Empowering Finance: Understanding the Beliefs and Values Embedded in Consumer Fintech

The last few years has seen a rise in fintech – the use of digital and information communication technologies to improve the provision of financial services. Fintech products, which are typically app-based, provide consumers with access to a wide range of financial services such as digital banking, mobile payments, investments, loans and insurance; prominent examples are Robinhood (a stock trading and investing app), Up (a neobank) and Afterpay (a buy now pay later service). Using data and algorithms to provide customers with streamlined application processes and personalised offers, many fintech companies position their products as empowering consumers and democratising finance. Thus, these fintech products are explicitly created to have particular beliefs and values embedded in their design. But what are these beliefs and values, and what are their social implications? Through a critical analysis of the corporate documents, app descriptions and screenshots from a number of fintech products available in Australia, I identify the beliefs and values embedded in their design and discuss whether they match those advertised by the fintech companies.

AALDERS, Rachel* (Australian National University, Australia)

Healthy Finances: Making Sense of Dollar Data As a Measure of Wellbeing

Critical research on fintech services such as payments, credit and investment often focuses on how these services use platform affordances to accumulate and monetise data. But the data is also returned to the consumer through fintech apps, often in the form of data visualisations that are increasingly framed using metaphors of health and wellbeing. Combining Rettberg's (2020) situated data analysis, a method for analysing power relationships, with Davis' (2020) mechanisms and conditions framework of affordances, which explores how objects afford, for whom and under what circumstances, I analyse how the concept of 'financial health' is presented in a variety of fintech apps. These apps are from a range of institutions including traditional financial institutions, neobanks and open banking platforms, and their use of 'financial health' both normalises and moralises particular monetary and financial practices.

AASAAVARI, Asmita* (University of Connecticut, United States)

Aging, Family Ties and Cultures of Caregiving

Using life history interviews, this paper explores the culture of caregiving, aging, and the biopolitical discourses associated with dementia in the American and Indian contexts. The research is situated in the context of families that are actively engaged in the provision of elder care in two cultures marked by distinct family forms, social norms, and ideas of filial piety. In doing so, I argue that families which utilize a team approach to caregiving experience more positive outcomes than those utilizing the primary caregiving approach. Since paid care has been commodified, social location, race, caste, ethnicity, and gender play an important role in shaping care recipients' and caregivers' experiences. Alongside, changes in family forms and increased participation of women in the labor market have also shaped the power dynamics and politics around caregiving in the personal and public spheres. Utilizing feminist theories of caregiving, and social gerontology; in this paper, I explore how intra-household politics, intergenerational relationships, gender ideology, and modern technology affect care arrangements. In doing so, I also focus on the nature of social support from the eldercare industry, and biomedical institutions and the experiences of caregivers and care recipients in navigating through them.

Family Ideals across Cultures

The family is undoubtedly the oldest institution in our societies. In all cultures, the family serves as a fundamental pillar where it's functioning through respective social norms and values also play a crucial role for the broader societal organization. Yet, in modern societies, the family institution is changing and with it, we know relatively little about how family ideals differ across cultures today. Whereas there is considerable research on the components of the family, such as children, marriage and its less tangible characteristics (e.g. communication and egalitarian attitudes), there is limited research on how individuals view family success across cultures. This paper reports on the finding of a vignette study implemented in China, Japan, South Korea, Singapore, United States, Italy, Spain and Norway in 2021. It takes a con-joint approach where the vignette comprise ten factors. Each of these factors are randomized, and every respondent answers to six different vignettes. The d-efficiency is about 0.98 which implies that the factors can be viewed as independent and enables a causal interpretation of estimated coefficients. The results show that divorce associates with less success, which is the case even in the US and Norway where divorce rates are high. Childlessness is also associated with less success, though there is no difference between the number of children in the family. In other words, having one child as opposed to two or three, has no discernable effect in any of the countries considered. Good communication between family members is viewed successful, whereas income status matter in all countries, bar Norway, the latter result possibly driven by the fact that this is the country with the lowest income inequality. Whereas there are important gradients in the estimated effects, the way people view a family to be successful is remarkably similar across cultures.

ABBASI, Parvez Ahmad* (Veer Narmad South Gujarat University SURAT, India)

Status of Yunani Medical System in Medieval and Modern India

The Ayurvedic system of medicine was in practiced in ancient Indian society. It was based on herbal medicines. *Vaidya*, *Chikitsaka* and *Bhisaj* were the professionals engaged in the pursuit of medicine. In the medieval period, *Yunani/Unani* System of Medicine came into existence. This system looks back to classical Europe, the *hakim* in India practiced *Yunani* (often spelled *Unani*) i.e., Greek medicine distinct from Ayurveda, or a hybrid system known as *Tibb*. This system of medicine flourished in the medieval period and several hospitals were established as an essential part of the *Yunani* medical system. One important feature of this system was the development of surgery in the *Tibb* system. The surgeon was called *Jirah* (phlebotomist). The ayurvedic system also persisted in society parallel to the *Yunani* or *Tibb* system of medicine.

However, during the British period, there was a clash between the modern system of Allopathic medicine against the local systems which were largely pluralistic and were aware of alternative traditions of medicine. In these systems, medicine was not viewed simply as a biological phenomenon, and emphasis was given to a patient's societal standing, environment, and relation with the therapist. As colonial arteries hardened in India, claims of Western superiority and scientific authority isolated these local systems of medicine. Allopathic practitioners saw themselves as modernizers and often treated their indigenous counterparts with contempt for their knowledge. Local knowledge was labeled unscientific or irrational. While Western medicine was accorded the status of official medicine, the state turned discriminatory and hostile toward the local systems of medicine. As a result, both the local system of medicines struggled for their survival in an adverse political climate which unfortunately continued even in the post-independence period as well.

ABBOTT, Owen* (Cardiff University, United Kingdom)

Forgiveness and Reconciliation in Families after Political Conflict

Despite interpersonal forgiveness being an established object of study in psychology and communication studies, sociological research into the role, significance, and practicing of forgiveness in personal relationships is virtually non-existent. This talk will draw on data from 41 in-depth interviews in the UK which represents the first qualitative sociological study on forgiveness in personal relationships. I will firstly illuminate the significant role that my participants regularly attributed to forgiveness in their family relationships.

I will then illustrate how forgiveness of family members in relation to disagreements around political or 'culture war' issues emerged as a common theme throughout my interview data. Multiple participants recounted how this often involved an ongoing process of conflict and reconciliation, which several described as becoming more frequent in relation to contentious political issues such as Brexit. This affirms recent work that shows increased prevalence in conflicts within families around divisive political issues in the UK (Hobolt, 2020). But it also builds further on Davies's (2021) recognition that people are often concerned to work through and mend family relationships after fractious political arguments. This talk takes this point a step further by showing the ways in which people try to resolve and reconcile familial relationships in the wake of such conflict. This included initiating moments of reconciliation and communicating regret after arguments had become unpleasant, seeking to understand and recontextualise the other's beliefs that they disagreed with, and forming strategies to avoid such conflicts occurring in a similar way in the future. This in turn indicates a significant point about the role of forgiveness and reconciliation in families: the 'non-voluntary' and deeply meaningful status of these relationships means that conflicts, even when based on strong ideological difference, are often sought to be mended and made manageable to facilitate the ongoing nature of the relationship (Kelley, 1997).

ABDEL-FATTAH, Randa* (Macquarie University, Australia)

COVID 19 As a Rhetorical Shield: Cultural Boycotts and the Case of the 2022 Sydney Festival

The recent cultural boycott of one of Australia's major annual cultural events, the 2022 Sydney Festival, attracted attention and solidarity from Palestine, the UK and US. Described in international circles as the most "effective, impactful and creative" since the inception of the Palestinian Boycott, Divestment and Sanctions (BDS) movement in 2005, the boycott was a striking example of how artists and activists negotiating multiple identities on sovereign Indigenous land worked together to formulate political demands and build transnational alliances.

After two years of a global pandemic, withdrawing from Sydney Festival came at a significant material cost for artists and arts companies. In rejecting calls to divest, Sydney Festival's board, arts companies, anti-boycott campaigners and politicians weaponised COVID-19 as both a rhetorical shield and blunt instrument of attack to pressure, threaten and undermine artists and boycott campaigners.

This paper will show how using COVID-19 to attack the boycott, and the disingenuous rhetoric of 'non-political and not-for-profit', were deployed by those who had defended government refusal to extend COVID-19 rescue funding packages to the arts sector. I argue that COVID-19 was exploited to undermine the agency of artists in their mobilisation of a social movement comprised of artists mainly based in Western Sydney, the most culturally and linguistically diverse region in Australia and the site of disproportionate lockdown measures, hyper-surveillance and police violence during the 2020 lockdown. I theorise how artists and activists re-constituted practices of resistance, solidarity and care. How did those involved create political communities based on solidarity as an ethical and embodied practice of care? What creative and new forms of grassroots organising were pursued? What counter-spaces of movement-building and allyship were formed? And finally, how did artists and activists reclaim the cynical narratives around COVID-19 to reassert their agency in a time of boycotts, protests and pandemics?

Spot-12.4

ABDEL-FATTAH, Randa* (Macquarie University, Australia)

Neo-Liberalism, Anti-Islamophobia Advocacy and the Betrayal of Palestinian Advocacy

On the occasion of Eid al Fitr 2022, one of Sydney's prominent mosques invited Australia's Prime Minister, Scott Morrison, a staunch 'friend of Israel' and exposed Islamophobe, to share in Eid celebrations. At another major mosque, Premier Dominic Perrottet, a Zionist, climate-change denier and Trump sympathiser, stood on the mosque's front steps and addressed a Muslim crowd of thousands. Mosque spokespeople boasted about the occasion as 'successful'. On the occasion of the death of Queen Elizabeth II, whilst Indigenous and colonized peoples spoke up about the violence of British imperialism, the Australian Federation of Islamic Councils, Australia's so-called peak Islamic body, issued a press release 'mourning' the Queen's death and celebrating her 'legacies.' This paper is interested in how Muslim 'leadership' responses to Islamophobia based on the logic of 'realpolitik', of neoliberal politics of recognition, of 'local versus global', effaces Australia's settler-colonial violence, privileging liberal multicultural frameworks of advocacy at the expense of movement building based on principles of solidarity with First Nations peoples. I explore how marginalised communities, with a particular focus on Palestinians as a case study, are betrayed by Muslim 'leadership' who succumb to the enduring and seductive power of common-sense ideas and scripts about the 'moderate/apolitical/integrated' Muslim— so powerfully sedimented over two decades of the war on terror and the privileging of liberal multicultural frameworks of inclusion in fighting Islamophobia. I investigate how cumulative, repetitive practices between the state and Muslim community organisations serve to embolden Islamophobia, racism and Zionism in the specific context of Australia, a settler colony. At a time when we are witnessing

renewed global consciousness of the 'intersectionality of struggles,' many Muslim leaders reveal a chronic failure to grasp that Islamophobia requires globally-oriented analytics including an understanding of Australia's role in the global war on terror.

ABDI, Cawo* (University of Minnesota, United States)

Muslim Refugee Schooling: Inclusion/Exclusion in the US Public Education System.

Educational attainment remains a key force that shapes the life chances of most Americans. For refugee children living in poor households, the American education system can be their ladder to social mobility and the realization of their American dream, or it can leave them behind as part of the millions of American citizens whose lives remain precarious. This paper explores the increasing role ethnocentric charter schools are playing in Somali children's education in in the United States. Research on how newcomers partake in the education system is key to understand how education resources are distributed across racial and class lines. Theoretical understanding of citizenship, social cohesion and exclusion and the politics of educational resource distribution and equity is necessary for us to formulate better educational policies in meeting the needs of all citizens including recent refugee groups.

Exploring Safe Space for Collective Democratic Practice in All about Girls

Young people are experiencing challenges in crises of democracy globally that affected their livelihood and engagement with formal democratic practices. The post-colonial struggles and traces of neoliberalism in Malaysia also influence young people's mediation of agency in informal collective participatory settings.

This paper explore ways that redefine space for young women to openly discuss girlhood, gender and feminism in youth activism, in which some of the issues were perceived as sensitive topics in Malaysia and is based on our on-going project with young people from diverse institutions across Malaysia. We adapt the creative approach of poster making, origami, movie screening and interactive tactics to create a safe space during our All about Girls workshops.

The workshops trace how democracy is experienced, learnt and re-imagine in a safe space created through our on-going series of workshops on gender and feminism consciousness-raising. We explore how materialism approach would support the transformative agency formation during informal collective settings using Transformative Activist Stance (Stetsenko, 2020). We hope our work contribute to conceptual and practical approaches in teaching and learning democratic values and improve young people's participation.

Nature School Pedagogy in Re-Imagining Sustainable Future of Young People in Malaysia

Climate emergency, Covid-19 pandemic and and geopolitical conflicts signal rapid change to the future and well-being of young people's lives. The changes relate closely to the issue of mental health awareness and support under overarching purpose in the age of planetary crises. This paper discusses ways the 'Nature School' or *Sekolah Alam* eco-pedagogy could redefine space for young people to raise consciousness, reflect and be guided in a training programme for young mental health facilitators in Malaysia. We organised series of workshops that adapted 'Nature School' pedagogy by means of camping and collective reflection practice to let both facilitators and participants learn about survival skills and mental health practices.

The purpose of these workshops is to develop and train young people as mental health facilitators for disaster aid programme which will take place in temporary evacuation centres across Malaysia, as one of the preparations of facing climate emergency such as flood and natural disaster. The ethico-moral perspectives is discovered during the workshop in which highlighted the safe space created among young people in connection with nature, thus it would improve reflection process in which is vital in mindfulness and mental health self-awareness. The approach emphasis on collective sense of human agency in relation with non-human subjects in nature.

We hope the reflections from the workshops will contribute to the conceptual approach and practical strategies in building the definition of Planetary Youth Research.

Economic Impact of Covid 19 and Gendered Violence's Among Working Women in Kerala

Economic impact of Covid 19 and gendered violence's among working women in Kerala

The COVID-19 pandemic has created a profound shock worldwide, with different implications for men and women. The impact of the crisis on women is stark and different for different fields. Around the world, women carry out far more care work than men – up to ten times as much according to the OECD Development Centre's Social Institutions and Gender Index (SIGI). The travels restrictions, at-home quarantines, educational institutions closures, much profound patriarchal impose, control on the attention and confidence by the family members at home, restriction on open thought process of women by others, continuous monitoring by the partners on each and every matters, etc imposed additional burdens on women. Women's economic roles within their household also have an impact. Lockdown situations exacerbate risks of violence, exploitation, abuse or harassment against women. There are gender differences in the ability to earn an income, be employed in salaried formal work and take on responsibility for unpaid care work throughout the pandemic, with women hit hardest. Key barriers to economic opportunities include restrictions on freedom of movement and access to financial services, formal employment and social protection (Clingain et al., (2021). In Kerala the situation is highly in apex. The pandemic in Kerala too led to losses of female employment, rise in gender-based violence, a deterioration of women's mental health and rise in unequal care burdens. But Kerala's response was distinctive. Kerala's economic relief package included cash support, employment, free food provision and zero-interest loans to women. Through helplines, the Government reached out and helped women report instances of violence and mental stressEven though the situation was like thus the economic impact of covid 19 on the working women was severely affected the economic structure of Kerala.

ABDULLAH, Noorman* (National University of Singapore, Singapore)

"Decolonising" Sociology through Teaching and Unlearning: Implications and Interventions

What constitutes an inclusive and accessible teaching and learning agenda in Sociology and Anthropology? Who are we teaching and speaking of and for? More importantly, what do efforts in decolonising the curriculum show in relation to the entrenched ways and means in which sociological teaching has been shaped? In this paper, I discuss some teaching and pedagogical interventions to decolonise the classroom and what it entails in a context of academic dependency and theorising from elsewhere. Two interweaving frameworks will be discussed pertaining to the state and potential of decolonising teaching – the process of silencing (F. Alatas, 2019) and the captive mind (H. Alatas, 1974). I invite candid discussions of possible pedagogical strategies for structuring meaningful and critical discussions in our classrooms, and the variegated classroom responses to these teaching efforts. Given the aspiration to teach inclusively and differently, a more creative classroom environment is imperative to stimulate critical discussion as well as to unlearn other teaching and pedagogical practices in a milieu where thinking, particularly alternative and critical ways of doing so, needs to be given due attention and recognition.

TG07-829.1

ABDULLAH, Noorman* (National University of Singapore, Singapore)

On Resonance and the Sensory: Teaching and Pedagogical Interventions

'Resonance' as a relational and phenomenological concept invokes the construction of meaningful, dynamic, and transformative relations between different social actors. The conditions that stimulate resonant relations are embedded in the grammars of social interaction which include mutual trust and reciprocity. Following Unni Wikan's (2012) plea for a more non-mechanical, embodied and sensate approach, I discuss the relationship between sensory ethnography and methods, and the anthropological and sociological imperative to cultivate 'resonant' social relations that are 'beyond words'. Drawing on a range of sensory scholarship that includes David Howes, Kelvin Low, Sarah Pink and Paul Stoller, the main thrust of the paper is to outline broad teaching and pedagogical directions, as well as individual and institutional best practices on how this can potentially be harnessed in the classroom.

RC31-461.1

ABILA, Sanley* (University of the Philippines Visayas, Philippines)

Mental Health Education for Filipino International Merchant Seafarers

This paper advocates for the integration of mental health education for Filipino international merchant seafarers to be part of the standards of maritime education and training (MET) in the Philippines. It intends to contribute research into the promotion of mental health (MH) through MET research. MH education is viewed as a long-term social intervention contextualized within existing research on seafarers' MH where a broad but negative picture of the MH of seafarers has been painted. Philippine MET is the official regime into which Filipinos are socialized and integrated into the international seafaring labor market, where Filipinos have carved a niche in the last 50 years. The Philippines has occupied a stable position as one of the top suppliers of seafarers for the global labor market. However, existing research on seafarers' MH paint a bleak picture of the future of seafarers' MH because of the perceived persistence of lack of improvements in imposing health and safety standards at sea, risky and stressful work and living environment, job insecurities, poor overall protection of the welfare of Filipino seafarers within a web of international and national regulations, and other work-place related factors unique to seafaring such as long-term social isolation. In 2018 the *Philippine Mental Health Act* was enacted where the promotion of MH is valued as part of Filipinos' basic rights. In effect, various organizations such as government agencies, maritime schools and maritime employers are mandated by law to formulate MH policies and programs for students and workers as strategies promoting MH. This law is crucial as seafaring remains one of the most attractive employment options for young Filipinos but remains to be one of the most dangerous occupations. How this law might be implemented in the contexts of MET and the maritime workplace remain to be seen.

RC13-193.3

ABRAHAM, Ibrahim* (Federation University Australia, Australia)

Serious Leisure and Leisure Time in Postsecular Perspective

The Serious Leisure Perspective (SLP) has been one of the most influential paradigms in sociological leisure research. As developed by Robert A. Stebbins, the SLP focuses on the "systematic" pursuit of leisure activities, through which individuals may find meaningful self-actualization and self-expression as their leisure careers develop. The SLP has been a normatively secular sociological paradigm, with serious leisure typically conceived of as a form of individual meaning-making in wealthy, westernized and secularized societies in which religion does not make claims upon individuals' emotional or time commitments. Only a handful of research studies take account of the potentially disruptive or problematic aspects of serious leisure's emotional commitments and time commitments upon the lives of religious individuals and communities.

This paper offers a "postsecular" critique of the SLP, by acknowledging the ongoing importance of religion in personal and public life in even strongly secularized countries, such as Australia, as well as the problematically provincial nature of any sociological paradigm that cannot take account of the more central role of religion in the lives of individuals and communities around the world. In proposing this postsecular serious leisure perspective, this paper draws upon ethnography with Christians involved in amateur music and sport, notably surfing, in Australia, South Africa, and the USA. This paper focuses on the complexities of negotiating the emotional and time commitments of serious leisure activities, with religious and other commitments, especially in the context of emerging adulthood. Rather than relieving stress and providing a sense of personal identity, serious leisure can be a source of spiritual, moral, and material anxiety for religious individuals. Moving beyond a dichotomous approach to work and leisure time, therefore, this paper proposes a more complex approach to serious leisure, recognizing the ongoing sociological significance of religion.

ABRAHAM, Ibrahim* (Federation University Australia, Australia)

Suffering Subjectivity, Spiritual Insecurity and Coming-of-Age in the Literatures of the South

Analyzing *Bildungsromane* (coming-of-age novels) from South Africa and Australia, taking seriously J.M. Coetzee's notion of "Literatures of the South" where, Coetzee writes, "the sun beats down in a certain way" across countries that have experienced similar colonial processes, this paper explores two important social scientific concepts around conflict and tension: suffering subjectivity and spiritual insecurity. Theorized by Joel Robbins as a way to think critically about comparative research, the notion of suffering subjectivity posits a way of understanding what unites—and potentially divides—humanity, though a focus on suffering and consequentially on notions of what is valuable and good. Theorized by Adam Ashforth, through his ethnography of post-apartheid South Africa, the notion of spiritual insecurity posits a way of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

understanding spiritual suffering in contexts of conflict and social tension in which multiple contradictory material and spiritual explanations for suffering circulate, with no criteria for establishing orthodoxy or hegemony.

Focusing on the *Bildungsromane* of black South African male writers, including Es'kia Mphahlele and Niq Mhlongo, and Lebanese-Australian male writers, including Michael Mohammed Ahmad and Omar Sakr, this paper reveals the spiritual insecurity at work in these narratives, which effectively dramatize conflicts between contradictory worldviews, including the fragmentation of religious discourses. Although characters inhabit increasingly secularized societies, the utility of religion problematically persists in providing occult explanations for suffering and processes for othering. This paper further suggests the concept of suffering subjectivity might serve a useful theoretical function in comparative sociological and literary studies, by guiding the analysis of texts from different socio-economic contexts that nevertheless reveal some similar underlying anxieties for individuals in complicated, if not conflicted, multicultural and unequal societies.

Migrant Women, Domestic Violence, and the State: A Comparative, Intersectional Analysis of the United States of America and Australia

Researchers, activists, practitioners, and other stakeholders in different contexts have worked across the globe to ensure that the problem of gender-based and intersectional violence remains a public issue and on the policy agenda. Researchers and community-based organizations have sought to acknowledge and document the gendered impact of policies and laws and the ways these disadvantage different groups of women, including those who experience multiple forms marginalization. They have also continued to push for structural and systemic reform. While countries are increasingly recognizing domestic, family, and sexual violence as a policy issue, rates of violence continue to remain high.

Drawing upon a contextual global sociology and a review of the scholarly and grey literature, media and policy documents, this paper examines the framing of domestic violence in the contexts of the United States of America and Australia in the past three decades, including the critical issue of citizenship status. It examines some of the policies, processes, and practices to better understand the setbacks and gains in addressing domestic violence for migrant women. Specifically, questions include: how has the framing of and responses to domestic violence shifted in Australia and the United States? What are cultural and structural inequalities that shape the nature of lived experiences of violence, including barriers to and opportunities for seeking help? What are factors that compound the violence and vulnerabilities? Where and how is meaningful change taking place in addressing domestic violence at the local, national, and transnational levels? Also discussed is the influence of neoliberalism on framing the problem and in defining the forms and flows of funding to address domestic violence. This paper concludes by emphasizing the importance of collaborative and interdisciplinary research for a more comprehensive contextual global understanding of domestic violence to enhance policies and practices, including for migrant women.

Babies, Children and Wars.

This paper intends to problematize, analyse and configure the way by which the diferent forms of wars highlight the children and the babies, and the kind of agency they feature. The contemporary wars assume a range of facets and dimensions always crossed by political, economical, biological, religious, ethnic and racial interests; and they have also transactional and local nature (the civil wars, and Brazilian "stray bullets" - always finding and killings black bodies).

This paper discusses the presence of infant actors in contemporary wars and the way by which they are affected from their perspectives , and, points out statistic data of the participation of these actors in the transactional and international collection of these agencies. We take as an objective to highlight the protagonism and the role of babies and children in different wars and the way how they emerge in the social atmosphere in different experiencies of wars.

To this end, we use as a methodology the bibliographic research, documental research, besides statistic data as well as the study of iconography about the wars and the accounts of experiences. The data were organized in order to emphasize the role of babies and children in war as well as the singularity of adult centered culture in these events.

Including Women and Girls in Computer Science: What Are the Challenges and What Is Working in Latin America?

The growing body of work on girls and computing show that the digital skills gender gap is growing despite global efforts to include women and girls. This is true in relation to the general use of ICTs, but also in more advanced research areas such as mathematics and computing, where programming is seen very much as a male domain. The picture, however, is complex. There are large regional variations and interpreting the gaps requires careful and contextualized analysis. This paper will discuss some recent experiences in Latin America trying to overcome this gap and show how they focus on issues of access, skills and leadership.

COVID-19 Pandemic and Transgender Women in India: Socio-Economic Vulnerability and Vaccine Hesitancy

In India, transgender women often referred to as *hijra* or *kinnar* remain marginalized and encounter interpersonal and structural barriers that subject them to social exclusion, discrimination, lack of education facilities, medical facilities and job opportunities. During the Covid-19 pandemic livelihoods of transgender women disrupted and they struggle to cope financially and physically. The present study aims to explore the socio-economic vulnerability faced by transgender women during the pandemic and explore the factors behind vaccine hesitancy among them in India. Using snowball sampling technique, 43 transgender women were interviewed during the months of June-August, 2021. Results indicate that the pandemic has adversely impacted their livelihood as most of them depend on prostitution and begging. In order to fulfil their daily needs during the lockdown, they borrow loans from multiple sources with a higher interest and remain in debt. On vaccination status, only 7 transgender women have taken one vaccine dose and rest are not willing to visit vaccine centre because of societal stigma and discrimination including from healthcare personals. The study reported that the transgender women suffered intensified social stigma, verbal hostility and transphobia attitudes of healthcare professionals and it caused panic, fear, anxiety and depression among them and thus they evade these spaces for further consultation or to obtain any other services. Many transgender women have decided not to take Covid-19 vaccine in order to stay away from hostility. Further, the lack of trust on medical professionals is also one of the principal concerns for vaccine hesitancy among transgender women, thus a systemic inclusive healthcare services policy is required to address the factors that may influence the vaccine acceptance among transgender women in India. Our findings illuminate unique information for policymakers providing vital information on vaccine hesitancy related to transgender population.

Integrated into Working Life, but Stressed. Effects of Subsidized Employment for Long-Term Unemployed Men and Women Under Consideration of Unpaid Work at Home

Social policies aim to promote the well-being and social integration of long-term unemployed individuals by active labour market programmes, such as subsidized employment. In this study, we investigate whether the mental well-being of long-term unemployed men and women benefits from subsidized employment and whether gender differences stem from workloads of paid and unpaid work. It is generally assumed that participants benefit from the monetary and latent functions of, here, subsidized employment. However, it has hardly been considered so far that the conditions in the household may

also be relevant for successful participation in programmes. Participants have to coordinate employment with unpaid work at home. In Germany, the country of our study, women, mothers in particular, still predominantly do the major part of unpaid work at home. Women in subsidized employment may thus face greater time burdens than men do and potential conflicts between working life and private life. We hypothesise that, in sum, women benefit less from subsidized employment than men do. We test the assumption with data from a German survey conducted in 2020 among about 5,000 participants in subsidised employment and a matched comparison group of long-term unemployed people who did not participate in the programme. We identify programme effects for men and women on mental well-being, using indicators for self-reported mental health and energy, applying propensity score matching. In addition, we use mediation analysis to show whether programme effects can be explained by the workload of paid and unpaid work. Preliminary findings indicate that both men and women benefit from subsidized employment, but the positive effect is reduced if the participants continue to do many hours of unpaid work at home. Although the effects are similar for men and women, high hours of unpaid work structurally affect more women than men.

Heuristics for Identifying Echo Chambers in Political Discussions on Twitter

Echo chambers are understood to involve the fragmentation of online populations into narrowly-focused groups, which actively reject dissenting opinions. However, there is no academic consensus on the existence or impact of echo chambers. Some researchers point to strong evidence of political homophily (actors who share a political affiliation are more likely to be connected online) as supporting the existence of echo chambers; others contend that findings suggesting average web users are exposed to cross-cutting information is evidence that echo chambers do not exist.

We present new research aiming to determine whether echo chambers have unique socio-technical characteristics. . We use a large-scale collection of tweets authored during the first 2020 US presidential debate, which we represent as a discussion network where nodes are Twitter users and edges represent reply tweets. We then test heuristics for echo chamber identification. Modularity clustering first serves to identify subnetworks with relatively stable composition throughout the debate, and where the majority of Twitter users share a common political orientation (we regard the existence of a durable and partisan cluster as a necessary but not sufficient condition for the existence of an echo chamber). We then test additional echo chamber indicators using computational and qualitative approaches: (1) presence of hate speech, othering, or mocking of alternative viewpoints; (2) lack of engagement with external or 'authoritative' sources of information, e.g. Wikipedia; (3) usage of conspiracy-related hashtags and keywords; (4) semantic network analysis to assess how debate themes affected the dynamic 'issue space' associated with the partisan cluster (we expect that in echo chambers conflicting viewpoints have no impact). Empirically demonstrating whether echo chambers exist can help to raise awareness about the openness of people's information environments.

Burden of Legal Access: Extrajudicial Grievance Redressal By Victims of Sexual Harassment in Indian Legal Profession

In my recently submitted doctoral thesis, based on interviews with first generation Delhi-based lawyers, I highlight that sexual harassment within the Indian legal profession arises from intrinsic sexism within the legal community. Lawyer-victims of sexism and sexual harassment despite being a part of the legal community choose alternate dispute resolution methods. Despite a functional knowledge of laws for protection of women from sexual harassment at workplace, lawyer-victims either start individual practice, change seniors, or opt out of the legal profession entirely. In a few cases wherein the lawyer-victims did raise the issue, they retracted their complaint to secure their careers because the accused was either a Supreme Court judge, a senior Supreme Court lawyer, or an ex-Chief Justice of India. All extrajudicial committees formed in these three instances where the cases of sexual harassment of interns by senior lawyers and judges became public, the appointed office bearers recused themselves from partaking in the proceedings.

It is an important discussion because it raises questions around the inaccessibility of law by legal practitioners themselves. This discussion also focuses on the burden of legal access while highlighting the experiences of lawyer-victims with complaint bodies within the Indian legal system and how it failed them over the years resulting in capable and educated women-lawyers leaving the profession.

Despite feminist resistances and regulated reformative action especially in the past four decades, the post colonial Indian Legal system has still not alienated itself from blaming the victim in cases of rape and sexual harassment.

To analyze the gravity of denial of justice to practitioners of law in cases of sexual harassment at workplace, I adopt Goffman's dramaturgical approach. I argue that the members of the Indian legal system assume a courtroom (on-stage) identity while acting on patriarchal (off-stage) behavior that is sanctioned by the society.

From Sexism to Sexual Harassment in the Indian Legal Profession: A Rocky Road to Women Empowerment

Formulation, interpretation and implementation of law in India in the 21st century have still not delineated from the patriarchal and positivist structure of the colonial Indian Legal System. In my recently submitted PhD thesis I argue that law making institutions such as courts, law implementation agencies such as the police and the legal interpreters of law such as lawyers carry social baggage to workplace that not only affects but heavily alters the social and legal realities of victims of rape and sexual harassment in India. My empirical work with first generation Delhi-based lawyers on their perspective on the crime of rape reflects that everyday sexism within the Indian legal profession is the root-cause of women leaving the profession. If we link this to women empowerment, how do we place higher vocational education in relation with the intrinsic sexism in the Indian legal profession? Is sexism a limitation to women's empowerment? To further complicate this argument, I ask, how does sexism within the Indian legal profession reflect on the authority of law itself to empower women in the country? I bring the experiences of sexism and sexual harassment of legal professionals in Delhi to the forefront to highlight how it pushes women out of the profession and into their gendered roles in the society. I bring to light the lived realities of educated women in one of India's most sought-after professions to showcase the irony between sanctions of law and actions of its agents. I draw attention to the contradicting role of legal awareness among female legal professionals in cases of their own sexual harassment at workplace. By doing so, I argue that sexual violence against women, physical as well as symbolic, is one of the most potent causes of failure of the law and the state in empowering its women.

At Risk of Poverty and Social Exclusion in Europe: A Study on Genders and Cohorts after Retirement

During the last decade public resources and attention have been directed to poverty amongst the working age population after spikes in rates of unemployment hit Europe after 2008 (Ebbinghaus, 2021), while pensioners have been relatively insulated from the crisis thanks to the social security systems in place. However, the latest EU Pension Adequacy Report shows that the progress made in protecting retirees has not been uniform across the EU and significant differences between and within societies remain, particularly concerning are the gender gaps and differences amongst age groups (Pension Adequacy Report, 2021).

This study addresses the question of how widespread poverty and social exclusion are amongst retirees in different European countries and explains the gender and cohort gaps in financial wellbeing using evidence on countries' pension systems, such as sustainability ratios, generosity of welfare provisions, efficiency of pension expenditures. It uses the EU Statistics on Income and Living Conditions (EU-SILC) and OECD data between 2014 and 2019. The study provides evidence of increasing at risk of poverty and social exclusion levels especially amongst women, particularly over 75. This trend is more evident in countries with no or little redistributive component in their pension systems, very low and flat state pensions, and where private / occupational schemes are more important components of retirement income. These features, involving retrenchment from welfare states, but often promoted as individual empowerment and new freedoms in planning own retirement, typically penalize women with more traditional career patterns of interrupted work histories, spells of unemployment or part-time work leading to lower and fewer pension contributions. There is also strong evidence that in many countries retirement income significantly declines for older cohorts (75+), where women are often over-represented, with higher levels of poverty and social exclusion at the time when the costs of care tend to increase.

Between Sexual and Migration Politics: Queer Migrants from Serbia and Bosnia-Hercegovina Living in Austria

LGBTIQA+ migrants from Serbia and Bosnia-Hercegovina in Austria are situated in the in-between of sexual and migration politics concerning the Serbian, Bosnia-Hercegovina, and Austrian government as well as supranational politics. On the one side, LGBTIQA+ regulations are not sufficient for the countries in question to be considered fit for EU accession. On the other

side, there are enough laws to protect queer people that asylum seekers from the Balkans are considered liars if they apply for asylum in the EU because of prosecution based on their sexual orientation or gender identity.

For the countries of the former Yugoslavia to be part of the European Union, they need to provide proof that they are part of the tolerant West (Parzić 2012). The proof is based on symbolic practices of LGBTIQA+ politics rather than concrete changes for the lives of LGBTIQA+ people. The reason lies in the migration politics of the European Union; especially concerning asylum. Countries are put in categories between safe and unsafe countries of origins based on laws, which are not necessarily practiced (Hunt 2014).

Queer migrants seeking asylum seem to not have adequate reasons for asylum, as the Balkan is included in the image of Europe and therefore partly West. Consequently, the sexual and migration politics affect the lives of queer migrants from Bosnia-Hercegovina and Serbia in Austria through the inclusion and exclusion in different spaces. Throughout the impossibility to fit only one category of identity, queer migrants create their own space.

This paper will be based on the research from my master thesis, in which 16 interviews with queer activists from Serbia, Bosnia-Hercegovina and Austria as well as queer migrants and refugees living in Austria were conducted. It will include the new developments of sexual politics in Serbia due to the EuroPride parade.

Scientific Labor and the Category of Subsumption

The Marxian category of subsumption describes the act of redirecting a hitherto non-capitalist labor process towards the production of market commodities. Subsumption comes to demand not simply the appropriation of the products of a labor process but the total re-organization of that labor process to square it with standardized temporal sensibilities and ongoing technological restructuring. This paper considers changes to the status and organization of scientific labor in contemporary Anglophone universities and research centers through the lens of "subsumption," drawing out the proletarianizing subsumption of petty industrial artisan labor in the first half of the 19th as an analog. How can this model/analog help us think about tendencies and shifts in the institutional organization, technological undergirding, and everyday temporal patterns and disciplining of scientific labor and what novel modes of agency might emerge out of these tendencies and shifts? The paper thinks through these questions, taking the postwar professionalization and contemporary automation and datafication of scientific activity as moments in a wider arc of scientific labor subsumption, before drawing out insights from the author's work within and research into contemporary labor organizing in the sciences to gesture towards possibilities opened up from below in the context of contemporary trends.

Institutional Processes and Colonising Practices: Indigenous Nurse Practitioner Workforce Development

Institutional ethnography (IE) lends itself to exploring tensions and disjunctures arising in our social worlds, providing the opportunity to explicate how institutional processes are organising our everyday actions. This explication raises into consciousness how authorised and, in our reflection, colonial knowledge practices are perpetuating injustices by devaluing and marginalising Māori (the Indigenous people or tāngata whenua). We enter this ethnographical reflection grounded in the ontology of IE as New Zealand embarks on a(nother) era of health reforms under Te Pae Ora (Healthy Futures) Act (2022). As co-leaders (one Māori, one Tauiwi/ non-Māori) and a Māori academic, of a national workforce programme to increase Māori nurse practitioners (NPs) working in communities, we explore our deep unease as to how the reforms, with their intent to promote equity, are being enacted. Our work is textually organised by Te Tiriti o Waitangi, New Zealand's founding document, which should guide all public sector work. Te Tiriti principles require tino rangatiratanga (Māori self-determination); equity; active protection of Te Ao Māori (Māori worldview); options for kaupapa Māori health services (for Māori by Māori); and partnership where Māori co-design systems, processes, and models of care using Mātauranga Māori (Māori knowledge).

In this session, we explore our experiences as we are caught up in (and endeavour to resist) how the institutional practices are seeking to organise our actions; how our knowledge and experience is marginalised and devalued; and how ruling institutional relations are perpetuating colonising and racist practices. We reflect on how IE offers a lens to not only explicate the disjunctures we experience, but offers a pragmatic approach to challenging the institutional processes being adopted at a national level. We too reflect upon the existence of favoritism within the health sector and how this is being used to perpetuate the status quo and retain organisational power.

The Role of Politics in Professional Regulatory Change: Three Case Studies from Canada

Accounts of professions' relationships with the state date back to the very foundation of the discipline of sociology (Spencer 1896, Durkheim 1992), and recently there has been increased scholarship in this area, especially in the West. This theoretically-informed research has explored how social trends – from governmentality through neo-liberalism to the crisis of expertise – have led to a redefinition of state-profession relations in many Western nations in the last few decades (Johnson 1995, Saks 2015, Chamberlain 2013; Eyal 2019). Resulting changes to professional autonomy, authority, and status, and a redrawing of professional regulation, have been documented. With some exceptions, this literature has paid scant attention to the role of politics in shaping profession-state relations and regulatory change. Nonetheless, political agendas, alliances and compromises can be decisive in shaping profession-state relations and regulatory change. This paper presents three case studies of recent regulatory change in three Canadian provinces: British Columbia, Alberta and Ontario. These case studies highlight the significance of political alliances, political agendas, state-profession conflict, and efforts to win over voters and appear responsive to consumer concerns, in prompting and shaping the content of new legislation altering professional regulation. The significance of the findings for theorizing state-profession relations and regulatory change is explored.

Of the Same World? Methodological Challenges When Integrating Survey, Epidemiological and Social Media Data.

In the present study we integrate different types of survey data (GESIS, SOEP, MCS) with Covid-19 infection activity data from the European Center for Disease Control (ECDC) and Tweets with content related to pandemic dynamics. Using different survey data allows us to control for the time period of data collection, obtaining a potentially time variant measure of attitudes (in this case towards face mask wearing). Further, we apply Sentiment Analysis using SentiStrength to Tweets matching a relevant search term, e.g. „masks". *In this set up, we can investigate the relationship between infection activity, its reflection in social media and the attitudes towards specific pandemic measures in a longitudinal matter*. Challenges in this project appear on different levels: operationalization of variables from different surveys (i.e. dimensionality) and following harmonization, definition of the time frame (single or aggregated time points), sample composition of tweets (location, weighting) and suitability of data fusion (does the data come from a shared environment/ from the same „world"?). In varying configurations of these factors, we investigate their impact on model effect sizes and data fit.

When to Labour Movements Support Universal Demands? an Organizational Perspective

When do labor movements come to support universal welfare policies? The proposed article examines this question through a comparative account of the British and American labor movements at the turn of the 20th century. Drawing on newspaper and meeting records from the Cigarmaker's International Union (CMIU) and the Amalgamated Society of Engineers (ASE) between 1876 and 1913, it considers why, given a common tradition of exclusive craft benefits, the two movements diverged on the question of universal state health and pension schemes by World War One—with the British labor movement abandoning its voluntarist orientation and the AFL preserving its.

Diverging from existing theories of trade union strategies, which tend to emphasize state and party structure, sectoral composition, pace and quality of industrial change, and the demographic makeup of labor movements, this article builds on the approach of social historians like EP Thompson and Charles Tilly in centering the importance of social networks and community ties in shaping trade union policies and aims. In particular, it investigates the role of friendly and fraternal societies in structuring trade union interests over this period. Consequently, the paper stresses the importance of organizational ties in shaping trade union orientations and strategies..

Antinomies of Segregated Social Policy: What Lessons for a Post-Covid-19 Architecture in Africa?

As of 05 March 2022, the reported SARS-Cov-2 infection in Africa stood at 11.549 million cases, and reported deaths stood at 252 312. Apart from South Africa (at 3.7 million), Morocco (1.16 million) and Tunisia (0.999 million), the morbidity and fatality rates have been considerably lower than initially predicted. Yet the socio-economic impact of the public health mitigation measures has been significant, especially among atypical workers and those in the informal sector. This paper explores the social policy responses to the pandemic in the context of three decades of merchandising for 'stratified, segmented, and segregated social policy.' Segregated social assistance instruments (especially transfers in cash) are part of the 3rd Wave Neoliberalism efforts at addressing vulnerability. The pandemic offers an opportunity to examine the robustness of such instruments.

Drawing on the experiences of Nigeria and Togo, and South Africa, we explore the crisis of inequality and poverty that the pandemic exposed and the robustness of the social assistance in place to respond to the vulnerability induced by the pandemic. We explore the responses in terms of 'fitness for purpose', adequacy, and quality. Against the background of the lessons from the social policy responses to the pandemic, we explore the options for a post-pandemic social policy architecture in terms of coverage, adequacy, comprehensiveness, quality, and responsiveness.

ADEYANJU, Charles* (University of Prince Edward Island, Canada)

COVID-19 and Nigerian Migration to Canada for Higher Education

This paper uses the qualitative research methods approach to examine the motivation for Nigerian migration for undergraduate education in Canada, with a focus on parent-sponsored undergraduate Nigerian students in Canadian universities. From the perspectives of parents and their children studying in Canada, recruitment agents, high school teachers in Nigeria, and an international student advisor in Canada, the study shows that migration for higher education is important to international students who use the student visa as a steppingstone to obtain Canadian permanent residence. The study finds that international education is attracted by the Canadian government not only because higher tuition paid by international students augments the declining public funding of post-secondary institutions in Canada but also because of its contribution to Canada's population growth and work force. Therefore, the ease of transition from international students to Canadian permanent residents is not fortuitous. Travel restrictions to Canada during COVID-19 in 2020 disrupted the flow of international students and other immigrants. However, Canada's subsequent COVID-19 response was in favor of international students because of their importance to the labour market and their non-reliance on public support. The paper concludes that migration of Nigerians to Canada for higher education will continue unabated due to the high demand for skilled and educated immigrants in Canada and the poor management of the public education system in Nigeria.

ADHAMI-DORRANI, Ladan* (York University, Canada)

The Ingrained Emotional Alienation in Amor Mundi

The brilliant and ever relevant Hannah Arendt, whose intellectual activities made her one of the most outspoken anti-authoritarian and anti-totalitarian figures of the 20th century, in The Human Condition speaks about world alienation. Arendt's texts shed light onto the covert and overt violence of modernity proliferated by modern nation states call for political participation in order to create a strong political bulwark against authoritarian and totalitarian ideas, movements and governments. Arendt's love of the world, or what she calls amor mundi, is derived from her political and ethical conviction that plurality is the law of existence. Although Arendt invites the inhabitants of the world to the love of the world, she considers emotions not only as parts of the heart (the private realm); but also, believes that, 'there is no continuity or certainty in man's ever-changing moods and the radical subjectivism of his emotional life.' While appreciating Arendt's significant contribution to the world and well beyond, there is an ingrained emotional alienation in Arendt's amor mundi. Through a post-modern, interpretive and critical approach, this paper relies on various texts including Hannah Arendt's On Revolution, Patrick Hayden's Hannah Arendt Key Concepts, Rosalyn Diprose's "Arendt on Responsibility, Sensibility and Democratic Pluralism", Dan Degerman's "Within the Heart's Darkness: The Role of Emotion in Arendt's Political Thought", and Catharine Lutz's Unnatural Emotions: Everyday Sentiments on a Micronesian Atoll and Their Challenge to Western Theory, to point out that Arendt is opposed to the entrance of emotions in the public realm with inevitable negative effects on amor mundi, or the love of the world.

Divorce-As-Care: Bhutanese Refugee Women and Their Migration Strategies

With families and relatives spread from America to Australia, the Bhutanese refugees who were once caged in refugee camps in Nepal are emerging as an important transnational Asian community. Based on my ethnographic research in Nepali refugee camps as well as cities in the United States, I explore how migration is affectively strategized by Bhutanese refugee women married to Nepali men. Marriage, as per the Nepali Constitution, allows non-Nepali women to become Nepali citizens, a condition that automatically disqualifies Bhutanese refugee women for the UN-facilitated resettlement in the global North.

In order to remain qualified for migration, Bhutanese refugee women have come up with a novel strategy of legally divorcing their Nepali husbands and keeping their refugee status intact. The women hope to migrate with their children, save money, become residents, return to Nepal to re-marry their former husbands, and sponsor their migration. Legally divorced, but socially together, I illustrate how aspiring migrant couples affectively straddle a relationship, both transient and permanent at once, with the goal of materializing their migration. I argue that divorce, not marriage becomes a fundamental strategy of care to navigate intricacies of migration and offers us new ways of understanding family intimacy, agency, and bureaucracy.

ADIL, Yashfeen* (Jadavpur University, India)

Covid-19 and Entrepreneurship: A Study of the Muslim Women in Kolkata, India

Traditionally, entrepreneurship has been dominated by men. The processes that create (and change) gender are inextricably linked with those that create (and change) entrepreneurship; gender inequalities are both the reason for and the result of the processes that are entailed in launching and sustaining a business. Likewise, entrepreneurship processes are both the cause and consequence of gender hierarchies (Hanson, 2009). Consequently, the number of women entrepreneurs has remained miniscule. Women make up for only 13.7 per cent of entrepreneurs in India (Jain, 2021). These businesses essentially remain small in terms of investments, number of employees, sales rates and profits. Even after having bended the gender norms simply by entering these male specific spaces, these women remain victims of gender bias, especially those at the margins of the society. In the context of India, it is the Muslim women who constitute the periphery of society. Hasan and Menon (2004) explain the disadvantaged and subordinate position of Indian Muslim women in terms of their experience and constitution of class, gender and community. With the outbreak of the Covid-19 and the impositions of the lockdown, businesses of the countries around the world have suffered a setback and it has presented them with multifarious challenges. It has naturally deepened the cleavages that exist between the women of different communities. Thus, the marginality of the Muslim women has increased further. The aim of this paper is to assess the impact of Covid-19 on the Muslim women entrepreneurs in Kolkata, India. It seeks to unearth the causes of the marginality of Muslim women when it comes to entrepreneurship, the challenges that Muslim women entrepreneurs face generally, the ways in which they have been affected by Covid-19 and the way in which they have negotiated the pandemic in order to sustain themselves.

ADIL, Yashfeen* (Jadavpur University, India)

Veiled Muslim Women and Agency: A Study of the Swadhinta Andolan 2.0 in Kolkata, India

This paper aims to highlight the agency of the Muslim women by focusing on their role in the Swadhinta Andolan 2.0 or the Park Circus Protests, Kolkata. It tries to determine how the veiled Muslim women were challenging the Indian democratic state, patriarchy and Islamophobia in these protests that were led and steered by them. The Muslim women lie at the intersection of gender and religion. The Muslim women's socio-economic and political marginalization is only seen through the lens of ignorance, traditional beliefs and inequities in the personal law (Saeed, 2005). It is not uncommon to think of Muslim women as 'voiceless', as tied and suffocated by their religion that is both inherently patriarchal and sexist. The protests against CAA and NRC are an important turning point for the Muslim women because it was for the first time that they were leading from the front while confronting stereotypes around their identity. The fear psychosis that grips the Indian Muslims (Shukla, 1996) was exacerbated by the passing of the Citizenship Amendment Act in 2019 and because of its possible linkage with the NRC (National Register of Citizens). The CAA and NRC were directed to strip the Muslim community of their citizenship. The unleashing of violence by the security forces in Muslim minority educational institutions bolstered the apprehension of the community. It is at this point that history was created as Muslim women took to the streets for not only protecting the rights of Muslims but also to protect the democratic values enshrined in the constitution. This paper hopes to gain an understanding of

denotes a presenting author. Abstracts are organized by first presenting author's last name.

the vulnerability of the Muslims and how the Muslim women in the course of the Swadhinta Andolan 2.0 blurred the private and public divide while melding their religious and national identity to challenge the State and stereotypes.

ADKINS, Lisa* (The University of Sydney, Australia)

Inequalities in the Asset Economy: Some Questions for Sociology

In the context of stagnant wages and decades of house price growth across Anglo-capitalist countries, homeownership and the wealth it generates has become a key axis of inequality and with it, wealth-based inequalities a signature of the neoliberal era. Continued house price growth, rising costs of living, income volatility and employment precarity have, for example, not only seen increases in the wealth portfolios of home owning households but also the emergence of significant sections of populations 'locked-out' of home ownership and the wealth accumulation opportunities it affords. Our present inflationary environment alongside interest rate increases on the part of central banks has led some commentators, however, to posit that the era of housing based wealth inequalities may be dissipating. Drawing on recently completed AHURI funded research focusing on young people's pathways to homeownership I show just how embedded and durable asset-driven lives have become, that is, lives that are arranged not around the dynamics of wage earning but the dynamics of asset ownership, including its exclusions. I point in other words to how the asset economy has transformed social worlds. In this context I ask: what challenges do lives lived and organized through the dynamics of asset economy raise for the discipline of sociology?

KONINGS, Martijn* (The University of Sydney, Australia)

The Asset-Owners' Welfare State

An increasingly dominant position in sociological debates argues that the welfare state has not been entrenched or rolled back but has instead been reconfigured in complex ways. However, the concern to document how much of the postwar welfare state has remained *intact* has tended to dominate the interest in trying to understand how welfare state institutions have been *transformed*. In this paper, we argue that the trajectory of the welfare state is best comprehended as a transition from one kind of welfare state to another – specifically, from a wage-earners' welfare state to an asset-owners' welfare state. Whereas the former worked to improve the prospect and conditions of wage earners, the latter subsidizes the ownership of assets, in particular residential property. We examine this transition empirically with reference to the case of Australia, which we take to be a paradigmatic case. More explicitly than elsewhere, the postwar Australian welfare state was organized around wage policy and opening up access to property to wage earners. The widespread property ownership that resulted laid the foundation for a new middle-class politics, one that shifted public support from wages to asset ownership. We develop this argument empirically in three stages. First, we chart the relative rise of public subsidies for asset owners compared with other forms of social protection. Second, we outline the political making of this shift, showing how successive governments have locked into pro-asset owner policies. Third, we explain the political survival of this situation by analysing how several decades of asset owner subsidies have created electoral constituencies for such polices. We conclude by reflecting on the need to come to terms with the institutional structures of the asset-owners' welfare state if we are to navigate, practically and conceptually, the challenges of the present moment.

Pres-3.4

ADOGAME, Afe* (Princeton Theological Seminary, USA)

The global politicization and religionization of COVID-19 pandemic – the future of the past or the past of the future?

Historically, global pandemic outbreaks have decimated societies, revealing socioeconomic disparities, racial injustices, and health inequities, but also, paradoxically, clearing the way for innovation and creativity in science, economy, political systems, and religion. While pandemic crises have been closely examined through the lens of social science, and medicine, perhaps not much attention is given to ways pandemics affect the individual and group sociology of the everyday life. Thus, the COVID-19 pandemic has rudely woken up the world from slumber on the things that we often take for granted. What would the 'real' world look like post COVID-19? What lessons for a just, humane, and more resilient global cosmos? How do we interrogate the intersectionality of science, belief, and COVID-19? The nexus between religion, science, and pandemics such as COVID-19 plays out in myriad ways. For instance, science challenges the legitimacy and potency of religion in offering protection, healing, security, and hope, while religion in turn confronts the efficacy and authority of science as panacea. Pandemics and religion are historically linked, and such connections have repercussions in all its waves, phases, and variants. Religion embodies archives of memories of pandemics, and pandemics were often framed in a religious idiom in historical perspectives. How does culture and society's collective memory affect the responses to pandemics and identify important lessons for decision-making as we hopefully adapt to a new normal? Amidst the promises and illusions of healing and hope, how can governments, policy makers, religious entrepreneurs and the civil society discern the COVID-19 crisis as an opportunity to learn from the policy missteps of the past and better prepare for the future? How have the COVID-19 pandemic and its afterlife necessitated new methodological toolkits, challenges, and ethical practices that sociology of religion and fieldwork ethnography must think with while envisioning a Just Post-COVID-19 World?

ADOLF, Marian* (University of Applied Sciences Vienna, Austria)

Strategies Against Epistemological Disorder: Updating Insights into the Connection of Communication, Knowledge, and Identity

In the face of the current disinformation crisis, the resurgence of propaganda and rising domestic and geopolitical polarization, we are puzzled by the forces and mechanisms at play behind the erosion of what we thought to be a firm social order. Instead, we see our shared social reality crumbling all around us: conspiracy theories abound, there is a growing sense of suspicion of others, and many people are increasingly alienated from traditional social institutions. Knowledge is disputed, facts are denied, and a rational course of action can no longer be assumed. Many of us feel as if the rug of a joint reality has been pulled from underneath our feet.

Various phenomena have been identified as the culprit, such as digital media, malevolent political actors, or the spiritual void of contemporary modernity. While there are many factors at play, my contribution looks at the nature of human knowledge as the main juncture where all these processes intermingle. Based on a monograph project, I revisit and update anthropological, social-theoretical, and epistemological approaches to the creation of a shared reality through communication and social organization and situate them within the digital setting of contemporary society. Knowledge emerges as a fundamentally social phenomenon which is particularly tied to an individual's identity: We are, what we believe we know, and we know based on who we believe to be.

This socio-epistemological insight lies at the heart of who we are as people, of what we stand and strive for. The possibility of a return to meaningful discourse, of getting through to one another, thus rests on a deeper understanding of the way, communication, knowledge, and identity are interwoven. In other words: To devise strategies to start rebuilding a shared social reality, we need to gain a better understanding of the social nature of knowledge.

Exploring the Barriers, Enablers and Strategies for Political Action Among Youth Activists in Rural Sweden

My paper speaks to the following themes posed in the session abstract: how democracy is experienced, learnt and re-imagined in and through young people's participation; contextual and intersectional barriers and enablers to democratic participation by young people; global North.

Young people's political actions are shaped by barriers related to adult-defined, narrow understandings of politics, and power hierarchies embedded in social categories. However, the types of barriers and how these are experienced and handled vary depending on the everyday social contexts, including the household, at school or in peer-centered contexts. However, previous research has not explored how such social contexts are shaped by place, and is limited to research on urban areas. Therefore, this paper extends the current knowledge by exploring rural youths' own experiences and strategies of doing politics embedded in *local political infrastructures*, that is the concrete spaces where young people do politics together with others.

I present the results of a qualitative study with participatory focus group discussions (FGD) that were collected in 2022 in three different rural locations in Sweden. The participants consisted of 18 youth activists (aged 15-25), who lived or recently lived in rural areas in Sweden. The content of the participatory FGDs was designed to further explore findings from an interview study with youth activists in rural Sweden, focusing on the barriers and enablers they faced, and the strategies they used. The empirical material was then analyzed using constructivist grounded theory.

The results of this study contribute to a deeper understanding of youth politics including their strategies, and how it is shaped by the enablers and barriers embedded in place. In addition, the study contributes with knowledge from a group that is often marginalized in studies of youth politics, i.e. young people living in rural areas.

New Facts and New Meanings of Violence in Contemporary Brazilian Society: Hatred, Cruelty, Intolerance, Radicalism

Since the early 2010s, contemporary Brazilian society has been experiencing a conservative social and political wave whose outcome is the arrival of the

extreme right to power under President Bolsonaro (2018-2022). This trend was accompanied by expressions of rejection of democratic institutions and of the principles that govern the culture of human rights. These are manifestations that appeal to hatred, cruelty, intolerance and radicalism of all kinds, suggesting recent changes in the facts and meanings of violence, including political violence, compared to the socially constructed scenario in the period of transition from the civil-military dictatorship to the democratic rule of law from 1988 to 2013. The presentation addresses the social bases of these mutations, focusing on: (a) the facts and social representations that constitute symptoms of these ongoing changes; (b) the groups and social classes that drive the cultivation of hatred and the appeal to violence in search of a new authoritarian legitimacy; (c) the consequent weakening of relations between rulers and ruled, which pose dangers to the survival of democracy in this society. Theoretically, the paper explores the polysemic nature of the concept of violence and its connections with social and political conservatism. The analysis is based on longitudinal surveys, interviews with residents of the city of São Paulo (Brazil), statistics on socio-demographic composition and dynamics, as well as documentary sources, such as clipping news.

