinate and disadvantaged. Equality of opportunity within occupational structures and within one's profession affects collegiality, professionalism, and quality of life. Thus, the racial, social, and status hierarchy among nurses impacts on relationships in the work environment. Antiracism theories discuss the combating of systemic racism across all institutions and criticize the notions of meritocracy, color-blindness, and social objectivity as they usually reproduce racial privilege and not equal opportunity. Policy initiatives against racism were adopted by professional nursing organizations and the College of Nurses of Ontario (CNO) recently added racism to its guidelines on abuse. Racism is achieved in nursing by resistance to extending the privileges of whiteness to persons of color and their supporters and continued denial of this resistance, (Hagey et.al.,2005; CBC Fifth Estate 2013, Zanchetta et al. 2021, Beagan et al. 2022) Thus, institutionalized

racism in nursing and the health care system cannot be ignored, as it is a question of social justice, and human rights; it is a form of racist oppression that usually gets lost in Canadian society (Jacobs 2007). This paper explores more than 30 years of studies completed by nursing associations and researchers with a lack of change as stated in 2022 when RNAO's Black Nurses Task Force.

Civil Society in the Age of the Algorithm

Despite public concern about the role algorithms play in amplifying social polarization and social inequality, sociology has been surprisingly slow to take up the algorithm as an object for theorizing. We offer a sociological review of the growing interdisciplinary literature about algorithms in digital media as a way to explore the relationships between algorithmic culture and civil society. We argue that algorithmic culture forces us to rethink some of the central normative understandings and utopian hopes of modern social theory, such as the nature of social movements, the possibilities of communicative rationality, and the transformative power of subjugated knowledges.

Women with Female Genital Mutilation/Cutting's Emotional Health Work and Reproductive Health Care Experiences

Women with female genital mutilation/cutting (FGM/C) are known to experience hardships surrounding their reproductive health care, including unfavourable interventions and outcomes during child birth, fear of unwanted obstetrical interventions, and stigmatization from health care providers. Still not understood, however, are the social relations that shape these reproductive health care experiences for women with FGM/C. We used institutional ethnography to delve into the research question: What are the social relations that shape the reproductive health care experiences of women with FGM/C? Eight one-one-one, in-depth, semi-structured interviews with women with FGM/C were conducted to better understand this population's reproductive health care experiences and how these experiences came to happen. We found that women with FGM/C engaged in emotional health work in order to prepare for their reproductive health care encounters. This work stemmed from exposure to anti-female genital mutilation discourse (a public discourse in which human-rights advocates aim to protect women with FGM/C, but stigmatize the practices, practicing cultures, and the women themselves); participants learned that they may experience similar stigmatization during their reproductive health care appointments. Participants therefore worked to mitigate potential discrimination prior to appointments by learning from relatives' previous experiences and looking for an inclusive clinic. By questioning assumptions latent in human-rights based anti-female genital mutilation discourse, which both helps and hinders the population meant to be protected, we may work toward a more inclusive reproductive health care environment in which women with FGM/C may not have to engage in such cumbersome emotional health work prior to stepping foot in the clinic.

Drug Policy, Politics, and the Production of Knowledge in Multisite Substance Use Trials

By situating themselves within clinical practice, pragmatic clinical trials aim to measure the effectiveness or feasibility of a treatment in the "real world." However, in substance use research, the "real world" is characterized by everchanging drug policies, public perceptions, and contentious politics that vary by jurisdiction. While such contextual influences typically go unmeasured in clinical research, localized features of the political environment may shape participants' clinical trial experiences and outcomes. In order to understand how research processes are embedded in broader social contexts, we conducted a nested qualitative study within a multi-site, pragmatic randomized controlled trial testing models of care for opioid use disorder across five Canadian cities. Through analysis of 115 interviews with 75 participants, we investigate how jurisdictional differences in drug-related policies and priorities shape participants' experiences with trial enrollment, treatment access, and medication adherence. By looking beyond individual- or trial-level factors to the local context, our results highlight how complex sociopolitical dynamics

have implications for the conduct of substance use research, participants' medical research experiences, and the comparative analysis of study data and outcomes across settings.

Enabling Education through Technology: Edtect Induced Challenges for National Education Policy of India

Consequent to the havoc that wrecked the Indian education system during pandemic, the National Education Policy 2020 (NEP) initiated by the Government envisages a landmark shift in the ethos and intent of education at all levels – a shift from thinking digital to becoming digital –infusing technology in all spheres of education: teaching, learning, assessments, credentialing and governance, supported by requisite infrastructure and a curriculum addressing 21st century skills imparted through immersive technologies. The NEP has taken lessons from the pandemic in its resolve to restructure and reorient the education system to insulate it from such crisis and to render it futuristically relevant in which the role of ICT is viewed as indispensable, particularly in the context of a system of education dependant on "chalk and talk". However, bringing 250 million students on ICT platforms is a herculean task in view of the financial constraints the Government is beset with, compelling it to collaborate with private Edtech sector, which is going through a phase of intense consolidation post-pandemic, providing it another opportunity for monopolistic profiteering just as during pandemic. It is a known fact that the Edtech sector registered an exponential growth and monopolistic control over e-learning during the pandemic which receded thereafter. Hence, collaboration with NEP initiatives could prove to be a decisive revival for the key players in the Edtech sector. The implications of these collaborative initiatives and interventions in pursuance of NEP mandates are presented in the paper which seem to indicate that Government's inherent limitations in funding the infrastructure and e-resources in universities and colleges on the one hand and its reliance for technology solutions on the commercially oriented and intensely competitive Edtech industry on the other seem to be the key challenges that need to be overcome by the Government and the higher education institutions.

JAHAN, Aarshi* (Dr. B. R. Ambedkar University, Delhi, India)

The Epistemological Function of Visuals- Questioning the Visual Representation of Dalit Community in Development Discourse

A visual depicts a meaning and educates its spectators. A sociological view delves into the epistemology of visuals. On the other hand, the study of visuals within the discipline of culture studies would question it's making, and the process of its meaning construction that influences social relations. A spectator has no control over the visual, however a visual has a potential to manipulate over ideological grounds. Alongside, magic bullet theory in Media studies states that audiences are 'actively passive' in terms of receiving the message through mediums. This paper is focusing on the representation of Dalit communities through visuals, the key images that are used to represent them in development discourses that thrive on imagery, picturing the vulnerable and a freedom to manipulate the visuals or 'what one should see' pertaining to various ideological stands. The study would present a critical inquiry on how vulnerable groups are presented through visual medium, specifically taking Dalit communities as subject. It would further elaborate on how visuals and imagery can construct or label the 'Other', the marginalised and the vulnerable, which depends on the underlining power relations that channelise the control over visual making. There are no presumptions that are organic, that our imaginations, beliefs, and perceptions are inevitably influenced, or to be precise, are the consequences of our exposure to the outside world. Vulnerable groups are at the core of every development discourse, therefore their representation is understood under the framework of undernourished, underdeveloped and highly vulnerable. Posters and advertisement visuals that are used to promote development schemes presents an evidence on *how visuals depict Dalit people* and *how does that shapes spectators perspective.* This will be an exploratory research which will use an interdisciplinary approach to study the epistemological function of visuals in constructing meanings and dominant discourses of development.

JAIKISHEN, Doel* (Youth for Unity and Voluntary Action, India)

Asserting Youth Identities and Mainstreaming Urban Poor Neighbourhoods: How a Festival Is Using Arts and Culture for Narrative Change

India's growth story often fails to account for the most marginalised. Yet their narratives are among the richest and most nuanced in the development discourse. Since 2018, the non-profit Youth for Unity and Voluntary Action (YUVA), in Mumbai, India, has used the medium of arts and culture through a narrative change festival (ComplexCity) to mainstream these conversations.

The presentation highlights learnings from the festival and contextualises them within the growing discrimation and shrinking spaces for democracy

in Indian cities. The author showcases how, via city walks in urban poor neighbourhoods led by young community leaders, and theatre co-conceptualised and developed by youth sharing their aspirations and realities, the festival provokes questions and ensures direct engagement among different sections of society. In an environment of misrepresentation and othering, the festival curates platforms for authenticity and dialogue, towards respect and cohesion.

At the city walks, hosted in an informal settlement and at a resettlement colony, young leaders share narratives of resistance, hope and collective action, focused on their housing and identity journeys. By sharing these with the city's middle class, which contends with none of these realities and is unfamiliar with notions of collectivising for change, the walks have emerged as rich conversation and learning spaces.

Similarly, the 'Baaton Mein' playlets devised by youth, basis their own experiences, desires and aspirations, foregrounds the nuances of growing up and negotiating jobs, relationships and life's struggles. The artists facilitate discussions post performance for a richer collective understanding of each other's journeys and experiences.

The presentation closes with a brief overview of other components of the festival, including photography, street plays, exhibitions used to draw in audiences and help question biases. It offers indicative pathways to foreground people's agency and leadership while using the arts to share and re-imagine narratives across class groups.

JAIN, Anuja* (University of Rajasthan jaipur, India)

Reinvigorating Happiness of Leisure in Covid Times

The exponential growth of the global pandemic significantly altered our lives in many different ways. The work pattern changed with home becoming a work place, resulting into an increase in work hours. The use of technology has changed the work life balance. Life in the pre-pandemic times revolved around spending free time on social networking sites, enjoying with family and friends, visiting places of interest are just a few examples. However, the onslaught of global pandemic has altered all of these leisure activities. The teleworking culture that pandemic catalysed will lead to improvements in economic and social metrics, such as worker well-being and parenthood. Thus, while this virus altered our lives, affected our means of support, limited our freedom, it also provided us with a better way of living that is hygienic, purified, yogic and sober.

This paper departs with the premise that it is obviously necessary to conceptualize happiness in terms of leisure. As reading would help to lead to the comprehension of the concept of happiness in terms of leisure, this study offers to enable researchers to understand, evaluate and acquire potential solutions to questions related to happiness and leisure. All that can be concluded is that since work is unavoidable and leisure time is in short supply, one must develop and research better ways to balance the two. The entire COVID-19 sojourn has taught that, many times, surprisingly challenging events can really help people discover happiness if they approach them in the proper way and with a positive outlook. The paper is primarily based on secondary sources, common observations, and people's conceptions of joy and leisure in contemporary times.

Green Neoliberalism in the Global South: Revisiting the Big Dam Debate in India

India, which now has the most dams after the USA and China, saw a boom in large dam construction between the 1970-the 80s succeeding the rise in global trends supported by global governing institutions. This upsurge led to the current scenario in which 1,041 of 5,344 large dams are older than 50-years, and almost 70% would hit the 50-year mark by 2050. The eroding dams feed into the plethora of perennial issues of dam safety, and resounding problems consequent from the immediate and long–term impact of large dams as well as the aggravating risks of dam failure-related disasters. Thus, placing the country on the brink of an emerging policy challenge of ageing large dams with no formidable alternatives to meet the developmental demands.

The uncertainties of climate change and its impact has added to the risks associated with large dams and the ageing process. Meanwhile, there is a renewed interest in construction of large dams for water storage and low-carbon energy generation in response to climate change. Consequently, a global debate has ignited over the future of ageing dams and the embodiment of its risks, which vary across Global North and South.

This study seeks to analyse the dam safety landscape in India by revisiting the global large dam debate and India's postcolonial bid for large dam construction partly informed by the approach in Global North. Utilising the primary and secondary data sources, the research deep dives into the diverse perspectives in understanding the complexities of the multi-layered drive for large dam construction, and the risks of its ageing. In this respect, the study

borrows from the theories of green neoliberalism to explore renewed interests in large dam construction while the looming risks of ageing dam infrastructure and its interactions with the aspects of climate change grapple the world.

WG01-767.3

JAIN, Priyanka* (Noida International University, India)

Reverse Migration of Indian Afghans in the Emerging World Order

Indian Migration in Afghanistan is not something new as through trade ties and expansion conquests, Indians were linked to Afghanistan. Kandahar was part of Ashoka's empire gifted to him by his grandfather Seleucus Nicator. Majority of migration from India to Afghanistan occurred from Punjab province and a colony by the name of *"Shikarpur"* was established in the 1800s in Afghanistan, comprising of Khatri Hindus. There was a population of 3,00,000 *"Hindkis"* as they were called in Afghanistan at this time.

In the 1990s, the number of Indian origin Afghanis were 45,000 and majority of them were based in Jalalabad and Kabul. Recently, in the year 2021, under *"Operation Devi Shakti"*, around 700 people have been evacuated from Afghanistan who carried Hindu scriptures and 2 Guru Granths. This may be termed as *"Reverse Migration"*. This paper is attempted to enumerate and evaluate the reasons of this reverse migration from Afghanistan to India and its repercussions on the migrating population and resulting strain on relations between both the countries. This reverse migration is of not just of People of Indian origin but also of Afghanis. This paper further evaluates the emerging new world order due to this reverse migration.

Such intense is the reverse migration that on September 25, 2022, a flight was arranged by Shiromani Gurdwara Parbandhak Committee, Amritsar, with thirty-eight adults, fourteen children and three infants. This was followed by an attack on a Sikh Gurudwara. Sikhs and other Indians in Afghanistan face humiliation at the hands of Afghans and women are forced to wear Burkha. They have to face spit on their faces and pressures of conversion are mounted on priority. With such treatment meted out to Indians, how far the demands of Afghans in India for grant of refugee status are justified, is question this paper explores.

RC12-188.1

JAIN, Rashmi* (Rajasthan University, India)

Introspecting Gendered Migration: A Cross Cultural Perspective

The decision to migrate is generally made in response to a combination of socio-economic and political pressures and incentives. Inequalities within and between countries create incentives to move. A prevailing misconception is that men migrate and women do not. Women migrants have often been "invisible", assumed to be economic dependents of spouses. With the shift in labour demand from industrial to service sectors in the globalized world, highly gendered niches have appeared in sectors like domestic work, health, child and aged care. These sectors are likely to be more female dominated. The growth in domestic service is often attributed to increasing inequality both in the rural and urban areas, the shift from an agrarian-based economy to a manufacture and service-based economy and the rise of an urban middle class. Export-oriented industrialization driven by foreign direct investment, particularly in the larger growth economies in Asia, but also in Latin America and Africa, has drawn females from rural areas to textile and garments factories, and into domestic caring jobs in the cities.

The paper will examine gender as a social construct that can greatly differentiate the causes, processes and impacts of migration between the two sexes. A gender analysis of migration looks beyond simple differences in migration behaviour between men and women – such as the likelihood and type of migration – and examines the inequalities underlying those differences. It also looks at how these are shaped by the social and cultural contexts of the individual, and the influence that membership of social groups and economic and political conditions can have on decisions about migration.

JAIN, Rohit* (Tata Institute of Social Sciences, Tuljapur Campus, India)

Shifting Contours of Social Movements: Study of Forest Rights Movement and Labour Movement in India

Social Movements over a period of time undergo a change. The movements respond to changing political and economic conditions. There is a continuous transaction and engagement going on between the state, market and society which influence the social movements resulting in new contours of the movement. The market plays an important role in shaping the demands of the social movements and the state responses.

In India, Forest Rights Movement and Labour Movement have been engaging with the state and market for more than seven decades. Forest Rights struggles have different dimensions ranging from conservation of forests, assertion of land rights, struggle against eviction from sanctuaries and struggle against corporate takeover. The state has responded sometimes positively to the movement's demands only to step back after some time. The Forest Rights movement is not only struggling to get the state to hold on to its promise but

also trying to get the state to step in for social and economic development of forest dwellers. Climate Change and the State response are also impacting the movement. In this context, the struggle for the movement is not only to save the livelihood resources but also develop its resources to live a life with dignity.

The Labour movement has also undergone a major change. The movement has moved on from organizing labour from formal sector to engage in a big way with informal labour. As more and more manufacturing processes pass on to the informal sector, service industry employing informal labour and pro industry labour reforms by the government, the labour movement is at the crossroads and finding ways to move forward

The paper will examine the changing contours of the Forest Rights Movement and Labour Movement in India through different case studies.

Potentials of a Rhizomatic Organization Theory: Deleuze, Guattari and the Decentralized Autonomous Organization

In 1972 and 1980, Gilles Deleuze and Felix Guattari released the two parts of their theoretical work "Capitalism and Schizophrenia", in which they re-examine central tenets of then-popular Marxism and psychoanalysis. Moving beyond this initial focus, they develop an extensive philosophical theory that touches on natural, cultural, social and political phenomena, thereby implying, but not explicitly developing a new theory of the organization. Their goal is to wrest theory from the hands of what they call "arborescence": a top-down, centralized understanding of the world itself as well as the knowledge of it. Instead, they call for a "rhizomatic" view: a bottom-up perspective that deconstructs the supposed solidity of transcendent categories (e.g. the subject, language and certain ideas) and replaces them by the "decentered" interaction of material forces and resulting constellations.

I elaborate a rhizomatic theory of the organization and probe its potentials. I therefore contrast the rhizomatic view with the arborescent theory of organization par excellence: the Weberian bureaucratic understanding of the organization as a hierarchical and formal construct. As an empirical example necessitating the formation of such a new perspective, I look at the recent phenomenon of Decentralized Autonomous Organizations arising in the block-chain space. Self-organization and automation through smart contracts, bypassing the need for a central authority and thus allowing for new forms of organizing, characterize these organizations. Concepts focusing on hierarchies, centralization and formalization cannot grasp these specificities.

Self-Reflection, Curiosity and Identity Practice in Digital Sexual Health Curation

Popular and academic discourse around young people's digital engagement, particularly in relation to topics of sex and relationships, has been frequently characterised by moral panic and concerns of exposure to inaccurate or unrealistic information. At the same time however, acknowledgment of gaps in formal relationships and sexuality education has seen growing recognition that digital spaces offer opportunities for young people to learn about sex, relationships and sexual health. Building on a growing body of literature exploring the ways young people navigate digital spaces with respect to sex and relationships, in-depth interviews were conducted with 22 young people aged 18-25 as well as 22 specialists working in sexual education and digital content creation in Australia. Interviews were semi-structured, guided by a range of questions that explored how and where young people explore sex, relationships, bodies and health online. Key themes were derived through reflexive thematic analysis. It was found that learning about sex, relationships, and sexual health in digital spaces is not a simple process wherein young people consume information provided by health specialists in a straightforward manner. Rather, young people engage with a range of resources, media, forums and discussions online to build understanding, learn about, and reflect on, their own sexual desires, identity, experiences and bodies. Digital spaces encourage young people to be curious about matters relating to sex, relationships and health because ideas and content are presented to them through social media and other forums, in a way that allows for immediate exploration of ideas and questions. In this way, digital spaces are an excellent environment for learning. Often concerns are raised that young people are vulnerable to acquiring misinformation about sexual health online. However, these findings show that online sexual health education is not a process of fact gathering, but a process of curiosity and self-reflection.

The Many Languages of Digital Sex: Digital Sexual Subjectivity, Sexting and Amateur Pornography

The discursive construction of sex and sexual practice has implications for how sexual subjectivities are positioned and either accepted or rejected. While discussions of sex and sexual practice have often been associated with stigma and characterised by long held taboos, new terminology for sexual practices is emerging in response to the increasingly common use of digital technologies in contemporary sexual experiences. Often referred to as 'sexting' and 'amateur pornography', these practices are facilitated by advancements in, and availability of, digital technologies. While much discussion of sexting has focused on young people, little is known about how adults understand and use terminology to refer to their engagement with sexualised imagery and video. To explore how adults discuss and conceptualise their digital sexual practices, 23 in-depth interviews were conducted with people aged 25-75 years old who had experience with creating nude, sexual photos and videos. It was found that adults carefully select and evaluate words to speak about their practices in ways that attend to the connotations and implicit associations of specific terminology. The language of amateur pornography and sexting was largely rejected by adults, with adults preferring to speak about their practices in ways that are disassociated from sex or sexual pleasure, such as via the use of innuendo or terms such as 'cheeky photos'. This resulted adults using a wide range of terminology to talk about their practices, grappling with terms that describe their practices in both terms of practice and subject position. While this presents difficulties in establishing a shared language for digital sexual practices, it also creates opportunities for constructing a language that is removed from negative associations, allowing for discursive creativity and positivity.

Disjunctive Globalization in the Age of the Great Unsettling

This paper argues that globalization has entered its most volatile phase in history. A series of social crises in the opening decades of the 21st century has led to the "Great Unsettling"—shorthand for the intensifying global dynamics of volatility, insecurity, and dislocation. Today's unsettling conditions involve serious disjunctures that reach beyond these general levels of global social order into the ontological bases of life on this planet itself. We argue that there is an overarching disjuncture powering the ecological, economic, political, and cultural dimensions of the Great Unsettling relating to technological change. We contend that increasing digitization of our lifeworlds resulted in the intensification of the disembodied formation of globalization. It has been charging ahead while the other three formations have been relatively constrained. The growing stature of disembodied globalization at the expense of other globalization formations has resulted in the reconfiguration of incipient globality from a condition of relatively balanced spheres of interconnectedness to an uneven global system dominated by digital flows. This massive juncture, then, explains much about the current state of globalization. In our view, what we are witnessing is not "deglobalization," but "reglobalization" understood as a profound rearrangement and reconfiguration of major globalization dynamics moving at different speeds and at different levels of intensity. The current COVID crisis should be seen both an adumbration and accelerator of a world of continuing and growing disjunctures.

Drawing Things Together. Design As a Practice of Negotiating the Shape of a Collective World

Social studies on design tends to increasingly analyze how design objects act and (de)stabilize social relations as well as the practices of their production, use, and meaning-making. Taking this approach, the focus is on the verb to design rather than on the noun design, and on objects having agency but also precarious, unstable and contested entities. Design is understood here as a situated practice of shaping collectives and negotiating with both humans and things. Such a study requires a methodological shift: neither the manufactured projects and objects, nor the long and complex creative process, can any longer be hastily explained using ready-made frameworks, and thus without empirical insight into the design practice.

In my presentation, I will provide a set of methodological recommendations for such a study based on approaches derived from Science and Technology Studies. After these considerations, I will present preliminary findings from my research on:

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

1. the relational ontology of design involving the multiplication of *what* is to be produced and *how*, and the generation of several alternative design versions of a single project. Here I will refer to reflections coming from the ethnographic studies of an ordinary disease conducted by Annmarie Mol, among others;

2. the role of designers in "problem-setting" practices, that is, not only their role in the field of creating solutions, but also the very definition of problems. This does not necessarily imply "social engagement" of designers, but is the essence of their work, which is always, to some extent, engaged, as it involves "ordering things and people" and "drawing things together".

3. the possibility of studying design as a practice of reshaping the world and incorporating design into the realm of *matter of concern*, problematic situations and interactions between the material and the social, rather than an innocent field of product manufacturing (*matter of fact*).

River Guardians: Socio-Ecological Movements in the Post-Soviet Georgia

In a short documentary "Land-Water" (Gogua/Tsotsoria 2021) a woman called Maka narrates: "There's a sacred connection between a person and the place where they were born and raised. As if I can't live or breathe elsewhere. As if we are made of the soil of our birthplace. As if God created us from that very soil".

Since October 2020 Maka has been protesting against the construction of a gigantic Namakhvani hydropower dam in the Rioni valley, in the west of the former Soviet republic of Georgia. The movement against the dam, starting with Maka and a few others from her village spending nights in shifts on the bank of Rioni River has turned into one of the largest grassroots protests in Georgian history. It has managed to mobilize not only other local actors from other regions of Georgia, but also to create a unique arena of collaboration between various agents: NGOs, civic and queer activists, academics. Importantly, this coalition also includes non-human actors: the river Rioni herself, several Orthodox Christian icons and the virtues of love and care have political presence in it.

The story of the Rioni Guardians, as Maka and her fellow activists would be called later open up an array of research areas for the scholars interested not only in environmental movements, but also in religion in post-Soviet spaces due to the multiplicity of actors involved in the movements and its attempts to transgress the space of hegemonic nation-state politics.

My engaged multi-method qualitative inquiry of the Rioni Guardians explores the entanglements between multiple human and non-human actors in the socio-ecological movements that challenge the normative, post-enlightenment dichotomies between religion and science, nature and culture.

Unfolding of the Secular Self and Controversies over Sexuality in Post-Soviet Georgia

In contemporary Georgia, questions surrounding the relationship between religion and politics, the Georgian Orthodox Church and Nationalism, sexuality and LGBTQI*-Rights have become sites of contestation between different factions of society.

A notable point of reference for such tensions is May 17, 2013, when a demonstration organized by the LGBTQI* community came under a violent attack from a large number of counter-protesters led by the members and clergy of the Georgian Orthodox Church. Eight years after the events of May 17, 2013, the LGBTQI* organization "Tbilisi Pride" planned a peaceful demonstration "March of Dignity" in the capital, Tbilisi on July 2021. However, right-wing groups, working in alliance with the church, prevented the gathering of LGBTQI* demonstrators. Once again, violence broke out in the central streets of Tbilisi, while the Georgian Prime Minister called the "March of Dignity" inappropriate as it was considered "unacceptable" by the "majority".

Building on recent interdisciplinary research perspectives of secular studies and multiple secularities, my research analyzes these public controversies through a multi-method qualitative inquiry. For this purpose, it puts the emphasis on the narratives of nationhood, sexuality, religion, and secularity. Further, it demonstrates how sexuality is being mobilized and articulated by various involved actors in the contemporary entanglements and disentanglements of the secular and the religious in the public sphere.

JANOSKI, Thomas* (Kentucky Univ, United States)

The Generalized Other As the Site of Political Identity

According to John Levi Martin and Nick Judd political sociology has relied far too long on the "Good Old Fashion Theory of Action" or GOFAT. * According to them, new theories should take into account "little" and "big" fields, and developments in cognitive and social psychology. They do a pretty convincing job of criticizing the old theory of social psychology in political sociology, which for the most part posits "interests," which says that we act more or less according to them. I would contend that political sociology has clearly not been a leader in advanced theories of social psychology. But what is the new theory of social psychology that we might construct? From one approach, cognitive psychology as advanced by Kahneman and Tversky looks at the cognitive errors that we make on a daily basis, which according to cognitive psychologists are numerous (e.g., anchoring on the first or the most recent actions). From a different angle, one could focus on the generalized other in symbolic interaction (perhaps a micro-field) whereby citizens decide on their attitudes, votes, and protests based on their social network contacts where they may be followers or opinion leaders on politics. How much one is influenced or an influencer is of critical importance. Or at the macro-level with technology, we may all be ruled by social media content that concentrates our attention toward our own biases. In any event, the social psychology of political sociology surely needs more attention than we as political sociologist have given it in the past. I have proposed a symbolic interactionist theory of political sociology based on the generalized other, interaction ritual chains, and structural differentiation to solve this issue.

Religion at the Center of the Environmental Movement: Laudato Si, Climate Change and Social Justice, a Case Study

This paper is about when faith (religion) and environmental social justice intersect. The last two decades (2003- 2022) have seen an increasing concern and intense vocalization among various environmental groups and green movements, of critical climatic changes wreaking havoc in all parts of the globe due to the uncontrolled and unregulated actions of humans, largely economic actions. Actions such as deforestation, the consistent and in fact increased over-processing and over-consumption of manufactured products from relying on massive meat production and consumption to carbon-emitting fossil fuel processes.

This paper offers a case study, for among these voices is a steady and globally emerging religious sector of climate enthusiasts and persons of faith acting for protection of the environment. This paper therefore delves into the significance and growing relevance of organized religion around the environment by offering a case study of the Laudato Si Movement, championing the key papal document of Pope Francis produced as an encyclical of the Roman Catholic Church, the *Laudato Si Encyclical (of 2015)* and adopted by the movement as its guiding principle and call to action. Relevant to the Laudato Si Movement and the encyclical is an ecumenical approach that is open not only to various Christian faiths, but also to all religions dedicated to the protection of the environment, respect for nature (animals, plants and human life forms) and by their actions creating a globally-relevant religious and environmental space where *creation* meets (and mitigates) climate change.

Seemingly Perfect Circumstances for Caring Fathers: Austrian Parental Leave System Showing What Is Missing in Caring Masculinities

Even though our research is based in the global north, it investigates very exceptional parents, both in Austrian and in the international context: Our interviewees are couples, in which both parents claim at least 5 months of parental leave. According to the Austrian Chamber of Labour, they belong to the mere 1-2% of all Austrians fathers, who claim parental leave for 3 months or more (Arbeiterkammer, 2022). The power relations in these couples are rather exceptional as well (Agarwal 1997; Sassler & Miller 2011; Menés & Safranoff 2021): Some male interviewees are younger, less educated and earn less than their partners.

These fathers, compared to the average population, set themselves high standards of parenting. Their time with their children without the mother's supervision amounts to at least several months, which according to Beglaubter (2021) develops a sense of ownership and accountability for the child. Despite that, their caring practices are still influenced by unconscious gendered misconceptions that still reproduce societal imbalance of gender roles, i. a.:

- our fathers, despite their enormous engagement in caring activities and household, believe the only beneficiaries of the dual arrangement are their partners, not themselves.

- referring to their children, they use the pronouns "we" and "our", as distinguished from the mothers who mostly use "I" and "my", which shows a greater sense of ownership;

- while on the leave, they mostly concentrate on their own routines, not on the needs of the infant.

The presentation will discuss the unconscious understanding of the caring role as a father, which prevents fathers from taking the full responsibility for their children. As the Austrian example shows, the incentives promoting paternal leave don't have an expected impact on arranging family life in a gender-equal manner. This presentation will point to the possible reasons behind this challenge.

RC25-376.2

JANSSON, Tobias* (Gothenburg University, Sweden)

Language As an Ideological Fantasy: The Role of Swedish Language within the Swedish Refugee Settlement Program

An important goal within the contemporary Swedish integration policy is to strengthen the establishment of newly arrived migrants in both the economic and societal spheres. Politically, one component has repeatedly been highlighted as decisive for these people's opportunities for establishment; to learn the Swedish language. At the level of practice, within the Swedish establishment program, this component is also attributed a central importance, and conditions newly arrived migrants' opportunities to both move through the program, and the opportunities to take part in state-organized financial support while in the program. This paper addresses the role of Swedish language acquisition within the Swedish refugee settlement program, from the perspective of newly arrived migrants. Through an analysis of twelve in-depth interviews with newly arrived refugees, I discuss how migrants experience and attribute meaning to the role that language acquisition plays within the settlement program specifically, and in integration processes more generally. In the analysis, I draw inspiration from Slavoj Žižek's concept of ideological fantasy, and discuss how (Swedish) language acquisition becomes a mechanism for processes of both social inclusion and exclusion. Results show that language acquisition becomes significant in multiple ways. Partly as a discursive concept, where it is recurringly presented a taken for given prerequisite for progression within a heterogenous set of imagined integration trajectories. Partly as a material component, where the opportunities to apply for certain jobs – or to receive support in obtaining these jobs – are conditioned by the lack of, or access to, grades in the courses of Swedish for immigrants. The main conclusion emphasizes the fantastical function that Swedish language acquisition fills within the refugee settlement program, where it acts as a symbol for a seemingly self-evident path into the Swedish society, while at the same time masking individual, institutional and structural obstacles to this path.

JARMOUNI, Rachid* (University Moulay Ismail, Morocco)

The Dialectic of Personal Freedoms between Moral Changes and the Intransigence of Political and Religious References: The Status of Moroccan Youth As a Case Study

While many of the Morocco's laws express a traditional/conservative approach to issues of individual/collective freedoms, the living reality of many Moroccans shows a significant shift in their values and moral systems. Most of these shifts have emerged, remarkably, in the periods immediately before and after the Arab Spring, forming a divergence of very complex transitional paths. This research paper discusses a paradoxical conflict that has emerged between a transformed societal reality and the official/informal religious/political orientations and structures. The latter are represented by political Islam movements, which have been ossified based on a stagnant set of concepts and texts, either religious or legal (especially in criminal law). These movements pose a challenge to the young people who are thirsting for religious freedom and are living in a society that accepts difference, pluralism and diversity. This situation has created massive waves of tension and existential/identity rupture for the youth, pushing them towards some sort of "thinning" of their religious beliefs, practices, behaviors, and attitudes (as revealed by many studies). Our exploratory study of the Moroccan youth revealed how this tension revolves around individual freedoms and their loss, manifesting itself in behaviours such as the public expression of non-observance of Ramadan fasting, engaging in consensual sexual relations, drinking alcohol, following a set of inheritance rules different from those prescribed in Islamic teachings, practice of abortion, among others, all of whom have triggered major social conflicts.

Migration Policies of Polish Cities. Municipal Government in Poland As an Initiator and Entity Implementing Migration Policies

One of the possibilities to counteract the negative effects of depopulation in Poland and a factor in social and economic development may be the migration policy. However, there is no such document at the national level, and the statements of politicians from the ruling coalition indicate resistance to including migrants in national policies. The need to introduce migration policies was only introduced in a slogan in the draft National Urban Policy 2030 (draft presented for consultation in December 2021).

Migration policies are implemented at the level of local governments, in a more or less orderly manner.

The aim of the paper is to answer the question whether and how Polish cities carry out activities for migrants (immigrants and re-emigrants), in particular:
1) preparing offices to service and cooperate with people who do not speak Polish,
2) the conditions for educating children and young people with experience of migration,
3) activities for the professional and social adaptation / integration of people with experience of migration,
4) involving migrants in local public life and law-making processes.

The paper is based on research conducted on a representative sample of Polish small and medium-sized cities (quantitative research) and the analysis of migration policies in all large Polish cities (qualitative research). The study was conducted in two part. First, planned, in December 2021 and January 2022. Second, ad hoc, experiences resulting from the migration crisis following the outbreak of the war in Ukraine in February 2022.

Care Models of PLHA: A Comparative Assessment of Africa, India & USA

The treatment, care and support of the People living with HIV/AIDS (PLHA) require specialized services depending upon the disease progression and the available resources. The PLHA thus, require formal institutionalized centers for care which specialize in catering to their diverse needs. Over decades, the syndrome emerged as a global phenomenon, and for that matter each country devised its own mechanism to counter the epidemic. This research article intends to highlight the different care models taken up by Africa, the place of origin of the epidemic, USA as a leader in providing healthcare services and India as a developing nation and to learn from the success stories from each of these countries. This article is based on systematic review which is majorly based on published sources and reports pertaining to HIV/ AIDS. The e – resources like Google scholar, Jstor, Pub Med threw light on the evolution of different care models by each country in accordance with socio-cultural and demographic scenario, the amendments made in these models over the period of time. The study identifies the Female Sex workers and MSM are the most vulnerable section of the society and unsafe sexual practices are the major mode of transmission of this disease. However, education emerges as a way out and it is through rigorous campaigns and awareness generation programmes that myths and misconceptions related to it can be overcome. It will help to reduce the rate of incidence and manage the rate of prevalence within the country future. It is necessary to mention here that government alone cannot counter the epidemic, community support and participation is therefore essential to pave way for a better future.

JASSO, Guillermina* (Two Washington Square Village, United States)

From Fairness and Loss Aversion to the Golden Number: Signals for Futures Research?

When people experience a change in income, losses loom larger than comparable gains. And when they judge the fairness of their income, deficiency is felt more keenly than comparable excess. The loss aversion of prospect theory and the deficiency aversion of justice theory arise, respectively, from the value function and the justice evaluation function, which can be written $J = \ln(A/C)$, where the actual amount A can change from Time 1 to Time 2 or be larger/smaller than the just amount C by an amount k, where J is the justice evaluation or the value outcome.

Further, empirical research indicates that losses are felt twice as keenly as gains. Accordingly, this paper asks a simple question: When is deficiency relative to the just reward (or loss relative to the reference amount) felt twice as keenly as excess relative to the just reward (or gain relative to the reference amount)? This question is unexpectedly answered by the Golden Number of mathematics. Specifically, deficiency (or loss) is felt twice as strongly as excess (or gain) when the deficiency (or loss) and the excess (or gain) are $\{[\sqrt{5}]-1\}/2$ or approximately .618 of the just or Time 1 amount.

Because the Golden Number has been thought at least since Plato to be uniquely beautiful, present in nature and treasured in art, the question arises whether researchers and/or respondents may be (unconsciously) choosing magnitudes of loss/gain that hover about the Golden Number, themselves in thrall to this amazing number.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

More deeply, the paper asks: What does it mean when the Golden Number suddenly appears in scholarly work? Is it a signal from nature? Are fairness and loss aversion important themes for futures research? Might there already be ideas and themes in futures research about to give rise to the Golden Number? What might they be?

SATO, Yoshimichi (Kyoto University of Advanced Science, Japan)

Rational Choice and the Justice Pulse: Inferring Justice from Inequality

Since antiquity it has been thought that justice concerns play an important part in many choices and decisions – e.g., to sign a petition; to participate in a demonstration or strike; to vote; to join an uprising or fight a war; to leave a country -- and that justice concerns are themselves linked to inequality. This paper combines those two ideas to develop a way to take the justice pulse of a society and thus monitor individual propensities and societal health. The world's countries differ greatly in taking the justice pulse. Some have never taken it. Others have taken it once or twice – e.g., Japan and the United States are among the 13 countries in the International Social Justice Project (ISJP) of 1991. Moreover, survey-based data on income and justice may have limitations, which may be easier to correct in income data. The proposed procedure takes advantage of (1) algebraic links between inequality measures and justice measures and (2) the new high-quality World Inequality Lab income data (Pikkety-Saez-Zucman 2018) combining survey, tax, and national accounts information. The procedure is applicable to two cases – when the individual compares own actual reward to equality (as during national celebrations or sports events), producing justice evaluations where the just reward is the arithmetic mean, and when the individual compares own actual reward to the actual reward of every other person in the society, producing justice evaluations in which the just reward is the geometric mean. Thus, $J = \ln[X/E(X)]$ and $J = \ln[X/G(X)]$. Then $E(J) = \ln\{[G(X)]/[E(X)]\}$ in the first case (exactly linked to Atkinson Inequality and Theil MLD) and $E(J) = 0$ in the second. We also use the income data to estimate other parameters of the J distribution, e.g., median, proportion-underrewarded, percentiles, providing a fuller picture of the justice pulse.

Asian New Zealanders' Experiences of Racism during the COVID-19 Pandemic and Its Association with Life Satisfaction

Racism is an important social determinant of well-being. This study is to explain how the racism experiences of Asian New Zealanders during the COVID-19 pandemic impacted their life satisfaction. For this purpose, we conducted a cross-sectional online survey and collected 1,452 responses in 2021. Our descriptive and logistic regression analyses yielded the prevalent types and settings of racism, and identified subgroups exposed more to racism and its association with life satisfaction. Results show that nearly 40% of participants experienced racism, mainly in public places, social media, and mainstream media. Predominant types of racism they experienced were verbal attacks and microaggressions. Younger, student status, temporary visa holding, and rural area participants were more likely to experience racism. Associations between 'not experiencing racism' and 'high life satisfaction' were statistically significant. This study identified two underrepresented subgroups, students and migrants, who were disproportionately exposed to racism. This study clearly reveals that experiencing racism during the COVID pandemic had a negative impact on the life satisfaction of Asian New Zealander participants. These findings tell us where anti-racism interventions are most needed. It also informs us that such interventions are needed to ensure the well-being of Asian communities in a COVID world.

Critical Analysis of Everyday Resistance Theories in Studying Iranian Women's Struggle for Rights

This paper explores the meaning and analytical adequacy of "everyday resistance" as a conceptual framework for analyzing women's struggle for rights. It is an analytical attempt to understand how the resistance literature is conceptually deployed to make sense of everyday acts of "ordinary women

citizens," particularly Iranian women's struggle for their rights. The conceptual frameworks related to everyday resistance, including Practice of Everyday Life, Everyday forms of Resistance (Scott, 1989), and Quiet Encroachment, that examines the role of gradual socioeconomic changes via the individual acts of the citizens to claim or redress what they perceive as their rights, have been increasingly applied in gender theorizing. Nonetheless, the meaning of "resistance" and the methodological constraints to assess it in the empirical works have remained widely unexplored. To pave the way for further empirical studies on resistance in the everyday life of women, this paper asks: "does the notion of resistance in the theories of Everyday Resistance help us conceptually to move forward in understanding Iranian women's struggle for their rights?" To answer this question, this paper takes two analytical steps. First, focusing on leading theorists of everyday resistance, it offers a critical comparative analysis of resistance in the work of de Certeau, Scott, and Bayat, highlighting its internal integration of the concept and the shortcomings of these theoretical endeavours. It then applies textual analysis to discuss the conceptual application of the everyday resistance literature, focusing on five scholarly works on Iranian women's attempts to acquire their rights. It contends that despite the premises of the concept and its related theories to underscore the daily resistance of women, these works contain three main problems that partially resulted from the contradictions within the theories, including the issue of subjectivity, the issue of methodology, and misconstruing everyday resistance theories.

Private Sociology: The Origins and Impacts of for-Profit Courses Outside Academia in Iran

This paper examines the privatization of Iranian sociology in the past two decades by focusing on the emergence of for-profit sociological classes outside academia. Relying on archival data as well as up to 50 semi-structured interviews, we argue that since 1979 political censorship and ideological hirings in universities have resulted in major curricular and pedagogical shortcomings. Beginning in the early twenty-first century, student associations began to react to the diminishing quality of their classroom education through collective protests and by organizing reading groups and book clubs that went above and beyond the official curriculum. Over time, they morphed into private, fee-based courses outside the university. This paper examines the implication of private classes for power relations within and outside academia and its relation to financial, social, and symbolic capital. In particular, we explore how, by offering individualistic alternatives, they undermine student mobilization for curriculum and pedagogical reform within the university. This paper has significance beyond Iranian sociology, as these changes are part of wider global trends, outside the political and ideological context of Iran, and resonate with the neo-liberalization of higher education.

Territorial Inequalities, Technological Transformations and Social Mobility in France

Numerous studies in sociology and economics have highlighted the importance of inequalities in social mobility within a single country. This paper proposes to explain these territorial inequalities in France by focusing on the roles of three factors and their interactions: technological and economic transformations, the gendered segmentation of the labor market, and spatial inequalities in access to education. The first objective of the paper is to understand how the transformation of the types of jobs available as a result of technological and economic changes affects intergenerational social mobility. The second objective is to understand how this impact of technological and economic changes varies according to the gendered segregation of the local labor market and the opportunities for access to higher education or vocational training. It uses the French Labor Force Surveys that make is possible to analyze social mobility at the city and neighborhood levels. The occupation is measured with the Weedeen and Grusky's microclass scheme and the social class with the European Socio-Economic Classification (ESeC). The paper shows the diversity of the effects of technological and economic transformations on social mobility. The reduction in skilled worker jobs in industry affect mostly men's social mobility, while the increase in the personal services sector, especially for the elderly, mostly affect women's social mobility. Similarly, the creation of new jobs in scientific fields affect men and women differently, depending on their specialization, with men more often trained in physics and women in biology. Finally, the creation of new types of jobs has different consequences depending on the possibility of accessing to higher education in the territory. It is thus the interaction between these three factors that must be better understood in order to explain the evolution of social mobility and spatial inequalities.

From the Coast Onward. Research Trajectories for the Urban and Social Regeneration of a Costal Periphery

San Giovanni a Teduccio (SGT), Naples' neighborhood, presents peculiarities: for much of the 20th century it was highly industrialized concentrating in its tiny coastline important political and economic interests (Salmieri L., 2018). The deindustrialization processes, began in the 1970s, have progressively transformed the urban, environmental and social space of the district (Forte F., 2003), transforming the pre-existing full places into empty ones (Mela A., 2018) denouncing an unsuccessful transition.

Considering the ecological-environmental, human, infrastructural, institutional, historical-archaeological dimensions; privileging a territorial approach and crossing quali-quantitative methodologies, this paper focuses on the current state of the coastline, the main criticalities and potential resources, the inhabitants' point of view towards forms that a concrete action of urban- but above all social-regeneration of the neighborhood could take starting from that of its coastline.

From this empirical research some prospects for further study emerged. SGT appears as an urban space marked by an apparent immobility, whose territorial forces move in constant tension with each other: horizontal (among inhabitants) and vertical (between administration and social fabric), external (foreign industrial interests) and internal (endogenous productive traditions), morphological (coastal zone and inland zone) and identity (working-class and rural).

The socio-spatial ambivalence emerges in the specific coastline area, in the different ways of individual inhabitants and social groups to perceive the sea resource, its state of heavy pollution, the spaces denied by the remains of industrial plants: some are more inclined to adaptation, some show individualistic behaviors, and some are projected towards new planning, forms of neighborhood, solidarity and associative intervention. Those living in the memory of the past and those living in the possibilities of the future. These plots unravel haphazardly in the space from the coast to the hinterland, subtend multiple identities, configure both a constraint and resources for the territory and its prospects for regeneration.

The Impact of the Covid-19 Pandemic on the Food Waste and the Environmentally Unsustainable PPE Consumption.

Restrictions due to Covid-19 have generated changes in food purchasing, preparation and disposal behaviors, which have been reflected in the lower quantities of wasted food. From a comparative perspective, it is significant to note that several international studies have revealed that such a change in food consumption habits has been recorded in many States around the world such as U.S. (Rodgers R.F., 2021), Brazil (Gomes-Haensel-Schmitt V., 2021), Germany (Strotmann C., 2022), Romania (Muresan I.C., 2022), Perù (Vasquez-Neyra J.M., 2022), Spain (Vidal-Mones B., 2021), Italy (Pappalardo G., 2020). The common circumstances created by the pandemic induced populations from different socio-cultural-national backgrounds to operate a similar decrease in food waste (with differences in magnitude depending on the specific contexts). The pandemic has enhanced people's attitude toward food waste reduction and more sustainable consumption models (Galanakis C.M., 2020).

However, the regulatory measures to contain the spread of COVID-19 have impacted negatively the environmental sustainability of individual consumer habits (Selvaranjan K., 2021). In fact, to counter the spread of the virus, Personal-Protective-Equipment (PPE) are used, most of which contain plastic (Akber A.S., 2020) or other plastic-derived materials (Uddin M.A., 2022).

The face-masks European Union imports more than doubled during the first half year of the pandemic, and the EU's domestic production was also growing. The data concerning the PPE waste show that there is an urgent need to recognize, thus regulate, this potential environmental threat.

The general phenomenon of consumption in time of crisis, including the waste of bioclimatic resources in the Covid-19 era, needs to become the subject of further sociological studies aimed at investigating what are the social stimuli that lead to certain forms of consumption, and the impacts that these consumptions have on global ecosystem. This must be addressed from a multidisciplinary perspective, considering together socio-economic and legal aspects.

Global Crowns: Black Women on Emotions Surrounding Natural Hair the Globe

Abstract

The CROWN Act is current legislation in the United States that seeks to end hair discrimination within institutions of work and school. While protection against discrimination is prevalent within U.S. law, a recent federal law passed in 2019 allows employers the option to ban locs in the workplace. It is the passing of this law that initiated the efforts of the Crown Act. Since its fruition, the Crown Act is now law in 16 states but much of the U.S. remains without this protection. This year the House of Representatives passed the CROWN Act and it is not pending Senate Approval before it can be made law. Black hair is significant to the African diaspora from a socio-historical context and has remained a meaningful source for self-expression and celebration of blackness. While the policing of natural hair is gaining media attention in the U.S. and around the globe, the surveillance of black bodies is not a new concern. Anti-blackness is a global concern and natural hair is just one aspect of its oppressive gaze. This project seeks to obtain the narratives of Black women across the globe describing their experiences and emotions surrounding natural hair styling options. This empirical study will provide insight into the significance of emotions within race scholarship and more specifically, the importance of creating safety within society for natural hair as an option. Black women and Black children are the most visible targets for natural hair policing and have been subject to various consequences when their natural hairstyles do not meet dress code policies at work and school. As the Crown Act gains recognition around the country and adoption throughout the country, it remains critical to understand the global experiences of Black women who choose to wear natural hairstyles.