ADORNO, Sergio* (Apartamento 32, Brazil)

Organized Crime, Public Opinion Makers and Police Organizations in Contemporary Brazil

This presentation is part of a broader survey whose main objective was to monitor the chain and flow of operations that move the international illicit drug trade from production operations in the Andean countries to distribution operations for the Brazilian consumer market. It focuses on international drug trafficking, especially cocaine in the countries that make up the so-called triple border (Argentina, Brazil and Paraguay), in the past two decades (2000-2019) as reported in the national, regional and local press. Although this documentary source reveals problems, as pointed out by the specialized literature, it allows a holistic approach to aspects of the flow of operations, such as borders and trafficking routes; police operations; migratory flows and mobility across national borders. At the same time, it allows to know the network of relationships including: coca leaf producers, cocaine producers, wholesalers, retailers, transporters (drug mules, vehicle drivers, aircraft pilots, boat pilots); police and judicial officers; businessmen, professional politicians. The focus provided by the newspapers clippings reveals the connections between public opinion makers and police sources.

Educational Inequalities in Argentina: Mechanisms, Dynamics and Evidence

The goal of giving all young people the same educational opportunities is often thwarted by multiple factors. In this work we will analyze the different mechanisms that interact and that produce as a result an unequal configuration of access to quality education for children. In order to shed light on the discussion, we attempt to contribute to a better understanding of inequalities in education from an intersectional lens. To this end, we propose developing a theoretical framework that groups these factors into three main categories: the family environment, the allocation process between children and schools, and the characteristics of the educational system. We propose to analyze the factors that make up each of these domains, identifying the main mechanisms and reviewing international and local evidence.

Family characteristics impact on educational outcomes of children both directly, as well as indirectly, through school choice. This impact can be explored analyzing family characteristics in terms of its economic, cultural, and social channels. Factors such as education of the parents themselves and the investments they make during early childhood turn out to be crucial. Inequalities develop well before entering school, but unfortunately are not ameliorated much within the school system. Children from high socioeconomic status (SES) families tend to get matched with similar children in better schools than those attended by children from lower SES. The differences in "school quality" also matter in the configuration of a more unequal education. They can be approximated by looking into the physical and human resources school have (including characteristics of the teachers, size of classes, and pedagogical resources available), the student body composition (through peer effects), and by educational outcomes, when they can be measured.

The Value and Distributive Effect of Public Education Expenditure in Argentina

The public provision of education is a policy implemented by governments to equalize opportunities for children and youth and contribute to greater equity. The objective of this work is to value and to quantify the redistributive effect of the public provision of education in Argentina, using three different methods. Each method values education from a different source: the first one considers the cost of provision, the second one, the salary bonus the labor market assigns to each educational level, as well as the higher probability of having a job, and the last one, the amount paid for a similar education in the private education market. After estimating the value, we analyze how the distribution of household income is modified by adding the value of the education that children and young people receive in the public sphere. These education values calculated using the three methods are assigned to each student who attends a public school associated with its educational level and jurisdiction. Then, the change in inequality is studied through the Gini coefficient and Concentration index. It is observed that public education is equalizing, the Gini coefficient falls for the whole country from 0.42 to 0.375; this result is maintained with the three methods used. The addition of the value of public education to the income of families with children and youths in public institutions results in a more progressive income distribution for the four educational levels, that is, less unequal than that without it. In turn, it is observed that the three fist educational levels also have a pro-poor effect, while the higher level has a progressive but not pro-poor effect. As a conclusion we can assure that this intervention promotes equity under the three approaches used.

Circulation and Reception Studies As a Way to Enact a Transnational History of Sociology

The importance of circulation as a phenomenon has been asserted over the past decades. There have since been ongoing efforts to conceptualize the circulation of academic knowledge and develop adequate methods to study it: circulation of concepts, circulation of theories, circulation of books, etc., scrutinized qualitatively or quantitatively. If one can approach its study from an internal or external perspective, circulation generally supposes an object's displacement over boundaries (spatial, disciplinary, temporal, hierarchical, institutional) (Keim 2014). My communication would refer to reception as a particular element of circulation, namely the sum of prints a circulating object leaves in a specific space.

Based on my doctoral dissertation, my communication would offer empirical elements to sustain the claim according to which circulation and reception studies constitute an innovative way to study the transnational history of social science. By studying the French reception of three worldwide known scholars — Raewyn Connell, Achille Mbembe and Walter D. Mignolo — and focusing on their individual trajectories — the starting point being their higher education — I compiled and analyzed the interactions they had with French academic fields and vice-versa.

A. Mbembe and W. Mignolo both studied in France and worked there for some time: during the late 1960s and during the 1980s, before moving to the United States of America. Their individual trajectories illuminate the shift that occurred in the global economy of knowledge during the second half of the 20th century: the fading away of France as an intellectual center and the growing North American hegemony. R. Connell's French reception highlights how the constitution of French masculinity studies relied on her works circulating and being received, and vice-versa. The communication would thus emphasize the extent to which the transnational production of knowledge has an effect on the structure of national academic fields.

Social Movements and Radical Democracy: Colombia and Turkey Compared

Similar to many other social movements since the turn of the 21st century, activists in Colombia and Turkey have, too, tried to implement radical democratic practices in their activism. Inspired by the language, narratives, and practices of non-hierarchical and decentralized horizontalism, assembly, forums, and other forms of non-capitalist prefigurative politics, they developed a vision for building a type of democracy that could catalyze equality, freedom, and solidarity. Yet, looking back, these efforts to achieve radical social transformation with an alternative vision of economic justice, political equality and social solidarity have largely failed.

By comparing the 2013 Gezi park protests in Turkey and the protests of 2021 in Colombia this paper aims to demonstrate the mismatch between the concept of radical democracy as currently formulated and the ways it is articulated by activists in non-European contexts. Put differently, we argue that although on the surface the two cases seem to be different due the specific contexts in which social activism takes place (resisting conservative religious authoritarianism in Turkey and post armed conflict recovery in Colombia), what unites them in their failure is the inherent contradictions in translating the concept of radical democracy (along with its conventional narratives, practices, and repertoires of action) into non-European contexts. We conclude that a more comprehensive, non-Eurocentric, decolonized articulation of radical democracy is urgently needed not only for highlighting the diversity of goals, methods and motivations of social movements around the world, but also for better comprehending the factors that preclude the emergence of a robust political movement and enduring political imagination.

The Golden Hour of Informal Workers' Organizational Experiments Under Neoliberalism: A Cross-Country Study

In contrast to earlier assumptions of informal workers' inability to organize, recent scholarship has shown that, despite challenges, informal workers have been experimenting with diverse organisational forms, intersectional identities, and the integration of workplace and social reproduction concerns. These organisational experiments are replete with failures and successes, but they offer exemplary innovations and represent a rare (and unexpected) bottom-up attempt to attain social justice under neoliberalism. Despite their significance, however, we know almost nothing about the conditions under which they arose. This paper analyses how national-level political conditions shaped informal garment workers' organizational experiments in three large, liberalizing countries of the Global South—Brazil, China, and India. These countries have had varying configurations and histories of political systems and civil society structures (including trade unions), enabling us to examine how these factors differentially shaped their informal garment workers' organizing innovations.

Drawing from fieldwork we conducted in 2012-13, we find that a decentralised political administration, a competitive multiparty system, a radical history of traditional trade union organizing, and a commitment to a rights-based political culture fostered the space for informal labor to undertake organizational experiments. Our findings suggest that changes in these conditions – namely the centralization of political power, repression of traditional unions, and retrenchment of democratic space - erode the space for labor's organizational experimentation. Indeed, such restructuring of the space for experimentation has taken place in our country cases within the context of the authoritarian turn under neoliberalism. The result has been a decline in informal workers' organizational experiments. This paper thus offers insight into what we call "the golden hour" of informal workers' organizational experiments, it underscores the potential threats to future innovations in social justice, and we hope it can catalyse a discussion on the merits and challenges of cross-national qualitative research on labor.

The Impact of Generalized Trust and Institutional Trust on Formal Volunteering and Charitable Giving in Turkey

Trust has been stressed in the literature as one of the dimensions of social capital. Generalized trust is one of the most focused variables affecting volunteering and giving. Even though most research on measuring trust is mainly on measuring generalized trust, in recent studies the effect of institutional trust on formal volunteering and charitable giving is also getting attention for more comprehensive understanding about trust dimension of social capital. Using the data set from the 2021 survey on Volunteering in Turkey, this study aims to explore the impact of generalized trust and institutional trust on volunteering and giving in Turkish society. Regression analysis will be conducted for how generalized trust and institutional trust associated with formal volunteering and charitable giving. The survey was conducted by a joint project of the Ministry of Youth and Sports and Istanbul University and is the first household survey about volunteering conducted in 26 cities in Turkey with 5028 people above age of 15. The survey data is expected to establish an insight in volunteering behavior and variables (i.e. trust, life-satisfaction, values, motivations) influencing it in Turkish society. With its national scope the data from the 2021 survey has the potential to be start of longitudinal national research program as well as providing comparative data with global research programs.

AGOAS, Frederico* (Interdisciplinary Centre of Social Sciences, NOVA University Lisbon (CICS.NOVA), Portugal)

Towards an Integrated Historical Sociology of Colonial and Metropolitan Social Research

Building on prior research on the development of agrarian social research in Portugal at the School of Agriculture, from the late 1930s, and on the introduction of the social sciences at the Colonial School in Lisbon and parallel colonial surveys, in the mid-1950s, this paper presents current research on the development of the first systematic Portuguese industrial social research from the 1930s on, next to a private Social Work School, also in Lisbon, and on the development of the first systematic colonial social research in the mid-1940s, next to a local-colonial research center, in so called Portuguese Guinea, to offer a short overview of the parallel (yet converging) pathways of Portuguese colonial and metropolitan social research and its relationship with the institutionalisation of sociology, in the 1960s. Taking into account Portugal's relative position on the world scene as a semi-peripheral imperial power for most of the 20th century, and the country's contemporary transition from a backward constitutional monarchy, progressive republic (1910), military dictatorship (1926) and fascist state (1933) to a modern liberal democracy (1974), this paper further suggests the potential paradigmatic reach of the Portuguese case. Far from being a standard story, it nevertheless allows one to explore not only several political, economic, and social contexts, but also the whole spectrum of social environments subject to social research – rural, industrial, and colonial –, and the whole set of actors involved – academic, private, state, and local-colonial. Hence, this paper shall also hopefully contribute to overcome the perceived double divide between disciplinary and governmental histories of social research and sociology, and central and peripheral histories of the same subjects, besides the somehow subsidiary divide between colonial and metropolitan narratives.

What's in an Image? the Public Life of the Digital Fetus

Based on the analysis of a corpus of pregnancy online texts, this paper examines the growing dissemination of fetal images on the web. The public life of fetal 3D images – followed through ethnographic observation on different social media - elicit questions about "surfacing the body interior," (Janelle Taylor, 2005). How has ultrasound imaging surfaced the fetal body into public view? This is not simply a matter of technology but of fetuses becoming public, socially and culturally. Fetal sonograms are representations that emerge out of particular material, and ways of working with bodily and other matter (Barad, 2007). Once we conceptualize the body as materializing in and through social practices, new perspectives open. It becomes possible to recognize bodies as having contours and boundaries that are not simply given by nature but accomplished through histories of collective human activity and power struggles. The concept of the *public fetus* (Duden, 1991) has been used by feminist scholars to describe the increasing use of obstetric ultrasound and the spreading of public images of fetuses. Declining critical multimodal discourse analysis in an STS perspective, the analysis of the collected web-ethnographic corpus explores the key concepts of body, gender, normality and disability as used in the process of entangling scientific knowledge and narratives of women's pregnancies on the web while performing the social representation of the fetus. The female bodies, conceived in the field of biomedical diagnostic as the site of pregnancy control, become the site for the social construction of the *digital fetus* due to the embedding of imaging technologies and communication practices on the Web. At the same time, the dis- embedding of the fetus from the mother's body becomes a performative result of sociotechnical dispositifs while it enforces the possibility of thinking of it as a commodity in a newborn bio-market.

RE-Conciliation and Teleworking: OPEN Dilemmas in Times of Pandemic

The pandemic situation experienced worldwide led to the approval of measures by different countries in order to face the fight against COVID-19. The Spanish State was one of the states that suffered the most from this impact and that led to decreeing the state of confinement of citizens through the approval of Royal Decree Law 8/2020. The old problem of reconciling work life with family life became urgently needed as the health crisis became resounding and the closure of educational centers took place. The passing of weeks without the possibility of supplying resources that usually assist families, as a consequence of the measures imposed by COVID-19, gave rise to the aggravation of the care crisis experienced by our society. This scenario encouraged us to start an investigation whose samples would be taken during the confinement period and which would have as its objective the observation of the impact and difficulties faced by women with family responsibilities who lived through this

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

stage, having to combine these care provision needs with your working day. We will show the results obtained in this research from the analysis of two collected samples, one qualitative and the other quantitative. Regarding the first, the field work carried out consists of 18 in-depth interviews with women. The design of the structural sample took into account various criteria and the group was made up of women who mainly teleworked. Regarding the second, the data of the quantitative analysis were extracted from the answers obtained from the survey "Uses of time during confinement". We focus our analysis on some of the qualitative and quantitative results obtained in this research. The aim of this paper is to identify some important difficulties women are facing while combining family responsibilities with workday duties in this confinement stage, particularly through the telework formula.

AGUEDA, Rodrigo* (State University of Rio de Janeiro, Brazil)

Beyond the Joá: Infrastructure Building Future(s) in Rio De Janeiro

The Joá Bridge, an infrastructural complex comprised of four tunnels and two-level bridges, extends for 1.25 kilometers between the neighborhoods of São Conrado and Barra da Tijuca. Built in 1971, it was the most expensive urban construction in the state at the time, with an unprecedented technical complexity and size. Hemmed in between an 844 meters high mountain and the vast Atlantic Ocean, that infrastructure connected not only the South Side of the city to its West Side, but also connected ideas of progress and modernity with imaginaries of nature, tranquility and nostalgia. Those contradictory connections shaped the recent urban expansion and inequality of Rio de Janeiro, as well as the promises of future that circulated alongside with the cars, people and infrastructures towards the hinterlands of Barra da Tijuca.

Through the construction of the Joá, we can investigate those various circulations, promises, and temporalities that help create the future of the city expansion. From an urban infrastructure perspective, historically analyzing the construction of the Joá infrastructural complex helps us understand the discourses and politics surrounding the under-construction neighborhood of Barra da Tijuca. The circulation of infrastructures, such as water, cement, electricity and telephone lines, that became possible due to the construction of the Joá, moved alongside the many promises and imaginaries that were essential for the expansion of the real-estate market. Among people and cars, contradictory ideas were put together to sell the newborn neighborhood and to reproduce urban inequality. Isolated from the city while connected to it, modern and of the future while nostalgic and bucolic, are some of the aspects that the sociotechnical compositions of the bridges and tunnels made possible. Through a historical research on newspaper articles, this paper investigates the intertwined constructions of the Joá, of Barra da Tijuca, and of promises of future.

AGUIRRE, Benigno* (Disaster Research Center US, USA)

CAN WE AGREE on Panic?

The intent of this presentation is to review social science studies of emergency evacuations to argue for the difficulties in understanding them as panic, and to point to the continued misunderstandings that occur in a number of computer and engineering science publications when panic is used to model them. The paper first presents five usages of panic in social science literature. It then shows how the conceptualization of one of these approaches on panic flight, assuming the prevalence of nonsocial and self-centered behaviors has been transformed by recent studies of emergency evacuations from buildings which show that the crisis evacuation is best understood as social behavior in which people exhibit means-end rationality and social solidarity, and as acts of socialized individuals moving towards sources of actual or perceived safety. The conclusion suggests first, that the continued usage of the irrationality formulation by a minority of engineers and computer scientists writing on the topic of emergency evacuation and their use of "herding," or the notion that during dangerous conditions people follow the actions of others, leading to conformity, is not supported by a majority of findings in the social sciences, and second, that a likely solution to the disconnect between the two science communities is to increase the adoption of transdisciplinary collaborative research designs.

AGUJA, Mario Joyo* (Mindanao State University-General Santos City, Philippines)

The Philippine Military during the Covid 19 Pandemic: Perspectives, Roles and Challenges

This paper investigates the role of the Armed Forces of the Philippines during the COVID-19 Pandemic. It aims to understand the role played by the military during the pandemic and the challenges it encountered, both in terms of resources and governance. It used interviews of key informants and primary and secondary data such as government reports and other published materials.

The "securitized" approach during the CoVID-19 pandemic by the Philippine government resulted in the full mobilization of the security sector. Policies related to setting up checkpoints, implementation of community lockdown, community curfew, and the establishment of operations centers made the security sector highly visible. It was an added responsibility for the armed forces on top of its dual mandate for external and internal security. While the armed forces have better mobilizable human resources and logistics than the rest of the government agencies to assist during the pandemic, the covid engagement adds a burden to its regular mandate for external and internal. The security threat posed by China in the West Philippine Sea and dealing with the continuing threats of insurgency by the Maoist rebels and other extremist groups is already a challenge to the ethos and efficiency of the armed services.

While the Philippine military can effectively support emergencies, its current focus on internal security adds a burden to its effort to focus on inter-state or external-territorial defense. This is the heart of the institutional problem of the Philippine military. It will continue to be so until such time that the Philippine National Police can level up to handle counter-insurgency operations.

RC31-JS-57.6

AGUSTIN, Retno* (CIRCLE Indonesia, Indonesia)

Gbv, Migration and Human Trafficking in Eastern Nusa Tenggara, Indonesia

GBV in NTT is a factor that increases the women vulnerability as well as a root cause of human trafficking. The study on GBV and Human Trafficking in 3 research locations in NTT found that: **first,** victims of sexual violence were at higher risk of being victim of human trafficking. They feel the burden of stigma and the social-economic burden they bear is too much. So that all ways to migrate to improve their fate even with the higher risk becoming victims of human trafficking will be taken. **Second,** victims of acute and intensive domestic violence are at higher risk of being a victim of human trafficking. In general, married women who are victim of domestic violence do not imagine the concept of divorce as a solution to their marriage problems. This view is in line with the Christian view of marriage once to death. Therefore, women victims tend to choose to run away of their homes instead of divorce.

While running away, they use the closest network of relatives, neighbors and acquaintances as migration transit point. In NTT tradition, families and relatives are considered as people who *"never do harm"* and will doing good by help each other. The findings shows brokers who part of human trafficking networks are often identified as relatives. The women who are trying to get out of this circle of violence/domestic violence do not assume that the path to finding work through this channels is risky.

In conclusion, harm norm against women and GBV becomes the background that further prompts Human Trafficking. Women from NTT choose to migrate because they experience GBV at home and in the neighborhood. Non-procedural migration often becomes an effort to save oneself from an abusive situation. In other words, they're out of the frying pan, into the fire.

SSEWAYA, Achilles (Makerere University, Uganda)

Social Construction of Prepayment in Water Service Provision in Uganda.

Utilization of technological innovations impact on societal relationships and consequently influence social change and social interaction including the way people communicate, do business and access services (Cascio & Montealegre, 2016).User experiences are different based on interactions, negotiations and social struggles that take place between different actors, not only those present in given face-to-face encounters but also those who are absent yet nevertheless influence the situation (context) affecting actions and outcomes (Long, 2001).

This paper interrogates user experiences of prepayment as a technology for delivering potable water services in urban poor settings of Uganda . It also assesses the contextual drivers of utilization of such a technology. The study is anchored on the Actor Oriented Theory by Norman Long (2001) and the Social Construction of Technology (SCOT) by Bijker and Pinch (1984). The study adopts a cross-sectional case study design to examine how user behaviours towards prepayment technology are a function of user understandings, meanings, principles and culture that shape behaviour.

Findings indicate that utilization of prepayment technology in delivering water services is outcome of a complex process involving interdependent drivers and occurring at varying levels of time and space. Users socially construct meanings out of technologies which affect how they react. The problem of underutilized technological innovations remains a social problem because an incomplete acceptance of technological changes or unsatisfied needs make the users to revert back to old systems since users are actors with agency operating within dynamic social structures.

AHMAD, Sana* (WZB Social Science Center Berlin, Germany)

Automated Content Moderation: A Site of Social and Economic Inequalities in India

Content moderation is a multivalent concept that is key to the functioning of social media platforms. On one hand, it allows technology firms such as Facebook, Twitter and Google to maintain some semblance of public discourse on their platforms. On the other hand, it is based on data processing practices where firms are able to extract processed data for both generating advertisement revenue but also for infrastructure expansion processes. Crucial for both these processes is the accuracy of content moderation decisions which is not only affected by the dynamic character of social media platforms, but also by the large-scale outsourcing of this work to IT-services firms in India. Driven by reasons of labor cost arbitrage and extracting local skills and tacit knowledge, technology firms or lead firms undertake specific organizational strategies in the content moderation value chains to ensure quality service delivery, and reduce uncertainty and labour indeterminacy. This presentation is informed by the author's dissertation on content moderation value chains an labor process, and will focus on the use of automated technology for extracting labour productivity. The analysis is informed by both qualitative and quantitative methods including 66 interviews with workers, supply-side representatives, social media policy makers, trade unionists, and other experts based in India and the USA. The research findings indicate that the use of automated technology for content moderation work has resulted in centralization of control with the lead firms and increased high degrees of work standardization. Correspondingly, the study aims to make two main contributions to the session: first, regarding the power asymmetries in the content moderation value chains with reduced supplier upgrading possibilities, and two, for reduced labour discretion over their work and time, and restricted spaces for resistance.

TG10-849.3

AHMAD, Sana* (WZB Social Science Center Berlin, Germany)

Social Media Platforms and Social Relations: Using a Sociological Lens

Social media platforms are unique socio-technical infrastructures that are characterized by multiple use-values. By integrating technology within the frame social communication, technology platforms such as Facebook (now Meta), Twitter and Google operating these platforms are able to generate value through the data capture processes. These processes have largely been studied in the field of design studies but also within the media and communication scholarship. At the same time, there exist several gaps in terms of understanding the social relations that underpin the "enormous wealth creating power" of these technology firms (Mazzucato, 2018) and their obscure business models (Morozov, 2022). The question here is if there exist conceptual tools within the discipline of sociology to fill this gap. By bringing her study of content moderation work on social media platforms, the author shows that there exist both opportunities and challenges in working with established sociological theories. Content moderation, i.e., the screening of user-generated content, is a multi-layered practice that already starts with the flagging activities of social media users and by capturing this user knowledge through the platform features, technology firms are able to transfer it to the production processes in outsourced firms. The author's analysis shows that this strategy serves the function of ensuring content moderation accuracy, and has negative implications for work and workers in the content moderation value chains. By bringing these research findings to the table, the author aims to further the discussion on how sociology can respond to the challenges associated with studying highly digital, dynamic and scalar technologies such as social media platforms that tie in different stakeholders together.

AHSAN, Manzuma* (East West University, Bangladesh)

The Cultural Construction of Women through Language: Exploring Gender Identity in Bangladesh

Language is a cultural universal that is the principal means of human communication inside the society. Language is consisted of words used in a structured and conventional way that people convey by speech, writing, or gesture. It plays a significant role in shaping the perceptions of people on various social phenomena and thus revealing the reciprocal relationship of language and society. Keeping this perspective in mind, this paper has made an effort in exploring the cultural construction of women through language. The major concern is to investigate the indicators of the 'body-image' of women as a cultural construction among the people of Bangladeshi society. By employing a qualitative research design, including a purposive sampling for selecting the respondents, the present study has been conducted both in the greater city of Dhaka and three purposively selected villages to cover an 'urban-rural' variation. The study has found out that the 'body-image' of women is made by the perception of people which is shaped by their construction in Bengali semiotics and specifically through the gendered view of the organic metaphors of women. The study is associated with some outstanding multi-disciplinary theories that have enriched it strongly. By following the theoretical framework,

the analyses of this study are done from a critical view of 'deconstruction' along with the notions of semiotics, psychoanalysis, and cultural theories for a more profound depiction of the truth of this study. The study is an exploratory attempt conducted to fill a research gap on women in Bangladesh. This gap relates to the perception of people about women with their bodies and their construction in Bengali linguistics formation and metaphors and thus the cultural elements like semiotic expressions of people and the metaphors have given a new shape to the 'body-image' and thus the gender identity of women in Bangladesh.

Historical Injustice and Displacement of Indigenous Community from Their Ancestral Land and Territory: A Case Study in Munda Community of Bangladesh

The rights to lands, territories and resources are at the heart of indigenous peoples' struggles around the world. Indigenous peoples' relationships to ancestral lands are the source of cultural, spiritual and social identity, and form the basis of their traditional knowledge systems. Indigenous Munda community living adjacent to world's largest mangrove forest Sunderban of Bangladesh is facing serious threats of displacement from their ancestral lands. They faced historical injustice as their lands are illegally grabbed by the vested interest group. Although Bangladesh constitution declared all basic human rights for the citizens of Bangladesh, but notion of indigenous people is not recognized by the constitution. Again, laws supposed to stop such processes of land dispossession of the indigenous communities however, in practice, land dispossession continued until today.

The study found that due to different forced migration events of the history including partition of India in 1947, the communal riot in 1964, the Indo-Pak War in 1965, the promulgation of Enemy and Vested Property Acts, the agents of anti-liberation during the Liberation War in 1971 etc. have supported and encouraged the grabbers to surreptitiously grab the lands, forests, and other resources of the indigenous peoples. Again, existing social distance and economic exploitation of the vested interest group made Munda people became more alienated from the mainstream and more vulnerable community. The study recommended that apart from ratification of United Nations Declaration on the Rights of Indigenous Peoples, existing sectorial laws of Bangladesh specially Forest, Fisheries and Land laws are needed to be further developed changing the colonial legacy to ensure access and collective rights of indigenous people on their ancestral lands, in the common property, forest and fisheries resources of the country.

Loss and Damage in the Indigenous Way of Life and Opportunity for Sustainable Livelihood: A Case Study in Munda Community of Bangladesh

Indigenous Munda community living adjacent to the world's largest mangrove forest Sunderban, close to southern coastal belt of Bangladesh is facing serious threats of displacement from their ancestral lands due to climate induced natural disasters. The community is now facing increasing rate of tropical cyclones, storm surges, high tides and associated salinity problems. At present, saline water intrusion in their agricultural lands has created lack of livelihood opportunities, acute crisis of potable drinking water and population displacement. In this scenario, Munda women particularly became more vulnerable due to changes in their agricultural way of life, acute crisis of potable drinking water and other non-economic loss and damage incurred by climate change. The study is conducted followed by a participatory method and aims to understand the nature of losses and damages of the Indigenous Munda community of Bangladesh, possible resilient livelihood opportunity for Munda people in face of climate change and also to create opportunity of legal claim by the victim community for their due compensation from the responsible entities.

Sobre El Crecimiento De La "Informalidad" En La Era De La Digitalización De Los Procesos Productivos

La "informalidad" como rasgo de los mercados de trabajo formó parte permanente de la dinámica de reproducción del capitalismo en los países de América Latina, donde los debates sobre su origen y permanencia recorren décadas de los siglos XX y XXI, debido a que continuamente la realidad negó la tesis dualista que auguraba su desaparición, a medida que se desarrollara el capitalismo "moderno" y desapareciera la economía "tradicional". Paradójicamente, en el capitalismo contemporáneo, la creciente

denotes a presenting author. Abstracts are organized by first presenting author's last name.

automatización(digitalización), indicador del alto grado de "modernización" de los procesos productivos va paralela al aumento de la "informalidad" con la expansión de las plataformas digitales que ponen en marcha nuevas modalidades de empleo "informal". Se trata de una paradoja que reactualiza el viejo debate sobre la reproducción de la "informalidad" en América Latina, esta vez en condiciones históricas en las que ella deja de ser un rasgo del capitalismo periférico, para convertirse en uno del sistema en su conjunto.

En esta ponencia, en base a información de fuentes secundarias y desde un enfoque teórico que considera como dimensión explicativa de la "informalidad" a la formación ampliada de una sobrepoblación relativa, se quiere aportar a la reflexión sobre la reproducción de la "informalidad" en la era de la digitalización. La finalidad es visibilizar los alcances y límites de los enfoques que sobre la "informalidad" se produjeron en América Latina, pero, además, identificar las contradicciones que emergen de la automatización capitalista, en tanto medio para captar en toda su complejidad, los problemas humanos que ella plantea, como la expansión de la precariedad del empleo asociada a su expansión. Para ello nos preguntamos: ¿Cómo y por qué se expande la "informalidad" en los mercados de trabajo de América Latina y el mundo en la era de la flexibilización laboral y de la digitalización de los procesos de trabajo?

Survey Method's Impact on Sexual Violence Indicators

Sexual violence is socially sensitive topic in most of the societies. Previous studies have shown that socially sensitive topics have higher measurement and non-response errors in surveys and under-reported information in administrative databases. Still, the special surveys are considered the most reliable source for collecting information about sexual violence, although the method of data collection has an essential role on data quality.

The aim of the presentation is to analyse the impact of different survey data collection methods on sexual violence prevalence results. We use Eurostat initiated gender-based violence pilot study information from year 2018.

METHOD

The pilot study was collected separately in three survey modes: CATI (computer assisted telephone interview), CAWI (computer assisted web survey), CAPI 1000 (computer assisted personal interview). CAWI is the only mode without the personal contact by interviewer. All modes had their initial independent sample of respondents. We analyse the prevalence rate results about the sexual violence in three different modes. In order to eliminate the impact of selectivity of respondents to modes by age and education we use genetic matching. It allows to compare the substantial answers in different modes, regardless of their different social structure.

All sexual violence is measured in five groups: harassment at work during life-time, violence by a non- partner since 15 age, violence by a current partner since 15 age, violence by a former partner, violence in childhood up to age 15.

RESULTS

Results show that CATI method seems to produce the most different results, compared to CAWI and CAPI.

La Sociologie Clinique Face à l'Autoritarisme Dans Le Maroc Actuel : Quels Enjeux Épistémiques Et Politiques Pour Les Récits De Vie ?

Malgré les réformes politiques et constitutionnelles qu'a connues le Maroc, sous le règne du Mohamed Six, plusieurs politologues et commentateurs reprochent l'autoritarisme doux du régime politique existant. Le pouvoir supraconstitutionnel du monarque en tant que commandeur des croyants, lui permet d'exercer une hégémonie totale sur toutes les institutions politiques, économiques et sociales, en dehors de tout contrôle institutionnel ou critique externe.

Certes, la création de l'instance d'équité et de réconciliation en 2004, la réforme constitutionnelle en 2011 et la création d'un nouveau modèle de développement en 2021, ont contribué à une certaine réconciliation entre la société marocaine et les autorités de l'État. Toutefois, l'esprit de l'État témoigne d'un retour du refoulé politique punitif, où les institutions coercitives ne cessent de faire retour à la violation des droits de l'homme. Plusieurs activistes politiques et acteurs de la société civiles sont arrêtés et emprisonnés ces dernières années. Il s'agit d'une déviation étatique vers l'assujettissement de la société, afin de réduire au silence des voix rebelles assoiffées de démocratie et de liberté.

Devant cette résurgence de l'esprit autoritaire du « Makhzen », le recours à la sociologie clinique est un positionnement paradigmatique critique, dans lequel on recherche à coconstruire des connaissances basées sur la voix des sujets souffrants du mépris et de l'exclusion. S'appuyer sur une posture clinique nous incite alors à analyser les processus socio-psychiques qui caractérisent les rapports des sujets au système politique dominant. Il s'agit d'approcher le vécu sociopolitique des acteurs dans sa dimension existentielle et relationnelle pour expliciter comment adviennent-ils face à leur histoire, leurs désirs et leurs aspirations. Les récits de vie des acteurs deviennent alors non seulement un outil de collecte de données mais aussi un levier d'engagement de la part du sociologue clinicien dans des enjeux du changement, de l' émancipation et de la conscientisation.

Examining the Traditional Rite of Inheriting Traditional Arts within the Social Class Structure in Japan's Regional Cities

This study examines the social class structure, where traditional performing arts are bequeathed in Japan's regional cities. Specifically, we analyze a festival held once every six years in a city along a central Japanese mountain, using a questionnaire survey administered to both residents and groups performing the festival. In Japan, Western culture that has been largely imported over last 150 years, is already measured as cultural capital. As a result, Japan's shared research finding indicates that, women possess a higher Western cultural capital than men. However, one major point of difference is that, unlike Western countries, Japan's Western art rarely interacts with politicians. Rather, male politicians frequenting local traditional festivals and other events, are associated with androcentric local communities. Many such areas maintain such androcentric traditional structures. Therefore, this study will focus on the social structure of these communities, by examining a community hosting traditional festivals, some of which presumably have a 1,000-year-old tradition. A survey will be conducted in the upcoming month of November, and the results will be reported at the conference of 2023. Based on the preliminary survey's results, the festival is considerably important for the people residing in this locality, and is also mutually affected by the area's occupational structure. In particular, it is an opportunity for the local ruling class to redistribute resources, and an important diversion for workers with ties to the area. This paper reports the results of a further quantitative analysis of the relationship between this region's social structure, and the traditional performing arts.

The Changing Memory of Schooling By Social Class Structural Reorganization through Societal Industrialization: Focusing on Japanese and German Postwar Educational Practices

This research report focuses on the changing memory of schooling, due to the post-war industrialization of developed countries, as a comparative historical-sociological study of Japan and Germany. In particular, it focuses on Japan and Germany's changing experiences and memories of collectivity in schooling, among the second World War's defeated countries, through teaching practices in schools introduced during industrialization. Results of the analysis are described through a few details. During the post-war period of United States' occupation of Japan, "democracy" was introduced into many classrooms, with emphasis on experiential learning. However, as Japan entered a period of rapid economic growth, business elites and political leaders started demanding highly systematic subject-based education. At this time, a form of collective pedagogy that was apparently very familiar to the spread of manufacturing, became widespread as a democratic educational practice. As a result, "Han", activities through small intra-classroom groups, were widely adopted in Japanese schools. Contrastingly, people remembered this practice as "postwar democracy" with pros and cons, and became an important collective memory while discussing Japanese education after postwar reconstruction and economic growth. Similar educational practices existed specifically in the former East Germany, where both these countries referred to the Soviet educational thinker Makarenko. In the former West Germany, on the other hand, this collectivity was eliminated almost entirely, with the widespread of individuals' skill enhancing vocational training. This study will also focus on this mutual process of knowledge transfer.

Terrorism in the Lake Chad Basin: Understanding the Economic Dimensions and Role of Vigilantes in Counter-Terrorism

Terrorism particularly by Boko Haram and its affiliates especially the Islamic State West African Province (ISWAP) has been a major challenge to Nigeria and other countries in the Lake Chad Basin including Niger, Cameroon and Chad. Although the entire area is affected, Nigeria is most impacted by the crises. Several arguments have been put forward to explain the emergence of terrorism in the region such as inequality, youth bulge, poverty, religion, and more recently political manipulation. Data obtained by the Council on Foreign Relations' Nigeria security tracker reveals that over 41,000 fatalities relating to terrorism have been recorded in Nigeria alone in the last ten years (2012-2022). Although terrorism in Nigeria is largely confined to the North-Eastern region,

denotes a presenting author. Abstracts are organized by first presenting author's last name.

recent attacks especially the attack on a church in Ondo state (South-Western) Nigeria has shown that terrorism is a national menace and terrorists have the potential to strike at any part of the country.

In response to the rising menace of terrorism in the country, the Nigerian government along with its regional allies have taken diverse approaches to combat the menace. Some of these measures include militarisation of volatile regions, dialogue with restive groups, use of private militaries amongst others. Despite these approaches, violent Islamic movements continue to spread in Nigeria and along the Lake Chad axis. This article argues that two key issues are still under-researched in the fight against terrorism in the region. The first is the economic dimension of terrorism especially relating to finance and incentives for fighters while the second is the role of local vigilantes as key allies of the military especially in the joint military operations. Understanding these two perspectives and responding adequately to them would go a long way in fighting the menace of terrorism and violent Islamic movements in the region.

"Beyond the Greedy Institution: Nigerian Military Families and the War Against Boko Haram".

Abstract

The Nigerian military has been engaged in an interminable conflict with the Islamist terrorist groups, Boko Haram and its splinter faction, the Islamic State in the West African Province (ISWAP) since 2009. This war has resulted in high casualty losses in the Nigerian military, creating a community of bereaved military parents, widows, orphans, colleagues, and other members of the military family setup. Like other militaries, the Nigerian military is a greedy institution, however, the sacrifices of service outweigh the benefits to soldiers and their families. This has resulted in recent waves of desertions, resignations, and retirements from the Nigerian Army.

Using the Greedy Institutions concept as a theoretical backdrop, and drawing from a wide range of sources, including primary data collected from widows of Nigerian soldiers who have died in the war against Boko Haram[1], this paper seeks to explore how Nigerian military families, have encountered, engaged, and even sought to escape the greediness of the Nigerian military. It uses this to examine how open or closed the Nigerian military family is, how they deal with the demands of soldiering and multiple deployments to the enclaves of the Boko Haram, and how bereaved military families understand the meanings of these deaths for a greedy institution.

Keywords: Nigeria, Boko Haram, Military families, greedy institution.

[1] This data was collected for my doctoral thesis, titled: Coping and Social Support Strategies of War Widows of Nigeria Army Combatants in the war against Boko Haram.

The Welfare State and Freedom of Choice: An International Comparative Analysis

In international comparative research, earlier studies paid much attention to freedom of choice because this issue has been regarded as a crucial factor in various important outcomes, such as subjective well-being. Although many studies have focused on freedom of choice as an independent variable, a relatively small number of studies have explored the determinants of freedom of choice. In particular, research on how welfare policy affects freedom of choice is scant at best. Against this backdrop, this study examines whether public social expenditures enhance the level of freedom of choice, and shrink inequality of freedom of choice stemming from socio-economic status.

For the analysis, this study adopts merged data from the World Values Survey (1981–2022) and the European Value Study (1981–2017), combined with macro-level data on country characteristics. The dependent variable in this study is the freedom of choice score. Moreover, as an independent variable, the present study employs public social expenditures derived from the OECD Social Expenditure Database (SOCX) to capture the effect of welfare policy. This analysis also includes several individual-level variables related to socio-economic factors to capture inequality of freedom of choice. In addition, this analysis employs two-way fixed-effects models to estimate the within-country effects by controlling for unobserved time-constant country characteristics.

Through an international comparative analysis, this study found that public social expenditures are positively associated with freedom of choice. This indicates that freedom of choice in a society characterized by the welfare state is higher than in a society based on a market economy. Therefore, the present study reveals new consequences of the welfare state and delves into research on freedom of choice. This study also discusses the impact of public social expenditures on inequality of freedom of choice due to socio-economic factors.

How Can the Digital Revolution Transform the Meaning of Modernity?: A Systems Theoretical Reconsideration

In sociology, there has already been an accumulation of discussions on the transformation of modernity for decades. It can also be said that modernity has been in constant transformation. However, how can sociology provide a more accurate description than "constant transformation"? To answer this question, we will discuss here not the transformation of modernity, but the transformation of the interpretation schema of modernity.

The focus here is on rationality, among the various concepts that construct the idea of modernity. Although Niklas Luhmann also discussed the transformation of the interpretation schema of rationality, in his case, he mentioned the dissolution process of the "rationality continuum", or the narrowing of the meaning of rationality, in response to changes in the structure of society (functional differentiation of society). In contrast, what we consider here is the relationship between the digital revolution and the semantic transformation of the concept of rationality. The clue is algorithmic decision-making, which has been expanding in recent years. According to the classics of sociology, the foundation of the modern concept of rationality is computational clarity. However, in algorithmic decision-making, it is not clear whether it is the decision maker or the Artificial Intelligence that does the calculation. Here, we can see a shaking of the concepts that form the foundation of modernity, such as subject, choice, and decision-making. The blurring of concepts for interpreting modernity makes it difficult to describe what is currently underway.

In conclusion, what the digital revolution has brought about is not so much a transformation of modernity as a transformation of the interpretation schema of modernity, and to describe this more accurately, it is necessary to approach the distinctions that construct concepts such as rationality, choice, and decision-making from a meta-level perspective, that is, a sociocybernetic point of view.

AKBIYIK, Melike* (Istanbul University Department of Sociology, Turkey)

Career Plans of Sociology Students in Turkey after Pandemic

The Turkey unemployment rate for age 15+ is 11.4% in the first quarter of 2022, while 21.1% for the 15-24 age group. According to EU Statistical Office data, in November 2021, Turkey has the highest unemployment rate after Spain and Greece. The general trend in the report is that as the education rate increases, the unemployment rate decreases, excluding Turkey. In Turkey, the unemployment rate for university graduates among the population aged 20-64 is 12.7%, almost the same as for those with primary education and below (12.6%). While the statistics are like this way, more than 50 Sociology Departments admit thousands of new students to higher education every year. Approximately 14000 students have graduated from sociology departments every year, however the employment of sociologists in the public sector has been almost non-existent, since 2015. This adverse condition, especially regarding the employment of sociology graduates, deserves to be evaluated together with the economic crisis experienced together with the pandemic.

"What can I do with a bachelor's degree in sociology" is one of the greatest concerns for students in Turkey. This study aims to discuss how high education experience and future plans of new sociology graduates have been affected by this pandemic. Since 2015, the survey of career plans of sociology students after graduation has been done in Istanbul University Sociology Department (except 2020). Although the structure of the questionnaire applied in 2021 was changed, the emphasis of the pandemic has not been added to the questions. This study tries to compare the knowledge and skills they think they gained, undergraduate satisfaction and future plans of sociology students who graduated in the pre-pandemic (2015- 2019) and post-pandemic (2021-2022) years. The results of the study will be described in three parts: demographic characteristics; evaluations about curriculum and experiences; and their future/career plans.

Gender Data for Empowerment: Rights Based Approach to Measure and Monitor Gender Equality in Turkey

In the last two decades, Turkey faces with a major gender backlash similar to many other countries with conservative regime change and rising of neoliberal authoritarianism. Despite long lasting efforts of women's movement to advance women's human rights, recent regressions including the drifting away of central government institutions from the concept of gender equality (GE), withdrawal from the Istanbul Convention, leaving the instruments of it and participatory democracy idle, and in particular the exclusion of women's organizations from policy development processes come along with the political regime change just after coup d'état add to the importance of CSO-led initiatives in ensuring

GE and participatory democracy. Against this background, our study aims to discuss rights-based GE monitoring by using gender data and indicators as being one of the key tools to strengthen participatory democracy in Turkey. Indeed, mainstreaming of GE only realized through independent monitoring which contributes to targeting the fields where inequalities are deeper and intervention is needed and considering the current situation in Turkey, there is an urgent need to establish and strengthen the mechanisms to realize it at both the national and local levels. Further our study aims to share the knowledge and experiences to shed light on rights-based methodology to develop GE indicators and cross-nationally comparable GE index whose data and materials are disseminated via different tools. The case study of our study is the "Gender Equality Monitoring Center" that we have developed within the scope of the project we are carrying out. In this center, which we developed within the scope of the CEİDzler project funded by the EU Delegation to Turkey, we focused both on disseminating the information produced by CSOs in academia through the e-library, and on enabling CSOs to advocate based on data through the gender data portal and improving their capacities.

BENDAHAN, Mohamed (Mohammed V, University of Rabat, Kingdom Of Morocco, Morocco)

The Impact of Turkish and Korean Series on the Production and Consumption of Television Content in the Maghreb Country

Since its emergence in the Arabian Peninsula, the Muslim religion has evolved in the four cardinal points with more success and establishment in the East and West. The history clearly shows us the multiplication and diversity of religious practices and expansionist ideologies via ideological motivations from the Middle Ages to the present day. One era followed another and the means of dissemination of Pan-Arab, religious or hegemonic ideologies in the broadest sense took the form of orality, writing and representation on traditional media as well as on digital media.

In this case, the Maghrebian space, which interests us in this research, is no exception to this rule. The era of modernity, marked by the rise of individualism and the weight of the mass media, has imposed on the Maghreb countries, newly emerged from the protectorate and colonisation, a management of their identity adapted to emerging societies. The evolution in the three countries despite common references, has seen divergences in the recognition or secularisation of the islam, which is dominant in these territories, as well as their identity references.

In the light of a discussion-analysis between the three countries, we will try to identify the specificities of the use of the media and the related identity practice in the face of the media flows qualified by some as "expansionist" and by others as "competitive" from Turkey and South Korea.The preferred methodology is immersion research to detect the interactive mechanisms between media and culture and/or media and religion. How can we compare the forms of mediatisation of religion/culture and their impacts on the public space? Can we speak of a religious and cultural space stabilised by the traditional media? And what is the influence of social networks and satellite television? How is the diversity of religious media spaces experienced via VOD?

AKHMETIANOVA, Rimma* (Centre for Strategic Research Republic of Bashkortostan, Russian Federation)

Digital Poverty Profile of the Region: A Case Study of the Republic of Bashkortostan

In view of the deteriorating economic situation in the Russian Federation as a result of external sanctions and also the consequent decrease in the income level and the rise in unemployment on the labour market, the Russia's population is expected to fall intensively into poverty. Based on the data from SberAnalytics, the poverty level is higher than according to Rosstat that is primarily due to the delay in statistical data on a timely estimation about the decrease in the standard of living of economically active population groups. The most common reasons for falling into poverty are low wages and the inability to find better-paid jobs.

The social poverty profile of the region based on the analysis of data from the regional software complex "Register of the Poor" of the automated system "Targeted Social Assistance" indicates that gender, age, place of residence, level of education, and presence of children in the family are factors contributing to the risks of becoming poor. Married women with primary vocational education who have three or more children are exposed to the highest risk of falling into poverty in the region.

Innovative digital solutions allow the real-time monitoring of the social and demographic poverty profile in municipalities, including those with a high proportion of "the working poor" for further analysis of opportunities for their retraining and employment within the framework of investment projects implemented in these regions. The knowledge of how the poor are distributed across the region makes it possible to focus social support in the areas most in need. The social "portrait" of poor families allows adjusting budgets for retraining programs, when people have the opportunity to learn in the professions available to them and as a result to obtain a permanent income.

AKIFEVA, Raisa* (The University of Western Australia, Australia)

Child-Rearing Styles, Practices, and Values of Russian-Speaking Migrants in Spain and Australia: National Habitus and "Parenting Paradox"

In this paper, the notion of national habitus (Elias, 1996, 2002) is applied to migrant parenting practices and values, placing this concept in the context of the debate regarding the nature of parenting and its adjustment to a new context. This research, drawing on interviews and observations collected in Australia and Spain and secondary data, confirms the findings of previous studies about the limitations of applying a standardized view of parenting styles to the study of the migrant experience. In the case of Russian-speaking migrants, the perception of their styles is interconnected with child-rearing practices. Specifically, certain practices, such as those related to taking care of child health in the way which is customary in some parts of the post-Soviet space, are associated among migrants with manifestations of greater severity than is demonstrated by local parents. For Russian-speaking migrants, adherence to certain rules is not a matter of personal choice, since not following them is considered hazardous to children's health or a sign of uncivilized behaviour according to internalized norms. The research also argues that there are two conflicting internalized groups of ideas from two contradictory discourses: 1) "liberal" concerning the desire to develop the child's autonomy and 2) medical and "civilizing" related to the desire to raise a "cultured" and healthy child, which lead to a "parenting paradox" reproduced by the migrants.

AKIFEVA, Raisa* (The University of Western Australia, Australia)

Russian-Speaking Communities in Spain and Australia: Cultural Production Dilemmas and Power Relations.

In this paper, based on ethnographic research conducted in Perth and Madrid, I answer questions of what community is for small migrant groups of Russian-speaking migrants and its role in cultural (re)production. The empirical base consists of interviews with migrants, observational data, analysis of social media, and secondary data. I argue that studies of community and migrant organisations overlook the important role of struggle and power relations in the community. The Russian-speaking migrant community is conceptualised as a field of cultural production (Bourdieu, 1993), a space comprising agents and migrant institutions that are in competition for the right to speak on behalf of the community and to produce legitimate cultural products. The community leaders are analysed as cultural producers involved in power relationships. Contrary to the popular view in migration studies that leaders of migrant organisations pursue goals related to the needs of migrants, and to the preservation of culture, this research argues that what they produce (including activities, performances, lessons, concerts, mass media resources and other cultural products) depends on their taste, cultural capital, and other resources they possess. They may transmit political ideology, such as Russian soft power, and focus on accumulating their own resources or different types of capital. In this process, community leaders experience 'cultural production dilemmas', i.e. what they need to produce and how, seeking to shore up their own version of Russian-speaking-ness.

Functional Toilet for Menstruating Adolescent Girls: A Study on Northern Bangladesh

A functional toilet should be needed in the learning environment for adolescent girls worldwide to receive an inclusive and high-quality education. Studies revealed that gender-specific toilets and their amenities and insufficient sanitary supplies are factors in lower educational attainment, drop-out rates, and unsatisfactory academic performance for adolescent girls. Toilets that are not functional cannot guarantee a healthy atmosphere for teenage girls' education and sanitation, especially during menstruation. This study sought to understand what the term "functional toilet" means and how it affects girls' usual academic performance. Key Informant Interview (KII) and Focus Group Discussion (FGD) were conducted with a survey technique on 230 high school-aged adolescent girls from seven randomly selected schools in the Dinajpur region to accomplish the objectives. Mostly tabular descriptive statistics and graphical analyses are employed in analyzing the data. Results revealed that 73 percent of the girls in school are unaware of whether their toilets are functioning properly, even though they have become accustomed to using the toilets at their school for many years. Less than 30 percent of the girls have attempted to describe how toilets work in terms of sanitation facilities, such as the availability of water, hand soap, or covered bins for the disposal of tissue or menstrual kits. 76 percent of the girls mentioned that they frequently struggle

in class or skip classes during menstruation because they lack the privacy to change their pads, clothing, or napkins in time. When menstruation starts at school, 88 percent of the girls return home. According to teachers and pupils, the lack of functional toilets has been linked to poor academic achievement. The study's findings might contribute to developing a new definition of a functional toilet and its role in Bangladeshi girls' education.

Impacts of Menstrual Waste on Water Bodies: A Study on Northern Bangladesh

Plastic waste is one of the growing environmental concerns in urban Bangladesh. In many countries, including Bangladesh, menstrual disposable plastic kits are not regarded as waste or solid waste. Consequently, there is still no procedure to dispose of discarded menstrual kits appropriately. Many women dispose of plastic menstrual waste in their household trash cans and toilet flushing points or throw it into local water bodies. These practices harm local urban water bodies and endanger the ecosystem and neighboring communities in the Municipal area. Under the circumstances, the primary aims of this study are to measure the amount of menstrual waste produced by reproductive women (10-49) and to investigate the impact of this waste on water bodies in the urban environment of Dinajpur in northern Bangladesh. Primary data were collected from 384 social survey respondents, 1 focus group discussion, and 3 key informant interviews to accomplish the study's aims. Results indicated that a menstruating woman typically used ten sanitary napkins on average in a menstrual cycle. Based on these figures, Bangladesh may produce around 9039.6 metric tons of menstrual plastic waste annually. Thirty-four percent prefer to dump used menstrual products in the nearest water body, such as a canal or pond, due to an inadequate waste disposal infrastructure. When the local canal overflows with rainy water, it causes drainage congestion and environmental pollution, which harm human health and community livelihood. Surprisingly, the Municipal authority does not have a specific guideline for regulating menstrual waste management. Therefore, not much effort is put into sorting out this plastic waste; all garbage is gathered and thrown in the same place as other rubbish. This study might help increase public awareness of the issue, and menstrual waste governance with multiple stakeholder participation can help promote environmental sustainability.

The Role of Social Networks in Escaping Homelessness: A Qualitative Study on Former Homeless Men in Istanbul

The success stories of the former homeless are not only related to public and civil contributions, but also to their cultural capital, level of hope, future plans, and skills to deal with uncertainty. Social networks of homeless people among themselves and their social ties with local actors are also important for their social reintegration, participation and inclusion. This paper tries to describe the experience of leaving homelessness with special emphasis on the contacts among and around chronic homeless men. It aims to explore their daily routines, place choices, local environments and relations they built both before (family members, relatives and friends) and during homelessness (shopkeepers, NGO volunteers, public officers and other homeless people). Is the social capital gained before or after homelessness more important in the recovery process? What is the function of hierarchy and cooperation in homeless groups in terms of reintegration? How do their ties to local networks effect their recovery? In order to understand the role and functioning of social networks in the experience of leaving homelessness closer, this research adopts qualitative method and phenomenological design. The study analyzes data retrieved from external and participant observation in public areas with higher homeless population, and in-depth interviews with NGO volunteers, public officers (social workers, security guards, mosque priests or *imam*s etc.), business owners or employees (restaurant, hotel, bakery etc.) who are in close contact with homeless people, and with former homeless individuals themselves. Initial findings of the 24-months research project on escaping homelessness in Istanbul funded by the Scientific and Technological Research Council of Turkey (TUBITAK 121K287) show that some "streetwise" senior homeless men have an organizing role and a higher prestige among homeless groups, and those "public character"s constitute a bridge between the homeless and local communities which accelerates escape of homeless group members from homelessness.

"Felt Population": A Qualitative Study on the Subjective Perception of Population Density in Istanbul

A local supermarket cashier going to work on foot, a white collar driving for hours in traffic jam for some days, and an employee interchanging several vehicles at crowded transport hubs every weekday may have different images of the city even if they live in the same neighborhood. Similar to concepts like felt air temperature or time, perceived corruption, subjective age, well-being or social status which underline personal/contextual aspects of phenomena, Jacobs' "uses of space", Lynch's "image of the city" and Lefebvre's "lived space" emphasize urban actors' subjective experiences instead of objective calculations or "conceived space" designed by planners.

Different perceptions of urban population too may be analyzed in this framework, both in terms of crowdedness and diversity. Focusing on variation of demographic images, mostly ignored by disciplines such as urban sociology, social demography, urban planning and human geography, this study develops the concept of "felt population" in order to explore the differentiation between individual receptions of urban population as experienced by various residents of the city. How are impressions of population density and composition shaped? What is the role of daily routine and intra-urban mobility in the formation of this subjective demographic perception?

Adopting qualitative method, phenomenological design and maximum variation sampling, and excluding non-working and working-from-home population on the one hand, and "felt population diversity" (religious and ethnic) on the other, the research aims to describe various "felt population density" experiences of urban residents going routinely to a workplace from various age, gender, socioeconomic status and profession groups. It focuses on their everyday activities, residence-workplace distance, trip hours, route preferences, means of transport, level of traffic jam, sense of crowdedness and hurry of roads and stations. This paper analyzes initial data retrieved from in-depth interviews conducted with participants living in one single neighborhood (Burhaniye) in Uskudar (Istanbul, Turkiye).

African-Asian Anti-Colonialism in 1960s Cairo

In late 1957, Egypt under the leadership of Gamal Abdul-Nasser, hosted the First Afro-Asian Peoples Solidarity Conference, which led to the establishment of the Afro-Asian Peoples' Solidarity Organization (AAPSO). With its Permanent Secretariat in Cairo, the delegates, activists, writers and intellectuals associated with AAPSO hailed from different anti-colonial liberation movements - including the sizable number of African liberation movements that were given political asylum by Egypt and hosted by its African Association - and postcolonial political parties and movements in Africa and Asia.

AAPSO's self-declared aims were broadly centered on advancing anti-colonial national liberation, and anti-colonial solidarity and unity across the African and Asian worlds. Transnationally, the first decade of AAPSO's existence saw a flurry of activities by the organization that attempted to further the organization's self-declared aims, including Conferences in newly independent Guinea-Conakry (1960), Tanzania (1963) and Ghana (1965), and the laying of the groundwork to bring South America to its African-Asian organizational solidarity structure through the Tricontinental Conference in Havana (1966). At the same time, in Egypt AAPSO hosted African-Asian Youth, Women and Writers Conferences and an African-Asian Film Festival, and engaged in a trilingual Arabic, English and French program of publication that included a bulletin, an academic journal, a writers' journal, commissioned studies and organizational materials.

This paper explores the idea of African-Asian anti-colonialism within this south-south political and intellectual milieu of late 1950s and early 1960s Cairo. It pays attention to its structural manifestation, the brief attempt to institutionalize it through AAPSO's activities, and the different networks, activities and ultimately meanings that came to be associated with it.

The Role of Emirati Women during the COVID-19 Pandemic and the Challenges

Using a qualitative methodology of personal interviews and participant observation, this research investigates the role of Emirati women in the fight against the Covid-19 pandemic and the attendant impact/challenges. Research participants included female Emirati health care workers and educationists. There was also an observation of Emirati families to observe the challenges women went through in the course of the pandemic. Contrary to existing narrative about the invisibility, docility, marginalization, victimhood and dependency of Arab women, this research reveals that Emirati women were able to exercise agency in the fight against the pandemic due to the following factors: longstanding government empowerment of women, a sense of patriotism, supportive male relatives and female dominance in the health and educational sectors. In the course of the pandemic, Emirati women have contributed in the following ways as: volunteers; international aid workers;

denotes a presenting author. Abstracts are organized by first presenting author's last name.

care givers; health information agents, and virtual teachers. In spite of this, challenges abound as a result of the following: increased family conflict; domestic violence; psychological toll of COVID related deaths; economic challenges; and increased domestic responsibilities. The Emirati women's case provides lessons for policy makers and societies desirous of female empowerment.