Policing the Rainbow: An Empirical Examination of LGBTQ+ People's Perceptions of Police As Friend or Foe in the Context of "Trust in Government"

In the United States and elsewhere, sexual and gender minorities experience criminal victimization at higher rates than the general population, report crime victimization to the police at lower rates than those who are not LGBTQ+, and have disproportionate contact with the criminal justice system. In this context, this research utilizes survey data from the first nationally representative sample of LGBTQ people's experiences with, attitudes toward, and perceptions of law enforcement to examine factors that affect their and their non-LGBTQ+ counterparts' willingness to report crime to law enforcement (n= 799 LGBTQ respondents and 760 non-LGBTQ+ respondents). Preliminary analyses reveal statistically significant differences between LGBTQ+ people and their counterparts in terms of their perceptions of whether they are being over- or under-policed and well- or ill-served by the police, their assessments of select police behaviors and the police in general, legal cynicism, and trust in government. Multivariate models in progress build on these findings to assess the degree to which these and other variables, such as those associated with demographics and cultivation, predict both willingness to report crime to the police and the degree to which relevant predictors differ by each population (LGBTQ+ and non-LGBTQ+). In addition, the analyses discern the degree to which the LGBTQ+ community's relationship to the police is part and parcel of a larger relationship to varying levels of trust in government or a distinct relationship with police as arguably the most visible face of government at the local level. The implications of these findings for future research, including on reporting behaviors and police avoidance more generally, are discussed in the context of a nascent body of literature that reveals the plethora of ways in which LGBTQ+ communities are both overpoliced and underserved and continue to have a fraught relationship with the police.

"My Whole Life Was the Two Suburbs That Surrounded the Church:" LGBTQ+ Experiences of Australian Pentecostal-Charismatic Churches As "Greedy Institutions"

LGBTQ+ people who participate (or formerly participated) in Australian Pentecostal-Charismatic Christian (PCC) churches often experience what one informant called "the struggle between being gay and being Christian and that space kind of in-between." Despite their sexuality and/or gender identity being rejected or treated with suspicion by these typically conservative churches, several informants reported high levels of commitment and involvement in these congregations, together with a rich and full community and religious life,

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

often grieved by those who had subsequently left the church behind. Arguably, the category "Greedy Institution" invented by Lewis A. Coser helps explain the apparent disjunction between LGBTQ+ people remaining in typically non-affirming PCC churches. Greedy Institutions demand a high level of affiliation, taking time and energy away from other commitments, but participants are not coerced - rather, they volunteer their allegiance freely and often happily, receiving a deep experience of community and belonging in return. In this paper, I argue that recognising PCC churches as Greedy Institutions will help to explain why some LGBTQ+ participants remain in these churches, despite tensions between faith and their sexuality/gender identity – or in the case of those who leave, why they stay as long as they do.

A Study of the Diffusion Process of Youth Job-Seeking Subsidy in South Korea: Using Fuzzy Set Ideal Type Analysis to Assess Governance Strategies of Youth Movement

This study examines the complex effects of governance formed by local governments and social activists in the process of 'Youth Job-seeking Subsidy', a unique system that was first attempted by local governments and spread into the central government of South Korea.

In order to examine the interaction between political environment and social movements and its policy results, the youth job-seeking subsidy is an appropriate case. The 'Seoul Youth Allowance', the prototype of the subsidy, started from the proposal of the social movement organization named Youth Community Union. It was proposed along the path of the mayor's active governance policy. Considering that the central government at the time was very conservative, such an attempt was very unusual, and the government even filed a lawsuit against the introduction of this policy. However, after the subsidy was implemented, the keyword 'youth' has become increasingly important in local electoral politics. Eventually the youth allowance has been extended to the all local government under different names.

Researches about social policy introduction and the role of social movements are being actively conducted. Various studies have been accumulated on the process by which socio-political contexts stimulate the mobilization and their strategies of social movement organizations and obtain political results through them (Amenta, Caren, Chiarello, & Su, 2010). Among this affluent research flows, this study is based on the 'political mediation model' of Edwin Amenta and collegues. The key argument of this approach is that the political influence of social movements is mediated by specific political contexts.

This research, using the fuzzy-set analysis, find out how the youth movement in South Korea acquired power resources with its governance strategies.

Cultural Placemaking of Street Art: Measuring the Impact of Street Art on Pedestrian Activity and Crime in Cincinnati

Street art plays a critical role in the urban regeneration process by combining spatial characteristics that increase the cultural atmosphere of a place. As a creative expression of ideas and culture, street art is considered as a flexible, community-oriented placemaking strategy for social and economic revitalization. Recently, street art has gained attention as part of environmental planning that enriches the quality of urban life and reduces the fear of crime through increasing human interaction in the public realm, following Jane Jacobs's (1961) argument for "eyes on the street." Over the past few decades, Cincinnati, Ohio, has gone through a dramatic transformation with the use of street art. Along with street art, the integration of the city's sustainable planning policy, historic preservation, new construction of mixed-use buildings, and multimodal transportation has catalyzed the growth of new commerce in downtown, university, and surrounding neighborhoods. Taking this initiative, since 2007, the non-profit *ArtWorks Cincinnati* has created more than 180 public murals throughout the city and collectively featured the city's history, identity, and culture. While the city is rapidly growing, there is no empirical research that has attempted to assess the physical and social impact of street art, particularly on crime. Have murals benefited the perception of public safety and social cohesion? Under what socio-demographic and spatial conditions do murals draw these effects? Using multiple datasets including U.S Census data, GIS data, and crime data, we will employ quantitative and qualitative analyses to create the typology of mural locations based on morphological and socio-demographic contexts and measure how these factors are associated with pedestrian activity and crime over time. Our study suggests that urban design and policy could help improve pedestrian experience of street art by building ecological and spatial linkages to local amenities and community spaces for sustainable placemaking.

JERONIMO, Helena* (ISEG School of Economics and Management, Universidade de Lisboa & CSG/Advance, Portugal)

Riscophrenia: The Risk Fallacy and the Repression of Uncertainty

The idea that it is impossible to eliminate uncertainty has come into its own in the first quarter of the 21st century, contradicting the devotees of calculability and the sophisticated forecasting tools of today's societies. A succession of crises – from the terrorist attack of 9/11 to the world financial crisis of 2007-8, the covid-19 pandemic in 2020 and the war in Ukraine which began in February 2022 – remind us insistently of humanity's vulnerability, the inescapable unpredictability of human action and decisions, and the intrinsic randomness of the natural world.

There is, however, a hegemonic tendency to use a probabilistic concept of risk, which elevates it to a central dogma of certainty based on the image it offers of supposed security and control over randomness and contingencies. To interpret the world in terms of risk means liberating it from the idea that there are certain dynamics in the world which do not depend on human beings, to make progress with forecasts, and above all to provide the foundations for a culture of control and management by decision-making bodies.

In this paper, I put forward the concept of *riscophrenia* to describe this tendency. In that line, I criticise the inflated use of the notion of risk and the fallacy that chance can be eliminated, knowing that such efforts are inglorious, neglect the prudential principle, and may produce new unpredictabilities and uncertainties. Risk analysis does not allow for questioning the embedded foundation of the very instrumental vision that strongly permeates modernity. Not only does it adjust to the model which produces those problems, it also legitimates, justifies and ratifies them. I argue that these elements keep us from considering that human existence and life in society possess inherent unpredictability, and that uncertainty is inescapable.

COVID: Emerging Pattern of Leisure and Women in India

Yogendra Singh has said that emerging pattern of leisure is deeply influenced by changes in social structure, economy, technology and cultural and political processes in society. It would be simplistic to talk of the pattern of leisure in the singular even for the traditional Indian society. This society had its own periodic phases of cultural and structural differentiations. Instead of one there were many traditional patterns in society. Cultural ideology and social structure of this society closely defined leisure activities. Ideologically, the concepts of time and history as they shaped the definition of self and society also influenced the notions of leisure and work. All traditional societies, even simpler ones, had their own cosmology and metaphysics of time, birth and rebirth which patterned their rhythm of work and leisure. Sacred and profane, pragmatic and transcendental, utilitarian and non-utilitarian levels of symbolization of work deeply influenced their perception of leisure and leisure time.

The new agriculture which has ushered in 'green revolution' in India robs people of their old styles of work-leisure relationships and its ritualization. The role of village 'Chaupals', community wells, temples or other sacred or cultural places has been weakening due to penetration of mass media, cinema and video system of entertainment. During the period of COVID, the forces of social mobility, migration, class restructuration and intensity of culture contacts, from within and outside the country, have resulted in changes in the pattern of leisure.

In the light of above thought, this study will reveal new emerging patterns of leisure in relation to women of different categories in Madhya Pradesh (India) during and post COVID period on the basis of case studies.

Does Cultural Capital Still Matter?: A Meta-Analysis of the Effects of Cultural Capital on Reading Performance

As the concept of "cultural capital" has been widely utilized in the literature in terms of examining the possible effects on student's academic achievement, the main purpose of this study was devoted to reexamine its validity. To be specific, this study applied "meta-analysis" technique to further analyze the past empirical studies on the topic of "cultural capital" and "reading performance" to examine whether "cultural capital" is still a crucial factor affecting student's reading performance. In addition to this factor, we also tested other possible moderator variables (e.g., school level, data source, publication type, publication year, and region). Based on the findings, we are able to have a better understanding regarding the influences of cultural capitals, including the institutionalized cultural capital, the objectified cultural capital, and the embodied cultural capital, on student's reading performance. Some possible suggestions for education are also addressed.

Partially Patriarchy? Coresidence of Young Adults with Their Parents in the Least Affordable City

The parent–adult child coresidence has attracted rising research attention. Intergenerational coresidence in Western societies is found as a negotiation of resources and needs between family members, while the coresidence in East Asian societies has long been seen as a traditional norm. As a global Asian city, Hong Kong is a distinct hybridization of Chinese and Western cultures. It is also the least affordable city with extremely high living costs. Nevertheless, the government provides subsidized public rental housing, and its share is more than 30% of all types of housing. Drawing on the 5% of the latest Hong Kong Population By-census, this study examines how the traditional norms and resources associated with whether young adults (age 21–40) live with their parents in parent-headed and child-headed households in the context of available public housing and high living costs.

The results show that compared with other housing types, young adults in public rental housing are more likely to live in a parent-headed household. More importantly, in public rental housing households, males are more likely than females to be the household head. The study suggests that while the parent-headed and son-headed coresidence reflects a traditional norm of patriarchy, it relates to the public housing policy. The patriarchal norms expect sons are the permanent members of the family and daughters will move out after marriage. According to the policy, the rest family members can continue staying in the public housing. However, the male household dominance is not observed in the subsidized sale flats and private housing. Instead, young adults with better education and higher income are more likely to be the head in the coresidence with parents. This study shows that the transformation of the parent-child relationship in a global city relates to the interplay of cultural norms, resources, and housing policy.

Trajectories of Leaving the Parental Home: Traditional Values, Individualistic Attitudes, and Youth Transitions of Chinese Young People

Leaving the parental home is a key marker of the transition to adulthood. Research on the transition to independent living tends to focus on a singular transition rather than the trajectories. However, the home-leaving process has become fuzzy and reversible, as recent studies on Western societies show that young home-leavers "boomerang" back to their family home. In East Asian societies, traditional family values require adult children live with their ageing parents to provide care. Meanwhile, because of the rapid modernisation, young people in these societies may hold individualistic attitudes and prefer living independently. Consequently, the home-leaving trajectories are complex but are not systematically investigated.

Drawing on nationally representative longitudinal data from China (2010–2018), we use sequence analysis to classify eight different home-leaving trajectories of young people (age 16–35). We adopt multinomial logistic regression to assess how young people's traditional values, individualistic attitudes and youth transitions lead to these trajectories. The results show that compared with females, males, particularly males of rural origin, are more likely to live with their parents. Besides, a college education does not increase young people's likelihood of independent living. Instead, college-educated youth are more likely to stay in their own/partnered parental home after marriage (intergenerational nesters). The findings support the perspective of traditional values that emphasizes filial piety but contradict the perspective of individual attitudes that stresses the positive effect of education on the preference for independence. More importantly, we find that the experiences of transitions to work and parenthood lead to different home-leaving trajectories. Compared to employed youth, those with discontinuous employment are more likely to "boomerang" back home and those who experienced prolonged school-to-work transition tend to be "nest-stayers". Having a kid also increases young people's likelihood of being intergenerational nesters. This study beckons researchers to examine young people's linked life course trajectories.

Doing Personhood：Another Breakthrough of Vocational Education Qualification ——a Qualitative Study on the Group Culture of Higher Vocational Students

How to improve the social mobility of higher vocational students has attracted more and more attention, but the current focus is on the discussion of external environment, and not enough attention has been paid to the student's consciousness and efforts . Employing in-depth interviews and observations in higher vocational schools in A city，we found students trying to break through the limitation of vocational education qualification by actively understanding and practicing of "doing personhood ". This study shows the connotation of "doing personhood" of higher vocational students includes the growth of self-awareness, the general expression of professional ability, and the social rules in advance. The logic of "doing personhood" is that they seek superior self after cooling out their studies, alternative compensation for lack of knowledge and skills, and dislocation competition strategy under the restriction of diploma. The essence is that higher vocational students accumulate social capital through "doing personhood" when they are unable to reverse the unfavorable economic capital, family capital and cultural capital.

The Islamophobic Consensus: Datafying Racism in Catalonia

Drawing on critical race, decolonial theory and critical data studies this presentation analyses the weaponization of automated and semiautomated tools against racialized population in Catalonia. We point to the necessity of building a non-Anglocentric theoretical framework from which to study a new global phenomenon: the digital welfare and surveillance state. We frame its rise within the wider context of the Southern European iteration of racial neoliberalism, what we coin as the Islamophobic Consensus. As the presentation demonstrates, the digital welfare and surveillance state does not rely on the same technologies, focus on the same subjects, and pursues the same objectives in every context. On the contrary, it draws on contextual genealogies of domination, specific socioeconomic structures, and distinctive forms of distributing power. We demonstrate how automated and semiautomated technologies designed to govern 'deviated' 'risky' and 'dangerous' Muslim youth 'radicals' connect with colonial punitive governmental strategies. To do so we provide an empirical analysis on the ways the Islamophobic Consensus is being operationalised in Catalonia and expose the overlapped racism mechanisms governing the lives of racialized black and brown young adults.

Mechanisms Used By Local Bureaucracy for Disaster Risk Management: The Case of Local Government in Cali, Colombia.

The understanding of the state derived from the analysis of routine processes carried out by public officials has permitted the demystification of notions of the state as a powerful and coherent unit separated from society. Instead, the state has been revealed as a set of incoherent and contradictory practices, where different perspectives, interests and experiences coexist. Although it has received less academic attention in the disaster risk field, its focus on the struggles between public servants and their competing interests may contribute to understanding the difficulties these officials face in the management of disaster risk. This Doctoral research focuses on public servants working at the Planning Office in Cali, whose responsibilities include the enforcement of regulations relating to the use and occupation of high-risk areas. In the performance of this function, they are continually involved

in disputes, not just with people directly affected by their decisions, but also with officials from other offices. In this study, these dynamics are captured and analysed using anthropological methods such as interviews and, significantly, the ethnography of documents. This second method highlights the essential importance of writing and documents in daily practices of bureaucracy. Some of the documents analysed are those designed to inform people about the level of disaster risk in the area they are living. A key finding of the analysis is that expert knowledge, and the language that is used to express it, is not only central to the development of agreements and documents, but also serves to establish relations of authority that are ultimately at the core of state power and may hinder the development and implementation of disaster risk management.

Adapting Qualitative Research to the Context of Covid-19: Tourism Planning and Social Participation in the 2020 Lockdown (Spain).

In February 2020, this research team had designed a participatory methodology in the framework of a strategic development plan for a major tourist destination on the Spanish Mediterranean coast. This work consisted of a series of participatory workshops with stakeholders in the city. However, before starting the fieldwork, we were surprised by a strict containment (March 2020) in the context of the Covid-19 pandemic. Given the uncertainty about the evolution of the pandemic, the prolongation of the lockdown and the need to fulfil our mandate, we had to adapt the research methodology to the new context. The impossibility of carrying out the scheduled participation workshops was a methodological challenge due to the great difficulty of coordinating these dynamics in an online format, which made this option inadvisable. Faced with this circumstance, this team adapted the methodology to achieve the initial objective of having the participation and contribution of local stakeholders to identify problems and strategic lines of action in various areas of interest. As a methodological alternative, we used the qualitative material that the research team had from a previous phase of tourism diagnosis carried out in 2018. A total of 42 interviews were re-analysed according to the new dimensions of analysis. In addition, in order to consolidate this analysis, the information obtained was endorsed and complemented with a total of 25 online interviews with stakeholder representatives and experts in the thematic areas of analysis. Due to the socio-economic uncertainty at that time, the decision was taken to introduce a new dimension of analysis in the onerviews was introduced: the destination's capacity to adapt to the Covid-19 pandemic, with aiming at identifying new opportunities despite the upcoming difficulties.

Indifferent, Coerced or Embracing? Clinical Pathways and Autonomy of Chinese Physicians

The majority of Chinese physicians work in the public sector and are heavily dependent on the organizations in which they practice. Previous studies have found that Chinese physicians lack corporate autonomy typically enjoyed by their western counterparts, but little is known about the extent of their clinical autonomy. Public hospitals in China have been faced with the demands to control cost and maintain accountability, and have attempted to manage the clinical practice of their physicians using a number of standardizing tools, the most recent of which is clinical pathways. In this paper, we seek to understand Chinese physicians' access to clinical autonomy by examining their experience of the implementation of clinical pathways and the distribution of that experience. Theoretical perspectives on professions and bureaucracies and discussions on the specific relationship between public hospitals and physicians in China generated disparate predictions. We apply cluster analysis, a method of unsupervised machine learning, to data from a survey of 1,119 physicians from 23 public hospitals in four large and geographically diverse cities in China. We found that although clinical pathways were centrally mandated, large portions of physicians in public hospitals were able to either circumvent them or take control of them, and thereby maintain control over their practice. Although Chinese physicians were thought of being closely bound with their hospitals, lower-level physicians did not seem to face more coercion in the process of pathway implementation. Rather, coercive practices tended to concentrate in low-prestige practice settings, such as secondary hospitals. Physicians in higher-prestige settings had the latitude to either avoid clinical pathway or try to engage with pathway implementation.

Coping with the Climate War and Resurgent Authoritarianism

Michael Mann (2013, 2021) has introduced the metaphor of "climate war" to describe the conflict between climate scientists and climate deniers such as

the oil industry. Drawing on that metaphor, philosopher and sociologist Bruno Latour (2017, 2020, 2021) has challenged traditional approaches to sovereignty by taking more seriously the *geo* of geopolitics, i.e., its environmental dimension: the ongoing climate emergency is a national security threat for every country. In a very different vein, political scientist Mark Beeson (2010, 2016) has argued that China offers an efficient model of environmental authoritarianism to cope with the challenges of the climate emergency. However, the Russian invasion of Ukraine is a cruel reminder of how authoritarianism only adds fuel to the fire of global warming.

How therefore can democracies vulnerable to authoritarian regimes address the twin challenges of the climate emergency and ensuring the protection of their sovereignty? On one hand, the military is called on to rescue civilians exposed to climate change-related disasters (mega-fires, giant typhoons and floods), long droughts, and rapid sea rise. The military must also cope with more conflicts caused by increasing pressure on natural resources. On the other hand, due to its heavy reliance on fossil fuels, the military itself has a tremendous carbon "bootprint", which cannot be neglected. For instance, the Pentagon is the world's largest institutional consumer of petroleum products (Crawford 2019), but little data is available on consumption by Russia or China.

Through a literature review and empirical research on the case of Taiwan, which faces rapidly growing military pressure from China, I aim to propose a theoretical framework for this new field of research at the crossroad of environmental sociology, geopolitics and military sociology.

Public Health Activism to Address the Psychosocial Impacts of Unexpected Fetal Findings in Pregnancy

With technological advances in prenatal testing, increasing numbers of women and other pregnant people receive unexpected news of structural or genetic fetal variation. While screening and diagnostic technologies have advanced and expanded their reach, the psychosocial impacts of receiving unexpected fetal findings during pregnancy are largely unsupported by health and allied health professionals and unaddressed by professions that encounter women and other pregnant people on this journey. Individual professionals hold concern and attempt to address this practice gap, yet poor and distressing service-user experiences are common. This paper is both case study and research report. The identified gap in public health practice is being addressed in a collaborative, networking approach that actively draws together stakeholders and consciously validates both professional and lived experience knowledge. This project is subtle rather than noisy public health activism: the work occurs outside of health services and systems and aims to effect change to current, medically-focused practice models to more effectively respond to significant service-user psychosocial experiences. Through The Unexpected is a not-for-profit organisation started by a lived experience expert who is also a mental health nursing clinician and academic. The organisation operates as a networking hub and has won philanthropic funding to develop an online training program for health and allied health professionals. This project includes two phases of co-design research: first, health and allied health professionals are surveyed on their experiences and training requirements; second, women and other parents share lived experiences and insights on topic areas and co-design training resources. The project aims to create change within professional understandings of prenatal testing practices, so that addressing psychosocial aspects of receiving unexpected fetal findings becomes a central concern for all relevant health professions, whereby women, other pregnant people and their families and supporters receive the support they need to navigate this complex experience.

Teaching and Learning in Micronesia: Exploring Island Centered Pedagogy through the Lens of Island Wisdom

This research explores the question of culturally relevant pedagogy within the educational landscape of Micronesia. It centers its analysis within the context of a learning process that brought together some sixty educators on Guam over the past year to reflect on insights gained from both the *precollegiate* and university learning environments. The framework that guides this analysis and exploration is informed by five key elements of Micronesian culture and tradition: 1) Island wisdom; 2) Philosophy and spirituality; 3) Culture, tradition and way of living; 4) Art, literature and storytelling; and 5) Island centered pedagogy. The question at the heart of this research examines both the educational content and methodology that is most meaningful and empowering for Micronesian island cultures and peoples. This analysis takes into account the unique environment that our students find themselves within – an environment marked by the tensions between two powerful forces that are at once ever present and yet in many ways oppositional in nature. These forces of tradition on the one hand and modernity on the other, of collectivism and individualism, create an often difficult reality for students, and teachers must be prepared and sensitive to help them navigate these tensions as they pursue their educational goals. In the end, the research highlights key insights,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

approaches and strategies that we hope are meaningful for educators as they continue to strive to foster environments within their classrooms throughout Micronesia and beyond to the greater Pacific region, that are transformative and empowering for students.

Concept of Fatherhood in Polyandry a Case Study of Family Structure and Gender Relations Among the Thityyas of Malabar, South India

Family structure in India underwent a drastic change in colonial times. The pace with which family structure and gender relations had been slow because of the fact that the concept of family in the society was intertwined with the caste system which moderated the marriage systems and family relations. The present study is aiming at analysing the nature of fatherhood in a system known as fraternal polyandry in social science literature. The reference group selected for the purpose is a middle caste in Malabar in south India, Thiyyas who are at present clubbed with two other castes, Thandans and Thiyyas. Polyandry is a very ancient system that may be traced back to the Vedic period in India. The system became popular in the various parts of the Indian subcontinent, notably Sri Lanka, Ladakh and Tibet. Polyandry in Malabar is an area relatively untouched by scholars, though there have been a few studies in a general context. The authors' investigations into polyandry in Malabar have brought to light the fact that the system had an active presence in this part of India until relatively recent times--upto the late 1950s. The study strongly argues that fatherhood in polyandry in Malabar had never been contested in a system which essentially tried to protect the patriarchal interests in regulating female sexuality and preserving family property for the descendants in the male line. The study has been carried out using intensive interviews with the survivors of polyandry and their descendants in randomly selected households in a few specific areas in Malabar. The study has also utilised documentary evidences for understanding the nature of inheritance of property by the children of fraternal polyandrous families. The authors have also perused a few important autobiographies and biographies for insights into the spirit of the time when polyandry existed.

The Mental Health Consequences of Parental Incarceration from Adolescence to Young Adulthood

Little is known about how school and community conditions may impact the mental well-being of children with incarcerated parents. The present study investigates whether adverse childhood experiences (ACEs) measured at the family, school, and community levels explain the relationship between having incarcerated parents during childhood and mental health of young adults. Across four waves of data from the National Longitudinal Study of Adolescent to Adult Health (Add Health), 6,986 participants who were in grades 7–12 completed questionnaires on various sociodemographic, criminological, and health metrics. Results indicate that children with incarcerated parents are prone to depression, and the more often a parent has been incarcerated, the higher the level of depression for the child. Moreover, the more times a parent was incarcerated, the more likely other adversities are present. The school context provides a unique lens to explore the relationship between parental incarceration and depression. Inadequate school resources amplified the negative effects of parental incarceration on mental health. Taken together, the results of this study underscore how parental incarceration is a distinctly harmful childhood experience, and this work expands previous findings that experiencing parental incarceration during childhood has long-term, generational consequences to mental health.

JONES, Paul* (Research School of Social Sciences, College of Arts and Social Sciences, the Australian National University, Australia)

The Utility of 'Modern Demagogy' for the Charisma/Populism Analytic

In populism studies attempts to employ the figure of the demagogue are often dismissed as signifiers of 'liberal anxiety' (Kazin) or of the allegedly mistaken 'moralist' response to rightwing populism (Mouffe). One might then think that this figure has little conceptual provenance. Not so for Max Weber. His seemingly ambivalent reflections on the modern demagogy that he identified with the arrival of expanded suffrage and modern journalism was plainly informed by his conception of charisma.

Du Bois' usage of the concept moves in parallel with Weber's. Adorno and, perhaps most remarkably, Gramsci, developed critiques of demagogic risks in modernity that took Weber's work on demagogy and/or charisma as a starting point. Of all the recent theorists of populism, however, only Nadia Urbinati grants demagogy a central role.

This paper will draw on my *Critical Theory and Demagogic Populism* (MUP 2020) to advocate the utility of 'modern demagogy' for theorizing populism by stressing its capacity to clarify the relationships between populism, fascism and charismatic leadership.

I suggest a needed first step is an ideal-typification of modes of modern demagogy undertaken in the spirit of Worsley's use of Shils to sketch an ideal-typification of modes of populism. Consider, for example: the 'positive' demagogy of UK Prime Minister Gladstone acknowledged by Weber; the contrasting intellectual demagogy he rejected in 'Science as a Vocation'; Du Bois' warnings of the demagogic potential within the Black clergy; the demagogic dimensions of the failed Caesarism that Gramsci identified in 'Boulangism' in France; the 'neo-classical' chamber oratory demagogy of Enoch Powell announcing the 'new racism' in the UK, curiously neglected as such in Paul Gilroy's work and Stuart Hall's theorization of 'authoritarian populism'; and of course the disinhibitedly 'incoherent' mode of modern demagogy analyzed in depth by Adorno and all too familiar today in Trump and Hanson.

JOOSSE, Paul* (University of Hong Kong, Hong Kong)

Integrating the Study of Charisma and Populism through the Sociology of Emotions

Most theorizations of charismatic power focus on the role played by 'positive' emotional states (love, thrills, respect) in creating solidarity by binding followers to leaders within social movements. Yet 'negative' emotions also attend charismatic upheaval and lay the groundwork for authoritarianism, particularly when it charisma appears in its revolutionary mode. This presentation combines classic Weberian formulations of charisma theory with insights from contemporary populism studies to illustrate the role played by fear, anger, and confusion in destabilizing rational-legal and traditional social orders. I argue that charisma's 'emotional shadow' is important for understanding charismatic power for two reasons. First, negative emotional states invigorate supporters of charismatic movements—a recognition that is key for integrating Weber's classic insights with contemporary understandings theories of populism. Second, negative emotions can work to signal charismatic legitimacy: shock, fear, and confusion on the part of institutional elites and/or countermovement enemies serve as proof for the institutional rupture that charismatic missions promise. I demonstrate these insights using the case of charismatic/populist support within the 'Trump phenomenon.'

Improving Social Protection in India through Partnerships between Civil Society and the State

Over the last 15 years, India has witnessed a growth in rights-based entitlements and systemic reforms to build an inclusive social protection system. The COVID-19 pandemic has particularly created the need to increase the reach of social protection, revisit implementation, and extend it to vulnerable groups beyond traditional definitions and notions of vulnerability. Civil society has a critical role to advocate for social protection and to support last mile connectivity for the most marginalised in the spirit of 'Leave No One Behind'.

The presentation outlines a framework for a robust and effectively functioning partnership between state and civil society for social protection, based on interventions by the Indian non-profit, Youth for Unity and Voluntary Action (YUVA) in the state of Maharashtra. Components include access to social protection among vulnerable groups through different bottom-up models and practices; alongside evidence generation to ensure advocacy for greater and universal social protection. Specifically it shares learnings from YUVA's ground-level 'Social Protection Facilitation Centres' as model collaborations between the state and civil society. The presentation highlights the role of community capacity building for demand generation to ensure access, coverage as well as sustainability of the facilitation centres. It also expands on data and knowledge gaps on emerging kinds of vulnerabilities and indicates possibilities of real-time people centric evidence gathering processes to fill these gaps.

Finally the presentation raises critical questions for future work on policy and praxis. This includes recognition of vulnerable groups largely 'invisible' in official statistics - migrants, caste-based groups, gender minorities, young persons, religious minorities, and so on. It argues for positioning technology as an enabler for social protection, and cautions against surveillance and privacy risks. In conclusion, it establishes the importance for civil society to work with governments to ensure social protection systems strengthening.

Experience of Indian Students Abroad: Victims of Recruitment Agency Frauds.

Student migration from India has seen a dramatic increase over the past two decades. Global connectivity and expanding information flow are important reasons, the conditions of despair, unemployment and lack of opportunities in the home country are also identified as a reason for students to migrate for their higher education. This paper aims to expand on the migration journey of Indian students who currently reside in the United Kingdom, Canada, Germany, Australia and the United States of America. Recruitment agencies and consultancies in India play a central role in the decision-making of these students and the various facets of their migration including choosing the university, course, visa process, accommodation on arrival and even part-time employment in the destination country. Given the increase in the number of agencies and consultancies in the country and their integral role in a student migrant's life, the proposed paper aims to break down the varying experiences of students who have gone through this process. To gain a more effective understanding of the same, the paper will identify the various challenges faced by Indian students at the time of migration and after they arrive in the destination country. The involvement or lack of involvement of recruiting agents post arrival will be of primary focus. In-depth qualitative interviews with students will help in filling the knowledge base regarding the economic, social, psychological and academic challenges faced by these students abroad. Since this paper is part of a larger work aiming to study the recruitment process of Indian students planning to study abroad, the paper will benefit from the exhaustive review of the literature already done. The paper will also dwell on the living and academic conditions of the students abroad and compare them to the promises made by the recruitment agencies at the time of migration.

Embodying the 'anti-Diet' Movement: The Lived and Learned Experiences of Health Professionals in the Broad Anti-Diet Community

The anti-diet movement is comprised of a diverse set of voices that overlap and conflict in various ways. It includes the fat liberation movement that developed in the 1960s, 'second-wave' feminist voices opposed to beauty practices and, more recently, weight-neutral health professionals. While all three broad movements have played an important part in defining and challenging diet culture, tensions between groups exist. Most notably, health professionals' roles have been problematised by their provision of healthcare and the influence they exert on client or patient health behaviours. While 'anti-diet' health professionals focus on improving health and challenging weight-centrism, they are often accused of promoting healthist attitudes and depoliticising the origins of anti-diet activism.

Anti-diet health professionals, however, are seldom acknowledged for their unique position within the broader movement as both people experiencing body dissatisfaction and anti-fat bias, as well as health professionals. In this paper, we explore how health professionals who play a part in different facets of anti-diet activism are influenced by their lived and learned experiences. Specifically, we ask: how do health professionals who represent the intersection of different anti-diet movements negotiate the importance of their lived experiences (e.g., of living with a larger body) and their learned experiences (e.g., of being a health professional)? We examined the perspectives of 27 female health professionals (four focus groups, *n* = 16; 11 in-depth interviews) across three countries (Australia, the United States, and United Kingdom). We found that anti-diet health professionals draw upon both their lived and learned experiences in their advocacy and activism. They described the implicit and persistent role of their personal lived experiences as women under patriarchy, Eurocentrism, and capitalism in shaping their learned experiences as health professionals. We discuss the implications these experiences have for the contributions of anti-diet health professionals to the broader anti-diet movement.

Meditation, Ritual, and the Body: Ecstatic and Cathartic Expressions of Country.

Colonisation, genocide, ecocide, and climate derangement, are ongoing tragic events. In Australia, one way spiritual practitioners respond to this is to deepen their engagements with First Nations' perspectives/practices and allow First Nations' connection with Country to reshape how a person experiences and (en)acts.

Recent studies of Australian religious and spiritual practices show a swing toward participation in nature experience and spirituality and a move away from traditional religiosity. The paper discusses several examples of spirituality in Australia that represent, or are guided by First Nations voices. The paper argues that some important elements of these practices are A) that they presume First Nations' perspectives/practices are normative, rather than an exceptional, experience of human life. B) Spirituality practices curate the experience of Country as one of participation in a living, ongoing story, that embraces the whole person. C) Participants understand the consequences of these two elements as entailing taking visceral responsibility for protecting Country.

After outlining these positions, we discuss the narrative and experiential elements that inform these spiritualities, referring to categories of ecstasis and catharsis. We contrast these analyses to the standard introspective models utilised by mindfulness-based approaches. The ecstatic element is primarily associated with a felt sense of intermingling between person and Country. Catharsis flows from an embrace of mutual vulnerability and ritual intensity with Country as divine kin. Both effects invite the participant to recognise or renew, their responsibility for Country. As such, these spiritualities are closer to practices that act as conditions for a 'religious' or 'mystical' experience with ecstatic and cathartic features.

On the basis of these observations, we speculate that the main measures for defining the success or failure of the spiritual practices are whether participants experience transformation, metamorphosis or conversion, rather than more established measures of well-being.

'Demons Make War on Those Who Are at the Summit of Prayer': How Early Christian Contemplative Practices Responded to Harmful Experiences.

Empirical data suggest that unusual experiences are a regular part of meditation practice today, independently of whether what is sought is health, performance, exploration, or spiritual development. Traditional texts could help contemporary meditators to understand them. The texts from early Christian desert traditions, describe many experiences that, to contemporary persons, might seem unusual. Among these experiences are encounters with demons. Demons can be spirits of divinities like inspirations, as personifications of spirits of holy or profane sentiments or places, demons might express a range of beliefs and sentiments. The function of demons in early Christian meditative traditions is an interesting representation of the demonic trope; the texts also provide insights into the cognitive dimensions of the demonic encounter. Referring to texts from Maximus the Confessor, a key figure in the Christian spiritual tradition, I discuss the cognitive conditions experiences of demons presume, and ways for meditators to respond to demons.

For Maximus, demons are both autonomous, operating in manners distinct from the experiencer, and personifications of stubborn distractions, passions, and temptations. Demons are like other more standard barriers to meditation, and they arise when one neglects practice or is distracted. However, read carefully, the experience of demons presumes positive conditions, too, the substantive familiarity with meditative practice, more specifically the meditator has stabilised focused attentiveness of their consciousness, can analyse the constitution of thoughts, and make enquiry into the causes of barriers to practice. To counter demons, Maximus recommends applying the processes that act as positive conditions to examine the cause of the demon itself. I argue that the aim of the countering is not to create a deeper or more refined experience, but simply to restore the meditator to a normative continuity of meditative practice.

To conclude, I'll evaluate some of the advice Maximus provides considering contemporary contemplative research.

Old Unions and New Technology: Connective and Collective Action from Above and below

The summer of 2022 saw a marked revival of collective action by established, mainstream unions in Britain – after many years of relative quiescence – with largescale strikes in education, railways, and postal services, among others. While it is unclear how sustained this uptick of collective action will be, it nevertheless raises a number of questions for researchers. Among these is the role of new communication technologies and practices of connective action that precede and accompany collective action by workers. At head office level, it is clear that union communication strategies have been influenced by the experience of Corbynism, with all its strengths and weaknesses. At the same, there are signs that recent rank-and-file activism has been influenced by processes of self-organisation – including online methods – found in platform worker organising as well as wider social movements (Maffie 2020; Bennet and Segerberg 2012). Furthermore, there is evidence of cross-fertilisation of militant practices among workers in different unions – both mainstream and grassroots – in emergent "communities of practice" (Smith 2021). The emergence of novel

connective action practices, both from above and from below, in a context of increased collective action, suggests a complex interaction worthy of further investigation. This paper presents findings from research looking at practices of connective action in four mainstream British unions, at both head office level and in local workplace branches, and compared with more radical grassroots unions, examining the relationship between these practices and collective action including strikes.

JUAN, Hsiao-Mei* (National Chung Cheng University, Taiwan)

Artificial Natural Death: The Presentation of Good Dying in Hospice Care

Hospice care is a new philosophy of care that views death as a natural life process. Rather than prolonging the pain of death, it allows patients to die comfortably and painlessly, and supports family members to feel reassured. The ideal of hospice care is a natural and peaceful death. However, how to interrogate this promise? This article aims to provide a set of concepts and tools for such an examination, and offer analyses and discussion of the local practice of natural death. In such an effort, I use current research on hospice care and Goffman's dramaturgy theory. The point of departure is that the natural death of hospice care is not letting the living organism die 'naturally' and without intervention, nor is it merely a matter of showing autonomy by signing up for DNR. On the contrary, a peaceful natural death involves a series of interventions and care, mixing with human and non-human elements. Therefore, the question is not limited to what natural death is but is mainly concerned with *how* it is arranged and performed in specific ways, both locally and in individual contexts.

To explore this question, I use field and interview data collected from the hospice ward in a teaching medical university in Taiwan. I start by addressing what peaceful natural death for patients and families is. Next, considering Erving Goffman's concepts, e.g., presentation and settings, I analyze the interpersonal, technic-material, and physical-spatial arrangements to perform good care for a comfortable natural death. Finally, I turn to denaturalizing the natural death by referring to an arrangement of relations and practices that simultaneously produce the interpersonal, the technic-material, and the physical-spatial embodiment of natural death, thereby retaining the risk of misrepresentation. In so doing, I will highlight the artificial naturalness of natural death and contingencies of care working.

JUAN, Hsiao-Mei* (National Chung Cheng University, Taiwan)

The Rationalities of Welfare Chauvinism and the Future of the Welfare State

A growing body of research shows that the principles which support welfare chauvinism and the welfare agenda of populist radical-right parties (PRRPs) go beyond the identity and refer to the deservingness criteria regarding resource allocation, social justice, and fairness in the welfare state establishments. Studies also display that PRRPs and their chauvinistic welfare stance have reshaped the establishments of the welfare state and have had enormous consequences for welfare reforms from the 1990s onwards in many Western welfare states.

This paper attempts to put the rationalities of welfare chauvinism in the transformation of the welfare states that implement active programs, e.g., workfare, activation, and social investment, in response to crises of welfare dependency and fiscal burden. In doing so, this paper proposes a framework of productivist citizenship and ethics for describing the principles of welfare distribution after the 1970s. In addition, this article declares that this transformation accelerates welfare chauvinism. Welfare chauvinism and social welfare after the 1970s have homeotic welfare beliefs. They highlight equity over equality, responsibility over rights, and giving-taking-reciprocity; they take a critical stance against the marginalized and their behaviors, e.g., unproductivity and welfare dependency. Moreover, they engage in authoritarian moral disciplines and tend to control or punish non-productive people or immigrants while advocating for productivist citizenship as an imperative for welfare entitlement. Welfare chauvinism culturalizes the immorality of immigrants, accusing them of being morally lazy, parasitic, fraudulent, and deceitful.

This article offers two alternatives to think of new forms of social solidarity that go beyond the forms based on productivist and national citizenship: universal basic income and citizenship based on human vulnerability and rights. As such, the contribution of this paper is not limited to a better understanding of welfare chauvinism but also allows us to figure out the limitations and possibilities of the welfare state.

JUDD DE LA LUZ, Michelle* (National Autonomous University of Mexico, Mexico)

Being a Woman within an Anexo: Violence Against Women Suffering from Substance-Related and Addictive Disorders in Mexico

In Mexico, a part of the population with disorders related to Substance-Related and Addictive Disorders (hereinafter SRAD) is cloistered —both voluntarily and involuntarily— within establishments commonly known as "*anexos*". A part of these establishments is not regulated by the Federal Commission Against Sanitary Risks (Cofepris) or by the National Commission Against Addictions (Conadic), which in Mexico are the bodies in charge of regulating residential treatment for SRAD. In addition, to date there is no census to know how many *anexos* exist, despite that *anexos* are being widely legitimated spaces, violent practices that violate users' dignity and human rights are recognized within them. Furthermore, the establishments that comply with what is established in the Official Mexican Standard NOM-028-SSA2-2009 in facilities with a residential modality for the attention of SRAD, tend to have unaffordable costs for the great part of the population, which makes SRAD treatments an issue of class and gender in Mexico. This paper exposes the experiences of women who have been inside *anexos*, specifically their experiences of violence within them, as well as an analysis of the relationship that the fact of being a woman produces particular experiences for reasons of gender within the *anexos* that make up their lives as women with SRAD. This study analyzes the symbolic, physical, sexual, and medical violence (in its psychiatric and gynecological dimensions) that women experienced in these establishments. The ethnographic study and the discourse analysis, allowed to glimpse what were the internal subjective relations of this structure, how it was formed, what were the configurations of power that were used vertically towards these women, what were the roles that were stipulated for the women, the medical assaults they suffered, and how the users were sexually exchanged as a currency of "punishment and reward" by the men of these institutions.

JUKKALA, Tanya* (Malardalen university, Sweden)

Alienation Among Young Women in Marginalized Suburban Areas

This paper concerns young women's experiences of living in marginalized (and stigmatized) suburban areas in the south of Stockholm. The focus is on experiences of alienation that appear in the young women's narratives and the way these experiences are dealt with. The young women describe feelings of alienation from the majority society, as a consequence of living in a stigmatized area (and territorial stigmatization). Moreover, they describe having to conform to strong prevailing norms concerning what young women in the area should look like, act like etcetera, which may result in feelings of alienation from the self. For many, a mental and physical disconnection from their housing area becomes necessary in the process of finding ones' own path. Yet the area often remains "home" and a place that the young women both return to and try to find in other places. While these young women's experiences of alienation many times are described as painful emotional processes, they are also often discursively transformed into positive aspects of their own personal development and character. The young women describe how their experiences have made them more empathetic, caring, helpful, willing to fight for one's goals etcetera. In other words, their experiences of alienation are transformed into a form of resource or individual human capital. The potential of positively experienced transformative aspects of alienation is emphasized in this paper.

JUNG, Chungse* (SUNY Cortland, USA)

Before Radical Sixties: Ethnic and Nationalist Mobilizations of the Global South in the Long 1950s

This study revisits the conventional ideas of 1968 – Eurocentric *the Radical 60s* and further *the Long 60s* – by juxtaposing the period, the long 1950s, of the global South. Remembering the events of 1968 has produced various types of a *myth* of the era that had attracted Anglophone scholarships. Notwithstanding introducing the protests of 1968 as global events, early scholarly works on *the Radical 60s* began with a distinct focus on Europe and North America. Scholars of different regions then expanded the spatial scope of the 1960s by examining sociopolitical activism and cultural movements in the contexts of the global South. Simultaneously, the temporal scope of the 1960s initially focused on the late 1960s is now understood as *the Long 60s*. However, this *Eurocentric* epistemology can be decentered by the empirical investigation of the world-historical pattern of protest events in the global South compiled from a historical Anglophone newspaper, the *New York Times*. According to the dataset of protest events nospanning 43 countries/regions in the global South, the long 1950s, from 1946 to 1966, shows one of the most revolutionary periods in the long 20th century. The countries and regions in Latin America, South Asia, and Southeast Asia led to the emancipatory struggles of the *long Radical 50s* in the global South. In particular, the years between 1956 and 1961 can be observed as a greater moment in ethnic/nationalist mobilizations and anticolonial

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

protests from many peripheral countries such as Algeria, Argentina, Cuba, India, and Indonesia. By examining the interplay of global and local processes to reveal the social and political dynamics of the struggles against exclusion and exploitation in the global South, this study attempts to remap the world-historical territory of protest events and redraw a pluralistic global history.

Ethnonationalism or Asian Panethnicity: Koreans and Korean Americans Responses to Anti-Asian Violence during the COVID-19 Pandemic

This study explores the experiences and responses of Koreans and Korean Americans to anti-Asian violence and racism in the U.S. during the pandemic. This study analyzes more than 30 personal in-depth interviews from three groups (young adults, older adults, and small business owners) of Korean immigrants and Korean Americans in the metropolitan New York area. The empirical investigation shows that most of the participants experienced anti-Asian hatred either directly or indirectly during the pandemic. However, regarding the perception and solution to anti-Asian violence and discrimination, the participants have largely different perspectives depending on their socio-economic status, educational experiences, and political mediation in South Korea and the U.S. One of the most striking findings is to identify the increasing anti-Chinese sentiments and rising ethno-nationalism among Korean immigrants during the pandemic. On the one hand, Korean immigrants also show a negative attitude toward coalition building with other Asian ethnic groups and racial minorities to react anti-Asian violence and hate crimes. On the other hand, younger Korean Americans insist solidarity with pan-Asian ethnic groups and other racial minorities is necessary to cope with increasing anti-Asian racism. Furthermore, this study argues that *vulnerability of group*, *cohesiveness within the community*, and *distrust of justice institutions (law enforcement)* induce different views on the perception and solution to anti-Asian violence and racism in the Korean and Korean American communities. The different level of vulnerability of the group and cohesiveness within the community leads to different solutions against anti-Asian violence and racism: a combination of the weak vulnerability and the higher level of cohesiveness has pursued a *strategy of exclusion* such as ethnonationalism. Otherwise, a combination of the strong vulnerability and the lower level of cohesiveness has sought a *strategy of inclusion* such as panethnicity.

JUNG, Hyun* (Sogang University, Republic of Korea)

Quantification As a Symbolic Capital in Sociological Field

According to Bourdieu(2004), mathematization was one of the most decisive processes of differentiation in the Newtonian Age of physics. Through mathematization, the advocates of Newtonian physics could claim themselves as scientists while others who supported competing paradigms eventually failed. Not surprisingly, many of us could find the homologous pattern noticeable in the developmental process of the sociological field, especially that of the United States. Still, one of the most crucial differences between them is that mathematization was not the only measure of demarcation. Under the influence of positivism, which Bourdieu(1991) referred to as "hyper-empiricism", the quantification of sociological research has been emphasized repeatedly whether inside(see Merton and Lazarsfeld) or outside the discipline(see Menkiw, 2007). In this respect, it would be instructive to give an account of the rising of quantification by the theoretical frameworks of Bourdieu(1991, 2004). Using the terminology of Bourdieu, I will illustrate how methods of quantification have become symbolic capital and how sociologists could distinguish themselves from researchers from other disciplines as a means to increase the relative autonomy of the field. To be more specific, I will focus on the example of qualitative researchers in the sociological field, who strive to distinguish themselves from anthropologists with no "empirical" data supported by statistical analyses.

JUREIDINI, Ray* (Hamad Bin Khalifa University, Qatar)

Informal Financial Charges and Transfers in Corruption of Migrant Labour Recruitment

The paper provides an analysis of migrant labour recruitment from Asian and African countries to the GCC with specific reference to Qatar. Although migrant worker payments have been recognized and criticized over the past decade or more; and despite labour law legislation in most GCC states forbidding recruitment charges to workers, the practice remains. While origin country governments allow recruitment agents to charge migrant workers 1 - 2 months' salary for their services, far more is charged. Of particular interest are the kickback payments to employees of the employing organizations. This process will be detailed with some documentary evidence. It is a roughly estimated that for the GCC alone, up to US$10bill has been transferred from recruitment agents to employing companies at destination in informal kickback payments. These kickback payments are forms of bribery, extortion or exaction, depending upon who initiates the transaction. The charges to workers can vary

according to how much the employer is willing to pay for various elements of recruitment costs, the greed of agents and the unwillingness or inability of governments, employers and agencies to stop it. The practice distorts the labour market to include willingness and ability to pay as a criterion for selection. Worker payments, which are often borrowed at high interest rates, can result in forced labour, labour indebtedness and trafficking. Despite global campaigns to introduce fair and ethical recruitment by the ILO, IOM, Business and Human Rights, Migrant Forum in Asia, the UN Global Forum of Migration and other human rights organizations, the employee-pays principle persists. Some economists argue that this is inevitable, given the high supply of labour and limited demand. It is argued here that despite the market forces, there is a need to moralize the market and try to eradicate the corruption.

Unhcr Refugee Zakat Fund

The UNHCR has adopted the Islamic charitable institution of *zakat,* one of the 5 pillars (obligations) of Islam. In 2019 it introduced the Refugee Zakat Fund, backed by Islamic scholars and fatwas to tap into Islamic charitable giving in the face of declining UN resources. The first Zakat Initiative was introduced by UNHCR as a pilot program in September 2016, partnering with the UAE non-profit Tabah Foundation. In April 2019, the initiative was transformed into the Refugee Zakat Fund, to: "help individuals and Islamic financial institutions to realize their social responsibility with global impact". It was from the outset seen as a pragmatic collaboration between Muslim philanthropy unable to reach its constituency, and a UNHCR that was unable to meet the assistance needs of refugees and the displaced. With over 100 million forcibly displaced globally, around half are from Organization of Islamic Cooperation (OIC) countries. The fund initially sought to address the needs of mainly displaced Muslims in states that were not signatories to the 1951 Refugee Convention, namely, Jordan, Lebanon, Bangladesh, Malaysia and Iraq, and the signatory states of Egypt, Yemen and Mauritania. The fact that the Zakat fund distributes exclusively in cash has a number of benefits for donors, recipients and UNHCR as will be discussed in the presentation. The use of digital means, rather than on the ground personnel in distributing the financial aid was a most convenient measure during the pandemic, minimizing physical contact and infrastructural costs.

JUTEL, Olivier* (university of otago, New Zealand)

Platform Governance and the Hybrid War Industrial Complex

One of the lasting impacts of Russiagate on platform governance has been to re-territorialize the internet, drawing platforms and users into hybrid war logics. The Russian disinformation threat constitutes dangerous bodies invading an imagined American territory requiring vigilance and digital hygiene (Möllers, 2021). Disinformation expertise has become the central governance problematic of the internet with national security elites steering the editorial policies of platforms and engaging users in ways to fight disinformation with "truth". This has been accompanied with a flourishing of NGOs, consultants and research centres cultivating the cultural capital of disinformation expertise across 'the field of power' (Bourdieu, 1996).

This paper is concerned with how the disinformation rubric reverts to positivist cold war theories of communication as part of the hybrid war industrial complex (Galeotti, 2019). Where cold war communication infrastructure was governed by command and control logics, hybrid war governance advances through notions of disinformation expertise as a cultural capital permeating different professional fields. The academy, journalism and cyber-intelligence fields are involved grappling with the problematic of disinformation and developing forms of knowledge that rely on big data epistemologies, Kremlinology and psychological warfare notions of communication. The assuredness of this expertise is as a form of meta-capital, allowing adherents to identify as a member of the universal class of technocrats able to divine truth. Platform governance is thus not simply a matter of algorithmic and structural power but the ways in which users inhabit platforms and are given means to aspire to the symbolic power of universal truth. It is in this way that this governance model can evoke notions of digital civil society even as the priorities of the national-security state become locked in to the space making practices of online.

Engineering Software Service Professionals: Hiring and Training Practices in Thiruvananthapuram City in India

Based on semi-structured interviews with 58 software professionals, this article explores the process of hiring and training of software professionals in Thiruvananthapuram city, in the southern province of Kerala, India. The success of India's software industry is based on the steady supply of skilled labour, which was a product of early state investment in scientific and technical expertise (Upadhya, 2016). Thiruvananthapuram is not one of the major sources of information technology (IT) services exports in comparison to metropolitan cities like Delhi, Bangalore, or Hyderabad. However, the province

    denotes a presenting author. Abstracts are organized by first presenting author's last name.

of Kerala, where it is located, boasts of a literate population comparable in proportion to that of the developed world. This combined with the location of the Indian IT industry in the global value chain results in unique hiring and training practices that creates the software engineering workforce.

A labour process analysis of software services work in large IT services companies shows that software development, testing and team management are the three critical components of the profession. In smaller companies, these three roles blend into each other. The construction of the profession of software engineering in India means that even those without a formal engineering degree can be absorbed into the workforce at lower cost to company. This paper argues that the construction of the professional identity of the software engineer in the province, both by the employer and the employee is what allows the industry to thrive in a geographical location known for labour militancy. There are no major efforts of unionization among the engineers here because of their self-identification as professionals rather than workers. Consequently, employers, employees, the state and foreign clients are in delicate balance with each other due to the ability of the business community to construct a professional identity among software service workers, despite providing low value-added services.

Reflections of Kerala State Transgender Policy on the Life of Transgender People.

REFLECTIONS OF KERALA STATE TRANSGENDER POLICY ON THE LIVES OF TRANSGENDER PEOPLE

Radhika K
Junior Research Fellow,
Center for the Study of Social Exclusion and Inclusive Policy
University of Hyderabad, India
17siph03@uohyd.ac.in

ABSTRACT
This paper deals with the changes that has happened in the transgender lives after the implementation of Kerala state transgender policy, 2015. Kerala is the first state in India which implemented a state policy for transgender community. The Supreme Court of India judgement, 2014, popularly known as NALSA judgement, triggered the formulation of Kerala state transgender (TG) policy, which ensures the constitutional rights and welfare measures for transgender people. As per the SC judgement, transgender people cannot be discriminated on the grounds of their gender identity, and expression of gender identity comes under the right to freedom of speech and expression. The policy proposes equal access to services, public space, employment and opportunities. The policy formulation was followed by a transgender survey, around 4000 transgender persons participated in it. Survey estimated the presence of more than 25000 transgender people in the state. Transgender community faces stigma, discrimination and multiple exclusions within various socio-economic, political and cultural spaces because of their gender and sexual identity. The study focuses on the reflections of state transgender policy on the lives of transgender community in Kerala. For this study researcher used primary and secondary data sources such as personal interviews, policy document, SC verdict and related studies. Before the implementation of the policy there was large scale migration, least accessibility to public space and transgender people were not considered as citizen with equal rights. Notable changes have been happened in the transgender lives after the implementation of the policy.
Key words: Kerala State Transgender Policy, Transgender, Stigma, Discrimination, Equal Rights

Cybercriminal Communities: Online Communities and the Development of Young People's Cybercriminal Behavior

Cybercrime causes enormous annual human and economic damage internationally, and organized criminal organizations are at the center of this international crime. However, there are also other types of social networks that support cybercrime. Previous research has suggested, for example, that young people who commit cyber offenses tend to be involved in online cybercrime communities. These communities are virtual networks formed on different online platforms, from social networking sites to discussion forums and darknet sites. In online cybercrime communities, individuals can learn new skills required to carry out offenses, and likeminded interactions and social norms further encourage positive attitudes towards crime. Perhaps the most well-known example, here, are the hacking communities, in which individuals can experience validation of hacking behavior and hacker identity. However, the potential connection between online communities and youth cybercrime offending has not yet been further elaborated. In our presentation, we use a three-wave longitudinal data collected from Finnish adolescents and young adults (aged 15 to 25) between Spring 2022 and Spring 2023. Based on the longitudinal data, we will analyze the development of cybercriminal behavior among young people and how online cybercrime communities can affect this development. Considered cybercrimes include both cyber-enabled crime (i.e. online hate speech, and image-based sexual abuse) and cyber-dependent crime (i.e. hacking, cyber fraud). In our reflection, we elaborate on the role of social networks in the development of cybercriminal careers. We also consider whether cybercrime online communities can act as a pathway towards more serious and organized crime. We conclude that, while organized cybercriminal groups are of great importance, the sociological research on cybercrime should also focus on other kinds of networks and social organizing.

Global Social Policy Ideas in the Covid-19 Crisis: Expansion or Retrenchment?

Global crises, such as the current Covid-19 pandemic, do not only pose a threat to human life and economic activity but they also constitute complex challenges for social policy institutions and actors. Even though concrete social policy decisions are predominantly made on the national level, international organizations (IOs) contribute an important frame of reference for national decisions. In this paper, we focus on the content of social policy ideas.

We analyse three globally operating IOs (WHO, World Bank, ILO). Through an analysis of prevalent ideas and discourses, we study how the IOs imagine appropriate responses on the (national) level of social policy to cushion the impact of Covid-19. The particular focus will be on the fields of health policy, labour market policy, and basic social security.

Our particular emphasis is on testing the validity of existing conceptual and theoretical accounts in explaining IO recommendations. These relate to: path dependence (for example short-term expansion followed by retrenchment); crisis followed by fundamental social policy change (for example convergence of ideas); and/or contradictory messages (for example for different social policy fields).

The paper reports first and preliminary findings of a new research project run jointly by Bremen University and Bielefeld University.

KABEMBO, Ireen* (Lingnan University, Hong Kong)

'who Will Take Care of My Child When I Die? a Skeptical Engagement with Family Caregivers of Youth with Substance Use Disorders in Zambia'.

Background

Although family support is viewed as a norm in many African settings, the increasing individualization that has permeated most globalizing societies has led to the disintegration of the social fabric that held families and communities together. Currently, notable dynamics exist in how relatives, friends, neighbors, and communities engage with family caregivers of youth with substance use disorders in Zambia. There is a 'skeptical engagement' with family caregivers of youth in recovery from SUDs, that emanates from the actual and perceived threat these youth pose to people around them. This scenario has resulted in the relational world of FCGs being fraught with skepticism from family relatives and those in their neighborhoods. Most people have reservations regarding the sanity and recovery of a chaotic young person, whose recovery trajectory is characterized by relapses and inappropriate behavior that is difficult to handle. With diminishing social capital, weakening familial ties, and a limited supportive presence, family caregivers experience difficulties, poor social relationships, and perpetual anxiety about the future of their youth, which negatively affects both their mental and physical health.

Methodology

This qualitative study explored the lived experiences and subjective meanings of 30 FCGs using semi-structured in-depth interviews. The first interview involved the creation of a caregiving timeline, and a follow-up interview captured the caregiver identity, the youth's behavioral and mental changes over time, experience of healthcare service use, and the COVID-19 pandemic, among others.

Results/Policy implications

Most FCGs of youth with SUDs, particularly female caregivers without a spouse, experience abandonment by family relatives, who distance themselves from the caregiving role. Findings show that the fear of violent attacks, theft, and transference of delinquent behavior are among reasons for the 'skeptical engagement' and limited interaction with FCGs. Increased community awareness of SUDs as a chronic condition and support for family caregivers is needed.

Food and Nutrition Loss in Urban Agrifood Chains: Leveraging Lessons Learnt from the Africities Project to Address Food Loss in Lusaka, Zambia.

Background

Food and nutrition loss is among the shocks that continue to affect food systems worldwide. At the local level, increased food loss among smallholder farmers and marketers results in loss of produce and reduced profit margins. This scenario consequently leads to food insecure households, and a loss of nutritional security for urban consumers. Findings from the Africities Project show substantial food and nutrition losses at the harvest, post-harvest, transportation, and open-air food markets of the urban food value chain. Drivers of food loss such as food spoilage, theft, lack of storage facilities, lack of own transportation vessels were cited. To address these challenges, the project seeks to transition from only examining the bottlenecks in the four stages of the agrifood chain, to the trialing of context-specific innovations and interventions in these stages.

Methods

This is a mixed methods (quantitative and qualitative) study that involved surveys and interviews focused on smallholder farmers and other key actors in the urban agrifood chains. The development of the data collection tool was done in partnership with key stakeholders, policymakers, and researchers. Focus Group Discussions, workshops, stakeholder engagement meetings, and exchange visits between farmers from Lusaka and Mzuzu in Malawi were also done.

Results/Policy implications

In leveraging lessons learnt to reduce food losses, key interventions have been co-created. These include building capacity in affordable technologies and food preservation methods, building standardized infrastructure and shelter, promoting food bulking and improvement of road infrastructure to avert transportation challenges, consumer sensitization on the purchase and consumption of dried foods, own feed making for fish farmers to minimize the cost of production and reduce fish stunted growth, the building of food banks to reduce the dumping of food, protect the environment and feed vulnerable urban households, among others. New policies to address urban food loss are needed.

KADOBAYASHI, Michiko* (Japan Women's University, Japan)

"Awareness Contexts" Reflected in Cancer Tobyo-Ki

In Japan a lot of memoirs of illness called tobyo-ki have been published since the latter half of the 1970s. Today tobyo-ki has become a culture. In my sociological research on transformation of cancer tobyo-ki, I found it is closely related to "notification", and I think it is possible to consider it from the perspective of "awareness contexts" in "Awareness of Dying" by B. G. Glaser and A. L. Strauss, who were medical sociologists in the United States. Their qualitative study in the late 1960s classified patients' "awareness contexts" into four categories: "closed awareness", "suspicion awareness", "mutual pretense" and "open awareness". The study contributed greatly to the subsequent increase in the notification rate. Although it is based on society in the United States, I find Japanese tobyo-ki also describe "awareness contexts" and show the development along these four categories. We can see the change of the patients' consciousness with the change of awareness contexts in their illness narratives.

Recently, S. Tashiro, a socialist, has proposed a new concept of "post-open awareness". Nowadays as cancer is no longer a particular disease and notification become commonplace, one's own death is predictable. Tashiro says that the research on "dying process" under post-open awareness has been hardly accumulated in Japan. In addition to Glaser and Strauss' four epistemological contexts, I examine what the cancer narratives are like in this new era of "post-open awareness". Tobyo-ki in this new era is memoirs in which the patients create the process of dying and death itself. Understanding "everything" makes them clarify the goal and raise awareness of coping well with their diseases. You can see people considering how to spend their remaining time and practice their ideas in many recent memoirs of illness.

KADRI, Michele* (ILMD, FIOCRUZ, Brazil)

COVID-19 and Mental Health Among Indigenous Peoples of the Brazilian Amazon

In 2020 the UN warned that mental health should be at the center of discussions on post-pandemic recovery. But it was not an issue addressed by the Brazilian National Plan against COVID-19. Social inequality and barriers to access public services have driven the Amazon region to suffer greatly the spread of the virus, an even more serious situation among indigenous populations. The Articulation of Indigenous Peoples of Brazil (APIB), a community-based organization, reported that in 2020 the SARS-Cov-2 mortality rate among them was about 16% higher than the national rate. According to PAHO, because they are socioeconomically marginalized, they suffer greater impact in an emergency scenario.

Science can play a relevant role in reducing such inequity, whether by gathering evidence on reasons of vulnerability or by supporting capacity build to amplify self-care and prevention strategies. However, a bibliographic survey carried out in July 2021 at the Virtual National Health Library (BVS) reached only 7 papers when filtered by the descriptor 'indigenous' in the Region of the Americas. This deficit of knowledge impacts the development of training based on scientific evidence consistent with ethnic-regional needs.

In this sense, the starting point for developing training specifically in Mental Health in the context of COVID-19 for health care workers was to carry out a KAP study to investigate the barriers to health promotion. The study was divided into three blocks: sociodemographic data, knowledge about mental health and information about COVID-19 and was carried out with 533 indigenous youth.

This communication intends to discuss the results of this study, taking into consideration the challenges to promote mental health in a context where violence, land invasion, deforestation, illegal mining, murder of indigenous leaders, alcoholism and suicide mainly among the youngers was further aggravated because of COVID-19 in these territories.

KADYAN, Sneha* (OP Jindal Global University, Jindal Global Business School, India)

The Impact of COVID-19 on Garment Workers in India: Recovery with Women Empowering Alternative Models, Fair Trade

Interlocked global-local economic systems of production are entrenched in long established structures of inequality. The COVID-19 pandemic has revealed the inequities between global North and global South with succinct explanations of the course and effects of this unbalanced yet intersecting relationship within international trade wherein concerns over women's empowerment are paramount. The paper calls on for transformative research that emphasizes the centrality of women's empowerment in studying social change in the garment industry in India, to reconceptualize a new normal that is more sustainable through Fair Trade. Despite the global presence of India's garment sector, women workers are from the most marginalized communities in India, both economically and socially. As the pandemic reveals the most vulnerable in the global arrangements, I focus on alternative forms of trade that are socially committed to the cause of women to analyze how such organizations may pave the way differently for women through the pandemic providing timely support.

Occupational Prestige, Gender and Judicial Clerks of a Domestic Violence Court

The purpose of this investigation is to understand how domestic violence clerks in the state of São Paulo evaluate occupational prestigie and the criteria used for this evaluation. In Brazil, judicial clerks are a group composed mostly of white women, who have held such positions more often than men, according to data from the National Council of Justice (CNJ, 2019). Theorists who study gender, race and inequalities have observed that predominantly female occupations are less valued than male occupations, including receiving lower wages and lower chances of promotion. However, there is still a lack of research that analyzes the relationship between the gender composition of an occupational group and occupational prestige. In this sense, we seek to understand: In this sense, we seek to understand: how is the attribution of occupational prestige between male and female clerks? What are the criteria used? Do these symbolic valuation criteria vary according to gender? Still, this investigation seeks to understand whether the current Brazilian context, marked by political polarization and authoritarian, violent manifestations and greater vulnerability of human rights (especially women), influences this assessment of occupational prestige, considering that it is a court of violence domestic and family. Is there greater proximity to the naturalization of violence against women or is there a mobilization of legal professionalism in its relationship with the rule of law? For that, we used the theoretical contributions of the sociology of professions and occupations. The selection of a domestic violence court is justified by the willingness to collaborate with the research,

being a structured court, with expressive movement of processes and acting team. This is an empirical and qualitative research, using data collection techniques, semi-structured interviews with male and female servants, as well as ethnography.

KAIS, Shaikh Mohammad* (University of Rajshahi, Bangladesh)

Debunking the Myths: Shrimp Aquaculture and Environmental Degradation in Bangladesh

In recent years, shrimp culture industry has experienced an exponential growth, especially in Asia, due to shrimp's high demand in the global seafood market. Similarly, brackish water shrimp farming has been on the rise in south-western Bangladesh. Coastal shrimp industry, however, has become an expedient target for environmental critics looking for a scapegoat to blame for the loss of the world's mangrove forests and the rich and varied vegetation they support. The major complaints against the shrimp industry are that it causes, among others, biodiversity loss, ecological damage, loss of mangroves, and conversion of croplands. Drawing on primary and secondary data from Bangladesh shrimp industry, this paper explores the popular negative image of shrimp cultivation and critically examines how and to what extent shrimp aquaculture is responsible for environmental degradation in the coastal area. It concludes that the issue of coastal environmental degradation is in fact too intricate to be blamed on one culprit and that, contrary to the popular view, commercial shrimping contributes very little, if not 'no', to the loss of mangroves.

Adhoc-883.2

KAIS, Shaikh Mohammad* (University of Rajshahi, Bangladesh)

Global Warming at the Margin: A Study of the Sociology of Climate Change in Bangladesh

In the evolving process of climate change, from a science-based question to a top global policy matter, mainstream sociologists have been quite invisible in professional, public, and policy discourses on global warming, maintaining 'a strange silence' on the subject, and 'a mixed but largely uneasy relationship' with it. Similarly, climate change is little studied by Bangladeshi sociologists despite the fact that it poses threats to social life here, as do other 'social problems'.

With an aim to uncovering the level of importance given to climate change issues in sociology departments in Bangladeshi universities, this study has been conducted by collecting information from six public universities. In addition to content analysis of sociology curricula, selected teachers have been interviewed to grasp the internal undercurrents. Collected data have been analyzed qualitatively by finding out themes and patterns.

This research unearths three critical factors behind the marginal responses to global warming from mainstream sociology in Bangladesh. First, sociologists seek to separate the discipline from other sciences by focusing only upon social structure and social explanations. Thus, up to now, sociology curricula have avoided global warming agenda because of its alleged 'natural nature'. Second, sociologists have a propensity to suspect teleology in general and they emulate the indifference found in contemporary society towards the future. With a myopic vision, sociologists in Bangladesh tend to address the immediate social ills and retain a 'safe distance' from climate threats, which they view only a future concern. Finally, a general lack of expertise on climate crisis among Bangladeshi sociologists impede a widespread incorporation of climate change courses into the curricula.

KAJTA, Justyna* (SWPS University, Poland)
PUSTULKA, Paula (SWPS University, Poland)

Between Nesting and Autonomy: Young People and Housing Transitions during Social Crises

Research on housing transitions, which are understood as crucial for the broader transitions-to-adulthood, consistently points out the significance of housing stability in young adults' lives. The pandemic, war in Europe and inflation all arguably exacerbated the already unfavorable conditions in the housing market. Hence, young people navigate the challenges of co-residing with parents, leaving home, and establishing housing autonomy in the crisis context. Although our paper focuses on the pandemic-related housing experiences of young adults, we perceive the COVID-19 crisis as a component of complex, multi-crisis global reality. Importantly, we study Poland, where housing structural challenges overlap with the dominance of the homeownership regime, and leaving the parental home occurs relatively late.

Based on the multi-component ULTRAGEN study (*Becoming an adult in times of ultra-uncertainty: intergenerational theory of 'shaky' transitions*), this paper presents findings on the young people's housing paths during the pandemic

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

crisis and its aftermath. The analysis pertains to accounts shared by 35 young adults (aged 18-35), interviewed longitudinally in two waves (summer-autumn 2021 & autumn-winter 2022).

Drawing on data from 2021, the paper offers a new typology for investigating housing transitions during the crisis. The typology, called "ABCD", accounts for two dimensions. The first is the pre-pandemic housing situation (living with parents vs. living independently), and the second reflects the evaluation of the housing situation (comfort vs. discomfort). Four types of housing situations were distinguished: (A)Appreciated nesting, (B)Burdensome nesting, (C)Consolidated autonomy, and (D)Disrupted autonomy. We argue that the housing situation during crises depends on age, economic situation, social support, and previous housing (in)stability. Secondly, interviews from the second wave of the QLS (2022) add a temporal perspective to the presented typology and verify it in relation to new crises (war in Ukraine, inflation), as the factors contributing to unsteady transitions.

KALANDADZE, Mariam* (Central European University, Austria)

"from Georgian People": Compassion As Moral Obligation and Humanitarian Aid for Ukraine

On the day of Russia's invasion in Ukraine, on February 24, solidarity protests broke out in Tbilisi, Georgia. Protests were organized by civil society, continued for two weeks and ended by several humanitarian aid campaigns. By explaining components of compassion that Georgians felt for Ukraine, this paper examines how based on anger, shame, moral obligation and sense of identification solidarity protests transformed into humanitarian initiatives.

Compassion that was felt towards Ukraine was based on strong sense of identification (Jasper, 2018) with Ukrainian people, which was propelled by collective memory of Russo-Georgian war and belief that Ukraine and Georgia share the same future. Solidarity was understood as moral obligation: Georgia had to support Ukraine and reciprocate compassion that Ukraine had felt for Georgia amidst Russo-Georgian war in 2008. In result of sense of obligation and gratitude, when Georgian Government made statements that did not express support for Ukraine, moral emotions (Jasper, 2018) of anger and shame were evoked among protestors. In result, civil society took responsibility and initiated humanitarian campaign "From Georgian People".

Project "Death Cafe"

Currently, there is a demand in modern society to discuss death theme and change the culture of attitudes to death. The range of issues discussed is quite wide: analysis of death as a sociocultural phenomenon, existential fear of death, the specifics of this life stage, the role of death in understanding the value of life, euthanasia, suicide, digital immortality, as well as preparing people for death, especially in hospices, nursing homes for elderly and disabled people.

Project "Death Cafe" as a social franchise is presented in 82 countries. The first Death Cafe in the UK was offered in September 2011. Death Cafes have spread quickly across Europe, North America and Australasia. Over 14600 Death Cafes have been held to the end of 2022.

The objective of Death Cafe is "to increase awareness of death helping people make the maximum of their live" and to change culture around death and end of life.

The Death Cafe model is implemented on a not for profit basis. Death Cafe has no staff and is run by volunteers. Death Cafe is a discussion group - an open, respectful and confidential space where people with different beliefs can safely express their views on death and dying.

The "Death Cafe" project is an example of a self-organizing citizen's mutual aid practice in one of the most sacred areas of human life.

The report is devoted to the study of the thematic field, mechanisms and principles of the work of the "death cafe" groups, as well as the functions and significance of the death cafe movement. The authors had the opportunity to take part in cafes in Moscow and St. Petersburg and are ready to present the preliminary results of insider analysis of the effectiveness and growth in popularity of this kind of social non-institutionalized movement.

KALE, Sampat* (Tata Institute of Social Sciences - Tuljapur Campus, India)

Assessing the Role of Civil Society Organisations in Sustainable Development of Adivasis in India

Civil society organizations (CSOs) play a very vital role in rural development, environment protection, and promotion of sustainable livelihood programmes in India. We have a long history of reform as well as resistance movements, and social movements striving to protect lives of the poor and sustainable rural development. The impact of the work has been recognised by the state, civil society institutions, and corporate social responsibility programmes.

The paper aims to critically examine the role of CSOs and the long-term impact of their work on the socio-economic status of *Adivasis* in the central belt of India. The researcher has used the case study method, focus group discussion and personal interaction with individuals, and groups of the tribes in Maharashtra, Jharkhand and Chhattisgarh. It is very pertinent to explore why certain organisations are successful in creating sustainable livelihoods and how they influence multi-stakeholders in neo-liberal regimes.

Government of India and other donor agencies have changed engaging strategies for rural development. Many of them are using convergent approaches, direct implementation of projects and also community-led project development approaches. Collective action has resulted in building on the wisdom, indigenous knowledge of *Adivasis*, increasing their access, control and active participation towards creating resilient management of natural resources in the study areas.

"Ground-Eye View of Existing Climate Change Induced Vulnerabilities and Response of Social Movements in India"

"Ground-eye view of existing climate change induced vulnerabilities and response of Social Movements in India" Dr. Sampat Kale, Tata Institute of Social Sciences, Tuljapur Campus Maharashtra, India
Submitted to
Social Movements, Socio-Ecological Practices and Climate Change
RC 48 Social Movements, Collective Actions and Social Change
Language: English, Session Type: Oral, Session Organizer: Benjamin Tejerina, University of Basque Country, Spain
Climate change-induced vulnerabilities have increased in the last two decades, affecting the lives and livelihoods of millions of people across India. Extreme weather conditions have devastated the life of those on the margins of the society at large. The objective of the paper is to understand the implications of climate crisis with a ground-eye view.

Among the new social movements in India, *Save the Western Ghats Movement* works with socio-ecological perspectives in western India while *Chipko Movement* worked for the protection of the forest and ecology. The *Deccan Development Society* strives towards crop improvement and seed sovereignty and *Beej Bachao Andolan* works towards the conservation of indigenous seeds.

The author has used case studies, participatory methods, and ground-eye view methods to interrogate and understand the consequences of climate crisis-driven inequalities. The conceptual framework of Governing the Commons, an idea discussed by Elinor Ostrom is used for the enquiry of the study. The socio-ecological practices promoted by social movements are primarily striving towards sustainable development of people and planet through prosperity, peace and partnerships at the grassroots in southwestern India.

Collective action has resulted in participatory management of scarce livelihood resources, inspired women's leadership, and promoted traditional seeds conservation practices. Thus, this paper focuses on social change, rural transformation and resilient management of resources.

RC44-627.6

KALLAS, John* (Cornell University ILR School, United States)

Emerging Categories of Strikes in the United States

Recent evidence suggests that workers and their organizations are beginning to reprioritize militancy to confront increasing employer power. While many strikes still consist of indefinite work stoppages to advance demands and build collective power, many workers and their organizations have strategically adapted the strike to overcome the limitations of traditional strike models. Drawing on data from the ILR Labor Action Tracker - an innovative and comprehensive strike database in the United States - I identify emerging categories of strikes organized by workers in the United States. Examples of strike categories include, but are not limited to, fixed duration strikes in which workers walk out for a predetermined length of time before unconditionally returning to work, sickouts, nonunion walkouts, and demonstration strikes involving a minority of employees. I discuss the form and function of these types of strikes by contrasting them with each other and traditional, indefinite work stoppages. In addition, I plan to analyze the outcomes associated with each type of strike to further our understanding of the conditions under which certain strikes are most effective.

Highbrow, Popular and Mundane Leisure Participation, 1981–2017: The Meltdown Scenario, Omnivores and Snobs Re-Visited

Research on the social stratification of leisure activities and changes in it over time has focused on and debated about the rise of omnivorousness and the decline of highbrow snobbery as forms of an upper-class approach to leisure activities and culture (e.g., Peterson and Simkus, 1992; Peterson and Kern, 1996; DiMaggio and Mukhtar, 2004; Yuksek et al., 2019; Nault et al., 2021). We address the two interconnected but rarely jointly examined questions of the supposed (1) "meltdown" of the distinction value of highbrow activities, and (2) rise of omnivorousness and decline of snobbery as forms of distinction. In doing so, we demonstrate the often-neglected importance of the way popular culture is conceptualized and measured through activities regarding the substantial findings on both questions. We use unique, high-quality but under-analyzed longitudinal data from Finland, collected by Statistics Finland in 1981, 1991, 2002 and 2017 (N=12,325). By highbrow activities we refer to attending opera, classical music concerts, theatre or musicals, and art museums or exhibitions. We contrast highbrow activities with popular and mundane activities and use the latter two for differentiating the snobs and omnivores. We find that the participation rates for highbrow activities remain stable, but the meltdown scenario is supported. We show that the omnivorous and snob groups are of similar size over time and find little support for the omnivorousness thesis. Moreover, we observe a large-scale shift over the decades from the mundane, "old popular" activities to modern popular culture activities. As our tentative conclusion we propose that missing the changes in popular culture can preclude researchers from observing the possibility that there have always been omnivores side by side with snobs. Rather than being an isolated echelon, participation in highbrow activities continues to be more of a tip of a pyramid in overall participation in leisure activities.

Manifestation of Dalit Consciousness through Ravidas Bhakti: A Phenomenological Study from Jammu and Kashmir

This paper attempts to analyse the undertheorized Dalit consciousness among the Dalits of Jammu and Kashmir, manifesting itself socio-culturally through Ravidasia identification. The prevalent conflict situation in Jammu and Kashmir sidelined other social issues of the region as depicted by the scant literature and representation of the Dalits of this region. Since the socio-economic condition of these Dalits is relatively better than the average Indian Dalits, the political assertions by them were not aggressive and radical. Nonetheless, the everyday symbolic violence existing in the forms of microaggressions, condescension, caste slurs etc. have been endured by these Dalits, inculcating in them a sense of shame and low self-esteem. This reflects in the symbolic assertion by Dalits through identification with the Dalit Bhakti saint Ravidas. The Dalits of this region have been participating in *Ravidas Jayantis* and *Sabhas*, and organising events in *Ravidas mandirs* to identify and assert themselves as a separate group. The Dalit consciousness manifested through these socio-cultural events highlights their search for a dignified existence. However, interestingly, this assertion has predominantly been limited to the socio-cultural level and has not strongly transcended into a political assertion on the lines of Ambedkarism. It thus becomes pertinent to understand what shapes the nature of Dalit assertion and the case of Dalits of Jammu and Kashmir presents a unique situation because of their relatively better material status and low exposure to physical violence. The author by tracing the association of these Dalits with Ravidas attempts to explore how and why has the inclination of these Dalits been more toward socio-cultural-spiritual assertion and identification rather than political. The author also postulates the inaccessibility of Ambedkarite discourse and culture to the common Dalit masses as a limitation, preventing them from carving a politically assertive identity.

KAMANO, Saori* (National Institute of Population and Social Security Research, Japan)

Can We Capture Same-Sex Couples in Surveys? Erasure of Same-Sex Couples in Population Census and Comparable Surveys in Japan

The Japanese Population Census defines a household as individuals sharing a domicile and livelihood, and it also asks about *de facto* marital status, explaining it as the form of union which does not require submission of the marriage registration paper. Therefore, cohabiting same-sex couples who consider themselves "married" can declare their relationships as "married"

if Person 1 and Person 2 check the same sex (either 'male' or 'female') and indicate their relatedness respectively as "household head" and "a spouse of the household head". However, no statistics have been published on the number of same-sex couple households in Japan.

In the first part of the presentation, I will discuss how same-sex couple households are excluded from Population Census in Japan in the enumeration process in which the relatedness of such responses in 2015 is changed to "other relatives". Then, I will present arguments by activists and the government on how same-sex couples should be treated in the census. I will also introduce the actual experiences of receiving and answering the census form by individuals living with a same-sex partner based on interviews I conducted.

In the second part, I will introduce the results of a preliminary analysis of a person's same-sex couple status from a population-based study. The study was conducted in Osaka City in 2019 under the project "Demography of Sexual Orientation and Gender Identity: Building a Foundation for Research in Japan" (Grant-in-Aid for Scientific Research) headed by the author. Through the analysis, I will discuss the challenges and possibilities of capturing same-sex couple households in the Japanese context.

Who Are More Equal? a Comparison of Legally Married Heterosexual Couples, Cohabiting Heterosexual Couples, and Cohabiting Same-Gender Couples in Japan

The few qualitative empirical studies on relationships of cohabiting same-gender couples in Japan have shown them to be more equal than what has been revealed in research about heterosexual couples (see Kamiya, 2017 and Kamano, 2009). However, there is to date no quantitative or comprehensive study of the relationships of cohabiting same-gender couples nor comparison between same-gender relationships and different-gender relationships or between men and women in same-gender relationships in the same study.

To fill the gap in the field, we conducted an online survey through an internet survey company with the largest number of survey monitors in Japan. We collected a total of 3092 responses that consist of approximately 500 men and women each in three types of relationships: legally married heterosexual relationships, cohabiting heterosexual relationships, and cohabiting same-gender relationships.

Most questions were adopted from the questionnaire used in *American Couples* (Blumstein and Schwartz, 1983), which is to date the most comprehensive in the field that is still applicable today and to Japan. We also added questions on the municipal partnership registration system.

In this presentation, we discuss the pattern of division of various housework tasks and who has more say in various aspects of daily life, among other aspects of couple relationships. Preliminary analyses on housework division show that first, division is most skewed among individuals in heterosexual marriage and least skewed among individuals in same-gender cohabitation, with that of cohabiting heterosexual couples in between. When income differences within couples are considered, the partner with the lower income, regardless of gender, was found to prepare dinner more frequently in all three types of relationships. In addition to undertaking multivariate analyses to examine determinants of housework division, we would explore if ideas on same-gender marriage and local partnership certificates would affect the relationship dynamics of same-gender couples.

Waiting for Development: Land, Livelihoods, and Lockdown in Rural China

This paper examines how the Covid-19 pandemic has affected rural economies and the livelihoods of villagers in China. Villages in China are not only grassroots administrative units but also the locus of economic activities and the provider of welfare for rural residents. The village government manages the collective economy and supplies villagers with a range of public goods, from healthcare and education to old-age allowance. Since the mid-2010s, the government has launched a campaign of "rural revitalization" to bring capital investments to the countryside. Policies over land use and transfer were relaxed such that rural land can be directly circulated in the market to commercial users, who were seen as agents of rural modernization. The increased prominence of corporate actors has contributed to new developments in the countryside, from commercial farming to rural tourism projects. These have created new job opportunities for villagers and revenue streams for the collective economy. As in other emerging economies of the Global South, however, the pandemic has dealt a heavy blow to rural economies in China. Production was brought to a standstill, while restrictions on movement have prevented domestic travel. Drawing on fieldwork in Nanjing, this paper examines the impact of lockdown measures on villagers' livelihoods and the strategies adopted by state and society actors in addressing the challenges. How have village economies that

are reliant on different types of land-based investment been affected? In what ways are rural households' ability to adapt dependent on the differential levels of political, economic and social capital they have access to? Using data collected from household surveys and field interviews carried out in 2022, this paper sheds light on the variegated impact of the pandemic on rural livelihoods and contributes to understandings of how Covid-19 has affected the geographies of development in Global South emerging economies.

KANAI, Masayuki* (Senshu University, Japan)

The Role of Trust on Wellbeing in Different Social Settings

The role of trust in society is one of the central topics in rational choice sociology as it aims to dissect the relation between micro motives and macro social settings. Evolutionary approaches to trust and society, such as the emancipation theory of trust (Yamagishi & Yamagishi 1994), have been influential in this topic. The emancipation theory expects that bridging trust, like generalized trust, prevails more in industrialized societies with high opportunity costs than in traditional societies, in which bonding trust like trust in the family is more adaptive. Most of the empirical examinations of this hypothesis used data from Western societies. Thus, this paper tests this hypothesis in East and Southeast Asian societies, which have rich historical, cultural, and social diversities.

The data were drawn from the Social Well-Being Survey in Asia, 2015-2017 (International Consortium for Social Well-Being Studies 2020), which covered seven East and Southeast Asian societies. The sample size of each society ranged from 995 to 11,786. We used subjective wellbeing as the dependent variable to operationalize the payoff of trust for individual actors that the theory assumes. Bonding and bridging trust as independent variables are operationalized as trust in the family and generalized trust, respectively. Demographic and socio-economic characteristics such as gender, marital status, and working status were controlled in the OLS regressions in each society.

The results showed that bonding trust has a significantly positive effect on subjective wellbeing in all East and Southeast Asian societies, but bridging trust has a positive impact only in East Asian societies. This finding suggests that the emancipation theory of trust is also supported in Asian societies, which are diverse in their social settings.

Becoming Citizens and Changing the Citizen: Dual Strategy of Mental Disability Movement in South Korea

While the exclusion of a minority population works as a strong motif for protest, it limits a movement's expansion by removing human and material resources. The mental disability movement in South Korea clearly demonstrates this dilemma. This movement has had severe difficulties mobilizing resources, leading the movement to start decades later than other disability movements.

How did the South Korean state and society render these difficulties, and which strategies the mental disability SMOs adopted to overcome them? To explain this, the author interviewed seven activists in Seoul and collected original archival data from the government, Seoul city, and two mental disability SMOs.

My analysis based on grounded theory reveals that society's active adverse response and passive non-response caused obstacles to the mental disability movement. In response, the mental disability SMOs have taken a dual strategy, struggling simultaneously to become citizens and to change the notion of the citizen. With the former, they have attempted to show they are also competitive, capable, and safe people, which is the 'suitable' citizen whom society can regulate. Meanwhile, with the latter, they asserted they deserve basic civil rights even though they have mental disabilities and do not have as much productivity as others.

The author argues this dual strategy resolves the dilemma in two ways. First, it encompasses both the liberal and social democratic regimes, traditionally regarded as incompatible. Secondly, by becoming citizens, SMOs mobilize resources by cooperating with the state. However, by expanding the eligibility criteria of becoming a citizen, SMOs affect the mass and the state's perception of the mentally disabled. This study is expected to propose a successful strategy for SMOs without abundant resources, and to establish a desirable relationship between the SMOs for the socially marginalized and the state welfare institutions.(The comparison with Japanese case will be suggested and presented)

KANNABIRAN, Kalpana* (, India)

Beyond Hubris, Triumphal Pageantry and Whataboutery: Re-Notating the Secular for Our Times

Insurgent imaginations of sororal, queer fraternity, convivial living, radical equality, and cultural pluralism abound in scholarship about India – as also histories of political violence, sectarian strife, democidal violence, colonisation, impunity, and graded inequalities with the heightened everyday violence of normal times – all deeply gendered. Discussions around secular worldviews, 'tolerance,' the annihilation of caste, majoritarianism, minority rights, secularism, religious conversion and state have been embedded in these spatio-temporal contexts, intensely animated at times, more everyday at others. The constitutional imagination of secularism has been central to these deliberations since the founding of the republic. Now 75 years old, the memorialising of this founding has ranged from triumphalism to deep reflections on the meanings of freedom, *azaadi-swaraj*. In thinking through secularity in India at this time, the constitution of India serves as my point of departure. Migrating it out its enclosure in courtly habitations and towards symbolic action, collective mobilization, strategic litigation, parliamentary processes, political praxes and literary performance, enables a conversation on the possibilities of a deliberative, transformational and insurgent citizenship and an idea of justice that moves beyond reductionist denominational declamations. A close look at the micropractices of resistance (performative and discursive) in different locales in different socio-cultural, linguistic and denominational contexts has the potential of unforeseeable, discoveries of vernacular archives of secular praxes with lessons for our present-futures.

KAO, Ying-chao* (Virginia Commonwealth University, USA)

Toward a "Liquid Sociology" of Modern Conservatism: Theorizing the Anti-LGBTQ Movements Flowing between Taiwan and the United States

Taiwan became the first Asian country to legalize same-sex marriage in 2019. However, during Taiwan's "culture war" and societal debates on LGBTQ rights and sexual citizenship, anti-LGBTQ politics has risen in Taiwan. It shows a sign of the anti-LGBTQ politics in the US and the anti-gender ideology movement in Europe having expanded to East Asia and impacted Taiwan—the "beacon for Asian gays" endorsed by the *New York Times*. This article, a chapter from my book manuscript, established a seven-dimensional framework that I call "liquid conservatism" to go beyond the Euro-American-centric anti-LGBTQ movement studies and re-conceptualize the dynamic, fluidity, and mobility of moral conservatism through the lenses of Zygmunt Bauman's "liquid modernity" theory and the tradition of *Liquid Sociology*. To liquify the rigid thinking of moral politics and religion-based activism, the "liquid conservatism" converges seven conceptual streams, including transnational flows, sexual fluidity/flexibility, non-linear temporalities, multi-institutional analysis of social movement, contextualized ideological politics beyond the left-right spectrum, racial politics and diversity of conservatism, and the dynamics of spiritual and charismatic/ Pentecostal deconstructions of traditional religious and denominational boundaries. Theorizing transnational anti-LGBTQ activism through the "liquid conservatism" framework helps to reconfigure the US-based sociological theories of anti-LGBTQ politics by hybridizing them with the trans-disciplinary studies of geopolitics and globalization/transnationalism, queer and feminist theory, decolonial time, social movement and contentious politics, critical race/ ethnicity theory, and transnational religions. This conceptual move challenges the methodological nationalism assumed in the US-based studies. It also provides a seven-dimensional framework to analyze and explain anti-LGBTQ activism *not (only)* as a domestic issue, but *also* as a globally mobile regime and sex-political institution that has been flowing between Taiwan and the US (and across other national borders) by reconsidering its rigidity and liquidity in the *geopolitical/geographic*, *sexual*, *temporal*, *institutional*, *ideological*, *racial*, and *spiritual* dimensions fluidly and flexibly (the "Geo-STIIRS" model).

Mediating Effect of Institutional Trust on the Public Attitude Toward State Surveillance.

Previous studies indicate that attitudes toward implementing government surveillance systems to collect personal information are affected by privacy concerns, perceived impacts and need, effectiveness of the system, and transparency in the process. Few studies examine how orientations toward individualism and collectivism might affect attitudes and the extent to which trust in institutions moderates attitudes. This study posits and tests an explanatory model to investigate the extent to which institutional trust and cultural values of individualism and collectivism affect support for surveillance systems. The results, based upon a U.S. nationwide survey, show that individualism and collectivism intensify concerns about personal privacy and social justice. Further, institutional trust not only has a positive effect on perceived social justice, but moderates views consistent with surveillance and further enhances support for using surveillance. Implications of the findings are reviewed with respect to understanding public support for government use of network surveillance.

Digitization and Confidence in National Institutions in the Gulf Countries

Public institutions are the catalyst for development and the well-being of the citizens of a state. The national confidence in state institutions depends on how they are viewed by the public as fulfilling their mandate to the benefit of the society. The new technology spread and digitization of all the life domains make an impact on public opinion on government efforts and public institutions. This paper aims to highlight the relationship between digitization of society and confidence in the national institutions in the Gulf countries. Based on the WVS data of the recent wave 2017-2020, the research results demonstrate that there is positive correlation between digitization at the country level, Internet usage and social media usage at the individual level and confidence in police, army, courts, mass media and other national institutions

Labour Market in the UAE: Moving Towards Decent Work?

The paper provides a detailed description of the organization of the labour market in the Arabian Gulf countries. What are the employment contract types? How much is the rate of informal employment in the country? Who is going for part-time work? Which job are most decent ones? All these questions are highlighted in the study. Using both official statistics and Gallup World Poll 2011-2021 the authors estimate the rate of part-time work, temporary employment and informal employment over the last 10 years. The dynamics shows that some of the GCC countries are moving to decent work SDG. Gender differences in employment patterns explain most of the trends in the country.

KARAKAYA, M. Fatih* (Istanbul University, Turkey)

"Restructuring" the Consumer Credit: A Frame Analysis of Non-Performing Loan Market in Turkey

In the non-performing loan market, buyers are those specialized companies purchasing bad-loans of banks and other financial firms for pennies-on-the-dollar. These bad-loan buyer firms either attempt to collect the debts or package these assets and sell to another bad-loan buyer firm. Because the majority of the consumer credits (60% in Turkey) are unsecured loans, historically, non-performing consumer loans are the major part of the NPL purchases. Since the volume of the consumer credit market in Turkey is eighty times higher than the volume at the beginning of the millennium, NPLs have become a troublesome fact for the financial sector. After the 2001 banking crisis *Savings Deposit Insurance Fund* set the scene for selling the NPLs to so-called asset management companies (AMCs). By 2008, private banks have started selling NPLs to those AMCs as well. With a 20 % growth per annum between 2008 and 2019, Turkish NPL market reaches $50 billion today.

However, defaulted borrowers have no say in whether and to whom their debts are sold. They just receive phone calls, letters, and e-mails from an AMC that offers a hand to save them from an ongoing default. Although the promotions of AMCs underline their well-mannered staff kindly helping borrowers in getting rid of the burden and stigma of defaulted debts, there are many complaints about the quality and the language of the services of AMCs. Thus, the encounters and interactions within the collection process still have the mixed taste of stigmatization, marginalization, harassment, discrimination, negotiation, solidarity, compromise, forgiving and so on.

This study aims at employing a Goffmanesque frame analysis to the mediated encounters and interactions via phone calls, letters, and e-mails to understand how AMCs *restructuring* both the formal and the informal default patterns of personal debt relations while restructuring the non-performing loans.

NINA-PAZARZI, Eleni (University of Piraeus, Greece)

Does Participation in Modern Day Work Unions Improve Job Equality and Democracy?

Uncontestably work unions are the genuine factor improving job equality as key expression of social and gender equality. Who ignores the fact that women's social position has widely differentiated towards really better life standards because of enhanced socialization through multiplied participation at work?

As history shows, employees' organization (firstly in trade unions and secondly in associations of labour unions) generally managed to diminish demonstration of domination in workplaces whilst helping women, youth and any powerless. Participation goes always parallelously with justice and any aspect of positive change.

Nowadays, various Social Economy enterprises and organizations deal adequately with the actual way to spread democracy at work. In important and necessary areas, from upgrading buildings' capacity to upholding corporate governance models and from participatory governance in social enterprise to maintaining an interactive organizational behaviour against casual uncertainty, responsible action is taken. Certainly, set limits are well prescribed by legal framework, when civil and social state is present, as long as rule of law principle is fully respected.

Analysis of social movements in France, Europe and Latin America, their sui-generis "cradle" and usual "fermentation space", respectively in common notion, proves that the best argument versus resurgent authoritarianism era is providing opportunities to everyone. Such an associative policy would never become the fieldwork which finally makes it easier for authoritarian regimes to exist and "flourish". Any type of inequality, from gender to lack of respect for different culture, is to blame for all kinds of conflicts.

Covid-19 pandemic changed thoroughly whatever concerns health and security worldwide. Interprofessional committees' collaboration and citizens' self-organization constitute best solutions for contemporary problems. Groupworking into a multicultural context connects uniquely urban collective action to traditional rural community. Transition to green and digital economy, adoption of a climate-friendly sustainable growth along with tolerance for migration issues evolve as modern challenge.