Keywords: Emirati women, Covid-19, pandemic, frontline, agency, empowerment, society, state

Being Nigerian Vs Being British/American: Identification and the Meaning of Integration Among Nigerian Migrants in the United States and United Kingdom

There is evidence that the United States and United Kingdom are major destination countries for Nigerian migrants, and that the governments of host countries increasingly ensure that immigrants embrace the cultural identities of the receiving country through different migration policies. With exposure to new and different social and economic systems, migrants may have to choose one of four acculturation patterns, namely, "separation", "assimilation", "integration" and "marginalization". The study seeks to: (1) understand how Nigerian migrants self-identify- i.e whether they identify with Nigeria more than the host country or otherwise-; (2) examine how Nigerian migrants understand the notion of "immigrant integration". Data for the study were drawn from 256 survey responses and 31 interviews (17 from the US and 14 from the UK). Statistical Package for the Social Sciences (Version 27) and Nvivo (Version 12) were used for data analysis. The majority (75.4%) of the survey respondents reported that they have embraced the culture of the host country, while also retaining cultural elements of their country of origin. Thirty-Six (14.1%) respondents reported that they have retained the Nigerian culture and will not imbibe the culture of the host country. The qualitative study also found that most of the participants reported allegiance to the Nigerian culture more than host country, and their justifications revolve around food, language/accent, citizenship, duration of stay, etc. Only six participants identified as British/American primarily due to their unpleasant experiences in the country of origin. Despite overwhelming identification with the country of origin, most of the interview participants conceive of integration in the colonial sense- as the process of "sinking", "copying", "learning", "adopting", "assimilating" and "adopting" the culture of the host country. The implications of the findings are discussed.

Muslim and Hijab Penalties in the United States and United Kingdom? the Case of Nigerian Immigrants

Following 9/11 attack in the United States, there has been a rise in Islamophobia in the West, and Muslim immigrants have been targets of different levels of discrimination and intersectional inequalities. Muslim penalty refers to the discrimination or inequality that immigrants experience because of their Islamic identity, while hijab penalty is targeted at Muslim women who wear the veil. This study explores the role of religion and gender (as well as their intersection) on the integration (labour market and health) of Nigerian immigrants in the United States (US) and United Kingdom (UK). The data for the study were obtained from 256 survey responses and 31 in-depth interviews. It was found that Muslim women significantly reported being terminated from a previous employment more than Christian women. Non-Muslim immigrants reported better health status than Muslim counterparts. The qualitative study shows that religion is not a barrier as long as immigrants remain "good Muslims" by hiding their Islamic identity (i.e not bearing Islamic name and not dressing in a manner that suggests identity with Islam) and holding "positive" and "liberal" views. Although there are laws against discrimination in the host countries, there are barriers that deter immigrants from reporting their experiences to the appropriate authority. Nigerian immigrants did not perceive much problem with discrimination based on gender or religion because they experienced worse situations in their home country where opportunities are allocated based on tribe, gender and religion.

The Dilemma of Existing Marital Relationships in Ghana: Experiences and Perspectives of Abused Women in the CAPE COAST Metropolis

Being married and have a peaceful, happy family life is one of the key values cherished by many individuals and ethnic/cultural groups in Ghana. Among all cultural groups in Ghana, including the Fante of Cape Coast, marriage is not only a bond between two individuals but also bonds the extended family members, friends, work mates, neighbours, church members and relations of the married couple. The close participation of these extended networks of family and friendship relations makes it quite difficult for married women, in

particular, to exit marital relations that have been marred by various forms of abuse and violence in the home. This paper examines the dilemma, experiences and challenges that women in the Cape Coast metropolis who have troubled marriages go through and the challenges they face when they decide to leave their marital homes. The paper examines the difficulties such women go through in arriving at the decision to leave their marital relationship against the background of pressures from their parents, extended family members, friends, work mates and church leadership within the context of a highly patriarchal society. Drawing on the lived experiences of some Ghanaian women, I discuss how extended family relations, culture and religion mediate women's decision making processes under abusive situations.

Bans, Gender, Unpaid Labour and Surveillance: Precarities of Nigerian Twitter Influencer Entrepreneurship

Several studies have drawn attention to the structural inequalities of online influencer entrepreneurship and culture, including pay rate, gender, race, sexuality, and class. However, not enough interest has been paid to these disparities in Africa and particularly Nigeria, where the social media economy is fast growing. Thus, in this paper, I present under-researched forms of precarity Nigerian Twitter influencers experience as observed from an online ethnographic research.

I focus on the temporalities of influence and explain them in four ways. Firstly, through Twitter's algorithms which bans or restricts Twitter influencers' accounts and the 2021 Twitter ban. Secondly, through the gendered disparities Twitter influencers are exposed to, which dictates who is likely to earn more or grow relevance. Thirdly, through the bottlenecks that mar influencers' work and income. These bureaucracies spike the price of campaigns and make influencers do more for less or nothing. Lastly, I provide insights into the physical harm or torture that can come to these influencers because of their social commentaries.

These nuances help in analysing new forms of authoritarianism arising on social media and their entanglements with the influencer economy. More importantly, they call for more academic and policy attention in Nigeria's and Africa's digital economy.

ALAKITAN, Muhammed* (University of Cambridge, Nigeria)

Ethics, Context and Fabrication: Doing Social Media Ethnography in Nigeria

For the past three decades, studies have been concerned about the growing use of internet-mediated research methods and their ethical implications. Whilst some scholars suggest that online research methods require a separate set of ethical standards from traditional ethics of research, some others posit that there is only a need for an extension and not separation. Nevertheless, it is generally agreed that the traditional methods for protecting research participants' privacy by anonymising data are no longer adequate for contemporary online ethnography where data, studies and reports are increasingly traceable.

In this paper, I adapt from my research on Twitter influencers in Nigeria and present two major ethical challenges of social media ethnography - privacy and choice of methods. I argue that studies should be more concerned with the process of making ethical decisions and meaningful representations of human experiences online than the pursuit of describing the 'objective reality', as ethical decision-making is a continuous reflexive process. I contend that this particularly allows unheard voices to be active in their meaning-making process. In addition, these nuances underline the researcher's obligation to protect research participants' privacy and choices before, during and after fieldwork. I build on studies on fabrication that posit that researchers should focus on processes of research in making ethical and methodological decisions. I conclude that a useful way to approach the ethical tensions that arise with social media research is by actively describing the methods of every ethical decision made.

ALAM, Jan* (Department of Sociology, Kohat University of Science and Technology, Kohat KPK, Pakistan)

Religious Identity and Politics: Exploring the Factors of Political Persecution Faced Religious Minorities in Pakistan

Religious minorities are victims of political isolation and oppression in societies where they are subject to violence and discrimination. This study was undertaken in a terrorism affected area to explore those elements that subjugate and suppress religious minorities' political participation and representation. To conduct an in-depth analysis, a qualitative inquiry was used for data collection and analysis. The researcher interviewed 13 Christians, 7 Hindus, 6 Sikhs, by using a purposive sampling technique and a semi-structured interview guide. The primary data were analyzed by using the thematic analysis technique. The researcher found that some of the underlying factors behind the political persecution are leadership vacuum, political neglect, post-election

negligence, vote dislocation, political ignorance, and political subordination. This study presented a framework for policymakers to solve minorities' political problems, and the future minorities' researchers to better understand their political oppression on local and international levels.

ALATAS, Imad* (University of North Carolina, Chapel Hill, USA)

"I Get to See My Kids Grow up": The Lived Experiences of Muslim Househusbands in Malaysia.

Patriarchal societies have dictated that men and women adhere to distinct gender roles. Men are expected to be the financial breadwinners of their family while women are expected to be the primary caregivers. However, families today are undergoing various transformations in their structures. These include a "switch" in gender roles where women are now the financial breadwinners while their husbands take on the role of a househusband. The experiences of being a househusband, and an ostensibly greater involvement in fatherhood, are mediated by various social categories such as cultural context and religion.

In Malaysia, a country with one of the largest Muslim populations, the idea of being a househusband is not widely accepted. *Quranic* verses are often used to justify the belief that sex roles have been divinely ordained such that the man is the main income-earner and head of the household. While research has been done on Muslim attitudes towards women's issues, gender equality, and gender justice, research on the experiences of men and Muslim attitudes towards househusbands and other family practices are less extensive. The role of househusband raises questions about how a Muslim man feels in relation to his family and broader Muslim society. It is also a vantage point through which one can study the experiences of men who do not subscribe to traditional ideals.

In a country where debates about Islam and gender are hotly contested, a study on Malaysia can serve as a theoretical contribution to the sociology of religion and gender by grappling with questions about how people "do" religion and gender today. My research questions are as follows: **How do Muslim househusbands in Malaysia generally perceive their role and social position? What challenges do they navigate internally and within the Muslim community as they assume the role of a stay-at-home father?**

ALATAS, Syed Farid* (National Univ of Singapore, Singapore)

Coloniality and Secularity Among Muslims: A Decolonial View of the Modern Human Condition

Discussions on secularism and secularity among anti-secularist Muslim scholars since the twentieth century have been dominated by concerns with the existentialist problems of disenchantment, despair and the meaninglessness of life, and the consequential desacralization of knowledge, as well as with that of the secular state, the concomitant marginalization of shari'ah law, and the evisceration of Islam of its public function. This paper engages in a critique of these concerns by suggesting that such positions against secularism and secularization adopt a narrow and limited view of the problem of the human condition in modernity. They tend to be articulated in abstract and ahistorical terms and generally fail to relate the problem of secularism to our modern political economy and social life. Specifically, the dominant Muslim narrative reduces the question of the modern human condition to secularism and secularity without reference to an omnipresent and seemingly inescapable coloniality. This paper provides a critical, decolonial account of the dominant Muslim anti-secularist narrative, a narrative that fails to identify nineteenth century secularization as the 'rescuing' of racist ideas from its sixteenth century articulation within Catholic theology, thereby ensuring the continuing entanglement of racism with colonial capitalism. The nineteenth century secularization of sixteenth century racist theologies is the proper context within which to understand the enmeshment of secularity with coloniality. The paper draws upon and engages with the writings of Syed Muhammad Naquib Al-Attas, Ramon Grosfoguel, Nelson Maldonado-Torres and Anibal Quijano, among others.

Community Action Workers Facing the Needs of Seniors in the Context of a Health Crisis. a Worker's Perspective.

This presentation's aim is to question the socio-territorial effects of COVID-19 on Quebec community organizations by showing the local dynamics of adaptation that they have shown to ensure support for the population, but also the difficulties they may have faced and the learnings and changes to put in act. The specific measures put in place to protect the elderlies, based on the reduction of physical and social contacts, have paradoxically exacerbated the difficulties of the elderly in accessing services and care, especially in rural territories already subject to these problems. In this context, community action

has been decisive in meeting social, material, or health needs. Our qualitative methodology is based on 114 semi-structured interviews with people aged 70 and over (63), family caregivers (18) and community workers (32).

The results of our work highlight the importance of community social intervention practices to improve the living conditions of seniors in rural areas, particularly in a pandemic situation. The commitment of different actors has allowed the emergence of local networks of mutual aid, solidarity and social innovations (Tremblay et al, 2016; Bouchard, 2011:7). While the responses provided for the community sector testify to the community's capacity for reaction, resilience and adaptation, they also highlight the characteristics and mobilization capacities specific to each territory, which do not allow for homogenization of the services offered (Alberio, 2015: 59). We will also focus on the work conditions of these workers who are often in precarious and low paid employments. Moreover, the massive loss of volunteers aged 70 and over, due to the health measures, questions the functioning of this social and territorial development model. It also highlights the over-responsibility of citizens, particularly the elderly, whose volunteer involvement in community organizations is essential to the survival of their community but also the workers of this sector.

In Search for Profit and Environmental Protection. a Possible Combination? the Fisheries Sector in Québec

In public opinion, fishing as an industry has very often been associated with various environmental issues. In this article, we focus on the environ mental discourse of fishers, as well as their behaviour and professional practices. Our reflection is based on a qualitative research project, which took place between 2016 and 2018 in the Gaspésie region of Québec, Canada. The professional «ethos» of fishers is strongly linked to nature and the environment. Their proximity to nature makes them witness to many environmental issues, thus developing an environmental awareness. The captain-owner's discourse on the environment revolves mainly around their vulnerability to changes in the ecosystem. Our analysis focused on two main categories of environmental behaviours: voluntary and imposed actions. Voluntary environmental actions are mainly motivated by the desire to protect the marine resource in order to ensure the sustainability of fishing sector. Environmental behaviour imposed by fisheries regulatory bodies mainly concerns fishing quotas, fisheries management zones, fishing gear and bycatches. The degree of acceptability of these imposed actions may greatly vary.

ALBERT, Mathias* (Bielefeld University, Germany)

What Would a Planetary Youth Study Look like? the Challenges of Overcoming Methodological Nationalism

While there can be little doubt about the desirability of planetary youth studies in face of global crises and challenges, its realization has to tackle the problem of a deep-seated methodological nationalism that characterizes much of youth studies. This methodological nationalism first and foremost pertains to national frames of (both qualitative and quantitative) data collection and associated research structures. However, it also pertains to a range of basic conceptual issues, such as most notably the difficulty of applying basic concepts such as 'generations' to a globally extreme variety of societal contexts.

The proposed contribution reflects on these difficulties, and on the possibilities of overcoming them, by imagining the project of an 'ideal' planetary youth study that would cover the global variety of livelihoods, social contexts, attitudes and perspectives of young people. In doing so, it will demonstrate that the challenges posed cannot be overcome by simply 'globalizing' best practice examples of national or regional youth surveys or studies. Rather, it argues that any planetary youth study as a project (and serving as a symbol for planetary youth studies as a field of inquiry) requires three basic components in order to overcome any underlying methodological nationalism: an adaptive and reflexive conceptual framework, a dynamic yet integrated data infrastructure, as well as a high degree of interactivity in terms of involving young people in the drawing up research designs. Following this depiction of an 'ideal' planetary youth study in substantial terms, the contribution will then reflect on how to possibly reconcile such an endeavor in existing research and research funding landscapes.

ALBERT BLANCO, Victor* (Université Toulouse 2, France)

Loving and Controlling Diversity. Neighbors' Associations and Religious Pluralism in European Cities.

Loving and controlling diversity: neighbors associations and religious pluralism in European cities

This presentation aims to examine the role of neighbors' associations in religious governance in cities. During the last decades, the religious landscape of European cities has become more pluralized, a process related to migration and international mobility. This diversity translates into symbolic and material markers in urban space, such as new worship places, public rituals and

celebrations or specialized shops and restaurants. Scholars have examined how religious communities "take place" in urban space, and they have also investigated the governance strategies displayed by public authorities. However, less attention has been addressed to the role of secular associations and urban social movements in the regulation of religion. Based on empirical qualitative research conducted in different neighborhoods (one working-class area and two gentrified ones) in Paris and Barcelona from 2016 to 2020, I examine the role of neighbors' associations in the regulation of religious expressions in urban spaces. These associations, who involve inhabitants from one neighborhood, are very active in contesting or promoting urban transformations, organizing public festivals and markets, or claiming for public services. By doing so, they also actively participate, alone or together with public authorities, to make (or not) a place for religious groups in urban space. I claim that these associations have an ambivalent role. On the one hand, they promote coexistence and diversity but, on the other hand, they can also display strategies to control (and even evict) religious expressions in complex urban areas.

RC53-724.2

ALBERTH, Lars* (Leuphana University of Lüneburg, Germany)

Absent Bodies and "Institutional Doppelgängers" – on the Generational Structure of a Family Court's Space

The practice-theoretical notion that children's bodies and spaces are only produced through participation in practices hides the generationally (i.e. age-group) inequality in the distribution of preconditions for participation in practices. The context of practices remains underspecified where the pre-selection of participation and marking of bodies is ignored. To illustrate these processes, I draw on the theoretical vocabulary of symbolic interactionism. This vocabulary is particularly suited to reconstructing the collective preparation of unequal participation of bodies, because of symbolic interactionism's notion of inter-situational trajectories of social organization. The physical absence of children in court custody proceedings in the United States serves as an empirical case. This lack of participation is only made possible by the establishment of an "institutional doppelgänger" of the child, embodied by adults in their capacity as guardian ad litem. The career of this institutional doppelgänger begins with the transformation of the vulnerable child's material body into a legal category, leads to a second step to a separation of the child's voice and its representation by adults, and finally ends in an alliance of the guardian ad litem and the court, that distances itself from the will of the child in favor of the legally prescribed sequence of custody solutions. These pathways lead to the structure of a public space, that at the same time claims to be the legal space of the child's best interest, while imposing a physical space that structurally excludes the child.

ALCAYAGA-ROJAS, Claudia* (Pontificia Universidad Católica de Chile, Chile)

Advancing in the understanding of the assembly of health care for people with chronic diseases in the social scaffolding built in Primary Health Care centres in Chile

It is proposed to explore the healthcare network of the chronically ill in the Primary Health Care Centres of the national health system. The project discusses the very concept of traditional medical care and conceptually expands the components it includes, incorporating people, technologies, materials, spaces, procedure manuals, instructions, and other elements that "act" in the network of care.

Analysing the care of the chronically ill in this way leads to conceiving their care in a different way to the conventional one, including other elements and given their agency, this also involves considering new dynamics, which can promote or hinder care. To this end, it is proposed to identify the elements -actors- involved and to know the existing links between them, which will make it possible to see the articulations of this care network.

Through a methodological design based on the central concepts and components of the Actor Network Theory, from the perspective of Bruno Latour and Annemarie Mol, it is hoped to apply a perspective that includes the notion of a material scenario that makes the phenomena possible to rescue the gaps in traditional observation, which will allow a better understanding of the process of care in primary care. The methodology contemplates four dimensions that correspond to different fields of observation and data collection linked by the care network of the Chilean public health system. The first field addressed was the managerial level, through participant observation at the Ministry of Health in one of the departments that elaborates and implements the care model through technical guidelines, administrative suggestions, training of territorial teams, etc. Specifically, the processes of elaboration of one of these documents were observed, which yielded interesting observations of the alternative processes to the creation of the text.

An Assessment of Climate Change Vulnerabilities: The Case of Mongolia

According to the Intergovernmental Panel on Climate Changes (IPCC), vulnerability is defined in terms of persons living in areas in which climate hazards are increased in frequency and severity. As such, the IPCC estimates there are around 3.3 to 3.6 billion that could be considered as vulnerable persons. Over the last 80 years, Mongolia's average annual temperature increased by 2.25°C and the country is facing some of the most pronounced climate risks including rapid desertification, water scarcity, changing precipitation patterns and seasonal intensification of extreme weather events. Natural vulnerabilities are compounded by socio-economic and behavioral patterns that are highly dependent on climatic conditions, such as livestock husbandry and arable farming.

Drawing on a nationally representative survey conducted in Mongolia between September and November 2022 by GGGI, CCRCC and IRIM researchers, this paper aims to understand the socio-economic and geographic vulnerabilities of the various population groups in Mongolia in the context of climate change. First, using a simple vulnerability index, the paper looks at differences between vulnerable and less vulnerable groups in terms of their knowledge about causes and effects of climate change, impacts of environmental changes on their livelihoods, capacity to cope with climate-induced disasters, access to information and differing needs to adapt to climate change. Second, the paper analyses potential relationships between demographic and socio-economic vulnerabilities (e.g., age, gender, livelihood, income, employment, education, and migration status) and geographic vulnerabilities (e.g., rural, urban, ecological zones and hazard prone areas) of households and individuals.

As such the paper aims to contribute to broader discussions about to what extent inequity and poverty hinder adaptation and resilience by excluding people from socio-economic progress, and to what extent disadvantaged and vulnerable groups are vulnerable to climate change compared to less vulnerable groups within the country.

The Socio-Economic Impacts of COVID-19 on Individuals, Households, and Communities in Timor-Leste

This paper presents results from the socio-economic impact assessment (SEIA) conducted among the population in Timor-Leste during the COVID-19 pandemic. Based on the findings of the joint UN-Government nationwide survey conducted with 4292 households through a nationally representative face-to-face interviews between July and September 2021, the paper explores the impacts of COVID-19 on livelihoods, employment, access to education and health services, food insecurity, and social cohesion and response measures taken by the Government of Timor-Leste. Analyses were conducted to shed light on various income, gender and geographic inequalities and other pre-existing social vulnerabilities. Timor-Leste was hit by an unprecedented tropical cyclone and large-scale floods in April 2021 affecting 33,865 households nationwide. This presented various methodological challenges to the impact assessment of COVID-19.

The survey finds how the COVID-19 situation has exacerbated underlying issues within the country, including large gaps in development between rural and urban settings, the effects of climate hazards, and limited access to basic services. The study reveals that the negative impacts of the pandemic hit hardest the poorest households, households outside the capital municipality of Dili and households with high levels of social vulnerability, but the relatively well-off households also experienced losses and challenges. The study finds although the impact of COVID-19 was significant on various objective well-being indicators there was no clear impact on subjective well-being. Majority of the respondents felt positive affect during the COVID-19 restrictions in 2021 yet there were significant differences in terms of happiness based on various socio-economic background of the respondents.

Based on the results, authors are keen to discuss: ways to overcome methodological challenges when analyzing the impacts of two major events, in this case COVID-19 and a natural disaster; relevance and accuracy of subjective well-being indicators in crisis situation; opportunities for further in-depth analyses using the survey data.

Unpacking Philippines' Zero Waste Community Sites As a Pathway for Degrowth in the Global South

The socio-ecological crisis has brought about various pathways to rethink development and its consequences especially in relation to neoliberalism and its excesses. In the more developed countries, the word "degrowth" has entered the vocabulary of activists and academic circles since the early 2000s. Over the years, degrowth practices have ranged from living the principles of degrowth, rethinking society, acting politically, creating alternatives, fostering connections and unveiling the self. As with any other development alternatives, degrowth merits critical examination. Experiences of practicing degrowth in the Global North will be different from that of in the Global South. As a global alternative path towards socio-ecological transformation, degrowth needs to be explored because it engenders alternative conceptualizations and practices of development that highlight its cursorily examined yet significant social and cultural dimensions.

While alternative practices of development are deemed and oftentimes lauded for being more nuanced, participatory, and just, a deeper analysis on how it is being diffused on the ground merits a study. Is degrowth possible in the Global South? Are cases of action contributing towards degrowth already flourishing in these countries? Some indications of this trend are apparent in, for instance, in experiences of Global North countries. These questions deserve attention developing on the critiques of growth that have been an intrinsic part of resistance by key social movements and progressive organisations in the South for a long time but have properly not been identified as such. The paper explores these questions and the intersections of alternative development in the Global South through degrowth. Using critical socio-institutionalist frameworks and through methods like ethnography, it tries to situate these from the lens of community-led zero waste management project sites in the Philippines.

ALENDA, Stephanie* (Universidad Andres Bello, Chile)

Constitution-Making in Chile: The Tortuous Quest for a New Socio-Political Order

On 25 October 2020, 78% of the Chileans approved the proposal to change their constitution adopted in 1980 during the Pinochet dictatorship. This text has been amended almost 60 times since 1989. 79% also agreed to have a directly elected constitutional convention, with gender parity and reserved seats for indigenous peoples. The Constitutional Convention delivered the new constitutional text on July 4, 2022 after a year-long process, triggered by massive protests in 2019. The proposal is progressive and innovative, advancing rights for women, indigenous people and the environment. These aspects reflect the influence of decolonizing discourse, post-human concerns and indigenous epistemologies. However, the constitutional project is resisted because of its "maximalism". In the polls, the "No" option leads ahead of the referendum that will take place on September 4, 2022. Using a political-sociological approach, we aim to analyze this fluctuating process as a fluid, discursive and combative realm of competing interpretations. This shows how truths are construed and constructed, what their power effects are, and what kind of resistances they invite. We will study constitution-making as an area of contentious politics of competing discourses and interpretations shaped by various groups' diverse interests, ideas, and preferences in an environment of high polarization. This implies approaching the complex power relations between dominant and vulnerable social and political actors and the consequences of this process to redistributive and identity politics.

ALEXANDER, Jeffrey* (Yale University, USA)

How the Civil Authority of Office Saved American Democracy

This paper will demonstrate how "civil" authority regulates the exercise of organizational power in a democratic society. After making a theoretical argument about such regulation, in terms of Civil Sphere Theory (CST), I will introduce two empirical cases that illustrate how officials' civil conceptions of their obligation caused them to resist the illegal and corrupt exercise of authoritarian power in the weeks following the contested 2020 Presidential election in the U.S. In doing so, I offer a new explanation for the survival of American democracy during one of the most critical and dangerous moments in American history. Between November 3, 2020, and January 6, 2021, a corrupt sitting President unleashed a furious assault designed to compel election officials to reverse the national vote. Key state and national officials successfully resisted these authoritarian efforts. Without their resistance, a powerful President and his prebends would have hijacked the electoral process, triggering a spiral of chaos and civil conflict may eventually have undermined key beliefs and practices of U.S. democracy. In *The Civil Sphere* (2006), I conceptualized "office" as a critical regulatory institution of the civil sphere. If civil power is to be sustained against state power, office authority needs to be exercised in democratic way. While "office" is, indeed, a form of rational-legal authority (Weber), it involves obligations that are horizontal

(acting on behalf of citizen others) and not only hierarchical (obedience to impersonal authority). What U.S. citizens learned after the 2020 election — but sociological theory has not yet metabolized — is the significance of such a civil approach to office. After explaining this significance theoretically I will examine the actions and discourse of two key resistants -- Brad Raffensperger, Georgia's Secretary of State, and Mike Pence, America's then-Vice-President.

Resilience in Recovery: Understanding Long Term Recovery Groups Coordination of Unmet Needs

The United States and the rest of the world are experiencing more devastating disasters at a higher frequency, which has been argued as a direct result of climate change. Socially vulnerable communities- such as low-income households, people of color, female-headed households, persons with access and functional needs, and non-native language speakers are often disproportionately impacted due a legacy of segregation and racism that dictate where they live- which is often in the most hazardous areas with low quality housing infrastructures. Due to the inequitable government processes that continue to generate and exacerbate racial and economic inequality following a disaster, these communities are either left with unmet needs- and forced further into poverty- or these needs are addressed by the community itself.

Nonprofits are a crucial component of the social safety net for socially vulnerable populations during disasters and non-disaster times. These organizations support recovery of the needs left unmet and also respond to all disasters that are too small to reach the threshold for a federal disaster declaration. One central way they do this is through Long-Term Recovery Groups (LTRGs) that operate "unmet needs tables". The efforts of these groups include construction coordination, case management of unmet needs, and spiritual care via volunteer and donated resources. There is currently no database to quantify the existence of these organizations. This presentation displays our preliminary data collection and provides information on the existence and extent of LTRGs.

Glitches in the Discourse of Aspiration: Between Enterprise and Compromise

The discourse of aspiration, which promotes a future oriented, employable, and accountable subject, has been globalized, popularized, and embedded in "Western" school education and among iGeneration youth. In recent years, sociological inquiry has criticized the discourse of aspiration for fostering neoliberal ideologies which blur and disregard social inequalities. This study challenges the common understanding of the neoliberal discourse of aspiration as a coherent structured ideology, and asks: How do social actors make sense of aspiring selves despite social limitations and inequality and what are the discursive tools through which they match future trajectories with everyday experience? We followed the discourse of aspiration in a qualitative study among 60 educators and recent graduates to better understand its articulations in everyday life. We draw on Michel de Certeau's (1984) "practice of everyday life" to introduce the concept of "glitch" as a tool for analysis in the sociology of culture. We offer an analysis of cultural glitches as lexical anomalies and disruptions in the consistency of the neoliberal logic underlying the discourse of aspiration. Findings show that while the discourse of aspiration is broadly embraced within Israeli education and among youth, glitches from the discourse emerge when its neoliberal logic confronts various life circumstances. We identify three main glitches: glitching from "the sky is the limit" by lowering the aspirational sky, glitching from future orientation by focusing on the present, and glitching from individual accountability by yielding to the force majeure. We argue that despite these disruptions in the manifestation of the mythic language of aspiration, the neoliberal logic of accountability and employability is strengthened rather than challenged. Our research presents the concept of glitch as a tool for analysis and contributes to the sociology of the future and the literature of self-making processes in the iGen era.

House-Sitting and Opportunities for an Infrastructure of Care in Unequal Cities

The increasing social and infrastructural inequalities, including the growing issue of unaffordable housing, is forcing many older Australians to take on unconventional pathways and experiment with alternate means of home-making, such as house-sitting. This research is built on Tronto's (1993, p. 103) definition of care as an eco-system, embodying both human and non-human relations in a 'life-sustaining web', and explores opportunities for care that

emerge from practices of house-sitting. Drawing on semi-structured interviews with older house-sitters (aged 50 years and over), the research aims to answer the question: 'is house-sitting a housing system that cares?'

Findings suggested that house-sitting has the potential to perform as an infrastructure of care within the context of a vastly inadequate income support and inefficient housing system that is particularly affecting older people. House-sitting was found to provide a rent-free accommodation and an opportunity for the sitter to experience a state of being at home, although on a temporary basis. Less financial burden also had the potential to increase the sitter's capacity for care-related expenditure. House-sitting as a space of care however presented an interplay between the relief from financial stress alongside the increased stress caused by housing mobility, insecure tenure and a lack of a caring governance- the power imbalance between owners and sitters caused by a lack of legislations and policies about house-sitting practices- that put older house-sitters, particularly those who are on verge of homelessness, in a vulnerable position, leading to negative impacts on their wellbeing. This is an area that has been largely under-researched and there is a need to conceptualise house-sitting within a larger context and focus more on the meaning and function of housing and home-making through non-conventional pathways.

ALIOGLU TURKER, Ozlem* (Ankara University, Turkey)

A Visual Analysis of Syrian and Ukrainian Displacements on Conventional and Social Media

In the nospan of a decade the world has witnessed mass displacements due to wars and other regional instabilities. The impacts of current humanitarian crises are multiplied by mass media, internet and incredible speed of social media. The impact works as the two sides of the same coin. On the one side, almost immediate spread of images of human suffering arose international public reaction and eventually forces states and other international actors to improve policies. On the other side, visualization of refugee populations on their way to asylum, triggers anti-immigrant sentiments in the receiving societies. Fake images, political manipulation and alienation are at work in both processes. Increased accessibility of camera broke down the monopoly of photojournalism but at the same time the connection between seeing and believing is highly eroded. Nevertheless, among numerous images flowing from several resources a few come to the forefront, centralize the public debate and settle in the visual memory.

This paper focuses on the illustrative photos of recent major displacements of Syrian and Ukrainian populations. The prominent images which have become the common visual memory of public will be analyzed with references to the actual social phenomena. The intention is to wove a cross-disciplinary path between sociology of migration and visual sociology. Mass displacements and refugee 'crises' are controversial and highly debated issues of current world politics. Comparative analysis of the two major displacements via visual material would be an attempt to give insights to both sub-disciplines. The perspectives of conventional mass media and social media, the interaction between the two are also questioned. The paper seeks to analyze how social phenomena effect the visual and how the circulation of visual materials/images shapes social phenomena with the multiplier power of current communication mediums.

ALISAUSKIENE, Milda* (Vytautas Magnus University, Lithuania)

The Perception of Gender Equality Among Women of Faith in the Baltic States: Driving Tractors or Sharing the Childcare and Housework?

This paper discusses the preliminary findings from the fieldwork among women of faith representing various religious traditions in the Baltic States – Lithuania, Latvia, and Estonia conducted in 2021 within the framework of the Baltic Research Programme project „Religion and Gender Equality: Baltic and Nordic Developments". Project contract with the Research Council of Lithuania No is S-BMT-21-4 (LT08-2LMT-K-01-036).

The analysis of 120 interviews among other topics also discussing the perception of gender equality shows the reflected patterns of gender roles in various religious traditions and the influence of social characteristics of informants like age, and education on them. The location of the retrieved data in the social and historical context of gender equality development in the Baltic States allows for identifying certain features of the perception of gender equality among women of faith. The interviews reveal generational differences rather than those of religious tradition. Communism experience created resistance towards gender equality ideals among interviewed women, while the informants who experienced sociopolitical transformations from communist to the neoliberal socioeconomic regime had a more relaxed and tolerant view toward gender equality. The youngest cohort of informants born and raised in the independent Baltic States supported the gender complementarity idea expressed in their religious traditions but applied gender equality principles in childcare and housework on a daily basis.

ALLASTE, Airi-Alina* (Tallinn University, Estonia)

Becoming (digital) Citizen in Estonia. New Migrants' Perception of Their Integration and Participation

The digitalisation of contemporary society has changed the political agency as well as ways of being a citizen. It has been argued that there has been a cross-national shift in the post-industrial democracies from a dutiful citizen to an actualizing citizen model favouring loosely networked online participation and favouring social media as a source of information. 'Digital citizenship' can be both an aspect of and a precursor to political participation; that is, something that enables individuals to fully participate in society. The importance of the politics 'of what we are saying and doing in social media' and the use of the digital environment by governors to enhance citizenship is highlighted.

The objective of this study is to investigate how young new migrants become citizens in Estonia. Using evidence from the qualitative interviews the paper focuses on the meanings informants give to their experiences in integrating and participating in Estonian society.

An in-depth micro-level analysis is based on interviews with new migrants aged 16-29 who have been in Estonia for more than a year and with open plans for the future. The sample consists of secondary school pupils or university students from different countries of origin from Europe, the USA, the Middle East, and Asia. Interviews were conducted from October 2021 to April 2022. All interviews have analyzed using the combination of open and axial coding with the software Nvivo.

Estonia labelled as the 'first digital nation', has many advantages of facilitating new migrants' adaption. On one hand access to various E-services and transparency of the state, increase the trust of the institutions and potentially encourage participation. On the other hand, the conditions for participating are highly dependent on cultural integration into the host society and social networks in Estonia, which could be enhanced in digital environments.

ALLASTE, Airi-Alina* (Tallinn University, Estonia)

Meaning, Motives, Contexts and Risks of High-Intensity Drinking in Estonia

This paper is focusing on the alcohol culture from a comparative perspective. Comparative research strategies can be divided according to their interest and focus. They might seek generalizing, universal knowledge, but also unique knowledge on a specific topic. The paper discusses the results of the alcohol study based on using images for comparative analyses. Reception analytical group interviews (RAGI) use images such as video clips as an activation device. Images in this context are not treated as representations that reflect reality and they do not necessarily imply awareness of who is representing what. The concept of 'images' within the framework of RAGI describes a perspective-cognitive moment in action rather than goal-oriented and normative. Film clips in this context are considered as knowledge stock of the world we live in, often imaginary rather than based on experiences. The empirical part of this paper is based mostly on 8 focus group interviews (41 participants) conducted with the RAGI method in Estonia, but using the reference points from the material of the other countries that participated in the study. The paper discusses the meaning of high-intensity drinking, different motives and contexts for alcohol drinking and risks related to it among young adults in Estonia, highlighting the particular cultural aspects in contrast to Denmark or Italy.

Gestational Surrogacy in Spain: Online Markets and Discourses

International commercial surrogacy (ICT) is an increasingly transnational and 'cross-border' phenomena that have consolidated in Europe. The disparity of the legal policies and jurisdictions has enabled to flourish a range of agents that offer services to "guide" the process of intended parents in countries where surrogacy is prohibited. The paper contributes to explaining the modus operandi of such entities that act as gestational surrogacy brokers. We analyse 11 entities advertising in Spain that promote surrogacy in countries abroad. Through discourse analysis of their online public information, we propose a typology based in their narratives: 1) For-profit surrogacy brokers selling legal and medical expertise; 2) For-profit surrogacy entrepreneurs selling personal experience (former parents of surrogate children), and 3) Associations that act as intermediaries for their associates and political lobbyists. Our findings show that this active sector still rising even in the context context where gestational surrogacy is officially banned, COVID-19 still existing and regional conflicts have arised. We consider this can be useful for further analysis of countries were similar brokers have emerged. This is a sector accountable to no one, with marketing mechanisms maintained in the borderless realm of the World Wide Web. This agents makes possible the economic exploitation of women body promoted and purchased in a globalized, transnational bio-market.

SDG Rural Labs: Approaching Rural Contexts to Social Citizen-Science.

The ODS RURAL LABS project is based on a complex systems perspective (García 2000, 2006), participatory action research and citizen science. From this approach, it is essential to recognize that social problems have a complexity that transcends scientific disciplines and that a diagnostic and prospective analysis is necessary to know what to intervene and how to complement knowledge to make transformations in the social system.

The mission of the ODS Rural Labs project is to contribute to the implementation of the ODS in rural and peri-urban contexts through participatory action research, generating dynamics of collaboration and citizen science with a community vision, involving different sectors of the population and university experts.

The project seeks to consolidate the proposal to use the context of the ODS Rural Labs project, which is developed in rural contexts in Spain and Colombia, as an input to develop practices linked to the service-learning perspective, exploring the concept of citizen science. To do this, we promote dialogue between teachers and non-teaching professionals, in order to build a comprehensive perspective and strategies that take advantage of the environment of ODS Rural Labs, the territories in which it affects and university student practices. The team involved includes teachers from different disciplines. The professionals involved are members of local associations, youth technicians, specialists in the field of culture and local entrepreneurship projects. From this experience, the paper reflects on the systemic perspective applied to Group and Community Empowerment.

ALMEIDA, Eduardo* (Universidad Complutense de Madrid, Spain)

Weaponized Development and the Deterritorialization on Indigenous Peoples in Mexico

In the middle of the chameleonic Mexican polity, development has become a war against indigenous populations. From the aggressive rise of neoliberalism in the 1990's under Carlos Salinas' presidency to Lopez Obrador's administration, a number of interconnected infrastructure and extractive megaprojects have been underway in the whole country and most of them have faced strong resistance, specially in indigenous territories, a resistance that has been met with sophisticated forms of containment and repression by the Mexican State.

In the past few years there has been a change in the presidency's discourse under a renewed liberal-nationalist narrative of progressivism, but beneath lurks the same industrialism that oscillates between neoliberalism and statism. From the Alpha-Omega and the Puebla-Panama Plan alongside NAFTA to the infrastructure projects of López Obrador's 4th Transformation alongside the USMCA, an infrastructure gigaproject of energy production and transmission, of merchandise and tourist transportation, and of resource extraction has been attempted by the last six presidential administrations, all of it directed by a notion of development that prioritizes industrial production, urban growth and international trade.

Parallel to that gigaproject there has been an undeclared policy of deterritorialization of indigenous peoples. Through social policy programs constructed both as humanitarian aid and social containment projects, and through a growing process of militarization and paramilitarization, indigenous territories are under siege. The State and market dynamics have been able to adapt to the narrative of cultural and racial diversity as long as it is individual and detached from a specific territory. Through processes of assimilation within the "mestizo" nationalistic identity, folklorization of diversity o violent displacement, there is a trend towards the extermination of indigenous peoples as territorialized communities.

Development has become a weapon of the Mexican State against indigenous peoples.

Perceptions of Use of Complementary and Alternative Therapies in Women with Breast Cancer

Breast cancer is the most prevalent cancer in the United Kingdom, and most people with this cancer, mainly women, have been treated with chemotherapy by medical doctors. Chemotherapy, in turn, has caused severe side effects, yet relatively little UK research has been carried out into the use of complementary and alternative therapies to tackle these side effects or simply to improve the quality of life of breast cancer survivors. The pilot study presented here aims to understand the perceptions of the use of CAM in women with breast cancer, by addressing four main research questions: (1) What CAM therapies do women with breast cancer use? (2) Why women with breast cancer have used CAM? (3) How women with breast cancer have used CAM? (4) What women with breast cancer have thought are the benefits of using CAM? This paper will present the findings regarding the third question. Qualitative semi-structured interviews were conducted with 9 female breast cancer patients in March and April 2017 at Brighton and Sussex University Hospitals Trust. The interviews have been analysed using a general thematic analysis guided by a grounded theory. Two main themes have emerged so far: (1) CAM as a self-help approach, and (2) Mixed use of the public, third sector and private CAM services. The concept of 'Internet optimism' and the Cancer Act 1939, which limits the advertisement of cancer treatment to certain health professionals, will be used to help discuss and explain these findings. This will enhance our understanding of CAM use by cancer survivors, of the power relations between orthodox health professionals and CAM therapists and will potentially form the basis for a major impact case study, which varying types of healthcare professionals will be considered.

ALTMANN, Philipp* (Universidad Central del Ecuador, Ecuador)

A Particular Tradition - Sociology in Ecuador in the Latin American Context

Sociology in Ecuador is connected in a particular way to the Latin American context. While it was part of some of the major developments -the Latin American Association for Sociology, the debate on dependency theory- and produced some of the most influential Latin American sociologists -Agustín Cueva and Bolívar Echeverría-, Ecuadorian sociology developed a particular tradition that cannot be simply understood from other Latin American experiences. For once, academic sociology started in Ecuador only in 1915, decades after many Latin American countries, based on different references, namely Spencer and Tarde. Then, in Ecuador never developed the empirical sociology that during the 1950s and 1960s defined sociology in Mexico, Argentina, Chile, etc. Instead, it jumped directly to critical sociology in the 1970s, marked by a Marxist approach and a continental debate. This presentation will trace the processes of institutionalization in Ecuadorian sociology and highlight the relationships or lack of them to other Latin American traditions. In order to do so, it will focus on the development of schools of thought around certain pioneers that define a canon and topics of interest, as well as the breaks between different schools of thought in Ecuadorian sociology between the 1910s and the 1980s.

ALTMANN, Philipp* (Universidad Central del Ecuador, Ecuador)

Discursive Shifts and Strategic Alliances in the National Indigenous Uprisings in Ecuador in 2019 and 2022

After a crisis of over 15 years, the Ecuadorian indigenous movement surprised everyone with its strong participation in the national strike of October 2019, turning it into a national indigenous uprising. As such, it was connected to the civil unrest of that time in Colombia, Chile, and other Latin American countries. While this national strike began with transport workers and the indigenous joined in later, in June 2022, the indigenous movement was the leading actor. They organized and upheld the mobilization for almost three weeks. However, compared with October 2019, the demands of June 2022 downplayed traditional indigenous concepts. While October 2019 was defined by demands for a post-petrol society and respect for indigenous territories, June 2022 focused on more comprehensive social demands to stop neoliberal politics, broader access to education, more and better-paid jobs, etc. This shift

in demands corresponds to a shift in the alliance politics of the indigenous movement. In 2019, the indigenous movement connected to international allies, primarily related to the discourse around degrowth and "leave the oil in the soil". In 2022, these ideas were largely absent. Instead, demands were shared with the worker unions and other national actors, preparing a national alliance. With this, the relationship between the indigenous movement and the state also changes. The national strike of 2019 was connected to the politics of (territorial) autonomy that prevailed during the long crisis of the indigenous movement after 2001. The uprising of 2022 engages the state more directly, demanding not only respect for indigenous autonomies but almost exclusively a different state politics.

ALTROGGE, Judith* (Institute of Migration Research and Intercultural Studies (IMIS) Osnabrueck University, Germany)

Transnational Activist Struggles Against Deportation As Political Remittances to the Gambia

Between 2014 and 2017, many Gambians left their country under dictatorship to look for greener pastures elsewhere. Immigration numbers from the tiny nation rose high particularly in Italy and Germany. In late 2016, the Gambian people voted their decades-long dictator Yayah Jammeh out of office. The ensuing transition government promised to focus on a re-newed democratic development path. With Jammeh gone, European plans to deport Gambians erupted quickly. However, after a short-lived rise in deportations, the government permitted chartered deportations from the EU, even imposing a unique moratorium in 2018, eventually accepting Schengen visa sanctions in 2021.

These refusals started after civil society activities and public turmoil incidents, both in the Gambia and Europe, particularly Germany. These included demonstrations and public shaming of the Gambian government, blaming them to sell 'their' migrants' rights for European bribes. While in deportation arrangements, the origin country has a comparatively more passive role than the destination country, the Gambian activists were successful in addressing their own government, demanding the self-claimed democracy to defend its citizens' interests abroad.

In this paper, I show that the protests were successful mainly due to their transnational nature, with present migrants in Germany and activist counterparts in the Gambia joining forces while formerly deported migrants not prominently involving themselves. These anti-deportation struggles cross the categories of anti-deportation movements in destination countries on the one side, and post-deportation movements in origin countries on the other. I discuss them as a specific form of political remittances to the young democracy.

The analysis is based on field research in Germany and the Gambia conducted between 2017 and 2021. It considers qualitative interviews with Gambian and German civil society actors, government representatives, representatives of European countries and International Organizations, as well as secondary sources in newspapers, social media and policy documents.

Yes We Can!? a Theoretical and Empirical Examination of the Concept of Building Resilience through Cross-Sector Cooperation in Light of the Ongoing COVID-19 Crisis and Disasters Yet to Come

The ongoing global COVID-19 crisis poses a series of multidimensional cascading challenges to civil society and governments around the world: functional, identity-related, cultural, economic, structural, intra-and-inter-organizational, and more. The cross-sector cooperation is crucial both for effective preparedness and for handling with the above challenges. Our study focuses empirically on the Israeli case, while in parallel strives to formulate culturally-sensitive, nuanced and globally applicable policy recommendations for disasters yet to come. In 2017, as part of an inter-ministerial process led by the Israeli Prime Minister's Office, the concept of "Building Resilience Through Partnerships" was designed to formalize and strengthen cross-sector cooperation before, during and after various types of disasters. Our research examines the interrelationships between the three sectors (public, private and non-profits) during the COVID-19 pandemic using the neo-institutional approach and in doing so we analyze to what extent the "Building Resilience Through Partnerships" model was implemented, what are the main causes for selecting the path taken and what intermediate multidimensional lessons and best practices could be cautiously drawn from the above for the ongoing coping with the COVID-19 crisis and various types of disasters yet to come. The research is based on a comprehensive systematic review and an empirical analysis through semi-structured interviews with key stakeholders from the three sectors. The main take-away messages and policy recommendations of our research are intended to contribute both practically and theoretically. Theoretically speaking, we deepen the analysis of the factors related to the resilience building through cross-sector cooperation, effective preparedness and inclusive mitigation strategies in the face of disasters Practically speaking, our culturally-sensitive, nuanced and globally applicable policy

recommendations are aimed to foster inclusive and effective cross-sector communication and partnerships throughout the COVID-19 crisis and (unfortunately, potentially, multiple) disasters yet to come.

ALVARADO MENDOZA, Arturo* (El Colegio de Mexico, Mexico)

Governance of Metropolis: A Comparative Study of Mexico City and Sao Paulo

We present a comparative study of different forms of urban governance in two metropolises, Mexico City and São Paulo, and addresses the challenges of governing security where there is strong presence of organized illicit actors, and citizen's participatory practices demanding protection of the state. Who governs these two cities and how do they do it? What is governed? Do urban governments today have the capacity to solve these challenges in the face of profound political changes that have altered the structures of governance and ways in which cities are governed?

Urban governance could be defined as a process of coordination between actors and institutions in fragmented and uncertain environments (Le Galès, 2011; Le Galès and Ugalde, 2018). This is a matter of collective action *between* rulers, citizens and illicit actors. Democratic governance is a way of regulating legitimate violence and limiting other forms of unlawful coercion. To go beyond this argument, we propose that in most metropolises there is no hegemony of a single group, just as not all metropolises can claim sole territorial sovereignty, as it is often shared by several actors, which feeds an idea of disputed governance. We also propose that unlike the theoretical proposal in relation to the governments of nation-States, cities are not equivalent to them, nor do they have the same institutional, normative and power-related organizational instruments. To explain our proposal, we built on the idea of spatial regimes, where we can find certain spaces under the control of the government or the citizenry, where an acceptable legal regime operates, as well as other places under the territorial control of criminal groups where they exert coercive control of society that rivals government. Governance is better understood as the articulation of spatial regimes at the micro and macro level that produces hybrid regimes of governance.

Police Strategies after Pandemic. between Abusive Authoritarism and Community Approaches Estrategias Policiales Después De La Pandemia Covid 19: Entre El Autoritarismo Abusivo y El Acercamiento a Los Ciudadanos

Police strategies in mayor metropolis is becoming more complex, particularly after the covid19 pandemic. This reveals several persistent violent and abusive police practices against citizens in the world. As a consequence, some police authorities in metropolitan areas are trying to reform its organizations, to make more responsive to citizens needs and reducing abusive practices. Some of these practices are based on community police strategies. The paper analyses this strategy in the metropolitan area of Mexico City and evaluates 1st. whether or not it is more effective to improve community-police relations; 2d. to reduce crime and 3d. to solve the persistent problems of abusive police practices, particularly after the pandemic, where a militarization and increase authoritarian security practices are implemented by states.

Las organizaciones policiales en la mayoría de las metrópolis se ha vuelto más compleja en años recientes. En particular la epidemia de covid19 en el mundo produjo importantes re-acomodos de las estrategias, así como reveló muchas prácticas abusivas y lejanas a la protección de la ciudadanía. En consecuencia algunas metrópolis están implementando programas de policía de proximidad, de acercamiento y promoción de la participación ciudadana. El objetivo del trabajo es comparar estas prácticas en el entorno metropolitano de la Ciudad de México para mostrar: 1o. la efectividad de estas prácticas para construir mejores relaciones de confianza con los ciudadanos; 2o. reducir el crimen y 3o. resolver los ancestrales formas de abuso de las prácticas policiales, particularmente hoy día del incremento de gobiernos autoritarios, populistas y pro-militarizantes . El análisis es parte de un estudio de las nuevas estrategias de policía en metrópolis del sur global.

Climate Change and Sustainability Education: A Fragmented Conceptualization and the Pressing Reorganization of the Latin-American University

Sustainability education oriented towards climate action challenges Latin-American universities in three levels -institutional, organizational, and operational-. The Latin American case is difficult given its heterogeneity, and its diverse and complex social reality. This paper aimed to analyse the conception of climate change in the Latin American University to explain the categories with which sustainability education could stimulate its communities towards

climate action. The methodology was qualitative; 24 universities from six Latin American countries -Argentina, Chile, Colombia, El Salvador, Mexico, Peru- were selected through a convenience sample; 75 semi-structured interviews were applied in four dimensions of climate change -knowledge, perception, attitude and incidence-; the sustainability education model was analysed through the structure of its institutional policies, the name of the learning units of its educational programs, its linkage model, its research projects aimed to mitigate climate change and the social intervention projects. The main findings showed a fragmented concept of sustainability, three types of climate adoption -awareness, consumption, and action- and four common categories that affect sustainability education -new technologies, digital competences, interdisciplinary training and expanded intelligence-, which indirectly and unsystematically promote the climate action. The multiple social realities in the universities in Latin America do not show its climate action. For instance, in top-level private institutions, the sustainability education has a strong institutional approach -their green campus projects had been successfully implemented from renewable energies to sustainable buildings, and the sustainability education in their educational programmes is transversal-. However, in most of the public universities, sustainability initiatives have a strong individual approach. In some public campus, the LED lighting systems are barely changing or being automatised, nevertheless, their communities intervene in rural territories through eco-technologies to improve dwellings that are not capable of maintaining a basic line of welfare or implementing sustainable agricultural practices.

JIMÉNEZ AGUILAR, Francisco (University of the Basque Country, Spain)

Anti-Feminism, Secularization and Gender in the Spanish Far-Right Vox

In just two years, Vox passed from being a residual party since its creation to becoming the third political force in the country. Although the reasons for the rise of Vox are varied, its strategies to present itself to public opinion, its ideology, and its discourse represent the culmination of the development of different forms, groups, and forces of the extreme right in Spain over the last two decades. In this presentation, I will analyze the antifeminism of Vox as a structuring element of its ideology and as a clear example of the evolution of its political discourse concerning the traditional Spanish extreme right. Through secularization in its conception of the relations of gender and combining traditional and new types of masculinities and femininities, they have adapted its antifeminism to contemporary realities. In addition, I will also show how this antifeminism has centered its discourse during the COVID-19 crisis, becoming again the place from where they articulate their strategies, claims, and mobilizations.

From Moors to Muslims: Categories, Controversies and Critical Events in Spain

How and when did the term "Muslims" come to be used as a category in the Spanish public debate, what critical events put it to the fore, and what are the main controversies about it? By answering these questions, we aim to sketch the discursive atmosphere in which the individuals object to designation have strived to contribute their identity elaborations, their standpoints, activities and organizations as civil society actors in the last decades.

Our presentation offers a content review of the public debate generated by each critical event on Muslims, based on two main sources: academic publications and press articles from the two most read national newspapers, leftist *El País* and conservative *El Mundo*. For most recent events, relevant social media (Twitter and Instagram) are analyzed. This qualitative analysis allows for a description of the arguments coined by academics and journalists, but also by politicians and civil society actors. From their discourses the categories and tropes that have dominated the framing of Muslims in Spain emerge.

Two main categories and three main controversies populate these evolving debates. The ethnic category "Moor", which traditionally names Moghrabi's with deep othering intention, has been abandoned in favor of the religious category "Muslim". The trope of irregular labor immigration and its precarious incorporation to local society, which pervaded debate by the end of the 20th Century, has been superseded by controversies on the accommodation of religious practice in the urban context (regarding the building of mosques), gender equality (regarding the wearing of veils in public) and the risks, roots, and remedies of jihadist terrorism. Our international comparison shows that these themes are common to other European national public debates, but their development is idiosyncratic to each country, conditioned by previous trajectories of migration, accommodation, and recognition in local contexts.

Social Construction of Mental Illness in Micronesia

In many cultures, mental illness has become an important social issue because of its impact on various social institutions, such as the family, education, and the economy. Micronesian communities, however, still consider it a largely taboo subject, creating barriers to openly discussing or even acknowledging its impact on the well-being of both the individuals and their communities. This study explores the emphasis on the social construction of mental illness in Micronesia, more specifically, in the CHamoru and Palauan cultures. Additionally, Micronesia has strong spiritual components which may explain how mental illness is frequently interpreted as a sign of poor fortune or spiritual possession, which could bring dishonor to the family. Due to the spiritual components, emphasis of this study is placed on the collectivist culture in Micronesia, which further exemplifies the social construction of mental illness. The study also takes into account the impact of Western media and how it affects their indigenous understanding of mental illness. The study utilizes mixed methods of qualitative and quantitative research methodologies, using surveys and interviews to further explore the social construction of mental illness in the CHamoru and Palauan cultures.

The Issue of Data Accuracy When Data Collection Is Performed through Black-Boxed Digital Technologies

used by car insurance companies collect a variety of information such as the route, speed, braking and impact. In the future, these technologies will also acquire data like the driver's alcohol content. In this regard, some scholars believe that these innovative methods have the potential to overcome the need to question individuals. Common sense attributes to digital technologies a purely technical nature, which gives an aura of objectivity to the results of their processing and, therefore, also concerning the data collected. When these algorithmic systems are destructurable, they can clarify the procedures that led to the formulation of that data, but when, on the other hand, it is black boxed systems this is not possible. This contribution, starting from the perspective offered by the STS literature and Critical Algorithm Studies, also making use of a case study, regarding the black boxes used by auto insurance companies, suggests that innovation in data collection processes should consider the socio-technical nature underlying digital technologies. Opaque processes of automated data collection make it difficult for the researcher to reconstruct the data path, especially regarding the accuracy and the reliability. For these reasons, we believe it is important to question how the use of this data to the detriment of traditional data collection processes can produce unreliable data. This contribution seeks to understand how, through quasi-experiments and test-retests, the reliability of these technological tools can be estimated. These digital technologies will offer in the future further interesting tools and ways to collect data effectively, but this cannot be separated from the continuous comparison regarding the accuracy and reliability of the data collected.

Engaging Role of Women Entrepreneurs in Social Development:Stories from India

On-Site Presentation
Engaging Role of Women Entrepreneurs in Social Development: Stories from India
Jayashree Ambewadikar
Assistant Professor
Central University of Gujarat, India
Jayashree.ambewadikar@cug.ac.in

Women has the capability to execute significant role building backbone of a country's economy. Many women does has the domestic responsibility to balance different task and prioritise them, has skills for managing people and time, and keeping household budget which can be characteristics of entrepreneurship. These virtues and assets of women are to be cherished for productive channels. But in real-time there are challenges in creating and developing small business for women. Though knowing women's contributions to enterprise as a major engine of global economic growth, still they do not have right to fundamental education, credit system, marketing prospects, etc. The utmost priority of the national planning should be to encourage women power which is the single most important source of social energy. Because emancipation of women is the necessary condition for economic and social development of the nations. There are women who are overcoming such challenges and doing development for themselves, family and society at large.

The objective of this paper is to understand the historical account of women entrepreneurship, critically examine challenges of women entrepreneurs and evaluate role these women entrepreneurs as a source of social development. This paper has theoretical framework related to women and / in development. The framework of women entrepreneurs in social development is applied. The methodology of this paper includes case studies of women entrepreneurs from heterogeneous background engaged in diversified enterprises to study their journeys of entrepreneurship, challenges at different levels and her/their contribution in social development. Sufficient secondary data from books/ journals, reports, websites etc in from different languages are used. This paper will give idea about Indian women in the sphere of entrepreneurship and social development.