Small Modular Reactors and the Spatial Distribution of Risk: Local Perceptions on the Novel Decentralised Model of Nuclear Energy Expansion in Canada and Finland

Interest in nuclear power has greatly increased in recent years, at an accelerating speed in the wake of the Russian invasion in Ukraine. Nuclear energy is frequently presented as a vital means to 1) cut carbon emissions and 2) enhance energy security. However, the formidable difficulties faced by large nuclear power projects in the West has spurred the search for new solutions. Key among such promised solutions are the Small Modular Reactors (SMRs), usually with a capacity of 10-300 MW and produced via modular assembly-line model. Proposed for a range of end uses beyond mere production of baseload electricity (e.g., district heating, desalination, hydrogen production, local power for industry installations or urban agglomerations), SMRs promise to be cheaper, safer, quicker to deploy and more readily accepted by local populations than their large predecessors. However, SMRs pose major new challenges for local acceptance and risk perception: to be economically viable, such reactors would have to be sited near population centres, in large numbers, yet it is far from certain that SMRs will avoid the kind of vehement local opposition that has often obstructed nuclear energy projects.

This paper addresses the thus far little researched question of local perceptions concerning SMRs, presenting the results of the four opinion surveys amongst local residents near proposed SMR facilities. The surveys were conducted in 2021 and 2022 in the Helsinki metropolitan area in Finland and Saskatchewan and Ontario in Canada. We analyse residents' support for SMRs, risk perceptions, trust in safety regulation, and views concerning SMRs in comparison with other energy sources. The paper provides vital insights into the local-level acceptance challenges faced by the promised nuclear revival, by analysing opinions in varying geographical locations, in two high-trust countries with advanced plans for SMR development and deployment, and populations relatively favourable to nuclear energy.

Leading in a Hyper-Masculine Organization: The Gendered Leadership Selection Paradox

Why do women receive equal or better performance ratings than men in managerial assessment centers (MACs) even when they are structured in ways that systematically disadvantage them? This study provides the first attempt

to understand this MAC gender paradox using a multi-method approach in a large semi-military governmental organization. In the study we have access to quantitively data from the organization HR of the demographics, 60-degree feedback and performance scores of 1031 managerial candidates assessed in the MAC over 10 years. We also conducted 30 in-depth interviews with MAC evaluators, that were conducted in person and lasted between 45 to 90 minutes. The interview focused on questions such as: What was your experience with men and women in the assessment center? What were the differences between men's and women's behavior and performance? Do you think you behave differently toward men and women at the center? How would you characterize the women who come to the center as compared with the men?

The study revealed that the MAC was a gendered environment in which organizational practices, language used, and the underlying logic establish and reinforce men as assertive or protectors and women as weak and in need of protection. In accordance with the MAC gender paradox, women were successful at the MAC despite systemic bias against them. Interpretive analysis revealed that women candidates generate discomfort which evaluators alleviate by increased attention to the extent to which they conform to gender ideology. We coin the term benevolence effect to describe evaluators' tendency to over-valuate and advance women candidates who conform to traditional stereotypes of white femininity. The benevolence effect paradoxically contributes to the preservation and perpetuation of the sexual binary and the idealization of the abstract manager as male-bodied in the organization, even as it contributes to the promotion of women.

The Relationship between the Christian Mission and Israel As a Modern Jewish Nation State: Israel's Response in Light of Christian Missionary Activity, 1948- 2008

Converting Jews to Christianity has always been an objective of Christian missionary activity. Although non-coerced Jewish global conversion to Christianity was uncommon across history, each case shocked the Jewish community, and led to ostracizing the converted people socially and culturally. The Jewish motivations for conversion were various, such as gaining access to certain privileges and genuine choice.

Christian missionary activity among Jews in the land of Israel intensified during the 19th and 20th centuries. The establishment of the State of Israel and the mass immigration of Jews in the early years of the State altered. The theological ideology on the Protestant Church circles, who interpreted these developments as the fulfillment of Biblical prophecies. As a result, Missionary organizations began to act more vigorously in Israel and succeeded in converting some Jews.

This increase activity in Israel was perceived by Jewish religious groups as a threat to the religious and national identity of Jews in the country and created a great deal of concern.

Here we question whether there is ambiguity regarding Israeli institutional response to the activities of the Christian missionary organizations and demonstrate various aspects of the official Israeli position towards Christian missionary activity in the country. We will also relate t o the following issues: Which elements in Israeli established NGOs in order to combat missionary activity? How do they act? What are the reciprocal relations between the State and these organizations?

Patterns of Employment and Use of Social Benefits and Services Among Persons with Partial Work Capacity

In this study we examine patterns of employment and social benefit and service use among persons with partial work capacity. It is estimated that in Finland, at least one fourth of working age people have health-related impairment that is negatively affecting their work life participation, and over 65,000 people are outside of work force due to health reason although they are willing to work. Despite various labour market programs aiming to facilitate the employment of persons with partial work capacity, their inclusion in the labour market remains a challenge. Previous studies often focus on specific programs or benefits, however, less attention has been paid on how different subgroups of persons with partial work capacity navigate in the social security system.

In this retrospective study we use register data on individual's employment, services (use of health care and employment services) and social benefits (e.g. unemployment, social assistance, disability and rehabilitation benefit) that covers the whole working age population (18 to 65 years of age) living in Finland in year 2020. Age, sex and socioeconomic status will be considered as background factors. The follow-up period is from 2005 to 2020. In the analysis, a person is defined as having partial work capacity based on information on their sickness and disability allowance spells and use of health care.

Our study not only provides information on the various subgroups of persons with partial work capacity in terms of their service and benefit use, but it also sheds light on a wider question of how persons belonging to a vulnerable group in the labour market are protected by the welfare state. In addition, the study benefits policymakers in planning multisectoral customer-orientated service and benefit pathways to support work capacity and increase sustainable participation to working life and opportunities for those with partial work capacity.

KARNER, Tracy Xavia* (University of Houston, United States)

Access and Permission: The Rules of Visual Representation

What can we photograph? Who gets to be visible? Who is left invisible? Answers vary by governmental regulations, organizational IRBs, legal counsel and academic disciplines. For visual researchers, negotiating the morass of regulations often leaves certain segments of social life off limits as institutional procedures designate what can be studied from what cannot. Scholars have long debated this politicization of representation in ethnographic fieldwork and the role image creation can ethically play in visual research. In this paper, I posit that a latent consequence of human subject regulations is to deny visibility to particular populations and social situations. IRB procedures engender specific systems of representation that dictate both who can be included in research and thus, what can be known. Much past work used passive covert methods to contribute key insights to our sociological body of knowledge. Those, like Goffman's seminal study of Shetland islanders (1956), would not be approved under current human subject regulations. Drawing from my work alongside a documentary photographer in Kakuma refugee camp, components of the informed consent process are problematized and weighed against the appropriateness, and perhaps the moral imperative, of ethical visual representation. Discipline specific ethical guidelines (ISA, ASA, IVSA) are in stark contrast with those of documentary photography associations. Contemporary US human subject regulations are based on a biomedical model where informed consent consists of providing subjects with information about the research project, purposes and procedures, and any risks, benefits and alternatives. In contrast, documentarian and photojournalism guidelines focus on accuracy of images (eg, not staged or manipulated) with no need to inform subjects of the possible uses of their image nor their need to sign consent forms. In sum, what we lose seems to depend on how we label our work--as scientist or photographer--which dictates what becomes visible and known.

KARNER, Tracy Xavia* (University of Houston, United States)

Museums, Festivals, and Scenes: Building Community Around Photography

Photography, in Houston Texas, provided the impetuous for an inclusive community that bridges classes, generations, and geographies as well as reflecting the racial diversity of the city. This project chronicles the origins of this photography community within the broader context of Houston and traces its evolution from a small group of interested individuals in the mid 1970s to its international recognition as an important designation for photography a little more than a decade later. Data were collected through qualitative methods of participant observation, intensive interviews and extensive archival research. Insights center on the development of three core institutions: the Photography Department at the Museum of Fine Arts Houston; FotoFest, one of the largest international photography festivals in the world; and Houston Center for Photography, a membership-based photography organizations. While each organization played a different role within the community, by focusing on the common desire to create interest in, and an audience for, photography, leaders found collaboration mutually beneficial and were generally supportive of the activities of each other. Analysis of the intersectionality of power relations among both members and organizations as they encountered opportunities to compete, inter-relate, and cooperate are discussed. Additional exploration of how tensions among organizations, stakeholders and members provide a broader understanding of how power was exercised at different stages of the community's growth. Five key themes emerge as important drivers of success: accessibility of photography as an art form, professional experience and personal connections of the key leaders; longevity of organization founders; historical timing and local entrepreneurial culture of Houston. Charting the shift from regional interests to international recognition within a broader organizational analysis, the Houston case provides an insightful look at how a diverse and vibrant art world came to be.

Citizen Participation and Online Environments after a Crisis of Democracy: Lessons from Iceland

The aim of this research is to analyze the role of the Internet in modern politics in order to establish its transformative potential for well-established democracies that have recently experienced profound political crises based on a case study of Iceland. A number of studies highlighted the democratizing effects of the Internet such as greater governmental transparency (Best and Wade 2009; Groshek 2009; Howard 2011), greater civic offline engagement (Boulianne 2015), among others, in civic dialogue (Coleman and Blumler 2009, 12); improving information dissemination and exchange between governments and other organizations and citizens (Tsagarousianou 1999). This study aims at establishing the transformative potential of the Internet long-term after a democracy has experienced a major crisis.

Indeed, Iceland may offer fresh evidence in this regard. The country was deeply affected by the financial crisis in the years 2008-2011 that, among others, implicated a number of politicians. The economic downfall and the inadequate response of the politicians, "created serious mistrust in the political system" among Icelanders (Arnason, 2016). Furthermore, the year 2016 saw another political crisis as the largest anti-government protests in Iceland were staged over the implication of top Icelandic political leaders in the Panama Papers scandal, and in 2017 over a government sex scandal coverup. These developments that undermined the trust of citizens in the political leadership led in recent years to popular mobilizations, rise of contentious politics and attempts of the public at reforming the political system through civil society engagement. The Internet has played in Iceland an integral part in these processes. It is important thus to study to what point the Internet has served a tool for a transformation of politics in such cases. This paper is based on interviews of Icelandic activists from the national politics, local governance and grassroot organizations.

Being Essential but Foreign. the Lived Experiences and Coping Strategies of Migrants Working in Poland during the COVID-19 Pandemic.

Even before the COVID-19 pandemic, migrants in Poland were in a relatively weak position in the highly precarious labour market. The pandemic crisis highlighted these inequalities, but at the same time provided an opportunity to highlight the 'essentiality' of the low-paid jobs that migrants were relatively more likely to have. In our paper, we draw on biographical narrative interviews with migrants working in Poland during the COVID-19 pandemic in selected industries, which were considered essential for the survival and reproduction of our societies during the lock-downs, i.e. care, transport and retail. In particular, we recall and analyse the lived experiences of frontline work during the pandemic as well as at the dynamics between overlapping micro-crises imposed on interviewed migrants culturally, institutionally and structurally. Finally, we look at how our interviewees coped with these unexpected conditions and under what biographicla and structural circumstances they manifested resistance, resilience or resignation.

The paper presents the preliminary results of a research project "ENDURE: Inequalities, Community Resilience and New Governance Modalities in a Post-Pandemic World" co-funded by the National Science Centre, Poland as a part of the Trans-Atlantic Platform RRR Call 2021.

Making of the Essential Workers? the Twitter Discourse of Polish Trade Unions during the Covid-19 Pandemic.

The COVID-19 pandemic, on the one hand, highlighted inequalities in labour market and, on the other hand, was seen as a chance to improve the working conditions of relatively underprivileged workers, who were deemed to be 'essential'. The emergence of new categories such as 'essential', 'key' or 'frontline workers' in the broader discourse has opened up the opportunity to increase the discursive power of labour and to mobilise workers around these new names and identities. However, its effectiveness depends on the strength and sustainability of the new framing. In my article, I will analyse the evolution of the work-related discourse on Twitter in Poland during the first year of the COVID-19 pandemic (2020/2021). By reaching for quantitative and qualitative analyses, I trace the ways in which unions have portrayed labour on social media, with a special focus on the discussion around essential and frontline workers. I then juxtapose the results with 'non-unionised Twitter' discourse (including campaigns of gratitude to essential workers), looking at the directions and intensity of the flow of identified concepts. Finally, an attempt will be made to identify the institutional, structural and

cultural obstacles that have stood in the way of translating social media discourse into real actions aimed at improvement of working conditions. The paper is the result of a research project "ENDURE: Inequalities, Community Resilience and New Governance Modalities in a Post-Pandemic World" co-funded by the National Science Centre, Poland as a part of the Trans-Atlantic Platform RRR Call 2021.

The Infraordinary Life of Researchers: Meeting Places and Scientific Culture in the University-City of Lund, Sweden.

In this paper we are interested in how the growing University, i.e., the University as a place of increasingly urban dimensions, affects the infraordinary life of researchers. We here focus especially on the transformation of mundane meeting places (old and new), where researchers across disciplines might meet. In the paper, we are thus looking into changing territorial landscape of research and disciplines and its relation to everyday life, including the effects of new interdisciplinary venues, the introduction of new public spaces and transport within the University area, etc. The paper takes Lund University as a case and uses different methods, such as Perec-inspired observations studies and time-geographical notations. Lund University is currently undergoing a large-scale expansion and transformation in relation to the building of the European Spallation Source (ESS), which allow us to contrast the infra-ordinary chores of researchers with the large-scale visions and strategies of European and Swedish research politics.

The Future As a Public Good

The purpose of this paper is to nurture reflections on the colonization of the future in the present with a particular focus on Africa. This paper aims at exploring how participatory research and particularly anticipatory action research can contribute to a decolonising process.

Considering the future as a public good, this paper develops a reflection on the colonization processes that can turn it into a club or a private good. This paper mobilizes the notions of participatory knowledge production and local action research as a way to decolonize the future and empower imagination. This paper revisits the tenets of participatory action research as a means to achieve this objective and discusses the main features of a non-colonial anticipatory action research in the context of African futures.

This paper highlights the challenges associated with connecting anticipatory endeavours focusing on action research, the creation of collective intelligence and co-design, with the intention of encouraging the decolonisation process. It includes design principles and anticipates a possible process of counter-decolonization.

This is a conceptual paper, which does not provide field-tested evidence. Yet, the authors hope it serves as an input enabling to design methodologies that will prevent the colonisation of the future when engaging in future-oriented research activities in Africa and elsewhere.

This paper provides an integral approach to the colonisation of the future, as a renewed old question. This paper also connects this process with a reflection on the nature of what could be non-colonizing anticipatory action research.

What Social Policy Is Expected By the Middle Class? the Universal Conditions and Local Experiences Based on the Diaries.

An analysis of the social policy needs of the middle class was carried out on the basis of three diary contests completed in Poland in years 2016-2022: among Poles who experienced unemployment (373 diaries), the ones during the first (448) and the second wave (250) of the COVID-19 pandemic. The authors of the collected diaries are mostly people located in the middle of the social structure, with the higher education, with the overrepresentation of women.

Their stories highlight a threatened sense of security, status and identity instability, sense of inequality (in comparison to the more cared ludic class)

denotes a presenting author. Abstracts are organized by first presenting author's last name.

and express claim for the access to the essential social services to be offered through a common system with the high-quality. At the same time women express needs to be treated with dignity, considering their life aspirations, with the available choices, which are linked both to the active protection on the labour market, but also to the available social services. The analysis takes into account the depiction of the universal conditions that nowadays condition functioning of the middle class representatives, which we confront with the experience of a post-communist country.

Crisis situations such as periods of unemployment (sometimes "by choice" after a period of professional exploitation) or COVID-19 pandemic create the conditions for claims communicating to the state. A tension appears between the expected quality of life and the ability to fulfill middle-class aspirations (including independence through the purchase of services at the market) and the need for support. This tension is often linked to a sense of depletion and the "torment in the game of survival" (not status only).

We present how values, norms and needs resonate with the availability of services and state policies, in which the middle class is treated as a possible bypassed recipient of the offer.

Social Logic in Gabriel Tarde: An Intersection of Sociology and Philosophy

Gabriel Tarde, who is the subject of our intervention, is known for his sociology of "imitation". In contrast to Émile Durkheim, his opponent, Tarde's thought is not limited to sociology proper: in fact, Tarde's sociology does not do without a philosophical foundation. In this perspective, our intervention is close to the "social logic" in Tarde, because his "logic" is nothing else than the intersection of philosophy and sociology in the his thought. In the sociological doctrine of Tarde, we find that logic plays a considerable rôle, especially for the formation of the social reality. An infinity of imitative flows combine each other, for more and more *logical harmonies*, avoiding the contradiction. This is how the social reality is formed according to the logic. We underline that this kind of logic is based on our "belief", that is to say a variable degree of affirmation. In other words, according to Tarde, the logic does not deal with the absolutely true proposition, but more or less probable one. This psychological point of view allows the Tardian logic to deal with the concrete judgment in our social life, which is subject to the influence of others. But, the belief in the Tardian sense is not only psychological, but also ontological, which means that the belief is nothing more than the degree of reality itself: sufficiently solidified by the logical combination with other beliefs, a belief becomes a reality, no longer a possibility. Thus, the logical formation of social reality is based on the ontology of belief. We try to investigate Tardian logic, as well as on its ontological significance, and thereby to understand how Tarde established sociology as a "science", during the first formation of the sociology in France.

Older Adults' Civic Engagement in Various Way: Based on Their Life Histories and Local Newsletters

Japan has an extremely high aging population. The birthrate is also declining rapidly. In this context, it is important to view the elderly not only as recipients of support, but also as proactive and autonomous actors who contribute to the resilience of local communities. In this presentation, a community of about 3,000 households in Shiga Prefecture, one of the many "new towns" that were built in Japan especially in the 1970s, will be used as a case. The land was created by carving out a mountain, and was uninhabited before the town. Therefore, people had to build the community themselves, and still do not see any traditional customs such as festivals and ceremonies, etc. Households that moved to the area in their 30s in the 1980s are now around 80 years old. Therefore, I conducted a life history survey of 25 elderly persons between the ages of 75 and 85, and examined the diversity of their involvement with the local community, while also confirming life events such as marriage, employment, and relocation. In addition, all monthly local newsletters from 1977, when the neighborhood association was founded there, to the present were collected and databased for quantitative text analysis. The results showed that (1) the elderly contribute to various activities such as volunteerism, self-governance, and support for the lives of their children; (2) although the elderly themselves do not see a direct relationship between the work they did in their youth and their current activities, they are strongly influenced by the way they form connections, their attitude toward projects, and the process of organizing; and (3) newsletters are useful for capturing the atmosphere of a community, but it is difficult to analyze individual lives, and life histories are the opposite, so it is effective to use them in a complementary manner.

KASAI, Yoshinori* (Keio University, Japan)

Voluntary Association As a Predecessor of Resident Self-Governing Bodies in Japan

In Japan, there are resident self-governing bodies, *Jichikai*, throughout the country. One of the main reasons for the existence of those organizations throughout the country is that those organizations were created or reorganized top-down for the purpose of national control during World War II. This has led many to understand that the predecessors of today's *Jichikai* are the end organizations of the wartime wing of the system. However, these organizations were not created from scratch during the war, and many of them utilized organizations that existed in village communities before the war. However, such organizations are still considered to be symbolic of the feudalistic and patriarchal Japanese village community of the prewar period. Against this backdrop, this presentation focuses on the *koh*, associations that existed in many places but was created on a bottom-up basis. There existed an extremely diverse range of *koh* in local communities, including those based on religious beliefs, those for intraregional finance, and those for professional groups. Among them, *Ise-koh*, a religious organization for joint pilgrimages to the famous *Ise Jingu shrine*, were organized nationwide. In this presentation, I analyze five existing *Ise-koh* in a village in Shiga Prefecture, Japan, by collecting the account books of *Ise-koh* from the 18th century to the present from residences. As a result, it became clear that in this village, the *Ise-koh*, a religious and voluntary organization, had an important continuity as a predecessor of the subsequent *Jichikai*. This is in sharp contrast to the view of the autonomous community association as controlling and top-down. To supplement the research, (1) a GIS analysis using some 19th century old maps was conducted to identify the spatial extent of the villages, and (2) life history and folklore surveys were conducted to clarify the regional characteristics of contemporary society.

KASAPOGLU, Aytul* (Baskent University, Turkey)

A Relational Sociological Evaluation of Forced Migration, Which Has Become a Disaster in Turkey and Consent-Based Remigration

Turkey has conditionally signed the 1951 Geneva Convention, it treats only those who come from the West as refugees. Therefore, while some of them, such as Syrians, are under the status of "temporary protection", live illegally in almost every province of Turkey and are highly involved in working life. Even though Turkey made legal regulations regarding foreigners in 2011, unfortunately, the immigration problems are overly politicized by the conservative government in power and are made into domestic politics with Islamic discourse. On the other hand, in a deep economic crisis that Turkey has never experienced in its recent history, attitudes towards immigrants have also changed due to the use of immigrants as cheap labor in the choice of export-based economic model. Some see cheap immigrant labor as the main cause of unemployment and want them to be sent back, while others think that the Turkish economy would worsen if there were no illegal immigrants, or they want them to stay by employing them. As can be seen from the fact that the current conservative government gives citizenship to immigrants for money, it needs the immigrant vote to win in the elections in the near future. The absence of an official immigration policy of the state in Turkey and the vacillation of the government with short-term self-interested tactics show that the migration, which has become a disaster, cannot be managed. In this presentation, it will be discussed by focusing on differences and uncertainties with a holistic, critical and relational sociological perspective, first by identifying a situation and then by considering short, medium and long-term solutions. In particular, it is expected to contribute to the relevant literature on consent-based non-compulsory remigration policies, as well as the liminal status and differences of immigrants in Turkey.

Forest Fire in Himachal Pradesh: An Environmental Review

Forest fire in Himachal Pradesh: an Environmental Review
ABSTRACT
Nothing destroys the forests and biodiversity like the wild fire. It causes irreparable loss to flora and fauna in the forest. Hill forests of Himachal Pradesh and India are exposed to forest fire every year. Local People often ignite fire in forests to have flush of green grass for their cattle. With the passage of time, population of Himachal grew manifold. It pressurized the forests and natural resources to a great extent. Development and commercial activities accelerated the exploitation process of forest resources and produced heaps of waste material. It is collected and often dumped near forest areas and burnt to ashes. Uncontrolled fire spreads in nearby forests. Sadly, the age-old method of igniting forest fire still remained in vogue. Consequently, pollution level increases everywhere resulting in high ultra violet rays, pollution and other environmental problems. Interaction and discussion with the local people near burnt forests areas of Shimla, Mandi and Kullu Districts supported the above views. The present Paper reviews the traditional mindset of the

Indian people as well as people of Amazon forest towards conservation of forests. The study is based on Historical Method of research. The information processed consists of past and contemporary perspective on the forest fire. Besides consultation and review of the secondary sources, research findings available on the websites are also incorporated in the perspective. Forest resources and biodiversity must be preserved for future generations. Everyone should join hands to control the forest fire. In this context, public awareness and environment education are the need of the hour. For healthy climate and pollution free environment, the forest fires and other devastation must be stopped in Himachal Pradesh, India and the world over.

Keywords: Forest fire, Biodiversity, Carbon, Pollution, Environment, Ecosystem.

KASSEM, Ali* (National University of Singapore, Singapore)

Islamophobia, Racism, and the Modern Condition: West Asia North Africa, Modern Nation-States, and Anti-Racism

Islamophobia has received growing attention over the past years across public, media, and academic debates (Beydoun 2018; Kumar 2012; Lean 2012; Tryer 2013; Green 2015; Saeed 2016; Wolfreys 2016). Throughout, it is often assumed to be a 'western' phenomenon, and its study has almost exclusively focused on cases and happenings from the global north (Yel and Nas 2014; El Zahed 2019; Bayrakli and Hafez 2018).[1] Grating against this assumption, this paper thinks and re-thinks Islamophobia from alongside the lived experiences of people in the West Asia North Africa region. Beginning with a case-study of Islamophobia in Lebanon and extending into comparative analysis across Egypt and Tunisia, the paper argues that Islamophobia is a form of structural, institutional, and pervasive racism in the West Asia North Africa region. Thinking this alongside anti/post/decolonial theorisations of race and racialisation, the paper argues for the need to conceptualise contemporary racism in the global south beyond its Euro-American confines – but as a global historical post-colonial connected phenomenon from which the modern condition itself can be (re)understood. Based on this, the paper asks what role can (or should) the modern nation state, its institutions, and its legal systems in the global south occupy in undoing Islamophobia.

[1] It is worth noting here that this includes writings in English, French, as well as Arabic.

On the Hollowing of Decolonisation and Possibilities for Teaching Otherwise

Over the past years, various post, anti, and decolonial scholars have argued that the (globalised) westernised university model is a specific epistemological model of knowledge production and dissemination both in form and in content (Grosfoguel 2016, Bhambra et al. 2020). Accordingly, many have argued for the need to decolonise the westernised university as committees and projects have emerged, particularly in the Anglo-American academy, to reshape teaching and learning. The key form this has taken has been the so-called diversification of teaching curricula – mainly by adding research and scholars from the global south or historically marginalised communities in the global north. This paper argues that such an inclusion falls far short from liberatory decolonisation and rather often aborts the possibility of such a decolonisation. The inclusion of epistemologically assimilated and mimicking bodies and selves as has standardly been the case, I posit, permits the reproduction of hegemonic oppressive Eurocentric knowledge in the guise of liberation. Decolonisation must be an epistemological – as well as material – disruption and re-construction of teaching curricula through the incorporation of knowledge made through and by bodies situated epistemologically elsewhere. The paper accordingly explores three challenges and barriers to such a decolonisation – language, training, and purpose – and possible means of overturning them within a university setting.

WG08-JS-2.1

KASSERI, Zacharoula* (Hellenic Mediterranean University, Greece)

Conducting Qualitative Research in the Field of Drug Dependence: Emotional Risks and the Vulnerability of the Researcher.

Biographical narrative research has a strong tradition in the field of drug dependence as it provides valuable insight into the experiences of people with substance use problems. Conducting a qualitative study in this field, is a challenging endeavor: it requires not only the theoretical preparation of the researchers but also, they're dealing with strong emotions that may emerge in the research process. Emotions that surface in the research process, however, are not always a topic of discussion in studies about drug dependence: researchers prefer to present their findings, without providing enough information about the setting of data collection. The main reason for this, is that the reference to emotions can easily be perceived as a sign of inadequacy

of the researchers or considered as conflicting with the proper scientific style that an academic paper should have. The development of ethnographic research on drug use and the emergence of biographical reflexivity as a methodological tool for the study of vulnerable social groups, invites the researchers to reconsider their practice and openly discuss their own emotions during the entire study. The presentation is based on biographical narrative research conducted with women in recovery from opioids in a drug-free residential therapeutic community (TC) in Greece. Using examples from this research, the presentation will focus on (a) the emotional dynamics that may develop in the researcher's attempt to gain access to the field, and to gain the trust of participants; (b) the emotional risks and challenges that the researchers may face in the research setting of a therapeutic community and (c) the vulnerability that the researchers may experience in trying to handle the issue of self-disclosure (what kind of information the researcher may share about oneself with the participants) and the impact of the research processes on the participants' lives.

TG03-JS-18.4

KASSIR, Alexandra* (American University of Beirut, Lebanon)

Collaborative Research and Coproduction of Knowledge in the Context of Protracted Displacement

This paper draws on a two-year long academic-artistic collaborative project in Lebanon between researchers, artists, local organizations, and young Lebanese, Syrians and Palestinian refugees who participated in the research program "From education to employment: trajectories of young people in protracted displacement in Lebanon and Jordan" (Centre for Lebanese Studies-Lebanese American University & Centre for Development and Emergency Practice-Oxford Brookes University). Since its inception, our study sought to open spaces for a co-production of knowledge to provide a deeper insight into young people's trajectories and experiences in education and employment. This commitment to work with, rather than on young people, lead to different types of collaborations, and artistic productions including, a collaborative analysis, the launching of a creative writing hub, a yearlong online storytelling and theatre workshop held during the pandemic and the production of a collaborative filmmaking project. Drawing on this experience, this paper reflects on the role of these research-arts collaborations in opening safe spaces for young people in Lebanon, during the pandemic and at a time where an anti-refugee rhetoric is largely promoted by the establishment. It discusses the value and challenges of these creative and collaborative processes and particularly examines the extent to which they expand approaches to knowledge production, bring to light shared experiences, struggles and aspirations too often made invisible by public discourses separating between the "refugees" and the "host communities" and offer opportunities to build enduring connections, beyond the scope of this project

RC09-141.4

KASTEN, Anna* (Ernst-Abbe-University of Applied Sciences Jena, Germany)

Authoritarianism in the Context of Humanitarian Aid for Refugees on the Polish-Belarusian Border

Since August 2021, a humanitarian crisis has been raging along the Polish-Belarusian border. Refugees, especially from Afghanistan, have been prevented from crossing the border into Poland by Polish border guards, making it impossible for asylum seekers to apply for asylum. A temporary barbed wire fence was put up and a year later replaced by a wall 170 km long and 5.5 metres high. In response to these government measures, Polish citizens have begun to organise humanitarian aid. The resulting organisations also include volunteers from the Catholic Intelligentsia Club, who later that year were charged with "aiding illegal migration". The volunteers have since been acquitted.

These humanitarian efforts are threatening to put the Catholic Church on a collision course with the government. On the one hand, the Catholic Church has been the driving force behind Poland's shift towards a nationalist, authoritarian and heteronormative society, on the other hand, her humanitarian aid in this government-created crisis undermines their support for Poland's nationalistic, authoritarian government.

This begs the question: Which agents in the Catholic Church are currently constructing the borders of humanitarian aid and how they are going about constructing them? This lecture is predicated on the premise that said agents' ambivalent practices (providing humanitarian aid while supporting the Polish government's anti-immigrant policy) reveal new forms of authoritarianism, which are forming around current social issues and not so much around agents such as the Catholic Church. These authoritarian agents conceptualise solidarity rather selectively and not intersectionally.

The results of the lecture are based on an empirical analysis, which was carried out by means of the knowledge-sociological discourse analysis, in order to analyse the interactions between discourse, humanitarian aid and border regimes and to work out new forms of authoritarianism.

KATO, Gentaro* (Otemon Gakuin University, Japan)

Self-Restraint As a Measure Against COVID-19 in Japan: From the Perspective of Risk and Morality

This presentation will discuss "self-restraint," a distinctive feature of Japanese countermeasures against COVID-19. When a state of emergency was declared on April 7, the Keidanren (Japan Business Federation) ordered all companies to reduce their workforce by 80%, including teleworking, which was a measure to prevent infection by halting economic activities. However, it was argued from the outset that it would be difficult to control people's social activities under Japanese law. The above directive was not mandatory, and all infection control measures as a matter of policy were carried out in the form of "requests for self-restraint" with no penalties.

This presentation will focuses on the background that self-restraint functioned like a social slogan and the request for self-restraint worked to some extent, from the perspective of risk and morality. Although morality is a social collective representation and has a social function, it is not institutionalized like law or politics. Risk control by morality is generally done from the perspective of good or evil, when some action is the source of risk. Risk is placed on the side of "evil," and the act that poses the risk is immoral.

Considering self-restraint in Japan from this point of view, it is thought that many people behaved in such a way because they unconsciously defined what kind of actions were socially good. Furthermore, those who did not act in such a manner were harshly criticized, and excessive reprovals, which sometimes accompanied the use of force, came to be known as the "self-restraint police". Combined with the Japanese behavioral culture in which people are conscious of the eyes of others, self-restraint as a social norm is thought to have contributed to the prevention of infections while it is informal and non-institutional.

RC12-180.3

KATO, Masatoshi* (Ritsumeikan University, Japan)

Merits and Limits of the Judicial System As a Conflict Resolution Mechanism in Japan: The Case of the Social Conflict in Isahaya City

This paper analyzes the merits and limits of the judicial system as a conflict resolution mechanism. The judicial system is considered to be the most reasonable and reliable mechanism of conflict resolution in modern society. There is no doubt that it works well in many cases. However, in the case of the social conflict in Isahaya City, the courts have been unable to resolve the conflict, actually aggravating the problem.

The social conflict in Isahaya stemmed from the state-run Isahaya Bay reclamation project. After intense discussions, the project was initiated in 1989 and completed in 2007. However, prior to completion, some fishermen took the state to court to stop the project. According to them, the reclamation project affected their catches of fish. After a trial in the high court, the fishermen won. That is, the state was ordered to open a floodgate. Consequently, some farmers of the reclaimed land filed a countersuit to stop the gate from being opened. According to them, if the state opened the gate, farming on the reclaimed land would be damaged terribly. After a trial in the lower court, the farmers won and the state was ordered to keep the gate closed. In short, there were contradictory judicial decisions on the same project.

Why was the judicial system ineffective? Based on process tracing, interviews, and questionnaire surveys, this paper shows that the judicial system could not resolve the complex social conflict. While it focused on the legal aspects of the conflict, the stakeholders asserted the social aspects, such as their own identity. Therefore, in such cases, if the judicial system issues a decision, the concerned stakeholders might not be satisfied. Finally, this study implies that we should create a new conflict resolution system in modern society, and the theories of deliberative democracy provide some insights.

Marriage Attitudes after Marriage Equality

Attitudes toward same-sex marriage in the US have shifted quickly over the last few decades (Kaufman & Compton, 2020). In this study, we examine different dimensions of marriage attitudes to understand whether support for marriage equality suggests a broader shift in who can marry and what marriage means. We ask: what are attitudes toward marriage in a post-marriage equality society? How do people who support same-sex marriage feel about marriage more generally? How do these attitudes vary by gender and sexual orientation? Using data from a national probability-based panel of US adults, we examine attitudes among 2,806 American adults. We use cluster analysis to identify groups of people based on their attitudes toward three dimensions of marriage – general attitudes, attitudes toward same-sex marriage, and attitudes toward polyamorous marriage. Our findings show that marriage attitudes cluster around three groups. The first group – **traditional marriage supporters** – holds positive views of marriage but does not support marriage between same-sex couples or polyamorous unions (28.5%). The

second group – **pro-marriage** – holds positive views of marriage between two people – including both different-sex and same-sex couples – but opposes polyamorous marriage (37.4%). The third group – **post-marriage** – has neutral views about marriage generally, supports marriage between same-sex couples, and neither supports nor opposes polyamorous marriage (34.1%). Gender and sexual minorities are more likely to fall into the post-marriage group while cisgender and heterosexual individuals are split fairly evenly across the three groups. Overall, there is great support for marriage between two people, including across genders. Many who support same-sex marriage still have more traditional views of marriage. No group fully supports polyamorous marriage, but this may see shifts in the future.

KAUNISMAA, Pekka* (Humak University of Applied Sciences, Finland)

Profiles of Participation in Voluntary Activities Among Finnish Youth

The presentation will show interconnections between different types of participation in voluntary youth organizations and other types of involvement in leisure time activities among Finnish youth. It is based on survey gathered in March 2021 N=14 939, mostly 14-17 years old.

The questionnaire contains key variables indicating actual participation in both activities organized by voluntary organizations and other types of activities. The data will provide a detailed picture of participation consisting also the intensity of involvement and engagement.

In the presentation is explored the interconnections between different types of participation (different hobbies, activism etc.) by means of factor analysis. The analysis will lead to different profiles of participation among young people. The results of factor analysis will be compared to other variables that indicate socio-economic position, social and personal resources, value commitments and dispositions of social action.

The presentation will continue with a short discussion on whether different profiles of youth participation connects to indicators of socio-economic background, personal resources, and social inequality.

Further questions base on a set of value and attitude indicators. There will be an analysis of connection between types of participation and different types of value sets (conservative vs. liberal, self-oriented vs. other oriented). Finally, participation is compared to indicators of social resources (e.g. feeling of loneliness, importance of friends, activity of social life).

Overall, the presentations will provide an empirical view to participation Finnish youth, and its relation to values, attitudes and resources.

The analysis is based on sociological concepts of participation, active citizenship, social resources (human and social capital) and inequality.

Changing the Female Biocapital Market Via Reproductive Technologies

This paper is a theoretical exploration of how social changes and scientific developments could change the female biocapital market. The paper uses the framework of reproductive technologies currently in development across the globe, such as in vitro gametogenesis, genome editing technologies, and ectogenesis, to consider what the potential future use of these technologies could mean for the female biocapital market. Discussions are situated in relation to Ulrich Beck's (1992) concept of risk society. First, the paper explores social shifts in cultural norms and values, and how these changes could impact policy changes in the United Kingdom (UK). Suggestions for potential policy changes are grounded by triangulated findings from indicative primary research on attitudes towards human germline genome editing (hGGE) as a reproductive choice. The research consisted of an online survey of a tailored sampled of 521 members of the British public, 13 semi-structured interviews with experts and professionals who could speak to the landscape of hGGE in the UK, and structured interviews with 21 people affected by monogenic conditions. Second, the paper discusses how policies surrounding reproductive technologies influence applications and the use of reproductive technologies in a globalised, transnational market. Finally, the paper considers how reproductive technologies currently being developed may impact fertility tourism, social inequalities, and women's lives.

Covid 19 Crisis and Online Education System: Narratives from Rural Households (India)

Covid 19 has had a shocking effect on the world. The sudden outbreak had increased uncertain deaths and widespread coronavirus. Eventually, the shutdown of all public sectors and schools was also closed. In India first lockdown was followed on 23 March 2020, and the sudden shutdown of all the

institutions. Thus, the online system had become a new mode of teaching for almost two years in India. It became a tough time for both the parents and the teachers, as teachers had to take online classes and provide education to their children. Thus, the present study is initiated to understand the impact covid on children's education through a qualitative approach. For the present study 100 interviews were conducted with the parents of school-going children through a semi-structured interview schedule. In which 50 households of higher caste (General caste) and 50 households from lower caste were taken purposively to see the effect of covid and problems faced due to online mode of education. The data was collected after the end of the lockdown, but an online mode of education was still followed by children. Questions were asked on the number of school-going children, their educational background, type of school, mode of learning, parents' involvement in children's education and problems faced by them during the lockdown. The study found that the online mode of education had an increased burden on the parents as they had to purchase a new phone and borrowed from others to curb the situation. There was a shift of schools from private to government schools to deal with expenditure. Even dropout had also increased in lower caste children because of loss of parental jobs and shortage of money. Children became addicted to social media and more spending on phones. It affected their overall socialization and learning also.

Covid-19 and Return Migration: Increasing Indebtedness in Migrant Families (India).

The Covid-19 pandemic has caused massive shocks and sudden changes in the lives of migrants and their families. A lack of financial resources and a rise in the restrictions on mobility and work resources are two effects that have resulted in massive employment losses worldwide. For this, the study is being conducted to investigate the consequences of the pandemic on migrant households and migrant returnees and their mitigation methods. An ethnographic approach was used on a sample of 200 migrant households in rural Punjab.

The qualitative technique reveals a dramatic increase in return migration and indebtedness among migrant households. The migrant returnees were landless and marginal farmers who worked in the fields daily. However, due to a lack of job opportunities, the migrants took on domestic work. Furthermore, left-behind families often endured increased loans to fulfill their necessities and support the country's migrant returns. Even women faced more burdens in the left behind families due to the non-availability of remittances. As a result, they started working in MNREGS and other labour activities. Women also sold their gold ornaments to deal with the situation. Finally, the investigation found a lack of government action in financial support and protection for migrant returns.

Leisure As Drug Abuse Among Youth

Drug abuse means the use of any drug, to the point where it seriously interferes with the health, economic status, or social functioning of the drug user. In doing so, it acts as an obstacle to social development. The prevalence of substance use among youth is alarming. Young people are not only the victims but also the active participants in the drug trade. Although a multiplicity of factors are behind the participation of youth in the drug abusing and drug trafficking, it has been shaped by socioeconomic vulnerability, violence, intimate relationships and economic considerations. The present paper highlights the issues of drug abuse among youth with a special focus on how leisure boredom plays an active role in drug abusing among youth. The selected area for the study is Punjab district of India. The bane of drug abuse in Punjab has acquired the proportions of a pestilence that has shaken the entire society in the state. It is observed that in Punjab "drug abuse" is a raging epidemic, especially among the young. According to a survey, 66% of the school going students in the state consume "gutka" or tobacco; every third male and every tenth female student have taken to drugs on one pretext or another and seven out of ten college-going students are into drug abuse. The data for the present paper is obtained through secondary sources which include newspaper articles, information by government departments, websites, organizational records etc.

Marginalized Community and Economic Justice

Food security is one of basic and prominent target for the current economic and political policies. All major global economic giants are pursuing bilateral or multilateral economic agreements and deals around this crucial need. Due to prolonged and acute agrarian crisis in the Indian agriculture (which revolved around the Green Revolution) it resulted into death and distress in rural economy in one side and malnutrition and inaccessibility of food on the other side. It is the prevailing reality in the plains of north India, which are supposed to be food bowl of India, since last five decades. This paper deals with the explanatory descriptive analysis of the farmer agitation fought against the three farm bills, which later became a prominent peasant movement in recent past. The study highlights the detrimental phenomenon of economic justice for different strata of society involved in this agitation with varying degree of dependence upon land. Either it is ownership of land, marketing rights or bargaining rights, the economic security of diverse social classes is the axis of social security. Green revolution which acted as technological paradigm shift in Indian agriculture, gave rise to the acute social and economic inequalities which pushed majority at the margins of mainstream economic system. Already captured by brahmnical social order of society, this capitalistic intervention made majority section of society as marginalized in general and distressed the already deprived section with more acute deprivation. No social justice can be there without economic justice is the crux of this paper which highlights the social and economic position of active participants, their targets , achievements and future prospect of this historical movement.

The Impact of Social Media on the Dynamics of Ethnic Community in Rajasthan

The progress of any society depends on the education, philosophy and social media of that community. In the era of modernization, education and social media are changing the culture, traditions, lifestyle and social values of the society which are impacting the personality of people and common mass. Social media as an influential social force, inundated with reality, gives rise to such forces and ideas which have the potential for social change. There is a close relationship between social media and modernization. Some consider modernization as a process and some as a reward. The process of modernization is a multipronged process whereby social change is desirable. It increases the knowledge of the person and it can also control the environment. Sociologists linked modernization with social media, education, social and cultural change in the present context and discuss its importance. In the present research paper, the changes taking place in the Sikh community have been reflected through the modern communication system and modernization. Due to the influence of social media, the migration of the Sikh community took place from Punjab to various states and other countries outside India. As a result of migration, ethnic community is formed, through which participation in social and religious festivals of all other disciplines, talking in Hindi and Punjabi language, and change in fashion and food related habits are studied. Through this research paper, we have tried to sheds light on impact of social media on the formation and lifestyle of ethnic community.

Imperial Frontiers, Sacred Histories & Golden Ages: Tracing Modern Genealogies of Race, Religion and a 'Hindu' Nation

In this paper, I consider the following questions: from where does the religio-cultural mapping of the pluralist terrain of the people-nation of India by Hindu nationalists emerge, which is universal in language and simultaneously antagonistic toward religious minorities? How was the national self-consciousness of India conceived in relational opposition to a religio-cultural Other? Due to colonial expansion and the project of modernization, novel linguistic and cultural frameworks emerged within India that allowed for modern equivocations of public/private and religion/secular to proliferate under the garb of 'Indic tradition' in postcolonial contexts. Exploring such continuities, this paper illustrates the link between race and historical progress in Western philosophy at the root of the colonial imaginary and reveals how Indic scholars foundational to Hindu nationalism have operated upon the modern philosophical nexus of race, religion, history, and nation. Synthesizing scholarly considerations of Kantian natural history and the concept of race, Hegelian ontotheology which linked Kantian conceptions of race and natural history to culture and religion, and the point of culmination in Max Müller's comparative philology, Aryan Invasion theory and conception of a Vedic golden age, I show how modern concepts employed to establish historical, religious and racial difference upon the frontiers of European imperialism crept into the theorizing of modern Hindu revivalists and reformers at the foundations of Hindu nationalism, like Swami Dayananda Saraswati and Swami Vivekananda, who adopted these imperial frames of reference while selectively appropriating caste hierarchies to establish the grounds of 'Hindu' superiority, in racial and spiritual terms. I argue that the rise of ethno-religious nationalism in the Indic context, and the manner by which it orients toward religious minorities, should be understood through colonial contact-zones as Hindu nationalism combined Orientalist and Occidentalist perspectives in its historical imagination of a 'superior' national 'Hindu' community along exclusionary religio-racial lines.

Human Rights of Marginalised Sections in India

Human Rights of marginalised sections in India

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

India is a land of diversity and home to all the religions in the world. It's the second most populated nation but is full of marginalised people who are still struggling to promote, protect and preserve their Human Rights. The concept of Human rights in modern society is defined as every individual being endowed with a few rights that shouldn't be inhibited by default such as freedom, dignity, equality, justice, and peace irrespective of religion, caste, creed, race, etc. But practically these rights are not enjoyed equally by every individual in India as it differs based on some discrimination that comes under the umbrella of Marginalised groups.

Almost every democratic country in the world including India has constitutional provisions for providing equal rights to all their citizens to live a life with equality, honour, and dignity. But India has been facing discrimination since the ancient period which is ascribed by birth and it still continues till date no matter what the legal system defines. The reach of Human rights to marginalised sections is limited by people of higher class and it seems to be inbuilt in genes which is being carried forward from one generation to another in Indian societies. Women are a major part of marginalised population in India and are restricted to rights in both their personal and professional life.

Key Words: Marginalised, Equal rights, Society, Women, Caste

People and Everyday Life with Future Energy Systems: Integrating Qualitative Foresights into Industry Scenarios

In the field of energy, scenarios are used to forecast plausible futures and energy demand, stimulate public debate, and inform policy outcomes regarding energy systems. Industry scenarios are currently dominated by engineering, economics, and behavioural frameworks that determine how social factors and people are modelled. The relationship between people and energy is understood through consumption and technologies, where economic incentives, automation, and digitalisation shape the material impact of energy futures. Critical gaps remain in understanding broader lifestyle trends that may impact energy demand, and in accounting for people's expectations about how their everyday practices may change in the future. Addressing these oversights, and as part of the 4 year Digital Energy Futures project, this paper introduces an interdisciplinary forecasting methodology and resultant scenarios to inform future everyday life and energy outcomes. We outline a methodology for augmenting current approaches to energy forecasting by building scenarios using ethnographic data from households engaging, preparing, and planning to live with energy and emerging technologies. More specifically, our findings and trends were applied to evolve the underlying assumptions of key industry driving forces into key foresighting concepts to produce evidence-based near, medium and far futures. This novel approach to energy forecasting grounds scenarios in the context and constraints of everyday life, where people's energy use and participation in energy systems is contextualised by their household practices and routines. By scaffolding industry scenarios with foresights generated by people, our visions for the energy transition foreground household priorities such as equity, care, comfort, safety, and resourcefulness. The outcomes offer diversified understandings of social uncertainties and point towards new data sets for industry to consider when forecasting people's futures.

Inequality of Housing Recovery after Great East Japan Earthquake Disaster

This paper examined how the pre-disaster socio-demographic characteristics affected the inequality in the permanent housing recovery after the Great East Japan Earthquake. This study analyzed the data collected from a population social survey conducted in Natori City, Miyagi Prefecture, ten years after the disaster(n=899 temporary housing households). The number of days in temporary housing were examined by survival analysis method. Housing recovery trajectories turned out to be determined by such pre-disaster socio-demographic characteristics as age, gender of household head, family size, and tenure status differences. The results showed that the elderly, the single, and the female-headed households suffered from much slower housing recovery speed. The "haves" recovered much faster than the "have-nots". These findings were triangulated by survival analyses of similar Sendai City housing recovery data. These two findings confirmed that pre-existing inequalities explained post-disaster housing recovery gaps. It is discussed that targeted and aggressive intervention programs such as disaster case management program alleviated these gaps.

Reflective Process in Case Conferences: Focusing on Structures That Enable Equal Dialogue

This presentation clarifies the functions and practical implications of the reflective process used at case conferences, in which psychiatrists with different perspectives participate. Narrative Therapy is a new approach to psychiatry, which has been developing since its predominance in the biomedical model. It consists of various approaches with a common philosophy that the therapist-client relationship is one of equality. Within narrative therapy, the Reflecting Team is an attempt to transform the very structure of treatment (Andersen 1991). In the Reflecting Team, therapists, who have previously been the sole observers, become the objects of observation by their clients, and the positions of both the observers and the observed are reflected, generating new narratives and insights.

In this presentation, I describe an application of the Reflecting Team to interactions between therapists to facilitate dialogue between professionals who rely on different theories and ideas. Recordings of interactions between therapists were collected and analyzed in the methodological attitude of ethnomethodology. The results revealed the following. First, with the changing roles of the observer and the observed, conference interactions shed light on what happens in ordinary practice, including what the case reporter is unaware of but does with clients. Second, the reflective process allows discussions between therapists to be understood as advice rather than criticism. This makes it possible to share opinions on an equal standing. Finally, the consideration of the conference scene is not limited to that scene but influences multiple sessions, thereby having effects across scenes and time.

Applying the reflective process to case conferences enables multiple participants to discuss their perspectives, allowing them to reflect on their daily clinical practices and exchange opinions on an equal standing. This empowers therapists to share ways of dealing with cases across positions and generations.

A Hybrid Education and Leadership Development at the National Defense Academy of Japan (NDA)

National Defense Academy of Japan (NDA) celebrates its 70th anniversary in 2022. The joint-service military academy, which was established in a new democratic Japan after WWII, is facing new challenges in the age of hybrid security today. The unique characteristics of NDA include civilian president, civilian-majority faculty, 4-year civilian college-equivalent academic education, with limited military education and training, no obligation to serve after graduation, and required 1-year additional service-specific officer candidate schooling to be commissioned as a Japan Self-Defense Forces (SDF) officer. A hybrid education of civilian college and military academy is the hallmark of NDA. However, NDA needs further adjustment and self-innovation due to security challenges surrounding Japan, in particular, intensifying military concerns in the Indo-Pacific region, as well as diverse and global new missions of SDF, increased operational domains, while facing recruitment challenges with decreasing youth population in Japan. Therefore, NDA continues to work on new visions for institutional reforms, including the "Vision 100" in 2020, and current on-going project involving Ministry of Defense and SDF leadership. In this paper, following a brief historical review of cadet selection, education, and training at NDA, the contents of educational reform visions and expected policy changes are examined in detail.

Living in Two Locations in the Recovery Stage from Fukushima Daiichi Nuclear Power Plant Accidents

Eleven years have passed since the Great East Japan Earthquake and the Fukushima Daiichi Nuclear Power Plant accident occurred. Reconstruction projects of the affected areas are underway, and various types of assistance for victims have already been cut off. But in case of the nuclear power plant accident, reconstruction is carried out without the residents. In the evacuation-designated areas, decontamination work and infrastructure development are carried out by local and national governments, aiming to revitalize the areas to encourage residents to return to their homes. However, after prolonged and dispersed displacement, the reality is that there are many residents who still continue to evacuate or who already have decided to move to evacuation areas.

This study examines the process of rebuilding the lives of evacuees and their current living conditions after the nuclear disaster, focusing on their relationship to the local communities. For this purpose, based on fieldwork in Fukushima Prefecture and interviews with evacuees, this report depicts the lifeworld of evacuees in the reconstruction process after the accident.

This study reveals that evacuees are rebuilding their lives by establishing a new lifestyle of dual life in a wide living area and have chosen to live in two locations, traveling back and forth between the evacuation area and their

hometowns. Many of the evacuees continue to maintain a base of life in the evacuation area even after returning to their original hometowns. Also, those who have not returned to their hometowns still keep holding on their attachment and sense of belonging to their hometowns, and they are more or less maintaining, or hope to maintain, their relationship with their hometowns. It will be important to support staged return and flexible ways of interacting with the community in order to reconstruct the affected areas and victims' lives of nuclear disaster.

Story-Telling Vs. Argumentation. Reconsidering the Importance of Argumentations in Narrative-Biographical Research

The assassination in Hanau has to be understood as a social disaster involving hardship. The collected one-to-one interview data also illustrates this traumatic and traumatizing social disaster from a methodological/methodical perspective. Following Schütze's premises of narrative-biographical qualitative research, narrations would have to follow adequate stimuli. According to the separation of text types, which is also used in the documentary method according to Bohnsack, narrations would have to dominate in order to grasp the practical meaning (Sinn) of actions, and descriptions, argumentations, and evaluations would have to be taken up rather secondarily as background constructions. How can it be understood, if in narrative-biographical interviews some affected individuals answer consistently argumentative, evaluative and/or descriptive? Still, other persons affected by the same assassination produce narrations easier. What is here significant for researchers? How can one capture a practical biographical meaning when investigating about biographical effects of a social disaster in the form of a far-right extremist attack? What practical, social, and individual meaning does it have from a methodological perspective that some of the interviewees functionalize argumentations, evaluations, and descriptions? Text types other than narrations have long been considered only as secondary constructs in narrative analyses or according to document meaning (Dokumentsinn). My claim is that traumatizing social disasters impair the memory and narrative capacity of those affected in the form of a *perversion of the text type priority*. For those affected individuals, the present experience *gains an essential relevance*, because arguing about it, criticizing (evaluating) the misconduct of those responsible, and describing the events do not function as "healing by story-telling" according to Rosenthal, but as **"gaining resistance and resiliency" by arguing, describing and evaluating**. Briefly, the question of how text types can function in interviews about social disasters such as the Hanau assassination is my main interest to investigate.

Uncertain Practices: How Syrian Refugee Doctors Work in Istanbul

Studies of temporary protection policies often focus on how temporary legal statuses produce uncertainties in the lives of status beneficiaries. Less attention is paid to the ways that temporary protection policies shape host country institutions, such that both beneficiaries and co-nationals with other legal statuses are affected. This paper analyzes the case of Turkey, which has extended temporary protection to over 3.6 million Syrians since 2014. While most Syrians have temporary protection statuses, a sizable number of healthcare professionals have, by this point, received citizenship. Their livelihoods are nonetheless shaped by a politics of temporariness: legal healthcare jobs are tied to limited humanitarian projects and equivalency processes end in consular bureaucratic impasses due to tensions between Turkey and Syria, with no efforts to resolve the issue. Drawing on interviews with Syrian healthcare professionals in Turkey, this paper analyzes how doctors in the city of Istanbul attempt to mitigate the continuing uncertainties perpetuated by the Turkish state's ambivalent policies toward Syrian refugees. It finds that doctors are caught between legal stability through the formalization of work and economic stability through informal but relatively lucrative work. In order to attain legal stability, doctors take on low-paid government jobs in Migrant Health Centers or apply for equivalency, though they can only progress to the level of general practitioner. In order to attain economic stability, they work informally as specialists. They legitimize this work by situating themselves as critical providers at both a local and a global scale. They provide care not just to Syrians, but also to other Arab refugees and migrants who live in the city, as well as Arab medical tourists. The paper argues that when stability through formal legal pathways are circumscribed—even for citizens—migrants attempt to stabilize their livelihoods through appeals to alternative legitimating logics.

KAYSERILIOGLU, Erdem* (PhD, Koc University, Turkey)

Humanitarian Aid As an Economic Action: A Gift Perspective

Interest is a key term to formulate economic motives, and we tend to perceive it as "self-interest" of individuals or social classes. Economic and moral anthropology challenges the self-interested conception of economic action by arguing disinterested motives as constituents of market relations. However, this creates a gap in explaining how disinterested sacrificial expenditures create opportunities for self-interested investment. Disaster is a good example to speculate on this discarded problem in economic sociology. Disasters (environmental, humanitarian, or epidemical) call for a solidarity between different polities and institutions. Governments mobilize compassionate sentiments to organize donation and relief campaigns, but these expenditures to save lives bring opportunities to open up a region for transferring aid as well as capital to a crisis zone. Following infrastructure plans aim to ameliorate the environmental and human costs of the disaster, and they require an economic logic to boost an efficient reconstruction through aid and investment. Though appearing contradictory, logics of disinterested and self-interested economic actions coexist in a state-led humanitarianism. Therefore, I argue that humanitarianism constitute an economic action, and I offer gift concept to formulate the coexistence of disinterested expenditures to save lives and opening up a region for self-interested market investment. Marcell Mauss defines gift exchange as a blend of disinterested and self-interested motives. There is a recent literature borrowing gift perspective to explain international relations (Heins et al. 2018; Mallard 2011, 2019) and disaster capitalism (Swamy 2017, 2021). This paper provides a reinterpretation of gift concept and suggests it as a tool to study international humanitarian aid and economic incentives. Finally, I introduce Turkey's humanitarian aid to Somalia's 2011 drought crisis, which mobilized Turkish official and Islamic NGO agencies while creating unexpected market opportunities for an emerging donor country in a so-called failed state.

Return Migrants in a New International Migration Ecosystem: The Interplay of Return Migration, Culture of Migration, and Anti-Migration Narrative, with a Focus on Iran

Return migration has always existed, but its meaning and significance have changed recently as a result of a fundamental change in the international migration ecosystem. We have studied the return migrants' experiences in, and their interactions with, a new migration environment in Iran that is characterized by the presence of three new phenomena: a) 'subjective migration', as a state of mind among the residents of an immigrant-sending country, in which a high number of citizens desire to emigrate but only a small fraction of them manage to do so; b) 'culture of migration', as the product of a sustained and sizeable increase in the number of objective (actual) and subjective emigrants, which turns migration into a stage of the life-cycle and a rite of passage; and c) 'anti-migration narrative', as resistance toward the dominant social trend that is pushing citizens to migrate. In such an environment, return migrants feel forced to come up with a repository of 'effective' responses to migration inquiries, as a way to minimize the social pressures and the risk of social stigmatization. They often take extreme positions against migration and destination countries and justify their return by promoting a reactive nationalist narrative. We draw on three kinds of data: 68 semi-structured in-depth interviews; a nationwide survey on the desire for migration; and the analysis of the discussions on social media (particularly Twitter), using Machine Learning and Natural Language Processing techniques. The findings are presented, along with their implications for a new theory of international migration that corresponds with the contemporary global migration ecosystem.

Secularization of Islam or Secularization of Muslims? the Case of Post-Revolutionary Iran

The discussions about the possibility of secularization and secularism in the Muslim world suffer from a conceptual bias -- that is, their focus on the secularization of Islam, instead of secularization of Muslims. As a consequence, the focus of these discussions has shifted to textual analysis of Islam's sacred scripts and, to a lesser extent, to Islam's history as a reflection of those scripts. One result of this conceptual bias has been the emergence of a semi-consensus that Islam is not compatible with secularization and/or secularism. In doing so, such discussions ignore two major factors/forces: the secular ideals/interests of Muslims that may or may not be compatible with the implications of their faith; and the unintended secular consequences of their otherwise faith-driven decisions and actions. In this paper, I show the shortcomings and conceptual confusion that have resulted from this conceptual blindspot, through a discussion of the religious developments in Iran since the occurrence of its 1979 'Islamic Revolution'. The empirical data show a deep secularization of the Iranian society that extends from the ordinary people's attitudes and behaviours to state's political philosophy, and from the state's foreign policy to the contents and structural position of the Islamic seminaries. These findings offer two implications for the discussions on Muslim world's encounter with secularity: the intermingled nature of sacred and secular, and the need for a shift of discussions from Islam to Muslims. A corollary implication of these two is a need to shift the attention from theological to social.

How Context Matters: Challenges of Localizing Participatory Budgeting in Vienna

Participatory budgeting originally aimed at promoting greater political representation and resource distribution for vulnerable populations. As it globally circulates, however, existing literature points out that its local variations often fall short of proper tools and mechanisms to advance its emancipatory potential. So far, extant research has rarely placed what contributes in different spatial contexts to their divergence. The challenges and the potential of distinctive institutional arrangements and opportunity structures at the urban scale will be our focus. In particular we will investigate how the policy idea of participatory budgeting landed in Vienna at the district level in 2017 (*Partizipatives BürgerInnen-Budget*), with what outcomes, and how it evolved into a city-level project for climate change adaptation (*Wiener Klimateam*). Our paper will explore how the local institutional and structural conditions – including the political backing for such initiatives – influence the motivations, expectations, and experiences among different governmental stakeholders at multiple governance levels, and, in turn, shape the place-specific outcome of participatory budgeting. It unpacks the specific opportunities and constraints of the deployed participatory tools in both budgeting processes, according to three core values of democratic governance (*legitimacy*, *justice*, and *effectiveness*). The conclusion will discuss the potential trade-offs between these three dimensions, arguing that the current form of participatory budgeting may increase legitimacy in the process, but effectiveness in the delivery and the empowerment of vulnerable populations in the outcome less so.

KAZIBONI, Anthony* (University of Johannesburg (UJ), South Africa)

Disengaged Citizenship in Post-Apartheid: A Case of Madibeng Hydropolitics

South Africa attained democracy in 1994 after more than three centuries of colonialism and apartheid. The new state was founded against the principles of dignity, freedom, nondiscrimination, the supremacy of the Constitution (1996) and universal suffrage. Participatory democracy was also critical as it would allow citizens to participate in governance and politics effectively. Over the last six local government elections in the new South Africa (i.e. 1999; 2004; 2009; 2014; 2019 and 2021), voter turnout has declined. Abstainers and eligible voters who do not vote continue to grow. Through looking at post-apartheid "invited" and "invented" spaces of participation, this article looks at factors influencing people's expressions of citizenship in the new South Africa within the context of the hydropolitics of the Local Municipality of Madibeng, located in South Africa's Northwest province. Through employing a qualitative research methodology underpinned by a social constructionist epistemology, data collected suggests that some participants viewed the new South Africa as an exclusionary space in which they could not express themselves freely. They withdraw from expressions of citizenship due to fear, coercion or duress, a phenomenon I term *disengaged citizenship*.

KAZMIERSKA, Kaja* (University of Lodz, Poland)

From the Biographical to Emotional Work – Specific Features of Contemporary Life Stories of Young Adults.

When conducting autobiographical narrative interviews, we must always consider the possibility of confronting with the narrator's emotionally difficult experience. Although as sociologists, we should not take on the role and competence of psychologists or psychotherapists, there are also particularly sensitive subjects and encounters with interviewees that may even require the researcher to cope with such situations. Between these two fairly easily distinguishable alternatives, a third has recently emerged related to interviewing the younger generation.

Recent research experience gained in projects that collect interviews with people born in the 1980s and 1990s shows that there is a significant cultural/generational shift in the way of storytelling. In earlier generations of interviewees, emotionally difficult situations in the interview were embedded in emotionally difficult biographical experiences. Whereas in younger generations it's not just about the emotions involved in sharing difficult experiences but about working on one's own emotionality in general, which is reflected in the narrative. Young interviewees very often undertake rather emotional then biographical work during the interview and quite often the storytelling process is supported by psychotherapeutic training. In my presentation I will comment on this phenomenon and show implications for the research process.

Health Care Service to Underprivileged Children in India: An Appraisal of Integrated Child Development Scheme in Karnataka State

The Integrated Child Development Services (ICDS) Scheme is the World's largest Programme under the Health Care Policy in India aimed at enhancing the health, nutrition and learning opportunities of infants, young children and their mothers through supplemental feeding. The Scheme provides an integrated approach for converging basic services to Under-privileged section of the population through community based workers in Anganwadi Centers. There has been significant progress in the implementation of ICDS Scheme, both in terms of increase in number of operational projects and Anganwadi Centres in the state of Karnataka. Since 2007, 204 ICDS Projects and 62,580 Anganawadi Centers and in 3331 mini centers were in Operation. Since then children up to 6 years and their mothers were getting the benefits of this Programme. The state demonstrated significant improvement in the mental and social development and nutritional impact on the beneficiaries who received supplemental feeding. This study explains components, the functioning and current status of ICDC programme and attempts to identify its strengths and weakness.

This paper is descriptive in nature and based on the secondary data collected from various surveys. The study emphasizes the fact that, the ICDS programme has a huge potential platform in providing comprehensive nutritional supplements to pregnant women and lactating mother along with children in order to reduce problem of Malnutrition and Declining Morbidity rate.

New Education Policy-2020: An Innovative Initiation in Karnataka State, India

Education is the key catalyst for promoting socio-economic mobility and prepares the citizens for the knowledgeable society. Higher education contributes to the growth of Nation by providing specialized knowledge and skilled manpower. In this background a Reformative Policy initiative is taken by the Indian Government from School Education to Higher Education by introducing a New Educational Policy (NEP). Karnataka State Higher Education Council has taken the initiation from 2020-21, to bring drastic changes in the Higher Education System. This policy has a multi-disciplinary, value-based approach focusing on holistic education along with life-skills with special emphasis on skill development to improve high employability rate among the youth. It aims at building a global best education system rooted in Indian ethos, thereby transforming India into a global knowledge superpower

Contextualizing the Indianization in formal education the policy Stresses on Modifications in the curriculum in view of employability, strengthening Teacher training institutes linking it with Multidisciplinary Universities to prepare high-quality teachers, improving Teaching Pedagogy, building synergies between Research and Teaching, and facilitating Research Centers. It envisages establishing a standard education for both private and public institutions in the country.

This paper provides a descriptive overview of the New National Education Policy of India and its relevance in the way of Reforms and Structural Changes in the system with Sociological Perspective. It is a great challenge to bring Educational Reforms to enlarge the adaptive capacity and quality of the higher education system. NEP is more responsive to the changing situation to meet the needs of diverse population and development of the Nation. When the formal education relates with life it also cultivate the moral values among the citizens for that, it needs cultural transformation. Then it will become a powerful instrument for the social and economic development.

COVID-19 and Gender Inequality in India: Reproduction of Patriarchy

This paper is an attempt to argue that COVID-19 has restrengthened gender-based inequalities which has and shall have severe socio-cultural implications particularly on democratic values underlying with equality, freedom and gender justice. This has been evident with the rise of authoritarian leadership across the globe and their initiatives in strengthening patriarchy and weakening spaces for gender justice. Gender inequality refers to a situation where men or women enjoy disproportionately higher share over valued good and consequently have better "life chances". Gender inequality intersects with other types of inequality like educational attainment, economic, political etc. It has been evident that pandemic has reinforced gender based inequalities. During pandemic economy across the globe contracted and Indian economy

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

too shrank sharply. Women working in informal economy or had left their villages for cities in search of better economic opportunities and future prospect for their children have been the worst sufferer during pandemic. Their dislocation from the economic domains came with burden of extra child care as schools were also shut down. Undoubtedly women in general have far less control over resources. Structural location of women i.e poor, marginalized or minority further accelerates. Besides other challenges women having poor access over resources will be worst sufferer of accessing quality education and job opportunities which will further widen inequalities of wealth and participation in democracy. It will undermine gender equality and will reclaim patriarchy. Therefore, there is need to bring back equity and gender justice discourse under the curriculum both in schools and higher education. Instead of focus on vocationalisation of education university should reclaim its theoretical spaces to raise the existential, structural questions. Under the neo-liberal paradigm twin forces of corporate and social conservative has undermined all the democratic spaces in which women have been the worst sufferer. COVID-19 has exposed it vividly.

Rising Authoritarianism and Devaluation of Liberal Education: A Sociological Reflection

Attack on universities particularly public universities has been one of the central features with rising authoritarianism. The combined forces of market fundamentalism and social conservativism under the larger paradigm of neo-liberalism has undermined the liberal purpose of university and has created the culture of conformism and obedience to socio-political economic authority which has resulted in diminishing democratic values across the globe. Economic and technological rationality with emphasis on values of individualism, quantification and efficiency with 'commodified', 'useful' knowledge has taken precedence in university than its production of fundamental, theoretical knowledge which are required not only for intellectual excellence but for critical inquiry of dominant and official narratives too. 'On-line' in the place of in-person education which has the possibility of making education particularly higher education inaccessible to large section of society. COVID-19 has further accelerated unequal distribution which can further undermine the democratic principles of freedom, equality, pluralism and accountability and reproduce and strengthen authoritarianism. Question is education in general and university in particular facing the "crisis of purpose"?

This paper is an attempt to highlight the significance of 'education for citizenship' for which liberal or general education is required. Liberal education besides its 'intellectual reflection' and knowledge for its own end is liberal in the sense of its effects on the individual's 'intellectual self-empowerment' which is more than 'useful' in immediate context. It is an education which fosters social responsibility and self-reliance with focus on reason and sensibility and prepares individuals to participate in the larger interest of humanity. Therefore, university with its illuminating and emancipatory potential can play critical and historical role in reordering the global order by cultivating sustainable democratic ethos by producing self-reflective, creative and critical citizens. University needs to preserve and provide 'epistemic accessibility' to its community of scholars by teaching 'all branches of knowledge'.

KEAHEY, Jennifer* (Arizona State University, USA)

Agrarian Transformation and Resistance in Post-Authoritarian Environments

This paper engages the cases of Latvia and South Africa to examine development at two frontiers of the modern-colonial world-system. German crusaders invaded Latvia in 1195, beginning a period of colonization that culminated in Soviet occupation at the end of World War II. Across the world, Dutch merchants invaded South Africa in 1652, with colonizers establishing a white supremacist Apartheid state in 1948. Although these authoritarian regimes espoused oppositional ideologies, they modernized in similar ways, using displaced labor to industrialize colonial production and trade regimes. When Latvia and South Africa transitioned to democracy in the 1990s, small-scale farmers established local food and fair trade networks in accordance with Indigenous science and in relation with global justice movements. Yet they soon found themselves confronting a new master. When the Soviet bloc collapsed, Anglo-American interests proclaimed private capital as the bearer of freedom, enabling corporate agriculture to extend its territorial control. Unchecked by democratic institutions, a small group of global overlords have standardized agriculture around the world in accordance with corporate market interests, reproducing authoritarianism in practice. To unpack the material and ideal forces shaping agrarian transformation and resistance, I identify two existential types of development. As a colonizing mode of existence, *authoritarian monocultures* are grounded in the logic of categorical separateness. This development modality enacts endless warfare with difference to ensure uniformity and top-down control, co-opting ideological movements to rebrand itself across spacetime. In contrast, *egalitarian ecocultures* are rooted in Indigenous cosmovisions and cultural histories of resistance that recognize the interconnected nature of reality. This emancipatory mode of existence is situated in the liminal cracks of the world-system, where bottom-up actors are

innovating alternatives that work with, rather than against, the diversity of life. The converging catastrophes of the Anthropocene indicate a world-system in existential crisis. How will development respond?

Acceptance of Smart Home Technologies for Aging in Place

As life expectancy rises, the aging of the French population continues. Demographic forecasts by the French National Institute for Statistics and Economic Studies (INSEE-2019) predict a sharp increase in the proportion of people over the age of 60 until 2035 and estimate that 4 million of them will be losing their autonomy by 2050. As for the majority of Europeans, this evolution is accompanied by a widely shared desire to stay at home as long as possible. So, how can we address this combined issue of loss of autonomy and aging at home ? One of the solutions is technological and concerns the smart home specially designed for seniors.

Smart home technologies support aging in place and bring real benefits to the health and well-being of seniors in addition to the energy savings, comfort and security they can provide. These goals can be achieved by combining IoT and AI technologies in order to provide services based mainly on the recognition of activities and the detection of anomalies and risk situations that seniors may face at home. The current market offer is mostly oriented to home automation in a broad sense and is poorly adapted to the needs of the elderly.

The design of such a solution must be articulated to its adoption, which is a critical issue among the elderly. A systematic review based on models of acceptance of technologies by seniors followed by interviews highlighted the significance of various acceptance and rejection factors that we will present at the congress. In view of the results, it is essential to closely accompany the user-centered development process of AI-based smart home solutions with inquiries that address the limitations related mainly to their usefulness, personalization and evolution over time, accessibility, and ease of use given seniors' lack of technology familiarity.

Women Who Tech: Strategies and Branding Among Foreign Women Entrepreneurs in China

This study examines foreign women entrepreneurs in China, focusing on how the intersection of race and gender mediate their business strategies and branding for success. Existing literature on foreign migrants in China describes the transnational corporate and entrepreneurial sector as male-oriented. While a few studies of foreign women in China examine their experiences as trailing spouses, little attention has been paid to young women pursuing independent business or career opportunities in China. This research narrows the focus to women who tech in China, showing how they are becoming a part of the move from "Made in China" to "Design in China", highlighting their gender, race and skills as driving factors for their achievements. This study is based on semi-structured, long-distance interviews with twenty foreign women in their early twenties to early thirties attending to the recent transformations in China's business sector, where the number of young foreign women tech entrepreneurs is rising. Weaving together migration studies, studies on the racialization of whiteness in Asia and technology studies, this research shows that in China, whiteness, gender and technological innovation intersect. I argue that foreign women strategically perform a racialized white identity, or desirable qualities associated with whiteness, to market their products. Such dynamics must be understood in recent migration flows to China, including the negotiations and challenges that mainly women face to cope with business. They still demonstrate a certain degree of agency as women to highlight their tech developments, performing themselves as skilled entrepreneurs and essential technological drivers.

KEI, Milo* (University of Newcastle, Australia)

Australian School Strikers' Everyday Acts of Political Participation and Resistance

The School Strike 4 Climate (SS4C) movement is part of a 'durable' and 'highly networked' global social movement that involves millions of young people. SS4C, known in Europe and elsewhere as Fridays for Future, is a student-led climate focused environmental movement increasingly concerned with issues of economic and social justice. Secondary and primary school students are responsible for planning, promoting and participating in strike actions around Australia in concert with their global counterparts. Those who lead the organisation of strike actions share several similar economic and social attributes, including relatively privileged backgrounds and high levels of scholastic engagement. This research project seeks to examine the influence of leaders and participants on the socio-cultural value placed on ecological practices within a student-led social movement. It also examines

activists' attitudes to the media's representation of the movement which shows a high degree of reflexivity about the movements political impact. Activists individualised ecological practices can be seen as part of their repertoire of protest techniques and an expression of collective political displeasure toward continuing governmental inaction on climate issues. Using a Bourdieusian framework, this qualitative research project interviewed SS4C activists about their political participation, socioecological practices and climate strike actions before and during Covid-19 lockdowns in Newcastle and Hunter region in NSW and Melbourne, Victoria.

RC34-JS-30.2

KEI, Milo* (University of Newcastle, Australia)

Political Practices As Repertoires of Protest Action in Young School Strikers in Australia

Student activists, especially student leaders, involved with the School Strike 4 Climate (SS4C) movement in Australia are often deeply engaged with open democratic processes, sometimes for the first time, in their efforts to organise protest actions. 'Do-it-ourselves' political participation often involves extensive communication with fellow students and the public, consensus-based decision making, and negotiation with school and community authorities. Overt political actions like protest marches and public rallies are only the most visible components of young people's political participation. Individualised ecological and political practices can be thought of as part of the repertoire of protest tactics in the movement, especially by participants themselves. Participants of SS4C actions generally show high levels of political literacy and an interest in political affairs; attributes lacking in their general peer groups and shown to be declining since the early-mid 1990s. This research seeks to explore the nexus between SS4C activists political practices, both individualised and collective, and a worldview firmly tied to claims of ecological justice and the alleviation of social and economic injustice in an open and democratic manner. Employing the conceptual tools of Bourdieu, this research project investigates the experience of young people's participation in SS4C actions in Newcastle and Hunter region NSW and Melbourne, Victoria. The project utilises qualitative interviewing to explore their thoughts on the efficacy of mobilising in the SS4C movement, their experiences of organising actions, and the value they ascribe to their socioecological practices in contemporary Australia.

On Authoritarian Intellectuals

It is an uncomfortable reality that intellectuals have in many occasions supported authoritarian conceptions of the state and society with their craft and academic credentials. Visions of society that, in order to be realised, would need to make many people disappear, represent a threat in many parts of the world today. Drawing on the German history of political ideas, this paper focusses on protofascist intellectuals such as Carl Schmitt or Oswald Spengler. They elaborated the subversion of law with the aim to render the state more authoritarian. They prefigured elitist conceptions of populist leadership. Their ideas delegitimised the liberal democracies of the interwar years. After 1945, their thought has continued to circulate, within Germany, Europe and beyond. Starting at the end of the 1940s already, over the decades, far right intellectual circles have canonised those thinkers and their conceptions of society and the state under the label of the "conservative revolution". Their legacy can be traced with an approach to studying knowledge circulation. It resurfaces today in a variety of places.

Black-White Paradox in Mental Health: The Significance of Racial Classification Vs. Self-Assessed, Other Assessed, and Incongruent Skin Tone

African Americans tend to have mental health outcomes that are equal to or better than those of Whites despite living in a society where they face more intense racial discrimination. Most research on these paradoxical findings relies solely on racial self-classification to assess these differences, obscuring other important dimensions of racial identification such as skin tone. The current study uses data from the National Survey of American Life to investigate whether or not the paradox is consistent across (a) other measures of African Americans' racial identification (self-evaluated and other evaluated skin tone and congruence between the two measures) and (2) across multiple measures of mental health (depressive symptoms, 12-month major depressive disorder, and 12-month social anxiety disorder). We additionally examine whether perceived racial discrimination amplifies or diminishes the African American mental health advantage. Results from our multivariate regression analyses revealed that the African American mental health advantage persists across all racial identification indicators, but the strength of the association varies by the mental health measure considered. Findings are most robust and consistent for depressive symptoms. African Americans report fewer symptoms than Whites when skin tone is assessed by ether themselves or others, but the disparity is smallest between Whites and African Americans with lighter skin tone and between Whites and African Americans who are perceived as being lighter than they see themselves. Multivariate-adjusted models also reveal that perceived discrimination amplifies the African American mental health advantage. These results demonstrate the relevance of embracing a broader view of racial identification when considering racial disparities in mental health.

Pandemic Policing and the Construction of Publics: An Analysis of COVID-19 Lockdowns in Public Housing

COVID-19 containment measures have cast a spotlight on the uneven impacts of public health policy with particular populations or sites targeted for intervention. Perhaps the starkest example in Australia was the 'hard' lockdown of nine public housing complexes in inner-city Melbourne from 4–18 July 2020, where residents were fully confined to their homes. These complexes are home to diverse migrant communities and the lockdown drew public criticism for unfairly stigmatising ethnic minorities. This paper analyses media articles published during the lockdown to explore the implications of broad, top-down public health measures for culturally and linguistically diverse communities. Drawing on Lea's (2020) conceptualisation of policy ecology, we analyse the lockdown measures and community responses to explore how normative assumptions get freighted into health policy mechanisms, constituting health subjects (or 'target populations') in narrow, exclusionary terms. Our analysis identifies a number of different, sometimes competing subject positions at work in the lockdown policy measures and public responses to them. Via the mobilisation of police as compliance officers, locked-down tower residents are positioned as risky subjects in inherently risky places, setting up a policy instrument oriented around a classed and racialised view of non-compliance. Attending to how such subject positions are produced, and resisted at the grassroots level, highlights that policy instruments are not neutral interventions, but rather instantiate classed and racialised patterns of exclusion, reinforcing pervasive social inequalities in the name of public health. We conclude with some suggestions for how policy might circumvent these deleterious effects and better serve the needs of diverse communities.

How Can Social Capital be Detrimental: An Investigation of the Malaysia Case

Although there are different definitions of the social cohesion concept, there is somewhat consensus on Forrest and Kearns's (2001) definition which suggests that the concept has five components: common values and civic culture, social order and social control, social solidarity, place attachment and identity, and social capital. This paper focuses on the social capital component. Social capital generally is utilised in a very positive connotation. Therefore, the empirical research has focused extensively on the positive outcomes of social capital. However, I argue that the harmful aspects of social capital have not been adequately examined in the literature. Using empirical data collected through qualitative methods, I examine how social capital can also be detrimental to society. As the case study of this paper, Malaysia is a plural society with a high proportion of ethnic minorities. The literature indicates that Malaysians have low levels of social capital. In fact, the reality is more complicated. Within their communal walls, both the dominant ethnic group of Malays and the main minority group, Chinese Malaysians, have high levels of social capital. The perpetuation of the colonial legacy of an ethnically-divided social and political system has fostered in-group solidarity and led to inter-group rivalries. The high level of in-group social capital has thus led to social exclusion, inequality, nepotism and favouritism. The clear division between Malays and non-Malays and the politics centred on ethnic identity led to social hierarchies. Moreover, in-group solidarity between ethnic groups leads to discriminatory practises; Malays and Chinese suffer from favouritism and glass ceiling problems in work life. Consequently, high bonding social capital strengthens their ethnic identities by weakening their belonging to national identity. Thus, I contend that social capital itself does not indicate social cohesion in a society. Rather, a high level of social capital can also impede social cohesion.

Islam and Ethno-Religious Identities for Social Movement Mobilisation: A Case Study of an Islamic Movement in Malaysia

National or ethnic identities support the mobilisation of religious movements in some countries where religion plays an important role as a crucial component of identity. This combination, however, can be very detrimental to social harmony especially in countries with great diversity, such as Malaysia. In Malaysia, there is are substantial ethnic and religious minorities, and ethnic identities are often conflated with religious identities. However, identity politics rooted in a fragmented society along ethnic and religious lines creates socio-political tensions and grievances that facilitate the mobilisation of social movements. Being ideologically a far-right Islamist movement in Malaysia, the Malaysia Muslim Solidarity Front (ISMA)'s ethnoreligious ideology is rooted in the need for the ontological security of Malay Muslims. The movement creates its power struggle against rival Islamic movements and other civil society actors through a shift of common sense from the Ummah solidarity (Muslim Unity) toward Malay-Muslim solidarity. ISMA's main diagnosis frame is that Islam and Malays are under threat in Malaysia because of the non-Malay elements in the government or party politics. In this respect, the movement integrates the religious and ethnic identity which materialised in their slogan "Malay consensus, Islam sovereign". The movement's efforts have political outcomes. ISMA influences popular consent through rallies and voter awareness programs aimed at affecting voting behaviours of Malay constituents in favour of their candidates. So far, ISMA has achieved increasing support to mobilise Malay-Muslim voters on a few occasions showing that the frames they invoked resonated among the Malay-Muslim population. Using the case of ISMA, I examine how an Islamic movement rationalises the use of ethnic identities in a religious ideology and combines religious and ethnic identities to influence its audience and gain political power. The empirical data have been collected using qualitative methods and analysed through the framing analysis.

KELLEHER, Vicki* (University of Tasmania, Australia)

Research Outside of Time: Contacting Our inside World through Poetry

During recent years poetic inquiry has been gaining recognition as an arts-based research methodology and may be most simply described as research that uses poetry as/in/for inquiry. Threading its way through the silent, the inexpressible and the non-ordinary, poetry carefully attends to the language of the researched, while intrinsically opening gentle spaces for the reflexivity of the researcher. It is difficult to express clearly how it does this, but somehow the writing of poetry intrinsically slows down the research process and finds expression for what is not spoken but felt and sensed. Therefore, through spoken research poetry this presentation explores the idea that research through poetic inquiry happens outside of time, at quieter and often silent sites, where the *outside* world is slowed, and the *inside* world is contacted and expressed. In these silent moments, only presence is required and the senses are given free rein to guide the researcher through complex inquiries. There have been moments in the research reading, thinking, and doing that have threatened to overwhelm me while conducting research with participants into their lived experience of complex trauma. Poetry has afforded myself as researcher a way to contact these silent places within myself; to step out of worldly constraints of time; and create soft places to land my feelings, stray thoughts, emotions, and memories; enabling new ways of doing to emerge from each new poem.

Co-Opted Pharmaceuticalization: Reconsidering Polydrug Use with Prescription Medications Among Young Adults in Nightlife

Pharmaceuticalization is widely known as "the process by which social, behavioural, or bodily conditions are treated or deemed to be in need of treatment with medical drugs by doctors or patients" (Abraham, 2009). Ordinary bodily conditions become reconstructed as in need of treatment with pills. We contend that a form of pharmaceuticalization drives the combination of prescription pills with other substances among young people participating in nightlife. Using qualitative interview data from 214 young adults involved in nightlife, we examine how pharmaceuticalization becomes reengineered within nightlife contexts to shape how young people engage in polydrug use by using prescription pills to offset bodily experiences produced by their nightlife activities. "Co-opted pharmaceuticalization" occurs when young adults view conditions produced by 'bodily indiscretions' associated with nightlife as opportunities for pharmaceutical intervention. They see adverse corporal experiences produced through nightlife participation as ripe for management with prescription pills. Young adults integrate prescription pills into their wider substance use repertoires to manage experiences stemming from the contexts of nightlife experiences within the wider domains of their lives. They combine pills with other substances to manage bodily experiences deemed undesirable (though not medical conditions) and which are produced by their own behavioral excess; doing so seems routine, obvious, and commonplace to them. Rather than utilizing pills to become healthier patients, they appropriate them to become more functional 'outlaws'. The perception of bodily discomfort as a site for pharmaceutical intervention emerges in part due to a broader shifts in the entrenchment of pharmaceuticals in their lives and resonates in particular ways as a function of the social contexts they inhabit. The management of risk – in a holistically construed sense – leads young people to view combinations of pills with other drugs as an obvious and sensible way to manage undesirable bodily experiences.

VUOLO, Michael (The Ohio State University, USA)

The Rise and Decline of Racial Stratification of Prescribing and Overdose Mortality: Reconsidering Fundamental Causes in a Drug Crisis

The 21st century rise in drug overdoses undermined the state's ability to control population-level health. The stratification of overdose mortality ensued, with considerable escalation of overdose mortality among White Americans compared to Black and Latino Americans. On the surface, this pattern contradicts expectations rooted in the Theory of Fundamental Causes. We contend that beyond the surface such shifts in mortality align well with Fundamental Causes in that these trends may be directly driven by processes of privilege in clinical interactions. Deaths among White Americans rose more considerably as an outgrowth of privileged access to controlled substances in clinical encounters. Yet, it remains unclear how subsequent policy actions may have ameliorated such racial stratification of deaths. We examine Prescription Drug Monitoring Program (PDMPs) laws as governmental responses to control overdose mortality in order to assess how policy may differentially shape overdose mortality by race. Within the context of Fundamental Causes, we would anticipate that such policy intervention would most directly affect White deaths by intervening on the factors that left prescribing patterns less questioned for those in positions of privilege. We find reductions in the opioid overdose rate 2 years post-implementation and sustained effects through year 5, with similar effects for prescription opioids in polydrug use circumstances, benzodiazepines, and psychostimulants, but these results hold only for Whites. We conclude that laws leading to the implementation of Prescription Drug Monitoring Programs have more directly intervened on mortality among White Americans. We contend that such laws intervened on decision making processes that privileged Whites in ways that unwittingly drove disparities in overdose mortality.

KELLY, Melissa* (Toronto Metropolitan University, Canada)

Intersectional Identities: Highly Educated Zimbabweans Negotiate Race, Class, and Ethnic Hierarchies in a South African City

Efforts to understand African immigrants' experiences with Afrophobia and xenophobia in South Africa have focused on those who work in the informal sector and engage in precarious, low-wage employment. Many of these individuals lack legal status and, according to popular discourse, are seen as competing with local South Africans for jobs, housing and services, all of which are in short supply. Less research has considered the experiences of highly educated immigrants who are in South Africa legally and hold professional positions. This research set out to understand how the experiences of highly educated immigrants with Afrophobia and xenophobia may differ from their less privileged counterparts. How and in what contexts do their social position and legal status make it easier for them to cultivate a sense of belonging while living in the diaspora? Secondly, how has this impacted their identities? In order to answer these questions, multiple in-depth interviews were carried out with highly educated Zimbabwean immigrants living and working in a South African city. The study finds that highly educated Zimbabweans do not fit easily into the intersecting race, class, and ethnic hierarchies that are typically used to classify and discriminate against immigrants in South Africa. At the same time, their racialized status makes it challenging for them to cultivate a sense of belonging in their workplaces and neighbourhoods, which are often populated with White South Africans. The findings of the study suggest a need to extend the theory of intersectionality to include professional status in order to better understand the complex experiences, identities, and social positionings of African immigrants living and working in post-apartheid South Africa.

KELLY, Peter* (Deakin University, Australia)

A 'Code Red for Humanity': Sociologies of School Strikes for Climate and the 'Problem' of the Anthropocene

In August 2021, the UN Secretary-General António Guterres (2021) issued a press release coinciding with the publication of the Intergovernmental Panel on Climate Change (IPCC 2021) Working Group 1 report Climate Change 2021: The Physical Science Basis, in which he claimed that the 'IPCC Working Group 1 report is a *code red for humanity*. The alarm bells are deafening, and the evidence is irrefutable: greenhouse-gas emissions from fossil-fuel burning and deforestation are choking our planet and putting billions of people at immediate risk'.

In this presentation I draw on a recent contribution to discussions about young people's collectivities in which we developed an analysis of the emergence of the School Strikes for Climate (SS4C)/Fridays for Future movement.

In presenting an account of the emergence of SS4C and the ways in which millions of young people around the world imagine the 'code red' that the Secretary-General refers to, I will draw on the concept of 'entanglement' (Haraway 2016) - and the ways in which this concept travels from quantum physics and biologies into the socio-cultural - to trouble key sociological concepts such as structure and agency, and to think differently about individuals, groups and collectivities. Particularly when collectivities are often imagined as cohorts of discrete individuals. In addition, I will explore how to make present the often sociologically strange physical, bio-chemical, governmental, moral, and affective 'lines of force' that energise earth systems – oceanic, atmospheric, terrestrial, capitalist – and which often exist beyond sociologically orthodox understandings of 'structures'.

I will suggest that this work can trouble the limits of the 'human exceptionalism' and 'methodological individualism' (Haraway 2016) that characterises the sociological orthodoxies of young people's activism and participation in collective action - and signals the contours of a sociological imagination for the Anthropocene.

COVID-19 and Young People's 'Future Presents': Scenario Planning, Hopes and Anxieties in the Anthropocene

In this presentation we situate the emergence of the pandemic, and the challenges that the public health crisis produces for young people's health and well-being, and their sense of belonging, in the unfolding crises of global capitalism, of earth systems, and bio-diversity that is heralded by the Anthropocene (Braidotti 2019).

In developing this argument, we will draw on a place-based scenario planning project in Melbourne (AUSTRALIA) that was undertaken during 2021-2022. This future-focussed methodology enabled us to capture some of the anxieties, uncertainties and hopes that young people in Melbourne's inner north gave voice to when we provided them with an opportunity to reflect on and respond to questions about what Adams (2010) identifies as their *present futures* and *future presents*. In referencing the work of Adam (2010), Haraway (2016) and Braidotti (2013) we situate scenario planning with young people and other stakeholders as a *radical politics of hope*. A politics that emerges in our imagining of *the future* is "an active object of desire", an object that "propels us forth and motivates us to be active in the here and now", and of the idea of *hope* as an "anticipatory virtue that permeates our lives and activates them" (Braidotti 2013).

In reflecting on these young people's stories, and the future orientation of the scenario planning methodology, we will suggest a number of ways in which futures oriented sociologies of youth might play some part in developing a 'sociological imagination' for the Anthropocene. The importance of a re-imagined sociological imagination for the Anthropocene is evidenced in the anxiety and uncertainty, even anger and frustration, that young people - prior to and during the pandemic - have expressed about futures that are 'used up' before they arrive.

Urban Governance of Liminally Legal Children Frontline Actors and Institutional Legacies in Tel-Aviv and Jerusalem

Increasing numbers of migrant children worldwide grow up with fragmentary and revocable legal statuses that perpetuate their liminal legality as socially present yet legally non-existent. Scholars of migration have mainly explored macro drivers and micro-level effects of liminal legality paying less attention to the role of urban governance and frontline actors in shaping migrant children's pathways of incorporation amidst broader processes of local rescaling. Taking into consideration that neoliberal rescaling is anchored in the uneven institutional landscapes in which it unfolds, this comparative research shows how different trajectories of urban rescaling result in two modes of governance: centralized–segregated in Tel-Aviv, and particularistic–integrative in Jerusalem. Grounded on 87 in-depth interviews with local agents and surveys of municipal policies and NPG and NGO reports, we show that in cosmopolitan-oriented yet ethno-nationally homogeneous Tel-Aviv, actors maneuver institutional ambivalence by emphasizing liberal status-blind principles in the provision of segregated services. Conversely, in ethno-religious oriented yet ethno-nationally heterogeneous Jerusalem, migrant children are incorporated in integrative frameworks that recognize their particularity. Drawing on an inter-city comparison, we argue that local actors both reflect and mobilize inherited institutional landscapes and legacies of sensemaking of "otherness" as they negotiate similar national restrictive migration policies. Integrating critical scholarship on uneven urban rescaling, attentive to structures of social provision and policy paradigms, and local actors' sensemaking, we foreground the centrality of cities in forging liminal legality as a multidimensional space where policies, institutional contexts, and agency work together in emplacing migrant children, suspended between legal categories, as urban subjects.

Autocracies in Practice: Historical Legacies, Cultural Articulations and Violence Among Putin, Trump, Orban and Their Kin in Democracies' Assaults

De-democratization invites reconsideration of both structures and practices in social change. What conditions enable "strong men" – including Putin, Trump, Orban, Lukashenko, Xi, Modi, Bolsanaro, Erdogan, and Duterte -- to gain authority and what strategies facilitate their rise and aggrandizement? Following a brief review of the structural arguments, including globalization's effects, governance's complexities, and catastrophes' multiplications, I elaborate 3 elements a comparative and historical sociology this global transformation invites.

First, what makes these autocratic expressions similar, what different? In particular, how do different histories of democracy, colonialism, racism, misogyny, and militarism shape authoritarian expression? Not all strong men are white Christians inheriting empires with colonizing histories, but they tend to express similar resentments for constraints on their righteous rage.

Second, what practices exemplify authoritarian assault on democracy? In particular, how do certain kinds of truth claims justify violence and against whom in the distinctive manifestation of strong man leadership? Even while the actual violence varies considerably – from Putin's criminal invasion of democratic Ukraine to Trump's criminal treatment of migrants on US borders – the predicate of actual harm depends on a mythos of symbolic collective suffering.

Thirdly, can we evidence admiration, imitation and reciprocal amplification among autocrats? In particular, can we trace public expressions of mutual support among these authoritarians and any effects in policy or governance? I conclude by focusing on the articulation of Putin, Trump, and Orban in their different but complementary mobilizations of violence and fear. I develop that analysis not only to illuminate my more general arguments, but to encourage others to illuminate similar articulations among others of manifestly anti-democratic transnational authoritarianism.

Probing School Bullying Practices As Classification Struggles: Challenges and Possibilities for Youth Social Justice

The analysis on which this paper is based draws on qualitative interviews conducted in 2018 and 2019 with 26 young people between the ages of 16 and 24 accessing youth homelessness services in two cities located in Ontario, Canada. We begin from a place of skepticism about the efficacy of school-based interventions in bullying for preventing or ending the widespread victimization of homeless young people in schools. Instead, we build upon sociological work that has theorized bullying as a social phenomenon embedded within wider systems of power designed to maintain the dominance of the dominant, for instance by protecting white identities (Myers & Bhopal, 2015); or by maintaining normative gender performances (Morales, Grineski & Collins, 2019; Ringrose & Renold, 2013). Drawing on the work of Pierre Bourdieu, we approach schooling as a field of power wherein multilayered forms of inequality and the maintenance of dominance, both hidden and explicit, are reproduced. The main findings of this study reveal the need to understand school bullying as part of *classification struggles* (Bourdieu, 1984) between students, which are marked by and generated through not only gender norms, heteronormativity or other oppressive normativities such as sizeism, but also intricately bound up with class-based distinctions. By providing a multifaceted account of the complexity of school bullying practices, we propose that the tools and resources for the struggle to counter-act and challenge bullying and contribute to youth social justice, particularly for impoverished and/or homeless students, may be strengthened.