AMBROGIO, Barbara* (University of Calabria, Italy)

Industry 4.0 and Unproductive Labour

Industry 4.0, a production model based on the integration of digital tools and artificial intelligence in the automation systems of the production processes of goods and services, can be interpreted as part of the process of development of the productive forces, or rather of the introduction of scientific and technological innovations in a potentially coherent organizational model. This allows, as such, a greater production of surplus value, as well as, in the specific case, an extension of the real subsumption to tasks and duties over which there was previously formal control.

The question therefore arises of how the cyber-physical and organizational infrastructure of I4.0 modifies the production process with respect to the production of value. The hypothesis is that this has several implications: not only the increase in labor productivity in general - therefore an increase in the rate of exploitation, reduction of downtime and costs - but it intervenes substantially in a series of works - design , monitoring, prototyping for example - which in Kurz's Marxist reading are defined as unproductive.

More specifically, what appears from the applications in the aforementioned sectors is that the massive trend of rationalization and reduction of physical activities and cognitive processes is able to intervene in a considerable and, also, contradictory way, taking into account that the overlapping and synchrony of the phases, as well as the complex integration between tangible and intangible elements of production, brings further friction to the valorisation process.

Approaching Contested Entanglements: Postsocialist Colonialities in Membership, Mobility and Memories

Recent approaches to postsocialist transformation in Germany and Eastern Europe increasingly address the nexus between postsocialist and coloniality-like relations. A number of scholars relates post-socialist studies to decolonial approaches, in order to address (dis)continuity of colonial-epistemic unequal power relations and subjectivities as well as heterogeneous quality of post-socialist orders.

The proposed contribution draws on a work-in-process monograph that systematically brings together postsocialist studies and post- and decolonial theories. Using sociology of entanglement lens, we re-read aspects of the transformation processes in Germany and Eastern Europe and highlight the added value of the decolonial perspective for the analysis of (1) post-socialist power/knowledge claims, (2) social constructions of belonging and membership, (3) migranticized mobility dynamics and (4) social struggles over post-socialist memories.

Gendered Violence in the Name of Imperial Memories: Renegotiation of Social Membership of Mobile Ukrainian Citizens in Germany and the Russian Federation

Membership of Mobile Ukrainian Citizens in Germany and the Russian Federation
Anna Amelina and Jana Schäfer, BTU Cottbus–Senftenberg

The research interest of our paper relates to patterns of social membership being currently renegotiated in the context of Russia's neo-colonial war in the Ukraine. Combining coloniality-sensitive and queer-feminist/intersectional theories with the multidirectional memory approach, this contribution aims to analyse the nexus gender/sexuality regime(s) and memory regimes in the context of war-related violence. Focusing on mobile Ukrainian citizens' experiences of war-related (gendered) violence (including the dis/continuities of violence against cis-women, cis-men *and* queer people), the paper analyses movers' (re)interpretation of (post-)socialist membership against the complex forms of coloniality/ies that carry the legacies of Soviet, socialist *and* neocolonial elements. Combining a Foucauldian genealogical approach with multi-sited ethnography, the paper reveals hybrid coloniality elements in the nexus between gender and memory regimes by comparing data from semi-structured interviews with Ukrainian movers in the post-Soviet diaspora of the European Union (specifically Germany) and the Russian Federation. The paper also relies on the expert interviews with representatives of diaspora organizations and/or organizations for the prevention and postvention of gendered violence.

AMIGO, Rotchel* (Bukidnon State University, Philippines)
AMIGO, Cheryl (Bukidnon State University, Philippines)

The Role of Social Capital on Organizational Resiliency: The Case of Migrant Community

This paper is an exploratory study that aimed to identify, describe and compare factors of resiliency on two types of cooperatives that had existed for a long time. The cooperative as a social system was examined using Parson's AGIL scheme, which aimed to determine the functional imperatives found within the system. Furthermore, 120 respondents were interviewed using the survey questionnaire to determine the members' socio-demographic characteristics and ascertain the members level of social capital. A concurrent mixed method was used in the gathering and analysis of data.

This study found the following factors of resiliency in the organizational structure: adaptive policy, good leadership, and cooperative as a site of innovation. Furthermore, member-respondents of the cooperatives have shown a high level of social capital in three dimensions, namely; Trust, Norms and Reciprocity; Networks and Collective Actions; and Information and Empowerment. However, the result on the T test shows a significant difference between cooperatives in two dimensions, namely; 1) Trust, Norms and Reciprocity and 2) Networks and Collective Actions. An examination on the profile of the organizations and their members revealed that the member's ethnicity, religiosity, close family ties and neighborliness may have contributed to a significant difference in these dimensions. Furthermore, the factors mentioned were found to have an impact on how the cooperatives respond, cope and mitigate threats, crises and disasters. This study also reveals that between cooperatives a better social capital is associated with better resiliency.

Thus, this study recommends to the cooperatives a more robust network affiliation, routine risk assessment, and regular training and seminars of leaders and management staff. Moreover, cooperatives are encouraged to invest and sustain their members' social capital through innovative ways primarily to address the needs of the young generation.

Motherhood and Institutional Violence Among Displaced Afghan Women

The August 2021 takeover by the Taliban of the Afghan government led to multiple displacements and disruptions to Afghan women's lives, both within Afghanistan and outside of Afghanistan. This paper examines in-depth, the experience of four Afghan women refugees and asylum seekers who became mothers in the wake of the Taliban takeover. The paper follows their

journeys to motherhood in India, Pakistan, Slovenia and Switzerland through the precarious crossing of borders and negotiations with health, state and refugee/asylum-seeking bureaucracies which do not take into account needs of post-natal care for mothers and babies, and as such placed them precarious situations, endangering well-being and inflicting trauma and violence. The paper examines these dynamics and how these women responded to these experiences to make visible the gendered violence of current practices in refugee/asylum seeking institutions and processes. Through the comparative analysis of these women in distinct institutional and cultural contexts, the paper also makes visible how this type of violence may be countered.

*Note: this paper will authored with the women themselves. However, at the moment of the submission of this abstract, the women are not certain about whether they will want their identities already noted given the various uncertainties of asylum seeking and refugee resettlement processes they are embedded in. As such, only one author (myself) is noted here for the purposes of the submission deadline. However, we would request if it will be possible to add the other four women as co-presenters if they choose by the time of the presentation to identify themselves.

Counting on the Machine: The Construction of Social Trust in Artificial Intelligence

A growing application of Artificial Intelligence (AI) is rapidly changing how we live our life today. A cacophony of digital devices designed with machine learning capabilities gradually penetrate into the most intimate space of human relations and activities, suggesting what music to listen, what food to order, and which persons to be friended. More importantly, AI enters a new phase where our ability to make decisions is being replaced by a set of algorithms, which inform the machine to work on its own logic often causing social issues. This paper centers on trust in AI. In modern society, trust is extremely important particularly in the adoption of digital technology. As sociologist Anthony Giddens notes, trust is a foundation of social stability. It functions at a deep level of social life. Horizontally, trust facilitates interaction between individual humans who live as a community; vertically, trust mediates the power structure that allows the government to rule the people. This paper examines how the level of social trust in AI is causally linked to the mode of AI governance across the sociotechnical landscapes in Singapore. Using the framework of sociotechnical landscape, two empirical questions are addressed: (1) To what extent do Singaporeans have awareness of, and trust in AI?, and (2) What are the key factors that mostly influence Singaporeans to trust and distrust AI? This paper draws on a study, which seeks to assess the amount of trust Singaporeans have given to AI-driven technologies. Public trust is analyzed against the degree of awareness of machine learning capabilities embedded different AI-driven technologies. In addition, it attempts to identify the key factors that influence how Singaporeans decide whether or not to give trust to AI of different systems.

Experimenting Collaborative Urbanism in Southeast Asia

In dealing with the complexity of urban challenges, what forms of governing practice that are available for a megacity to resort to? Can a megacity government rely on multiple actors to improve urban infrastructures and city resilience? Framed around the concept of collaborative urbanism, this paper is about "collaboration" as a method of urban governance in Global South applied to address increasingly complicated urban problems. The case study is situated in Jakarta, Indonesia, the largest city in Southeast Asia, to examine how collaboration becomes a platform of urban governance in which chronic social and environmental issues are resolved concurrently by an assemblage of urban actors. By collaboration we mean a process of engagement in which the city government opens up the opportunities for multiple entities to contribute to changing the urban landscape of the city. In this this paper, we describe the role of collaboration as a governing method in shaping the urban transformations Jakarta has made to improve liveability and resilience. Specifically, the discussion focuses on what has transpired in Jakarta for the past five years, a period whereby collaboration was set as a means of "collective governance" allowing the Jakarta city government to recruit various actors across civil society and private sectors to directly and actively engage in the planning and execution of urban projects. Two sectors of urban infrastructure are showcased to assess the impact of collaborative practices on building stronger resilience against urban risks in Jakarta. We argue that while collaboration is advantageous to facilitate negotiations and resources transactions in urban growth for the sake of citizens, the approach remains challenging to be fully implemented.

Exploring the Experience of Tax Payment in the Urban Informal Economy in Ghana

Informality is a characteristic feature of many developing countries. The informal economy involves activities that lacks any type of legal protection, and where workers do not have secure employment contracts, social protection, or workers' union (Vosko, 2006; Williams, 2015). Ghana like many other African countries have high rate of informality. Despite the informal economy being employer of majority of the workforce in Ghana, the sector faces many challenges. The link between informality, poverty and inequality is more pronounced in the poor urban neighbourhoods (Bromley and Wilson, 2018; Durizzo et al, 2021). The COVID-19 pandemic has exacerbated pre-existing inequities (Akuoko et al, 2020; Schotte et al, 2021). Recent years have seen debates around the relationships between informal workers and the state, informal taxation, and social protection for informal workers in Ghana. There is growing recognition among researchers and policymakers that despite their informal status, many informal firms still do pay a variety of formal fees and taxes (Carroll, 2011; Joshi, 2017). This research highlights the effects that these fees and taxes can have on different groups and the urgent need in expanding empirical research on this subject. However, informal taxation is an unexplored area in Ghana despite the country's high rate of informality. This study attempts to bridge this knowledge gap through to deepen the knowledge base on this issue, both for the context of Ghana and the wider scholarship on informality, gender and tax. Using mixed methods through in-depth semi-structured interviews, focus group discussions, key informant interviews and surveys, this study will examine these experiences in the selected urban neighbourhoods- Accra Metropolitan Assembly (AMA) and Kumasi Metropolitan Assembly (KMA), in two of Ghana's largest cities.

RC30-436.3

AMOAH, Daniel* (Memorial University of Newfoundland, Canada)

Ghana in the Age of Cities: Exploring Critical Challenges to the Urban Informal Sector

Rapid urbanization and unemployment are current global challenges especially in developing countries. Ghana like many other Sub-Saharan African countries is undergoing rapid urbanization. About 60 percent of Ghana's population now lives in cities and urban areas (UN-Habitat, 2020; Ghana Statistical Service, 2021). The urbanization process however faces numerous challenges including high rate of unemployment, poverty and inequality, all of which has been exacerbated during the COVID-19 pandemic (Dadzie et al., 2020; World Bank, 2020). The urban informal sector/economy is prevalent in Ghana. Over 80 percent of new employment in Ghana is created in the urban informal economy (GLSS7; Dadzie etal., 2020). Studies (Hart, 2008; Baah-Boateng, 2011; Anuwa-Armah, 2015) have shown that Ghana's economic future depends significantly on what traders in the urban informal sector/economy are doing. Despite its crucial role, the sector faces many challenges. Informal workers are among those most affected by the COVID-19 pandemic (UN-Habitat, 2020, ILO, 2020). Recent years have seen debates around the relationships between informal workers and the state, informal taxation, and social protection for informal workers in Ghana, and where critical negotiations between informal workers and the state have become increasingly visible topics of discussion. This paper examines and evaluates challenges to urban informal business operations/informal workers in Ghana in the context of COVID-19 pandemic which has exacerbated pre-existing inequities. Using the World Bank's Ghana Informal Enterprise Survey, Ghana Labourforce Survey, and a systematic review of the growing body of scholarly literature on the urban informal sector, this paper discusses the challenges to urban informal business operations/ informal workers in Ghana.

AMWE, Ruth* (Princeton Theological Seminary, USA)

Constructing Spaces of Duality: Feminizing Social Movements and Methods in Nigeria

The proliferation of religious extremism and religiously motivated violence in Africa is increasingly eliciting scholarly interest, though there remains a deficiency in feminizing such discourses. Nigeria has endured the explosion of these instances such that Nigerian women are often especially at risk of diverse forms of human rights violations including rape, kidnap, assault, torture, and murder. Their participation and/or instrumentalization, however, in orchestrating such acts of violence complexifies the relationship between gender and religiously motivated violence. Nonetheless, their efforts to form part of the nexus of public discourse critiquing religious extremism and violence in the public sphere remains understudied. To abridge this gap, therefore, this paper will juxtapose two cases of women-led social movements that occurred in Nigeria within the past decade to examine the resources Nigerian and African women utilize in their mobilizing quest towards demanding accountability and justice. On the one hand, I explore the #BringBackOurGirls movement which

began in 2014 and attracted immense transnational support and sympathy. It encompassed an array of majority elite women from Christian and Islamic faith traditions who leveraged the use of social media towards asserting their demands. On the other hand, I examine the Atyap women's naked "protest" which occurred in the thick of the Covid-19 pandemic in 2020. It consisted mainly of women in rural areas who invoked a historical ritual deeply embedded in African indigenous religions alongside an overt expression of Christianity to seek justice and demand accountability. This paper will engage contemporary scholarship at the intersection of religion, violence, social activism, and gender to propose that Nigerian and African women's pursuit for social justice through social movements are often constructed in spaces of duality where their ability to operate within and through seemingly contesting variables is affirmed, such that their agency is firmly asserted and remains uncontested.

RC37-549.3

ANACIN, Carljohnson* (Griffith University, Australia)

Sariling Sikap, Suporta Lokal: The Do-It-Ourselves (DIO) Ethos in Online Communities of Independent Songwriters

Due to the temporary closure of live music venues globally as an impact of the COVID-19 pandemic, many musicians resorted to doing online performances and promotions. The possibility of transmediating musical activities has been evident recently and the role of social media in this shift has been paramount. These new possibilities for music production, performance, and distribution, as well as collaboration and networking, have helped not only established professional musicians but also independent and amateur ones. Drawing on Facebook music communities (FMC) involving independent and amateur songwriters from the Philippines, this presentation shows how 'virtual music networks' transformed musical processes and practices during the pandemic. These FMCs are regarded as do-it-yourself/do-it-ourselves (DIY/DIO) support systems and sites of career trajectory negotiation, which have been helpful to this cohort of Filipino musicians during the COVID-19 crisis. This presentation re-examines online communities as sites that enable independent musicians to participate in, reinforce and complement the mainstream music industries. By engaging in the DIO ethos, they both support and resist the usual mainstream music business practices for music production, consumption, and distribution in the Philippines. Through this, a democratisation of the music industry is seen and experienced as facilitated by these online music communities.

ANACIN, Carljohnson* (Griffith University, Australia)

Utilizing Capitals As a Response to the Music Industry Precarity amid COVID-19 Pandemic: The Case of Filipino Cover Musicians in Australia

Creative labour is known as a precarious endeavour, particularly in the music industry, compared to other fields such as health, education, or technology. With the COVID-19 pandemic, the precarity and vulnerability have been magnified among musicians globally, migrant musicians included. In this presentation, the experiences of Filipino musicians who work as full-time musicians who play cover music in Australia reflect the already existing precarity of the music industry that had been exacerbated by the pandemic. With the economic, mental, and cultural impacts of the pandemic, Filipino professional musicians utilized their social and cultural capitals to respond to the lack of gigs and shows. But by doing so, the uncertainty of securing a sustainable career in the music industry has also been difficult for migrants. Moreover, as they increase their socioeconomic mobility and survive adversity, they also have less access to cultural participation through music. This presentation offers a perspective on the impact of the pandemic on migrant musicians who are included but underrecognized as part of the music industry and the long-term concerns on the unstable nature of the gig economy. It also leads us to rethink the relations between the individual agency of the musician and institutional structures, a springboard that could potentially help in informing policy decisions concerning migrant musicians and creatives in general during crises and post-pandemic.

ANAND, Geetika* (University of Cape Town, South Africa)

Practicing in Cities Against the Backdrop of the Nation and the Self: Auto/Biographies of Urban Practitioners from South Africa

There is a growing consensus around the significance of urban development practice, and the complexity associated with intervening in cities and urban systems at large. Furthermore, with the endorsement of Sustainable Development Goals (SDGs), followed by the New Urban Agenda (NUA), cities have taken centre stage in the global debates and development agenda, and national governments across the globe are increasingly coming up with urban policies and programmes. As the locus of urbanisation shifts to Africa and Asia, this transition is particularly critical in the global South where there is rapid urbanisation and the capacities within the urban institutions are relatively limited. While several studies have focussed on how these global and national commitments pan out at the local level, inverting the perspective, this paper asks: situated in these contexts, amidst influences from all around, for an urban practitioner, what does it mean to practice in the city?

Centring the narratives and experiences of practitioners and their contexts, the paper highlights drivers, motivations and influences behind practitioners' work trajectories and transitions. The paper draws from biographical interviews conducted with 30 practitioners working in the urban development sector in South Africa. It particularly pays attention to the multiple spatial scales – neighbourhood, city, provincial, national, and transnational – practitioners find themselves in and navigate through in their professional as well as personal lives. In these practitioners' auto/biographies, what happens at these multiple scales, especially at the national and at the city, directly inform their career choices and decision making. It is further argued that these multiple scales do not only form a context within which these practitioners continue to practice, they also feature prominently in practitioners' considerations for positioning themselves at an appropriate scale for maximum impact based on their own values and interests.

Leisure during COVID-19 Pandemic Among Undergrad Students: A Study of Lucknow City, India

In the beginning of 2020, Covid-19 pandemic shocked the entire world and India was no exception. The pandemic disrupted every domain of human life, and this has led to different adjustment in different aspects of life. In response to this pandemic, various countries imposed mandatory lockdown in their respective countries. Government of India also ordered nationwide lockdown, limiting the moment of 1.38 billion people in March 2020.This lock down had a distinct nature of implication on every section of Indian society, be it migrant labor, health department staff, students and others. Students across the country were bound to remain in their house as the educational institutions were in complete shutdown.

Within this context, this paper aims to re-examine the understanding of leisure among Undergraduates and try to find out whether the recent pandemic had reshaped their understanding of leisure or not. Although the concept of leisure and youth are not new, but the context in which these two concept are examined is new and it offers us to look back at already existing concepts from a new perspective

The area of this study will be Lucknow city in India, which was badly affected from the consecutive waves of pandemic. Densely populated demography made the city more vulnerable in comparison to others. Because it is also a hub of educational institutions of Northern India; the impact of COVID-19 pandemic on students living then in Lucknow, was much higher than other cities. This offers an opportunity to investigate the responses of the students, in terms of leisure activities while offering an insight into sociology of leisure.

Collapses Ahead of Us, Pandemics Ahead of Us – Exploring Resilience of Societies and Health Regimes Performance

Pandemic of this scope and rate was just a realisation of trends in emerging infectious diseases (Binder et al., 1999; Carlson et al., 2022) and as such is just one of the episodes in the 21st century in which environmental degradation creates worsening living conditions for humans and societies far beyond the initial spillover event. Therefore, it is of utmost importance to try to explore and learn as much as we can from the current pandemic situation in order to have better understanding of what future can bring to societies and how societies can react. Since the beginning of the pandemic, different attitudes and approaches were noted between countries regarding how to minimise the negative societal effects and contain the spread of the virus. This variation in defining and implementation of appropriate measures, ranging in the most extreme cases from herd-immunity strategies to severe and complete lockdowns, resulted in differing outcomes in official public health statistics related to the pandemic. In this presentation we focus to explore resilience of societies with understanding how the societies have performed in terms of pandemic in general and healthcare system in specific. As pandemic performance measures we have used (a) share of people who completed the initial COVID-19 vaccination protocol; and (b) total excess deaths (per 1 million); and (c) multidimensional Global Health Security Index. A purposive sample of three European countries (Germany, Italy and Croatia) was used in the analysis. Results of the measures of pandemic performance were analysed in the context of social resilience of selected countries presented through a degrowth donut mental model (Domazet et al, 2020.; Medak et al, 2020.) which is visual analytical tool aimed at exploring nature-society nexus but also helpful in understanding the multidimensionality of resilience of societies in general and health system performance in specific.

ANDAL, Aireen Grace* (Macquarie University, Australia)

Of Play, Poverty, and Pandemic: Insights from Slum-Dwelling Children during the COVID-19 Pandemic and Its Early Aftermath in the Philippines

This paper examines the spatiality of play among slum-dwelling children during the COVID-19 pandemic and its early aftermath. I take 'play' as a prism to understand the pandemic and early post-pandemic context of a slum neighbourhood in San Jose del Monte City, Philippines. Through remote fieldwork, children 9-12 years old shared their experiences of the pandemic and how it affected their play spaces. In the lockdown context, there has been an apparent change in children's playing mobilities when COVID-19 entered their lives in 2020. The most apparent change in the spatiality of children's play lives was the restrictions of crossing over other territories outside their own immediate neighbourhood. However, in the early post-pandemic context, at least three main concerns about children's play spaces remained the same. First, the precarious playing conditions such as the presence of mosquitoes persist. Second, children remain uncertain if they can stay as playmates due to constant threat of evictions and displacements. Third, the city continues to render fewer interstitial spaces for children to play at because of the conversions of urban spaces into residential or business sites. These findings show that children's play lives reflect a compromised and undignified life in both the pandemic and early post-pandemic contexts. These children continue to play in a city that excludes them. Such analysis has two-fold implications. First, play spaces offer unique perspectives in showing how the pandemic has impacted slum-dwelling children. Playing is not separate from the politics of urban spaces but are rather uniquely positioned within power structures in cities. Second, there is an urgent task to legitimise the voices of slum-dwelling children as urban stakeholders, who have dignity and rights to be protected and respected. This is relevant to radicalise urban planning and policy making in terms of taking children's perspectives in decision-making.

Long COVID, ME/CFS and the 'long Haul': Histories of Contested Chronic Illness in Australia

While chronic illnesses have long been of interest to health sociologists, they have garnered renewed attention with the emergence of a large cohort of the global population living with a chronic condition known as 'Long COVID.' The widespread attention to this emerging condition is due in part to the immense scale of those simultaneously infected with SARS-CoV-2 and their subsequent presentations of 'Long COVID.'

Peer-reviewed literature on 'Long COVID' is gradually materialising and early studies indicate many commonalities between the symptomology of Long COVID and other existing contested chronic illnesses such as Myalgic Encephalomyelitis/Chronic Fatigue Syndrome (ME/CFS). What can be learnt from these previous experiences, which entail similar lived experiences and social difficulties, for the emerging and contested condition Long COVID?.

Like Long COVID, ME/CFS has consequential impacts for those who are affected by the conditions, including exclusion from employment or education, and difficulties accessing necessary social and financial supports. But unlike ME/CFS, Long COVID has gained widespread (and often more supportive) media attention, with various consequences for the epistemological and ontological status of those living with these conditions, and interactions with the medical and social system that surround them.

Drawing on literature in the sociology of contested illnesses, sociology of knowledge and critical disability studies, this paper examines the varied histories of ME/CFS and Long COVID in Australia by employing representations of both illnesses in the Australian news media and scientific literature. This includes examining the origins of the naming, framing and contestations surrounding each illness and the particular social context within which each condition became (or may be becoming) stabilised as an accepted biomedical condition.

Empathy through Education

In each of the various locations in which young people are detained on justice-related matters in Australia and New Zealand, there operates a school or education centre. The educational staff who work in these locations navigate the requirements, restrictions, policies and procedures of both educational governing bodies and youth-justice related site administrators to provide relevant learning experiences to students with complex life experiences and learning needs. This presentation will provide a brief summary of education provision within justice-related youth detention across Australia and New Zealand. Special attention will be given to the direct and indirect strategies employed throughout education programming to promote the development of empathy and socio-emotional well-being among students. The presentation will highlight the importance of skills in social understanding and emotional regulation for both accessing education and desisting from offending behaviour. Importantly, it will give insight into the outstanding and innovative work being conducted by educational teams operating within secure youth justice facilities in Australia and New Zealand.

How Has the Pandemic Affected the Professionals of the Care Network for Victims of Gender-Based Violence? a Qualitative Perspective.

COVID-19, in addition to the global health crisis, brought many other consequences, highlighting many social problems, for example, the increase in gender-based violence (GBV) and revealing the weaknesses of the system that had not been so visible until now. The situation caused by the pandemic got even more complicated due to constantly emerging new, often mutually exclusive, confusing and unclear policies and guidelines. Uncertainty and constantly changing procedures did not ease the already difficult situation for health-related professionals, including helpline and frontline social workers. The proposed abstract examines how helpline services have been changing during the COVID-19 and considers the special importance of telephone and online assistance to victims of violence. The objective of the research is to understand the perspective and experiences of professionals one year and a half after the COVID-19 crisis in Spain. The research is based on 28 in-depth interviews with professionals from the GBV support network. The main areas of analysis refer to the following topics: (a) pre- and post-covid perspective; (b) changes in policies, protocols and guidelines; (c) high demand vs. quality of service; (d) available resources; (e) coping behaviors; (f) the physical and mental well-being of the professionals; and (g) organizational support. The abstract offers a perspective of the work at the front line and thus contributes to a better understanding of the difficulties and problems that arise from the crisis situation and that have a direct impact on the quality of the provided services.

ANDRASZAK, Joanna* (Universitat Rovira i Virgili, Spain)

Why Telecommuting Was Not Here to Stay? the Case of Social Services at the Municipal Level in Spain during the COVID-19.

In the context of the Covid-19 pandemic, many new challenges have arisen for social services' frontline professionals. The high demand for service, whose provision has been limited by health restrictions and protocols, has put public servants in an extremely difficult position and has faced them with great challenges, such as changing the model of work to telecommuting without prior experience and adequate preparation. What was observed, after a year and a half after the outbreak of the pandemic, was that once the labor market has returned to a certain normality, workers, companies and institutions started to return to face-to-face work. The reasons are multiple and vary according to each case. The general objective of this study is the analysis of the factors that condition the abandonment of telecommuting and the experiences of the professionals, and their perception of the quality of work, as well as the quality of the services provided remotely (by telephone, on-line, etc.) or in person. It is of great importance to understand how various factors (the type of users, complexity of the service, level of responsibility and type of communication with citizens) condition the ability to work and provide services remotely while maintaining the required quality of services. The research uses a qualitative methodology, which consists of in-depth interviews with 33 professionals who work in the Social Services at the local level in Spain from seven municipalities of five different Autonomous Communities, and from varied professional trajectories, professional stages and environments.

Civil Society Engagement in Food Systems Governance in Canada: Experiences, Gaps and Possibilities

Civil society organizations (CSOs) commonly experience food systems governance as imposed by governments from the top down and as unduly influenced by a small group of private sector actors that hold disproportionate power. This uneven influence significantly impacts the activities and relationships that determine the nature and orientation of food systems. In contrast, many CSOs have sought to establish participatory governance structures that are more democratic, accessible, collaborative, and rooted in social and environmental justice. This research seeks to better understand the experiences of CSOs across the food systems governance landscape and critically analyze the successes, challenges, and future opportunities for establishing collaborative governance processes with the goal of building healthier, more equitable and sustainable food systems. The presentation will

share findings from a survey of CSOs in Canada to identify who is involved in this work, key policy priorities, and opportunities and limitations experienced. Following the survey, interviews were conducted with a broad cross-section of CSO representatives to deepen our understanding of experiences engaging with food systems governance. The findings suggest that what food systems governance is, how it is experienced, and what more participatory structures might look like are part of an emergent and contested debate. We argue for increased scholarly attention to the ways that proponents of place-based initiatives engage in participatory approaches to food systems governance, examining both current and future possibilities. We conclude by identifying five key gaps in food systems governance that require additional study.

Belief in the Just World in European Cultures – Comparative Analysis

General belief in justice, in well-ordered and balanced social relations and the equity of merit and reward is described in the concept suggested by M. Lerner as "belief in the just world". BJW helps to justify existing inequalities, to cope with unjust life situations, to keep an optimistic view, but can serve as a barrier for questioning and changing unfair social relations. European social survey (ESS) conducted in 30 countries and Russian social survey (RSS) revealed the prevalence of rational-skeptical views of people in "large Europe" on the chances of general justice. The average level of BJM appeared to be relatively low in most other countries included in the analysis. To confirm the methodological rigor of these conclusions, the evaluation of statistical cross-national equivalency of BJM scale was conducted in one country Russia. The empirical validity of the BJW scale was assessed using cognitive interviews on randomly selected follow-up sample among RSS respondents. It showed the interpretative and motivational multidimensionality of the concept, but also the consistency of empirical semantic space of the concept to theoretical construct and general validity of the scale. Factors influencing the formation of BJW have two-fold structure. The impact of value-cultural factors leads to the similarity of views on BJW in Europe on aggregate level. Personal and socio-demographic factors played on individual level have differential impact. BJW as a general worldview attitude has a strong impact on framing particular socio-political attitudes and evaluations. High level of BJW is related to loyalty toward the existing political system, trust to governing institutions and positive evaluation of the incumbent's performance which is consistent with findings from previous research. The hypothesis about the impact of BJW on the support of conservative ideology and anti-liberal social attitudes was rather weak and significant only in a few countries.

Comparative Longitudinal Surveys of Older Generation As the Method to Study Ageing – Methodological Challenges in Case of Russia

Life extension, increase of elderly among population, their consumer power, demand for rights and social status drive the increased importance of this group in modern society and the attention of inter-disciplinary research groups. As natural human process ageing has universal character but many aspects of it are influenced by specific national and cultural context. Longitudinal ageing research starting as early as the 1960s in the USA, got really global only in the last two decades. European SHARE, ELSA in GB were followed by CHARLIES in China, LASI in India and many others. Russia join t this line of research in 2021 conducting the first round of Russian National ageing survey (RuNAS). It aims to be comparable with SHARE but has many specific questions and modules. It covers such aspects as health, wellbeing, social networks, emotional and spiritual life, civic engagement of people over 50. The first national survey of elderly of such scope in Russia revealed substantial methodological challenges. Some of them are related to the high diversity of this group in education, communication and technology skills, and health status. Cognitive load obtaining biographical information about such details as dates of life events was very high and raised the issue of data precision versus data quality. Sensitivity of specific topics adds to the need for further methodological research in this area. Surveying elderly in longitudinal design, researchers are confronted with ethical issues, data protection and general security issues. Moving forward with methodological knowledge of studying elderly, we will gain more from the strengths of comparative method ageing studies. This method has the potential to uncover universal vs. culture-specific or context-specific trends and factors. In policy areas, it helps countries to gain from each other's experience and adjust the decisions.

The Challenges of Capturing Complexity through Longitudinal Survey Research: The Case of the Canadian Paths on Life's Way Project

Longitudinal research faces many methodological challenges in that it must evolve over time as study participants move, age, get married, have children, engage with the labour force in various ways, become mature students, and caregivers of ageing parents. In this presentation, I will use the 33-year longitudinal research study – the *Paths on Life's Way Project* – to illustrate these challenges. The *Paths* project began in 1989 to explore the educational choices made by a large sample of 1988 British Columbia, Canada high school graduates with follow-ups conducted in 1993, 1998, 2003, 2010, 2016, and most recently during the pandemic in 2021. Given that the *Paths* project focuses on continuity and change in terms of education, employment, family, and other adult activities across the life course, we felt compelled to document the impact of the pandemic in relation to data collected in previous waves. In 2021, we conducted the seventh 33-year follow-up during the COVID-19 pandemic to capture *Paths* respondents' experiences and behaviours of, and views about, the unique life changing "exogenous shock" that reverberated through the lives of *Paths* respondents and their families. In this presentation, I will focus on the challenges of survey development, contact tracing, data collection, and analysis across the years *including* data collection during the pandemic. Also, I will discuss the opportunities and challenges of conducting comparative longitudinal analyses using my experiences with the Australian *Life Patterns* project and the German *Pathways from Late Childhood to Adulthood* project as examples.

La Visión Actual De La Sociedad Andaluza Por El Futuro De Europa: El Marco De Las Políticas Europeas Dirigidas a Sus Regiones

La Unión Europea promueve una serie de políticas para el desarrollo de las regiones europeas, con acciones estructurales y ayudas económicas (De Faramiñán Gilbert, 2002)9.

Desde otra perspectiva, Andalucía es una región de características periféricas para Europa, catalogada en Objetivo 1, pero a su vez es una de las comunidades autónomas que más favorece la estructura de España por su riqueza medioambiental, patrimonial y cultural, con una población muy concienciada con su identidad social. Además, cuenta con diferentes herramientas para participar en el desarrollo social de Europa (Remir Moyano y Fernández Longo, 2021)10, siendo también una parte activa de las políticas que repercuten a la ciudadanía europea.

En este estudio se ha realizado una encuesta para comprender la percepción de la sociedad andaluza en los asuntos que conciernen a Europa y su futuro, tales como el desarrollo económico, social y político de Europa. También, se trataron otros temas articulados en la Conferencia sobre "El Futuro de Europa". Asimismo, se impulsó un estudio cualitativo identificando aquellos aspectos fundamentales en el nexo entre Europa y Andalucía.

La idea final de este trabajo es mostrar los resultados y conclusiones más relevantes tanto en la encuesta realizada a una muestra representativa de la población andaluza como en el discurso a través de 10 grupos focales, en aspectos tales como la identidad europea de la ciudadanía andaluza, su perspectiva sobre el papel de la región en la gobernanza europea, así como los retos e intereses que identifican como prioritarios para la región.

Este trabajo forma parte de un estudio mucho más amplio desarrollado por la Fundación CENTRA y la Secretaría General de Acción Exterior de la Junta de Andalucía, teniendo como finalidad el diagnostico adecuado de las líneas de actuación de la región de Andalucía en el futuro de Europa.

Interviewing Walls? Lessons and Methods from Urban Surfaces

If walls could talk, what would they say of our cities? Would they speak of neglect and destitution, of wonder and creativity, of struggle and privilege? Which language would they use, and who would they speak for? And what would their stories say about urban public life in the 21st century, and our production of urban space?

"Interviewing walls? Lessons and methods from urban surfaces" is an introduction to the surface semiotics method I have been developing in my research, to investigate urban surfaces as key spaces of visibility, property and belonging in cities. I propose "wall interviews" as a visual ethnographic method aimed directly at urban surfaces and their markings, to unpick the multiple authorship of the surface discourse. The presentation will be a demonstration of this method, through multiple surface photographs and material analyses.

Drawing from visual, legal, and semiotic studies, as well as graffiti, street art, and public signage, the method approaches urban surfaces as sites of spatial production and regulation. I will show how urban surfaces are distinctive spatial conditions of great value to municipalities, artists, vandals, property owners, advertisers, and tourists alike. Surfaces are archives of cities, and my paper explores how these archives are produced, regulated, and recruited to serve specific political agendas in cities.

The "interview" includes components such as legal and illegal public signage, peeling advertising posters, artistic murals, anti-graffiti surface coatings, as well as aspects related to governance, politics, and law, all of which determine the *surfaceality* of our cities. I bring these together under a proposal for a *surface semiotics*, a novel methodology for identifying and interpreting the multiple functions of urban surfaces and inscriptions, alongside strategies for their production and control.

Stuck between the Global North and South: Middling Migrants in Australia and Singapore

The literature on 'middling transnationals' is growing although studies on Asian middling migrants are still relatively lacking. Current understandings on middling migrants are also frequently fixed on migrants' mid-level skills and their middle-class status. Drawing on interviews with Nepali migrants living in Melbourne, Australia and mainland Chinese migrants living in Singapore respectively, this paper considers how their middling visa status and imaginaries interact with anxious desires. This paper argues firstly that migrants from the Global South experience heightened anxious desires due to imaginaries oscillating between the Global North and South. Second and relatedly, it argues that migration regimes keep migrants compliant through managing their anxious desires. By detailing the experiences of different groups of Asian migrants in separate migration regimes, this paper aims to highlight the heterogeneous experiences among middle-class migrants originating from the Global South, and the techniques used by different states to produce temporary and compliant migrants.

Non-Contributory Pensions As Human Rights in Mexico

In Mexico the dramatic increase in the number of older individuals occurs in a context in which formal retirement plans are extremely limited. In 2019 only 23% of women and 40% of men had access to a contributory pension, largely reflecting high levels of informal sector employment. Given this reality, Mexico along with 40 other countries has introduced a non-contributory income support program for older citizens with no other pension. The *Programa Pensión para Adultos Mayores* (Pension Program for Older Adults) has made pension coverage nearly universal. Without such pensions most older Mexicans, especially women and rural residents, would suffer extreme poverty. The level of support though is minimal, and a large fraction of Mexican elders continue to live in poverty. Many are forced to continue working well past 65. In light of the new demographic reality these basic pensions have become an essential lifeline. For that reason, they are a major focus of civil society efforts to ensure that older individuals who are entitled to benefits in fact receive them. An important set of these non-governmental organizations include older individuals themselves. Their demands for the recognition of their human and social rights have become a core aspect of a new active aging. In this presentation we draw upon a recent qualitative study of the role of civil society organizations in advocating for the social rights of older Mexicans, including pensions, in five Mexican cities. Increasingly, social rights are viewed as integral aspects of human rights. At a time in which the State faces serious fiscal challenges in providing basic services, an active and dynamic civil society is necessary in order to prod government to attend to citizens' needs, as well as to protect their human rights and to assist in service delivery directly.

A Bumpy Road to Development: The Everyday Politics of Potholes in Hyderabad, India

In this paper, I draw on the embodied experience of driving on road surfaces in Hyderabad and show how roads become the literal terrain on which political sensibilities are shaped. Drawing on ethnographic material collected over three years, I analyse how potholes, speed bumps, and smooth roads shape driving in a city that is attempting to brand itself as a "world-class" city. Moving the gaze of the sociologist from how infrastructures and systems come to be to how they are experienced, how they are talked about, and how they are imagined in everyday life reveals how ordinary Hyderabadis make judgments about the state's capacity to care, its neglect, its callousness, and its responsibilities. The so-called chaotic road, I argue, is the literal and metaphorical terrain on which visions of modernity and mobility wrestle with the cacophony of everyday democratic practice.

ANNAVARAPU, Sneha* (Assistant Professor of Sociology, Singapore)

Aesthetics of Authority: Smart Policing, Unruly Citizens, and the Politics of Visibility

Critical to the popular representation of Indian roads as "chaotic", traffic indiscipline is an abiding Orientalist tragicomic stereotype *and* a source of culturally intimate local humor. In both official discourse and everyday traffic talk, the "typical Indian driver" that treats rules as mere suggestions figures not just as an administrative and epidemiological issue but a symptom of cultural and moral failure of a postcolonial public. State agencies and NGOs in India have long been attempting to make motorists obey traffic rules and regulations using a variety of punitive, persuasive, and infrastructural strategies. Drawing on multi-sited ethnographic fieldwork conducted over four years in the southern Indian city of Hyderabad, this paper explores the logics of state authority in attempting to elicit obedience and compliance from motorists on the road. Twisting existing research on urban policing in India, it examines how and why traffic law-enforcement in Hyderabad is undergoing an "image makeover" and why traffic police are attempting to position themselves *not* as agents of state violence but as smart, tech-savvy, and *friendly* service-providers. Instead of writing it off as marketing frivolity or as an insidious cover, this paper contextualizes and locate these moves within the historical context of postcolonial policing as well as the urban branding of Hyderabad. In doing so, this paper builds on current research that goes beyond how the state "sees" to taking seriously how the state wants to be "seen".

Relations between Family Background and Persistence in Overqualification – Comparative Results from UK and Germany

While research has documented many factors associated with the risk of overqualification, we know little about how overqualification may contribute to the reproduction of inequalities from one generation to another. Social stratification research finds a substantial relationship between parental background and child educational attainment (Breen and Müller 2020). In addition, some research has focused on inequalities in socioeconomic status attainment between university graduates from privileged social origins (Torche 2011; Witteveen and Attewell 2017). However, that research contributed little to our understanding of the various sources of these differences.

To address this shortcoming, we ask to what extent parental class background influences one important career dynamic in the UK and Germany: the risk of overqualification and the probability of exit from overqualification. In both cases, family background is likely to influence the risk of overqualification and exit probabilities in various ways. First, family's financial capital could influence overqualification, because graduates from wealthy families might have the opportunity to search longer for an adequate job. Second, the process of finding a job can be influenced by the parents' social capital and networks (Jonsson et al. 2009). Third, the transmission of cultural capital from parents to children may contribute to higher chances of accessing the most elite jobs available to university graduates from higher social origins (Laurison and Friedman 2020; Rivera 2015). Finally, social differences in aspiration could also affect individuals' occupational choices due to the will to prevent downward mobility (Jacob and Klein 2013).

To test these hypotheses, this paper provides a comparison of the occurrence as well as the persistence of overqualification in UK and Germany between 2010 and 2020. The results derive from analyses of data from the UKHLS and the NEPS SC6. Exploratory results show that having a father in a higher-status occupation lowers the probability of overqualification.

Between Labor Control and Worker Empowerment: Authoritarian Innovations and Democratic Reforms in Mexico

The continuation of Mexico's long history of labor control can be explained by processes of 'flexible authoritarianism' (Hamilton and Kim, 2004) and

'authoritarian innovation' (Curato and Fossati 2020). An authoritarian innovation in Mexico has been a system of worker control exercised through 'ghost unions' and 'protection contracts' (La Botz 1999). 'Ghost unions' were so named because workers did not know a union existed at their workplace. Rather, official union leaders established pacts with employers, who would recognize the union and then sign collective agreements that fail to protect the rights of workers. The governing party held national power built on this system of labor control from 1928 until 2000, when an opposition party won the presidency. However, this did not signify the end to authoritarian practices (Rubio 2004). In a process of authoritarian innovation, official labor unions re-invented themselves and developed ties with the new political elite, promising 'labor peace' in exchange for a continuation of their privileged position as the dominant representatives of Mexican workers (Zepeda 2021). Andrés Manuel López Obrador of the left-oriented opposition party, MORENA, took power in 2018 and enacted far-reaching labor reforms that empower workers to reject existing corporatist unions and their protection contracts. And the re-negotiated free trade agreement between Mexico and the US allowed for sanctioning power on individual firms and included a rapid response mechanism that has proven highly effective (Polaski 2022). At least 14 independent unions have won elections against official union and thus representation rights at the workplace level. But the old unions are fighting back and continuing to re-invent themselves by using new authoritarian innovations. Thus, Mexico finds itself in an intense competition between authoritarian innovations and democratic innovations, the outcome of which will determine whether workers will face greater control or greater empowerment in the years to come.

ANSARI, Arvinder A.* (Jamia Millia Islamia, India)
KAUSAR, Hina (Jamia Millia Islamia, India)

The Politics of the Veil in India: Contesting Stereotypical Representations of Muslim Women

In many countries, veiled Muslim women are the primary victims of Islamophobic attacks. The veil or hijab - a highly visible expression of being a Muslim woman – has been portrayed as a threat to ideas of integration and national cohesion, as well as a visual depiction of gender inequality and discrimination.

The increasing fear of terrorism and the growth of political Islam have led to a suspicion of all Muslims, particularly veiled Muslim women, making them especially vulnerable. Islamophobic political rhetoric has become more common, and it is based on the notion that Muslim women are oppressed by the Islamic veil, which is viewed as a tool of political and patriarchal control by Muslim males over their female counterparts. In India, the largest victims of violence and hatred are Muslim women, they have experienced varying degrees of hostility because of their Hijab. Many young Muslim girls were recently prevented from attending college in Karnataka due to their Islamic attire and were also harassed by their classmates at college.

As a result of their intersectional identities, Muslim women in India have been subjected to a disproportionate amount of violence and othering. In today's Hindu-majoritarian India, the Hijab controversy has been exploited to exclude and discriminate against Muslim women, thereby humiliating the entire community.

This paper argues that the contemporary climate of Islamophobia has imposed additional challenges on hijab-wearing Muslim women in terms of politics, lived experiences, and life opportunities. This paper contends that misconceptions regarding the hijab have contributed to a contemporary form of Orientalism in which veiled women are viewed as oppressed and perhaps dangerous.

ANSON, Jonathan* (Ben-Gurion University of the Negev, Israel)

The Second Mortality Transition and the Extension of the Human Life Span

The mortality decline in the past 100 years has been greater than at any time in human history and most of this decline has occurred at younger ages: infancy; childhood and young adulthood while mortality at the oldest ages, for those who attain those ages, has remained largely unchanged.

As a result, the mortality curve, which at older ages is approximately log-linear, has become steeper and steeper. In the present analysis, we consider how the slope of this curve (the rate of ageing) has changed over time and, in particular, how this rate of ageing relates to the level of mortality at younger ages. If the human life nospan is fixed, and all people have to die by a given age, then we would expect the slope to continue to increase over time, irrespective of the level of mortality at younger ages. On the other hand, if the human life nospan is increasing, then we would expect the increase in the rate of ageing to have attenuated over time.

Using over 4,000 male and female national lifetables from the Human Mortality Database, from the middle of the 19th century to the present day, we show that, for about a century, from the mid 19th to the mid-20th century, the rate of ageing did indeed increase, even as survivorship to age 50 declined. However, since the 1970's, however, this increase has been attenuated, indicating that the mortality transition has entered a new phase, a Second Mortality Transition, one in which the rate of ageing is accelerating more slowly, even as young and middle age mortality continue to decline. The implication is that at the very low levels of mortality we are experiencing today, the human life nospan does appear to be extending.

En – Epi – Pan – Demic Reflections on Epidemiology

In this paper we will try to clarify the differences between three concept: endemic' epidemic, and pandemic.

Looking at historical data, we shall try to define the boundaries of each of these concepts and the conditions under which an endemic becomes epidemic, epidemic becomes pandemic, and vice versa.

We shall argue that the three are social phenomena as much as they are medical phenomena. Throughout history, only few en- epi- and pandemics were controlled by medical innovation. In most cases, contamination has been constricted by social change, be it on the individual, behavioral, level, or on the level of social structure and organization. As examples we shall present the cases smallpox as compared to HIV and plague.

Having established that en- epi- and pandemics are social phenomena, we shall explore the possibility of describing other human behaviors and attitudes in epidemiological terms.

RC47-663.2

ANTENTAS, Josep Maria* (Universitat Ramon Llull, Spain)

Social Movements, the State and Internationalism

The present millennium began with important discussions on transnational collective action, in a context of the rise of the global justice movement. Alterglobalization can be conceptualized as a moment of rising internationalism, although this is a term that was not part of the movement's vocabulary. This showed an historical break regarding the labor movement tradition following the defeat of the emancipatory processes of the twentieth century. The post-2011 cycle has had a weaker internationalist dimension, paradoxically due to the magnitude of the social outbursts. The crisis of legitimacy of domestic political systems "nationalized" the logic of the protests, even though they were the result of very similar policies. Also, the gap between the big challenges of domestic political situations and the organizational weakness of many social organizations absorbed almost all energies in everyday domestic activity. The re-nationalization of the protest, however, coexists with what we can call a 'diffuse and ambient internationalism' based simultaneously on an important mutual identification and inter-influence between many national struggles and a weak capacity for joint international action.

The nationalization of protest expresses in a positive sense the magnitude of the national political crises and the opportunities open to many protest movements, but at the same time it contains important strategic limits in a context of a chaotic crisis of global capitalism. In the era of globalization and, specifically in the era of its crisis, national and supranational arenas, and the domestic national agendas and global issues, are combined in complex ways. This creates a complex terrain for social movements in which different scalar levels intersect - the concept of the sliding scale of spaces (Bensaïd, 2008) being useful for capturing the scalar complexity of the action framework of contemporary movements and the limits of just action in the national arena.

RC44-627.5

ANTENTAS, Josep Maria* (Universitat Ramon Llull, Spain)

The Multiple Debates on the Strike: In Search of Complementarity and an Overall Vision

The analysis on the role and features of the strike as a form of protest is shaped by the wide diversity of contemporary social conflict. There are multiple strategic debates that point to different aspects of the strike but many of them are often segmented and in relatively little mutual discussion. There is a need for an overall vision that seeks complementarity between strategic approaches and forms of strike. The goal of this communication is to give an introductory overview of some of the main current debates regarding the strike.

Austerity policies after 2008 led to significant strike activity, mainly in public sector, either driven by unions (such as the numerous strikes in Greece) or through a combination of union strike activity and citizen movement (such as the 'Tides' in Spain). Production transformations, unemployment and precarity, and the relevance of the public sector for strike activity have created discussions about new models of strike, emphasizing the importance of the territorial and spatial dimension of protest. This is the case, for example, of the debates on the "social strike" (which update the older discussions on the "metropolitan strike" or the grève par procuration that emerged in nineties). The rise of "platform capitalism" and of logistics has opened up debates on the possibilities of collective action by workers, their strategic power and the existence of choke points in the global supply chain. Debates have also emerged about the relationship between strikes and other forms of protest, such as riots or blockades (sometimes subsumed under the label of "circulation struggles"), or boycott. Finally, the very concept of strike has been re-framed by immigrant workers' initiatives, the climate strike and, in particular, by the feminist movement which proposes an extension of the very concept of strike to the terrain of social reproduction.

RC02-52.7

ANTUNES, Caio* (Federal University of Goiás - UFG, Brazil)

Education in Mészáros

István Mészáros maintains that education – understood in its broadest sense – occupies an absolutely central place in the process of production and reproduction of the social life of human beings. That is, to the extent that general social reproductive parameters are not automatically perpetuated, they have to be internalized, so that individuals end up adopting the ultimate horizons of a given social order as their own. If the general determinations of the reproduction of life deeply affect each sphere of human existence with some influence on education, under the system of social metabolism of capital, education has the sense of internalizing the alienated and reified general reproductive parameters of the system, in order to that each individual receives a kind of spiritual and material inheritance from the capital system and thus ensures the continuity of capital's social order. Therefore, a frontal challenge to education, by directly affecting the very processes of ideological internalization, represents a profound challenge to the social structure in question, and a radical social transformation of this social structure can only really happen with an effective contribution of education – again understood in its broadest sense.

RC30-437.3

ANTUNES, Ricardo* (UNICAMP (Campinas), Brazil)

Nuevos Laboratorios De Experimentaciones Del Trabajo En El Capitalismo Pandêmico

En la era del capitalismo digital, un número creciente de trabajadores y trabajadoras se encuentran en situaciones cada vez más inestables y precárias. Los ritmos intensificados de trabajo y el sistema de "metas", acarrean el aumento de la explotación, enfermedades, acosos, depresiones y suicidios. Trabajos ocasionales y intermitentes, en las más distintas actividades de servicios, se vuelven en "emprendedores", uma mezcla de *propietarios y proletarios de sí mismos.* Con las tecnologías de información y comunicación a ritmo intenso, los servicios cada vez más "comoditizados" también si subordinan a la lógica de la mercancía y del valor.

Contra la "rigidez" vigente en las fábricas del siglo del automóvil, el capitalismo de plataforma amplía todavía más su rasgo destructivo en relación al trabajo. Se expande el trabajo intermitente y uberizado. Las grandes corporaciones digitales se enriquecen y el trabajo se se vuelve aun mas informal, flexible, precário, características marcadas del capitalismo en el Sur global y que también se están expandiendo en el Norte, com la Amazon (y Amazon Mechanical Turk), Uber (y Uber Eats), Google, Facebook, Airbnb, Cabify, 99, Lyft, iFood, Glovo, Deliveroo, Rappi, etc.

Pero, si éste era el trabajo antes de la explosión del coronavirus, ¿qué se está gestando en el presente, en medio de la pandemia del capital? ¿Qué experimentos de trabajo se están ideando en los laboratorios de experimentaciones del capital?

La nuestra hipótesis central és que el *capitalismo pandemico* viene presentando varios experimentos de trabajo que están siendo gestionados en laboratorios de capital, por grandes plataformas digitales, para expandirse sin límites en la fase post pandemia.

Una Apuesta Al Futuro y La Urgência De La Alternativa Socialista: La Contribuicíon De Istváu Mészáros

István Mészáros, desde el final de los años de 1960, develo la crisis que *asola el capital, tras experimentar la era de los ciclos, se adentraba en una nueva fase, inédita. Beyond Capital (Más allá del capital),* una de las más agudas reflexiones críticas sobre el capital, sus engranajes y mecanismos de funcionamiento, tiene al menos cuatro ejes centrales: 1) el *sistema de metabolismo social del capital;* 2) la *crisis estructural del capital;* 3) *capital y capitalismo* son fenómenos *distintos* ; 4) la *actualización histórica de la alternativa social del socialismo.*

Sindo *expansionista* en la búsqueda desmedida de plusvalor, *destructivo* en su procesualidad pautada por lo descartable y la superfluidad, el sistema de capital se vuelve, en el límite, *incontrolable,* asumiendo la forma de una *crisis estructural endémica, crónica y permanente*, lo que replantea, dado el espectro de destrucción global, la búsqueda de una alternativa socialista urgente, apuntando a la construcción de un nuevo *modo de producción* y de un nuevo *modo de vida* cabal y frontalmente contrario a la lógica destructiva de lo que definimos como *capitalismo pandêmico.*

En la búsqueda por controlarlo, fracasaron tanto los innumerables intentos efectuados por la socialdemocracia, como la alternativa de tipo soviético.

Por fin, la obra de Mészáros realiza una síntesis inspirada en Marx, pero también de la matriz ontológica de Lukács y de la radicalidad de Rosa Luxemburgo. El resultado és una síntesis original, que revisa nuestro pasado y nuestro presente, ofreciendo un manantial de herramientas para aquellos que *apuestan a un futuro más allá del capital.*

Visibility Politics of Urban Food Workers and Their Precariousness

During the Covid-19 pandemic crisis, food system was disrupted globally. By maintaining food security, especially in urban context, food workers have to sacrifice themselves as essential workers. However, their unaware frontline workers role is invisible and excluded from crisis management policy measures. In 2021, this research has investigated vulnerability and risks facing by food workers in Bangkok Metropolitan Region, Thailand. The mixed method is applied with a combination of quantitative and qualitative researches. The quantitative part collects primary data using questionnaires from a total of 398 food system workers. The qualitative research consists of 25 face-to-face in-depth interviews, 2 group discussions, 1 brainstorming session. The main findings indicate that the most vulnerable food workers are self-employed workers and workers in micro businesses, whose precariousness was demonstrated through income security and employment instability. During pandemic, while street food vendors, workers in fresh markets, convenience store workers, grocery store workers and small restaurant workers were pushed into poverty, food court workers without social insurance were at risk to poverty. Our discussion would explore more on diverse precariousness conditions experienced by these food workers' groups. Their visibility within urban politics will be inspected and their concerns will be brought to light.

How Did They Live in the Period of the Innovative Local Government?: Life Histories of Young Workers in Administrative Reforms of Local Government in the 1960s and 1970s in Japan.

In the 1960s, young people were seeking progressive changes in politics and in their own lives around the world. During that period Japan was expanding economically, but suffered environmental problems caused by the inefficiency of politics. Then, reformist mayors emerged in various cities and started a new movement, forming an association named "Innovative Local Governments." The innovative municipalities aimed to propose and implement urban policies tailored to regional values rather than the national values of the central government. They also enhanced citizens' participation.The aim of our study is to understand the innovative movement through the experiences of young workers in local governments at that time. Previous studies in political science have shown that innovative municipalities eventually lost support from citizens due to a contradiction within their system; they behaved as the new establishment while proclaiming themselves anti-establishment by their movement. However, this study would have a strong focus on what remained after the abolishment of the municipalities, in terms of politics from a sociological point of view. We analyze as a case study a leading innovative municipality, Yokohama city government (1963-1978) under Ichio Asukata. Under his administration, various reforms based on citizen-oriented viewpoints were implemented by the coordinative mechanism organized by the urban planner Akira Tamura.Our concern is how young workers at the time experienced these innovations and how they transmitted their efforts and results to later generations. We use the method of life history for this purpose. In order to modernize "governance" for enabling local governments to solve local issues, participation of, or collaboration with, citizens, the private sector, public institutions, and non-governmental organizations is required. The results of this study would enable those concerned to envisage the innovative movement of local governments as the base of "governance" by positioning municipal workers as gatekeepers of governance.

Energy Poverty in Southeast Asia: Climate Change Mitigation and the Quality of Life

In this paper, we discuss an energy transition framework for developing countries in the context of climate change mitigation. Based on our field research that explored lifestyles in Thailand, Vietnam and Myanmar, we posit that we reconsider the concept of 'energy poverty' in order to explore the ways to improve people's quality of life, while keeping GHG emissions low. In our mixed-method research, we interviewed about 30 households (quantitative), and our survey (qualitative) yielded over 1,000 responses in each country with a representative national sample. The energy transition in Southeast Asia is a shift from solid fuels such as firewood, rice husks and straw to liquid fuels,

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

and then to electricity, which is a modern form of energy. Indeed, electricity has been key to the improvement in people's quality of life in the countries we surveyed, and we have identified two aspects in this argument: actual (in)accessibility to electricity and an inability to pay for it (affordability). Our research shows significant differences in accessibility and affordability between urban and rural households: e.g. energy poverty in 12% of urban and 68% in rural households, which are not connected to the main grid in Myanmar. We therefore introduce two fundamental elements to the definition of energy poverty for developing countries. The first is the main grid connection, and the second is the connection to any electricity sources other than the main grid (e.g. currently 1% in urban and 3% in rural areas in Myanmar). Connections to the grid and other energy sources greatly affect the quality of life including household appliances ownership. Importantly, they assure access to social networks (and to solar panel electricity supply in rural areas) through smartphones ownership. Only through considering these new dimensions of energy poverty, we can then tackle energy transitions and improve the quality of life.

Media Discourse and the Experts' Roles in the Scientific Evaluation of the Children's Thyroid Study.

A thyroid survey for children has been conducted since October 2011, mainly by the Fukushima Medical University. The survey was proposed because of the fear of thyroid cancer in children, as occurred in Chornobyl, the nuclear power plant accident on March 11, 2011. In 2014 and 2021, one of the UN organizations released a report that assessed the health impact of radiation on children's health, which said there was no increase in thyroid cancer in the region. Some experts called for a halt to the program, but it has continued.

Newspaper coverage has played a significant role in this policy decision on thyroid screening. The expert committee for evaluating the results of the Fukushima Prefecture survey has a considerable influence on the overall assessment of the scientific findings. Still, the newspaper articles on the committee's decision differ significantly from one newspaper to another. These different attitudes towards the scientific assessments by the media are a major factor causing the government (Ministry of the Environment) and Fukushima Prefecture (the implementing authority) to withhold their decisions. We analyzed differences in coverage of the thyroid gland in four newspapers: a local newspaper in Fukushima Prefecture, a regional newspaper in the Tohoku region where Fukushima Prefecture is located, a local newspaper in the Tokyo metropolitan area, and a nationally circulated newspaper. Comparing 1) the number of related reports over time and 2) changes in the contents by content analysis (e.g., tone) over time in the four newspapers to explore the movements and experts' voices behind them. The results suggest huge differences between the four newspapers, suggesting that this makes policy decision-making difficult. Using these results, we discuss the role of experts' understandings and the construal of scientific evidence by their expertise, position, and other aspects such as attitudes toward nuclear and the current government.

APPIAH, Adou* (Departement d'anthropologie et de sociologie, Côte D'Ivoire)

Syndicalisme Et Résilience Ouvrière : Quand Les Militants Se Défendent Eux-Mêmes

Alors que les indicateurs macroéconomiques de la Côte d'Ivoire sont satisfaisants selon les observateurs internationaux et particulièrement le FMI (2021), les conditions de vie et de travail des salariés et de leurs organisations sont peu reluisantes. En effet, des leaders syndicaux sont arrêtés pour des troubles à l'ordre public et emprisonnés (CSI, 2020). Dans le classement 2021 concernant l'indice CSI des droits dans le monde, la Côte d'Ivoire a obtenu la note 4. Ce qui implique que les droits des travailleurs et plus particulièrement de leurs représentants, sont systématiquement violés. Cette situation conjuguée avec le passif historique (syndicalisme de participation) des centrales syndicales en Côte d'Ivoire (Appiah, 2013) a conduit à un affaiblissement des organisations ouvrières.

Face à cet état de fait, il est légitime de questionner les modalités de défense des travailleurs. Autrement, comment les travailleurs parviennent-ils à assurer leur propre défense dans un contexte de syndicalisme affaibli ? La communication tente de saisir les stratégies adoptées par les militants pour leur défense. Elle s'appuie sur une revue de littérature et une enquête de terrain réalisée dans une entreprise auprès de 20 personnes, dont des leaders syndicaux, des responsables d'entreprise et des militants syndicaux.

Plus concrètement, il s'agit de saisir les relations de pouvoir et les jeux d'acteurs au sein d'un système et ainsi rendre compte des stratégies développées par les travailleurs pour défendre leur emploi lorsque les syndicats affichent leurs limites. La résilience des militants à travers leur mobilisation suggère une appropriation des luttes par ceux d'en bas à travers diverses stratégies, notamment négociation, de l'ad'hocratie, de la migration syndicale et de la grève. En même temps, il se pose la question de l'efficacité et de la validité de ces actions initiées par les travailleurs indépendamment de leurs leaders et parfois à l'encontre de la législation en vigueur.

Branding a Nation's Hospitality

Hospitable encounters are integral in place-rooted tourism experiences. Hospitality, as a virtue, is increasingly engrained in national tourism strategic plans with pursuits of constructing national identities in the competitive international tourism market. The Philippine Department of Tourism recently launched the Filipino Brand of Service Excellence, a program that promotes the best qualities and values of the Filipino people in and through touristic encounters. It envisions to elevate the service quality extended by tourism establishments by standardizing ways of interacting with customers, handling complaints, and performing micro-gestures (e.g., *Mabuhay* greeting). It re-imagines Filipino hospitableness by branding national hospitality founded on seven core values (7Ms) deemed to be shared amongst diverse ethnolinguistic groups of the Philippines. However, promoting a single national brand of service excellence presents risk of overrepresentation in favor of a certain cultural group. We critically examine the construction and representations of Filipino hospitality in the Filipino Brand of Service Excellence program. We draw insights from a critical discourse analysis of videos that promote the programme, and webinars and training videos posted on YouTube by certified program trainers. By engaging in a localized approach to forming a national brand of hospitality, we analyze the program as an effort to reconstruct Filipino cultural identity and challenge homogenous views of Asianness in the global tourism context. However, such an effort could lead to issues on the power play and the dichotomy of nationalism versus regionalism. We also argue that such an initiative is essentialist, and to some extent, imperialist, as it tends to subsume multiple notions of hospitality endemic in the Philippine archipelago into an imagined narrative, given its goal to standardize hospitable encounters and implementation following internal marketing approaches practiced in commercial hospitality. Our analysis contributes to discussions on national identity formation and nation branding in the context of international tourism.

Retracing Algorithms: How Digital Social Research Methods Can Track Algorithmic Functioning

The expanding use of algorithms in society has called for the emergence of "critical algorithm studies" across several fields, ranging from media studies to geography and from sociology to the humanities. In the past five years a consistent literature on the subject has developed. Inspired by these studies, we explored the ways digital traces may be employed for auditing algorithms and find evidence about algorithmic functioning. We focus on the analysis of digital traces through search engines and Application Programming Interfaces (API). We present four cases of how digital traces may be used for auditing algorithms and testing their quality in terms of data, model and outcomes. The first example is taken from Noble's (2018) book Algorithms of Oppression. The other three examples are very recent, two of them related to covid-19 pandemic, and about the most controversial type of algorithms: image recognition. Search as Research, and the analysis of digital traces and footprints within quasi-experimental research designs, are useful methods for testing the quality of data, the codes, and the outcomes of algorithms.

The Internalisation of State Ideologies By Minorities: A Comparison of the National Language Education in China and Japan

This paper explores how state ideologies were internalised by Uyghurs in the People's Republic of China (PRC) with a comparison to that of Okinawans in imperialist Japan in terms of national language education. It compares the promotion of Mandarin Chinese in the Xinjiang Uyghur Autonomous Region (Xinjiang) and the penetration of Standard Japanese in the late-nineteenth to early-twentieth-century Okinawa/Ryukyu based mainly on literature research. The government of the PRC has been disseminating the ideology of "the ethnic unity under the Chinese nation" as a response to the unrest in Xinjiang, while it has been accused of the oppression of Uyghurs. Scholars studying Xinjiang have shown many forms of resistance by Uyghurs against the assimilative policies including the use of the Uyghur language. Okinawa, the former Ryukyu Kingdom, accommodated the linguistically diverse population, but imperialist Japan imposed forcible national language education on Okinawans through the course of its invention of the Japanese nation. Following Okinawa nearly a hundred years later, Mandarin education has begun to be promoted in a top-down manner in Xinjiang, which corresponds to the re-conceptualisation of the Chinese nation as an assimilative notion. The comparison between Okinawa and Xinjiang shows the internalisation of state ideologies among Okinawans and Uyghurs, claiming the national language as "modern" and the minority language as "backward." It also reveals the dual phenomena of spontaneous learning of national language and reluctance and resistance towards national language education in both regions. Social and economic success in the future that is supposed to be brought by the competency in national language motivates the minorities to learn it, while the state discourse of the modern-backward binary is reaffirmed. However, as Okinawa's case suggests, state ideology can be a source of sustained resistance when it contradicts the real socio-politico-economic situation minority people live in.

Economies and Environmental Citizenship: Linkages between Economic Growth and Citizen-Led Environmental Activism in Bengaluru, India

Bengaluru in the late 20th and early 21st Century witnessed two simultaneous trends which have shaped the image of the city. First, the city emerged in the late 1980s to become a global attractor of investments in information technology and technology-based entrepreneurship. At the same time, the city witnessed a rise in citizen-led environmental movements, characterised specifically in the conservation of urban flora and fauna, water-body rejuvenation, and preservation of green spaces. The 'IT worker' and the 'environmental activist' have emerged as two prominent stereotypes of the Bengaluru citizen.

This paper examines the linkages between Bengaluru's economic development and environmental activism. It argues that while the city's booming economy, particularly its IT industry, is often seen as growing at the cost of its environment, there are also significant factors which have complemented economy and environment. A particularly significant link exists between the development of Bengaluru's economy in the late 20th century and the emergence of environmentally conscious citizen movements. The dependence of Bengaluru's growth upon scientific and technological industries led to the creation of an ecosystem of high-skilled scientific and technical workers who had both the knowledge and resources to undertake environmental activism as citizens. Furthermore, the growth of Bengaluru's technological industries also complemented the rise of formal and informal scientific institutions and collectives who could draw upon scientific research to inform their activism.

As a result, Bengaluru's citizen activism is often led by high-skilled high-income workers, who engage with public agencies in complex collaborations and contestations unique to their socioeconomic positions. Linking this to the evolution of Bengaluru's economic structure allows us to ask new questions about the future of such activism, as it changes in response to economic restructuring and confronts new demographies of workers in coming years.

RC02-54.5

ARAKALI, Amogh* (Indian Institute for Human Settlements, India)

Locals within Globals: Theorising for Local Environmental Factors in Global Manufacturing Chains Using Case Studies from India

At national and sub-national scales, global manufacturing chains can be seen as ensconced within Special Economic Zones, Industrial Corridors, Manufacturing Zones and Industrial estates - industrial spaces which are deliberately planned to address global trade and economic needs. When such spaces are planned by prioritising global economic needs, their spatial planning is often delinked from local and regional concerns such as local environmental factors or employment structures.

Such delinking, while beneficial in achieving certain targets such as increased manufacturing efficiency, can increase long-term risks for both the industrial space itself, as well as the larger global chain it is part of. This is particularly true when the planning of industrial spaces is delinked from local environments and ecologies, since a negative environmental disaster in one location on the chain can have cascading effects further down. The COVID-19 pandemic illustrated the impact of local shutdowns on global value chains in two notable cases - the shutdown of ports in China which raised commodity prices in markets across the world, and a slowdown in semiconductor manufacturing, which created chip shortages for global tech-based industries. With increased climate change and higher risk to local ecologies, there is an increasing need to integrate local environmental factors into the spatial planning of industrial spaces.

This paper uses case studies from India's planned industrial spaces - specifically, it's National Industrial Corridor Development programme and related state-level schemes for industrial development within corridor influence zones - to highlight the delinking of these spaces from local and regional environmental considerations. It will argue that accounting and planning for local environmental considerations within these programmes can significantly de-risk both these spaces, as well as global chains from environmental impacts over the long-term.

ARAKI, Satoshi* (University of Hong Kong, Hong Kong)

The Skills Trap: Explaining the Emerging Inequality in Education, Skills, and Well-Being

Recent studies argue that high skills are the key to achieving favorable socio-economic outcomes such as better jobs, income, health, and subjective well-being. However, while such a positive story has been evidenced by the average effect of high skills, we know little about stratification and inequality among highly skilled people. Whereas individuals with certain socio-demographic attributes fully leverage the advantage of high skills, others might suffer from unfavorable outcomes despite their equally advanced skills. Put differently, there may be an overlooked social structure, or "skills trap", which undermines the benefits of possessing high skills among particular groups whilst protecting the select community. Should this be the case, an increase of highly skilled people in a given society would result in exacerbated inequalities between those who can and those who cannot gain averagely predicted rewards. In this study, using the large-scale international survey data for OECD countries and a range of statistical models, I analyze the association between skills, multidimensional well-being, and socio-demographic attributes, with close attention to who is penalized socio-economically despite being highly skilled. Country-specific investigations and cross-national multilevel analyses show both (1) common forms of the "skills trap" confirmed across countries and (2) its unique structure observed merely in specific societies. These findings and analytical approaches contribute to better understanding the nuanced process of stratification and inequality under the influential discourse on the positive impact of high skills. Policy implications are also discussed.

Covid-19 and Gender: Impacts on the Labour and Family Trajectories of Women from Different Generations in Argentina

The crisis provoked by COVID-19 has signified an increase in social inequality in Argentina. The expansion of the virus along with the social distancing measures implemented by the State had greater impact upon low-income households. Within the households, women have been the most affected, as they tend to face a greater imbalance with respect to care responsibilities and more difficulties in inserting themselves and staying in the job market.

Decades of academic and political debate begun by feminists, have demonstrated how the unequal distribution of care strongly influences the inequality of opportunities between men and women. The persistence of traditional patterns of gender, which intersect with inequalities of class and race, among others and the absence of integral systems of care provoke a lesser participation of women in paid work with a broad range of consequences in their life trajectories, not only in terms of income, but also self-esteem, and wellbeing. Recent investigations show that the division of labour between the sexes begins in their youth and, as a result, women have to be flexible in their working hours, or become the first ones to be excluded from productive occupations.

Drawing from a biographical method, this research seeks to understand the effects of the COVID-19 pandemic on the employment and family trajectories of women whose lives have been traversed by several forms of precarity. This paper presents the preliminary results of biographical interviews of two generations of women from low and middle income sectors who live in Buenos Aires: young women between 19 and 29 years old and their mothers. The intersectional perspective guiding this project deems that race, age, and sexuality are identity categories that intersect in specific ways, generating different experiences of discrimination and inequality that need integral responses that better their living conditions on the post-pandemic stage.

Beyond Legitimacy: How to Study Authority in Contemporary Societies

The understanding of authority via legitimacy proposed by Max Weber has been the most influential in social thought and social research. Drawing on a 10 year long empirical and theoretical research program on authority and power asymmetries in social life, this paper argues, firstly, that the theory of authority via legitimacy is no longer equal to the task of addressing the problem of the exercise of authority today. One of the main reasons for this is that the sociohistorical conditions that gave rise to this focus have been transformed, affecting the ways in which individuals establish relationships with hierarchies and therefore changing the conditions for the unfolding of relationships of authority. These transformations put pressure on the relationships that people establish with hierarchies, and therefore, on the exercise of authority as it was previously known, because they call into question constituent dimensions of authority: a) the traditional supports of authority (e.g.: truth, trust, mediation); b) the notion of a stable, organic and indisputable hierarchy; c) tutelary forms of authority based on naturalized hierarchies; d) a stable architecture of social power attributions, and e) the importance of relational authority roles and figures as a social task (Araujo, 2022). Secondly, the paper discusses how to overcome the limits of a legitimacy approach to the study of authority by presenting a relational and interactive theoretical-methodological approach to the study of authority (RIAA) (Araujo 2021). Thirdly, drawing on data from the First Survey on Authority in Chile (NUMAAP, 2021) (n=1500) and results of qualitative studies, the paper exemplifies the above discussed using the case of Chile. Specifically, the paper shows how in Chile supports for the exercise of authority have changed. It also shows how performance and efficacy have become more important than individual attributes for the exercise of authority.

ARAUJO, Kathya* (Universidad de Santiago de Chile, Chile)

Neoliberalism, Democratization and the Circuit of Detachment: Risks and Opportunities.

Individuals and the social bond have been deeply affected in the last decades by the impact of the so-called neoliberal economic and social model as well as by the push for democratization of social relations. They have change ordinary challenges people must face in social life as well as individuals' responses to these challenges. Based upon the outcomes of a 20 yearlong research program, this presentation intends to discuss the risks and opportunities that this process entails for the future of societies, by analyzing the case of Chile, a country considered an early and particularly radical case of neoliberalism. It will focus on one of the most important outcomes of these processes in this country: the generation of *a circuit of detachment*, that is, a process that leads to different forms of disidentification and distancing from institutions and from the social logics and principles that order the social bond. This is a dynamic process comprising four components: excessiveness, disenchantment, irritation and, finally, detachment. It will be argued that the circuit of detachment can be read as both hopeful and worrying. It is worrying because the currents that run through Chilean society are very dissimilar; because it raises the question of how in this context of detachment the problem of social and political regulation is to be solved; and because it produces a high degree of uncertainty regarding the fate of the political bond. It is, at the same time, hopeful in that it shows Chile to be a society of individuals who recognize, across the board, the limits and costs for their own lives of the economic, development, social and relational model that has governed them for the past several decades and the seek for new paths and models, even if this does not yet finds an adequate political expression

El Sindicalismo En Empresas Multinacionales Que Operan En Chile En El Marco Del COVID-19

La ponencia se propone examinar las orientaciones que ha seguido la acción sindical en empresas multinacionales que operan en Chile en el contexto de la crisis desatada por el COVID-19. En particular, serán objeto de análisis los casos de Walmart, Starbucks y Banco Santander. La presentación comenzará aportando antecedentes referidos a las dinámicas económicas, laborales y sindicales en estas empresas a nivel mundial, para luego centrar las reflexiones en el caso de Chile. En este marco, serán objeto de atención las tendencias referidas a la reestructuración de las empresas, la ampliación de los procesos de automatización y digitalización, la amenaza del desempleo, el cambio en las relaciones laborales y los márgenes de acción de las organizaciones sindicales. Las empresas transnacionales muestran una gran capacidad para gestionar sus negocios e inversiones en vistas a aumentar su competitividad, lo que será contemplado en el análisis. Respecto del sindicalismo, que será nuestro foco principal de atención, interesa mirar sus estrategias, la identificación de repertorios y el tipo de incidencia que logran en esta etapa

pandémica (el modelo de acción sindical emergente). La ponencia cerrará con algunas propuestas para futuras indagaciones en este campo, teniendo como perspectiva el fortalecimiento del sindicalismo y la necesidad de ampliar la reflexión sobre sus concepciones y prácticas.

Los Estudios Sindicales En Chile: Debates Epistemológicos y Teóricos.

La producción de conocimiento en el campo de los estudios sindicales en Chile ha experimentado una interesante evolución en las últimas décadas. En los años de la dictadura la investigación valoró la dimensión política del actor sindical, se centró en las grandes organizaciones y subrayó las variables estructurales e institucionales para explicar su desarrollo. El horizonte de cambio en aquellos años estaba marcado por el tránsito desde el autoritarismo a la democracia, lo que orientó tanto al sindicalismo como a los propios investigadores. Sin abandonar dichas aproximaciones lo que ocurrió posteriormente es que se han incluido otras miradas, en diálogo permanente con disputas teóricas y metodológicas más amplias. De tal modo, los estudios no han estado ajenos a los debates sobre el fin del trabajo, los procesos de globalización, la descentralización de la producción, la crisis de la democracia, el conflicto ambiental, entre otros fenómenos (aunque existen diferencias en términos de la cantidad y tipo de publicaciones y actividades asociadas a cada eje). Asimismo, existe acuerdo respecto de la heterogeneidad del mundo laboral y sindical, lo que ha derivado en la utilización de diversos soportes teóricos y metodológicos. En este marco, la ponencia propone una reflexión sobre el recorrido de los estudios sindicales en Chile, identificando cambios y continuidades en sus orientaciones epistemológicas y teóricas. Esto permitirá visualizar perspectivas consolidadas, otras emergentes y eventualmente algunas desatendidas en ciertos momentos históricos.

ARBOGAST, Mathieu* (Cems (EHESS) & Cresppa-GTM, France)

Social Acceptability of Contradictory Gender Norms: Lessons Learned from a Socio-Demographic Analysis of TV Series

How can sociology of television be enriched by new approaches? Is it possible to study fictional characters as a population? When television studies include « demographic » data, these are mostly limited to the general description of the sample. The demographic approach brings new possibilities to analyze fictional contents, including longitudinal analysis. In the wake of the Cultural studies, we consider that television is not a pure reflection of the society, but it reveals social relations instead, as well as power settings and inequalities. Prime Time programs in particular, tell a lot about what is socially acceptable. As such, it is a very fitting material for a sociology of the norms. Beyond traditional quantitative content analysis, we use demographic methodology to add analyze the longitudinal dynamics. Following Chalvon-Demersay, we analyze the heroes of TV series as a twofold entity combining the character and the actor.

Our mixed method combine multivariate quantitative study and qualitative sequence analysis. It combines analysis of the content and of the cast (e.g. survival analysis) to obtain a comprehensive understanding of what fictions convey.

We analyzed a corpus of 36 Prime Time cop shows. Among the main results, the share of women in the cast grows between the first and last seasons. The cast turnover also deepens the gender age gap.

Women are underrepresented at the higher ranks, but not at legwork level. Hence, it is acceptable to show successful female cops who use their firearms and can fight. But this liberal gender norm coexists with more conservative values: women are mostly young and thin, and they are much more eroticized than men in the episodes.

Beyond the specific frame of postfeminist media studies (Mc Robbie 2004), we propose to use the concept of "normative pluralism" to analyze how mainstream TV fictions simultaneously display contradictory norms.

ARCHER, Robin* (London School of Economics, United Kingdom)

Postmaterialist Values and Opposition to War: Comparing Generations

Postmaterialist Values and Opposition to War: Comparing Generations
Robin Archer (Program Director, Political Sociology, LSE)
This paper will consider what changing attitudes to war can teach us about generational value change and its sources. Which sections of society are most likely to oppose participation in war? The main answer since the 1960s has focused on the university educated young, especially those from elite institutions. This answer is underwritten by an influential wider thesis about shifting generational values and the rise of postmaterialist values associated

with work of Ronald Inglehart and his colleagues. Their work is amongst the most widely cited in the social sciences and is often invoked as a major explanation for the jarring political realignments of the present.

This paper seeks to reassess Inglehart's thesis and illuminate the present by looking back in time to the Edwardian world of the early twentieth century. If the thesis is correct, there should have already been a small group of postmaterialists then, among those who grew up in an environment of physical and economic security. Data on the class background of Edwardian university students on the eve of the First World War suggests that they fit the bill. But while the elite of materially secure students in the 1960s and since have been at the core of anti-war activism, it was precisely their counterparts – though far smaller in number - who most enthusiastically embraced participation in war in 1914.

Why did these groups of materially privileged students behave in such different ways? And what are the implications for the postmaterialist values thesis? In this paper I will explore two possible answers, before returning to the present to consider the implications of these answers for contemporary debates about political socialisation and current generational shifts in political values.

Radical Resistance and Radical Retreat on the Eve of the Great War

Radical Resistance and Radical Retreat on the Eve of the Great War
Robin Archer (LSE)
Why did radical resistance fall away on the eve of the Great War, even in Britain where opposition was strongest? Labour movements and their radical allies were by far the most important organised restraint on war-making, and on the eve of the Great War, they made frantic efforts to mobilize opposition. Britain's ruling Liberal party and its strong tradition of anti-militarism gave opponents their most powerfully placed allies in Europe. In Britain, the forces for and against intervention were finely balanced and Britain's entry remained uncertain. How was the resistance to intervention overcome? This paper examines the role of appeals to honour, paying particular attention to the role of these appeals in convincing radical liberals to accept British intervention – something which they had been successfully blocking until shortly before war was declared. It also examines parallel appeals in the United States and Australia. The paper then considers why the language of honour was effective, and whether it still plays a role more than a century later. It concludes by considering whether there are contemporary lessons for us today.

Robin Archer is Associate Professor (Reader) in Political Sociology and Director of the Ralph Miliband program at the London School of Economics. He was previously the Fellow in Politics at Corpus Christi College at the University of Oxford. His works include *Economic Democracy* (Oxford) and *Why Is There No Labor Party in the United States?* (Princeton). He is currently researching opposition to the First World War and conscription, especially in the English-speaking world.

Introducing Prosumption As an Analytical Tool for Innovation: From Systematic Review to an Integrative Research Agenda

The concept of "prosumption" is regaining attention, in particular in reference to challenges such as the digital and green transitions, and social innovation. In various fields (from energy to mobility, from food to care services), knowledge, expertise and practices of prosumers are becoming increasingly essential in contemporary economy. This contribution aims to present a brief review on the evolution and implications of the concept of prosumption, especially in the field of economic sociology, sociology of organization, sociology of agriculture and food and isociology of professions. Such an introduction will provide the coordinates for the debate and the presentations that follow on specific analytical fields.

Digital Agriculture, Agroecology and Agricultural Innovation Discourse in Australia

The promotion of digital technologies in agriculture is gaining increased momentum as offering a suite of tools able to address challenges of a changing climate and a demand perceived with a growing global population. These innovations are based in the dominant industrial-productivist agriculture regime that places unsustainable pressure on biodiversity and the wider environment. This agenda appears to be in contrast to 'retro' innovations like agroecology that place less emphasis on productivity and intensification, instead employing holistic and long-term ecosystem approaches. This research

explores the intersection of these two approaches to examine the extent to which digital agriculture is able to respond to, and engages with, agro-ecological producers and agroecological systems. To do this, I draw from interviews with over thirty producers across Australia who self-identify as practicing principles of agroecology to examine engagement with digital technologies, alongside benefits and barriers digital tools present in their farming operations. Findings provide new insights into the place of digital and data driven technologies in supporting eco-system based approaches to production. This may assist policy makers to develop responsible innovation policy that is commensurate with the values and practices of producers who have ecology at the centre of their production approaches.

Cinema As the 'Othering' Apparatus in Intensifying Polarization: The Construction of 'Us Vs Them' in Post-9/11 Indian Movies

From contemporary sociological perspectives, how the 'identity' of a certain social group is imaged, constructed, and disseminated through cinemas cannot be overlooked for many critical reasons. History suggests that in almost every polarized society, cinema is widely used by the power apparatuses as an instructive instrument for indoctrinating attitudes, values, and beliefs for the systematic re/shaping Otherness. This paper sets out to understand to what extent Indian cinema industry played a decisive role in shaping the public sentiment of 'Us vs Them' regarding Hindu and Muslim. Using close reading method, this small-scale interpretative study specifically aims at analyzing six different Indian movies (of different language) that constructs popular narratives which contribute to the process of othering of Muslims in Indian social milieu. Another important purpose of this study is to critically analyze how the directors in their stories actually explained or represented 'Us vs Them'. The primary conclusion of this study is that the selected six films have fundamentally nourished the 'cultural, political and ideological otherness' of the Muslims and reduced their identity into 'Them' through various direct and subtle cinematic representations.

Color-Status Exchange: Evidence from Mexico

In societies historically structured by ethno-racial hierarchies, the investigation of how race and ethnicity affects dating and marriage has been at the center of research agendas of social stratification scholars. Examining racial intermarriage becomes key to understand some of the mechanisms leading to social mobility. A classic explanation of racial intermarriage suggests black individuals would trade their high-SES to marry a white partner. Yet, evidence testing this hypothesis comes disproportionally from the United States and focus only on race-status exchange. Some scholars question whether this hypothesis can be generalized to contexts where racial boundaries are more permeable, such as in Latin American countries, where policies of racial mixing were embraced.

In this paper, instead of investigating race-status exchange, I will examine skin color-status exchange in Mexico. In this country, skin color is more consistently associated with SES than racial classification; therefore, it is likely to influence who is more or less desirable for dating and marriage. Furthermore, in Mexico, ethnographic studies have shown marriage is often understood as an opportunity to "improve the race" by producing lighter offspring, suggesting that inter-color relationships are used as a strategy for intergenerational upward mobility.

Despite the existence of a clear socio-economic and educational gradient on skin color and the ethnographic evidence suggesting that a process of skin color-status exchange may be occurring, there are no population studies available that test this hypothesis. With the exception of a population study using racial/color classifications in the Brazilian Census, but not skin color. In this paper, I will use a novel representative dataset from Mexico, the Mexican Family Life Survey (MxFLS), which represents the first effort, in Latin America, to collect information about skin color of respondents and their spouses/partners, thus allowing testing skin color-status exchange in a country that has historically embraced racial mixing.

The Challenge of Public Universities to be Able to Respond to the Needs of Inclusion, Equity and Development, in Unfavorable Contexts.

The relevance of universities refers to the way in which they respond to the needs of society. However, starting in the latter part of the 20th century, the world abruptly experienced a series of changes in different fields, which had a significant effect on the role and development of universities worldwide.

One of the aspects that most affected the universities was the advance of neoliberal policies, which exerted strong pressure towards the reduction of the

State, in particular everything related to welfare policies in particular, to the reduction of financial contributions to public institutions, including those of higher education.

Since the end of the seventies of the last century, a new public philosophy has been imposed in which it is stated that the private sector is more efficient and of higher quality than the public sector and that competition between individuals, institutions, systems and countries constitutes the best regulation. and quality assurance (Rafael, 2018).

In addition to this, according to what Ramírez Gallegos (René, 2018) pointed out, scientific production has been an instrument of capital accumulation; that is, scientific-technological investment has had as its main objective not life or democracy, but the accumulation of wealth: knowledge and education for income.

Universities and many of their academic units have been pushed to create programs oriented to the search for rents through the privatization and commodification of knowledge; that is, to an underproduction, underuse and concentration in few hands of the benefits produced by knowledge.

In this paper, the opportunities and threats facing public universities in increasingly hostile government environments are analyzed and proposed for discussion.

Power Resources, Social Ties, and Inequality: Rural Threats and the Distributional Outcomes of Rural Development in Indonesia and Malaysia

Researchers have shown that threats from rural forces can have consequential impacts on state development policies in rural areas. Facing such a threat, governments are likely to allocate more resources to the agricultural sector to contain the threat and build political support among the rural population. Other than to develop rural infrastructures like irrigation, roads, and markets, the government may use the resources to provide farmers with subsidized production inputs such as fertilizers and seeds. Governments may also enhance the provision of social services in rural areas by building more schools and health centers for rural dwellers. However, how the threat may also affect the distributional outcome of rural development policies remains under-theorized. Under what conditions did rural threats lead to more equal development outcomes in rural areas? Drawing on the case of rural development in Indonesia and Malaysia in the 1970s, this study aims to answer this question by assessing the effect of power relations between the rural population and the state elite on the distributional outcome of rural development in the two countries. This paper argues that the distributional impact of state development policies in rural areas is a function of the political standing of poor framers in front of the state elite in the resulting political configuration created by the threat of the rural forces. The presence of social ties linking poor farmers and the state elite can enhance the distributional outcome of rural development programs. Otherwise, the benefits of the rural development programs are likely to be skewed toward rich farmers.

Disturbance of the State-Profession Dynamic in a Globalised World after the Ravages of the COVID-19 Pandemic: Disputes between Systemic Powers and Labour Rights.

For decades, professional autonomy was understood as an essential characteristic of the professions. The new labour relations have not only put at risk professional autonomy but also the security and stability of workers, including those with a high level of training, in a globalising world of unequal employer-employee relations.

In Latin America, the working conditions of professional groups have progressively deteriorated. In the particular case of nursing, rates of underemployment, unemployment and precariousness have been reported in which it is possible to identify similar patterns in some countries of the region (Mexico, Colombia, Ecuador and Argentina). One factor of concern is the absence of state oversight and the promotion of temporary, flexible and insecure forms of contracting that the state itself implements as the contracting party. Another aspect to consider is the gender inequalities in the

work environment, in addition to the monopoly and hierarchy established by professions with managerial positions within health institutions. These characteristics have been accompanied by deregulation dynamics that have been justified and exacerbated since the COVID-19 pandemic. This paper proposes a discussion based on the patterns observed in the labour dynamics of four Latin American countries, from the perspective of the nursing occupational group and their aggravation in the context of the pandemic. These discussions raise questions such as: What role has the state played in shaping the new dynamics in the health market? How have nurses positioned themselves politically in the defence of labour rights? What challenges are set for this group in an environment of diverse disputes between systemic power, labour rights and health needs?

What Are the Social Conditions for the Successful VET in Japan?

The Japanese employment system may have hindered the development of the public VET system in Japan. Based on the premise of stable employment until retirement, Japanese firms have been eager to independently develop the occupational skills of their employees through intense on- and off-the-job training. Consequently, Japanese firms have not substantially relied on the public VET system; they have utilized potential employees' educational background in hiring not as the result of an accumulation of human capital but as a proxy of trainability after hiring.

However, this situation has changed since the collapse of the economic bubble in the late 1990s. Japanese firms can no longer provide stable employment and ample training opportunities as in the past. This change has led to an increase in non-regular workers, who lack sufficient training opportunities in the workplace, and the disparity between regular and non-regular employment has become a serious social problem.

To solve these social problems, Japan must shift from the selective system of firms' independently developing occupational skills to the universally accessible VET system provided by the government and society. However, such a shift will involve difficulties, and various conditions must be met. Among them, this study focuses on people's attitudes toward vocational skills and their development. In particular, this research explores people's aversion to measuring and classifying occupational skills through the analysis of social survey data and discusses how this aversion affects Japan's VET policies, including the establishment of the National Qualifications Framework, which has not yet been realized in Japan, from a comparative perspective.

The Other Side of Values: Observing Wastes in Organizational Contexts

The ways in which organizations relate to values is of continuing sociological interest. The the literature is replete with accounts of how organizations successfully deal with multiple, possibly inconsistent value expectations. However, organizations do not only address and compromise well-accepted values in beneficial, valuable ways, rather organizations also produce valueless, that is waste. With the aim of illuminating the role of the valueless in the relationship between organizations and values, we ask how waste arises when organizations contend multiple values. Cross-fertilizing observation theory with theoretical insights from valuation studies we develop a framework that views waste as part of any valuation relevant to organizations. Specifically, we will suggest conceptualizing waste as the result of valuating observations that distinguish between values and wastes. The framework allows to move away from objective-seeming notions of what waste is and recognizes the contingency of (material and non-material) wastes. At the same time, it helps to order the realm of wastes by proposing to distinguish between valueless and disvalued waste. Most importantly, the framework challenges the everyday belief of increasing value by reducing waste and draws attention to the observer's standpoint behind the valuation, opening new considerations for the discussion of who is accountable for the waste.

Generational Humor, Identity, and Conflict on Social Media during the Pandemic

The pandemic has caused significant disruptions in many life spheres. To study how the pandemic influenced adolescents and emerging adults, we conducted a content analysis of social media posts on a pandemic-established youth-focused Facebook group, "Zoom Memes for Self-Quaranteens." By documenting both the proportion of memes devoted to particular topics, as well as their social meaning (through content analysis), this paper sheds light on how the pandemic influenced emerging adults. Based on a content analysis of emergent themes, our analysis classified memes into three categories. Pandemic humor emphasizes references to COVID-19, including

general issues, those who denied their vulnerability to COVID-19, and a coming apocalypse. Generational identity emphasizes the life spheres of importance to young people, such as education, romantic relationships, and friendships, as well as pandemic-specific topics such as lack of productivity. These posts also emphasize the existence of a shared generational identity through humor, with commonly-understood references. In the theme of generational conflict, adolescents and emerging adults employ generation-specific humor to express grievances with the older adults who comprise professors, political leaders, and university leaders. In these posts, youth express mistrust and conflict with institutional authorities who have control over their lives. This theme expresses generational conflict humor that emphasizes antagonism with older generations. Although the humor expressed in memes may be an outlet for self-expression, identity and social connection, especially during the pandemic, it has the potential to create divisions and animosity toward older generations. As expressions of how youth experience the pandemic, the creation and sharing of memes has the potential to impact not only adolescent and emerging adult development, but also relationships between emerging adults and older generations. Taken together, the memes draw on sarcasm and popular culture references to both reproduce and create shared generational experiences and social space in opposition to older generations.

How the #Metoo Movement Has Reshaped Discourses about Sexual Consent and Assault

The U.S. Center for Disease Control reports that over one-third of women have experiences with sexual violence and almost one in five have survived rape or attempted rape. Yet before the visibility of the #MeToo movement, over half of rape survivors did not acknowledge their experiences as either rape or sexual assault. The #MeToo movement, however, is chipping away at women's reluctance to define their experiences in these ways. Our study documents widespread cultural transformations that have taken place in the everyday lives of women as a result of the #MeToo movement. Women are not only redefining their experiences, but creating new expectations of sexual consent. They are also generating a new language that reflects women's agency and sense of empowerment and is also playing out in the legal sphere. These changes are part of a larger gender revolution that is profoundly affecting men's and women's lives and restructuring gender relations in still unforeseeable ways. This study is based on focus groups interviews with 74 U.S. college students from diverse backgrounds in order to examine a microcosm of broader changes in identity and culture. Our study finds that awareness of gender inequalities is more widespread than ever and patriarchal arrangements are increasingly viewed as unacceptable, especially among women. This rising consciousness is influencing people's everyday experiences and relationships, as well as politics and social movements. These changes are elevating women's experiences and their voices refuse to be silenced. At the same time, social change is uneven; many men feel threatened by women's rising power and are resisting these changes. Thus, despite an adversarial division between women and some men, the #MeToo movement is transforming how people view gender inequality.

ARORA, Meghna* (Vardhaman College, Bijnor, India)

The Social and Political Context of Dalit Mobilization in Western Uttar Pradesh:an Analysis of Voice, Facilitative and Coordinative Effects

Democracy provides new vistas to its marginalized citizens to articulate themselves with new definitions. In India, the chief aim of Dalit mobilization and assertion is to get them selves recognized as equal citizens with others and restore their dignity by challenging their exclusion from the mainstream society. However, scholars observe that Dalit mobilization and movement are not universal in nature rather contextual. It derives its unique characteristics with reference to the local social and political settings. Therefore, variations in the intensity and quality of mobilization of the Dalits could be seen throughout the different regions of India.

The present paper attempts to analyze the mobilization of the Dalits in the western region of Uttar Pradesh and specify various social conditions and political processes that either promoted or blocked it. It also attempts to examine the voice, facilitative and coordinative effects of the Dalit mobilization in the region in terms of its uniqueness.

For the purpose, the primary data has been collected through focus group discussions conducted with locally active people and intellectuals, and in-depth interviews with the local Dalit leaders and district-level officials. The secondary data has also been gathered from various government offices such as district collector's, census of India, and various other written records such as newspapers, party offices, etc.

The study concludes that the mobilization of the Dalits leads to the invention of distinctive identity which sometimes may be challenging as well as be counterproductive to the mainstream's interpretations and understanding.

Aesthetics of a Dystopia: Representation of Cityscapes and Environmental Inequalities

How do we define or construct narratives of (un)sustainability and climate future(s) in the epoch of the Anthropocene? Speculative fiction is one such popular narrative construction that allows us to investigate climate futures and what consequences would it have on marginalized social groups at the intersections of structural power and privilege. Within these narratives there has been a dominant understanding that social inequalities of caste, class and religion among others will significantly increase within these dystopian futures. We investigate one such OTT show to further understand these intersectional inequalities in popular imaginations of the future.

Leila(2019) is an Indian dystopian drama web series produced as Netflix Original and is based on a novel by the same name. It is set in the year 2047, in the fictional nation of Aryavarta, a heavily militarized fascist state obsessed with the ideas of purity. The story unfolds hundred years after India's independence, where India has been replaced by a techno-centric totalitarian regime with strict sectoral boundaries dividing the rich and the poor. The constant haze, fumes, darkness and the inability to see the sun, looms over Aryavarta. Visuals of destroyed ecosystems and extinct wildlife inform the narrative of Leila. Water is rationed and sold at Automatic Teller Machines (ATMs) and fresh air is available only to the rich ideologues of Aryavarta. Huge garbage mounds cover the ghettos where the *doosh* (marginalized castes) live in abject grime and poverty. The futuristic city has no space for *doosh* or *mishrit* (children of inter-religious marriages between Hindus and Muslims) and plans to build air conditioner domes for only the rich to be able to survive the inhabitable environmental conditions. Using Lefebvre's(1991) idea of spatiality, this paper explores the futuristic aesthetics of this city, its social stratification and its techno-centric futuristic worldview.

Fusion of Tradition and Modernity in India's Riverscapes

Waterscapes are integral to worldview of Hindus and this is reflected in several life-cycle rituals (birth, marriage, death) and annual community rituals and festivals. Nonetheless, traditional beliefs, practices, and ritual performances have not conserved water but only promoted a dichotomous conception where ideas of 'sacred' have become highly commodified in modern political economy. Clear example of these traditional water cultures are indicated by the Hindu pilgrims partaking holy dips in River Ganges which is regarded as a liberating river during the famous kumb mela's or during annual rituals of worshipping water bodies and welcoming the monsoon rains. Ideas of modernity have not diluted these conceptions nor prevented water pollution and contamination (sewerage, industrial pollution, and so on) of the riverscape. For any socio-ecological understanding, we need to factor a dynamic perspective of the relationship between tradition and modernity. This paper takes a reflexive overview of sacred waterscapes in select locales of northern India and explains how political economic considerations interface with the sacred nature in post-colonial India.

Gender, Environmental Inequalities, and Sustainable Consumption Among Delhi's Middle Class

The concept of ecological limits and carrying capacity defines and shapes questions of urban sustainability in the Indian capital city of Delhi, which is expanding into a National Capital Region. Environmental degradation, air pollution, scarcity of water, rising mounds of garbage, construction dust and vehicular pollution, shrinking green spaces and rising real estate prices have not dissuaded migrants from settling here. R. Guha has raised a political-ecological question when he asks how much should we consume? We face a big challenge, as an average citizen of Delhi gasps for quality air or does not have enough safe water to drink and deals with its mountains of solid waste. Socio-economic status, residential location and cultural capital shape interpretive frameworks and capacities to act and consume in urban India. Delhi's middle class woman has a credit card, she is vocal of her ability to earn, spend, and take part in decisions on household consumption and expand their ecological footprint. Based on fieldwork among urban middle class women residing in South Delhi, this exploratory study untangles the unsustainable consumptive aspirations and materialistic hedonism of 'global' citizens residing in a developing context. I critically demonstrate how the emergence of Delhi and its transformation into a global city is premised not on quest for urban sustainability but largely unrestrained hedonistic consumption and a widening ecological divide evicting and denying civic rights to the urban poor. What kind of policy shifts and gender interventions are required to ingrain and inculcate sustainable consumption?

Patterns and Determinants of Happiness Inequality in Turkey: As an Alternative Way to Understand Social Inequalities

Public opinions polls show that both the average levels and the distribution of happiness have dramatically changed in the last years with deepening instability as a result of political regime change and economic crisis. Yet existing literature of subjective well-being have only been carried out to explain the levels of happiness, and far too little attention has been paid to happiness inequality and the factors determining it. By using livability approach, which stresses the importance of the institutional settings in the distribution of life chances, the study aims to reveal the patterns of how well-being is distributed in society and to examine the factors affecting it at mezzo level over time in Turkey. In addition, the study set out to shed light on the relationship between the happiness inequality and authoritarian political regime fostering economic crisis at macro level. The study followed a quantitative research design and the main data sources are "Turkey Life Satisfaction Survey (2003-2020)", "Turkey Income and Living Conditions Survey (2006-2020)", "World Values Survey (1990-2018)" and database covering economic, political and social indicators of the country for the last two decades. For data analysis, first, we use descriptive statistics to analyze the distribution of happiness across different socio-demographic groups. Second, we run ordered logit models to check the relationships between subjective well-being measured by using percent maximum deviation method and socio-demographic characteristics of the individuals, and country level indicators. The preliminary findings of the study show that there are significant differences in subjective well-being across social groups experiencing relative deprivation in Turkey according to basic socio-demographic characteristics (i.e. age, gender, type of family, migration background, ethnic identity, education, employment status, receiving social assistance) with the changes in national income redistribution and political stability.

ARTEAGA, Nelson* (Facultad Latinoamericana de Ciencias Sociales, Mexico)

Structural Hermeneutics, Dialectical Hermeneutics: Is a Synthesis Possible?

Cultural sociology is committed to developing a structural hermeneutics that interprets social action as texts structured based on scripts. Through semiology, it is possible to understand the cultural forms of action based on the binary nature of their meaning. This makes it possible to define a deep structure in time based on opposition inherited from Durkheim's analysis of the sacred and the profane. However, structural hermeneutics has been questioned for its supposedly static character. The need for dialectical hermeneutics has been raised to allow us to examine how oppositions are absorbed over time into a new category that reduces the old oppositions to nothing.The discussion reproduces, in a way, the idea that there is a hermeneutics that sustains the existence of apparently motionless codes, in contrast to another that underlines how cultural codes are transformed, showing the finite character of symbolic structures. This paper suggests that it is possible to simultaneously hold both the structural and the dialectical character of culture by taking up Foucault's proposal in the *Leçons sur la volonté de savoir*. In these lessons, Foucault stresses the importance of the binary systems of religious and political classification in ancient and modern societies, distinguishing between the pure and impure actions of social actors. However, Foucault suggests that the innocent/guilty binary classification system introduced something different into the political and religious classification system: the idea of truth. "Truth" is created to distinguish who is innocent or not in the legal system, and this requires constructing a fact as true. This paper explores how the construction of "truth" brings deep cultural structures into play while allowing the creation of new classification categories. In this sense, it is a way to understand the processes of stability and change in cultural structures.

Marketization of Higher Education in India - Role of Accreditation

The number of higher education institutions (HEI) in India have expanded significantly in last thirty years. As per data of All India Survey of Higher Education (2022), there are 1043 universities, 42,343 colleges and 11,779 stand-alone institutions. Out of these almost 78.6% are in the private sector - aided or unaided colleges and only about 21% are in government sector. At the same time, several reports and scholarly studies have highlighted the poor quality of education. Concerns have been flagged by industries, Government agencies, policy makers regarding un-employability of graduating students.

The Indian Parliamentary Standing Committee's 341st Report (2022) has made recommendations on ways to improve the higher education system in India. One of the important suggestions is formation of an effective regulatory regime for higher education institutions across India. Accreditation, as one of the formal methods underscoring standardization and guarantee towards minimum benchmarking, has been in place in India since 1994. But as per report, only 20% of the educational institutions have opted for formal accreditation. The Committee proposes offering incentives to bring institutions under accreditation and making it mandatory for administrative approval and financial grants. What are the possible implications of these mandates?

The present study attempts to analyse reasons for the poor quality of higher education, role of accreditation, its origin, and methods used in the context of the teaching and learning process of higher education. The detailed analysis of government and industry reports shows that Accreditation as a systematic assessment of procedures adopted by higher education institutes, is carried out post facto by a third party, and is dependent on elaborate documentation. The assessments are expected to create a more competitive environment for students enrolment, funds and industry projects. At best, accreditation appears to promote marketability of HEI rather than quality of education.

ARVIN, Bahare* (Tarbiyat Modares University, Iran)

A Comparative Study of the State Power Structure in the Middle East with a Focus on the Recent State Power Structure in Iran

How many types of state power structures are there in the Middle East? How does the separation of powers work in the Middle Eastern states? The answer to this question rests on the role of the military forces as the main tool of states for governance. It also relies on the measures that are taken to prevent them from becoming absolute power. In this study, the state power structure in the Middle East has been classified into two distinct types: monarchies and secular republics in which the position of the president has become lifelong and sometimes hereditary in most cases. There are at least four outliers: Iran, Lebanon, Turkey, and Israel. This article focuses on the evolution of the state power structure in Iran before and after the 1979 revolution and the difference between the recent state power structure in Iran and the above-mentioned two types.

In Iran, the presidential system under the Guardianship of Jurisprudence (Velayat al-Faqih), we see a peculiar separation between the executive branch and the military power. Power belongs to the Velayat al-Faqih position who holds the power for life, and the executive power belongs to the president who is directly elected every four years. The transformation of the parliamentary system under the Pahlavi monarchy to the presidential system under Velayat al-Faqih has been an important development when it comes to limiting the power of the position that holds military power for life and has become the source of constant tension in the recent state power structure in Iran. This state power structure, compared to the state power structure in the Pahlavi dynasty, has allowed more democratic changes.

The Role of Intersectional Inequalities in Shaping Young People's Environmental Action in the UK

Young people are growing up at the intersect of interlocking global crises. Prominent amongst these is the environmental crisis. Concurrently, we are witnessing a resurgence of popularity across the global north and south in environmental action that is in part youth-led. Some young people appear to reject the validity of capitalism as an economic system that can solve the environmental crisis and instead are situating the environmental crisis as a matter of climate justice. However, not all young people are engaging from a left-wing or justice focused position, and neither do all have the same level of access to respond to environmental issues. Scholars are now recognising that social and economic inequalities are often neglected in analyses of youth political participation which requires attention.

This paper offers three key findings from research exploring the role of economic inequality in how young people experience and respond to environmental issues. The first highlights the prominence of intersectional experiences of race, space and class in how young people get involved in environmental action. The second explores how young people are mixing-up their political responses by combining desires for systemic change with a pragmatic willingness to engage with reforms to address environmental issues. The third finding highlights the challenges presented by current theoretical understandings of political participation and offers learning that re-defines and at times un-defines this term in a way recognises the nuance and complexity of who is politically participating, where they are doing it, how they are doing it and crucially, why they are doing it. Finally reflections will be shared around the methodological learning that emerged through this research project with young people with particular focus of the intersectional reflexivity of the researcher as well as and power in the research relationship.

The Spatial Distribution of Bottom Workers in Tokyo

The purpose of this study was to depict the lives of bottom workers living in Tokyo using a social atlas created from macrostatistical data. First, to determine where the poor live in Tokyo, we estimated the percentage of households with household incomes of less than 2 million yen, using data from the Housing and Land Survey and the National Census. The results showed that poor residential areas were concentrated in the northern and eastern parts of Tokyo's inner city. In the suburbs, they were found to be concentrated in Hachioji City in Tokyo, Isehara City in Kanagawa Prefecture, as well as in the Miura Peninsula, Yachiyo Town in Ibaraki Prefecture. In contrast, no specific areas of concentration were found in Saitama and Chiba prefectures.

Next, the social atlas was plotted for only the poor residential areas. The results showed that the northern part of the inner city had a higher percentage of foreign residents, temporary workers, and male part-time workers. In Tokyo, where the industrial structure is centered on the finance, information, and service industries, the upper white-collar class was concentrated in the central and southern parts of the inner city. On the other hand, those who work in the industries that support the daily lives of these workers are concentrated in the northern part of the inner city, which is assumed to include the bottom workers. The poor living in Tokyo's inner city include foreigners, young people working part-time jobs, and the elderly who have no choice but to work part-time in their old age.

The poor living in the suburbs were mostly elderly people. However, several clusters of poor residential areas with a high percentage of foreigners were found in Ibaraki and Chiba prefectures. In these areas, many foreigners live as laborers in agricultural areas and warehouses.

The Intersection of Radical Pentecostalism and Health Implications in South Africa

In South Africa, Christian Pentecostalism has witnessed significant evolution and in the process some pastors have experimented with various items including snakes, insecticides, and other poisonous substances to demonstrate their anointing and the power of God. While these practices may have adverse health effects on members, these activities have gone unabated in some churches. This paper examines factors that may be responsible for this new trend (conceptualized as Radical Pentecostalism) and provide explanations why the practice may continue in South Africa. A comprehensive review of the literature, relevant documents and videos form the basis for analysis and discussion within the broad context of socio-economic exigencies and the steady rise in unemployment and poverty rates in the country. To curb this dangerous trend, the paper highlights the strategic role the CRL Rights Commission must play to safeguard the health and dignity of vulnerable citizens that are caught up in this phenomenon.

ASANO, Tomohiko* (Tokyo Gakugei University, Japan)

The Puzzle of Authoritarianism of Japanese Youth

This presentation will focus on the puzzle of authoritarianism of Japanese youth. Some large-scale study like World Values Survey shows that in many societies authoritarianism has been gaining momentum for the last decade, which Foa and Mounk argues could lead to "deconsolidation of democracy". Fortunately, that is not the case with Japan, where authoritarianism, in its average scores, has not been growing. However, this does not mean that Japan is free from the global trend of "resurgent authoritarianism", as a certain part of the population in that country has been observed to be increasingly authoritarian. That is youth. According to some time-series survey research, young people in Japan, that is, those in their 10s and 20s, has become consistently more authoritarian for the last two decades. It is generally observed, not just in Japan but in other societies, that older people are more authoritarian than their younger counterpart. However, based on the results of WVS, this does not apply to Japanese in their 20s, who are found to be as authoritarian as those in 70s. Then the question might arise if young people in Japan could become more politically conservative, or even right winged, or if they start to distance themselves from democracy and liberalism these days. The answer to this question is no, at least, for now. Survey data I collected with my colleagues in 2019 indicates that young respondents' answers are more likely to be in favor of democracy and liberalism than their elder counterpart, when they are asked about several specific social and political issues: same-sex marriage, political right of immigrants, gender equality and so on. This presentation will examine the determinant structure of this puzzle Japanese youth poses, using the quantitative data collected in 2022 from randomly sampled nationwide respondents.

Homo Emigraturus: A New Social Category Beyond Migrant and Non-Migrant? a Particular Focus on the Case of Iran

Today's migration ecosystem is characterized by two features: that people are constantly exposed to the images of life elsewhere, thanks to media and advanced communication technologies, which portray migration as an opportunity readily available to them; and that, despite this exposure, they are seriously entrapped and immobile due to strict regulations on political borders. Combining these two features has resulted in a large number of citizens in semi-periphery and periphery countries who live a life in a limbo (or an 'in-between' situation). We have called this group *Homo Emigraturus* ('about to leave'), as a group who live their lives as if they are supposed to leave any moment. Although objectively residing in their country of origin, they develop a mindset similar to those who have actually migrated, with little attachment to their surrounding environment.

Using Iran as a case study, we have explored this emerging phenomenon and discussed its broader theoretical implications for international migration and social class system. We draw on the data from a nationwide survey on the desire for migration, informed by 68 semi-structured in-depth interviews, as well as the analysis of discussions on social media, particularly Twitter, using Machine Learning and Natural Language Processing techniques. The findings show that the spreading desire to migrate in a mobility-restricted population can lead to a significant reorientation of its social and cultural landscape, economic dynamics, and civic engagements, resulting in the intensification of the inequality between sending and receiving countries. The increasing rate of desire to migrate among Iranians has generated a very particular social environment that is informing some of the most important life and career decisions of the citizenry, including those related to gender identity and relations, economic activities, educational and career choices, national identity, political behaviours, family planning, and even spiritual experiences.

Home Role Negotiations and the Transnational Trajectories, a Qualitative Study on Second-Generation British Pakistani Women Spouses

Transnational migration is a vast phenomenon, which produces multifaceted impacts on the identity negotiation processes of immigrants. Theorising significance of migration for women who arrive host countries as dependents of their spouses also becomes a complicated process. Since 1960s Britain has been hosting a substantial number of immigrants arriving from South Asian countries; a region widely interpreted as a patriarchal belt, where patriarchal norms govern major domains of women's lives. Therefore, drawing upon Pakistani women diaspora as a case study, my study looks at the transnational identity negotiation processes of professional second-generation British Pakistani women who had arrived in the UK on spouse visa category. The rationale of choosing this cohort was to navigate intergenerational changes occurring within identity negotiation processes of British Pakistani women by comparing experiences of first-generation women iterated within previous scholarly literature. To address these processes, my study underpins the correlation between transnational experiences and conflated home-career commitments of these women by comparing their pre and post immigration experiences. It further reveals impacts of their home country cultural conscriptions in relation to their transnational trajectories by ascertaining the pragmatic strategies these women adopt to negotiate home roles with their husbands. To collect my data, I conducted in-depth interviews of four married women from three cities of the UK namely Leeds, Bradford, and London and employed thematic analysis to interpret women's experiences. It was revealed that women participants interpreted their transnational identities independent and empowered in comparison to their home country experiences. Women participants implemented an array of strategies like verbal negotiation, role modification and silence to negotiate home roles with their husbands while manoeuvring their professional careers. It was further revealed that most of these women had travelled to UK lacking knowledge about British policies, culture, and support systems, which could have, otherwise, benefited them greatly.

ASIF, Muhammad* (Bahauddin Zakariya University,Multan, Pakistan)

Public Approval of Vigilante Violence in Pakistan

Quantitative analyses of public approval of vigilantism often focus on a limited set of factors: perceived illegitimacy of the police, criminal victimization, and weak state capacity to tackle violence. They do not also specify the mechanism through which these factors induce support for vigilantism remains unexplored. In this paper, it is proposed that political encouragement, exposure to violence, and status and relational distance will increase approval for vigilantism by generating righteous anger against suspect norm violators. The data for the study come from a survey of 500 university students in

Pakistan. The results we report support our vigilantism approval model. They suggest that approval of vigilante violence is best understood as an emotional-political phenomenon. The implications for the study of self-help violence are discussed.

Can Social Media Help Combat Corruption in Developing Countries? Evidence from Ghana

Political corruption, which involves government officials abusing power to advance private interests, undermines democratic consolidation, human rights, environmental security, and development, especially in developing countries such as Ghana. Since the traditional mainstream media are often considered part of the capital and power network involved in political corruption, can social media play any positive role in combating political corruption? Based on in-depth semi-structured interviews and relevant secondary data, this study examines whether social media, such as Facebook, can be a positive tool for addressing political corruption in Ghana. Drawing on the media-as-a-watchdog theory, Habermas's theory of the public sphere, and the notion of citizen journalism, one key question is addressed: Are social media a positive tool for combating political corruption in Ghana? This study indicates that social media is a helpful tool for whistleblowers to expose corruption and a valuable platform for anti-corruption awareness, discussions, and mobilization. At the same time, the study indicates that social media is used to spread propaganda and misinformation and fake news to serve powerful interests, undermining its credibility as an effective anti-corruption tool. The results also show that anti-corruption activists using social media to expose political corruption and demand accountability face multiple challenges, including arrest, imprisonment, injury, and death threats. This paper contributes to the literature by informing the theoretical and empirical debate on social media's role in corruption.