The Infrastructural Labour of Logistics: Reorganising Warehouse Workers in South Africa

This paper examines working conditions of warehouse workers in logistics in South Africa. Logistics is a terrain that cuts across the economy and one which has become central to business operation, while also obscuring working conditions for many employees. Based on interviews with industry experts and warehouse workers and unions as part of an ILO study, this paper offers a preliminary examination of key dynamics of labour control and workers' responses in this 'sector'. A key focus is on the local application of algorithmic management in logistics firms, how this plays out in terms of wider supply chains, which operate through global companies and across African distribution networks. The specific adaptations of software to national and inter-regional conditions, impulses to replace workers with new technologies, the reliance on the use of contract labour ('labour broking'), and the limitations of organising for unions in these firms outline the conjunctural relations of logistics in place and for the reproduction of precariousness. The paper thus offers an analysis of the concrete material conditions from South Africa required to operationalise these vast distribution networks which appear all the more hidden (see Neilson 2012; Rossiter 2014). It is specifically interested in documenting the glitches, the 'frictions and stoppages' which disrupt the seeming seamlessness of such spatially expansive networks (Chua et al. 2018; Cowen 2014). This complex and varied field is constitutive of a reorganisation of capital investment in logistics in South Africa and in semiotic representations which further marginalise labour. The paper argues that these processes rely on 'infrastructural labour', which is both invisibilised and yet which creates new terrain for capital accumulation and new stakes for working class struggles.

KENNY, Katherine* (University of Sydney, Australia)

The Microbiopolitics of (self)Care

In this paper, drawing on feminist and STS scholarship on relationality and care, I explore some of the different ways that the subject of health and wellbeing might productively be reimagined as multitudinous: as extending beyond humanistic ideas of discrete individuality and individual responsibility. Here the microbiome is instructive. Our relationship to the microbial world has typically been characterised by an outmoded pathogenic imaginary in which 'bugs' are envisioned as enemies to be exterminated in order to protect individual human bodies from illness. But the failure to recognise the productive and protective features of our microbial kin has led to problems such as the overuse of microbicides and the rise of superbugs (i.e. antimicrobial resistance), and is also implicated in the rise of chronic conditions that now affect up to 50% of the population.

How we currently know (and manage) microbes illustrates some of the short comings of the traditional exterminatory approach to human-microbial relations. For example, practices of managing illness and infection are often temporally oriented towards delivering immediate solutions to individual 'cases'. The resulting overuse of antimicrobials not only contributes to the looming crisis of AMR but can also compromise the delicate biomic balance that has been developing within and upon each of us since we were in-utero, projecting the temporal consequences of the exterminatory approach to human-microbial relations both backward and forwards through time. However, some emerging (and some enduring) practices of care (for the self and for others) offer potential for a more expansive vision of the deep relationality of our health that can accommodate its multiplicity across scales, bodies, and timeframes well into the future-to-come. In this way, attending to the microbiome illustrates the deep relationality of our own health with the social conditions of our collective flourishing.

Algorithmic Bias As a Social Issue: Participation and Inclusiveness in AI

Algorithmic Bias has been a major issue for AI practitioners and policy makers alike. The claim for Data Science for Social Good is hit hard when it comes to unprecedented bias hidden in neural networks of the algorithm. In order to tackle this issue in a way that will make sure the outcome will not be compromised in the process, the Inclusive AI and Participatory AI principles must be prioritized. This paper will discuss the relevance of concepts of inclusiveness, equity, and bias in the context of AI as a tool for social good. The use cases of AI based decision systems in public policy and specifically smart city applications will be discussed to demonstrate the possible drawbacks of real time data, training data as well as the bias embedded in the algorithms. The significance of access to and informed use of data collecting tools (a.k.a. digital divide) will be emphasized as the keys to the solution, aside from fixing the biased algorithms. Thereby, the issues of AI based decision making and especially algorithmic bias will be examined within the framework of its social context.

Kindergarten Teachers' Emotions and Ethical Dilemmas at Work in the Time of COVID-19

Earlier work has been well-documented how emotional of teaching connecting with professionalism and affected by moral purpose of teachers, cultures, and contexts (Day & Qing, 2009; O' Connor, 2008). However, there is a missing link to explore how teachers interpret emotional experiences from ethical dilemmas encountered at work. Using social constructivist perspective, this study argues that emotional experiences are conditioned by the contexts in which social interactions with students, parents and other colleagues take place (Lasky, 2005; Oplatka & Arar, 2019). This qualitative study attempts to understand kindergarten teachers' emotional experiences by analyzing how they perceive and navigate the ethical dilemmas in work. An interpretive approach is applied with interview data collected from twelve Hong Kong kindergarten teachers. Data are analyzed inductively based on descriptions of critical incident cases reported. Researchers interpreted, coded, and grouped data into themes. The interview quotes exhibit that teachers' emotions are contextually bounded. The dilemmatic experiences stemmed from teachers can be characterized into three ethical considerations: Role of empathy and care, culture of reciprocal trust, and dispositions related to cultural responsiveness. The discussion will contribute to the depictions of emotional experience, especially teachers are facing multiple challenges in working with different stakeholders. It also gives us some insights into how teachers develop ethical judgment for dealing with the situations given in such critical incident cases.

RC52-720.1

KEUNG, Chrysa* (The Education University of Hong Kong, Hong Kong)

Professional Ethics for Early Childhood Teaching Profession

Within the early childhood context, kindergarten teachers encounter day-to-day ethical dilemmas. These relate to the multiple obligations and responsibilities that kindergarten teachers have when working with different stakeholders, such as children, families, colleagues, organizations, and policy makers (Dahlberg & Moss, 2005; Feeney & Freeman, 2007). Although codes of ethics for teaching profession have been developed and applied in the worldwide, understanding professional ethics of early childhood teachers has been an underdeveloped area of study in Hong Kong. Using the ethical codes from three counties as the base, this study attempts to explore and develop the principles of professional ethics for Hong Kong early childhood sector. Those principles are conceived as an essential part of the professional repertoire which helps teachers make judgment and choices of action in the real-life workplace (Campbell, 2000; Mahoney, 2008). However, those principles are not exhaustive nor applicable to every situation. This study reports the suggested principles of professional ethics which are built on reviewing the extant ethical codes from international and regional contexts and collecting qualitative data from the semi-structured interviews with a total of 13 pre-service and in-service teachers. Findings reveals that professional ethics among early childhood education can be conceptualized into five domains. The interview data also reflect that the dimensions and meanings of professional ethics are varied among pre-service and in-service teachers. This study contributes to articulate dialogues about the notions of professional value, moral reasoning, professional autonomy, and teacher identity. Findings of this study reaffirm the responsibilities and obligations of kindergarten teachers, and this could be seen as a source of insights into the ethical base of teacher professionalism in Hong Kong early childhood context.

Utilization of Leisure Time By the Ageing through the Various Platform of Social Media: A Sociological Study with Indian Context

Leisure time in Ageing and social media is now considered as a common word for all. Now in 21st century everyone is habitual to this word-' social media' and in ageing population the major issue is how to spend their leisure time through social media?In India many things are essentially done through social media, it has occupied all the sectors of the society. This paper actually tries to find out the reality of the term "leisure time of ageing population" and "social

media". How they spend their leisure time with with the help of social media? Does this social media actually helps elderly or not? Do they find it easy to use? And if they use social media for leisure time then for what purpose do they use? Have they experienced any threat because of this social media? All these questions will be studied through this paper. Data collection methods will be both primary and secondary.Primary data collection through questionnaire and secondary sources will be used to find the answers.Total 100 samples from ageing population will be taken for this paper. This paper will try to find out how leisure time is spent by the ageing population through the social media .

"This Country Has Laws": Rule of Law As a Tool of Entrenching Autocracy

This paper investigates the role of legal discourses and legal professionals in entrenching autocratic rule in the aftermath of the so-called Arab Spring in Egypt. In the aftermath of the spectacular street protests that swept the Arab world, and Egypt in particular, the movement for change was channeled into legal challenges handled by the legal system. Lay persons, opposition parties and activists were absorbed into these legal processes, fighting for this article in the constitution, for the abolishment of that vague wording, and demanding the passing of this new law, and the abolishment of that one. While this focus on legal processes is a continuation of Mubarak's 30-year "rule-by-law" regime, in the aftermath of the 2011 uprisings it ensured that the Egyptian judiciary and the legal system not only could control the process of democratic transition, but even reverse it. Thus, popular calls on the streets for "rule of law" came at a high cost: The masses of Egyptians remained in the waiting room, while the judges, along with the Supreme Council of Armed Forces (SCAF), steered the political transition towards autocratic rule. Judges became the experts on the transition, they could map the field of possibilities for the rest of the population and political actors and thus limited the horizons for change. Despite this political capture of the legal system, an underclass of precarious lawyers became the defenders of the law as a channel for meaningful change, thus challenging autocracy from within the very legal system that helped entrench it.

Big Infrastructure and Development: Mass Transit in Islamabad

Urban sociology, in the Global North, especially the US is heavily centered on the spatial isolation of racialized poverty. Understanding how segregation and inequality operate in cities of the Global South provides an opportunity to broaden the scope of urban sociology. Building on gaps in understandings of segregation and inequality and critical theories of infrastructure, I want to understand how mass public transport infrastructure contributes to segregation and inequality in postcolonial cities in the Global South. The Metrobus in Islamabad (BRT), an example of mass transit infrastructure, has been a major change in the transport landscape of Islamabad. BRTs fit into the imagery of an aesthetically pleasing 'world-class city' that Pakistani governments have tried to create, by displacing low-income settlements and rendering poor residents homeless.

On its face, public transit seems to offer economic development, mobility, and environmental improvement. However, not everyone in cities has equal access to mobility and space and these promises of public transit are not shared equally. In this study I focus on various types of public transport infrastructure, including the state-owned Metrobus and other privately-run forms of public transport to understand how the state reproduces technocratic, top-down understandings of urban development. Methodologically, I employ ethnographic fieldwork and semi-structured interviews, along with participatory mapping techniques. The findings reveal the assumptions embedded in the design of public transport infrastructure and how it impacts low-income residents and women particularly. The results of the participatory mapping can be used to inform future development policies on inclusive and sustainable transport.

Corollaries of Corporate Invasion: Colonization of Healthcare Sector in India

Even though the Constitution of India promises free healthcare for all its citizens, the private sector plays a major role in every sphere of medicine, representing 80 percent of total healthcare market which is estimated to be worth US$ 372 billion as of now owing to a huge investor demand from global as well as domestic investors, and private equity funds investing over USD 3.4 billion in Indian hospitals during the last decade. As one of the largest employers with 4.7 million employees as of 2021, the sector is becoming increasingly corporate in its culture and practice with mergers and acquisitions by the listed entities.. This trend has been observed both in clinical and diagnostic sectors of healthcare, having significant implications in terms of cost and quality of healthcare services for the clients on the one hand and health care profession

and professionals on the other. The paper seeks to ascertain implications of these trends for the healthcare practice and medical profession based on the secondary sources.

The authentic sources indicate that the private sector operates 58 percent of the total hospitals in the country with 81 percent of doctors. The large private hospital chains in the country dominated the market with 54.84 percent share in 2021, catering to 70 percent of urban and 63% of rural families. The findings of the study also seem to indicate that the concept and practice of family physician has been on the decline and the traditional systems of medicine are losing ground owing to the onslaught by the rising consolidation in healthcare industry brought about by incessant mergers and acquisitions. Best of the brains in the profession in diverse areas of medicine are signed up by the healthcare conglomerates at exorbitant salaries leaving behind small clinics and clinical practitioners insecure.

Beliefs and Myths: British Muslim Women Making Sense of Their Economic Inactivity

I will present data from a mixed methods (QUANT-QUAL) study to explore whether religious beliefs can explain high rates of economic inactivity among British Muslim women.

The economically inactive are those people who are not in formal employment, nor actively seeking it. Whilst a relatively marginal outcome for most groups, economic inactivity is the modal labour market outcome for British Muslim women, who are significantly more likely to be economically inactive than women of other religious groups. This disparity has been in evidence since the 1970s, without improvement, over time and generation (Anwar 1979; Modood 1997; Heath and Martin 2013; Sweida-Metwally 2022).

The reasons behind this disparity need to be better understood: firstly, because persistent labour market disparities for minority groups in an ethno-religiously diverse society indicate structural disadvantage (Cheung 2014); and secondly, because this outcome is likely to be a driver of socio-economic disadvantage among British Muslim households (Heath and Li 2015).

I used mixed methods to understand the reasons behind these high levels of economic inactivity. Statistically, I found that religious salience was not significantly associated with economic inactivity. Using qualitative methods, I found that none of the interviewees (27 economically inactive Muslim women) held a religious belief that economic activity was forbidden (*haram*), however, some women held religiously-informed beliefs that it was undesirable and harmful for the spiritual wellbeing (*barakah*) of the household.

In framing their inactivity as a religiously-informed choice, these women described their experiences in ways that emphasised their own agency, with little acknowledgment of structural factors that might limit opportunities for socio-economic integration. I suggest that religious beliefs do not drive high rates of economic inactivity among British Muslim women, instead, narratives that centre religious beliefs form part of an ideological strategy to cope with structural marginalisation in the labour market and wider society.

KHAN, Chabel* (University of Melbourne, Australia)

Policing the (risky) Family: Examining Mass Media Representations of Risk As Sites of Social Control

Understanding risk as entangled in social control is not new. Governmentality scholars and discourse analysts have broadly proposed that risk—usually understood at the levels of discursive formations, technologies, and governmentalities—can imbricate with and enact regimes of (bio)power. However, despite a groundswell of discursive-governmental research, there is a relative lack of studies critically interrogating how mass media representations of the 'risky' liberal(ised) family can act as sites to either augment or propel social control.

One of the few Foucauldian thinkers that have substantively addressed the interconnections of the liberal family, risk representations, and social control is Jacques Donzelot. Donzelot draws on his genealogical mapping of the liberalisation of France to propose three central claims about the social control of the liberal(ised) family: the necessity of a 'tutelary society' of 'social' practitioners and 'social' systems that both amplify and consolidate state-coordinated 'policing' of the family; the mutation of the male-headed family into a 'state-as-family' assemblage; and the disproportionate responsibilisation of the mother figure for 'social risks'. The paper draws on preliminary findings from a corpus-assisted critical discourse analysis of print news articles (N = 33,161) about Australian single-parent families to both refine and extend Donzelot's contribution to the contemporary antipodean context. Specifically, the paper seeks to demonstrate that by focusing on both the lexicality and discursivity of risk representations in mass print media allows for traces of Donzelot's claims about social control to be revealed. The paper concludes the agitational quality of Donzelot's genealogical claims provides a generative foundation for continued critical research into how mediatised risk language can operate as part of the social control both enacted on and through the liberal(ised) family.

The Role of Faith Based Organisations (FBOs) in the Rehabilitation of Offenders

Since time immemorial, religion has been and is part of society that provides a moral compass and stability in society. It regulates human behaviour so that there is conformity to norms and values that are upheld by society. Deviation from these norms and values is subject to sanction which results in incarceration. At the turn of the 20th Century, a more proactive step has been taken for the rehabilitation of those who have come into conflict with the law. The many secular programmes that were implemented in the rehabilitation of prisoners provided little to the desired effect which is highlighted by looking at the rate of recidivism. In this context the role of religion became increasingly recognised as a way to rehabilitate prisoners. In some instances, faith based programmes have been integrated into secular programmes whilst in other instances FBOs volunteer to independently provide their service. Irrespective of the approach used, there is sufficient evidence to support the view that faith based programmes have a positive effect on the rehabilitation of prisoners and helps to reduce recidivism.

The Contribution of Nepal's Tourism Workers and Industry to Promoting Responsible Travel

Tourism workers are vital contributors to the sustainable development of the tourism industry in Nepal. They could make all touristic destinations reachable and better to visit. The ethical considerations such as norms and policies that the workers follow have an immense impact on the execution of business plans in the field. Each project imposed by the tourism industry highly relies on activities the workers performed during the visit to various destinations. This study investigates the sustainable & responsive tourism program executed in the Everest region in Nepal from 1990 to 2022. Most previous studies emphasize defining the concept of sustainability in terms of tourism. They overlook whether the policies have been implemented to materialize sustainable tourism in Nepal. They have extensively focused on factors contributing to the sustainability of the tourism industry but missed explaining how particular norms and policies could strengthen the tourism workers. In this context, this study answers two key questions. First, it explores how tourism is encountering the issue of sustainability. Second, it answers what are the dominant factors that are invertible to sustainable tourism. This study was accomplished through in-depth interviews with and surveys of the local inhabitants, including ordinary and tourism entrepreneurs of the Everest region. This research identifies the positive impact the tourism workers' (i.e., behavior and attitude) on strengthening the sustainability of tourism.

Human Rights Violations in Workplace Against Transgender People in Assam, India

Transgender Persons (Protection of Rights) Act, 2019 discusses unfair treatment in or concerning employment or occupation. However, ensuring a gender-inclusive workplace does not ensure a safe and dignified life for the gender minorities of Assam. Male and female gender identities are the only two options recognized by the mainstream social construction of gender, which tends to demand conformity. By straying from the conventional gender standards connected to the sex assigned at birth, transgender people violate this binary idea of gender. Twelve interviews with male and female-identified transgender people above 18-year-old from the different districts of Assam were considered for a face-to-face interview to gather data. Despite having male or female bodies from birth, all participants expressed gender attributes that are more consistent with the opposite of their birth sex. A combination of purposive and snowball sampling methods was used to select the participants. This study has examined how workplace experience is determined by gender identity. The findings of this research reveal the workplace experience of female-to-male (FTM) and male-to-female (MTF) individuals and provide accounts of how they negotiate their gender identities within the workplace and deal with the issues that arise as a result.

Repair As Infrastructure: Case of Bengaluru, India

The different practices of "repair" offers a framework to unpack inequalities in provisioning of infrastructure in Indian cities. This paper draws on fieldwork in a Bangalore neighbourhood with diverse socio-economic characteristics (caste, religion, language and income) and built form (incrementally built self-constructed housing and slum resettlement housing). The paper discusses the lifecycle of repair practices across multiple forms of water supply that sustain the neighbourhood; from the city level grid of treated piped water supply to local grids of untreated borewell water and off-grid systems of water tankers and water ATMs. It highlights that water provisioning is not only about pipelines and water ATMs, but equally about systemising practices and materialities of repair for both gridded and off-grid arrangements of water provisioning. The paper argues that repair as a practice, allows infrastructure to be built incrementally across gridded and off-grid arrangements, and plays a significant role in actual provisioning, over and beyond the laying of infrastructure grids. The notion is significant as local government budgets in many Indian cities are limited. While local governments may have budgets for capital expenditure to build infrastructure, operational budgets for repair and maintenance are often constrained. For marginalised neighbourhoods experiencing inequities in provisioning through the formal grid- system, repair becomes an essential feature of coping in everyday life. Who asks for repair, where does the repair happen, at what scale and what kind of material is used for repair are all questions that link to systems of local skills, local social and political mobilisations, gendered structuring of time for households, etc. and thus become critical for understanding urban infrastructure itself. We present a case for focussing on repair as an integral part of building/rebuilding infrastructure, involving both state and non-state actors, especially for marginalised neighbourhoods in Indian cities.

Contemporary Crises: Erosion of Democracy?

Contemporary Crises: Erosion of Democracy?

Whether it Russia invasion of Ukraine, human rights crises across the world, refugee or migration issues, the 21st century is facing it all. The question arises as to whether democracy has lost its relevance or is there a greater search for democracy because of the stakes it is facing.

The paper intends to address few crises of the 21st century human social system to discover real areas of crises where democratic values seems inconsistent. Antidemocratic practices around the world has raised serious issues concerning the fate of the modern society. It will explore the debate between the two political constructs; democracy and authoritarianism in the light of the contemporary crises and see how democratic values are just but far-fetched ideals as numerous instances shows.

Expectation Work. Postdocs Sense Making of Academia

The postdoc position highlights one of the tensions in current academia where postdocs hold a highly competitive yet vulnerable position, which does not automatically provide secure future jobs. This situation creates pressure for the postdocs to work more and take on extra tasks and responsibilities. Postdocs know that it matters for their future career path what they are doing in the present and what has been already done in the past. This presentation focuses on postdocs' position by examining how they make sense of their experiences of organizational conditions and the pressures of work in academia. Based on the thematic analysis of 26 in-depth interviews with postdocs in social sciences in Sweden, I show how postdocs approach the conditions of university work to make decisions and continue working. I analyze different ways in which postdocs deal with the expectations and realities of their work, and make decisions to prioritize certain activities over others. In the interviews among other things, postdocs reflect upon the ways they deal with uncertainty, which is a part of the organizational conditions of work in the academic setting. Learning the expectations of the organization and tacit rules of the academic workplace becomes part of their sense making process. Analysing the expectation work that postdocs do allows getting an insight into the underlying order and daily practices, which are needed to sustain academia. Additionally, I examine various relational and power dynamics that this order entails and

reproduces. Overall, I show how the organizational conditions communicated in the form of expectations are shaping the understanding of the work and further decision-making of postdoctoral researchers.

"Where Are You from?": The Constant Reminder of Unhomeliness

"Where are you from?" This is a question that many minority Canadians anticipate being asked in their daily interactions. While Canada is a multicultural nation, and the multiculturalism policy is a factor that many immigrants choose Canada as their country of settlement, the dominant culture always reminds the minority citizens that they do not belong. First-, Second-, and multi-generation immigrants from the global South and East are always inclined to identify their nationality. Some never lived in their ancestral countries, but this question reminds them constantly of their "unhomeliness" and lack of belonging. While the question of the country of origin sounds like a harmless question, this is a foundational comment on a person's geographic identity and nationality. The dominant culture uses a question regarding their country of origin to deny the minority individuals belonging to the land of their residency. This paper discusses the cultural indicators for minority individuals that become the sources of segregation for these populations. These indicators are varied, such as the individual's (or their parent's) accent, skin colour, names, and any symbolic representation of their country of origin. This paper argues that through democratic racism and multicultural policies, the dominant culture has silenced minority groups in Canada. This paper elaborates on the effects of microaggression against minority Canadians and immigrants.

Cyber Communication and Culture of Violence

Communicational gadgets have become essential parts of every individual's life and body. Each person's cyber self is an integral part of their cohesive persona. While cybercommunication has facilitated people's interaction, it has become the foundation and platform for a new uprising of offences. Due to its anonymity and pervasiveness, cybercrimes are excessively committed by both adults and the young generation. Cyberbullying, cyberstalking, cyber-harassment, cyber-sexual-aggression, and even cyber-assisted murder have become familiar events in the news and everyday lives. In many cases of cybercrime, the legal system adjudicated the physical world's laws and regulations to address these criminal actions, which has been ineffective, as the material and the cyber worlds have two different cultures. In order to fight cybercrime, the justice system needs to become knowledgeable about the authentic culture of the cyber world. The paper criticizes the police and the justice system's attempt to fight cybercrimes using the physical world' laws and regulations. This paper critically explores how responsible authorities must deal with cybercrimes and cyber offences in the age of anonymity without disturbing the citizen's privacy and the new generation's newly forming boundaries in virtual space.

Violence, Gender, and Religion in Greater Toronto Area and York Region: The Experience of Iranian Muslim Women

Homogenization of Islam and the Muslim experience has rendered Muslim communities vulnerable to violence and subordination. To deconstruct this perspective and address the diversity of Muslim narratives, I am exploring Iranian Muslim women's experiences of gender violence among the Canadian Iranian communities. By revisiting the data collected during my doctoral research, I examine the intersection of gender, religion, and ethnicity to understand the unique experience of Iranian Muslim women in diasporas. Iranian-Muslim women experience Islamophobia at the global level, which is established in the long history of colonial and oriental discourse, but my analysis reveals an intra-communal religious conflict that ostracizes this demographic among their diasporic communities. In this presentation, I demonstrate how the Islamic Iranian Republic's politicization of Iranian women's choices and agency continuously affects their experiences in diasporas. I discuss the measures taken by Iranians residing in GTA and YR to criticize Iranian woman's religious agency. The Iranian Muslim women, especially those who choose to don the hijab, are encountering verbal abuse, sexual harassment, and damage to their properties, and above all, revocation of their communal membership. I will ask: how do Iranian secularism and political Islam affect the experience of Iranian Muslim women post-migration?

Deepening Inequities in Access to Health Care System. a Study of COVID-19 Situation in India.

In a country like India, there is an immense disparity in access to the health care system. Exorbitant medical fees make it almost impossible for the poor to have decent health care. In the process, people are forced to suppress their health needs and well-being. Here, the crucial preventive stage is lost. During the pandemic, we saw various instances where poor patients did not get timely help and many families lost their beloved ones. The poor were at the mercy of hospitals and doctors.

Our healthcare system should be viewed as a bane to the poor. It needs balance. Hospitals are like big companies, where profit-making has become more than a service to society. Hence doctors and hospitals are desensitized toward the poor. This monopoly is deepening the inequities in access to health care. Data shows that 7% of Indians fall below the poverty line due to healthcare spending and 23% of sick people cannot even afford healthcare expenses. 55 million people are pushed into the poverty line due to spending on medicines alone.

Based on the data available from NFHS, this paper also uses the triangulation method to develop a comprehensive understanding of the health care system in India and its impact on people.

The Rise in Domestic Violence during Covid-19.a Global and Human Rights Concern.

Freedom not only from violence but also from the threat of violence is the first indicator of rise in women's capacity for survival and empowerment. And, in India and other South Asian countries violence begins even before her birth. Historically violence against women is due to the unequal power relations that characterize gender relations in all parts of the world. Violence against women is a universal reality but at the same time, it is invisible. It cuts across all the cultural, social-economic, educational, ethnic, and religious barriers.

Violence by intimate family members is one of South Asia's darkest legacies. In a survey conducted in India on violence against women, 94% of the cases involved an offender who was a member of the family. It is estimated that 50 million women are missing in India either through sex-selective abortions, female infanticide, or female neglect.

Domestic violence is undoubtedly a human rights issue and a serious deterrent to development. Each person is a moral and rational being who deserves to be treated with dignity and respect. Lockdown during the pandemic exposed the issue of domestic violence worldwide. This paper explores the factors associated with an increase during Covid - 19. Data is drawn from incidents reported in newspapers and NFHS.

KHONDKER, Habibul* (Department of Humanities and Social Sciences, Zayed University, United Arab Emirates)

Contesting Postcoloniality: Sociology in the Twenty-First Century

One of the unintended consequences of the Covid-19 Pandemic has been an increase in the online connectivity as 800 million people were added to the cyberspace. Apart from potential developmental benefits that range from telemedicine to distant online education, the new connectivity and digitalization of the world opened opportunities to reconfigure sociology and rethink some of the conventional wisdoms surrounding the nature of sociology as a discipline and its role in shaping the new society. It would be useful to reassess and interrogate theories of postcoloniality in view of the new developments in the internet-dominated world. The paper will investigate how to challenge, in order to refine and repurpose, aspects of postcolonial theories in the world torn between global connectivity and the calls for deglobalization. How could sociology of development informed by the ideas of postcoloniality that evolved in the Twentieth-century interface with challenges of the Twenty-first century world? The challenges include climate change, growing socio-economic inequality, and a decline of democratic values. Reimagining postcoloniality may involve abandoning old paradigms and thinking of colonialization of science-technology dominated life-worlds and institutions in a digitalized world and adopting an intersectional approach to understand the changes.

Semi-Authoritarianism or Authoritarian Democracy on the Rise: South Asian Perspective

Problems of transition from authoritarian rule to democracies have been widely studied by political scientists and political sociologists ,especially in the context of Latin America for quite some time. The recent trends of democracies

transitioning towards authoritarian or semi-authoritarianism or people voting leaders with right-wing or authoritarian tendencies is a relatively recent phenomenon giving rise to concerns over the future of liberal democracies. Illiberal democracies of Southeast Asian variety have also been studied by scholars for some time. Yet, new explorations are needed to understand the rise of semi-authoritarianism in the context of the changing political economy of the world on the one hand, and the rise of China as an emergent power on the other. China provides a model, though inadvertently, that economic development and progress in social indicators are possible under conditions of statist authoritarian systems. This model is receiving some traction in Africa and South Asia with mixed results. The paper will examine, South Asia, especially the cases of Pakistan, India, and Bangladesh's turn towards semi-authoritarianism. The three countries provide important differences in their pre-existing structural conditions as well as in their political cultures. Pakistan has a long history military-rule, India has a strong democratic tradition, Bangladesh is in-between, alternating between democratic and military rule. The paper will focus on political economy as well as larger global political and ideological contexts to account for these transitions.

KHOO, Su-ming* (National University of Ireland, Ireland)

Connecting the Challenges of Quality and Equality in Higher Education in Ireland and South Africa – Learning from a Collective Intelligence Based Research Project.

This paper speaks to this panel's interests in higher education (HE)'s quest for relevance, particularly its thematic interests in governance, institutions and programme development for 'quality' teaching and learning. It presents results from a collaborative international research project connecting *equality (including equity)* and *quality* in HE (BCAUSE-IRC/COALESCE 2019/ 88). Sustaining HE as a public good is challenging in the global context of defunding, instrumentalization, narrowing, marketization and internationalization (OECD, 2007), challenges further exacerbated by ongoing pandemics, economic stagnation, inflation, and climate crisis. Despite widening access and participation, inequalities remain. South Africa's demands for systemic transformation of public HE towards an inclusive, equitable, rights-based system have wide relevance in this global context.

In the BCAUSE project's first phase (2019-20), experts from different HE specialisations, based in different global locations worked together using collective intelligence (CI) methods to develop a shared understanding of (1) key features of equity-focused quality HE, (2) barriers to equity-focused quality HE, and (3) options for overcoming these barriers. The results from the first phase highlight the potential transformative dimension towards equity-focused, quality HE, including: responsiveness to students, participatory design, pluralism and openness, and an educational imperative promoting equity in practice. Experts identified barriers and options focused on institutional resources and supports, excellence-equity tensions, systemic norms and pressures, reflective complexity, and awareness, empathy, and responsiveness to student needs. The CI of experts provided suggestions for ongoing research, strategy, and pedagogical or curricular innovation to foster equality-focused, equitable quality in HE.

The second phase carried out Collective Intelligence workshops in the two participating universities, NUI Galway in Ireland and UNISA in South Africa (2021-22) to develop institution-specific conversations around the barriers and options for operationalising equity-focused quality in each location. The third, final phase (2022-23) engages micro-grant initiatives to experimentally embed institutionally-identified options in the two locations.

Sustaining Ignorance amidst Planetary Omnicrisis

This paper explores why and how 'transformative' (including ecologically prudent, feminist, decolonial, peace and human-centred) narratives of development have been minimized in the development community's own knowledges? Why and how have efforts to shift development's central purposes and activity - from GDP growth to experienced human and planetary wellbeing - been marginalized, deterred or deferred? What is behind consistent failures to shift focus from means to ends, or change development's objectives from economic growth and conventional border security to sustaining health and wellbeing for human and planetary subjects?

The paper discusses the elisions of the 2022 UN HDRO Special Report on Human Security in the Anthropocene (UNDP 2022) as a starting point for interrogating failures to address the 'soul' of human security - human development. Can development be fundamentally 'humanized', ethical and transformative, capable of redressing violently unjust structures? This question remains foundational to carrying on with narratives, practices and studies of development today, in a 'broken world' where paradigms seem lost amidst multiple existential crises of a global Anthropocene wracked by climate chaos, extinction, drought, wildfires, inequality, excess deaths, hunger, disinformation and socio-political polarization. Amidst omnicrisis, critical perspectives remain stubbornly silenced. Why do existing critiques and alternatives get ignored, become un-known? How were paradigm shifts that emerged submerged, inconvenient critiques and initiatives circumvented, reimagination attempts forgotten and alternative solutions nudged out of reach?

Furthering work developed in previous DSAI forums on silences and ignorances (eg Khoo 2013, 2020; Khoo and Floss 2022) I take a sociology of knowledge approach, (especially ignorance studies, eg Gross and McGoey, 2015) to the puzzle of development studies' ever-sustainable failures to pursue transformative paths. It situates the critical perspective within broader, generalized crises of liberal infrastructures and internationalisms, and seeks hope in reparative commitments, facing inhumanity with truthfulness and ethical creativity (Khoo 2022).

Examining the Relationship between Religiosity and Social Hope with an Emphasis on the Role of Religion in Iran (Case study: Citizens of Gorgan and Aqqla)

It is necessary for any successful society to have well being, especially social hope among people. People, despite having hope and optimism about issues, provide the growth and development of their society. The religion has also mentioned hope in many verses and mentioned that you should not forget to hope in God even in the time of problems and sufferings like the times of crisis. Research shows that religious people feel more satisfied and happy in their personal and social life because of their hope in God. The aim of this study is to identify the relationship between religiosity and social hope, emphasizing the role of religion. The research method was survey and the population was made up of the citizens of Gorgan and Aghqala cities, of which 400 people were selected and studied as a sample by multi-stage stratified cluster sampling method at the times of covid19 pandemic (May to July, 2021). Data collection tools were Glock and Stark's religiosity questionnaire and Smith and Miller's social hope questionnaire. Cronbach's alpha coefficient was used to determine its reliability and the validity of content had confirmed already by previous researchers. The findings showed that there is a significant relationship between religiosity and social hope. While the difference in the level of religiosity between Shiites and Sunnis is not significant. Also, no significant difference was observed between the level of social hope among Shiites and Sunnis. The results of controlling the variables indicate that religion is an influential factor in the relationship between religiosity and social hope. Comparisons also showed that among dimensions of religiosity; The ritual dimension of religiosity does not play a significant role in creating social hope, while the other three dimensions of religiosity (belief, emotional, and consequential) have a significant relationship with social hope.

A Qualitative Enquiry into Rdp Houses As a Source of Sustainable Livelihoods: Imperial Reserve, Mmabatho Local Municipality, South Africa

RDP house renting has several significances for both the landlord and the dweller. In urban and surrounding areas backyard dwelling act as means for affordable shelters to those in need. With high migration of people to urban areas seeking employment there is not much available shelter to house all those in need. Thus, RDP rentals acts as a safety net for such a population. Backyard dwelling provides affordable, acceptable quality accommodation to the lower income South African. It further accommodates a diverse spectrum of vulnerable households; many of which are unable to procure subsidized accommodation (Shapurjee and Charlton, 2013). It further provides accommodation to students across the country in urban, townships and rural areas situated near institutions of learning. Apart from being beneficial to the dwellers, RDP house rental also contributes to the livelihoods of landlords. It acts as a socio-economic survival strategy for many households. In a country with a high unemployment rate and majority of its people living below the poverty line, many have been forced to investigate the informal sector for survival. With the provision of RDP housing this has opened the market into backyard dwelling. In as much as Backyard dwelling has some positive aspects it does however pose constrains for municipalities as it puts them under severe pressure on in terms of municipal capacity and the environment. Thus, this study seeks to address these gaps and additionally contribute to the body of knowledge on housing, sustainable livelihoods thus connecting the link between the state and beneficiaries.

Agro Processing As a Tool for Poverty Alleviation Strategy: A Case of Raymond Mhlaba Municipality

Abstract

Agro processing is viewed as a possible poverty alleviation tool for rural development in South African communities. Agro-processing can be a tool for income generation and local economic development for rural settings. This study sought to examine the role and impact of cottage farming in Raymond Mhlaba municipality, rural Eastern Cape province. The study further identifies ways of developing the cottage and agro-processing industries as a tool for poverty alleviation and local economic development. Grounded on the sustainable development theory and the human capital development approach, the study explores how rural people in Raymond Mhlaba Municipality utilise their livelihood capitals as a tool for survival. The researcher employed a qualitative approach by using in-depth interviews and focus group discussion. Findings of the study revealed that rural households embark on various survival strategies, cottage farming being dominant. The purpose of the study was to enhance small-scale farming using agro-processing as a poverty alleviation strategy, thus promoting a sustainable rural development for the Eastern Cape province.

Self-Help Group and Livelihood Patterns of Tribal Women

In the Indian constitution, the principle of gender equality is enshrined to adopt measures for the development and equality of women. Since independence, India like other developing countries is making concerted effort through five-year plans for development of women in general and tribal poor women in particular. Since last three decades, inspired by the success of Garmin Bank of Bangladesh and subsequent legitimacy of World Bank, IMF etc., the government has initiated financial inclusion through Self-Help Groups (SHG) under various development programs for poor tribal women. This has gained momentum by support of many national and international aid agencies for empowerment of tribal women. In this context, this study makes a humble attempt on SHGs in enhancing livelihood patterns and quality of life of vulnerable tribal women in a backward Nanded district, Maharashtra. The purpose is to know how SHG could bring to excel their potentialities and creativity in livelihood patterns of off-farm and non-farm activities related to agriculture, rural entrepreneur and subsequent improvement in quality of their life by reducing level of abject poverty, regional disparity, high illiteracy, inequality, wage disparity, displacement, mass migration as 'Dadan Labor' to out States, exploitation, domination and subjugation etc. This study follow structural approach linking history on larger political –economic situation, political will of welfare state in implementation of development programs by adhering guidelines of aid agencies, level of accountability of facilitating NGOs, responsibility of ITDA to comprehend the SHG issues in totality on poverty eradication of poor tribal women. Besides, theoretical perspectives of Max Weber protestant ethics of capitalism, Karl Marx accumulation of capital and feministic perspective of gender inequality, patriarchy, marginalization, used to comprehend the SHG rural financial services linking livelihood programs for development of poor tribal women.

Transgender and Human Rights: A Study in Mumbai City

Historically, transgender community commonly known as 'hijra' are seen in Indian society. Approximately, 6 million of hijras population are found in different parts of country and lives in most abject poverty without minimum basic living conditions. They are even hardly recognised as citizens of India. In April, 2014, in a path-breaking judgment, the Supreme Court of India affirmed the constitutional rights and freedoms of transgender persons including to those who identify with a gender opposite to their biological sex or gender assigned at birth. By recognizing diverse gender identities, the court has broken binary gender constructs of 'man' and 'woman' that have pervaded Indian Law since colonial times. Now the efforts have been made to ensure their right to lives in various forms like recognition as 'third sex' or 'third gender' reservation in government services, admission in educational institutions, sensitisation of their social-cultural existence, etc. Despite these progressive moves, violence against transgender persons is continuing unabated. Often, they are sidelined and face ridicules and abuse in public places. Law enforcement agencies often fail to understand that transgender persons are human being in their own rights, hence, need citizenship rights. Though, the Supreme Court verdict is very revolutionary in determining right to decide their self-identified gender-legal recognition but in many cases issues are still unresolved. Moreover, mere introduction of the law will not automatically solve their problems. Against this backdrop, this study which is under progress on 100 transgender located in railway station, slum areas, bus stand etc wherein they live and survive in Mumbai City, India . The preliminary finding reveals the quest of strong political will needed in favour of them otherwise the Supreme Court verdict will be in deadlock.

In Campus Away from Campus: Perspectives on Learning during COVID-19 from Students in a Kenyan University

The global pandemic occasioned by COVID-19 ushered in a 'new normal' that the world was unprepared for but had to live with. A long with the economic and social disruptions to normal life came disruption in learning. The confirmation of the first case of the coronavirus disease in Kenya on 12th March, 2020 was followed by a government directive that all primary and secondary schools close by 18th March 2020. Tertiary institutions were directed to close by 20th March 2020. However, in an attempt to usher the country into the new normal, the government soon required tertiary institutions to begin offering online classes. The institutions were also to conduct online orientation and matriculation of newly admitted students. The focus of this paper is a cohort of freshmen and women in one Kenyan university, currently in their third year, who joined campus remotely in 2022 because of COVID-19 related restrictions. The data were collected through anecdotal narrative recordings and focus group discussions. The analysis shows the disappointments and challenges these young high school leavers faced. Some of the challenges were financial while others were technological in nature. There were also challenges relating to the home learning environment. These range from financial, technological and learning environment. However, the analysis also reveals the resilient and innovative ways in which the students dealt with these challenges at personal and group levels. The innovations were not only driven by necessity, but also the realization that the university and faculty were, in varying degrees, also learning and adjusting to a new situation. Interestingly, even though physical on-campus learning has resumed, this cohort of students expressed a preference for full online or blended learning - concepts that were largely novel in the pre-COVID-19 Kenyan context.

Invoking the Gods to Change One Owns Gender, Gender Fluidity from an African Perspective (Case study of the Agikuyu)

Invoking the gods to change one owns Gender, Gender Fluidity from an African perspective (Case study of the Agikuyu)
Wanjiku Kihuha
Gender fluidity has been profiled within African contexts as foreign concept being imposed to Africans, I argue in this paper that the idea of Gender Fluidity has been within African Existentialism. According to the *Gikuyu* tribe of Kenya gender was not seen as static but rather as fluid this is expressed in one *Gikuyu* Mythology. In this *Myth* it was said that if a person of certain gender (Male/Female) wished to change their gender they would go round the *Mugumo* tree 7 times and their gender would be changed. *Mugumo* tree according to the *Gikuyu* is a sacred tree; *Mugumo* tree provide sites for religious ceremonies, home to ancestral spirits and centers where the elders can commune with *Ngai* "The *Gikuyu* god". As such the endeavor to change one's gender is seen as a Spiritual practice, this is because it was supposed to take place at the shrine. Whether the change happened in this work is besides the point, this work seeks to focus on the African thought that *Ngai* could change someone gender when invoked. The Study will evaluate the *Gikuyu* Myth to analyze the African traditional tools that the culture availed to change owns Gender. The study will also utilize a historical methodology to unpack how Gender fluidity have intersected Religion and Culture within the *Gikuyu* culture. The findings of this study will be instructive in theorizing Gender Fluidity in African contexts, with particular attention to *Gikuyu* community.

Perceived Empowerment and the Impact of Negative Effects of the COVID-19 Pandemic on the Quality of Life of Persons with Severe Mental Illness.

Background: Beyond its direct effects on physical health the COVID-19 pandemic has been shown to have negative effects on the living situation of people with severe mental illness (SMI). To date, there has been little research on resilience factors preventing people with SMI from experiencing negative effects of the COVID-19 pandemic.

Objectives: To investigate the role of perceived empowerment (PE)as a resilience factor, preventing people with SMI from experiencing negative effects of the COVID-19 pandemic on daily living.

Methods: We investigated negative effects of the COVID-19 pandemic on daily living in 931 persons with SMI at two times within six month between June 2020 and Mai 2021. To take into account the longitudinal structure of the data we applied mixed effects regression analyses and longitudinal path models.

Results: A majority of participants experienced negative effects of the COVID-19 pandemic on several dimensions of daily living. Negative effects increased with rising levels of illness-related impairment but decreased as the level of PE rose. While negative effects of the COVID-19 pandemic at follow-up were negatively associated with overall subjective quality of life baseline PE was negatively associated with the negative impact of the pandemic and positively with quality of life.

Discussion: Patients with SMI need support to reduce negative effects of the COVID-19 pandemic on their quality of life. The promotion of PE could help strengthen resilience in this target group.

KILIAS, Jaroslaw* (Faculty of Sociology, University of Warsaw, Poland)

Translations in the Making of Polish Sociology 1956-1989

The paper deals with the translations of sociological books into Polish, published from the post-Stalinist thaw in 1956 until the end of Communism in 1989. Translations played a special role in the formation of a distinctive identity of Polish sociology, which was relatively open to the West, but the scale of its international contacts was seriously limited, not only by political and bureaucratic constraints, but first and foremost by its inadequate economical resources. In a relatively closed academic community in which no more than one-two libraries with a barely adequate access to international scholarly literature existed, translations served as a surrogate of academic contacts.

In my paper I will analyze the body of all scholarly work translated into Polish from both Western and East-European languages. Doing so I will try to disclose various logics of publication of foreign works. The two most important ones were the logics of political acceptability and economical availability (eg. French books were more available then Anglo-Saxon ones as they were more affordable and less politically exposed). Another factor were the scholarly interests (and sometimes idiosyncrasies) of influential figures of the local social science; last but not least – theirs of personal contacts and relationships sympathies. Last but not least, Polish translation market was pluralist, and while the leading role played the great, state-owned publishing houses (first and foremost State Scientific Publishers, PWN), important roles played the Communist Party's publishing house Książka i Wiedza and to some extent also Catholic Church publishers.

The final part of my paper will deal with a few especially important translations, such as Becker and Barnes's *Social Thought from Lore to Science* (1964) or a collection of papers entitled *Elementy Teorii Socjologicznych* ("Elements of Sociological Theories", 1975).

Pandemic Cooking, Community and Sense of Belonging in Japan: The Coping Strategies of Foreign-Born Seminarians amidst the COVID-19 Pandemic.

In the context of migrant communities, heritage food practices express group and individual identities and contribute to well-being and adjustment in the country of reception. In many parts of the world, cooking frequency, grocery shopping, diet quality, and culinary practices shifted dramatically during the COVID-19 pandemic (Sarda et al. 2022). In the case of foreign born seminarians living in Tokyo, quarantine disrupted daily life and introduced new food activities and rituals requiring men to suddenly prepare, cook, and serve meals for their entire residential community. The literature on immigrant families' coping strategies through foodways, and especially those focusing on foreign-born men in East Asia has not been explored. Examining a diverse body of migrants from hailing from Vietnam, Congo, South Korea, Italy, and America, I explore how preparing, sharing, and consuming heritage foods enhanced the wellbeing, closeness and communal bonding of men living in shared residence in Japan at the height of the pandemic. By focusing on the food activities and perceptions of a group of foreign-born seminarians in Japan, this study explores how notions of home, a sense of belonging, and community are established in the wake of the COVID-19 pandemic. This paper contributes to our understanding of migrant foodways, coping strategies, and pandemic cooking by focusing on meso-level changes implemented by the Catholic church in Japan.

Discrimination during the Covid-19 Pandemic and Future Plans Among International Students from Asia in Canada

This study investigates how experiences of discrimination during the pandemic influences the post-study plans of international students from Asia in Canada. While the majority of international students intend to apply for permanent residency, it is not clear how this intention varies by the racial background of students and by experiences in place. Given the recent shift in climate with increased experiences of discrimination and anti-Asian hate, as well as a shift in policies and practices with Indigenization efforts, and diversity, equity, and inclusion goals, institutions are under increasing pressure to provide support to racialized international students, most of whom are from Asia, and many of whom do not seek institutional support or services. It is particularly important to understand how the pandemic has impacted the potential for permanent migration in light of Canada's immigration objectives that emphasize the desirability of international students as future workers and citizens. Using the 2021 Canadian Bureau for International Education International Student Survey, the analysis compares post-secondary students from Asia, specifically India, China, South Korea, Vietnam, and the Philippines, with their counterparts from other countries on their intentions for remaining in Canada after their studies in the heightened racialized context of Covid-19.

Dynamics of Food Politics and Governance in Seoul, 2011 - 2022

This research analyzes the formation and transformation of food governance in Seoul from the period of 2011 to 2022. Our analytical focus will be main actors (the mayors, NGOs, social movement activists, and experts) and their dynamics in the making and remaking of the Seoul Food Ordinance and Food Citizens' Committee. The strong social movement for free lunch program in the early 2000s provided fertile soil for the progressive mayor to pursue food policies which emphasized urban-rural co-existence, citizens' participation, and democratic governance. In this process, the Food Ordinance of 2017 was passed which made financial and personnel resources available for institutionalizing citizens' engagement in food policy planning and monitoring. The Food Citizens' Committee, which consisted of various citizens interested in food, has been at the center of food governance working with the mayor, civil servants, and the city council. With this collaborative work, Seoul had been able to actively pursue various food programs which included food festivals, 'good food' college, international conferences, and free lunch programs for daycare centers and schools. Yet, with the abrupt change of power which led to a new mayor in 2021, the existing food governance has been undergoing a rapid restructuring. There has been radical reorganizing of food related departments in the city and size of Food Citizens Committee is expected to be greatly reduced. Based on the documents and participant observations, I will attempt to describe this historical process, explain it by employing sociological concepts, and assess the significance and lessons of food politics in Seoul.