ASOR, Bubbles Beverly* (University of the Philippines Diliman, Philippines)

Caring for 'Liminal' Migrants: The Role of Religious Organisation in the Incorporation of Filipino Migrants into South Korea

Drawing on multisited ethnography of Catholic migrant centers in South Korea from 2012 to 2013 and qualitative interviews with Filipino migrants, Catholic priests and nuns and Korean church workers between 2012 and 2019, this paper examines the Catholic Church's institutional and organizational response to temporary labour migration and the challenges and opportunities it present to the Catholic Church in South Korea. I analyse organisational strategies of welcoming 'strangers' and caring for migrants rooted in the Catholic teachings, practices and experiences which may be regarded as relatively successful. However, these efforts have often been relegated as 'not political enough' or 'political but not contentious'. This paper argues that this very same appraisal of the Catholic care for migrants actually shapes the process of migrant incorporation in South Korea by not only serving as a resource of spiritual capital to make sense of the individual migrants' liminal presence and belonging in the Korean society but also by providing organizational resources to Filipino migrants which the migrants employ to negotiate and navigate occupational, legal and social liminality as a result of the temporariness of their status. Utilizing Coleman's notion of appropriable organization (1990), I examine how Catholic migrant organisations were established to primarily care for migrants by addressing the migrants' spiritual, physical, biological, mental, psychological, economic, and social needs. But these faith-based organisations are also appropriable for other purposes that are crucial in migrant incorporation such as providing migrants with spaces for interactions with co-ethnics and co-religionists which leads to collective identity formation, facilitating access to welfare, health care and 'multicultural' infrastructures, linking migrants to local population through social activities and events, and giving public voice and visibility to 'liminal' migrants. This paper intends to contribute to further discussion of the crucial role of religion in the process of migrant integration.

Educating Against Radicalisation and Violent Extremism: A Study of Peace Pedagogical Practices in Indonesia

As a geographically and ethnically diverse country, Indonesia is currently experiencing a glocal (global and local) dynamic of antagonism. The evolving antipathies and fragmentation evident in Muslim-majority Indonesia can be characterised by the increasing dangers of radicalisation and violent extremism (post 9/11), compounded by the dissemination of populist conceptions of Islamic identity antagonistic to orthodox readings of Islam embedded in the Indonesian constitution. The increasing dangers of radicalisation and violent extremism post 9/11, followed by a widespread popular misconception of Islamic identity, have created a dilemma for Indonesia as a Muslim-majority

nation. These phenomena are further exacerbated by turmoil in local communities, where tensions between tribal, religious, and political groups surface within national values and unity agendas.

This paper is based on a qualitative study which shows how educational practices outside formal classroom settings contribute to the achievement of peace and harmony. Freirean's dialogical approach distorts the entanglement of glocal issues into alternative narratives to live with differences. By focusing attention on the role of cultural identities (national, religious, and tribal) and their value systems, the study provides an opportunity to map the interplay between identities and associated value systems. The study also examines the negotiation of value systems in redefining Indonesian's national motto of *Bhinneka Tunggal Ika* (Unity in Diversity) into positive educational practices to inform and reinforce school curriculums in countering radicalisation and violent extremism.

ASTUTI, Wahyu* (University of Sydney, Australia)

Assembling Water Flow: Infrastructures and Speculation in Jakarta Metropolitan Area

This paper highlights how the multiple (human and non-human) infrastructures allow water to flow in and out of Jakarta through speculations on crises, infrastructure, and lands. With overlapping water and climate crises narrative in Jakarta, massive investment on reticulated water infrastructures is poured into Jakarta's peripheral area by national government and foreign aids to solve the crises. This follows the unavailability of piped water in many areas since water network was designed to serve colonial enclaves. Until today, clean water is made flowing into the city by trucks, carts, and jerrycans brought by small-to-medium-scale vendors at Jakarta's periphery. Through looking at such infrastructure configuration, this paper ask how speculation around crises and water projects stitch together human and non-human actors in bringing water flow? Secondly, through studying the land-water nexus from 'outside' of Jakarta, this paper discusses the socio-economic implication of water extraction in the periphery on land speculation around (reticulated and non-reticulated) water business. As such, this paper seeks to contribute to the debate on how water infrastructure configuration helps in re-imagining and debunking urban/core and rural/periphery dualism. The result presented in this paper stems from preliminary scoping work where interviews and field observations are conducted in three areas: in Lebak and Bogor where dams are constructed and another fieldwork in Bogor where water vendors operate. I discuss the findings with debate on situated urban political ecology and post-colonial infrastructure studies.

Language and Gendered Political Discourses: How Do Women Politicians in Kenya Reconstruct Their Political Agency?

Language and Gendered Political Discourses: How do Women Politicians in Kenya Reconstruct their Political Agency?
Norah B. Atambo, Emily A. Ogutu and Gatitu Kiguru
Kenyatta University, Kenya
Social practices have discursive effects on participants. Through an idea of language as discourse, this paper critically examines the discursive effects of the gendered political discourses on women politicians in Kenya and how the women reconstruct their agency in the political realm. The study uses Fairclough's (2001) and Van Dijk's (2001) approaches to Critical Discourse Analysis (CDA) in order to understand how the gendered discursive realm of politics in Kenya is created and contested. The objectives of this paper are to establish the discursive effects of the gendered political discourses on women politicians in Kenya, and find out how women politicians contest the discourses in a bid to re-establish their political agency. The paper, through a descriptive research design and a purposively selected sample, uses data from campaign speeches and opinion articles documented in the print media, and interviews of female politicians in Kenya. The data are analysed qualitatively, through thematic analysis and presented in written descriptions. The paper establishes that gendered discursive practices undermine the political standing of prospective and first-time women contestants. However, the gendered practices also act as a trigger for contest thus mitigating the negative effects and reconstructing women's political agency. The paper concludes that women politicians are not passive recipients of the distorted constructions and gendered ideologies that have been naturalized through language, but they contest them and encourage each other. The study findings complement other studies in Critical Discourse Analysis and provide a unique vantage point onto the questions of gender and development in Kenya.
Key words: Discourse, Discursive practices, Gender, Agency

An Intersectional Contextualized Path Framework of Mental Health, Leaves of Absence and Return to Work Among Professional Workers

In this paper, we present an intersectional, contextualized path framework of mental health, leaves of absence, and return to work experiences that informs our mixed method, pan-Canadian study of absenteeism and presenteeism of professional workers, and test out the framework with a multiple-regression model of the factors influencing this pathway.

The literature pertaining to the intersectional influences on the pathway from MH to LoA and RtW and the various contextual influences along this pathway was reviewed. This framework was then tested with multiple regression analyses of the data from our bilingual, self-administered survey that was conducted online between the end of November 2020 and May 2021 of 3759 workers in academia, accounting, dentistry, medicine, nursing, midwifery and teaching.

The literature emphasizes the importance of the different components of our conceptual framework affect the pathway from MH to LoA and RtW, namely: 1) *individual/intersectional* elements (gender, age & BIPOC identity); 2) family, work/organizational and system/societal level contextual influences. Applying this framework to our survey data revealed that women were 1.75 more likely to report having MH experience as were those who contributed more to family income, and women were 2.01 more likely to take a LoA for MH than men. Dentists were less and midwives more likely to report MH issues and Dentists and Physicians were less likely and nurses and teachers more likely to take a LoA holding individual and family factors constant. The only factor affecting RtW was BIPOC professional workers who were 68% less likely to RtW following a LoA for MH reasons.

Teasing apart the intersecting individual, family and work related factors affecting the MH, LoA and RtW pathway of professional workers can better enable the identification and development of targeted and more effective interventions to promote workplace wellness, accommodations and healthy return to work.

New Strategies for Urban Development after Covid-19

Covid-19 crises created a drastic confrontation with the insufficiency of our immediate living and urban environment in sustaining our basic needs. Living through the lockdown experience we realized that accessibility to fresh air, sunlight, natural resources, food and social networks even in a limited sense are the basics for a healthy living. Now in the aftermath of crises, urban professionals are in quest of developing new strategies for urban development that could accommodate these basics. Living Covid-19 experience in Mardin, a city in the Southeast Turkey, consisting of both modern and traditional urban areas, we witnessed the efficiency of the old/traditional settlement which has also been hosting the disadvantaged groups, vis-a-vis the ineffectiveness of the new settlement in dealing with crises. The processes of city-making have been operating almost in the same way through the dynamics of neoliberal economies creating an 'international urbanization style' which ignores urban diversities created by the local dynamics. In this sense, documenting the daily experience of people living in traditional and new urban areas during the first lockdowns, this piece of work aims to present what could be learned from the operative and nonoperative spatial, socio-cultural and economic features of our cities in order to be transferred as strategies to the new 'normal'. The research is designed in a qualitative phenomenological research method. In order to obtain data, in-depth interviews with 10 families living and/or working in the old and/or the new settlement were conducted. Questions vary to reveal changing spatial and socio-cultural and economic patterns of living before, during and after the pandemic and accessibility to immediate urban environment and natural resources. Through the collection of this data, we are able to present strategies learnt from traditional urban environments that could be transferred to the new urban design attempts.

Agriculture By Algorithm: Big Data, Digitalization, and Biotechnology in Climate-Change Adaptation

How do we understand the growing importance of Big Data, digitalization, and biotechnology in climate-change adaptation of agriculture and the possible implications for small-scale village farming? Central to this question is the algorithmic reordering of agriculture unfolding within a mode of thinking dominated by the epistemic authority of quantification and commensuration.

Based on a textual analysis of publicly available documents by the FAO, Bayer, and its partner start-up companies, this paper shows that this reordering embodies governance-by-data and measurable sustainability indicators, comprising a singular evaluative judgment about the calculative metrics of economic valuation. Supported by multi-stakeholder platforms, blended co-financing, and venture capital, this process is expanding "agriculture by algorithm" into village farming within the modernist fold of capitalism, while devaluing other valuations and practices.

Farming Imaginaries and Enrichment-Value Creation in Ankara-Turkey

How are we understand the continuing importance of small-scale village farmers in a country like Turkey under a continuing process of industrialization and commodification in agriculture? There are two sides to this question: one concerns land-use reconfiguration for commercial purposes, contraction of small-scale farmlands and village resources, and de-peasantization and de-agrarianization tendencies; the other relates to the absence of significant grassroots-based agroecological movements for reorganizing agriculture. Using official documents, statistics, ethnographic information, and in-depth interviews, the paper examines this question through the empirical illustration of the small town of Güdül (Ankara-Turkey). It shows that farmers uphold their presence and create an enrichment value for their labour and food collaboratively with consumers within fluid, trust-based everyday social networks. Invocated by farmers' farming imaginaries, enrichment-value creation comprises flexibly shared assessments and evaluative judgments of capitalist expansion into local village farming within the state-led developmentalist fold.

Towards Turkish Military Sociology: Challenges and Opportunities

The institutionalization of military sociology in Türkiye and its challenges are discussed in this presentation. It also highlights how military sociologists overcome the research obstacles by focusing primarily on micro-level qualitative research.

Military sociologists in many countries contribute to improving both military effectiveness and healthy civil-military relations. However, the late arrival of military sociology interrupted similar progress in Türkiye. The institutionalization of military sociology only started in 2018 with the opening of postgraduate programs at the Turkish National Defence University. Currently, dozens of students continue their studies and work on their theses. However, establishing postgraduate programs that accept civilian and military students does not mean that researching the Turkish military is now freely and smoothly conducted. Refusal to grant research permissions remains the biggest obstacle to sociological studies. Therefore, it is not possible to conduct macro-level analyses. As an alternative, senior academics and postgraduate students try to circumvent the problem by using qualitative methods at micro-level analysis and examining the military with a bottom-up approach, relying on their immediate environment. For instance, in qualitative research, civilian or soldier-scholars attempt to conduct analysis by interviewing lower-rank soldiers that they already know. Although such studies focus on the experiences of individuals and allow micro-level analysis, many of them either have an inadequate sample size or include subjective judgments.

Additionally, some scholars focus on theoretical or descriptive studies due to the restrictions on empirical research. The development of Turkish military sociology, which is still in its infancy, is hampered by these issues. Overall, from an institutional perspective, it is safe to say that there is Turkish military sociology, but regarding the research opportunities, there are challenges that can fail its advent. Despite this conundrum, the future of Turkish military sociology can be bright, owing to talented young sociologists.

Racial Discrimination and Health Consequences – Evidence from Germany

In response to a series of racist murder attacks, the German government decided in 2020 to commission the National Discrimination and Racism Monitor (NaDiRa) to study the causes, extent, and consequences of racism.

As key part of NaDiRa, we set up an online access panel (NaDiRa.panel). For the first time there is a large-scale longitudinal survey available in Germany that measures racial self-identification, ascription, discrimination, and racial inequality with various social indicators.

In this paper, we want to focus on the relationship between racial discrimination and health. Discrimination across the life course can cause chronic stress and become embodied. It can severely affect health, either directly (allostatic load) and/or indirectly (e.g., harmful behaviour). Although this relationship is well studied in the US, there is no such study for the German

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

context. Thus, we have no evidence about the extent of racial discrimination in Germany, and how the experiences are connected to health. Furthermore, we will add new insights to this research strand by taking an ecosocial approach. From this perspective, the relationship at the micro level might be moderated through factors at the neighbourhood level (e.g. racial composition, infrastructure) as they might buffer stress emerging from discrimination or increase negative effects through neighbourhood deprivation.

We raise the question, how racial discrimination affects subjective and mental health and if this relationship is moderated by neighbourhood characteristics.

The NaDiRa.panel consists of a probability-based sample drawn from official registers. Thus, it allows to draw inference about the German population in general and about racialized groups, which are oversampled. The initial wave was conducted 2022 (N=19.000). Addresses were geocoded and matched with data at the neighbourhood level.

Spatial analyses have not been conducted, yet. Preliminary micro-level analyses imply that even a medium extent of discrimination shows a substantial and significant association with both outcomes.

Gender Studies Pertaining to Work-Family Balance Among HIV-Positive Gay Men in Japan

In this paper, we will explore the development of gender studies specifically related to the work-family balance by focusing on gay men with sexually-transmitted HIV in Japan. Focusing on this demographic, we discovered a family style that has remained unexplored in previous studies. In this study, we call it "the sphere of family intimacy." HIV-positive gay men are all but invisible in Japanese society, as they have been excluded from public health due to being radically stigmatized for things such as having sexually transmitted diseases, being gay, and having difficulty working. Focusing on HIV-positive gay men in Japan is important for gender research, because Japan ranks 116th for gender equality. It can be said that the issue of gender inequality is becoming ever more critical in Japan, so it is imperative that we analyze the gender structure or mechanisms that create care norms that assume male breadwinners and heterosexuality. Although Japanese women have been addressed in gender research, there are few studies of so-called sexual minorities, and even fewer that address sexually-transmitted HIV among gay men. Work-life balance research in Japan has been pioneering targeting married female workers who had to go back and forth between work and home. Based on this research, we have been able to capture a realistic foundation of what their lives are like, and expand upon the concept of "work-family balance". Likewise, we focused on HIV-positive gay men and analyzed the magazine "G-men", which aims to reduce instances of HIV/AIDS and is edited by HIV-positive gay men in Japan. By focusing on them, it is possible to obtain a view of care work that is different from assuming family and public support. This analysis is the first step in our study of the "work-family balance" among gay men.

Parenting within a Transnational Context: The Case of Indian and Indian American Return Migrants and Their Families

By analyzing data from 95 interviews with Indian and Indian American return migrant parents, as well as current and former students of Bangalore-based high schools, this study investigates how parents raise children to become the next generation of elite professionals, and how youth experience these childrearing practices. Analyses reveal that parents raise their children according to the logic of *transnational concerted cultivation*. Transnational concerted cultivation consists of three elements: exposure to life in India, international travel, and educating children in 'good' schools. It is the first element of transnational concerted cultivation that is the focus of this chapter. In this study, I argue that by exposing their children to India, parents aim to provide children with the skills necessary to become high-achieving, hardworking, and empathetic. They also want their children to be 'better' connected to their Indian cultural heritage than they would be if they stayed in the USA. While a better connection to Indian culture may be parents' aim, the analysis reveals that being in India produces new contradictions and challenges for parents and youth related to identity and cultural engagement as they navigate life in India. By building upon literature related to parenting, social class, and racial-ethnic identity, this study connects the childrearing practices of elite, return migrant parents to the experiences of those raised to become the next generation of elite professionals.

Cryptocurrencies and the Promise of Individual Economic Sovereignty in an Age of Digitalization: A Critical Appraisal

Cryptocurrencies have fuelled an ideological bifurcation between utopian imaginaries of borderless individual economic sovereignty and egalitarianism among libertarian sympathizers since Hayek and more recent dystopian admonitions against financial disruption and inequality by state actors. Providing a state-of-the-art sociological account of this debate, this paper conducts the first empirical study on the links between cryptocurrency adoption, individual economic sovereignty, and wealth inequality using a novel 2020 cross-societal database of the population-level adoption of the six largest cryptocurrencies. Analyses show that cryptocurrency adoption neither ameliorates nor worsens wealth inequality, but that the geographical expansion of cryptocurrencies is dependent on the very political economic conditions and state permissions that their libertarian enthusiasts spurn. This paper concludes by invigorating a programmatic call and agenda for the empirical, sociological study of cryptocurrencies and the methodological designs required to sustain it.

A Country of One's Own: An Intersectional View on Legal Resident Status of Foreign Spouses in Switzerland

In this study, we analyse the lives of foreign spouses in Switzerland based on their residential status. Despite Switzerland's large migrant population, early years in the country for foreign spouses of Swiss citizens are characterised by a vulnerable residential status, rendering them dependent on their partner and undermining their bargaining power. This uneven power dynamic is particularly pronounced for immigrant women, as insecure legal status is compounded by unequal gender relations. Women's autonomy is contingent on their ability to access their own sources of income, if they wish, and lean on support networks outside their marriage – both these capabilities are undermined by precarious residency status. We are interested in the lived experiences of this group of migrants married to a Swiss citizen, migrant women in particular, and how their lives change as they progress from this precarious status to permanent residency, generally after five years in Switzerland.

We use the Swiss Household Panel, a longitudinal study with data dating back to 1999, to conduct our analysis. Using individual fixed-effects models, we exploit the five-year threshold at which spouses generally receive permanent residency to see whether, for women in particular, there is a change in social and economic participation in the community, and whether household arrangements – domestic tasks and child-rearing especially – become more contested. Early results show an uptick in women's paid work following receipt of permanent residence, as well as more willingness to express dissatisfaction with the division of household labour. For migrant men with Swiss spouses we see little effect. This suggests that upon receiving permanent residency, foreign women spouses show more willingness to exert their own agency in household matters, work, and community participation. To avoid prolonging vulnerability of female migrants, migration policies should therefore provide a fast, smooth path to permanent residency.

'Lipstick Innovation!" Contextualizing Disruptive Innovation through Digital Technologies in Professional Services: Boundary-Work in Law and Auditing

Artificial intelligence (AI) and attendant digital technologies (AI hereafter) have become the most hyped technological innovations across the globe (Alvin, 2018). The 'fourth industrial revolution', 'disruptive innovation', and 'digital transformation' are some terms scholars use to describe the scope and magnitude of revolutionary changes portended by AI technologies. In legal services for instance, the UK government asserts new technologies will "fix" (Katzenbach, 2021) the access to justice problem, while The Law Society (2020: 6) claims legal service providers' adoption of new technologies will reduce the cost of legal services and facilitate productivity and wealth creation elsewhere in the economy. Such claims are augmented by extensive coverage in the professional press of the benefits legal practices derive following adoption of new technologies **and** the risk to firm survival should other practices resist such innovations.

Although an emergent body of literature provides much needed empirical evidence of the gap between the hype surrounding AI technologies and practice (Armour et al., 2020), such studies view innovation as an end itself, overlooking the more complex relationship between power and the development, diffusion, and application of new technologies (Jasanoff and Kim, 2009). We address this oversight by applying the combined lenses of 'sociotechnical imaginary' (Tidwell and Tidwell, 2018) and 'professional jurisdictions' (Abbott, 1988) to a

small-scale study (encompassing Chambers, law, and audit firms) and conclude that, at field-level, innovation claims are premised on the mutual advantage experienced by actors within a linked ecology and that such advantage is framed by the macro and institutional context.

Delivering Labour Precariousness? Grounding a Socio-Spatially Sensitive Theory for Platform Food Delivery Workers

As the platform economy gains momentum, an increasing number of workers face precariousness, and disempowerment. The loose regulation of platforms raises alarming voices among researchers about the quality of work and the bargaining power of platform workers. Amid social distancing measures of the Covid-19 pandemic, the role of the food delivery workers rose in prominence, as were their working challenges. The platform economy won the lion's share of the enhanced delivery needs and managed the huge workload of food distribution. The current article dwells on this framework and explores the following research questions. Do platform food delivery workers face higher labour precariousness than mainstream food delivery workers? What are the effects of the Covid-19 pandemic in their working condition? The case of Greece was selected for the current research due to the multifaceted crisis that the country has faced since the economic crisis of 2008/2009, which has shaped a deregulated labour market of high precariousness. At the same time though, a recent nationwide mobilization resulted into permanent contracts and increased working rights for platform food delivery workers. Consequently, Greece has been an arena of challenges and opportunities. Drawing upon key notions of Geographical Political Economy, the research followed a constructivist grounded theory, in which the involvement of the researchers with people, perspectives and research practices shaped the emergent theory. A theoretical sampling led to twenty-five semi-structured interviews in Athens with platform and mainstream food delivery workers and key informants. The metropolitan, urban space influences the nature of economic activities as well as social movements. Preliminary results show that responsibilities and financial risks are transferred to the platform food delivery workers, creating a short-term sense of independence but a long-term insecurity. In the same vein, the sustainability of the recently acquired labour rights seems to be constantly at stake.

AVITAL, Sharon* (Tel Aviv University, Israel)

Panic and Disappearance-The Body and Technological Authority

This paper studies the nuanced use of the body and technology for purposes of persuasion. The case study is the introduction of norms during the pandemic under an emergency decree by the Israeli government.

It claims, that a new architecture of behavior has created a double bind: on the one hand, the body has become the center of attention and the object of fear. On the other hand, the body has disappeared from many people' personal experience. Anxiety for the body along with its disappearance- facilitated doubts in one's body- physical sensations as well as emotions. Consequently, many deferred responsibility over their bodies to sources of authority in the form of technology and science, often at the expanse of previous family and social ties.

Different traditions point to the ways in which embodied actions shape beliefs, rather than the other way around. They include Festinger's classical studies on cognitive dissonance; Latour's "articulation;"; and Foucault's seminal work, Discipline and Punish. This paper deepens these approaches by focusing on the importance of what I call "the double bind."

Due to social distancing and masking, the visual and tactile diminished and mimicry as a channel of emotional contagion was limited to fear mongering news anchors. Lack of touch, has led not only to social isolation, but also in accordance with research on trauma to difficulties in processing emotions and consequently to doubts and anxiety.

This has become a fertile ground for the sowing of animosity and the use of digital medicine for surveillance and control. Massive testing continued a trend pointed to by Lupton, as quantifiable technologies are accepted as more authoritative and reliable than one' sensations.

The paper unpacks how behavior formed beliefs, the double bind and the implications of the authority and uses of digital medicine under these circumstances

AVITAL, Sharon* (Tel Aviv University, Israel)

The Rhetoric of Crisis during the Vaccination Campaign- Truth, Lies and Hate

The paper rhetorically analyzes the discourse of the discourse of the pandemic and especially the success of the vaccination campaign in Israel. The paper explains the methods of propaganda used, the rhetorical uses of crisis discourse or what Amgabdan calls "a state of exception," and how these were amplified due to ties between the media and politics.

The research demonstrates in detail, that Israeli media was biased and used one-sided framing even of complex topics. The spiral of silence was in effect and the media censored most critical voices including those of serious researchers, thus creating a façade of scientific consensus. Worse, this paper documented blatant lies including retrospect removal of data.

The coverage of the crisis was not only misleading but also affective and embroiled with strong emotions such as hate and fear. The vaccines were discussed from the early stages of the pandemic as a panacea to what previous PM Netanyahu dubbed as "the end humanity." Their salvaging potential was tinged with religious rhetoric and zeal and was appropriately accompanied by scapegoating of those choosing to not get vaccinated.

Derogatory language and labels (e.g., murderers, pedophiles, parasites) were consistently used by politicians and media personalities, trickled down to the public and created two, almost unbridgeable camps in society. The bifurcation and hate were amplified by the phenomena of social media' echo chambers.

Consequently, an extremely vehement discourse was formed and even stricter norms were adopted as "means to protect the public and truth." In that way, hate contributed considerably to the legitimacy of the new norms of the pandemic and the state of exception itself.

The paper points to ways in which the crisis and the introduction of the vaccines could have been covered with more responsibility and without harming the media' ethos.

Role of Social Organisation in Shaping Leisure Activities in India

All over the world we find two types of leisure time activities.One type of activities which help to improve the quality of life,and another is to abuse or affect the quality of life.All over the world consuming alcohol is an accepted way of leisure time activities. After globalisation this way of behaviour is getting more and more important. It's a prestigious view of behaviour in developing countries too, where previously consuming alcohol is not treated as an accepted way of behaviour. India is the country where consuming alcohol is banned. But during the British era and especially after globalisation, consumption of alcohol became prestigious. Over the period of time consumption of alcohol became common among the society.Regular consumption of alcohol has become a habit of several people. Drinking too much alcohol or excessive alcohol use can lead to increased risk of health problems and also leads to economic problems.

Alcoholic Anonymous(AA) is an international organisation working since 1935.In 2022 AA estimated its world wide membership to be over two million with 75% of those in the U.S. and Canada.

Through this research paper researchers want to review the work of AA in India particularly.

Mercado Laboral Informal En Paraguay: Una Aproximación a Los Empleos Segmentados y Heterogéneos

Paraguay se encuentra entre los países de la región con más alta incidencia del empleo informal, según los datos del Instituto Nacional de Estadística (INE), seis de cada diez ocupados eran informales en 2021. Esta dominancia de la informalidad de los empleos y sus respectivas consecuencias en la vida de los paraguayos y paraguayas es lo que nos genera el interés por conocer sus trayectorias profesionales y sus razones de entrada al empleo informal, suponiendo que les atraviesa y afecta de manera distinta.

En este punto queremos pensar una estructura segmentada y heterogénea de perfiles de trabajadores y trabajadoras, el objetivo es conducir a una estructuración del trabajo informal y a la construcción de una jerarquía social a través de estos perfiles, para lo cual hemos partido de la tipología de ocupación según las estadísticas de empleo, para construir con el trabajo cualitativo, las trayectorias profesionales de las personas, teniendo en cuenta las razones que tienen ellas para ingresar al trabajo informal.

Entre las diferentes razones hemos dado con quienes se encuentran en la informalidad por tradición familiar, por oportunidad de negocios, por causa del desempleo, por necesidad de sobrevivir o por la facilidad de tener dos o más empleos.

Estas razones, nos hacen pensar que los trabajadores y las trabajadoras parten de situaciones socioeconómicas diferentes y este factor determina sus trayectorias de empleo presente y futuro, sobre todo en un país, donde las condiciones económicas y sociales desfavorables, favorecen al surgimiento de trabajos informales, convirtiéndose en una oportunidad aprovechada por los trabajadores, generando nuevos patrones de consumo y nuevos tipos de actividad, pues las personas encuentran mejores condiciones para desarrollarse y mejorar su nivel de vida en la informalidad, como una estrategia consciente de adaptación a las nuevas condiciones socio-económicas.

Reframing Reality: An Analysis of the Experiences of Vulnerability and Resiliency Among Poor Black Women during Recovery

This work explores how poor African American women define and navigate the long-term recovery process in a structurally and culturally violent society; more explicitly it explores the specific ways in which they actively resist against structural and cultural violence; and how do poor African-American women understand and define their own vulnerability and resiliency in the context of disasters and their recovery process? From a theoretical perspective, this work proposes a Critical Race Theory approach to disaster science's understanding of how poor African American women live in a structurally and culturally violent society; and thus, their recovery post-disaster is influenced by said violence. Through a radical ethnographic study, this work is centered around the lived experiences of African American women in Louisiana, USA; and their experiences facing and recovering from disasters. I use methods such as interviews, field observations, and archival data to provide a historical and contemporary analysis of these lived experiences; as well, as to challenge imperialistic notions of disaster theories around recovery, resilience, and vulnerability. This work considers more broadly how poor African American women are extremely vulnerable to both structural and cultural violence, and how these types of violence become exacerbated during their recovery process. Data collection is currently underway and will be finalized at the end of November, 2022. Data analysis will begin in January 2023. Data will be analyzed using a qualitative data analysis software. Data will be coded in relation to interview topics and using the study's theoretical framework: cultural violence, structural violence, structural dislocation, recovery theory, and sites of resilience theory.

The Reorientation of Interventions Towards Young People in the Context of Pandemics and the Issue of Police Violence. Analysis of the "Envión" Programme (Argentina, 2020-2021)

One of the most widespread objectives of social crime prevention and violence prevention interventions for marginalised young people in Latin America is to establish protection mechanisms against police violence against these young people, which is understood as part of a broader process of social exclusion. If the practices of police violence against young people have been reoriented in the context of the pandemic and the restrictions on movement linked to it, the modalities of intervention of assistance programmes for young people in this context have also changed. This paper aims to characterise the transformations that have occurred during the pandemic in interventions for marginalised young people in Argentina, focusing on the case of the "Envión" programme in the Province of Buenos Aires. Using a qualitative methodological approach that combined in-depth interviews, participant observation and documentary analysis, we will analyse the reconfiguration of the "proximity" strategy proposed by the programme to address the dynamics of marginalisation of young people in segregated neighbourhoods of Buenos Aires.

Young People, Work and Education: Perspectives and Problematizations on the Question of Insecurity in Post-Pandemic Argentina (2021-2022)

In Argentina, since 1990, the "question of insecurity" has been installed in the political and media scene, with a problematization centred on street crimes, configuring poor young people from urban neighbourhoods as figures of dangerousness. In this way, young people began to be the protagonists of public and political debates on crime control and during the last three decades, they have been one of the social groups intensely stigmatized as producers of violence and insecurity, in a sense that in particular focuses on concern about their subjective dispositions and their links with work, education and social policy. This paper aims to reconstruct and analyze the ways of problematization, the articulations and the tensions between the question of insecurity, work, education and young people from popular sectors in Argentina in the period of pandemic and post-pandemic, from the perspective and positions of workers from different socio-occupational groups that make up the social space.

To carry out this work, a qualitative methodological approach and an analysis procedure based on the theory founded on the data were adopted. The fieldwork consisted of conducting focus groups made up of people belonging to different working sectors and was carried out in the year 2022, during the post-pandemic scenario in Argentina.

Participatory Approaches for Inclusive Agtech Development: Investigating Innovation in the UK Agricultural Robotics Sector

The agricultural robotics sector in the UK is an emerging area for investment, with the UK government identifying robotics as one area for capital support, and the development of agricultural robotics forming a focal point of the UKRI Transforming Food Production challenge. In particular, there are a number of SMEs in the UK targeting development of autonomous field robots, which aim to provide machines that can address labour shortages, improve mapping and data collection, and reduce agricultural inputs. A recent report from DEFRA identified autonomous agricultural robotics as part of the second and third waves of automation in the horticulture industry, and such solutions for autonomous crop monitoring and autonomous harvesting are currently in "the development pipeline" - still pre-commercialisation but emerging as prototypes.

There has been relatively limited investigation of the extent to which agricultural robotics development in the UK involves a breadth of stakeholders outside the private robotics development community, and there have been calls for a focus on responsible innovation and inclusion in the sector. This talk will present the results of a project running in Autumn 2022, which aims to understand the picture of participatory approaches for responsible innovation of agricultural robotics in the UK. Through interviews with private sector developers and academic researchers, this research seeks to understand how roboticists view their role in supporting safe and ethical technology development, and to what extent participation currently factors in the development of agricultural robotic technologies. It will compare a view of this participation with a narrative review of the academic ideal of participation, with a view to providing insights for future research into the integration of participation and responsible innovation practices into AgTech development.

Searching for Home: Conflict, Deterritorialisation, and National Belonging Among the South Sudanese Diaspora in the UK

Belonging, and the politics of belonging, have become increasingly complex phenomena in recent years (Yuval-Davis 2011). Nira Yuval-Davis (2011: 10) has observed how 'belonging tends to be naturalized and to be part of everyday practices. [However,] it becomes articulated, formally structured and politicized only when it is threatened in some way.' There are few situations where this dynamic is so pronounced as in ethnicised intra-state conflict, which co-opts and distorts national narratives of belonging in order to redraw the parameters of who is included and excluded in the nation (Hall 1990; Bhabha 1994). The political salience of national narratives have acute repercussions for diaspora identities, which already 'inhabit a grey zone between different definitions of 'insider' and 'outsider'' (Sigona et al. 2015: xxii).

This study examines the discursive construction of identity among the South Sudanese diaspora in the UK. Having campaigned for, voted for and celebrated the secession of South Sudan in 2011, South Sudanese citizens in the UK have experienced intra-communal rifts replicating the dynamics of the conflict in South Sudan since 2013. Drawing on data from focus group discussions incorporating photo elicitation and interviews, this paper outlines the elements of the national narrative members of the South Sudanese diaspora identify with and the contradictions between this narrative and their experiences as citizens of South Sudan. It outlines five strategies that participants use to resolve this tension, including avoidance, despair, taking a historical view, retraction of national boundaries, and selective dis-identification with co-nationals. The politics of national belonging are consequential for practices of everyday peace (Ware and Ware 2021) and mutual support among a small and multiply marginalised minority community living under the UK's hostile migration regime.

Clandestine Labour: Australian Parents' Accounts of Returning to Work and Breastfeeding

Transitioning back into employment after the birth of a child is a significant adjustment period for parents that is associated with the cessation of exclusive or any breastfeeding. Understanding experiences of returning to employment while breastfeeding will inform workplace policies to better support working families who breastfeed.

This qualitative study undertaken in Tasmania, Australia in 2019, used interviews to explore public service employed mothers' (n=38) and fathers'(n=4) accounts of returning to work after the birth of a child and analyzed how they negotiated and practiced breastfeeding in their family during this time.

Parental accounts revealed a conflict that occurs when paid work (work life) interferes with the demands of breastfeeding, and breastfeeding (family life) conflicts with work life. In addition, as breastfeeding is rarely acknowledged in the work place it becomes a form of clandestine labor undertaken by parents in the weeks and months following returning to work. Parents often felt unable to discuss breastfeeding with managers or colleagues which served to further hide breastfeeding in the workplace. This aspect of returning to work is not adequately acknowledged in Australian parental/maternal leave arrangements, and family-friendly employment policies. Parents' accounts also revealed different stages in the process of returning to work while breastfeeding. These are 'leave-taking and planning for return', 'returning and doing work', and 'couple strategies'. Couple strategies provided insight into the many creative ways that mothers and fathers attempted to manage the challenges of caring for infants and breastfeeding in the context of paid employment.

The concealed nature of breastfeeding in the workplace has a negative impact on the duration of exclusive or any breastfeeding, creates stress in family and work relationships and reduces retention. Policies and leave arrangements for parents who return to work after the birth of child need to better acknowledge the hidden work of breastfeeding.

VASCONCELLOS, Fernanda (Universidade Federal do Rio Grande do Sul, Brazil)

Deciphering the Sphinx: Police and Criminal Justice in the Face of Authoritarian Temptation

The history of institutional mechanisms of social control in Brazil can be told as the history of the violent imposition of an unequal and excluding social order. Since the consolidation of the national state, there have been several episodes in which military and police forces have been used to suppress conflicts, revolts and popular manifestations of discontent. Even in periods of greater political openness, the patterns of violent action and uncontrolled discretion persist, and are related to the existence of shadow zones where death squads or private militias operate, producing high standards of lethality, fear and mistrust, and compromising the social legitimacy of the police. Despite the country's redemocratization since 1988, problems related to police violence, corruption, and the reproduction of social inequality as inequality of treatment by institutions were not resolved. What we intend to discuss is the low adherence of police officers of various hierarchical levels and generations to democratic and constitutional values, and the significant adherence to the siren song from an authoritarian perspective. A pattern of functioning of the Brazilian State in the field of public security, traditionally inquisitorial and elitist, aimed at the defense of particularist and corporate interests rather than guaranteeing public security based on universalist, democratic and legally legitimate criteria. Our research, of a theoretical nature, aimed to seek the resolution of the mystery in the rich production of the field of sociological studies of violence and conflict management in Brazil and Latin America . Key concepts such as police ethics, social accumulation of violence, socially implanted violence, legitimacy of police/judicial action, violent masculinity, need to be valued and activated for the understanding of a complex and multifaceted reality, and of social processes in which changes are often neutralized or blocked by actors and institutional structures that sustain unequal treatment criteria and privileges.

Penal Reforms, Patrimonialism and Criminalization of Corruption in Brazil – Balance and Perspectives

With the insertion of new actors, such as the Federal Police, the expansion of the criminal field and the emphasis on the federal jurisdiction, a new model of corruption control is installed in Brazil. Federal institutions — Federal Public Ministry, Federal Police, Federal Justice and Federal Regional Courts — gain visibility through major operations to combat corruption and organized white collar crime — and in these cases, the dock is occupied by large businessmen and important politicians. The good articulation between actors in the penal system and the mainstream media produces engagement and guides public debate, generating effectiveness and visibility in processes and investigations. The Judiciary begins to occupy a prominent position, assuming itself as an institution that, together with the Federal Police and the Public Ministry, intends to cleanse the country of corruption practiced mainly by members of the political elite. The Federal Supreme Court becomes the locus of debate and judgment of the most noisy cases, in view of the jurisdiction of most of the accused; previously adopted decision patterns are reviewed, in the direction of greater decisionism, taking into account a consequentialist perspective. The importance of this process of judicialization of politics for the political destinies of the country, as well as for the functioning of criminal justice and the fight against corruption, point to the need to deepen the analysis, from the perspective of socio-legal studies, integrating elements of legal sociology and politics, anthropology of the courts and political science to the studies of criminal procedure. The present research intends to map the debate carried out in the field of social sciences in the last decade on the phenomenon, to build a more solid and conceptually anchored theoretical framework for analysis and to identify trends in penal reform and judicial policy to combat corruption in Brazil.

Methodology for Creating a Library of Early Warning Messages

Risk communication is an indispensable mechanism for the strategic management of emergency situations. Sending early warning messages to the population significantly reduces the impact of disasters. The development of new technologies represents an opportunity to strengthen risk communication strategies. In recent years, mobile Apps or the sending of SMS messages have become increasingly widespread risk communication channels among the main emergency agencies. However, the use of new technologies as an early warning channel is still emerging. One of the main challenges presented by early warning 2.0 systems is the systematic and comprehensive production of warning messages. The objective of this research is the creation of a library of flood risk warning messages, which facilitates their systematic use by emergency technicians and covers the great diversity of fields of action that take place during an emergency. Based on an analysis of the calls to the 1·1·2 emergency service of the Generalitat Valenciana (Spain) during a disaster flood event of 2019, the review of specialized literature and the adaptation of a message structuring model, a library of flood risk warning messages is proposed. This library includes more than 100 messages structured in information triads, which are systematically classified into 55 thematic areas covering the main fields of emergency preparedness, action and recovery.

COVID-19 and Comparative Domestic Military Deployments: The Case of Brazil

This article analyses the nature of the involvement of the Brazilian Armed Forces in federal initiatives aimed at fighting the Covid-19 pandemic by considering the structural militarized character of Brazil's security apparatus. To this end, it will begin by addressing the current political context in which Jair Bolsonaro, an elected former member of the military, has assumed office since 2019. Next, it will highlight the general regulations for domestic military deployment in the country, as well as some cases in which this deployment has taken place prior to the coronavirus pandemic, considering existing legislations and general procedures that are meant to regulate the interaction between the Armed Forces and the civilian oversight in that exercise. It will then dive in the so-called Operation Covid-19, a national initiative to tackle the pandemic which demanded direct engagement of the Armed Forces, while taking into account the overall influence of military deployment in civil-military relations.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

In its concluding section, the article discusses lessons that may have been learnt as a result of the military engagement in health initiatives in light of the Covid-19 pandemic, as well as possible roles that the military may be required to perform in the future.

Berlin's Neighbourhoods in the Tourist Trap? Routines of Sharing Unsettled By New Urban Tourism

Cities have been tourism destinations for a long time, but tourists' use of the urban space has changed. A rising number of urban travellers disregards classic sights in favour of a more "local", "authentic" mode of travel. Such "new urban tourists" seek to embed themselves in urban day-to-day-living. They want to "live like a local", as the successful digital apartment-sharing platform Airbnb advertises. To achieve this, new urban tourists rent residential apartments offered for short breaks, rather than hotel rooms, and thus become new, temporary neighbours. By this, they do not only share residential space with locals for a while, they also compete with residents for the use of urban spaces, such as hallways, sidewalks, supermarkets, cafés, restaurants and parks.

While the real estate and tourism industries are reaping the profits of such "new urban tourism" and Airbnb argues that the money earned from sharing spaces helps locals in both disenfranchised and trendy parts of the city to "make ends meet", the rapid changes in some quarters have triggered protests by residents. Drastic rent increases and the disappearance of retailers of basic supplies from many quarters are just two symptoms of a broader social upheaval that has unsettled local routines of settling, dwelling and cohabitation. Drawing from qualitative interviews conducted in the scope of an interdisciplinary three-year research project on new urban tourism in Berlin, I ask what residents do and think when their surroundings are being transformed to cater to tourists with diverse sociocultural backgrounds. How do they deal with tourists suddenly living next door? Do they invite, celebrate, bear or avoid them? Are local routines and ideas of sharing preserved, changed or destroyed by new urban tourism? These questions also bring forward reflections about which socio-spatial inequalities sharing may entail in contested, commercialized and often unwanted sharing settings.

Affective Burden and the Performance of Anti-Racist Education from the Margins

Australian schools have limited policies and curriculum frameworks that support anti-racist education. Such work is often undertaken at the margins of education by community organisations and individuals, with schools outsourcing responsibility to third parties. In this paper we examine how such groups undertake and promote their work, the conditions which support and constrain the ways they interact with schools, and the discourses and strategies they draw upon from local and transnational antiracisms, focusing on the Black Lives Matter movement. We discuss the work of organisations such as ActNow Theatre Company in Adelaide and E-RACED in Brisbane, drawing on interviews with key figures in these organisations, as well as well as published writing and photographs they have produced. Building on perspectives from affect studies (Zembylas, 2015; 2018), we argue that anti-racist interventions, problematically concentrate an affective burden on Black performative bodies entering predominantly White spaces. These interventions are often based around the sharing of traumatic experiences that leave young racialised workers exposed to new experiences of racism. Such narratives of trauma and racism may then be essentialised as defining non-White lives. As workers, the leaders of anti-racist interventions are also marginalised within the education system as they are not teachers and are called upon to provide engaging and entertaining accounts of themselves to audiences of students with whom they have no prior connection, and with whom they will have no follow-up interactions.

A Rebellion with(out) a Cause? Popular Protest and Elite Transformation in Socialist Montenegro, 1988–1990

The so-called Antibureaucratic Revolution (ABR) is one of the pivotal moments in Montenegro's contemporary history, yet it remains severely understudied as compared to the other "refolutions" of 1989. What is unclear about it is how and why the nationalist ideas of a populist fringe were eventually adopted, promoted, and legitimized by people who initially came into the streets to articulate socio-economic grievances and demand political reforms to better the socialist self-management. By analyzing publicly available textual corpora

(e.g., newspapers, memoirs, police records) and rendering it through the "dynamics of contention" approach, this paper explores political opportunities, resource mobilization, and framing strategies during the Antibureaucratic Revolution and in its aftermath, that is – from August 1988 until December 1990. Specifically, this paper illuminates three aspects of the ABR: (1) the material and discursive conditions that made public dissent possible, (2) the waves of mass protests against the "corrupt, alienated, and inefficient party-state leadership", and (3) the mechanisms of the elite–mass interactions that eventually gave the counter-elites sufficient legitimacy to overthrow the old *nomenklatura* and "return power to the people". As such, the paper aims to understand why and how civil society turns "uncivil" during tectonic shifts in the nexus of polity–economy–society.

RC48-672.6

BACA, Bojan* (University of Gothenburg, Sweden)

From Infrapolitical Resistance to Political Rebellion: Trajectories of Dissent and Dynamics of Contention in Montenegro's Antibureaucratic Revolution

The so-called Antibureaucratic Revolution (ABR) is one of the pivotal moments in Montenegro's contemporary history, yet it remains severely understudied as compared to the other "refolutions" of 1989. What is unclear about it is why and how individual infrapolitical resistance developed into collective political uprising against the party-state *nomenklatura* within the timenospan of six months, ultimately resulting in the downfall of the regime in the smallest (former) Yugoslav republic. By analyzing publicly available textual corpora – such as news media materials, published memoirs and testimonials, and declassified police records, among other sources – and rendering it through the "dynamics of contention" approach, this paper explores how small-scale and low-key everyday resistance to the authoritarian practices was eventually transformed into a nationwide populist movement against the authoritarian regime as such. In addition to providing a theoretical bridging of civil resistance studies, social movement studies, and civil society studies, this paper investigates the roles that socialist populism, on the one hand, and ethnonational radicalization, on the other hand, play in grassroots mobilization within the authoritarian setting. As such, the paper aims to understand why and how civil society turns "uncivil" during tectonic shifts in the nexus of polity–economy–society.

Dialogue As a Social Research Orientation and Method within the Framework of Participatory Action-Research

Dialogue as an approach to social science research transforms the relation between researcher and researched and is a core feature in the orientation to research in participatory action-research. The purpose of the paper is to show how a dialogic relation in social research improves scientific knowledge generation, the transformative learning of participants as well as the capacity for contributing to social change. We draw on and compare contributions to dialogic approaches from southern (i.e. Freire, Fals Borda) and northern (i.e. Lewin, Reason, Gustavsen) traditions, and the way these approaches can support PAR and be combined in a paradigmatic clarification of an emerging dialogic social science. It takes a point of departure in openness to the other, democratizing the research relation striving for equal participation in knowledge creation where knowledge is co-created and made transformative in the interaction between participants. Ontologically it is a paradigmatic shift from depicting a given reality, to a participatory worldview where reality is co-constructed through generating transformative learning and cooperative action among concerned parties. We draw on project experience of PAR that shows that there are hugh challenges involved both in the struggle of transforming established paradigms of social research in a dialogic direction and in the cultural struggles in relation to structural inequality in society. At the same time PAR experience in enabling dialogic relations shows the potentials for empowerment of actors and more workable and efficient research methods and practices that can enhance scientific quality by mobilizing the learning and reflective capacity of all, in a way that can produce transformative social change. We contribute by offering a model of dialogic research in PAR which nospan southern and northern approaches and practices.

Embedding Indigenous Expertise in Marine Governance: A Co-Design Approach to Invasive Species Research and Control on the Great Barrier Reef, Australia

Outbreaks of crown-of-thorns starfish (CoTS; *Acanthaster* spp) are one of four leading causes of coral cover decline on the Great Barrier Reef (GBR). Their control is seen as important both in its own right and in helping the Reef recover from other stressors, including bleaching and cyclone damage,

likely to increase in severity due to climate change. Critical to the management of these threats, according to the Australian and Queensland Governments' *Reef 2050 Long-Term Sustainability Plan*, is inclusion of Indigenous expertise in Reef governance, partnerships with Traditional Owners in the delivery of Reef programs, and recognition of the rights of Traditional Owners to benefit from their participation. Attempts, however, to navigate the plural knowledge systems consequently implicated in Reef governance and management have had mixed success. This paper presents a case study of co-design processes developed with Traditional Owners to inform crown-of-thorns research, monitoring and control. The project highlights the importance of according Traditional Owners' epistemic authority through recognition of relationships between expertise, culture, connections with country, and rights to self-determination. The paper will explore: (1) the contribution of Indigenous knowledges and place-making to marine governance and management; (2) potential alignment between research priorities and community benefits through knowledge co-production between researchers and Indigenous communities; (3) the importance of cultural authority across terrestrial and marine resources; and (4) environment importance for cultural continuity. Overall, the paper wishes to illustrate a response to social justice in marine environments which Traditional Owners have long advocated for while calling for a greater participatory role in the management and governance of traditional sea country territories.

Monopolistic Consolidation in Pharmaceutical Sector: Implications for Medication and Innovation

The paper, based on the research reports and industry data, seeks to analyze and review the recent trends toward aggressive mergers and acquisitions in pharmaceutical sector, driven by profit motive, leading to the emergence of big pharma houses and its implications for medication through drug pricing and drug innovation. The industry survey reports indicate that the pharmaceutical sector has seen intense consolidation in the recent decades with annual value of mergers and acquisitions estimated to be in excess of $400 billion. More than 1,200 such mergers and acquisitions have taken place in the last two decades with top eight firms accounting for over 75 percent of global pharma business. Small generics drug makers have consolidated into bigger firms and those left out have been acquired by branded ones. Such consolidation not only enables the big pharma to expand their market share but also to monopolistically regulate the prices. Owing to the reduced competition, there is decline in innovation of improved drugs, reflected in decline new patents and allocations for R&D. More than half of the revenues of big companies come from patents and drugs developed by smaller companies taken over by the big players through mergers and buy-outs, leaving fewer innovative firms. Such consolidation benefits the shareholders at the cost of consumers. The ongoing consolidation of drug industry and monopolistic practices, driven by profit motive, have resulted in high prices, drug shortages, drug safety and lack of innovation, which could have alarming implications for public healthcare. Further, it is also observed that the drug regulators confine themselves to the efficacy and procedures of drug production with no jurisdiction over the drug business and there is laxity among industry regulators owing to the fluidity and ambiguity in legal provisions governing corporate operations that seldom guided by public interest.

Sociology of Science & Technology- Revisualization of Sociological Framework

Sociology has not paid much attention to science and technology for a long time. August Comte's "law of three stages," based on the progress of science and technology is often used to describe the field and then he introduced the new concept of Positivism to the social science research. However, his idea of sociology did not include science and technology as things to study from a sociological point of view. Instead, conventional methodological approaches were considered to be the best mode of research. Since then, sociology seems to have stuck with this strange way of thinking. Sociologists take science and technology for granted and perceive everything else as social. Sociology of science and technology examines sociology's role in scientific analysis. It analyses the link between science and society and knowledge construction. Historical and present studies help analyse the prominent schools of sociology of science and technology.

There are various sociological theories of science and technology. Too-rapid social change might cause structural-functional difficulties. Cultural lag occurs when cultural elements change quicker than non-cultural elements. Some middle-aged and older people dislike smartphones and other technological advances. Technological advances are driven by making money, and groups fund them. Science and technology aid dominant groups while hurting others. Conflict theorists and feminists say technology extends society's patriarchal structure, which prioritizes men's needs over women's. Knowledge is relative and changes through time and between communities, according to symbolic

interactionism. Scientists, researchers, and the public interact to create scientific "truths". Last, society decides who gets involved in science and technology.

Implications of Modernity on Cultural Practices of Indian Youth

Implications of Modernity on Cultural Practices of Indian Youth
*Dr. Mouneshwar Badiger, M.A. PhD
Modernity is a term of art used in the humanities and social sciences that arose in post-medieval Europe which includes a wide range of interrelated historical processes and cultural phenomena. The contemporary world in the wake of modernity is passing through dramatic changes. Traditions gradually got weakened at the hand of modernity. Religion and religious practices received the first blow, followed by the culture and cultural practices.

According to Youth in India Report-2017, India has 423 million youth population which constitute 34.8% of the total population.

The implication and intensity of modernity varies with nation, region, places and sections of population. Modernity has its own implication on cultural practices of Indian society. It manifested in the changes of cultural practices of youth in their day-to-day life. Indian youth reacted differently to modernity. In the present study, how the modernity has affected the Cultural Practices of Indian Youth has been examined.

Culture is "the complex whole which includes knowledge, belief, art, law, morals, customs and any other capabilities acquired by man as a member of society. In the present study Cultural Practices includes the mundane life style, attitude towards marriage and relationships, belief system and other aspects of Indian Culture. The Post graduate students studying in Private Universities of Bangalore City in India are selected as respondents.

In the review of literature it is found that, majority of the studies are conducted in western countries. Indian studies in this direction are very scanty in nature. Hence the present study has been under taken.

Key Words: Modernity, Implication, Cultural Practices and Youth.

Implications of Modernity on Spiritual Practices of Indian Youth

Implications of Modernity on Spiritual Practices of Indian Youth
At the inception of nuclear era, Elbert Einstein once said that the world would be completely changed by the Atomic Bomb. Now the same thing can be said about modernity. There is a never ending debate on pros and cons of modernity and its paraphernalia. Probing the purpose and comprehending the reality of life is one of the human aspirations. Modernity has brought drastic changes in the religious and spiritual aspirations of human beings in the present era.

In the review of literature it is found that, majority of the studies are conducted in western countries. Indian studies in this direction are very scanty in nature. Hence the present study has been under taken.

The present study has made an attempt to find the implications of modernity on daily spiritual practices of Indian Youth. The implication and intensity of modernity varies with nation, region, places and sections of population. Youth are always open to receive change unlike the old age and middle age sections of population. Youth is the more vulnerable section to experience the influence of modernity and its paraphernalia. In the present study, how the modernity has affected the day-to-day spiritual practices of Indian Youth has been examined. The spiritual practices include the belief in the existence of God, practice of Yoga and meditation, service orientation, reading scriptures, involvement in daily worship, daily prayer, maintenance of health, belief system etc.

The Post graduate students studying in Private Universities of Bangalore City which is the IT Hub of India are selected as respondents.

Key Words: Modernity, Implication, Spiritual Practices and Youth.

Navigating Spheres of Conflict. Artist's Collectives and Temporary Use in Social Housing Redevelopments in the City of Ghent (Belgium).

We present the findings of a three-year research study that unpacked the role and contributions of temporaryoccupations - in the form of artist collectives - to qualitative transitions of social housing estates in urban regeneration projects. The case study of 'Collectief Nieuw Gent,' an artists' collective located in the urban renewal project 'Nieuw Gent Vernieuwt' in the City of Ghent (Belgium), was used to establish recommendations for the future involvement of artists in urban regeneration projects.

While temporary use of unoccupied heritage buildings is common, implementing temporary use in temporarily vacant social housing is not. The project's goal was to raise the profile of the reuse of unoccupied social housing towers by artists among legislators, social housing firms, and designers and more importantly to illustrate its challenges and limitations.

The study identified that artists working in these temporary settings can be categorized as: the artist as vacancy guard (1), the artist as socio-cultural activator (2) and the artist as urban planner (3). These positions can exist separately or in combination.

The artist as vacancy guard underscores the need for unregulated, non-commercial area. Artists as sociocultural activators revitalise neighbourhoods through collaborative projects, while artists as urban planners drive urban change in a desirable direction.

The research also found that artists in social housing estates do not gentrify, which is not to imply that gentrification does not occur just outside the estate due to neighbourhood regeneration.

We conclude by explaining that through the temporary use, the artist collectives intervene in the sphere of conflict between the expectations of the government, the temporary user, and the public and are unable to provide solutions to major societal challenges, as is too often assumed. The power of temporary use rests in its ability to continue to interrogate its surroundings and imagine alternative future.

Capitalist Mode of Development and Community Rehabilitation: A Critical Analysis of Industrial Project in Odisha, India

The 'tribal land resources alienation' has been continuously seen across the country, starting from the colonial period to the contemporary period in India. Through the land alienation process, tribal communities not just solely lose their land, but they are to some extent de-associated from their social lifestyle. But, the inception of capitalist development in the form of accumulating the land resources from tribal communities leads to conflict between the local tribes and the corporate, particularly in the resources-rich tribal-dominated region.

The sustainable development of the tribal people revolves around land resources. The community see nature in every aspect of life, and the land resource relation among the tribes is like the moon and son relation. The life of the tribe is meaningless Without land. The tribal communities have been facing challenges in protecting their sustainable natural environment till the present time. The degradation of the tribal mineral resources is increasing in the current period. It is significant to look at the present situation of environmental resources.

Therefore, based on the existing literature review and tribal experiences, the present paper aims to study the recent factors that are responsible for tribal mineral resources degradation, particularly in Odisha. Further, the paper attempts to explore the consequences of mineral extraction on tribal sustainable development. It affects various capital of tribes such as Natural Capital, Physical Capital (people's Health, education), and socio-economic capital. The paper also highlights how the lower sections of people are too being impacted and restricted in access to the mineral/ natural resources due to environmental degradation apart from the tribal communities. What is the nature of state and tribal relations on land resources in the contemporary period? What are the consequences of the capitalist mode of development, the tribal community face? How do the affected tribes cope with the situations?

RC56-752.4

BAGINSKI, Pawel* (Doctoral School of Humanities, University of Warsaw, Poland)

Gender Power Relations and the Polish National Habitus in the Discourse on Violence Against Women

I will discuss how recent changes in gender power relations in Poland interact with the Polish national habitus. I will focus on discourses on the standards of treatment of women (with a particular interest in domestic violence) created in selected women's magazines during post-socialist transition (1980-2020), in order to show how "traditional" and national sensitivities were contested as the underpinning of patriarchal power relations. As gender plays a key role in the project of a nation (Yuval-Davis 1997), it is worth asking how the popular discourse on gender equality in Poland affected the national layer of habitus in Poland. The focus on domestic violence will highlight the significant gap in the state monopoly of violence and the changing definition of what constitutes violent acts, as a result of the shifts in the power balance between men and women.

Although historians of the state-socialist Poland observed some signs of decivilizing tendencies in the treatment of women from the 1970's onward, the process accelerated during the post-socialist transition, along with the growing influence of the Catholic Church and nationalist discourses, resulting in the overall retraditionalization in the gender order. On the other hand, changes in media and the growing impact of the western cultural norms resulted in the lowering of the threshold of shame in the public sphere (Szpakowska 2004) and

heightened sensitivity to social problems that were not effectively targeted in the state-socialist Poland. Since violence against women is a mechanism that maintains the patriarchal *status quo*, in analysing the Polish national habitus it will be interesting to look at how discourses contesting violence against women situated themselves towards "Polishness", understood as a patriarchal approach to women.

Family Design of Parental Leave in Russia: From Actual to Desirable

Parental leave policy may include a number of elements, which aim to reduce the gender gap in a difficult family life period after the childbirth. Today's parental leave policy in Russia focuses more on the duration of leave, but not on its flexibility. Leave can be taken by any family member; but mothers are the ones who can be considered major leave-takers.

Our study aims to compare the actual and desirable design of parental responsibilities' distribution during parental leave in Russian families. In 2022, we carried out a state-wide sociological survey of parents with children under the age of 3; we surveyed 1000 leave-takers. We determined a list of parental functions, then we asked participants who exercise each function at present ("more often the mother", "more often the father", "both parents equally") and recorded the perfect distribution.

Our study yielded the following major results: the only function which parents assign "more often to the father" is doing physical exercise with the child. Respondents advocated for the more equal involvement of parents in childrearing. The most obvious discrepancies between the actual and desirable design were revealed for the following parental functions: reading to the child, walking, teaching, taking the child to the kindergarten, playing with them.

We also found statistically significant differences in the distribution of parental load between two groups of respondents—married and unmarried couples. In the first case, the participation of fathers is more active than in the second one.

The need for the more equal involvement of both parents in childrearing revealed during the survey and the dynamic of family and demographic policies in Russia may be considered as factors, which highlight the urgence of parental leave system's transformation and the introduction of a separate type of leave for fathers in Russia.

Ethnic Politics, Illiberal Democracy and Power: The Cases of Sierra Leone and Guinea

African countries have been experimenting with multiparty democracy since the dawn of independence. In each phase, democracy has collapsed under the weight of ethnic contestation for political power, leading to various forms of military dictatorships and one-party rule. More recently, African countries have reverted to multi-party democracies. However, the common problems of disputed election results and election boycotts based on ethnic identities are becoming too common. Elected governments are also engaging in anti-democratic behaviors that favor certain ethnic groups. These include gerrymandering and prolongation of presidential terms. All of these issues raise the specter of illiberal democracies and the prospect for violence and military coups. Sierra Leone and Guinea are insightful cases in their struggles to forge a working democracy. Both countries are characterized by bitter ethnic political divides, political violence, and military rule. Given this constellation of factor, this paper seeks to examine the way ethnic politics breeds an anti-democratic mode of political power which leads to illiberal democracy and insecurity. The paper uses the cases of Guinea and Sierra Leone to show how ethnicity has been deployed in the political space and its implication for democracy and peace. The paper also raises the prospects for consociational democracy through deliberate institutional design as an antidote to diabolical ethnic politics in Sierra Leone and Guinea.

Military Regimes and Human Security in West Africa: A Critique of Democratic Failures in Mali and Guinea

Recently, democracy has come under growing attack in various parts of the world, from the United States to countries such as Guinea and Mali. Too often the attack on democracy has been connected to popular perceptions that democratic systems of governance are not able to deliver on core security, social, and/or economic needs. In West Africa, elected governments have increasingly been violating basic principles of democracy and failing to deliver on human security. In Mali, for example, the legitimacy of the elected governments has been undermined by the failure to combat terrorism, which has undermined human security. In Guinea, the elected government undermined democracy by engaging in anti-democratic behavior leading to mass violations of human rights and increased human security risks. In both countries, the military took power and promised to restore human security. However, military regimes have had poor records of governance in Africa. These cases raise important questions about the relations between human security and democracy, and military responses to the failures of democratic governance. This paper addresses the interconnections between the failures of democratic governance and the rise of military regimes, and the human security implications of both democratic failure and military rule. It uses Mali and Guinea as comparative cases to show how democratic failure happens and the risk of military rule. Moreover, it examines these issues through the prism of human security.

International Migration of Students from Punjab: Extent, Reasons and Implications

International Migration of Youth from Punjab: Extent, Reasons and Implications
Abstract
The international migration of Indians has been taking place since ages, but the nature and type of migration has completely changed during the last three decades. The most significant change is observed with regard to mass international movement for study purpose across the globe. India including Punjab has recorded unprecedented rise in the extent of student migration on the basis of study visa. In the current times, Punjab is a centre of discussion owing to large scale migration of students every year. Unprecedented increase in the international migration of students has serious economic and social implications for the parent country as well as for the family of migrants.

Given this, the objectives of this paper are three-fold: (i) to understand the extent of international migration of students from Indian Punjab; (ii) reasons of mass migration of students and (iii) implications of a large-scale migration of students for the family, society and Punjab. The present paper is based on the two types of data: first, three hundred interviews conducted from the students who are planning to migrate and doing preparation for IELTS exam, and second, some secondary sources such as newspapers, reports of various Ministries, government departments of both sending and receiving countries . Empirical results have shown that the migration of Punjabi students have significantly increased in the recent years. Surprisingly every 6th student migrating from India belongs to the Punjab state. Further, various push and pull factors have been contributing for the sudden jump in the migration of students from Punjab to different countries. This paper also explores implications of student migration for different stakeholders.

De Las Identificaciones Nominales a Los Creyentes Adversativos: En Torno a Las Recomposiciones Del "Ser Religioso" y "No Religioso" En Argentina, Chile y México

Si bien diversas encuestas en países como Chile, Argentina o México han identificado un aumento de las personas sin identificación religiosa, el universo de creencias y prácticas religiosas y espirituales reportadas continúa siendo significativo, aunque con notables recomposiciones. En la actualidad, la velocidad de las transformaciones socioculturales en toda América Latina, incluyendo varias controversias en torno a la injerencia pública de la Iglesia Católica y algunas iglesias pentecostales, exige repensar las limitaciones de estos modelos de identificaciones nominales con una religión como enfoques comprensivos para dar cuenta de lo que implica "ser religioso" y "no religioso" en la región. Por eso, resulta indispensable transitar de la pregunta ¿Cuántos son...? a ¿Qué significa ser...? Para ello, el trabajo explora y compara cómo se presentan las identificaciones religiosas y no religiosas en encuestas de Argentina, Chile y México, a partir de una reflexión sobre las categorías de respuestas disponibles en cuestionarios, un análisis de contenido de respuestas abiertas a preguntas de identificación religiosa, y la revisión de narrativas de identificación religiosa en tres estudios por entrevistas en profundidad realizadas desde el enfoque de la *lived religion* en cada contexto. Nos interesa focalizar en los modos en que personas creyentes que pueden o no identificarse con una tradición religiosa (generalmente cristiana) en un momento dado, dan cuenta de su propia identificación recurriendo a diversas marcaciones y clarificaciones. En especial, destacan los marcadores adversativos ('pero', 'sin embargo', 'aunque', etc.) los cuales parecen indicar una postura pretendidamente autónoma, de impugnación de sentidos a las categorías de identificación religiosa tradicionales, y una distinción respecto de instituciones religiosas en general o una adscripción religiosa (previa o actual)

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

particular. Los denominamos 'creyentes adversativos'. En su conjunto, estas personas parecen estar reconfigurando y cuestionando las formas en que se configura el *continuum* religioso-no religioso en nuestras sociedades.

Analyzing Urban Activism within the Context of the Right to the City for All: An Ethnographic Research on Prince Islands, Istanbul

Istanbul has been one of the most cited cities hosting social movements and urban activism that were proliferated with the Gezi Resistance (Tuğal 2013; Zıhnıoğlu 2019) as a reaction to the increasing neoliberal urban policies/projects since the 2000s (Yalçıntan 2013; Yalçıntan et.al. 2018). Among many examples, Prince Islands, one of the most historical and touristic destinations of Istanbul, were the target of many neoliberal policies and projects that various activist groups have formed and reacted against.

As an authentic part of Istanbul, Prince Islands are a multilayer place where people from different socio-economic and cultural capitals live.Particularly from October to May, the islands are isolated from Istanbul except from those traveling for work. Thus, in recent years, the islands have become a retrieval location for intellectuals, artists, researchers etc. Inevitably those local activist groups vary from each other with respect to their locations, discourses, participants, motivations and action repertoires. Ultimately the Prince Islands has become a particular site to elaborate the characteristics of those groups and their relations among each other and with their communities. In this ethnographic study, 38 interviews were executed; written and visual materials were explored with the guidance of the grounded theory methodology.

In addition to those findings on urban activism, this research aims to elaborate another theoretical link through the "right to the city" (Lefebvre 1968; Harvey 2008). In the literature on the fairly popular concept of the right to the city, urban social movements and urban activism have come to the forefront as they have been prescriptions to get the right to all by having a word on various urban issues for more inclusiveness (Newman 2009). Therefore, we also intend to illustrate the importance of recognizing the differences in a locality by relating this theoretical strand to urban activism in the Prince Islands.

Elmina and Cape Coast (Ghana) As Points of Intersection: Entangled Histories and Relational Memories

In this paper, which is based on empirical research in Ghana, I'm interested in the entangled histories and relational memories of enslavement and other colonial migration practices. It is based on the research project "Individual and collective memories of slavery and the slave trade", funded by the German Research Foundation.

Elmina and Cape Coast, two fortresses on the coast of today's Ghana, are places where we can reconstruct different layers of involvement in the trade with enslaved people by both local and European powers. Beginning in 1482, the Portuguese, the Dutch, the British, the Swedes and the Danes were present in the Gold Coast and were involved in the trade. In some cases, local actors cooperated with the European powers, or temporarily conquered the fortresses. Other colonial migrations also started here: in the 19th century, the Dutch recruited local soldiers to fight with them in the colonial war in the Dutch East Indies (today's Indonesia).

Today, Elmina and Cape Coast are among the most-visited monuments and the most contested sites of memory for the transatlantic trade with enslaved people. Many African American visitors come to learn about and to memorialize the enslavement of their ancestors.

Thus, these two fortresses are points of intersection of entangled histories and relational memories between Africa, Europe, America, and Asia.

The paper is based on interviews conducted at these two memorial sites and discusses what different groupings in Ghana, as well as visitors, know about (pre-/colonial) processes of enslavement and (forced) migration. A special focus is placed on silenced and "forgotten" topics, and on the relations between different historical memory practices.

Dynamics of Low-Effort Responding across European Societies

Public opinion surveys can serve as barometers measuring the dynamics of prevailing attitudes in societies. Participation in surveys may be seen as especially useful in democratic societies, where the governing elites and their contenders presumably monitor the demand side of the electoral equation. However, survey estimates can be biased due to a number of potential sources

of errors. Analysts use various weighting strategies to correct for biases caused during the design and collection stage of the process (e.g., coverage or non-response errors). As opposed to mere absence of responses from particular groups, however, it is more difficult to make adjustments for low quality of responses. One source of low quality of responses is careless and insufficient (low-effort) responding, meaning lack of engagement with the questions.

We explore a proposition that one of the reasons for contemporary rates of low-effort responding in Eastern European countries could be that, after the initial surge of optimism about the nature of democracy and expectations about elite responsiveness in the early post-communist era, the surveys stopped being seen as a potentially useful novelty and, as troubles tied to transition settled in, people became disillusioned and perhaps even cynical about the value of carefully considering their answers.

In this paper, we analyse 36 waves of ISSP and four waves of EVS surveys, covering a period from 1981 to 2020. Using multiple measures of low-effort responding, we look at shares of low-effort responders across particular batteries of questions on particular topics and shares of low-effort responders across whole surveys. We then compare these over the years, controlling for a number of individual and country-level measures, and describe the patterns showing sources of differences in low-effort responding. We juxtapose the patterns of low-effort responding in the Eastern European countries compared to the Western Europe countries.

Social Inequalities in Rapidly Changing World.

The impacts of climate change will disrupt the natural, economic, and social systems on which we depend on. This disruption is impacting global food security, damage infrastructure and jobs, and harm human health etc. These impacts are unevenly distributed all around the world, but some countries are facing far greater risks than others. However, all countries, communities and companies are feeling the effects of climate change. Climate change is deeply interconnected with global patterns of inequality. The most vulnerable people bear the brunt of climate change impacts irrespective of that they are contributing the least to this crisis. As the impacts of climate change mount, millions of vulnerable people face disproportionate challenges in terms of extreme events, health effects, food security, livelihood security, water security, and cultural identity etc. Certain social groups are particularly vulnerable to such crises, for example, female-headed households, children, persons with disabilities, Indigenous Peoples and ethnic minorities, landless tenants, migrant workers, displaced persons, sexual and gender minorities, older people, and other socially marginalized groups etc. The root causes of their vulnerability lie in a combination of their geographical locations that is their financial, socio-economic, cultural, and gender status, and their access to services, decision-making, and justice. Climate change is more than an environmental crisis, it is a social crisis and compels us to address issues of inequality on many levels: between wealthy and poor countries; between rich and poor within countries; between men and women, and between generations. The Intergovernmental Panel on Climate Change (IPCC) has highlighted the need for climate solutions that conform to principles of climate justice (i.e., recognition and procedural and distributive justice) for more effective development outcomes. The present paper will throw light on such issues of both developing as well as developed countries.

A Mixed-Method Study of Intergenerational Care Planning in Ageing Families: The Roles of Economic and Social Capital

Background and Objectives: This study examines the levels, processes and person-centred profiles of intergenerational care planning among ageing families in Hong Kong, and how economic capital, and family and community social capital affect care preparedness.

Research Design and Methods: A mixed-method research design was adopted. Survey was conducted jointly with the Hong Kong Panel Study of Social Dynamics in 2020–2021. Latent profile analysis was conducted with 213 pairs of ageing parents and adult children to identify person-centred patterns of future care preparation. Data from 140 pairs were analysed with Actor-Partner Interdependence Models (APIM) to examine the impacts of economic and social capital. Individual interviews were conducted with 60 pairs to provide in-depth and contextualised interpretations of quantitative findings.

Results: The latent profile analysis yielded three care-planning profiles: filial–active intergenerational planners, dyadic thinkers, and filial–passive intergenerational avoiders. The quantitative and qualitative findings suggest that the three profiles exhibit child-centredness. The formation of said patterns was influenced by the life stage and situation of both members of a dyad. The APIM results showed that for parents, children's mental distress was negatively associated with their active care preparation. For children, their own income was related to less avoidance of care planning, but parental income

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

was associated with fewer preparation activities. Family social capital showed significant actor effects that children's affectual closeness with parents was positively correlated with their active care preparation, whereas parents who perceived more intergenerational conflict had greater avoidance and involved less in active care preparation. Individuals' physical health moderated the actor effects of family social capital on intergenerational care planning. Furthermore, children's community social capital was positively associated with parents' active care preparation.

Discussion and Implications: This study contributes to the in-depth understanding of care planning experiences among ageing families with diverse resource levels under different family and community circumstances.

Intergenerationally Tied Relocation and Care Circulation in Ageing Families

Objective: This study examines the decision-making processes of intergenerationally tied relocation involving older parents and adult children.

Background: Previous studies on tied migration have mostly focused on couple-based moves within a human capital framework, lacking an intergenerational application. Focusing on ageing immigrant families, this study examines an emerging form of family migration characterised by care-related moves in which older parents, as the tied movers, join their already migrated children to provide domestic and childcare support.

Method: Through a thematic analysis of in-depth interview data of 34 Mainland Chinese respondents (mostly parent–child pairs), this study investigates older parents' initial decision to relocate and join their children in Hong Kong, and the changes during the post-relocation and post-decision planning phases.

Results: Tied relocation decisions vary through the relocation stages, mirroring concerns dependent upon older parents' role transition—from caregiver to care recipient. While the initial decision to relocate is predominantly about benefiting the adult children, there are different considerations for future prospect of tied relocation, due to the challenges of living in Hong Kong and related optimal eldercare arrangements that benefit both generations.

Conclusion: The findings show that intergenerationally tied relocation bearing the salient feature of cross-border caregiving broadens the conceptualisation of family migration. This is done by integrating a focus on floating older adults in application of tied relocation.

How Young People Frame Alternative Futures: The Power of Social Interactions and Context in European Secondary School Settings

This paper questions the way young people frame their future and the role of the social and cultural context in the development of the *capacity to aspire* (Appadurai, 2004), especially among young people from disadvantaged backgrounds in Europe. Our neoliberal societies widely expect young people to have a plan for their own future (Boltanski & Chiapello, 1999). However, for some adolescents, thinking about the future is a daunting task, as observed in North-Western Europe countless times. How and when do aspirations emerge? Looking at the role of society in the development of the capacity to aspire, I argue that not only the social, economic and cultural background matters but also the micro-social processes in which individuals are embedded, namely how individual life trajectories and the accumulated experience of social interactions become resources to explore the future in a productive way.

Building on some earlier work on the micro-sociological processes through which the *capacity to aspire* unfolds (Baillergeau e.a., 2015; Baillergeau & Duyvendak, 2019) and a discussion of the concept of *emergent aspirations* (Zipin e.a., 2015), this paper examines alternative future framing through the topic of post-secondary study choice, the guidance available to secondary-school students (at school level) and its potential to support - or hinder - disadvantaged students in thinking 'a life that they have reason to value' (Sen). This discussion is grounded in a 'thick description' (Geertz) of the Dutch case against the backdrop of a literature review of the French and Finnish cases.

Participatory Health Promotion: An Advanced Form of Democratized Prevention?

This paper approaches the democratization of prevention from the angle of the knowledge involved in participatory health promotion practices. Building on youth-led participatory action research literature and governmentality theory (Foucault, 1980; Wynne, 1996; O'Malley, 2008), we discuss the findings of the EU-funded CO-CREATE project (2018-2023), where 15 groups of 16-18 year-olds were to devise policy ideas towards childhood obesity prevention and to test them in the local context in five European countries (Netherlands, Norway, Poland, Portugal, United Kingdom). Inspired by the Youth-led Participatory Action Research methodology (Ozer & Piatt, 2017), CO-CREATE built on the assumption that childhood obesity is a systems issue for which solutions were to be found along a systems approach. Additionally, young people were to explore their own experience and environments for research purposes and identification of context-related opportunities and obstacles.

Based on qualitative content analysis of ethnographic data and follow-up interviews, we point to situations in which experiential knowledge was involved in the making of policy ideas and analyze how the various forms of knowledge got along with one another along the process, with a special focus on the political aspects of health risk and harm. Based on our findings, we suggest that advanced democratization of participatory health promotion entails a critical assessment of the knowledge at work in the way a health problem is framed and being prepared to take the steps to negotiate the outputs of such an assessment towards an inclusive collaboration of knowledge of health issues. From this analysis we derive a framework to analyze advanced forms of democratization in prevention.

BURKHANOVA, Flyura (THE FEDERAL CENTER OF THEORETICAL AND APPLIED SOCIOLOGY OF THE RUSSIAN ACADEMY OF SCIENCES, Russian Federation)

The Impact of Employment Factors on the Perception of Work-Life Balance Among Employees

The authors analyze some of the results of the population survey conducted in one of the Russian Regions (the Republic of Bashkortostan) in October-November 2020 as part of the research project "Quality of employment and human development". The subject of the analysis is the influence of labor factors on the perception of work and personal life as balanced or unbalanced among employees. The main object of the paper is to test the hypothesis that low quality of employment contributes to the formation of a sense of imbalance and dissatisfaction with work and life in general.

The results showed that the hypothesis was generally confirmed. A number of features of employment that characterize it as of low quality increase the proportion of people who feel an imbalance of work and personal life. Negative perception of work activity also contribute to an increase in the level of imbalance between work and the rest of life: dissatisfaction with working conditions, safety, psychological climate, technical equipment, sanitary and hygienic conditions; a sense of injustice, insecurity and difficulty to defend one's rights; non-compliance with the terms of the employment contract by the employer.

One of the results of the study is the conclusion that the feeling of balance or imbalance is associated with subjective assessments of work and personal life: they are more negative in the group that have no balanced work and life and more positive in the other group. In gender groups, the feeling of imbalance can be associated with different spheres: men with high workloads, women with high "family employment"

Thinking Urban Labor and Social Mobility Beyond the Precarity Discourse: A View from the Construction Sector in Douala, Cameroon

Since their emergence in the early 1970s, the notions of informal sector and informal economy have long been used to characterise African urban economies in terms of uncertainty and precariousness. Within informal economies, urban workers are generally represented as precarious, operating on the margins of international capitalism, and lacking various forms of security and representation. Such a conception of African urban work and workers has underpinned the developmentalist approach of the International Labour Office, which has consistently developed programmes to assist 'informal workers'.

Social science research has to some extent sustained this 'Afro-pessimistic' view of the continent's urban workers. In these contexts, a certain opposition has been created between workers and entrepreneurs. The former are plagued by uncertainty and the latter by accumulation in contexts marked by a crisis of wage labour as the dominant form of work. Urban construction workers, many of whom work in what has been called the informal construction system (Wells, 2001), have served well as an illustration of such theoretical developments. The present paper aims to break with the precarious approaches to urban workers, as well as the binary oppositions between uncertainty and accumulation that have dominated the view of African urban economies. Using the specific case of construction workers in Douala, the aim is to understand how urban workers, by facing different constraints, construct their social and economic trajectories day after day. These trajectories provide information on the dynamics of social mobility, which are themselves based on a set of factors or capital specific to the construction sector. It is therefore a question of understanding the aspirations of urban workers, as well as the way in which they deploy various resources, in order to seize the opportunities offered by the sector, while projecting themselves into the future.

Resonant Voices: Building Solidarities with Youth People through Creative Activist Knowledges

Against the current context of rapid change and the crisis of ongoing climate events in Australia, the COVID 19 pandemic, war in Europe and a shifting social and political landscape in Australia, it is important to create spaces, stories and knowledges that can support the psychosocial recovery of young people and their communities. Young people, like many, are at a point of fatigue and frustration, but also are looking for places to connect, build community and make sense of the complex world around them. However, young people are not often as readily believed, heard or taken seriously, facing challenges in their capacities as knowers and as creators of knowledge.

In response to these challenges and calls from young people, we created Resonant Voices, a project in which we sought to act together to 'slow down,' build connections and community and to translate and generate knowledges for and by young people using transmedia storytelling. Bringing in themes, quotes and other fragments from our research with young people during pandemic, the Resonant Voices experimental participatory research arts collective involved ten young people in Melbourne working together across several months. In this approach to knowledge translation and creation, a linear and literal model of taking previous research findings and making them simpler and shorter was not the goal. Rather, the focus was on aesthetic interpretation or 'aesthetic shaping' in which different threads, ideas and issues are reflected and resonate in new artistic representations. At the very centre of this project working alongside young people for epistemic and other forms of justice was the importance of building solidarities across diverse identities and experiences in times of extreme uncertainty. We discuss, show and reflect on the role of creative knowledge making in building local social movements with young people.

BAKER, Claire* (University of New England, Australia)

The Pendulum Swings? Crisis and the Role of the State in Australia

In recent years Australia has undergone a radical renegotiation of the role of the state in the face of significant crises. Following decades of neoliberal economic policy and the retreat of the state from social spending, rolling national and regional crises have heightened public demand for government action. Beginning with an unprecedented bushfire season in 2019-2020, state architecture and spending on crisis response began to shift. Followed quickly by the COVID-19 pandemic, the Australian public looked to government for financial support, irrespective of political background. This period marked the beginning of a sharp upward trend in government spending on crisis response as a percentage of GDP, and a rapid renegotiation of public expectations of the state to act as social safeguard for those facing catastrophic events. Dominant discourses regarding the need for state frugality disappeared in the wake of crisis and the shift in spending was even more notable for the fact that at a national level it occurred under a right-wing Liberal government. The renewed public expectation for the protective role of the state sets the scene for the focus of this paper, the New South Wales State government's response to crisis, including recent catastrophic flooding. The analysis outlines this response in terms of changes to the organisation of state supports to regional areas, and the particular shifts in spending that underpin this. Using a Polanyian theoretical frame, this paper examines crisis as a possible harbinger of the swing away from markets and back toward state regulation and support when marketized societies fail to protect vulnerable communities or take action to prevent continued crisis in the face of climate emergency. As the state expands in periods of crisis recovery, do reconstruction efforts represent a return to the state?

BAKER, Tom* (University of Auckland, New Zealand)

Intermediating Impoverishment: Consultants and the Emergence of Social Finance Markets

The last decade has seen the rapid expansion of social finance. Claiming to embody the 'invisible heart of markets', social finance is commonly framed as a way to supplement or supersede public assistance, bringing to public problem-solving the efficiency and effectiveness thought inherent to markets. In an era when governments have limited their capacity to address structural impoverishment and instead valorise behaviourally oriented forms of multi-sectoral and non-governmental action, circuits of social finance are increasingly being channeled, through market mechanisms, towards assisting and reforming the poor. As with all markets, not least ones in their infancy, social finance markets have required diligent promotion and ongoing institutional support. This presentation examines the role of private consultancies as a crucial organisational actor in this process. Spanning large conglomerates and a ballooning range of specialist consultants, it discusses how consultants create, maintain and expand markets for social finance. While the pre-figurative or performative work of promoting social finance is one way, the presentation focuses on a more prosaic but no less important role: intermediation. Through their intermediary function—whereby investors, public agencies and non-profits are brought together by a consultant to propose, negotiate and execute social finance transactions—consultants have gained a powerful role in identifying, diagnosing and addressing impoverishment. Drawing on an international study of Social Impact Bond implementation, the presentation shows how consultants are not simply intermediating social finance transactions, but the condition of impoverishment itself.

BAKER, Zoe* (University of York, United Kingdom)

Structure, Agency and Risk: How Does a Background of Care Affect Graduate Transitions?

Care-experienced students (those who have spent time in the care system often due to childhood neglect or maltreatment) overcome profound challenges to access and progress through higher education (HE). Such challenges include educational disruption (Sebba et al., 2015), and mental health issues arising from childhood trauma (Harrison et al., 2021). Cumulatively, these explain why care-experienced students are one of the most under-represented groups in UK HE (Ellis and Johnston, 2019; Harrison, 2017). Yet, for those who successfully access and complete their HE studies, we know little about their onward trajectories as graduates. Recent quantitative evidence of care-experienced graduate destinations presents a complex pattern; they are less likely to be employed (Harrison et al., 2021), though are more likely to move directly into postgraduate study (Baker et al., 2021). Dominant theories in the sociology of education would predict a continuation of disadvantage, which only partially exists here. To provide reasons underpinning this complexity, the presentation reports on empirical and conceptual findings from the first phase of a British Academy funded study which qualitatively and longitudinally explores care-experienced students' transitions from HE to graduate life in England and Scotland. The study accomplishes this through employing Margaret Archer's (2003, 2012) notion of reflexivity to conceptually identify what roles structural enablements and constraints, as well as individual agency, play in these transitions. This is coupled with a life course perspective (Giele and Elder, 1998) to understand how individual care histories in childhood shape constellations of structural enablements and constraints upon graduation. In reporting on these findings, the presentation will provide insights into how inequalities are reproduced (or not) for care-experienced graduates to understand whether HE helps to transcend early life disadvantages.

BAKER, Zoe* (University of York, United Kingdom)

'I Do Feel like Employers Do Look at You Differently': Inequalities in Access to Professional Employment for Care-Experienced Graduates

Labour market outcomes for care-experienced people (those who have spent time in state care as children) have consistently been found to be lower than the general population (Cassarino-Perez et al., 2018; Okpych and Courtney, 2014). One of the main reasons for these inequalities have been identified as being due to the care-experienced population having fewer, and/or lower qualifications (Sebba et al., 2015). This is often a result of the disruptive impact of the care system on schooling (Jackson and Ajayi, 2007) and the legacy of childhood trauma (Harrison, 2017). Yet, relatively recent quantitative data has found inequalities in labour market entry to persist even amongst degree qualification holders in the UK, with care-experienced university graduates being less likely to have entered professional employment compared to their non care-experienced peers six months after graduation (Harrison et al., 2021). Until now, there have been no *qualitative* insights into the transitions out of higher education and into employment for care-experienced graduates; this is needed to better understand the reasons and influences underpinning these inequalities. The British Academy-funded 'Care-Experienced Graduates

Project' which commenced in 2021 seeks to contribute to this knowledge gap by qualitatively and longitudinally exploring care-experienced students' transitions into graduate life in England and Scotland. The presentation will report on findings from the first phase of this project to provide understandings of the structural constraints experienced by care-experienced graduates in accessing and maintaining professional employment. Through identifying these constraints, the presentation will also importantly propose what structural enablements can be implemented by policy makers, higher education institutions, and employers to help care-experienced graduates negotiate and bypass structural constraints when accessing and maintaining professional employment.

Experiencing Stigma and Discrimination: A Study of Women Drug Abusers of Punjab

Experiencing Stigma and Discrimination: a study of Women Drug Abusers of Punjab
Drug abuse is a global phenomenon that affects almost every country in the world, but its characteristics and extent differ from region to region. India too is caught in this vicious circle, where the number of drug addicts is increasing day by day. In the Punjab state of India, this problem is seen in its worst form which is a matter of serious concern. It is bringing family disorder and violence, crime, lost productivity, the transmission of infectious diseases, excessive utilization of health care, etc.

Punjab's drug abuse problem is a half-told story as it's been about the men only. The spread of the problem to women has never been focused upon. With the de-addiction centers around the state reporting an increasing incidence of drug abuse by women, it is slowly revealing its contours. Just like the other problems affecting women, drug addiction among women is also layered over with stigma and denial. Because of their needs for privacy and a special environment, women drug addicts are more marginalized from society than men and suffer greatly. They are particularly vulnerable on the route of drug dependence. They are hard to reach population as evidenced by their under representation both in traditional drug surveys and in treatment facilities.

The present paper is an attempt to highlight the problems and challenges in the way of women drug abusers in Punjab with a special reference to the treatment facilities available to them. Some of the case studies would also be brought from the field to justify the present study.
Keywords: Drug addiction, Stigma, Denial, Recovery

BALAGOPALAN, Sarada* (Dept of Childhood Studies, Rutgers University, Camden, USA)

Opening Session of RC53 Sociology of Childhood"They Will Adjust": Relationalities and Entrepreneurial Self-Making in Young Women's School-to-Work Transitions in Mumbai, India

My paper explores young women's gendered navigation of post-school futures. Based on ethnographic research in Mumbai, it discusses the role that kin and care relationalities play in these women's efforts to sustain wage-work. Not only do these young women depend on vernacular and gendered repertoires of kin reciprocity to pursue their post-school ambitions, but skilling programs and the organized retail sector themselves, paradoxically, rely on these relationalities to craft neoliberal subjectivities. Structured around three different sites of a skilling program, their households and department store workspaces, the paper argues for rethinking entrepreneurial personhood in terms of the critical, and paradoxical, role played by these relations. Some of the questions it attempts to answer include: To what extent does a framing of affective labor as directly productive of all social reality hold true in capitalist contexts marked by urban survival in the majority world? How does this interplay between familial relationalities and forms of affective labor deconstruct the assumed segregation between spaces of production and social reproduction?

Sri Lanka's Road to Aragalaya: An Assessment

Sri Lanka's Road to *Aragalaya*: An Assessment
In early 2022, Sri Lanka's worst economic, social and political crisis triggered a nationwide wave of tumultuous public protests, known collectively as *Aragalaya*. The continuous public demonstrations placed responsibility for the crisis squarely at the feet of Gotabaya Rajapaksha's government and compelled the entire cabinet to resign immediately. Subsequently, unrelenting expressions of the peoples' frustration, desperation and anger led then-President Gotabaya Rajapaksha to resign and Ranil Wickremasinge was appointed as the ninth Executive President of Sri Lanka. His governance has been arbitrary and ad-hoc, as widespread repression and violence were employed to control political dissent by the protesters. This paper seeks to

identify factors and events that triggered this mass rejection of the Gotabaya Rajapaksha government in early 2022, and to assess a range of plausible future scenarios. The analysis indicates that *Aragalaya* appears to have collapsed, not solely due to Wickremesinghe's deployment of presidential powers to dismantle it, but also as a result of emerging ethnic and ideological fractures within the movement. If the government successfully casts the movement's leadership as 'leftist', it will more easily employ violence and intimidation – as did twice since the 1970s – to cow all other *Aragalaya* supporters into submission. And yet, while the *Aragalaya*'s lifenospan may well be short, this outcome is far from certain. The *Aragalaya* has been weakened but is not powerless, and the leftists' leadership has generated a least chance for the emergence of another mass anti-government uprising against the government in the foreseeable future.

Breaking Authoritarianism:Sdgs Made People Friendly through Localising SDG

There is pressing need and urgency for localising SDG This can be done with the involvement of local government. As they are closer to the people community participation can be ensured in plannig. Under the overall frame work of 17 SDGs, the local govt can adopt thematic approach. The identified thems are 1poverty free and enhanced livelyhood, 2, Healthy village, 3, Child friendly village4 water sufficient village, 5, clean and green village 6, self sufficient infrastructure villege, 7, socially secured village, 8 good governance 9, Engendered developed village. The goals are taken through themes, targets and indicators are aspirational in nature, relevant and placing the global goals that are universally applicable., in line with national policies and priorities as well as taking in to account local realities in a concise and easy communicable manner..SDGs are to be taken through themes.. Thems cross-cut SDGs and action on Theme has impact on different SDGs. The targets are measured by indicators These indicators are to form the local indicative frame work. The local governments in India has started plan preparation through thematic approach breaking the notion of top down approach and adoting the line of bottam up approach. People from all walks of life has a say in this people' plan. Thevplan is demand driven. It breaks the authoritarian cocept of bureaucratic planning. Many of the SDG targets can be attained throgh the people's plan.

Walls Saying No to War: Exploring the Language of Anti-War Street Art in Poland and Germany

The largest refugee crisis in Europe since WWII began in late February 2022 after Russia's military invasion of Ukraine. Around 7.5 million refugees fled their homes in search of safety and refuge, with a majority heading through (neighboring) countries like Poland, Romania or Germany. While Germany possesses more or less developed and effective integration policies and the experience of multiculturalism, Poland almost overnight turned from a transit country to a society bearing the main burden of helping refugees from Ukraine.

Against this backdrop, one of the issues often appearing in the public discourse is the role of art and culture in relation to the political and humanitarian crisis. Many cultural institutions, publishers or streaming platforms boycotted Russian culture. At the same time, creative artists contributed to the political discourse and supported Ukraine by condemning the invasion. As an example, street art with slogans "Glory to Ukraine" or "PutOUT" has become one of the most visible and widely discussed forms of political expression in public space.

The presented paper at the intersection of visual culture, sociology of migration and affect studies takes its cue from theories on politics of aesthetics (Rancière), public forum (Kalven) and emotions as cultural practices (Scheer). It is an attempt to analyze the anti-war discourse and the emotionalization of language at the nexus of street art, politics and social activism. The sample grows out of field work in 2022 and 2023 and includes cities in Poland (Warsaw, Gdańsk) and Germany (Berlin, Munich) as well as selected forms of street art: murals, posters and stickers. The study is based on a methodological triangulation of visual discourse analysis, participant online observations, and qualitative data analysis of press articles (national and local titles), websites and social networks dealing with the subject of street art related to war in Ukraine.

Digital Kinning and Digital Homing: The Role of Digital Care Labour

This presentation examines what we can learn from migrant and transnational families about the potential role of new technologies in aged care to improve social support and wellbeing. Drawing on the methodological and conceptual frameworks developed in the ARC project: *Ageing and New Media*, Raelene Wilding and I explore the role of distant and virtual support networks

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

in aging in place, including during pandemic lockdowns. We examine the way today's polymedia environments have created the conditions for synchronous, continuous, multisensory co-presence across distance that challenge the normative and ontological privileging of proximity in care and kinship relationships. Such conditions require us to consider the importance of human relations to the material world, in particular of forms of digital care labour. We propose the notions of 'digital kinning' and 'digital homeing' as ways to theorise the resultant human-technology interactions, and to explore how the rapidly changing polymedia environment is transforming how we communicate, imagine ourselves, and organise our everyday lives, including across distance. For older people in particular, these digital kinning practices often require facilitation by others, emphasising their social relational, intergenerational and performative character. It is in the creative and diverse practices at the intersections of mobilities and materialities that we see how technologies can transform the experience of caring, in and across place

RC11-174.3

BALDASSAR, Loretta* (Edith Cowan University (ECU), Australia)

Virtual Visits Home: Belonging and Home-Making in and across Place in Residential Care

There is a growing literature on the important role of visits home in the transnational migration process. Curiously little, however, has been written about the role of visits home for older migrants. This may be explained by the fact that, over time, older migrants often lose the capacity to travel due to health and mobility limitations. This is particularly the case for older Italian migrants in Australia for whom the long-haul flight to Italy is especially physically taxing – a journey that lasts on average 24 hours. However, new technologies like geographic and earth browsers, which accesses satellite and aerial imagery over the internet to represent the earth as a three-dimensional globe on the viewing screen, provide an opportunity for people to participate in 'virtual visits home'. In this paper, we build on our previous research on migrant visits to examine the role of virtual visits among a group of Italian residents in a residential care facility in Australia. Methods employed included ethnographic interviews and participant observation in virtual visits sessions. Findings indicate that virtual visits provide a means of recovering memories of past homes, enabling a 'stitching together' of past and present selves, as well as increasing social engagement and interaction. In addition, the ability to make virtual visits to places elsewhere can make the residential care home a more vibrant and interesting place to 'leave and return to', one of the features of homeliness that ensures that 'home' is not a 'trap', but rather a safety net.

BALLANTYNE, Glenda* (Swinburne University, Australia)

The Impact of Covid-19 Related Racism on Asian Australians' Feelings of Belonging

Research has shown the Covid-19 pandemic impacted disproportionately on racial and cultural minorities. People of Asian background in particular have experienced a rise in hate crimes and pandemic-related hostility, higher levels of anxiety and mental health issues and worse economic outcomes. There has also been growing evidence that these stresses have undermined the sense of 'belonging' of some of those targeted, with ramifications for equitable inclusion and social cohesion in diverse societies. This paper uses quantitative and qualitative data from an online survey of 436 Asian Australian collected from the Australian state of Victoria in 2021 to understand the impact of experiences of discrimination and racism on respondents' sense of belonging within the Australian community. The study's main findings are, first, that the pandemic has had a significant impact on sense of belonging among this cohort, with almost 50% of participants reporting feeling that experiences of racism contributed to a more negative sense of belonging to the broader community; second, that even those who reported a positive sense of belonging held increased fears and concerns for the future; and third, that negative sentiments were associated with length of time in Australia, with second generation Asian Australians and those who arrived before 2000 holding more positive views than those who arrived in the last two decades.

Cross-Funding for Production Structure By Abundance Perspective. a Tool for Organizations

Inequalities in the accessibility for financing production structures in productive unities of any size and type, is the starting point of the proposal.

Inspired by the algorithmic bias by Alice Rübsaan and its consequent repositioning of decisions makers, a model of cross-funding is respecified to the parts implied to lease or rent productive unities, by the abundance perspective by Peter Diamandis.

The business model dematerializes, demonetizes, and democratizes a percentage of rental income, converted to the reference unit selected by the type of production. That is retained by the tenant for applying it to the

maintenance of the productive infrastructure. The reference units are specified according to the market value of the weight units of products (grains, fruits, vegetables, spices, steer meat, fish, milk, and so on).

As efficient financing for productive unities, the business model is aligned with the purposes by the United Nations Organization for Food and Agriculture, and Melinda and Bill Gates Foundation, reducing poverty, feeding, increasing quality of life, and producing energy in sustainable terms, decreasing risks in farms.

Additionally, as the business model can scale globally through digital communities and strategic technologies as satellite service, a tool for designing complex organizations is proposed for its complete and consistent codification. Basically, a symbolic system of representation and a logic-semantic organization.

Evolution of Causality from Aristotle to Einstein. a Cognitive Tool for Everything

Since the Greeks, cause means "action", implying a sense of "consequence" in a time dependent and/or independent from space.

Aristotle distinguishes four genders of causes: material: those from which a thing is made or exists; formal: the phenomenic expression of the structure of what is studied; final: the end of the thing, its purpose; efficient: the agent that affects or has effects on something.

Under the explosion of the Arts and Sciences in the Renaissance, only the efficient cause satisfied the condition of experimentation of Modern Science. During four centuries, efficient causality, recalled as a necessary and sufficient condition, has been the tool for the advancement of modern science.

Until the uncertainty principle in quantum physics revealed the insufficiency of modern causality for the advancement of science.

Einstein accepted the challenge and established the conditions for an useful new causality for quantum phenomena. These conditions are: - the metaphysical concept of causality is not sufficient; - the concept of causality should be extended and refined; - should conform to the notion of experimentation in modern science; - it would be formulated as a strict law; and it would be useful to understand the complex phenomena of quantum physics.

At the end of the last century a new causality was formulated according to these conditions. It was formulated as a causal law, a cognitive tool for everything, in science and technology, applied to understand complex phenomena in quantum physics, including the quantum entanglement.

Poor Mental Health As a Correlate of Perceived Unmet Needs of Earthquake Survivors in Evacuation Camps: Posttraumatic Stress and Growth As Parallel Mediators

The survivors of the Cotabato 2019 earthquakes experienced compounded traumatic events: the series of severe earthquakes, the sudden and permanent evacuation from their residences declared as unsafe and uninhabitable, and the indefinite and protracted stay in evacuation camps where material and safety provisions are dire. The present study examines the impact of the earthquake survivor-evacuees' perceived unmet needs on mental health through the parallel mediations of posttraumatic stress and growth. One hundred twenty-one earthquake survivors who continue to live in evacuation camps in Barangay Ilomavis, Kidapawan City, Cotabato nearly two years after the disaster participated in the survey interviews. With the impact of COVID-19 accounted for as a covariate, the results of the present study show that (a) perceived unmet needs have a negative effect on mental health, (b) perceived unmet needs predict posttraumatic stress that in turn predicts poor mental health, and (c) while perceived unmet needs do not predict posttraumatic growth, posttraumatic growth predicts good mental health. While the impact of COVID-19 on the survivor-evacuees' living conditions is positively related to both posttraumatic stress and growth, it does not directly predict compromised mental health. Findings suggest that both posttraumatic stress and growth in the face of adversity provide pathways to mental health in the face of material want. Findings have a strong implication for integrated post-disaster programs that address both basic living needs and mental health problems. Thus, existing models of post-disaster programs that address survivors' needs should incorporate a comprehensive and continuing assessment of and intervention for mental health problems. Findings also have a strong implication for more research on growth and other positive outcomes in the midst of overlapping traumatic experiences. Furthermore, studies examining the internal processes known to foster posttraumatic growth and the mechanisms by which posttraumatic stress and growth co-exist are suggested.

BALZEKIENE, Aiste* (Kaunas University of Technology, Lithuania)

Spatial Analysis of Risk Perception: Methodological Challenges and Analytical Strategies

Space dimension in sociological understanding of risk perception is promising yet underdeveloped field with multiple research questions to explore. Survey research using spatial data is facing numerous methodological problems related to the sampling strategies, ethical considerations, valid analytical techniques and else.

This presentation will present empirical research on spatial distribution of public risk perceptions and spatial vulnerabilities, focusing on methodological questions and solutions.

Questions to be discussed: What is the spatial distribution of risk perception of different types of risks? How (and if) risk perceptions are related to exposures of multiple risk in the living areas of respondents? What is the social structure of population in the areas with high cumulative risk exposure?

Analysis is based on: (1) representative public opinion survey, conducted in with 2007 respondents (with geolocations coded), and sample included respondents from all 60 municipalities in Lithuania.; (2) spatial data for 30 risk indicators, representing five risk dimensions: social, economic, environmental, technological and geopolitical; (3) data from population census from 2019-2020, including income structure.

To analyze the spatial distribution of high and low risk perception, Hot Spot Analysis (Getis-Ord Gi*) is used, which identifies spatial clusters of high and low values of the variable based on z-scores and p-values. For comparing risk perception with risk indicators, spatial linear regression was used, which shows whether these variables are spatially statistically significantly related.

Results reveal the differences in spatial risk perceptions for various types of risks. Spatial structure of risks reveals the highest exposures of multiple risks in biggest cities. Elsewhere, the patterns of social vulnerabilities are revealed, showing that in the areas with higher risk exposure, the average incomes are lower.

This research contributes to the methodological advancement of spatial analysis of risk perception and vulnerabilities.

Death to Realism! Toward a Social Psychology of Palestinian Resistance

The Israeli-Palestinian conflict will go on, because there is reason for it to go on. Like other settler colonial histories, this conflict has always had a zero-sum logic as its central character, with the replacement or control of an indigenous population being key to the colonial project. The Israeli approach to managing the conflict for the foreseeable future involve ignoring the Palestinians; fostering relations and alliances with Arab countries; turning the terms of debate away from political or civil rights and into economic opportunities; and proceeding with the settlement policy, building up to what appears to be an inevitable annexation of most of the West Bank and the fragmentation of Palestinian territories. While the Palestinian strategy seems by contrast to be unfocused, splintered, and weak, a long range view of the social history of Palestinian resistance show us patterns of dynamism that correspond to every previous experience of closed possibilities. This presentation explores different dynamics of emergence of resistance, leading up to the present, and places them in the larger context of popular movements throughout the region.

BANDELLI, Daniela* (LUMSA, Italy)

For a Sociology of Placenta, a Neglected Form of Woman and Child's Biocapital

Placenta, and its cord, is a temporary organ that represents communication between mother and child. It is generally thought as 'hospital waste' and it is little known by pregnant women in societies where childbirth is a medicalized event. However, along with the development of regenerative medicine, around this organ several competing interests have revolved. For example, to maximize the efficacy of biobanking, the cord needs to be clumped in the first minute after birth, and the child is deprived of part of natural transfusion from the mother. In home-birth mothers are given the option to keep the placenta connected for days (lotus birth), to have it processed into naturopathic capsules, and to eat it (placentophagy) to cope with post-natal depression. Also, placenta canvas and burial are becoming popular trends.

As a whole bench of literature has been developed on the economic exploitation of women's body parts (breastmilk, eggs, gestational capacity and hair), this organ has gathered so far little interest in sociological scholarship on female biocapital. Anthropology contributes especially to the knowledge on placenta rituals; a few recent studies in sociology of science point at how medical discourse influences social perception of this organ as disposable; sociology of heath and STS reflect on individualistic /solidarity paradigms of biobanking. Yet, placenta is far from conquering a space in sociology of the body, little is said by scholarship on women's consent in reproduction, and meanings advocated in alternative childbirth communities are under-investigated.

I will make a case for the need to develop a sociology of placenta by drawing from a review of the few existing studies and by acknowledging contemporary social practices involving this organ. Is the notion of biocapital applicable to organs that are not traded or processed through medical technology but are simply self-consumed?

Digital Media Advocacy and Neoliberal Subjects-in-Waiting: A Critique

The increased marketization of the humanitarian field has instituted a neoliberal 'practice of humanity,' with complex ecologies of rights-based media interventions from the global North that are contiguous with older hierarchical politics of recognition and representation. Even though the newness of the 'digital' as a tool and space for humanitarian media advocacy has somewhat diminished, its subjects continue to be largely constituted as pre-technological, vulnerable subjects-in-waiting. Noticeably, some corporate digital humanitarian media projects, focused on the girl child and women in the global South, enable a digitally enhanced economy of looking.

This paper examines this economy located at the intersections of capitalism, feminism and technology as an instance of a market-defined humanitarian digital discourse. Taking as a case study the Nike corporation funded Girl Effect project, which claims to "build youth brands and mobile platforms to empower girls to change their lives," this paper critiques its promise of a transparent and direct channel of communication (through social media) between the subjects-in-waiting and also, equally importantly, a humanitarian public-in-waiting. Doing so, I argue, forces a reexamination of the claims of aesthetic and ideological purity of these digital discursive assemblages.

Migration and Religious Diversity in Australia

Australia has always been a culturally and religiously diverse society, beginning with its First Nations and subsequent waves of migration. This paper presents findings of the migration stream of the ARC funded Religious Diversity in Australia project. It begins with a brief history of migration to and religious diversity in Australia, and then examines ongoing issues of racism and belonging. It focuses on an analysis of interviews with community leaders of five culturally and religiously diverse migrant groups in Melbourne and Hobart, namely Chinese, Indian, Russian, African and Afghan communities. It reveals that culturally and religiously diverse minorities face significant barriers to belonging in Australia, given negative stereotypes about them, geopolitical tensions, and the prevalence of the myth of a white, Christian nation. It also stresses ways in which these communities are leading responses to address racism and religious discrimination, and to recognise the multicultural and multifaith reality of Australia.

Policing in Diverse Australia: Community Engagement and Respect in Tasmania and Victoria

This presentation focuses on findings from the Policing stream of the ARC Religious Diversity in Australia Discovery Project. Through concepts such as 'reactive' and 'proactive' policing, community policing, diversity, and reassurance, this presentation explores how police officers and staff from both Tasmania Police and Victoria Police approach and understand their engagement with religiously and ethnically diverse communities. As Tasmania and Victoria present two highly distinct contexts of religious and ethnic diversity, our findings explore the similarities and differences shaping policing practice in neighbouring states. Findings highlight attempts to build trust in police amongst religious minority groups, with these strategies informed and challenged by various political and cultural shifts. We draw on stories of interaction between officers and community members to illustrate complexities of contemporary policing practice, contributing a nuanced view of respectful engagement in diverse Australia.

Virtual Exchange in the Teaching of Social Justice and Sociology during the Pandemic: Initial Analysis of a Joint Australia-Korea Teaching Project

While online cross-cultural exchange, or virtual exchange (VE), is not an entirely new phenomenon, its use at the tertiary level has grown since the start of COVID-19, as universities continue to enact programs that are intended to marshall skills that support multiculturalism and globalization. Critiques of such efforts – and the neoliberal values that drive them – are as common as the programs themselves. Still, we assert, VE is, and will continue to be, an enduring feature of the tertiary landscape, especially when mobility is restricted. Subjects in the social sciences – particularly those centered around sociology and social justice – are ripe for effective VE, if design and implementation are done well. Yet there has been little analysis as to how design and implementation have impacted student learning in the pandemic context. This paper offers an overview of the initial stages of a multi-year VE teaching social justice project carried out jointly by the University of Sydney in Australia and Kyungpook National University in South Korea. It begins by drawing out the principles of the project, based on two related fields of tertiary learning: international exchange and online learning, noting and evaluating both approaches and critiques. It then describes the teaching project and our methods for evaluating it. An initial assessment of the first year of the project allows an analysis of institutional and pedagogical barriers that are often overlooked in the design of such projects. We conclude by offering our thoughts on the next steps of our own project, as well as suggesting a way forward in thinking about VE in the (post) pandemic context.

Muslim Women Law in Islam

Dr. Hasan Bano, Assistant Professor, Department of Sociology, DAV PG College, (BHU) Varanasi Email: drhasansocio@gmail.com 8299263519

It is generally maintained that Islam and modernity are incompatible and contradictory to each other. Also, it is thought that Islamic teaching are incapable of adjusting to modernity. This is a stereotypical way of thinking. It should be borne in mind that any religion, including Islam can be understood at many levels. How one understands religion depends on the perspective of the interpreter, rather that on the religion itself. Be it Hinduism or Islam, in India, these religions were interpreted differently by their orthodox and modern followers.

In Indian society, the position of Muslim women has been continuously changing in the course of time. The status of women in India underwent many changes with the advent of Muslim invaders. Her goldfield position deteriorated in that era. But in modern times due to growth of modern education, science, technology, mass communication and an over all awakening call by social media, a considerable number of educated women have become the center of a variety of career specially in education, industries, banking services, private enterprises and some have even taken up adventurous careers such as engineering, medical practice, civil services and even politics.This has widened their social network of interaction ranging from home to the society at large

The highly educated women have developed rational attitude & express modernity in their behaviour. They believe that their own efforts & commitment can change their plight & position.

Investigating Outcomes of Internet Use Among Older Adults in India

The focus of digital divide research and policy is found primarily on Internet and computer access. Recently, the digital divide research has shifted to the outcome-based research. This study examines multiple facets of how older people incorporate the Internet into their daily life routine and in what ways Internet can help them achieve tangible outcomes in their offline lives. Using Helsper's (2015) classification for Internet outcomes of corresponding fields, we determine how elderly populations benefits from being online. The mixed methods strategy that includes in-depth interviews, focus group discussions and household surveys with primary informants directed the data collection process for the study. The results reveal that older adults with greater access to the Internet—those with higher levels of education and income—benefit

more from Internet use. Mostly, factors such as performance expectancy, effort expectancy, social influence, facilitating conditions, digital literacy, technological anxiety, and reluctance to change determine the technology adoption among older adults. Frequent Internet users reported improvement in social connectedness, quality of life and well-being. This study contributes to developing an operational framework suitable for charting the disadvantages of the digital divide. By offering programmes and interventions to encourage Internet use and improve digital skills, as well as by enhancing digital accessibility and incentive systems, the government should go forward with its plan to close the outcomes gap Internet use among older adults. For policymakers, it turns the spotlight on the need to create an environment conducive to the digital inclusion of older adults, consistent with sociocultural structures and gender asymmetries.

Relation between Leisure and Social Activities (LSA) Participation and Perceived Life Satisfaction Among the Elderly: Evidences from Longitudinal Ageing Study in India, Wave-1

Introduction: Much like the global world, India is not untouched by the phenomenon of population ageing, and there exists strong theoretical and empirical evidence supporting 'quality of life' to be placed centrally for policy and planning of 'active and healthy ageing'. Whereas, subjective life satisfaction among elderly has been extensively explored from the lens of socio-economic and health-related standpoints, relatively less is examined about the elderly's involvement in LSA in relation to their subjective life satisfaction status. The present study is thus aimed to analyze the association between LSA participation and perceived life satisfaction among the elderly in India.
Methods: The study sourced data from the Longitudinal Ageing Study of India (LASI), Wave-1, which corresponds to the year 2019-20. Subjective life satisfaction was categorized into 'low, 'medium' and 'high' levels. A total of 11 leisure activities were included in present study to explore participation frequency – categorized into 'at least once a week', 'at least once a month, 'rarely or never' – and their association with life satisfaction levels. Multinomial regression analysis was used to statistically confirm the findings of the study.
Results: The percentage of elderly (60+) with 'high' life satisfaction was highest when they participated in active/physical and indoor/educational leisure activities at least weekly. Reading books/newspapers/magazines and using a computer for internet surfing are two leisure activities in the multinomial regression model that correspond with the maximum increase in relative likelihood of the elderly perceiving life satisfaction to be 'high'.
Conclusion: The findings from the present study unequivocally advocate a strong need to enhance leisure opportunities for the elderly in terms of elderly-friendly parks, open spaces, libraries, etc. Life satisfaction among the elderly must be explored from a multi-faceted approach to enable holistic outcomes as India is undergoing a rapid demographic shift.

Examining Gender Segregation and Its Impact on Maternal and Child Healthcare Services Delivery within the Community Health Workforce in the Upper West Region of Ghana.

Gender segregation in employment is a phenomenon of global significance considering its contribution to shaping gender equality, a global target for the Sustainable Development Goals. Consequently, there are gender differentials in remuneration, with women averagely earning lesser salaries per-hour than their male counterparts. Sectors such as healthcare are female-dominated although, most leadership positions in the health sector are held by men. The community health workforce is an essential part of the human resource that deliver maternal and child healthcare services in low-income countries. In Ghana, research shows a largely female community health workforce that is unable to provide required services to clients in under-served communities due to structural gender inequalities. Despite numerous studies on gender segregation, very few studies have examined the impact of gender segregation on the delivery of services in low-income settings. This doctoral study aims to fill the knowledge gap by using mixed-method research methodology to examine gender segregation and its impact on maternal and child healthcare services delivery within the community health workforce in the Upper West Region of Ghana. A sequential explanatory study is used, so that findings from the quantitative data can be explored in more depth by the qualitative methodology. Surveys, in-depth interviews and focus group discussions will be used to obtain in-depth responses from participants. The aims of the study are

to investigate the; impact of gender segregation on the delivery of maternal and child healthcare services; work-family-life balance; incidence and prevalence of sexual harassment; level of equity in access to resources and participation in leadership for males and females. The study seeks to produce relevant evidence on gender segregation to guide policy reforms and improvements in maternal and child healthcare services delivery. Thus, facilitate efforts to achieve the Sustainable Development Goals of achieving gender equality and promoting health and well-being.

Digitalization of the Interview: On the Online Methods during the Pandemic

The COVID-19 pandemic changed our habitual way of life. These changes touched digital-technologies as well: they turned from a highly specialized sphere into one of the most important means of labor and "means of production". In its turn sociology was affected as well: the pandemic formed some new theoretical as well as methodological challenges for social sciences, at the same time showed new opportunities for the development of traditional research methods.