Becoming a Transnational Professional: Skill Development Processes Among Migrant Professionals in Japan

Recent studies on labour migration have increasingly paid attention to the skills and competences migrants acquire through the process of migration and labour market transition. For the emerging groups of professionals whose career paths cross multiple national boundaries, this study argues that there is a need to shift the focus from skill transfer to skill development. Here, drawing on in-depth interviews with 44 Korean IT professionals and relevant actors

in their skill development, the process of skill development among migrant professionals in Japan is examined. Grounded in the literature on migrants' skills, this study extends our understanding of skilled migration by illuminating the differing training regimes in sending and host countries, as well as varying agents of skill development at different migration and skill development stages. The study points to the emerging transnational mobility of migrant professionals as a result of their attempts to exploit and/or overcome the training regimes.

Harder to Retire in Singapore or Korea? Korean Older Adults in Singapore on Linked Lives and Ageing in Place

Where do older people with transnational family background feel at home when they retire? This study expands the concepts of 'linked lives' and 'ageing in place' (Callahan 1993; Treas 2008; Wiles et al. 2012) for older people who live in a transnational migration context (Kim 2012; Treas 2008, 2014). We propose the concept 'ageing in transnational place/space with linked lives' to be useful to understand immigrants looking for the 'ideal' or 'right' place – right in multiple meanings of feeling at home and maintaining ties with their significant family members. In-depth interviews were conducted on two subgroups of Korean older and middle-aged adults--60 years and older and (2) between 50 and 59 years old--who have spent significant parts of their working lives in Singapore. Our sample also includes interviewees who participated in the study in 2006-7 (Kim 2012) and in this follow-up study in 2018-9. We investigate how older migrants construct and plan their 'ideal' place for later life. We find that they construct several patterns considering their own circumstances of familial and friendship relations, financial resources (e.g., public pensions) available, as well as their own 'transnational', 'local' and 'regional' preferences built up during the earlier life course. Health care and other institutional environments of both origin and host societies are also considered. In essence, their ideal location is characterized by living "nearby" to their adult children; flexible scales of "being nearby" to their adult children nospan from the same city or country to intra- and inter-continental. Our research suggests the importance of viewing ageing issues of transnational older adults through a transnational lens and, in particular, underscores the conceptual usefulness of extending 'ageing in place' and 'linked lives' concepts to flexible and multiple geographic scales from local to transnational.

Voluntary and Involuntary (im)Mobilities of Korea-Born Older Adults in Singapore and Los Angeles: Transnational Insights from Linked Lives, Social Welfare, Citizenship Choice, and Familism

How do transnational older people practice retirement and maintain intergenerational relations with the family's younger generations? To what extent do local contexts of co-ethnic community and immigration policy matter in more open or restrictive immigration regimes? These questions are answered by expanding an original sample in Singapore (Kim 2012) with new fieldwork in Los Angeles. We investigate and compare the late-life issues of Korean transnational families in two distinct contexts. Singapore has adopted a 'more restrictive' single citizenship migration system for the city-state having the largest Korea-born community in Asia. Representing the more open dual citizenship system, Los Angeles has the largest Korean expatriate community in the world.

We report a tri- or quad-polarization of retirement choices: remain in destination cities (where Korea-born Koreans spent most of their working lives), move back to Korea, or relocate elsewhere (other U.S. states or a third country). The upper middle-class and the professional middle class are less constrained by financial reasons. Two other important groups (voluntary immobile group and involuntary mobile group) find choices constrained by social welfare and medical insurance systems, their past work trajectories, and familial 'transfer' of their own wealth. We argue that difficult and limited choices of these groups reflect intersectionality of foreign-born immigrants, particularly, getting a job or running a small business in an ethnic enclave for their core working ages (i.e., in their 30s to early 50s) coupled with the fragility of ethnic enclave jobs/businesses in the globalizing and technologically advancing contemporary world. We point to the ambiguity of conventional policy-related immigration concepts and propose new categorizations and concepts (e.g. Baldassar et al. 2007, Treas 2008; Kim 2012).

Why Environmental Sociology Concepts Fail to Capture Reality: To Break the Impasse of Concepts in Environmental Sociology

Recent ecological crises such as climate change and/with Anthropocene raise new questions on the validity of concepts to grasp the environment-society relationship. New or modified conceptualizations of the relation and the works to clarify their constellations, such as in *Environment and Society* (Boström et al., 2018), have appeared but are still an intricate task. This paper suggests redrawing concepts for environmental sociology, using a metaphor of M. Escher's Drawing Hands and N. Luhmann's social theory. Esher's Drawing Hands shows a paradox that drawing hands become drawings and turn back on each other. We argue that the paradox, however, works only when we see the drawing itself until we don't see the drawer, that is Esher, and the drawer's drawing hands. This metaphor raises doubts whether society, the environment and their relations conceptualized in environmental sociology, similar to the hands inside the drawing, are trapped without considering the outside world of the drawing. They, the society, the environment, and their relationships are in the drawings, for sociological terms, as a social (communication) system. We scrutinize the constellations which consist of assumptions or schema on interactions between the environment and society in the primary theories in environmental sociology such as New Environmental Paradigm (NEP), eco-marxism, ecological modernization and actor-network theory (ANT). We question what the theories or conceptions observe and draw among myriad possibilities, how they identify and situate the environment, nature, society, or and culture, and the relationships among them, inside their drawings. In doing so, we look forward to showing the impasse of each concept and detouring the impasse. A drawer's drawing hands might become a key to re-constellate this trouble.

Worlding with Marine Debris -Alliance and Split of Beings in Marine Conservation in East Asia-

Marine debris, most of which made with plastics, is represented as an example of "destruction of nature by human activity" in the Anthropocene by showing the situation in which man-made objects have occupied the ocean. This study starts with situational awareness that marine debris is a bad thing "of course", and that the ocean is a space that needs to be protected from such things. These propositions seem so natural that they are undoubtedly treated as "facts". Before asking how to solve the problem, of which everyone agrees to removal, this study, however, questions that how we build our worlds with marine debris. How come we get stuck in a world entangled with marine debris? In east asian context, the Kuroshio current might be a key actor for us to understand the relation among near states, such as Korea, China, and Japan, because the current makes ways not only for salty nutrients but also for marine debris. Through the current, marine debris became problematized among them and made social exchanges. Now, we cannot understand a "social" relation without "natural" current. This study analyzes this situation through ethnography with concepts of a gift (Mauss, 1925) and naturecultures (Haraway, 1997). In this ethnography, international relations were made through marine debris. Marine debris is rethought as a thing to force to think, or political matter in this study (Braun et al., 2010). As showing materiality and spaciality of marine debris and marine spaces, it might be helpful to articulate a relation between nature and society in the Anthropocene.

Creative Resistance, Oblivion, and Un-Representability of Social Trauma

Social Disaster would yield double-fold collective problems in the modern society. Collective memory of the disaster requires social movement for institutionalization while social trauma would insist on the problem of "un-representability"(Adorno, 1977; Butler, 2004). Artists has practiced creative resistance against oblivion of the disaster. This study try to explain the artistic process of remembering social disasters as art practice by case-analysis of Korean theater work on "Sewol ferry disaster"(2014). In theater, artists interpret the personal and social suffering of the Sewol ferry disaster through collective perspective and endeavor to re-present traumatic accidents.

This study analyzes the theater work that remembers and represents the Sewol ferry disaster, asking the following questions: first, how has the artwork

to remember the Sewol ferry disaster developed so far? Second, what has the cultural trauma and the "un-representability" of the disaster affected the participants' practice?

According to the analysis of in-depth interviews and content analysis for this case, the struggle for collective memory would intersect with artistic performativity(Butler, 1996; Fischer-Lichte, 2004). Along with the request for the fact-finding investigation of the failaure of saving Sewol ferry, these theatrical works have faced an inflection point by period, passing through pending issues inside and outside of the artistic community. he work of the participants is not limited to symbolic struggles in the art field(Bourdieu, 1993), but an important aspect of the artist's social participation is discovered. This study found that artists have sought various artistic forms to transform them into cultural memories(Assmann, 2009), though the artists confront the 'un-representation' of suffering during their works.

RC38-562.5

KIM, Jini* (Sogang University, Republic of Korea)

Social Disaster, Place, and Struggle for Collective Memory

The social process of collective memory is that fragmented memories dynamically compete with each other(Hirsch, 1995). This study focuses on the place of memory as one of the cultural tools that form collective memory(Assmann, 2009), and analyzes how the place of memory of social disasters has been institutionalized. This study investigates how the placeness of the memorial spaces has been socially constructed and what factors have influenced the institutionalization process of the place of memory. Furthermore, the study aims to explore that the institutionalization of place of memory is a process for reflecting on social suffering and acquiring 'moral universality'(Alexander, 2003) that goes beyond the context of power struggle and hegemonic occupation of territory.

According to the analysis of field research, in-depth interviews, and content analysis for each case, the social disaster cases in Korea created a place of memory based on symbolic features of the local community. However, the institutionalization of the places differed due to the power and autonomy of local governments, the solidarity within victims and with others, and the resources and procedural institutions. In addition, this study found that, in the institutionalization process, the places of memory are being signified(internalized) as public values that can access the ultimate ground of moral horizons. The struggle for the memory of the bereaved family over the place of memory can be interpreted as an externalization process of the social suffering caused by disaster and as a call for social awakening. This study shed light on the place of memory in the process of internalization to reflect continuously in the public sphere oriented toward under moral universality and not to be forced to place collective memory of social suffering into oblivion.

Old but Smart Data for Smart Cities

In the era of smart cities, citizens' participation would not lead technological innovations. Yet as one of the decisive forces shaping its direction and main features, understanding ordinary people's needs and desires related to technological adaptation is essential to improve quality of life. More research on smart cities have thus started to focus on the critical role of citizen and suggested varied platforms to embrace people's participation. Those researches highlight new forms of participation through sensors, telecommunications, or digital platforms. However, those 'involuntarily' collected data cannot represent 'actual' expectations of ordinary citizen. Although the advent of smart cities depends largely on urban managerialism cum the relevant industries, it is ordinary people's demands, daily practices, and habits that enrich and modify its daily expression. In this context, this research argues that it is essential to understand how people understand smart cities and what they expect from the visions of smart cities for their quality of life. Given this empirical research which conducted interviews with 240 residents living in high-rise public apartments in Singapore, rather than innovative technological improvements, residents expected seamless and smooth living environments alleviating daily worries and concerns. Convenient online communications platforms for neighborly interactions were expected, which can economize personal time and living costs. Also, there were concerns about costs that individuals should supposedly pay. Further, two conflicting perspectives toward smart cities – the benefits of smart cities in terms of convenience, efficiency, or newness, and the woes about digital illiteracy and the possibility that human laborers can be replaced by highly developed technologies – were also expressed.

Gentrifying Otherness: Diversity and Whiteness in the Restaurants of Canal Saint-Martin Neighborhood in Paris

Although gentrification has become more than an ordinary research subject, a racial dimension of Parisian gentrification remains to be studied. Focusing on the restaurants which started coming up since the end of 1990s in Canal Saint-Martin neighbourhood in Paris, I aim to shed a light on how this urban and commercial phenomenon articulates with racial dimension through representation of "diversity" as well as the division of labour in the restaurants. My question started from a simple observation: why do minority entrepreneurs open a restaurant which represent their own origin while white ones open ones offereing dishes from all over the world? First, I will present how the differenti m·migration trajectory of Asian restaurant entrepreneurs influence their relation to whiteness in the context of gentrification. According to their im·migration history in France and class belonging, the intensity of "gentrification work" through their restaurants, to attract white middle and upper-class customers, remains unequal, in spite of the shared instability as a minority. Second, I will focus on white middle- and upper-class entrepreneurs, graduated from MBA courses, investing in the restaurant sector through commercial exoticism: opening restaurants which offer extra-occidental dishes in this neighbourhood. Opening a restaurant to which they don't identify themselves, they put forward their short international mobility experience, as a principal motif of their culinary offering. While minority entrepreneurs float between the affirmation of their identity and reversing stigma through the revalorisation of their dishes, white ones, in the dominant position within racial hierarchy as well as social stratification, appropriate the exotic character of otherness, principally to make profit as rapidly as possible, developing a gentrified fastfood. Finally, this "diversity" will be examined to understand from whose point of view it has been constructed and how it operates for the commercial purpose, revealing, disguising or euphemising racial relations of power.

KIM, Jiyoung* (IDHE.S-Nanterre, France)

The Coloniality of Spatial Production : Gentrification in Canal Saint-Martin Neighbourhood in Paris

While "settler colonialism" seems useful to study gentrification in Anglophone cities in Canada and Australia, this frame of analysis doesn't seem very relevant to understand Parisian gentrification. First, Paris was a metropolitan city of French empire, rarely concerned by the politics of settlement. Second, the French government doesn't produce census data on racial and ethnic belonging. However, the entrepreneurs of restaurants, who participate in the gentrification of the neighbourhood since 1990s, say often: "there was nothing in the neighbourhood before we open our restaurant", "It was an old filthy bar", "We priced up to sort out customers". Through this discourse and entrepreneurial practice for their restaurant, they reinforce to (in)visibilise and (de)legitamate certain population and business. In order to elucidate this spatial production process, I will first present the demographic evolution of Canal Saint-Martin neighbourhood in Paris, analysing the census data on the occupation of inhabitants. Second, I will analyse the 35 issues of *La Gazette du Canal*, a local magazine published by inhabitants between 1993-2003, several issues of *Histoire et Vies du Xème*, a magazine dealing with the local history as well as about 1400 articles published on this neighbourhood in the national French press. These data are helpful to overcome the institutional obstacle in the French context. They will also allow us to understand who voiced and whose voice was heard, while others are not. In breif, their "gentrification work" will be examined. Putting these different data in relation, I will make clear that the dynamic of gentrification in this neighbourhood relies upon the coloniality of power, since it refers both to a material system of capitalist exchange and a hegemonic knowledge practice, despite a relative absence of an explicit politic of settlement or racial branding in France.

Attitudes Towards Children and Subjective Well-Being: A Comparison between East and Southeast Asia

This study compared East and Southeast Asia in terms of the composition of latent classes regarding attitudes towards children and their associations with subjective well-being. Although low and ultra-low fertility has been an important policy issue in this region, there is a paucity of comparative research regarding subjective perceptions of children and their effects on well-being. We collected nationally representative data in Japan, South Korea, Taiwan, Singapore, Malaysia, Indonesia, the Philippines, and Thailand. The "family and changing gender roles" module of the International Social Survey Program was used to assess attitudes towards children. Happiness and life satisfaction were used for subjective well-being. Four latent classes were identified: strong inconvenience, moderate inconvenience, strongly traditional, and moderately traditional. The moderate inconvenience group was prevalent in East Asia, whereas the moderately traditional group was most common in Southeast Asia. East Asians were more likely to think that children are a financial burden and they create inconveniences in terms of parents' freedom and career development. In contrast, Southeast Asians tended to think that children are a source of joy and economic help, and not very burdensome financially and career-wise. Compared to the moderate inconvenience group, the highly traditional and the moderately traditional groups were happier and more satisfied with life

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

in East and Southeast Asia alike. However, the strong inconvenience group was less happy and less satisfied with life than the moderate inconvenience group in East Asia, whereas they were happier and more satisfied in Southeast Asia. Subjective well-being was correlated with the overall score of perceptions of children in East Asia, whereas subjective well-being was associated with positive items in Southeast Asia. The results suggest that East Asians took a more holistic approach, whereas Southeast Asians focused more on the positive aspects of having children in conceiving subjective well-being.

Diverging Paths for Highly-Skilled Immigrants: A Comparative Study of Two Male-Dominated Sectors

This study extends the current discourse on gender and highly-skilled migration by examining two male-dominated sectors–manufacturing management and information technology (IT) which have shown divergent paths for women immigrants. Building on the classic approach that explains different experiences of immigrant incorporation (Portes and Rumbaut 2006), we identify three contexts of reception relevant to the gendering processes of incorporation among the highly-skilled in industry sector, organization, and ethnic community. Our findings show that the openness of the industry sector to immigrant women in the host country, the presence or absence of a workplace culture that accommodates work–family balance, and gender-based professional networks within ethnic communities are significant factors with which male dominance is reinforced in the management sector but challenged in the IT sector.

Global Trade, the Neoliberal Political Economy, and Inequality

To what extent has the neoliberal political economy advanced by the multilateral system under the GATT/WTO contributed to the creation, reproduction, and exacerbation of inequalities? Global trade, and the globalization that it has facilitated, has had distributive consequences within countries, between countries, and even between regions. The emergence of global value chains and trade along the international supply chains are the most recent manifestations of systemic inequalities that are taking shape in the 21st century. Using the tools of network analysis, this presentation will touch on the longitudinal patterns of inequality within and between nations and regions since the end of World War II, going back to the origins of the neoliberal political economy in international trade.

The Role of Emotions for Antiracist Mobilization: Results from a Cross-Sectional Survey in Germany

Recently, antiracism and protests have gained increasing attention not only in the U.S. but also in various European countries (Beaman, 2021; della Porta et al., 2022; Milman et al., 2021), where there was a significant upswing of persons mobilized offline and on online platforms. While there are several studies that focus on the participation and public support of Black Lives Matter movement, a lack of large-N empirical analyses remains for European countries. Given the distinct histories of antiracist mobilization, discourses on racism and the distinct demographic compositions in the U.S. and in European countries, it is plausible to expect that patterns of participation differ across space. Drawing from a representative survey on (anti)racism in Germany (N=5003) conducted in 2021, this article seeks to explore the drivers of antiracist action with a particular focus on the role of emotional factors. The article thereby builds upon, and tests established sociopsychological models of protest participation (Klandermans et al., 2008; Simon et al., 1998; van Stekelenburg et al., 2011; van Zomeren et al., 2008). Specifically, we examine what motivates non-racialized group members compared to racialized group members to engage in collective and individual anti-racist action (e.g., Thomas et al., 2020).

KIM, Yisag* (Sogang University, Republic of Korea)

College Student's Choice of Dining As Symbolic Capital in Korea

Taste and food consumption have built a huge K-food market in Korea. The dining culture has rapidly changed in a contemporary global society. Therefore, the choice of dining (e.g., eating with others) becomes a cultural strategy that requires extensive information on food and restaurants with consideration

for monetary budget and the significance of social networks. Bourdieu (1984) emphasized the social meaning of taste in relation to social and cultural capital; however, cultural omnivores would pursue a wide range of consumption beyond class-oriented patterns.

Can the dining pattern and food consumption of college students be classified by socio-economic class? Is there an omnivore pattern exhibited by lower-class students? How does profilicity (Moeller, D'Ambrosio 2021) work in the choice of dining menu and place?

I conducted "mixed-methods" including surveys, in-depth interviews, and big data analysis. I collected offline surveys from 412 college students in Korea, conducted a series of OLS regressions, and I performed 10 in-depth interviews with college students.

The results supported the "omnivore pattern of all classes," indicating that income has no significant effect on an individual's meal expense regardless of one's class. The hierarchical distinction between social stratifications was not exclusively applicable to the high-income group. The low-income group was influenced by conspicuous consumption (Veblen 1899) which was mixed with Confucian face-saving culture. In particular, the choice of dining place (e.g., restaurant) was highly influenced by profilicity or online brand effects such as star ratings on Google Maps or reviews on Instagram. The social force of generalization (Simmel 1895) has a significant influence on the social construction of symbolic capital in K-food consumption.

Social Media Usage and Romantic Relationship in Japanese Youth Culture

People's communication styles have changed over time. The influence of mobile media such as cell phones and smartphones has been significant. Communication through mobile media has affected the friendships and romantic relationships of young people, particularly in terms of "encounters," "maintenance of relationships," and "choice of relationships"(Habuchi 2018).

How does social media use affect young people's intimate relationships? This study used quantitative data from the 2020 nationwide survey of Japanese university students by Japanese Youth Study Group to examine their encounters and maintenance of relationships as well as the various romantic relationships made possible by social media. For example, it examined if posting about dating on social media affected the duration of one's relationship with a partner.

The results showed that 11.2% of Japanese university students have used dating apps, and 13.7% have met physically with a person they first met through a dating app. Encounters prompted by social media are in the minority. Further, 21.3% of respondents have posted on social media about dating their partners. Moreover, social media does not just influence real romantic relationships but also makes it possible to establish virtual romantic relationships. Of the respondents, 18.6% have experienced romantic feelings toward a celebrity they have seen on TV or social media, and 32% have experienced romantic feelings toward game characters. We would like to discuss a retention of intimacy and the use of social media.

KIMURA, Hajime* (University of Toyama, Japan)

Deadlock in and New Intervention Pathway Toward Sustainable Energy Transitions: An Analysis on ESG Investment Using the Treadmill of Production Model

Both the levers and barriers to the current sustainable energy transitions are described based on the model of treadmill of production, which reproduce the negative spiral dynamics of the three sectors: 'investors and executives', 'government' and 'workers.' The pessimistic model makes clear that, in a global economy, any traditional environmental measures will fall short, "as they fail to account for the anti-ecological logic of capital" (Schnaiberg et al. 2008). The essence of the deadlock lies in "societal-environmental dialectic" inherent in the model (especially in the sector of 'workers') (Kimura, *in press*). In fact, French *gilets jaunes* (yellow vests) movement by 'workers' starting as the protesting the increase of the fuel tax "as climate change countermeasure (*officially* explained)", symbolizes the "tension" between society and environment. Thus, 'government' holds no social legitimacy for taking environmental measures, without economic justice too. Then, where is the pathway breaking out the deadlock?

The NGOs intervening in financial systems ('investors and executives') play the key role. The current tide of ESG investment is created, maintained and evolved, by the spectrum of NGOs and initiatives, ranging from disclosure of climate-related information (**CDP**, **GRI** etc.), goal setting for CO_2 reduction (**SBT**), using 100% renewable energy for business (**RE100**), to fossil fuel divestment movement (**350.org**) etc. (Kimura 2022). In the congress, the possibilities and challenges of the emerging ecosystem of NGOs will be discussed, based on the treadmill of production model.

KIMURA, Hajime* (University of Toyama, Japan)

"Treadmill of Production" and Climate Capitalism As Passive Revolution

Allan Schnaiberg's work is considered as one of the prominent contributions to "the ecology of Marxian political economy", as well as Veblen, Baran and Sweezy, according to Foster (2011). In the discussion, he indicated that Schnaiberg's political economic model (treadmill of production model) had been getting "more reified, mechanical form" with "even the critique of capitalism itself, systematically de-emphasized." While the divergence matters, it also contributes to bring us somewhat different perspective on "climate capitalism as passive revolution" (Carroll 2021). In fact, in a Schnaiberg's later article, the "reconciliation (integration)" of ecological modernization and treadmill of production model is suggested by himself. It is "a reformulated dialectical approach", where "dialectical" means "societal-environmental dialectic" (Schnaiberg 2004). The details are reported by the author (Kimura, *in press*). Anyway, it is important that the model can accept '*the environmentalist behavior as the consequence of the decision based on economic rationality*.' This paves the way for interpreting "climate capitalism" as slightly positive; that is, '*the next best*' *pathway (via the reform from within the market)* toward "global policy intervention", which is the only valid approach in a global economy (Schnaiberg et al. 2008). Indeed, the Interventions in financial systems by NGOs led to the institutionalization of climate-related financial disclosures (e.g. TCFD), thus enriching the soil for the civil resistance to fossil capitalism (e.g. divestment movement). In the congress, the significance of updating the model will be discussed.

KIMURA, Kunihiro* (Tohoku University, Japan)

Question Formats, Response Styles, and Satisficing: A Bounded Rationality Approach to Questionnaire Design.

Survey methodologists have referred to the concept of "satisficing," which they adapted from Herbert Simon's argument on satisfication in decision making. I would like to advance the appreciation of its implication to the survey response processes and thereby offer a suggestion to questionnaire design for improving data quality.

For this purpose, I would like to distinguish between response strategies, styles, and behaviors. Satisficing is a response strategy derived from bounded rationality. Satisficing can induce various response styles, such as acquiescence, dis-acquiescence, non-differentiation, middle response, and extreme response, depending on survey modes, question formats, and other settings. A response style may be a "plan of action" that guides a respondent's behavior. In this sense, we should operationalize response strategy and style as latent variables and response behavior a manifest variable.

As a part of a web survey, I conducted an experiment with four question format conditions: one is a check-all-that-apply format (CA), and the others are forced choice formats with two through four alternatives (2FC, 3FC, and 4FC, respectively). I hypothesized that satisficing would be the most frequent for CA and 2FC while it would be the least frequent for 4FC. I also hypothesized that satisficing would induce dis-acquiescence for CA, acquiescence for 2FC, middle response for 3FC, and both acquiescence and dis-acquiescence for 4FC.

Latent class analyses revealed that respondents tended to adopt dis-acquiescence in the CA condition, acquiescence in the 2FC condition, and middle response in the 3FC condition. These response styles were negatively associated with education (a proxy for a respondent's cognitive ability) and/or the logarithm of response time (a proxy for a respondent's effort in deep processing). The 4FC format seemed the least vulnerable to satisficing. We might explain these findings in terms of complexity of the tasks and abundance of information involved in the question formats.

Fear of Transmission of the COVID-19: Voices from Mothers of Young Children in Japan

The COVID-19 pandemic affected various aspects of life, including social relations. This study described how others' words and deeds related to fear of transmission of the COVID-19 among mothers of young children in Japan.

In June 2020, an online survey was conducted and gathered responses from 2,489 mothers of young children from 47 prefectures in Japan. The survey included open-ended questions related to others' words and deeds during the COVID-19 pandemic that influenced the participants. After obtaining descriptive data, similar experiences were extracted and categorized. This study was conducted after an ethical review by the author's university.

In this study, 379 (15.2%) of 2,489 participants reported some kind of negative experiences resulting from others' words and deeds, and most of these were related to transmission of the COVID-19. For example, others' attitudes disregarding the COVID-19 made participants uncomfortable.

"My boss said to us, 'You will not get the COVID-19, so don't be afraid. Just boost your immune system, that's enough.'"

"An acquaintance said to me, 'Why do you collect information related to COVID-19? You are too nervous, don't you have any other topic?' If I get infected with COVID-19, it will affect my husband's job and my child's school, that's why I collected information."

"I called the board of education to confirm how to deal with the COVID-19 at the school. But the board member laughed and said to me, 'We will not be infected with coronavirus and will not die', and I was very upset."

Depending on the individuals, perceptions of the COVID-19 differ, but "Disregarding COVID-19," reflected the perception gap between participants and others during the COVID-19 pandemic. Furthermore, these may have raised participants' fears about transmission of the COVID-19.

Key Person Who Influenced Behavior of Mothers with Young Children during the COVID-19 Pandemic

Backgrounds

During the COVID-19 pandemic, a variety of information influenced people's behavior. This study explored key person who influenced behavior of mothers with young children during the pandemic.

Methods

From June 16th to June 30th, 2020, the online survey was conducted and a total of 2,489 mothers with young children from all 47 prefectures in Japan participated in the survey. Participants were asked about the 10 types of persons, "How much did their words influence your behavior?" Responses were graded on a four-point Likert scale (1 to 4), and divided into two groups (influenced or not influenced). An ethical review board of the author's affiliated university approved this study. At the beginning of the online survey, participants provided informed consent.

Results

Persons who influenced behavior of mothers with young children during the COVID-19 pandemic were husbands (59.1%), TV commentators who were medical experts (56.7%), participants' parents/other family members (54.5%), teachers of child care centers/kindergartens (54.4%), prefectural governor of residential area (49.3%), friends (47.3%), TV commentators who were not medical experts (46.4%), family physicians/other health care providers (44.2%), colleagues (38.3%), and SNS (34.8%).

Discussion

More than half of the participants were influenced by the words of husbands, TV commentators who were medical experts, family members, and teachers of children. The words of TV commentators who were medical experts had more influence on mothers' behavior than the words of their family physicians/health care providers. It is necessary to further examine the mothers' trust in their family physicians/health care providers.

Climate Change Adaptation in Australia from a Professional Planning Perspective

Researchers at the Centre for Disaster Studies work across the planning and emergency management fields to integrate DRR into planning policy and legislation. CDS researchers participated in international meetings of UN ISDR at Hyogo and Sendai which identified the role of land use planning in reducing disaster risk. The Sendai strategy identified the importance of land use planning in tackling climate change adaptation. Three of its recommendations

targeted a) hazard lifelines critical to evacuation and recovery, and relocating infrastructure that is threatened by climate change; b) the need to build future DRR and climate change adaptation into strategic plans that indicate future settlement growth, specifying that hazard mitigation, climate change adaptation and disaster risk reduction must be conditions of development at the local government level; and c) a recommendation that urban design needs to evolve to incorporate disaster risk reduction and climate change adaptation. However, land use planning systems are still primarily geared toward promoting and facilitating development and have not evolved sufficiently to take account of DRR and climate change. The goal to create disaster-resilient and climate change adapted communities through the land use planning systems requires a change to the way in which planning is conceptualised and practised.

The Planning Institute of Australia is pursuing a 10-point strategy for climate change adaptation at the state and local government levels. Local planning advocacy groups pursuing these aims advise realistic actions and share case studies with local governments to work towards the implementation of each strategy.

This presentation will discuss the findings of this project and the proposed PIA action plan. The author will be presenting on behalf of Queensland PIA Climate Change working group.

Researching the Personal: The Contribution of Lived Experience in Liminal Research Spaces

In this paper, I reflect on research with decision-makers for young adults with profound intellectual and multiple disabilities (PIMD). As a sociologist, lawyer, and parent of a 24-year-old daughter with PIMD, I developed a research project from my personal observation of issues which emerge as a young person with PIMD becomes an adult. Transition to adulthood is a time when many legal and administrative interactions become complex and difficult for people with PIMD. I wanted to explore how the law works in practice for these young adults and their decision-makers, and better understand why problems arise.

I interviewed 12 pairs of participants (a parent decision-maker and a young person with PIMD), and another 6 parents where the young person was not able to be present. In these 18 interviews I asked parents to give a narrative history of their young person's disability, and then to describe their child's journey into adulthood in legal and administrative spaces. Interviews covered the areas of banking, income support, leaving school, voting, healthcare, and disability support in Australia's National Disability Insurance Scheme (NDIS). The research explored key problems and theorised about why the law does not deal well with people living with PIMD.

Here, I reflect on these interviews as *conversations*: where meanings were built and shared in a dialogue between people with similar experiences. The contribution of mutual understandings, meanings, and feelings was vital to the exploration of profound intellectual disability and its impacts. The shared lived experience of *whole-life management* made interviews an authentic and collaborative conversation about difference. It allowed demonstrations of emotion, black humour, and mutual recognition of insights, and led to deeper explorations of difficult experiences. This demonstrates the value and importance of reflexive use of lived experience in research, particularly in liminal spaces like care work and profound disability.

Biodiversity Conservation, Livelihoods and Traditional Ecological Knowledge of the Kuki People

Different indigenous groups inhabit the hill tracts of the northeastern region of India—each providing a case of complex linkages that exists between nature and culture. These communities exhibit various modes of behavior which illustrate their inherent effort of connecting themselves with nature. Their natural environment influences their religious beliefs and practices—land and resource use and their local ecological knowledge interconnect with religious restrictions and taboos associated with particular aspects of the environment. The elders have always transmitted such knowledge systems orally and as socio-cultural practices across generations. The culture and ways of life of the tribals are closely tuned to the nature and, as such, they intrinsically express their connections with land. This paper examines the cultural and beliefs systems among the Kuki ethnic group in the hills of northeast India. In this paper, I argue and understand that social and cultural values in Kuki communities are rooted in a worldview shaped by reciprocity and spatiality. Their traditional belief systems have displayed a sense of reciprocity and respect towards the cosmos. For the past centuries, the Kukis have maintained a holistic view of the socio-ecological system as their traditional beliefs and rituals are inter-linked and intimately related to the management of ecosystems. I explain how the Kukis perceive their surroundings by relating to components of their environment in the activities of subsistence procurement. My ethnographic account is drawn chiefly from empirical experiences of traditional discourse and practices that constantly engage with the Kukis.

KIPGEN, Ngamjahao* (Indian Institute of Technology Guwahati, India)

Hydropower Projects, Resistance, and Environmentalism in Northeast India

Hydropower projects often result in the depletion of natural resource, involuntary eviction and displacement, thereby posing a challenge to the indigenous people's cultural identities, subsistence, customary land laws and governance. Opposition to development initiatives like dams and hydroelectric projects is on the rise across Northeastern India. This paper situates the context of hydel power projects and its implications—present and future—for the indigenous communities such as Kuki-Chin ethnic group in Northeast India. Hydropower development and their impact is most perceptible on the economically and politically vulnerable communities inhabiting the peripheral areas. The study takes a cue from the recent socio-anthropological research that examine how peripheral regions, frontiers and borderlands are identified as 'new resource frontier'. In doing so, the chapter examine how both the central and state governments in the region are framing policies to market imperatives. The use of brute force to suppress local people resistance has accentuated their fears of losing their land and livelihoods, erasure of culture, identity and traditional knowledge. Based on field experiences, the paper discusses the competing value in relation to 'resource use' and 'ownership' systems. My argument is drawn based on a study of hydropower projects in Manipur state of northeast India. I note that tribal communities' resistance is rooted in their understanding of environment—land, water and forests, their utilization and distribution. In light of this, I argue for a conceptual and theoretical understanding that offers tribal understanding of their ecological worlds, which I call 'tribal environmentalism' for a future that will provide both human security, ecological justice and sustainable development.

KIPGEN, Thanggoulen* (IIT Kanpur, India)

Back to the Village: Return and Reception of Northeast Migrants during the Covid-19 Pandemic in India

The paper examines the return migration of Northeast people from metropolitan centres to their native home because of the Covid-19 pandemic in India taking a case study of the Northeast migrants who are mostly engaged in the service and hospitality sectors such as restaurants, hotels, shopping malls, spas, and call centres. Shutting down of these industries and business left the Northeast migrants with no source of income in places far away from their native home. At the same time, there is intensified racial discrimination against people from the Northeast because of their racial affinity with the Chinese who are directly associated with the cause of the pandemic. Cases of employers abusing and eviction by landlords who hail from the Northeast India are rampant which forced the migrants to leave cities and return to their native villages. Besides, the home returnees are stigmatise as 'carrier of the virus' and scapegoated for carrying and spreading the virus into the home community. For fear of the virus, the home returnees encounter multi-layered reception from the state and the community such as scanning and registration at the state borders, mass quarantine and village quarantine. Stigmatisation and discriminations against the home returnees from their co-ethnic members are also widespread.

Theoretical Formulations on New Social Movement: A Critical Appraisal

The issues such as grassroots development, community participation, women empowerment and sustainable development have gained traction among the scholars as they delved into the analysis of collective action and people's mobilization that are taking place across the globe. There have been people's movements which have tried to reshape the thought processes and actions on the issues of contemporary importance ranging from livelihood to environment. Various grassroots organizations, interest groups have played crucial roles in shaping these movements. These movements which rely on grassroots collective action and tend to offer new interpretations and solutions to the problems are popularly known as New Social Movements (NSMs). As the NSMs take up issues from civil society and everyday life, it seeks support from multiple actors representing multiple identities to steer the movements. As these movements are believed to have unique characteristics, they remain distinct from old social movements in terms of their approaches, strategies and organizational structures. Various scholars have tried to analyze the notion of new social movement by presenting its scope, nature and dynamics. While Habermas's concept of public sphere helps us to examine the aspects of people's actions and opinions, Offe's paradigms of old and new facilitate our understanding on the nuances of these two forms of social movement. McCarthy and Zald's resource mobilization theory argues how collective action is shaped by the changes in resources and organizational structures

as it explains social movement sector, social movement industries and social movement organizations. The paper makes use of secondary sources to present conceptual issues such as nature, structure and functions of NSMs. It specifically intends to critically analyze the theoretical formulations of Habermas, Offe, McCarthy and Zald on NSMs.

Real Utopias – Arts and Culture As Catalysts

Interest in the topic of utopia has grown worldwide; Google Scholar currently contains 1.19 million entries for the term "utopia". With the publication of the opus magnum of the American sociologist Erik Olin Wright on "Real Utopias" (2010), there has also been a wave of sociological analyses dealing with concrete realizations of utopian plans. The basis for these analyses is always clearly critical, initiated by concerns about the eminent global crises. Any criticism of the global crises and its roots can be and has been translated into feasible alternatives of living and working, producing and consuming, exploring and investing in places of new possibilities. Here, arts and culture play an active and decisive role in putting us forward in defining, communicating and realizing real utopias. A reflection on current theoretical concepts of real utopias and the significance of the arts is eminent for the above-mentioned reasons, but it should not stop there. A first sociological reflection and exploration of implementations of real utopias and the significance of the arts for their realizations is a part of a current empirical study in North Germany, and we will present first results of this study.

KIRDINA-CHANDLER, Svetlana* (Institute of Economics, Russian Academy of Sciences, Russian Federation)

From Global Economy to Bipolar Economy

The paper considers the consequences of one of the topical aspects of the complex and, according to some estimates, catastrophic state of the modern world - the collision of conflicting trends in globalization and sovereignty. The downward trend of globalization (not to be confused with internationalization) is observed after the global financial and economic crisis of 2008-2009. It has intensified under the influence of the covid pandemic and sanctions restrictions. Sovereignty trends, including those influenced by these factors have, on the contrary, an upward trend. In the 2020s, the contradictory tendencies of globalization and sovereignty increased the threat of world chaos. The resolution of contradictory tendencies and the formation of a new world order is possible on the basis of one of the models of a (new) unipolar, multipolar or bipolar world. The paper compares the perspectives of each of these actively discussed models of world development and the greatest probability is the formation of a bipolar world. Its peculiarity lies in the crystallization of two "poles of power" in the form of bipolar coalitions. Their composition was predicted by the author in the theory of institutional X- and Y-matrices (Kirdina, 2014. In Russian; Kirdina-Chandler, 2017) and is confirmed by modern practice. The core of one of them ("Western") is NATO and the European Union, - it includes 36 countries and its growth has actually stopped. The core of another coalition ("non-Western") is the Shanghai Cooperation Organization, BRICS and the Commonwealth of Independent States, - it already has 26 countries and a "queue" for joining. The paper argues that production chains, knowledge chains, and value chains drift gradually toward concentration within these coalitions. This is supported by an appropriate reorganization of financial institutions, instruments and flows in each coalition.

RC16-JS-127.2

KIRDINA-CHANDLER, Svetlana* (Institute of Economics, Russian Academy of Sciences, Russian Federation)

The Formation of a Bipolar World with a New Anti-Capitalist Coalition?

The "Great Reset" project of the WEF launched in 2020 aims to restore the global economy and ensure sustainable development and "activate innovation, science and technology to achieve significant breakthroughs that will help make ideas of sustainability more profitable." It continues the logic of previous WEF projects and is aimed at improving the position of global capitalism, which is losing its world leadership. In 2009 the project of the "digital revolution", announced as a reliable means of overcoming the global financial crisis of 2008-2009, was also presented as "the basis for the subsequent sustainable development of the world economy" (ICT for Economic Growth: A Dynamic Ecosystem Driving the Global Recovery. Davos: World Economic Forum Annual Meeting Report, 2009). Further consideration of it showed, however, that it contributed primarily to the creation of new markets for international financial players in the telecommunications sector compensating for the previous drop in profits in this area in earlier years (Ganichev, Koshovets, 2019, 2020, 2021) and has deepened global social inequality.

The paper argues that the "Great Reset" will not facilitate either the reversal of the tendency towards the destruction of the unipolar global world or the growing tendency towards the sovereignty of states. The result of these two opposite tendencies will be the formation of a bipolar world with a deeper

institutionalization of bipolar coalitions. The core of one of them ("Western") is NATO and the European Union, - it includes 36 countries and actually its growth has stopped. The core of another coalition ("non-Western" or "non-capitalist") is the Shanghai Cooperation Organization, BRICS and the Commonwealth of Independent States - it already has 26 countries and a "queue" for joining. These coalitions are already quite comparable in terms of total power. The role of sociologists is to inform societies about these processes taking place.

KIRDIS, Esen* (Rhodes College, United States)

Religion & Youth in the Middle East

Although the Justice and Development Party, an Islamic political party with the stated goal to raise a pious generation, governed Turkey since 2002, the youth in Turkey has become less religious and less likely to engage in religious rituals, according to the World Values Survey. This is a puzzling development because one would not only not expect religiosity to decline but instead to thrive in Turkey given the prioritization of religious education, the expansion of the Directorate of Religious Affairs' budget and reach, the rising visibility and influence of Islamic civil society organizations and businesses, and the continued electoral success of the Justice and Development Party in the last twenty years. Similarly, while the first rounds of post-2011 elections situated Islamic parties into positions of political power in Egypt, Tunisia, and Morocco, ten years later, youth describing themselves as "not religious" increased in Egypt six-fold from 2.7% in 2013 to 18.4% in 2018, in Morocco seven-fold from 3.8% in 2013 to 22.4% in 2018, and in Tunisia, it doubled from 24.1% in 2013 to 45.7% in 2018, according to the Arab Barometer. To understand this puzzling development, this paper questions the micro foundations of religion and politics at the individual level by looking at a similar development, the decline of youth religiosity, in four dissimilar political regimes, in Turkey (an illiberal democracy), in Egypt (a military regime), Morocco (a monarchy), and Tunisia (an unconsolidated democracy). By utilizing literature on sociology of religion, this paper argues that as the Islamists became more statist and the state became more Islamist, neither captured the youth's demands for structural change in their focus on moral law and order, or the multifaceted changes in and diverse iterations of youth religiosity.

KIRDIS, Esen* (Rhodes College, United States)

The Puzzling Rise of Fundamentalists into Political Power: A Comparison of Political Salafism in Egypt and Political Haredism in Israel

How and why have fundamentalists, who advocate literal interpretations of scripture, aim the reversal of secular modernity, and aspire for the formation of a theocracy, become politically influential when one would expect them to remain marginal in their mass appeal given their belief in one true faith, exclusive organizations, limited ideological appeal, and their strict codes of behavior for their followers? To study this puzzle, this paper utilizes a cross-religious comparative study and a most different systems approach. It analyzes how both Political Salafism in Egypt and Political Haredism in Israel, despite working in different socio-political contexts, have gone through a similar socio-political evolution from the margins of the political spectrum to its center. Whereas some Political Salafis in Egypt moved from the margins of the political spectrum into the second biggest voting bloc after the Muslim Brotherhood, some Political Haredis in Israel grew beyond their niche appeal amongst the ultra-Orthodox community and into the spotlight holding vital ministries in coalition governments. Building on the literature on sociology of religion, this paper hypothesizes that fundamentalists have gained political influence beyond their demographic appeal because (1) the Egyptian and Israeli states, by simultaneously allowing religious pluralism while also indirectly monopolizing the religious field, have opened the doors for the emergence of a "religious market" wherein a plethora of religious organizations critical, supportive, or neutral of the state emerged, and (2) in this "religious market" fundamentalists built a niche through their ideological purity, personalistic communities, and their strict organizations, which in turn allowed them to play the role of a "kingmaker," namely the role of a political actor that does not have enough mass support by itself but that still has enough support to influence the results.

KIRIYA, Shiene* (University of Tokyo, Japan)

Songs As Music and Songs As Sounds in Urban Plaza: Focusing on the Anti-War Folk-Singing Gathering in Tokyo in 1969

In 1969, people against the Vietnam War gathered in the plaza in front of Shinjuku Station, one of the largest terminal stations in Tokyo. They sang along the folk songs and then discussed with each other on various political issues. Passers-by such as commuters or students joined the gathering, and they temporally occupied the whole space. Eventually they were called "*folk guerrillas*".

Considering the spontaneous aspect of this folk gathering, it is difficult to perceive this event as a gathering organized by any certain group. It was a

denotes a presenting author. Abstracts are organized by first presenting author's last name.

crowd of passers-by who were strangers with each other that constituted the gathering in urban everyday space of this scale. The unique characteristic of this phenomenon requires us to focus on their practice of singing.

The "*folk guerrillas*" used folk song in two ways: song as music and as sounds. They sang their own political messages with the melody of popular songs, so that everyone could join the chorus. By singing folk songs with strangers in open space, they tried to present an alternative to the commodified folk music played in concert hall.

Yet their singing was not just political, but also physical. Since the plaza in Shinjuku Station was a newly-built underground space, the singing voice of people echoed and produced the effect of enthusiasm. As a result, more and more passers-by were attracted to join in their circle. Their folk song was a medium to make the bodies of people resonate with each other.

Through focusing on the role of songs in the Shinjuku gathering, this presentation would argue how the music, especially the physical sound of singing, works as a medium of collective spatial appropriation. The music is political, because its sounds as physical entity directly influence the bodies of people and the urban space.

KIRMIZI, Meric* (Sociology, Ondokuz Mayis University, Turkey)

The Role of Japanese Neighbourhood Associations As Social Infrastructure

This study reflects on Japanese neighbourhood associations as an example of social infrastructure at the neighbourhood level in Japan. Latham and Layton (2019) consider social infrastructures vital to make a good city. They define social infrastructures as public and commercial spaces that allow for social networks and connections. Japanese neighbourhood associations also enable residents' interactions at different scales from small groups to associations and above. Known as *jichikai*—'jichi' meaning self-government—or *chōnaikai* in Japanese, they create opportunities of active participation for urban residents of all ages. These bottom-up neighbourhood organisations help embody democracy in the true sense of the word as people's rule. Japanese and foreign scholars from various disciplines studied the social functions of Japanese neighbourhood associations (e.g. Ajisaka, 2000; Bestor, 1985). Most studies acknowledge the social function of Japanese neighbourhood associations for community-making and social inclusion, in addition to their more official functions, such as information dissemination. Yet existing work also underlines the difficulty of maintaining these associations as active in an increasingly neoliberal city life which leaves little time for people to engage in communal action. This paper provides direct observations of the collective publicness created by Japanese neighbourhood associations based on active participation in various events of two neighbourhood associations in the Horie neighbourhood in Osaka's Nishi Ward in 2013–2016. It contributes to the literature on Japanese neighbourhood associations by approaching these institutions with the theoretical lens of social infrastructures.

KIRTIL, Melek* (Istanbul University, Turkey)

The Impact of Family Structure and Affluence on Children's Behavioral Outcomes

Changes in the family structure have always occupied the public agenda, as they are an important factor in the reproduction of social inequalities. As children grow, they are influenced by different developmental contexts such as friends, school, and neighborhood, but the central role of the family in the child's socialization continues to influence children's behavioral outcomes, even at different ages. Negative behavioral consequences, on the other hand, cause children from disadvantaged families to be confined to certain social positions. Concerns about the difficulties that children from low socioeconomic levels or from broken/single-parent families may experience in accessing resources and the parenting styles they are exposed to have enabled such families to be a risk factor for juvenile delinquency. In this study, using ISRD 2 data, it will be investigated whether there is a relationship between self-reported juvenile delinquency and family structure and affluence. Data were collected from seventh, eighth, and ninth grade adolescents from 28 countries (N= 66,859) as part of the Second International Self-Report Delinquency Study (ISRD-2). The aforementioned cross-sectional study was prepared in order to determine the early deviance behaviors and their causes, and to identify the victimization/offending situations that are not reflected in official institutions, with multi-faceted questions asked to children. In the samples of different countries participating in the ISRD 2 study, whether there is a relationship between family structure and affluence and juvenile delinquency will be examined and the findings will be interpreted within the framework of the relevant literature.

RC21-312.3

KIRTIL, Melek* (Istanbul University, Turkey)

The Impact of Social and Spatial Inequalities on Juvenile Delinquency

The geographic concentration of poverty and wealth shows an international trend. This situation leads to the accumulation of inequalities in neighborhoods where the residents come from a low socioeconomic level. The fact that the effect of the place of residence on individuals becomes more evident day by day brings neighborhoods to the forefront as an important framework in which structural inequalities can be observed. Physical and social inequalities in neighborhoods negatively affect the development of children. The process, which began with the Chicago School's ecological perspective documenting that crime rates in some neighborhoods were not random, continued in the 1980s with the explosion of empirical studies on neighborhood effects. These studies have found significant associations between disadvantaged neighborhoods and situations such as violence and crime, dropout rates, substance use, employment, sexuality and early childbearing. However, few empirical studies have been conducted in samples outside the United States, despite the fact that the relationship between the structural features of neighborhoods and the deviant behavior of children has been studied for many years. The aim of this study is to comparatively investigate whether there is a relationship between the level of perceived social disorder in the neighborhood and delinquency in samples representing different cultures. Data were collected from seventh, eighth, and ninth grade adolescents from 28 countries (N= 66,859) as part of the Second International Study of Self-Report Delinquency (ISRD-2). ISRD 2 has been prepared with the aim of identifying early deviation behaviors and their causes with multi-faceted questions asked to children. In order to test the relationship between the perception of disorder in the neighborhood, which represents the physical, spatial and social inequalities in the neighborhoods, and the delinquency reports of children, a regression analysis will be performed and the findings will be interpreted within the framework of the relevant literature.

Medicine, Language and Risk Concealment: A Linguistic Analysis of Patient Information Leaflets in Kenya.

Pharmaceutical medicines are indispensible products for addressing health problems. However, they are not risk free. For that reason, accurate risk communication in Patient Information Leaflets (PILS) can enlighten consumers to fully comprehend the risks involved in using a medicine product and ultimately allow them to make informed choices about the suitability of a medication. However, a question worth mulling over is whether the quality of messages in PILs clearly exposes the risks in medicines. In the present paper, a Critical Discourse Analysis (CDA) approach is employed to examine the language of risk messages in PILs in order to find out whether the medicine risks are clearly articulated. A sample of ten product risk information texts is purposively selected from PILs accompanying medicinal products in Kenya. Fairclough's (1994, 2008) Critical discourse analytical tools are used to analyse the graphological, lexical, syntactical and discourse linguistic aspects of the selected texts. The analyses reveal that the risk communicators intentionally or unintentionally exploit linguistic tools to conceal the risks of the selected medicinal products. Such concealment of risk may manipulate consumers to underrate, misjudge and ignore dangers the medicine products pose.

KISEMBE, Everlyn* (Moi University, Kenya)

The Role of Language in Mobility Along the Kenya-Uganda Highway

During mobility, all forms/aspects of the mobility process are mediated through language, whether written or oral, yet yet linguistic analysis which is a great tool for making sense of complexities in mobility processes is often times minimally used and/or understood. During mobility along the Kenya-Uganda highway, individuals are confronted with various levels of choices on matters of personal meaning and survival, amidst restrictive social customs, limited economic roles, dealing with challenges arising from mobility, taking responsibility for outcomes of choices made, unsure of what one believes in, open to influence and manipulation from others among other conditions. All these are heavily inclined on communication. What role does language play in the mobility process along the Kenya - Uganda highway, and how does language structure such roles in interactions among individuals during mobility along the Kenya-Uganda highway? Using face to face questionnaires, observation and narratives, 128 participants in Bungoma county targeting specific sites along the highway namely; Bukembe, Kanduyi and Bungoma town were interviewed on reflective perspectives on mobility. The participants were randomly selected from stratified domains of the hospitality industry, transport, trade and health, with a conscience effort to balance the gender. Twenty case study informants were selected purposively as subset of 128, for mobility and identity experience narratives. The collected narratives, conversations, views, perspectives during

mobility are interpreted using various linguistic methods and language functions explained. These functions include but not limited to forming of identities which are relationally constructed through self and/or others, shaping individual's aspirations, livelihoods discussions, power relations, social exclusions and relations of inequality, social inclusions, contestations and negotiations, informative and symbolic functions evidenced in the linguistic landscapes. All these highlighted the role language played during mobility.

LGBTQ+ People and Disasters in Japan: Informational Infrastructure Building for This 'Invisible' Population

Disasters shed light and even magnify the discrimination and difficulties faced by LGBTQ+ people during everyday life in a heteronormative society. During emergencies, transgender and gender non-conforming people face inaccessibility to services and resources due to heteronormative barriers and the lack of reasonable accommodations. All of the barriers and difficulties are compounded by the fact that asking for support often means "coming out" in a situation that is at best uncomfortable and at worst dangerous. Many people choose not to come out in these situations, leading decision makers to erroneously conclude that there are no needs in this community.

Through our preliminary research project, we have found that local governments have made little or no consideration for LGBTQ+ people in their disaster plans. Many administrators have showed interest and concern but are lacking proper knowledge or tools. There is a need to connect decision-makers with the resources available and the real voices and needs of the LGBTQ+ community.

This project plans to use the concept of asset mapping in order to connect LGBTQ+ people to the resources they need without compromising their privacy or safety. Asset mapping enables LGBTQ+ organisations, NPO/NGOs and local governments to collaborate and provide necessary information/resources that members of the LGBTQ+ community can access during a disaster. This project will utilize mixed methods such as surveys and individual as well as focus group interviews to the members of the LGBTQ+ community regarding critical resources that they need. This will be followed by the creation of asset maps for the LGBTQ+ community and the evaluation of its effectiveness. This project will explore new and creative methods and produce data infrastructure that will sensitize the public to the human rights and deserved entitlements of the LGBTQ+ population and enrich the diversity and inclusiveness of the DRR practice.

Bite the Bullet and Carry on? the Robust Role of Individual Beliefs on Enduring Unequal Income Distribution — Evidence from 34 Countries

Last three decades have witnessed a substantial cross-national and historical variation in wealth and income inequality across post-industrial countries. Common assumption behind numerous studies has been that rising inequality would result in increasing demands for more equality. Rising inequality, however, has not led to a substantial societal backlash, growth of public discontent, or social mobilisation. Moreover, studies have observed an increase in the tolerance of socioeconomic inequality on individual level. I argue that for explaining individual tolerance of unequal income distribution, contextual factors that capture socio-economic conditions and inequality are less important than individual-level values and beliefs about the origins of and reasonings behind unequal circumstances. These inequality legitimising narratives range from ideas of equal opportunities, and individual liberties, to egalitarian values, and beliefs about the function of meritocracy. The findings from a linear mixed effects models on the latest World Values Survey Wave 7 data, collected between 2017-2022 from 34 OECD countries support the argument that individuals' agreement with inequality normalising narratives is positively correlated with higher tolerance of unequal income distribution. However, neither country-level objective inequality nor economic prosperity directly predict tolerance of unequal incomes; when compared to contextual factors, the acceptance of inequality normalising narratives is a significantly better predictor of inequality tolerance.

KIVELÄ, Mikael* (University of Helsinki, Finland)

Terminatio - Nomenclature As Disciplinary and Modulatory Power

Trying to establish a shared set of terms for complex phenomena is a fascinating site for sociocybernetic and systems-theoretical inquiries on power. What or who gets observed and included or left out? What is featured or suppressed in the included matters? What is the ostensible purpose or rationale of the shared terminology and for whom? And in what way do the attempted process and its products affect the future trajectories of approaching the

phenomena in question? In this paper I approach the complexities of power with case examples from a project creating categories and descriptions for contemporary learning spaces in a European research university. Its goal was to create categories and descriptions to enable users to quickly and reliably find rooms suitable for their learning activities. Drawing on deleuzoguattarian ideas of systems I try to provide a genetic account of the produced actual set of terms examining 1) selection, 2) differentiation, 3) differenciation, 4) structuration, and 5) territorialization involved. The process philosophy of Deleuze and Guattari arguably has quite a lot of resonance capability towards as well as shared territory with The Principles of Sociocybernetics as defined by Hornung in 2005. Thus, this present paper contributes both a case study on power as well as incentives to converse with traditions and theories explicitly affiliated with cybernetics as well as observation and processes, for example Pask or von Foerster. Such conversations can broaden analyses on power by examining the blind spots and modulatory mode of power encountered when employing a particular approach or theory.

Multicultural Coexistence with Buddhist Vietnamese Immigrants in Japan

In recent years, against the backdrop of the unprecedented surge in the number of immigrants in Japan, 'Intercultural Collaborative Learning,' (hereinafter called 'ICL'), has been attracting attention to promote the settlement of immigrants in Japan. Also, it would be necessary to prepare the environment for immigrants to continue their religious practise.

However, since the realities of the aspects of foreign Buddhists' practise have not been fully clarified, the rapidly increasing number of Vietnamese Buddhists should be taken up as an example. In fact, the Vietnamese Buddhist temples have been built recently, but they are limited to urban areas. Considering these circumstances, local Japanese Buddhist temples, which exist everywhere in Japan, seem to be the key for the realization of multicultural coexistence in Japan since not only Japanese Buddhism, like Vietnamese Buddhism, is Mahayana Buddhism but also local Japanese Buddhist temples have strong ties with local communities.

Therefore, this paper aims to examine how the Buddhist memorial service for the Vietnamese Buddhists and the ICL sponsored by the local Japanese Buddhist temples could affect the beliefs and interpersonal relationships of Vietnamese Buddhists. I conducted interview surveys with the Vietnamese Buddhists who participated in this Buddhist memorial service, the local Japanese residents and the Vietnamese Buddhists who participated in the ICL organized by the local Japanese Buddhist temple.

As a result, participation in the Buddhist memorial service can wipe away the image of local Buddhist temples as being unapproachable and lead to opportunities for them to be seen as places for Vietnamese Buddhists to pray. Also, it would strengthen ties among Vietnamese and offer them the opportunities to confirm their identities as Vietnamese. Furthermore, it is suggested that a good relationship with the Japanese people in the local community could be built through the ICL involvement of local Buddhist temples.

Support for Democracy and Understanding of Democracy in Post-Soviet Eurasia

The World Values Survey (WVS) is an international research program devoted to the study of social, political, cultural, religious and other values of people in different parts of the world. One of the project's main goals is to analyze values, norms and beliefs in comparative cross-national and over-time perspectives and to assess how values stability or change influences social, economic and political development of societies. The survey shows what people want out of their lives, what is important for them and what is less, in what they believe, their ideas about the right and wrong things. Over the years, the World Values Survey has proved the importance of population value study and has demonstrated that people's beliefs play a key role in economic development, emergence and flourishing of democratic institutions, rise of gender equality, and the extent to which societies have effective government. Present session unites papers which make use of the WVS data, including the most recent 7th wave of the WVS, conducted in 2017-2021 in cooperation with the European Values Study and covering over 80 countries and societies worldwide. Papers presented in this session address the issues of political culture and civil society, corruption and migration.

Commodity or Producer? - Structural Views on Temporary Agency Workers within the Swedish Manufacturing Industry.

This article offers insight on structural preconditions for well-being among blue collar temporary agency workers within the Swedish manufacturing industry. Building on a theoretical framework of critical realism, and twenty-five semi-structured interviews with managers from temporary work agencies, client organisations, and labour union representatives, an understanding of structural distance, technical strata and time are presented as plausible structural predictors of blue collar temporary agency workers' well-being.

This article presents a theoretical framework giving valuable knowledge about how temporary agency workers are seen as both commodity and producer taking skill and time spent at client site, and the preconditioning implications of agency workers well-being.

Concluding the article, a discussion on alienating and de-alienating mechanisms is offered along suggestions for further research.

Authoritarianism and Imperial Legitimation in US College Students

We present findings from surveys exploring US college students' beliefs about US imperialism. Three waves of a longitudinal study were administered to convenience samples of undergraduates, totaling N=217. We examine the extent to which pride in being an American, support for defense spending, and authoritarianism (using a six-item index) limit students' acknowledgment of US imperialism. We measure non-acknowledgment of US imperialism via perceived truth or falsity of descriptions of imperial harms or crimes committed by the US or rich countries generally. The seven items are combined into an imperial disbelief index. A higher value on the index means respondents more often view the descriptions as false, i.e., do not believe that the harm or crime occurred. Overall, we find that authoritarianism correlates weakly (0.188, 0.01 significance level) with imperial disbelief. Separating out some of the bivariate analyses, we find that:

- More authoritarian students are less likely to believe that when the US led the invasion of Iraq in 2003, Iraq posed no imminent threat to the US, so the invasion was a war crime.

- More authoritarian students are less likely to believe the US has been at war just about every year of its history.

- More authoritarian students are less likely to believe that 2014 US drone strikes may have killed 1,147.

- More authoritarian students are less likely to believe that the U.S. backs authoritarian dictators.

- Authoritarianism is unrelated to believing it true or false that rich country governments and corporations do things that lower poor country wages.

- Authoritarianism is unrelated to believing it true or false that during the Vietnam war, the US soaked Vietnam with herbicides.

How Authoritarianism Legitimates Imperialism

Focusing on the US, we offer a theoretical synthesis to deepen understanding of domestic acceptance of imperialism. Powerful corporations engage in non-democratic globalization from above, and states and corporations practice disaster capitalism and predatory interventionism. A rising authoritarian neoliberalism rooted in systemic capitalist crisis leads to growing wealth and power disparities. As a result, our era is more politically contested than when Marcuse about totalitarian one-dimensional hegemony. The hegemony described by Marcuse now breaks down in spasms such as the 2008 financial crisis, and twenty-first century global movements are challenging capitalism. As Wolin, noted, there is much resistance to totalitarianism. But critical theory, particularly Marcuse's version, is still relevant, since ideology still produces depoliticized conformity, resignation, acceptance, or support. The current exodus of Russians escaping military conscription, for example, is an exception proving the rule: oblivious to the history of NATO expansion and provocations and overwhelming US power, US majorities believe Russia's invasion of Ukraine is a threat to U.S. interests.

Many accept US imperialism due to its invisibility; to exceptionalism, to nationalist and chauvinist ideology; and to national security and international justice propaganda. But a more complete explanation must revisit the concepts of one-dimensional society, authoritarianism, false consciousness, and the core self. Domination still promotes false consciousness in many and a latent, minimal, fragile, but influential, imperialist self. Construction of the imperialist self involves oppressive othering and emotions shaped by culture. The false needs Marcuse described are still superimposed on individuals, perpetuating toil, aggressiveness, misery, and injustice.

Almost all social scientists today dismiss psychological authoritarianism and false consciousness. We need to walk through the door opened by scholars like Dean, who while warning against the posturing of grand and normative theory, acknowledges that "… our understanding of ourselves is linked to the ways in which we are governed…".

The Container Model of Society: The Concept's Origins and Its Theoretical Potential for the Modern Social Transformations Research

The container model of society was invented as an object for critic. Such sociologists like U. Beck or A. Wimmer and N. Glick Schiller used the container-concept as a metaphor that signified the unification and the standardization of culture, traditions, language, labor-market, education-system etc. within the framework of the national state. Thus, the phenomenon of economic and

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cultural mobility could be classified by the ideological system of a national state in the terms of "belonging - not belonging". The national state is represented like the homogenous unity, and the social mechanism of the social in-/exclusion is created. However, in the contemporary world we can see how media discourse (created by politicians, journalists and even some social researchers) place the "specific" groups of population into cultural and social "containers". There are two main points: First – inside the national state the public discourse of the "one" and "homogenous" population is forming. Second – outside from this national-state the individuals from it are considered like the attributive elements of this state.

We are going to examine the theoretical and epistemological potential of the concept of the container model of society including the following problems: what are the social mechanisms that always reproduce it; which kind of interaction exist between the different "containers"; to what extent media discourse influences these "containers". We will use the concepts of the container model of society (U. Beck, A. Wimmer, N. Glick Schiller, S. Hess) and super-diversity (S. Vertovec).

Design and Co-Design in the Concept and Policy of Building a Future Society for All Ages

The basic assumption of this paper is that the development of the theory and practices of design and co-design is crucial for the creation, implementation and evaluation of ageing policies, particularly intergenerational relations policy.

It is worth noting that 2022 marked the twentieth anniversary of the adoption by the United Nations of the Madrid International Plan for Action on Ageing (MIPAA) and the publication of a framework for active ageing by the World Health Organisation. Furthermore, this year also coincided with the tenth anniversary of the European Year for Active Ageing and Solidarity between Generations in the European Union (EY2012). Thanks to these events, one of the main ideas in international and national strategic documents still promotes the concept of building a "society for all ages," sometimes also referred to as an "ageless society."

The paper will draw attention to the timeliness and further development of initiatives initiated by MIPAA and EY2012. Examples of best practices will be highlighted in particular: integration of activities and services provided by different stakeholders; co-design of public policies on ageing; design and co-design in social and technological innovation related to the silver economy and creative ageing policy; participatory programmes for building smart, healthy and inclusive age-friendly spaces (SHAFE).

The summary will contain recommendations for European public policy entities and proposed directions for further research.

A Regionalized Analysis of Stereotyping on German Twitter

As publication cost in online spaces are relatively low compared to traditional media types, people from a wide range of backgrounds have the opportunity to voice their concerns and (political) opinions to the public in online spaces. As the barriers for publications are lowered, the internet and social media platforms in particular have been identified as catalysts for the spreading or reinforcement of stereotypes. Recent events have demonstrated that dynamics on social media have real world consequences. At the same time this low barrier to publishing has led to large amounts of readily available data for social scientists, requiring new tools to analyze this data.

In this presentation, I will illustrate how the combination of Twitter data and quantitative survey data can be used to analyze the regionalization of stereotyping in German Tweets. With the help of word embedding algorithms, I was able to analyze the different connotations of words within the gathered Twitter data. By including more than 1 billion German Tweets collected since 2018, the analyzed data offers a broad understanding of German Twitter. In my presentation, I will be able to illustrate how computational methods can generate sociologically valuable insights regarding the use of stereotypes on Twitter. Furthermore, I will reflect on the potential and limitations of these methods for future research regarding regional differences in stereotyping.

While the empirical example is focused on German Twitter, the methods used throughout the analysis can be adapted to other regions and languages as well.

Examining Socially Productive Activities Among Older Adults in Urban China: The Role of Household Registration System- Hukou

This study investigates the long-term impacts of household registration system (*hukou*) on older adults' engagement in socially productive activities (volunteering, informal helping and caregiving) in urban China over time.

Socially productive activities are essential to older adults' social inclusion and health and the capabilities of engagements are associated with older adults' socioeconomic resources. The household registration system in China which can be categorized into non-agricultural and agricultural *hukou* has been one of the important institutional factors that influence educational resources, job opportunities and welfare access. Drawing from the life-course perspective, older adults' *hukou* may reflect their earlier family socioeconomic backgrounds or migration experiences during the life course. To explore the role of Chinese household registration system in the variations of engagement, we use the samples of older adults (55+) in urban areas from the four waves (2011, 2013, 2015 and 2018) of the China Health and Retirement Longitudinal Studies (N = 2,659). Hybrid models will be employed to estimate the differences of *Hukou* status (non-agricultural, converted non-agricultural and agricultural *hukou*) while taking accounting the time-varying factors of health and family structures. Preliminary results based on two waves show that urban older adults who were converted into non-agricultural *hukou* and those who always have non-agricultural *hukou* are more likely to engage in socially productive activities than those who have agricultural *hukou*. The results provide initial support on the potential institutional impacts on the late-life opportunities. Older adults who were able to convert their *hukou* implies their better integration into the urban areas. Our next step is to provide findings based on the 4 waves of the data.

Linked Lives: Effects of Assortative Mating By Hukou and Education on Older Parents' Subjective Wellbeing in China

The linked-lives perspective in family contexts illustrates that key life events of one generation indirectly influence other generations who are closely connected with the one experiencing them. In familistic societies such as China where adult children's marriages are essential for old-age support, growing parental investment in ensuring suitable marriages have been observed. Assortative mating which indicates the couple's matches of similar social characteristics between the couple is an indication of marriage fit. As older parents in China still play important roles in suggesting and even deciding whether their adult children marry a "suitable" partner, pressure on ensuring assortative mating may be a source of stress for the older parents. Using China Family Panel Studies (CFPS) in 2012, we examine whether older adults' subjective wellbeing and mental health are affected by children's assortative mating on *Hukou (urban or rural household registration)* and education. Furthermore, we compare whether there are gender differences in the links between adult children's assortative mating and older parents' subjective wellbeing. The results show that adult children's marriages with matching urban *Hukou,* regardless of educational matching, are associated with older parents' higher satisfaction, higher confidence in future and lower scores in depression. We also find gender differences in patterns of hypergamy across *Hukou* and education. While parents of children in hypergamous marriages (rural wives married to an equally or more educated urban husband) report fewer depressive symptoms and greater family life satisfaction, those of rural daughters married to less-educated urban son-in-laws score higher on depression. Parents of urban daughters married to equally educated rural son-in-laws are better-off on all measures of subjective wellbeing, but parents of rural sons married to equally educated urban daughter-in-laws report lower family life satisfaction. These findings imply parent-child relationships and intergenerational support as potential mechanisms of how assortative mating shapes older adults' wellbeing.

KOBAYASHI, Jun* (Seikei University, Japan)

Beauty Capital: Roles of Physical Attractiveness on Social Inequalities from Rational Choice Perspective

This paper proposes a concept of "beauty capital" to provide a consistent understanding of the complicated roles of physical attractiveness on social inequities. The goal is to scrutinize seemingly obvious effects of how we look to others — our handsomeness or beauty — on our social lives.

To resolve mysteries of beauty, analyses rely on a theory of capital, a rich theoretical tradition in economics and sociology, which originated with Karl Marx. People invest time, money, and effort in beauty capital just as they do in human capital. Similarly, beauty capital can be accumulated and multiplied and provide returns to investors over time. Owing to this rational choice perspective, the paper challenges for dissecting the causal mechanisms of beauty.

Data from intensive interview descriptions are integrated with rigorous statistical comparisons. Qualitative interviews with beauty professionals vividly reveal nuanced subjective meanings of beauty. Quantitative statistical analyses of representative surveys are advantageous in depicting an objective whole map from a bird's-eye view. Japanese society is the focus as a crossroads of matured cultures and Asian societies.

Findings show that personal attractiveness can powerfully promote economic success, marriage, and happiness. The profound benefits of being handsome or beautiful are well known, yet few knows how and why.

Timing of Reproductive Events from Menarche to Menopause Among Host Community and Syrian Refugee Women in Turkey

The 2018 Turkey Demographic and Health Survey presents a unique opportunity to understand the timing of reproductive events (i.e., menarche, first marriage, first, second and subsequent births, and menopause) of Syrian refugee women in direct comparison to host community women in Turkey. The results of our analysis indicate that, with the exception of menarche, Syrian women experience each of these events earlier than host community women experience them in Turkey. On average, a Syrian woman enters her reproductive period at age 13.8; gets married at age 18.7, and has the first, second and third births at age 21.0, 22.7 and 25.4, respectively. The reproductive life nospan of Syrian women (28 years) from menarche to menopause is 6 years shorter than that of host community women (34 years). Cox regression results demonstrate that the reproductive trajectories of Syrian women are closely linked with their migration trajectories. Syrian women who experienced reproductive events after migrating to Turkey tend to delay the timing of those events until later stages of life. Such delays, in our opinion, can be explained by the destructive impact of armed conflict on Syrian refugee women in the recent past, and lesser social pressure in Turkey for women to marry and reproduce.

Food Insecurity, Armed Conflict and the Invisible Hunger

Latest estimates of food insecurity indicated that about 828 million people were affected by hunger and around 2.3 billion people in the world (29.3%) were moderately or severely food insecure in 2021 (FAO, 2022). Despite progress towards the 1996 Food Summit objectives in some countries, food insecurity numbers continue to rise in certain regions and among the most vulnerable groups. The Global Report on Food Crises (GRFC 2021) reported that food insecurity rates reached crisis level in 55 countries/territories both in terms of severity of the situation and the numbers of people involved and a significant portion of these are warn torn countries.

According to the UNHCR, the numbers of people who fled their homes because of armed conflict and persecution reached to an unprecedented 100 million people around the world in 2022. Displaced people because of armed conflict have been the most significant contributors to rising food insecurity rates in recent decades.

This paper argues that while several factors lead to food insecurity, food insecurity should be seen beyond the food system's failure in food provisioning but located in the failure of the key institutions of power in modern societies: international agencies of governance, the nation states, and the market. Using examples from recent cases of armed conflict from Afghanistan, Iraq, Libya, Syria, and Ukraine this paper examines how armed conflicts contribute to food insecurity at the national, regional and global levels. The paper points out that global levels of food insecurity estimations underestimate food insecurity rates among refugees, asylum seekers and stateless peoples.

(How) Do Moral Values of Organizations Shape Their Members' Identities? Examples from Public High Schools and the Armed Forces in Germany

We look at two empirical examples to understand how moral values in organizations shape their members' identity concepts, agency and status: Firstly, we analyze how teachers in urban high schools in Germany deal with Muslim religious holidays. Secondly, we point out how female recruits in the German armed forces connect to the norms of the predominantly male organization. Our findings are based on interview data from two qualitative research studies.

Teachers and female recruits reported us how they were pulled into conflicts between different moral values in their organizations. For example, teachers had to decide whether to demand performance or take into account that students wanted to skip school on important religious holidays. The interviewed teachers and recruits navigated such moral conflicts based on – often unreflected – guiding orientations. This involved choosing a way to present their identity, define their goals and relate to students or comrades. Their guiding orientations were shaped by formal and informal organizational rules, however, individual experiences were relevant as well.

In addition, teachers' and recruits' guiding moral orientations were closely connected to their social status. Morality distinguishes between good and bad, and it goes along with acknowledging or devaluing certain practices and people

(Hitlin & Vaisey, 2013; Kieserling, 1999). Thus, moral norms in organizations bring about risks of devaluing presumably non-moral behavior. This may lead to disadvantaging or discriminating against the people affected.

Public Displays of Attention: Exploring a Rare Form of Community Grievance Handing in the Global Mining Sector

The global mining sector is exceptionally destructive when it comes to land and the environment. This operating context is replete with historical, recurring, and unresolved community-level grievances relating to the systemic abuse of rights through, for example, the compulsory acquisition of land, forced displacement of people, and destruction of cultural heritage and common resources. These issues tend to arise where adequate safeguards and protections for local and land-connected peoples are lacking. Evidence suggests this 'grievance landscape' is expanding, with more allegations and claims making their way into the public domain. Still, little is known about how companies handle community-level grievances within the organisation. Over recent decades, specific high-profile incidents and issues have been handled by mining companies through inquiry processes with a deliberate public interface. This type of company-initiated, public-facing inquiry process – which I refer to as 'company-commissioned public inquiries' (CPIs) – is extremely rare. Through an in-depth scan of global reporting databases and records, I have identified an analytical set of CPIs in the mining sector related to social and environmental issues. This includes an independent inquiry into the 2019 Brumadinho tailings dam failure in Brazil, which killed 270 people, and a 2020 Board-led inquiry into the destruction of the 46,000-year-old Juukan Gorge rock shelters in the Pilbara region of Western Australia. My research is focused on the pre-cursor conditions and organisational processes leading up to the initiation of CPIs to understand how mining companies handle community-level grievances and why they address some issues in public and others in private. I mobilise a novel collection of sociological concepts like 'thresholds' for going public and 'deviance' from normative processes to frame my research. In this paper, I discuss findings from the analysis of the analytical set, and initial insights from interviews with key informants across five global mining companies.

The Simultaneity of Persecution and Perpetration - (Competing) Memories of the German National Socialist Past in Families of Stigmatized Victims

In our paper we will give an insight into our research on family memories and intergenerational consequences of persecution under National Socialism. Persons who were persecuted and murdered as so-called "asocials" and "Berufsverbrecher" ("professional criminals") under National Socialism were officially recognized as victims of this regime in Germany only in 2020 – 75 years after the end of World War II. To this day, these persecuted groupings have not formed a "we-group" and no collective memory of their experiences has been formed. Their history of persecution and their experiences have not been discussed in the German-speaking public, or in large parts of academia, or in the culture of remembrance, but instead have been tabooed. The reasons for this can be found, among other things, in the denying public discourses and the stigmatized social position of those affected, which persisted even after 1945.

On the basis of our multigenerational research in families of these stigmatized victim groupings, we will discuss how memory processes of the persecution of ancestors take shape within families, and how this interacts with discourses and the tabooing and depoliticization of the perpetration of crimes under National Socialism. Just as the history of persecution of these groups has not become part of a collective memory, their experiences have been marginalized in family memories, in which the perpetrators tend to be exonerated. We will discuss the collective and the case-specific conditions that shape this (de)thematization, and how these differ in successive generations.

Striking Fossil Capital - Towards a Theory of the Climate Strike

The climate strike has become a central strategy of the climate justice movement. This article examines both its success and its limitations as a form

of action. Its first part theorizes the climate strike as a *generational reproduction strike*, arguing that the climate strike movement's rapid growth has been enabled in particular by the successful mobilization of a generational subject (the *youth*), as well as in its targeting of reproductive social relations (in particular those institutionalized in the *school* and the *family*). I further assess the recent history of the climate school strike movement in the context of a broader conflict between 'green' and 'gray' capital fractions amidst an escalating climate and ecological crisis. I argue that the present ineffectiveness of the movement is related to its absorption into political projects of ecological modernization that fail to address the structural roots of the climate crisis. Political concessions to the movement have, thus, largely been limited to rhetorical commitments by governments rather than actual material adjustments to the fossil economy. The future effectiveness of the climate strike movement will therefore be determined by its ability to effectively challenge fossil capital in its totality. In view of this dilemma, the second part of this paper proposes a 'long history of the climate strike', placing the climate strike into the longer genealogy other forms of strike action that are opposed to fossil capital, such as labor, feminist, anti-racist strikes. Grounded in this longer history, I explore the potential of the climate strike to overcome its present strategic impasse through new alliances and a widening of the climate strike frame.

Revisiting Parsons: Social Integration through Consensus and Conformity Theoretical and Empirical Explorations

Social cohesion – the question what holds societies together – has always been a core question of sociological theory. Hence, the current political and sociological discourse concerning the crisis of social cohesion refers back to well established sociological ideas. Talcott Parsons (1971) identified an overarching consensus among members of society with regard to basic values and the resulting norm conforming actions as the basis of social cohesion.

In a qualitative panel study in Germany (N = 90), we reconstruct practices of social cohesion in different milieus and work with a heuristic that seeks to understands social integration as the interplay of four components (Grunow et al. 2022). Besides the concepts of cooperation and trust, Parsons categories of consensus and conformity play key roles: Consensus is understood as evaluative and normative notions of what is to be considered desirable and obligatory. Conformity denotes the willingness to comply with (in-)formally applicable rules and norms, regardless of whether this is done out of one's own conviction, through incentives or submission. Consensus is thus only one source of conformity among others.

Particularly in the pluralized societies of late modernity, an overarching consensus among society members seems to be an aspiration that is systematically and almost notoriously unlikely to be achieved (Beck 2004; Reckwitz 2018). In our contribution, we want to explore the relationship between consensus and conformity empirically. We ask whether and how acting based on shared values corresponds with acting (non-) conformably. (How) do they relate to shared values in order enforce conformity? The focus of the contribution is on how conformity is established through (or without) consensus. In doing so, we shed empirical light on a prominent but also controversial answer to the question of the foundations of social integration.

Craftspeople and Their Imaginary: How the Technological Development Shapes the Future of the Craft Sector

The rapid changes driven primarily by technological development and digitalization, but also globalization, climate change and demographic change are creating new challenges for the crafts sector, a sector that is mainly characterized by tradition and small family-owned firms. Firms are forced to constantly adapt and reinvent their own identity. The craftspeople working in this sector also are challenged to handle with the image of the sector in general and their personal identity within this imaginary. This profound process of change is having a lasting impact on our entire societies and economies and is accompanied by an implicit shift in mentality and values, also in the craft sector. This presentation wants to shed light on the dynamics created by digitalization and polarization and to provide orientation for future action and decision-making processes. For this purpose, we have outlined three future scenarios based on the degree of digitalization. The scenarios have been developed in the frame of a project in three regions in Italy and Austria involving experts and practitioners.

Deglobalization of Reglobalization?

For some years now, the imaginary, globalization—the process and the concept—has been undergoing a deep transformation along two main trajectories: de-globalization and re-globalization. De-globalization means to weaken the interdependence and interrelation of nations, institutions, agreements and civil society actors, revitalizing ethnic and tribal narratives and policies. Re-globalization instead means to reform and renew the pillars of the global order established by the international alliance of democracies after WWII and after 1989-91 by better balancing global, national, regional and local needs, developmental states and potentials. While de-globalization is about re-nationalizing, re-globalization on the contrary implies to strengthen globalism by the means of contextualization and "glocalization". I will present the contemporary dialectics of these two concepts and their multiple facets in an inter- and multidisciplinary approach.

Ukrainian Refugees in Vienna and in Kraków

The Russian military invasion of Ukraine that commenced on the February 24, 2022, led to the largest forced migration flows in Europe since WWII and one of the largest forced displacement crises in the world today. UNHCR reports show that six months after the onset of the Russian invasion, nearly one-third of Ukrainians (over 13 million people) have been forced from their homes and almost seven million Ukrainians have fled the war and are residing mainly in European countries. At present, there is only scarce and limited information on who the Ukrainian refugees arriving in the various host countries are. Our comparative analysis builds on two large surveys that were conducted simultaneously between April and June in Kraków (Poland) and Vienna (Austria). Specifically, we analyze how Ukrainian refugees arriving in Austria and in Poland differ in terms of their sociodemographic background, choice of host country as well as their return and stay intentions. Preliminary evidence suggests a highly self-selective migration from Ukraine to host countries, having implications for labor market integration in host countries. The farther Ukrainian refugees moved to the West, the higher their socioeconomic background, and the likelier their permanent re-settlement. Reliance on community networks and dependence on financial and social resources constitute well-documented effects of refugees' self-selection into Europe. In contrast, active choice of and familiarity with the host country are largely unique to the Ukrainian displacement, where previous cohorts of refugees from the Middle East or the Global South, while still self-selected in terms of education and social status, displayed much less knowledge and active choice of their host country. Host countries should be aware of the specifics of their refugee population and may want to adapt their integration policies accordingly, taking into account socioeconomic composition, intentions to return, and familiarity with the host society.

The Cinnamon Isle - Sri Lanka As a Utopia in the Travel Accounts of 19th Century British Colonialists

The coastal areas of Sri Lanka became under British rule in 1796 and the central mountainous regions in 1815. The period of British colonial domination lasted until 1948 and had an impact on the island that was far greater than the rule of the previous European colonial powers. The Second British Empire changed the relationship between the colonizers and the colonized, as new techniques of subjectification, surveillance, and discipline we developed. The value of overseas possessions was no longer only in the control over natural resources, but in advancing free trade. The production of knowledge on the colonized peoples was an important part of the practice of 19th century British colonialism in Sri Lanka. In the form of textual material such as political treaties, diaries, administrative records, letters, maps, and travel books, the military conquest was followed by the production of legitimizing cultural constructs that promoted the consolidation of the Empire. The presentation is based on an analysis of autobiographical books written by British men who either worked in the Sri Lankan colonial administration, moved to the island as settlers looking for their fortunes, or traveled there to explore the colony. The books are a part of an enterprise of knowledge production about the colonized and contain the writer's views on the people, culture, nature, and economic potential of Sri Lanka targeted at the British audience back home. The writers imagine a future for the colony as a utopia, which is like England, but with a better climate, beautiful nature, and ideal surroundings for Europeans to start life afresh.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

When they encounter problems or disappointments on the island, the blame lies with the natives, the present governor, or the current administration in Sri Lanka – not with the impossibility of the whole idea of the colonial project itself.

Volunteerism and Citizenship in the Context of the War in Ukraine

The Russian invasion and war in Ukraine have been widely condemned in the international community. Ukraine has received humanitarian and military aid from abroad and sanctions have been imposed against Russia by a coalition of states. Many large non-governmental organizations (e.g. International Red Cross, UNICEF) have collected donations and provided aid.

In addition, there have also been numerous bottom-up initiatives set up both by the Ukrainians themselves and by individuals in different countries. These include arranging for refugee transportation, housing refugees in private homes, sending shipments of humanitarian aid, creating art exhibitions to raise awareness, and using social media to share up-to-date information on the situation in Ukraine, for example. Volunteerism is understood as a chosen act of service that is undertaken for social benefit without concern for profit. When volunteering for humanitarian causes, the reasons for this activity stem both from the context and from the person him/herself. In the context of a war, crisis, or a natural disaster, volunteerism is often coupled with a sense of urgency. For the volunteer, this activity serves several personal and social functions, such as expressing one's values, strengthening social relationships, or reducing negative feelings.

This presentation discusses these volunteering activities through the lens of citizenship. It builds on recent theorizations on the *dynamics of hybridisation* – that is, the blurring of the lines between different forms of civil society engagement and political activism (della Porta and Steinhilper 2021). Volunteerism is understood as a form of activism and citizen participation – at times even civil disobedience – in various grass-root-level efforts to provide humanitarian aid, spread awareness, or help Ukraine and Ukrainian refugees in some other way. The presentation asks: what kind of implications do the wartime actions of individuals, NGOs, and loosely organized ad hoc groups of volunteers have on citizen participation?

Federalism, Decentralization and Participation for Good Local Governance and Conflict Resolution: A Case of Nepal

With the spirit of people movement in 2006 for ending a decade civic war between the state and then rebel party Maoist, Nepal adopted the federal democratic republican system with three tiers of government following the enactment of the new Constitution through Constitutional Assembly in 20 September 2015. The constitution provision of three tiers of power sharing mechanism is based on coexistence, cooperation and coordination (3C). Under this system, the Constitution of Nepal 2015 has provisioned the exclusive and concurrent functions in separate annexes for each level of government. It has also guaranteed resources to the local level based on its fiscal gap between expenditure needs and fiscal capacity. With this constitution provision, the devolution of power has been shared to local level in order to strengthen localism and development through democratic decentralized governance system. The devolution is boarder concept of decentralization where power and authority are provided to a local government with guarantee from the constitution. However, the devolution process to be success in the country, greater participation of local people needs in decision making process to make elected representative accountable for good local governance with quality services. This paper discusses the devolution and its implication on local levels that are directly related to local people and grass-roots democracy. The Constitution of Nepal 2015, Local Government Operations Act 2017, Good Governance (Management and Operation) Act 2006, the Federal, Provincial and Local Level (Coordination and Relations) Act 2020 and other sectoral legislation and published related documents are reviewed for this paper. Besides, three numbers of local levels (1 urban municipality and 2 rural municipalities) are taken as an empirical inquiry to find out the key achievement, problems and challenges facing by local levels in this new federal system.

Multicultural Society and Art: The Significance and Limits of 'social Inclusion' through Collaborative Expression

Since the 2000s, art projects with a theme of 'social inclusiveness', such as citizen collaboration and participation, have been frequently held in various cities and local communities. This is due to the diverse aims and intentions of various actors, including (1) attempts to form bonds through the arts in communities that are undergoing multiculturalisation, and (2) a focus on the usefulness of arts and culture in tourism and urban policy against a background of increasing inter-national and inter-city competition in the context of recent globalisation and a post-Fordist society. As a result, a situation has emerged where an unprecedentedly large number of citizens are now involved in the arts. In recent years, however, these 'socially inclusive' art projects have frequently encountered problems, such as raising debates on 'freedom of expression' concerning the restriction or self-restraint of socially critical expression in the arts, and criticism of selective cultural policy in government-led art projects.

In the social context of citizen-participatory art projects, which are entering a new phase after an initial period of enthusiasm, I aim to form a new view on the sociology of art from the perspective of civil society by focusing on those who "drop out" of the objectives of social inclusion and collaboration, as well as on those citizens who do not take part in and criticise the activities. Through empirical research based on participatory observation and interviews, I will go beyond the existing discussions that focus on the economic value of the arts, criticisms of art projects from an aesthetic point of view, and examine the social usefulness of the arts, the power structure of the arts system and the social institutions that constitute it.

Correlates of Vaccine Non-Uptake Among Younger Muslims in Britain during COVID-19 Pandemic

This study applies binary logit model to a small-scale web survey data (Survey of Islamic Practices during COVID-19 Pandemic in Britain, Nov. 2021, with 323 cases) to clarify the correlates of vaccine non-uptake due to the paucity of quantitative studies on Muslims in social sciences. Correlates includes demographic variables and those, related to household, religion, employment, peer and internet use. According to the analysis for both sexes, the correlates with positive effects on non-uptake include living with adults aged 16-24, no Madrassa schooling (supplementary class), work week of 36+ hours, non-essential work outside home, and having younger brothers. The correlates with negative effects include male, Asian, born in Asia or Middle East, stronger faith after the pandemic, employed, essential workers within household, younger sisters, fewer Muslim friends, internet use for news, and internet use for work.

The effects of younger brother and younger sisters are in the opposite direction possibly reflecting gender/order-specific roles within the family. The results are different by gender for a few other correlates, possibly reflecting the gender roles among Muslims: being married and Black tend to have positive effects on non-uptake among males but negative effects among females, while living with minors aged less than 16 has a negative effect among males but a positive effect among females. After the inclusion of an additional correlate of no testing, it has a positive effect on vaccine non-uptake, suggesting that non-uptake and no testing have positive correlation. But the direction of effect cannot be assessed easily because the effects of other correlates remain largely similar. It was not expected from previous studies to find that the effects of being Black and being Asian may be gendered, suggesting also vaccine non-uptake should be analyzed separately by gender. The detailed results by gender will be presented at the congress.

COVID-19 Vaccine: Nigeria Scenerio

Covid-19 pandemic is the deadliest disease mankind ever witness because of its peculiar nature which was not known to health care givers globally at the initial stage. Evidences abound that a lot of people globally died. For instance, Asia recorded 189, 442, 286; Europe was 226, 562, 403 and globally it was 621,285,115. With the alarming figure, the need for urgent health intervention was nonnegotiable. However, the vaccine finally came unfortunately, instead of embracing the vaccine; it was global protest against the acceptability and taking the vaccine. Hence, this study to provide Nigeria narrative as far as the vaccine is concern. A descriptive design was adopted for this study with a population of 597 using purposive sampling technique to select the respondents. The study took place in six (6) purposively selected communities in Ekiti state, Nigeria. A semi-structured questionnaire was designed for the study. Some of the main findings revealed that 276(46.2%) and 450(75.4%) strongly agree they understand and are aware of Covid-19 respectively. On the readiness to take Covid-19 vaccine, 198(33.2%) strongly agree taken first and second jabs and 171(28.6%) agree they are willing to take the vaccine without hesitation. Also, 186(31.2%) have not taken the booster and 168(21.1%) were undecided. Hypothetically, on the relationship between Covid-19 vaccine awareness and level of utilization showed to value χ^2=45.978, df=12 and p-value = 0.000; χ^2=45.978, df=12 and p-value = 0.000; attitude of Nigerians to Covid-19 vaccine and taking first and second jabs showed that χ^2 = 21.491, df=16 and P-Value = 0.160 and finally, cultural and religious belief and taking first and second jabs χ^2 = 39.830, df=16 and P-Value = 0.001 and χ^2 = 32.438, df=16 and P-Value = 0.009 respectively. Conclusively, Covid-19 vaccine is sacrosanct to mankind to reduce the spread and unprecedented demise of people globally.

Malaria Elimination in Nigeria: A Political Economy Perspective

Malaria is a common and dangerous disease in developing nations which affects mankind across different socio-demographic characteristics. Africa is a malaria ridden continent. Malaria is capable of killing an individual within 24 hours especially when parasite has eaten deep into the system of the individual. The increase in malaria cases and death globally is very alarming most especially in Africa. For instance, WHO revealed that in 2019, there was 227 million cases of malaria and in 2020 later increases to 241 million. Also, in 2020, malaria deaths shoot up by 12% while in 2019 it was 627,000 to 47, 000 (68%) of the additional 69,000 deaths. In Nigeria, the situation is worrisome, world malaria report showed that Nigeria has the greatest cases of malaria and death globally, in 2019 there were 27% cases and 23% deaths. However, it is pertinent to know that several interventions have been made by different interest organisations to eliminate malaria but unfortunately to no avail simply because the attitude and mentality of Nigerian stakeholders is very poor. All activities and polices towards the eradication of malaria in Nigeria are means to self-enrichment. To this end, this paper will discuss the political-economy of handling malaria issues in Nigeria using relevant secondary data from our previous works to explore the roles of all players in perpetuating malaria as a pandemic in Nigeria till date. A major preliminary finding of this study is that poverty is the major tool of political-economy that hampers the successful elimination of mosquitoes in Nigeria. The study will conclude that the act of perpetual self-centeredness of leaders in Nigeria wasted the laudable efforts and genuine interventions of different indigenous and international organisations in the reduction or elimination of malaria in Nigeria.

Modeling Macro-Level Public Opinion: Challenges and Opportunities

Combining public opinion data from different sources creates opportunities for new research that goes beyond the time and/or country limits of single-project studies, and enable better utilizing the wealth of survey data collected over decades in many countries of the world. This talk deals with the opportunities and challenges associated with country time trends of public opinion, and proposes steps of ensuring high quality of the resulting time series. First, it draws attention to the need of evaluating various aspects of survey quality and to the role survey documentation plays in this process. Second, it discusses approaches to harmonizing variables that measure the same concept but use different response scales. Third, it presents different way of modeling the country-level trajectories. Finally, it discusses ways of analyzing causes and consequences of public opinion with the estimated country trends.

Through Partisan Lenses. How Political Trust and Policy Assessment Changed Under the Law and Justice Rule in Poland

Political polarization is one of the important aspects of the populist wave that has swept through many democracies in Europe and beyond. We examine the consequences of increasing polarization for policy assessment and political trust during Poland's shift in power in 2015 when, in an atmosphere of heated political conflict, the hitherto right-wing populist opposition party Law and Justice came to power replacing the former two-term ruling parties, the Civic Platform and Polish People's Party. Our analysis relies on data on voters from two waves of the Polish Panel Survey POLPAN conducted in 2013 and 2018. Notably, first years of the Law and Justice rule, accompanied by favorable economic circumstances and widely popular social programs, brought an overall increase in political trust in Poland. However, what we observe underneath is a massive divergence between the so-called electoral winners and losers, which represents clear evidence of rising polarization and deepening political cleavage, but also of a 'party lens' effect. We find that electoral winner status both mediates and moderates the effect of evaluations of economic performance on political trust. Winners tend to have more favorable perceptions of the economy, which translates into higher political trust. Interestingly however, the effect of performance evaluations among winners is weaker than among electoral losers. This amounts to stronger sensitization of voters to party cues, and partial 'desensitization' to actual policy outcomes. We discuss these findings in the context of the current economic downturn.

KOMATSU, Hiroshi* (Matsuyama University, Japan)

A Fundamental Discussion on Shifting Transport Modes: Do the Modes Differ Among Cities?

One of the ways to decrease energy consumption is shifting from private car use to public transportation. Tons of studies have been testing factors of pro-environmental behaviors. When we try to shift the mode based on those studies, we might as well see the current situation of transport modes. If most individuals drive their cars, it might be possible to shift them to public transportations. But, if most individuals already take public transportations, there is no need for shifting. There is a little discussion on this issue in environmental sociology.

This paper aims to provide empirical data for a fundamental question: are there any regional differences in transport modes?

In 2019, we conducted social research in three cities (Kobe, Fukuoka, and Kawasaki) in Japan.

Findings are as follows: first, individuals commute to work in diverse ways. Sixty seven percent of Kawasaki respondents (n=631) take trains, bikes (10%) and cars (9%), Kobe (n=603): trains (49%), cars (22%) and bikes (8%) and Fukuoka (n=547): cars (37%), trains (19%), bikes (14%) and buses (14%). Commuting by trains takes longer traveling time than driving cars. Differences are about 12 (Fukuoka) to 20 minutes (Kawasaki and Kobe).

Second, means for groceries shopping also differ among cities and stores' location from individuals' place. When stores are located within 800 meters, respondents tend to walk or ride bikes (Kawasaki [86%, n=602], Kobe [78%, n=519] and Fukuoka [67%, n=530]). And over 800 meters, respondents tend to drive cars (Kawasaki [44%, n=234], Kobe [54%, n=346] and Fukuoka [67%, n=269]).

Those findings suggest that there may be regional differences in transport modes. And individuals may use different transportations for different purposes. There might be some factors that relate to those differences. We need farther studies to see if we can have similar findings in other regions and countries.