We faced the problem of limitations in the applicability of traditional methods while a qualitative gender-study devoted to the problems of institutional forms of care for the elderly (on the example of private board and care homes). This topic, being at the intersection of the sociology of gender and the sociology of care, is one of the most acute and sensitive topics. The empirical base should have been 64 in-depth unstructured interviews with women in Moscow and the Moscow region aged 40 to 65 years.

Planned research date: December 2019-May 2020.

The pandemic itself and anti-pandemic measures put us before a choice: to stop the study or to adapt the qualitative research methodology to new conditions. So, 25 interviews were traditional, and 39 were conducted using digital technologies (in-depth unstructured interviews in Skype or Zoom, when the informant was at home at a convenient time).

The methodological goal of the study was: to analyze and compare the features, as well as the level of openness of informants during traditional and digital-interviews on a sensitive topic within the framework of gender research.

Methodological conclusions:

- in general, respondents were franker during digital-interviews;
- during digital-interviews, respondents were less likely to avoid the most acute and sensitive topics;
- a digital-interview lasted 20% longer;
- respondents noted that it was easier for them to speak out, because they were in a familiar environment at home.

Social Distance and Inclusion: Features of Integration of the Elderly

Relevance. In modern society, when the proportion of the elderly among the population is growing every year, one of the most important objects of research is the integration of the elderly and it becomes necessary to analyze the social consequences of stereotypes about the elderly.

The object of the research is an increase in social distance between the elderly and other age groups as a consequence of negative gerontological stereotypes. The study based on the approach of E. Bogardus, adapted to the tasks of gerontological research.

Research methodology. Respondents were asked to indicate their attitude (positive or negative) towards an elderly person who performs the following social roles: "close relative"; "friend"; "teacher"; "doctor"; "neighbor"; "politician"; "colleague"; "manager"; "subordinate"; "salesman"; "bus conductor"; "cleaner, janitor, watchman"; "tourist". The sample was 800 people. Based on the results of the survey, an integral rating of social distance was formed.

Results.

The smallest social distance between elderly and other age groups exists in the family and household sphere. The social role of "close relative", "friend" or "neighbor" is perceived positively. The integral rating of the positions of "doctor" and "teacher" turned out to be very close to the integral rating of such traditionally low-status professions as salesman, cleaner, and conductor.

The greatest distance is observed in the professional and business sphere. So, an elderly person in the role of a "colleague at work", as well as a "manager", is perceived rather negatively. Most of the respondents categorically do not accept the elderly in the position of "subordinate".

In addition, the correlation between social distance and the level of income of respondents was revealed. The higher the income level, the greater the acceptable social distance between the respondent and the elderly person, and vice versa, among people with low incomes, the social distance was the smallest.

Topic Modelling on Climate Change Scepticism: Machine Learning Approach

While the reality of climate change has been downgraded from the principal focus of public concern since the rise of the COVID-19 pandemic, the slump in public awareness does not somehow degrade the threats of climate change itself. However, it creates new sources of opposition to climate policy at the structural and ideological levels. Structurally and economically driven arguments have been raised that the pandemic disruption makes it difficult for national economies to bear additional self-imposed burdens dictated by climate-policy goals. More importantly, however, the strong political polarisation over vaccinations and other pandemic measures strengthened the populist style of suspicion politics. As the climate emergency has entrenched itself as a permanent and general state of endangerment, it can easily be overshadowed by acute and specific crises (e.g., the financial crisis, the pandemic). Furthermore, the general crisis can also be overshadowed by emergencies at least partially resulting from climate change (e.g., the migration crisis, food insecurity). This paper will examine the dynamics of climate change scepticism in the public sphere and the evolution of the understanding of this phenomenon in academic literature over the last three decades.

BARAT, Erzsebet* (University of Szeged, Hungary)

Countering the Prevalence of Hate-Rhetoric in Rightwing Populist Political Communication: The Case of Hungary

The ubiquitous discourse of hate propaganda has been established as routine mode of communication since 2010 when the Fidesz-Christian Democrats collation first came into power and maintained a super majority in parliament four times to date. The naturalization of hate speech as banal mode of communication is a major instrument in the regime's cultural war that aims to replace the Hungarian cultural and academic elite and restructure their institutions with ones loyal to the regime. This order of hate speech has stigmatized several categories in the regime's propaganda, producing and reproducing four tropes of hate as empty signifiers (Laclau 1996) implicating one another without actual mention through a chain of equivalences. This discourse strategy draws on naturalizing the contradictory relationships across the tropes while underscoring the difference as absolute between 'us' perceived to be threatened by 'them'. I shall propose therefore that an effective rhetoric of political organization and critique should not be pitting reasons against each other because wielding the power to do that would be unimaginable. Instead, we should rather focus on the similarities that relate the diverse groups in opposition to the regime's values. This shift can be made possible by the intimation of trust instead of the affect of hate. I shall argue that emotions are acts, they do things (Ahmed, 2004). Consequently, trust does not necessarily require a deliberation of sameness. It is negotiated out of experiences of discomfort without transcending the participants difference (Hemmings, 2012). To demonstrate the explanatory power of solidarity mediated by a dialectic understanding of trust, I shall expose the logic of hate informing the four legislative activities of the Hungarian government during the pandemic that are all foregrounding the category of gender, the critical concept of feminist scholarship, only to stigmatize it as a 'legitimate' target of hate.

BARBALET, Jack* (Australian Catholic University, Australia)

The Imperial Passion of Race: The Case of Max Weber

Feelings of power and a subsequent disdain for the weakness of subordination, an associated sense of superiority, and feelings of participating in a collective identity marked by future aspirations as well as a shared past of common experiences underlying dominant values, together support a perception of racial distinctiveness. Max Weber, a foundation figure in modern sociology, famously rejected the notion of race founded on innate or biological characteristics. Less well known is Weber's development of an understanding of race founded on cultural and political factors. The importance of Weber's distinctive characterization of race cannot be appreciated when consideration is given only to his treatment of minorities. Examination of Weber's neglected account of the German people as a *Herrenvolk* or master race, consolidated by shared cultural values and realized through the expansive practices of a *Machtstaat* or power-state, indicates a complex ethnonational conceptualization of race. In these terms his life-long negativity towards Polish nationals, his ambivalent attitude to persons of Jewish heritage, his disdain for the Chinese, and his admiration for Americans and the British people are given clear expression. Weber's approach to race as an ethnonational manifestation is important for understanding not only his political commitment to cultural Germanism and German imperialism, but also his sociology. It is also relevant for understanding the racial undertones of big-power geo-political dominance today.

Understanding Chinese Society: Examining the Concept of Ritual.

The idea that significant aspects of contemporary Chinese society can best be understood through the concept of ritual has been advanced by a number of authors in recent times. In this presentation different approaches to ritual in the work of American sociologists, especially Ervin Goffman and also Randall Collins, will be compared with the classical Chinese account of ritual in the *Xunzi*. The presentation will then go on to consider which approach to ritual provides the more comprehensive explanation of certain family practices, namely filiality and child surnaming, and also certain friendship practices, namely sworn brotherhood and *guanxi* (instrumental particularism). Finally, a continuum of social forms, from ritual to institution (parallel to the magic-religion continuum in Weber's *Sociology of Religion*) will be presented and examined in order to consider whether concepts other than ritual are more successful or less successful in accounting for the family and friendship practices discussed earlier.

Building up the True Refugee. Legal Operators' Performative Work within the Asylum Process in Italy

In the frame of an extensive international literature that highlights cross-national differences and emerging definitions in the construction of the "deserving asylum-seeker", this article focuses on the frictions in the management of refugee status determination in Italy, spotlighting the performative work – operating through mediation and negotiation – of a specific asylum system's professional, the 'legal operator'. This semi-profession, although holding a distinct specialisation, does not have a definite public recognition and has limited possibilities of controlling the work processes in which it is involved - resulting in very fragmented local practices. Nonetheless, we maintain here that legal operators play a key role within the global regime that subjects migration to increasingly restrictive processes of bureaucratisation. From this perspective, this article shows legal operators' role in building and negotiating categories and labels that contribute to structure the legal representation of the 'true refugee', under many pressures related to increasingly hostile norms, emergency framings, and limited acknowledgment. This has consequences on both legal operators' agency and asylum seekers' life opportunities.

In Search of Sponsorship: A Digital Ethnography of Sugar Relationships in Brazilian Digital Media

Heterosexual sugar relationships are characterized of sugar babies and sugar daddies. Babies are young women from different social classes and daddies are middle-aged and upper-middle class or elite men. The sugar daddy must help the baby in her consumption ambitions and her professional projects, helping her to open a company or pay tuition for universities.

The digital social networks specialized in the search for sugar relationships sell the idea that having a sugar daddy is an eloquent possibility of personal self-fulfillment not only for the supposed experimentation of romantic love, but also as an opportunity for professional aggrandizement.

In any case, even though the sugar networks are marketed as alternatives to circumvent the class and gender inequalities reproduced at the heart of the capitalist system, they are part of a segment of commercial exploitation of forms of affective-sexual relationships.

To distance itself from a perspective that would decode sugar babies only as inactive in these contexts, I analyze the agencies, and modes of presence and online registration of these women to understand how they negotiate and experience the ideas sold through social networks sugar. I achieve this objective through interviews with sugar babies and through an ethnography in digital contexts, which follows and collects publications from posts from sugar baby influencers' profiles on Instagram.

So, this presentation aims to discuss how sugar babies strategically use in their favor the elements of market rationality that reproduce in the intimate sphere the values that structure the financial market and the world of precarious work, explaining the meanings that these women use about the fantasies marketed by social networks customized for meeting a sugar daddy.

Protest Mobilization on Whatsapp: Explaining Participants' Approaches before and during COVID-19 in Brazil

Social media is used extensively for protests mobilization in the so-called Global South. However, little research revealed on how protests change over time, especially on chat apps such as WhastApp. This paper seeks to address this gap in the literature and analyses how participants on WhatsApp refer differently to protests before and during the COVID-19 pandemic in Brazil. We look at the case of #Unidos Contra o Golpe (United Against the Coup), a WhatsApp "private group" of 121 members emerged in 2016 in Brazil to oppose the controversial impeachment of the then-president Dilma Rousseff. The qualitative analysis relies on individual level messages collected through digital ethnography. The article compares the messages from 2018 and 2019 with those from 2020 and 2021. Our results show the intention to struggle for democratic change at local level, but also to articulate creative solutions to face brazilian disarray during COVID-19 pandemic.

TG10-844.1

BARBOSA, Sergio* (University of Coimbra, Portugal)

Triangulating Qualitative Methods to Investigate Whatsappers

This methodological paper investigates how the triangulation of qualitative methods matters to conduct research on chat apps. I argue that the so-called WhatsAppers refers to an emerging (digital) activist who appropriates WhatsApp intensely to participate in political life. The theoretical framework builds on digital sociology and digital ethics to endorse a creative methodology from a qualitative nature, which have reinforced the research outcomes mainly on the evolution of action repertoires. To develop my argument, I look at the case of "#UnidosContraOGolpe" (UCG), a WhatsApp (private) group which emerged in Floranópolis, Brazil. The discussion is based on a triangulation of qualitative methods, namely: digital ethnography, analysis of chat messages and semi-structured interviews. It shows how triangulating qualitative methods matters to investigate private chat apps, as well as to constitute an effective strategy to capture the sociological meanings of mobilization and political participation on WhatsApp behind-the-scenes. The methodological paper has three main contributions: (a) the research enables to investigate social interactions on chat apps; (b) it shows emerging forms of conducting qualitative research on and with WhatsApp; (c) the paper opens up new opportunities to test emerging methodologies on digital sociology field.

What Can Artificial Intelligence in Care Homes Tell Us about Technology, Aging, and Ageism?

The COVID-19 pandemic shone light on the growing interest of artificial intelligence (AI) technologies to support later life. AI – from robots to interactive personal assistants – has been heralded as a solution to systemic issues in care homes, including to alleviate loneliness among residents. However, technologies developed for aged-care often rely on user-scripts categorizing older people as digitally unskilled or passive. This intensifies ageist views of the relationships between aging and technology. It is, thus, important to consider whether and how use of AI in care homes may contribute to ageism. Yet, research on this topic remains scant.

To help address this gap, we explored what ideas of aging underpinned practices and perceptions of development and implementation of AI in care homes. Drawing on 18 semi-structured interviews with AI developers and care home staff/advocates, we thematically analyzed how AI technologies for later life are imagined, designed, deployed, and contested. We employed the sociological concepts of 'promissory discourse' and 'aging anxieties' to frame manifestations of age-related stereotypes in these stakeholders' accounts of AI applications.

Results show that, despite positive intentions, both AI developers and care home staff/advocates engaged in benevolent ageism, advancing simplistic representations of aging, care, and technological capacity of older people. We further identified what we termed as *sociotechnical ageism* – a form that is not merely digital but created by interplaying social and technical ideas and applications of a technological system that situates older users and their contexts in a one-dimensional, inactive, and fixed light. Sociotechnical ageism rests on pre-conceptions about the disinterest and inability of older people to use emerging technologies combined with social assumptions about care and innovation. As AI is progressively used in care and health environments, it is critical to discuss its potential role in enhancing age-related bias and social inequalities.

A Shift in Earning Trend in Women : 21st Century Women Community Born to the Agricultural Families.

The present paper refers to an empirical study on the shift in the occupational pattern of women in agriculture, during the post COVID 19 period . The field survey is carried out in North Bengal District of West Bengal ,India , where women voluntarily joined hands with the men for better earning .The change in their earning pattern I made possible in coherence with the male professionals of the locality . COVID 19 lockdown has pushed them to joblessness. To revive from the same ,they switched off to skill based occupation . The present research aims to record the comeback of the women through empirical research and field survey. The narration involves the record of their shift in occupational pattern due to the stagnation in agro-economy . Hence ,the switch off to the techno based earning was obvious . The overall aim of the study is to convey the positive message though the women`s narrative of their occupational switch off . Thus the paper while narrating the effect of the new occupational shift recorded the never ending commitments of the women towards the family even under agro based economy . The researcher`s focus on the reality scenario ,therefore revolves round the tenacity of the women for better living while thriving for survival , The method adopted under the present study includes direct interaction with the agro-women group ,while the story of their survival during post pandemic period was considered inhabitable /The impact of the change accrued by them in reality is the main look out of the study .

An Analytical Study of the Women and Disability- the Legal Politics in India.

The author in the article tries to analyze the impact of the newDisability Act, entitled ` `The Rights of the Persons with Disability Act 2016 `, on the special women and the problems faced by their families in adopting the Law . To the author,the disability study remains incomplete without analyzing the ancillary legal provisions of the time meant both for special and the normal person . `The Rehabilitation Council of India Act 1992`. `The National Trust Act 1999` may act as a complementary law but `the Right to Education Act 2009 , the Reproductive Rights of Women Act 1971, refute the Act 2016. Keeping in mind the legal provisions, theresearcher aims to observe the consequences of the contradictory lawson thewomen with disability .. The paper aims to divide the content of disability Act into narrative and Implementation part to connect the both narrative to analyze the missing link of the Disability law in reality the Laws in the reality scenario. Since the Women with disability suffer from two dimensional effects, both from negative and positive aspects the far reaching effect of the same on the women with disability having the similar physical expression ,how far the discrepancy in the legal provisions needs to be observed from the women as well as from their family perspective . Since her protection becomes the most significant issue of the day. The article claims as an eye-opener on the deficiencies underlying in the Disability Laws and how far the policy initiatives needs to be adopted more sensibly to extend support to the women with disability and puberty of the special women causing serious consequences to the families giving birth to the special women .

Socioeconomic Bias in Teacher Assessments of Primary School Students: The Mediating Role of Student Attitudes, Student Behaviour and Parental Involvement

This paper aims to investigate socioeconomic biases in teacher assessments of academic abilities of primary school students. Understanding social biases in teacher judgements is important because it is a mechanism that can contribute to social inequalities in education. A social bias in teacher assessments is typically measured as a discrepancy between teacher assessment (e.g., ratings of student academic performance) and student scores on standardised ability tests that is systematically linked to student social class or socioeconomic status. A core limitation of existing research in that field is that it does not seek to uncover the processes that underlie these biases. Socioeconomic biases in teacher assessments might arise because teachers unconsciously factor in some student characteristics that relate to their socioeconomic background. Examples of these characteristics could be students' behaviour and attitudes towards learning or parental involvement in children's education.

In this paper we use three large-scale secondary data sets – the British Millennium Cohort Study (MCS – England), Growing Up in Scotland (GUS – Scotland), and the National Education Panel Study (NEPS – Germany) - to (1) identify socioeconomic biases in teachers' assessments of students' academic abilities, and (2) analyse the extent to which these biases are mediated by student behaviour in the classroom, academic attitudes, and parental involvement in children's education. In order to do so, we use causal mediation analysis. Discrimination studies such as this are typical cases of mediation studies in which the risk is that by conditioning on mediators (i.e., "holding constant" student ability and behaviour) spurious correlations through unobserved factors influencing both the mediator and the outcome may be introduced. Causal mediation analysis (VanderWeerle 2016) can overcome these problems. Our multi-country approach further enables us to explore how "macro-level factors" such as education policy and teacher training influence teacher bias.

Restructuring the City of Kolkata: A Study on the Spatiality of Protest.

In the last decades, a sort of urban renaissance has occupied the cities across the globe. Globalization, privatization and the neo-liberal policies have altered the characteristics and virtue of both the city and its population. It has not only altered the definition of production and consumption but the way a certain group of people react to denial. Kolkata is one such city which is known for its street protests, occupy movements, rallying, political graffiti, depicting everything from despicable slander to sharp repartee and, caricatures to propaganda; a strange amalgamation of moderation and extremism. Currently, Kolkata is undergoing a phase of beautification, still trying to match up with the pace of global consumerism. With the changing structure of the political-economy of the city, a certain 'consumerist' class has emerged who imbibed a modern lifestyle with cosmopolitan aspirations. Common open public spaces are disappearing giving way to gated communities and corporate endeavours, an attempt to transform into a well-regulated, systematic and well-governed metropolis. This shrinkage of the city space is the testimony of the dominance of a certain class and the restructuring of the urban space is driven by political power backed by the private endorsement of capitalist groups.

This paper looks into the spatiality of protest, how the restructuring of the city space hinders and reflexively modifies the medium and characteristics of protest. Theoretically, the paper explores the classical Marxian concepts to understand class conflicts, production of space and urban protests in an advanced capitalist, postmodern phase that we are living in. It intends to magnify the social relations, changes in political scenario, economic transitions, the way the citizens protest for their rights and survival and how the state utilizes catalysts like, "spatial reconstruction" and beautification of the city as a passive tool of controlling the territoriality of urban protests.

Examining the Different Political Sides' Memorialization of Using Tools of Natural Language Processing and Narrative Psychology

In 2020, Hungary commemorated the centenary of the Treaty of Trianon. The evaluation and the memorialization of Trianon are still among the most divisive topics in Hungary, dividing the different sides of the political spectrum. This division is present in both political and public discourses. Hungary's increasingly polarized public sphere provides a rich empirical base for sociological research. It makes it possible not only to describe the framing and the interpretation but also to analyze the similarities and differences in the memorialization of distinctive political sides. Since the transition of 1989, an intensive discussion has been present about Trianon. Moreover, the current government's intense and controversial memory politics resulted in abundant online content.

In our research, we examined the discursive framing of Trianon in today's Hungarian online media from the different sides of the political spectrum. Our corpus contained 11,535 articles connected to Trianon published between September 2017 and September 2020. We approached the corpus from two methodological directions, which we combined. First, we applied an LDA topical model from the Natural Language Processing (NLP) toolbox. Thus, we examined the structure, the main topics, and discourses about Trianon. Second, based on narrative psychology, we identified psychologically relevant markers (e.g., emotions, agency, cognition, time, negation, perspective) using the NarrCat content analysis tool. The quantitative results of the software help to understand intergroup relations and the identity construction of the different political sides based on the narration of this historical event. The combination of the topic model and the NarrCat analysis allows for a narrative psychological characterization of each topic, leading to a deeper understanding.

Considering Asset-Based Inequality through the Lens of Career Development and Loss: The Case of Australia's Auto Manufacturing Workers

Home ownership is central to quality of life for older workers in Australia, historically via the elimination of housing costs later in life and, more recently, in terms of intergenerational transfers via asset wealth inflation. At the same time, asset wealth among older workers is becoming increasingly unequal, sharpening the exposure of many pre-retirees to insecure, poor-quality jobs. This paper considers this problem through a case study of older workers whose long careers were extinguished by the disappearance of automotive manufacturing in Australia. Drawing quantitative and qualitative data from over 800 workers in Melbourne and Adelaide, it argues that this case study provides a window into generalised and overlapping problems of asset wealth inequality, precarious work and inadequate systems of social protection. The paper shows that most retrenched workers were too young to retire but also ineligible for unemployment benefits due to severance pay and household means-testing. Most found themselves in less-secure, lower-wage employment. However, unequal asset wealth accumulation due to unequal housing values in different residential property markets combined with differentiated career trajectories and pathways shaped the relative capacity of workers to negotiate uncertain labour markets and life after job loss. The paper argues that rising asset-based inequality was a process that did not emerge *instead of*, or *parallel to* established workplace, occupational and social class divisions but one that unfolded gradually *through* these divisions. The closure of auto manufacturing rapidly accelerated a process hitherto characterised by gradual, evolutionary change. Social inequality worsened considerably once the shelter of relatively secure employment was removed.

Reimagining the 'Ideal Worker': Evidence from Australian Warehouse Logistics

Recent changes to markets and technologies in warehouse logistics have encouraged employers to experiment with new practices of recruitment and workforce composition in terms of gender, citizenship and social class.

In Australia, warehousing jobs are occupied traditionally by older men from manual working-class origins and from a variety of migrant backgrounds. Recently, employers have aspired to recruit from a broader range of social groups, including more women, more recently arrived migrants, and workers from a different range of class backgrounds, including those with university degrees or with little prior experience of manual labour. Drawing evidence from interviews with local managers and workers, this paper argues that firms justify these changes on technological and organisational grounds; that they seek an ideal worker who is more flexible, adaptable and civil in terms of interpersonal relations on the shopfloor, more self-regulating in terms of personal wellness, and politically neutral in response to techno-capitalism's surveillance requirements. However, these aspirations come into conflict with operational demands in a sector which remains highly dependent upon manual labour despite recent technological change. The typical solution in high-demand, high-volume warehousing, the paper shows, is to revert to the recruitment of 'traditional' warehouse workers. This paper considers this issue in terms of institutional and temporal conflict between fractions of logistical capital; as a clash between long-term aspirations to reimagine the ideal warehouse employee in response to ongoing technological and organisational change and short-term demands which flow from the positioning of firms vis-à-vis markets and supply chains.

'Deep Stories' at the Dinner Table: Forgetting and Remembering Colonisation in Australian Settler Families

This paper explores how people relate to colonial wrongdoing via their own family history. It draws on Arlie Hochschild's theorisation of 'deep stories' (2016), which highlights emotional and narrative aspects of political affiliation and gestures to their historical roots. The paper extends Hochschild's theory into a different space, focusing on families in a settler colonial context to examine the complex and symbiotic relationship between family and national memory stories. To do this I draw from interviews with Australian settler descendants, each of whom was researching their family history and had found historical accounts of interactions between their colonist ancestors and Indigenous people that were previously undisclosed or unknown within recent generations of the family. This paper illuminates the memory-work that goes on in the everyday settings of family life; memory-work that is private yet vital in both reaffirming and questioning national myths and amnesias. Importantly, the paper explores ongoing impacts of British colonisation at an intimate scale and furthers dialogue between metropolitan and antipodean sociologies on this topic.

BARO, Lea* (DeZIM, Germany)

On "Feeling Represented" - How Affect Can Extend Our Understanding of Representation in Institutional Contexts

There is a representational deficit in German public institutions. State institutions meant to serve the people do not reflect the population. This is especially the case if we look at positions of power and examine their holders based on their migration history, gender, sexuality, and class background. At the same time diversity policy is on the rise in institutions worldwide and often claims to have increased representation as one of its aims. Diversity is a concept with affective powers, largely associated with positive affective responses. While this can only explain the rise of institutional diversity policy, it still shows the strong affective powers connected to diversity within state institutions, which frames the debates of institutional representational deficits and their solutions.

This is the context this study takes as a frame in asking how representation in an institutional context can be understood if we add affect into it. Using Jakimow's Affective Correspondence as starting point, this study aims to extend how we conceptualize representation in institutional contexts from an affect theory perspective. Combining Saward's Representative Claim with Wetherell's Affective Pattern, it opens the discussion what makes people "feel represented". It questions if this understanding allows us to move beyond the classical notion of identity categories often associated with diversity policy. Taking the capacity someone has to understand feelings in certain situations and towards concepts as a measure of the extent to which someone is able to be a representative centers shared lived experience. It also questions the process and information needed to evaluate what elicits this feeling. This shifts how we evaluate who or what makes us feel represented and why. Affect theory thus allows us to move beyond surface level characteristics to identify why we "feel represented" and deepens our conceptualization of representation in the context of state institutions.

Reflecting on Global Dialogues on Decolonising Truth-Telling: Challenges and Possibilities

There have been few critical conversations in Australia locating the call for truth-telling in the 2017 Uluru Statement from the Heart within global engagements with decolonial scholarship and praxis. This is despite sociology's increasing concern with Indigenous knowledges and governance, and decoloniality. This presentation reflects on a sustained engagement with the call for truth-telling in Australia through a global lens during a seminar series run by the Alfred Deakin Institute for Citizenship and Globalisation and the Institute of Postcolonial Studies between 2020 and 2022 entitled 'Decolonising Truth', which included critical discussions drawing on the experiences of Australia, Canada, Colombia, Timor-Leste and the Solomon Islands. Globally truth-telling has primarily been linked to discourses of recognition and reconciliation within the paradigm of transitional justice, which has seldom included a consideration of colonial power. As a result, the historical experiences of First Peoples in settler societies such as Australia, New Zealand and North America have largely remained outside the framework of transitional justice processes. This leaves the ongoing articulation of coloniality in settler-colonial political formations, such as Australia, unaddressed. In the light of this, we discuss the challenges and possibilities of decolonising truth-telling, both conceptually and practically, and explore how the 'transition' to new states and forms of 'justice' could be re-shaped and unsettled within Indigenous paradigms and decolonial epistemologies. This presentation therefore engages with a small number of global experiences of 'truth-telling' for a preliminary exploration of the ways in which truth-telling could be located more decisively within a decolonial project.

Social Class and Income Inequalities: Macro, Meso and Micro Level Approaches in Comparative Perspective

Traditional analyses of the relationship between social class and income usually rely on aggregated class schemes, such as Goldthorpe's or Wright's schemes. They thus assume that the 'big classes' of these schemes are internally homogenous with regard to their earnings prospects. However, this assumption has been challenged by Grusky's microclass analysis as well as by meso-level approaches, such as Oesch's approach to class analysis. Our article assesses the degree of macro-, meso- and micro-class structuration of income inequalities using data for 66 countries based on the ISSP, ESS and EVS data. We compare eight class schemes covering the three analythical levels and we assess class inequalities in income, career prospects and job security as well as in their main determinant, namely educational atttainment. We find evidence of high hetherogeneity of big classes and of microclass structuration of economic and labour market inequalities

Disputes in the Normative and Political Order in Chile Today: The Case of Patronage in Local Governments

We analyze whether patronage, as an informal political institution (Helmke & Levitsky, 2006), has changed in the context of the social transformations and decentralization of Chilean institutions. We hypothesize that the normative change unleashed since the scandals of 2015 and deepened with the social outburst of 2019, although it has generated a greater rejection of this practice, has not achieved an observable alteration at the subnational level. In the same way, the decentralization process and the drafting of a new constitution have not allowed the field of informal political institutions to be addressed at the local level.

The interweaving of the delivery of favours as a daily practice at the local, in relation to the networks' dynamics of regional authorities and parliamentarians, has been described for the case of Chile since the 1960s (Valenzuela, 1977). Today, in a context of high institutional fluidity, we show that a growing diversification of authorities and social actors has not led to a reversal of informal and authoritarian practices aimed at co-opting public resources: they play a coordinating role in an environment of low trust. Post-2015 reforms, especially in the field of decentralization, have not yet succeeded in breaking with their use in local governance, due to the tolerance of forms of favouritism and the search for personal or group advantages, despite a greater normative dispute based on legalism and public morality supported by subnational social movements.

This paper presents the results of the Fondecyt project 1211099 " No, those are not counted". Informal institutions and social cohesion: legitimation, critique and disputes in the normative order of today's Chile (2021-2024).

BARRAGAN, Diego* (Researcher, Colombia)

Everyday Labors and Time Measurements. an Approach to Public Accountants in Colombia.

In work environments, time measurements are tools to organize the exercise of professionals in their exchanges with individuals, communities or organizations. The paper analyzes how professionals assume their work as the center of their everyday life, allocating most of their time to it and relegating well-being activities. A quantitative approach was taken, applying a survey in 2017, 2018, 2019-2020 and 2021 to persons qualified to practice Public Accounting in Colombia. The everyday work of the professionals gradually intensifies and becomes evident in the times. The hours and days spent at work have increased with a particularity about the workplace, with the Covid-19 pandemic, a significant proportion of work was transferred to the home. In everyday life, no boundaries were established between professional or personal activities, but they had in common that the intensity increased and manifested itself in those who were mothers or who were responsible for other people. They changed from employees to freelancers, they stopped complying with a work schedule and began to use their personal time to meet the demands of their commitments. The time dedicated to well-being was reduced or non-existent, such as: sports, community or service activities, meeting with family or close people, participation and attendance to artistic events. In the everyday life of accountants, most of their time is spent at work, the changes in their roles from employee to freelancer mean that schedules are not established, responsibilities are assumed by individuals and well-being activities are relegated or nonexistent. Working time becomes the center of their lives, showing that the levels of demand have increased and that coping with these conditions is part of their everyday life.

Connecting the Regulation and Sociology of Gig-Work in Australia

Gig-work, where work is simultaneously fragmented and technologically intermediated, has become an entrenched feature of Australia's labour market over the past decade. This change has brought costs and benefits for workers, consumers and regulators, primarily because the work has been performed outside of employment relationships. This marks a step change from over a century of regulation. This position has largely been endorsed by the *Fair Work Commission*, Australia's industrial tribunal. However this is a live policy issue, with the Australian Labor Party government, elected in 2022, seeking to regulate 'employee like' forms of work. This presentation will capture key milestones in the ongoing regulatory dance between platforms, unions and regulators, but also what the trajectory of gig work has meant for who does what work, the experience of that work, and what this means for worker agency, as well as charting a need for future research.

Online Speech Laws in Modern Democracies: Understanding Social Effects on Democratic Participation and the Rational Agency of Citizens

The Government of Canada's 2021 guide and technical paper on a proposed online harms bill to crack down on hate speech raises questions about the social effects of online surveillance on the public sphere and democratic participation. Both the legal and ethical dimensions are needed to assess the social effects of online communication regulation.

In the legal domain, this paper will draw on recent jurisprudence on Canada's *Charter of Rights and Freedoms* to argue that online hate speech regulation stands in tension with *Charter* principles and democratic values. In the ethical domain, this paper will use a virtue ethics approach (via Alasdair MacIntyre and Shannon Vallor) to argue that such regulation fosters a "chilling effect" on public discourse and diminishes the rational agency of citizens required for robust democratic participation.

Gender Role Expectations and Family Life Satisfaction Among Guåhan Women

Although there have been major strides toward gender equality due in large part to the numerous waves of the women's movement, traditional western gender roles, stereotypes, and expectations still exist in contemporary Pacific cultures. Using social role theory, the present study explores differences in gender expectations between women in the CHamoru culture and other cultures in Guåhan. The authors specifically examine whether differences between generations of women exist in the expectation that the father should be the main financial provider. The impact of gender role expectations on satisfaction with family life are also explored. Analyses of quantitative data give some support for the persistence of distinct gender roles and their moderate effect on family life satisfaction. Limitations and suggestions for future research are also discussed within the context of island wisdom.

Quantifying Justice in Canada

Metrics and numbers are not merely objective representations of the world, but they are interventions in how power is distributed and affect access to opportunities thereby shaping life chances. Numbers and metrics are means by which states and organizations are able to observe, monitor, govern and take action, they are also powerful political and rhetorical tools. The sociology of quantification continues to be an emerging field that seeks a unifying theoretical foundation and which examines the production of numbers and their prerequisites in many domains. Quantification remains under studied within sociolegal studies. Institutional ethnography was designed to address objectification of people and their situations, an ideal sociological approach for examining quantification. In 2019 Public Safety Canada released a report advocating standard measures of public attitudes regarding police and in 2020 Statistics Canada and the Canadian Association of Chiefs of police committed to collecting police-reported Indigenous and racialized identity statistics for the first time. These new quantitative initiatives come at a time of increased scrutiny on police and growing public interest in improving police accountability. In this paper I use institutional ethnography to examine quantification in the Canadian justice system and consider its ethical and political implications.

Virtual Communities at Transnational Cyberlocalities from Mexico and US

This presentation aims to explore how a digital transnational community interact within a platform to understand how does digital capitalism and surveillance capitalism work. Digital capitalism is understood for this session as "the collection of processes, sites, and moments in which digital technology mediates the structural tendencies of capitalism (Pace, 2018:262)." Surveillance capitalism will be understood as a management practice that unilaterally claims human experience as free raw material for translation into behavioural data for commercial practices of extraction, prediction, and sales (Zuboff, 2019: 13)."

It explores how interactions within the programatic field of entertainment creates information that is useful for marketing and commercial purposes and adds cultural value to brands and companies.

Also, it explores cooperation and cosmopolitanism to see how these communities strengthen regional dynamics and facilitate to enhance experiences in cyberspace and also promoting activities in its physical environments, enriching production, services and profits far from the original app.

BARTA, Walter* (University of Houston, USA)

An Empirical Approach to the Analytic/Continental Divide

What is the difference, if any, between analytic philosophy and continental philosophy? Contemporary philosophers tend to identify themselves, and so contemporary philosophy is divided, roughly along these lines. Thus, two fields of discourse, the analytic and the continental, have emerged. But is this division substantive or rhetorical? Is it helpful or harmful? What are its effects inside and outside the discipline? Can these categories be concretely defined, or are they nebulous and provisional? Some metaphilosophers, like C. G. Prado, in *A House Divided*, have suggested that analytic philosophy and continental philosophy are distinguishable based on respective focuses, and that the divide falls along lines, such as these: problem solving versus political engagement, philosophical analysis versus synthesis (e.g. a genealogical orientation), bottom-up versus top-down approaches to disciplinary hierarchy. Others have suggested that the analytic/continental divide is erroneous, illusory, merely rhetorical, or simply nonexistent. Each of these constitutes a claim that is empirically testable against the fields of discourse of the two (sub)disciplines through a comparison of textual data: the presence of logically valent as opposed to politically valent words, manner of reference to historical figures, and distribution of textual citations. Inasmuch as these correspond to quantifiable metrics, each of the aforementioned questions may have a discrete and demonstrable empirical answer. The use of empirical and statistical surveys in philosophy is unusual, but its recent implementation by David Chalmers (as in his recent "What do Philosophers Believe?") and other influential philosophers has proven its ability to develop important insights.

Twitter-Hashtag #Ichbinarmutsbetroffen (#IamPoor) - Perspectives on Food Poverty

Poverty and its impact on food have become more visible since the COVID-19 pandemic and are increasingly discussed in public, e.g., on the social media platform Twitter. From May 2022, the German-language hashtag #IchBinArmutsbetroffen triggered a wave of public confession by people affected by poverty. The study examines which food-related discussions were conducted under this hashtag and what can be inferred from it about manifestations of food poverty in Germany, especially how it is experienced in its social dimension.

In the summer of 2022, MaxQDA was used to collect 31,785 tweets with the hashtag #IchBinArmutsbetroffen over a period of ten weeks. From these, 8,650 food-related tweets were identified. These were analyzed qualitatively, descriptively and with a sentiment analysis. Topic structures as well as representations and evaluations of users tweeting about food poverty in relation to their life situation, resources and barriers were identified.

The results show that food is a key area in which poverty is perceived and experienced. 27 percent of the discussions under the hashtag have a food-related reference. These are very diverse - both in terms of sentiment and content. They refer to both the material and social manifestations of food poverty. Different social, cultural, and mental manifestations of food poverty have been identified, which help to better describe and understand the phenomenon.

The analysis of Twitter discussions provides information about the life situations and perspectives of users affected by food poverty, and can be an important complement to ongoing materially oriented assessments. The findings provide impetus for poverty and food behavior research to consider the social aspects of food and nutrition in a stronger and more differentiated way. They also encourage putting the phenomenon of food poverty in the Global North back on the agenda of sociological food research in light of changing social realities.

Social Media and Adolescent Mental Health and Development. Risks, Pitfalls , Opportunity and Growth.

Abstract – Social media has assumed a significant place in an average adolescent's life today . Research findings on how social media is impacting mental health and development of young people is somewhat contradictory . Some studies link social media to loneliness, poor body image and low self esteem. Others show higher social connection as a positive outcome of social media. Are young girls more vulnerable to adverse effect of social media as some preliminary research suggest? This paper explores the theoretical issues and empirical research on how social media is impacting lives of young people with reference to social connectedness , Psychological wellbeing and identity formation. No other generation has had such profound interaction with social media as the generation Z . How this exposure to social networking sites is changing their social relations , impacting their mental health and what consequences it has on their overall development needs systematic in-depth research and understanding to reap benefits and curtail harm associated with these platforms. Through this review article we will address the ways new technology is impacting adolescent development, how to mitigate risk of cyberbullying ,adverse educational and mental health consequences, invasion of privacy; and support positive influence of this ubiquitous aspect of contemporary life .

Population Registers and Census Taking in Germany: More Than a Technical Relationship

In 2031, the German census is to be conducted entirely based on administrative data, extracted from various registers that have existed so far largely unconnected to each other. A crucial base for the census are locally organised population registers, which will be linked to each other using the individual tax ID. The introduction of a register based census in Germany is far from self-understood. Not only is there a dark side to population registers, which served in Nazi Germany for deporting Jews as well as other racially

targeted groups such as Sinti and Roma. Furthermore, census taking has been heavily disputed during the 1980, when concern about individual privacy was raised and administrative practice brought to the constitutional court, which in the end strengthened individual privacy. Therefore, the introduction of a register-based census, which implies a translation of the tax ID to roughly 50 directly affected (of overall around 200 existing) administrative registers calls for an explanation. Although, there was not much public debate around this apparent silent revolution, informal interviews with experts point out how politically contentious this process was behind the curtain. The proposed presentation will analyse the historical trajectory of the contentious relationship between population registers, census taking and personal IDs in Germany up until recent debates in German parliament. The presentation will conclude with a deliberation on the likely consequences of the generalisation of the tax ID for citizen-state relations in Germany.

Patterns of Change in the Justifiability of Euthanasia across OECD Countries

Public acceptance of euthanasia has increased as more nations adopted laws legalizing euthanasia and related end-of-life practices, yet few studies have investigated attitudes toward euthanasia from a longitudinal and comparative perspective. Thus, whether the net increase in justifiability is characteristic of a moving *zeitgeist* (period) or a matter of generational change (cohort effect) has not been discussed.

Using European and World Values Survey data from 1981 to 2021, we explored period variations, between–cohort differences, and within–cohort changes across 35 affluent countries. Descriptive results supported our hypotheses—both overall change and change within each cohort occurred toward higher degrees of justifiability, and younger cohorts were more permissive than their older counterparts. Employing a dynamic comparative, multilevel regression and a comparative version of cross-classified random effects regressions, we verified these consistent increases in the justifiability of euthanasia. In line with modernization theory, a change occurred between cohorts, indicating that attitudes changed gradually due to generational replacement. However, we also identified intra-cohort changes in the form of strong period trends related to the processes of human development across countries. Although some of the robustness checks showed ambiguity in separating period and cohort effects, the combinations of the latter three components were in line with substantive theory. Our results point to a more complex pattern of change than what was predicted by the leading approach in political socialization research: the impressionable years model.

BARTON, Ruth* (University of Tasmania, Australia)

Narratives, Stories and Ideas: The Missing Links in Union Repertoires.

Over the last 30 years, unions have grappled with their declining membership and power and have sought ways to renew themselves (Ellem, Goods and Todd, 2020). In Australia and other countries, the organising approach has been adopted as a solution and, as Simms and Holgate (2010) argue, has become a toolbox of practices applied in different contexts to different ends. They conclude that organising has been stripped of its politics. What I want to argue is that as unions have sought, through the organising approach, to become more action oriented and get their members to take action to achieve outcomes, there has been a neglect of the role of ideas and, implicit in this, politics. This has left members asking 'why do we want to or should we take action over that?' and perversely has contributed to a lack of action and that to redress this union ideas and narratives need to moved closer to the forefront.

The English historian EP Thompson recognised the importance of ideas in his analysis of the role and rejection of orthodox Methodism in the Durham coal mining villages (Thompson, 1976). Reed (2011) argues that the use of both secular and religious cultural features, the values of community and social solidarity enabled working people to moderate the impact of individualism, laissez-faire government and exclusionary politics on their lives. While the interplay of Methodist ideas and practices in nineteenth century England appears to be a world away from twenty-first century unionism, it does illustrate the interplay between culture, ideas and action. The challenge for unions is to rediscover ideas, stories and narratives. This paper will use data from Tasmania to explore the importance of union ideas to worker mobilisation.

BARTRAM, David* (University of Leicester, United Kingdom)

Do Immigrant Integration Policies Influence Subjective Well-Being Among Non-Immigrants? an Evaluation of Policy Change

Recent research indicates that there is a positive association between a country's immigrant integration policies and the level of subjective well-being among non-immigrants. The analysis in that research is cross-sectional and is therefore limited in its ability to tell us whether there is a causal relationship that corresponds to that association. For this purpose a longitudinal analysis is more effective. For a longitudinal analysis we need cross-national panel data, something that does not exist at the level of individual respondents. This article argues that we can address the research question via country-level data: we can use country-level averages of subjective well-being data from repeated cross-sections (here from the European Social Survey), match those averages to corresponding measures of policy (the MIPEX score), and construct a longitudinal ("within") analysis that tells us whether changes in policies lead to changes in subjective well-being. A key point is that we do not need individual-level controls. The core finding is that more accommodating integration policies do lead to increases in subjective well-being, but the effect is very small -- much smaller than is given in a cross-sectional analysis.

The Role of Organization in the Development of Social Structure in Society: A Sociological Study

Social structures are arrangements where human beings interact and develop. Society is amalgamation of different structures. Karl Marx discussed the economic structure and political superstructure. Emile Durkheim explained inter dependency imposes structure in the institutions. Herbert Spencer told that interdependent parts of society create structure. The organization plays important role in development of social structures in society. Organization creates economic structure, intellectual structure and social structure. The methodology of the research is- the research is conducted at Duliajan town. The research is conducted in Indological perspective. Primary data are collected with the support of interview and secondary data are collected with the assistance of book, journals and internet sources. The objective of the research is- To know the impact of organization in social structure of the town. In conclusion it can say that social structures plays crucial role in society. Organization creates social structure and it is necessary for organizational growth and helps in society's development.

National Identity and Sociology: A Comparison of the Institutionalization of Sociology As an Academic Discipline in Germany and Turkey

When we compare German and Turkish societies in terms of social and intellectual history focusing on the 1920s, two similarities draw our attention: the central importance of "national identity" formation as a key issue since the end of the 19th century, and the construction of a new political regime, leaving behind the legacy of an empire. Even if there were serious differences between the historical courses of two societies, those issues (national identity and political regime) had a significant share in the institutionalization of sociology as an academic discipline, because there was an expectation that sociology would play a mediatory role for social transformation. However, it is noteworthy to see that while the institutionalization of sociology in Turkey started before the collapse of the empire during the Second Constitutional Era (1908-1920), with first sociology department founded in 1914, and stagnated after the construction of the new political regime (the Turkish Republic), sociology as an academic discipline in Germany emerged, contrary to the Turkish case, in the 1920s when a new regime (the Weimar Republic) was established right after the collapse of the German empire, with first departments having sociology in their title in 1919. The main reason for this is that the regime change calmed the socio-political crisis in the late period of the Ottoman Empire but triggered a crisis in Germany. Therefore, it can be claimed that the institutionalization of sociology emerged as a response to a process of crisis in both countries. This study focuses on intellectual, social and political expectations from the discipline of sociology rather than the content of sociological discussions and thoughts in the 1920s, and tries to understand parallels and differences between the institutionalization processes of sociology in Germany and Turkey with special focus on national identity construction, political regime change and social crisis.

Researchers from a Minority World Working in a Majority World Setting; Prioritising Indigenous Knowledge When Working with Ugandan Communities

Global collaboration is recognised as strategically useful in High Education Institutions (HEI) worldwide to promote inclusiveness and learning across geospatial borders and co-produce internationally recognised research which

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

informs policy and practice. However, whilst debates about decolonisation continue to infuse HEIs, unequal global health research processes and institutional structures present barriers to inclusive practice whilst espousing the need to produce research that has a lasting impact on communities. As such, perspectives of indigenous knowledge holders (IKHs) are marginalised. This paper draws on two case studies from a 12-year-long partnership of HEIs at Nottingham Trent University, UK and Makerere University, Uganda, alongside research conducted in Teso, Uganda. The studies employ an intersectionality lens to understand the marginalisation of women's health concerning gender-based violence (GBV). Using the Gender, Equality and Social Inclusion (GESI) toolkit and Intersectionality framework, Early Career researchers from HEI in Uganda and UK provide insights concerning sustainable improvements in cases of GBV among marginalised women.

The study findings showed that prioritising the voices of marginalised women may alleviate violence within the communities. Infusing IKHs perspectives in each part of our research processes ensures equality among the marginalised, often silent voices and appropriate context-specific approaches to address community concerns. This research shows that global collaborations between HEIs must consider IKHs as core elements of the research study and not as peripheral. Invariably, this will produce a better understanding of the perspectives of the IKHs to address issues pertaining to social justice. These studies establish the need for collaboration with indigenous communities. The wider sharing or dissemination of such knowledge and research will work towards the decolonisation of research methodologies. Infusion of IKHs perspectives is a cyclical process requiring broader acknowledgement within global academic communities.

The Impact of Social Enterprise Projects on Women's Health in the Teso Sub-Region, Uganda.

This presentation details my research examining the impact of social enterprise projects (SEP) on women's health in Teso, one of Uganda's most deprived sub-regions. I specifically focus on the impact of SEP in relation to gender-based violence (GBV). Various evidence suggests that increasing women's income intensifies their work burden leading to a feminisation of poverty and greater health issues, whereas other studies suggest that economic empowerment is necessary to autonomy. Consequently, my research examines the mechanisms of social change within Teso concerning the development of women's agency and the impact of social transformation on Itesot women's health.

As a feminist researcher I questioned how I could mitigate the impact of my minority world view of women's empowerment within a majority world setting. Therefore, I applied intersectionality to my interpretation of the findings. Applying intersectionality mitigates a homogenised view of Itesot women and provides a nuanced insight into the intersections that affect their lives. Using an intersectional approach can also lead to an understanding of how SEP impact the interconnections.

This study indicates that when women became economically empowered it leads to a change in cultural and societal norms resulting in further violence. Therefore, to offset the fracturing of social norms, practices need to consider the intersecting oppressions leading to GBV; these factors interact within a web of complementary influences. Hence, patriarchal ideologies legitimise violence against women, alongside transgressions of traditional female gender roles.

This research indicates that SEP need to be introduced within a multilevel approach to improve women's agency whilst challenging unacceptable social norms. Multilevel interventions could effectively bring about positive change to communities by impacting more than one intersection of subjugation. Hence SEP could work alongside programmes and policies that sensitise the community to GBV to combat oppression and bring about greater gender equity.

My Mother Was My First Country: A Micro-Level Exploration of Identity and Xenophobic Sentiment

Politics of difference and exclusion have an important history in South Africa. Over 25 years since South Africa's transition from apartheid to democracy, black South Africans continue to experience various forms of racism and exclusion. This continued marginalisation, particularly economically and politically, has formed the basis for explanations of xenophobic sentiment and violence. In post-apartheid South Africa, violent xenophobic attacks directed at African immigrants have become a serious social problem. The majority of media attention and academic work focuses on these macro, public, expressions of violence. In this chapter I suggest that micro-aggressions, both racial and xenophobic in nature, experienced from childhood are insightful in illuminating second-generation immigrant experiences of identity, belonging, and citizenship.

Drawing from a portrait of a second-generation Congolese immigrant young woman; I use storytelling as a means of exploring the role of childhood experiences in creating a basis for the formation on both personal and national identity. The story of Nabarungu Bacumi* is centered on the role of her mother – a powerful yet destructive force throughout Nabarungu's childhood through to adulthood. It tells a story of how Nabarungu's mother influenced her complex interaction with and experiences of race and complexion, negotiating citizenship, disrupting gender roles, and finding home. Nabarungu's story gives insight into the experiences of a much less studied group i.e. second-generation African immigrants. This paper takes into account differences of generation, gender, and class in understanding xenophobic sentiment in South Africa.

"Maybe Your Home's the One That's Lost": On 'Returning', 'Home', and the (re)Claiming of 'African' Identity in the Film Black Panther

Over the past few years, social media has been a site for the expression of growing frustration with enduring racism, racial exclusion, violence, and discrimination against black people. Popular media has also come under strong condemnation for the misrepresentation and underrepresentation of black people and of Africa. Marvel's *Black Panther* (2018) has achieved overwhelming box office success in large part owing to its notable achievement of bringing to the fore politics of representation, identity and culture in a global context that rarely celebrates blackness let alone portrays black excellence stemming from Africa. For this paper, I am interested in the tensions of home, nation and diaspora as presented by the character of Killmonger.

Zooming in on key moments in the film, I interrogate the notion of 'home' as tied to the nation as a way of exploring identity and belonging as central, cross-cutting themes. I further reflect on my own positionality as a young, Congolese born and South African raised woman living in South Africa. I approach this paper as a reflection on what it means to be part of an African diaspora in Africa; in South Africa more particularly. This point is important because South Africa's past marked by apartheid and racial atrocities continue to mark and affect the lives of South Africans. South Africa has also come under the spotlight for violent xenophobia directed particularly at black Africans who are seen as not belonging in the country, perceived as threats to the country's economic and social integrity. Grounded in the theories of Hall (1990) and Yuval-Davis (2006), I highlight the important tensions and intersections of the utopian ideas of Africanity and issues of race and national identity.

Migration, Racial-Ethnic Discrimination, and Mental Health Outcomes for U.S. Adolescents

This study investigates the relationships across migrant status, racial discrimination, and the mental/emotional health conditions of children using a sample of 24,083 children living in the U.S. in the 2018-2019 National Survey of Children's Health (NSCH). Immigrants comprise one-eighth of the U.S. population and the children of immigrants represent one-fourth of U.S. children. Experiencing racial-ethnic discrimination as a child is associated with negative adulthood life outcomes. Racial-ethnic discrimination has been associated with adverse mental health among adults, but little is known about the relationships across migrant status, experiencing racial-ethnic discrimination, and poor mental or emotional health. Therefore, we address the question: What is the relationship across migrant status, having experienced racial/ethnic discrimination, and poor mental/emotional health for children, aged 12-17 years old? We use binary logistic regressions to predict the logged odds of having mental health conditions. There are two independent variables: 1) migrant status (i.e., born in U.S., second generation, or first generation) and 2) whether a child experienced racial-ethnic discrimination (i.e., Adverse Childhood Experience or ACE). This study also controls for sex, racial-ethnic group, parent's education, family income, and neighborhood safety. To date, we find that teens who have experienced racial discrimination are more likely to report having mental/emotional health conditions even after controlling for other factors that may be interrelated, and these findings are consistent with the literature for adults in the U.S. We will next test whether a teen's migrant status is associated with both experiencing discrimination and having lower mental/emotional health. It is imperative for society to create environments that are void of racial discrimination regardless of migrant status, so that every child can reach one's full potential.

Early Childhood Adversity and Early Mortality in an Ethnically Diverse Population

Childhood Adversity and Adult Mortality in an Ethnically Diverse Population
Background: The long term effect of early life adversity over the adult life cycle, and specifically in later life, has become an increasingly important topic of population research. Within this broad topic, less is known. however, on how the experience of early life trauma and, particularly, parental mortality, affects the individual health and aging experience in diverse populations. Date presented in this paper examine the early life experiences of older Mexican Americans in a probability longitudinal design of older residents of the US Mexico border region.

Methods: Data from the Border Epidemiological Study on Aging (BESA), a 12-year prospective study of 1200 Mexican American border residents (1994-1998) and mortality data from the 2019-2020 US National Death Index were used in examining the effects of early life adversity on morbidity and mortality for this population.

Results: Of the initial 1089 participants in the study's first wave, data analysis identified 130 (12%) participants who reported experiencing loss of a parent between ages 5-17. Those who experienced a father's death reported poorer health, lower education and income, higher BMI and increased all cause mortality decades later, after adjusting for demographic, socioeconomic and physical health in mid or later life. Elevated mortality risk for those who reported a father's loss was not substantially different between men and women. However, this early loss had major long term consequences throughout their adult lives not only in terms of their education and income, but their overall health. It increased the probability of an earlier death when compared to those who experienced no paternal loss. Findings suggest a death in population-based research that examines early life adversity, as experienced by parental death, and adult mental and physical health, education and economic achievement and earlier mortality.

BASU, Chandni* (Sister Nivedita University, Kolkata, India, India)

Searching for Freedom – between the Sky and the Earth

Experiencing home isolation sitting in Kolkata during lockdown will remain as a unique phase in life. Relief of lower air and sound pollution living in a house located next to a railway track and an overbridge is matched with the summer greenery around and the tweets of the birds visiting the neighbourhood in huge numbers while reclaiming the city space with butterflies and hoppers. The view of the blue expanse from the terrace complimented by the fresh air however is a completely different site when one looks at the railway track slums. Parked rickshaws and autos indicate the presence of men at home during the day while women also on leave continue with their home chores. The children remain busy with their online school classes.

Between the sky and the earth these sketches of freedom and unfreedom revitalizes memories of working with children and families at the asylum seeker's camp in Germany from 2018 to 2019. At the camp meaning of home is intertwined with experiences of freedom/unfreedom. How different or similar are the experiences of camp life in Germany from that of slum life in Kolkata? This article aims to reflect on the meaning of home and freedom in terms of its intertwining within spaces like the asylum seeker's camp, the slum or the middle class household's terrace. Significance of the marginal and the postcolonial come up here in relation to the spatial uniqueness and configuration of the camp, slum or the terrace in diverse societal settings like that of Germany and India. What is the interconnectedness within these isolated spaces of the camp, slum or terrace feature as important queries in this article. Could there be new imaginations of interconnectedness within varied spatial configurations?

BASU, Jayeeta* (Maharani Kasiswari College, India)

Competent Women Lawyers of Eastern India Juggling between the Maternal Wall and Breaking the GLASS Ceiling: A Sociological Study

Gender stereotyping is deeply embedded in the society and has always nurtured glass ceiling. The competent women after growing up in the equal platform like their male counterparts suddenly disappear from the legal profession or remain unnoticed after their marriages and especially after the childbirth. It is often the other male colleagues, judges and their clients who trap the women in an untold 'mommy track' making their presence limited in the High Court at Calcutta, India. Gender based stereotyping acts negatively for the competent women lawyers where she is expected to give prime importance to her children whereas its acts in favour for men as they are commonly treated as 'breadwinners' and childbirth increases his responsibilities of devoting more time to the profession. This helps the male

lawyers win over the place once equally shared with their female counterparts. With equal parental leaves, formation of creches and more of ladies toilets within the court premises are changing the family patters of the parents from this profession. This paper attempts to locate the changing family patterns and changing forms of parenting amongst the women lawyers in Kolkata and if glass ceiling is a common reason to the competent educated woman from the legal profession to suffer a setback in Eastern India. It further puts up if the maternal responsibilities pre-set upon the women, questions their level of professional performances. 50 women lawyers practicing in the High Court at Calcutta, West Bengal, India were interviewed with open-ended questionnaire aging between 30 and 45 years of age. Mixed method is used for the study. Purposive sampling technique was used with the empirical area as Kolkata.

Understanding Inequalities: The Concept of Wealth Elites in Sociology

Inequality is an important concept within the discipline of sociology. Community manifestations of structural inequalities have been explored within the discipline. When the question comes to wealth inequality, inequalities and unsustainable growth are seen to be two sides of the same coin (Agarwal and Agarwal, 2016). Reports suggest that while economic inequality today is increasing at a rapid rate, so is the accumulation of wealth by elites (Hansen, 2014). The usual way of understanding such inequalities is from the point of view of the dispossessed and marginalized instead of those in power. The main concern of this paper is to find out what happens when we turn the telescope (Savage, 2021). It will try to address this by looking at the wealth elites as a conceptual category. It will attempt to argue that to understand wealth inequality, it is necessary to study those who have wealth and power as well as the processes by which they accumulate such power. This allows us to go beyond the homogenous understanding of the category of wealth elites and to appreciate their internal differentiations in terms of identity, means of accumulation and consumption. However, by looking at inequality through the concept of wealth elite, it would not be solely restricted to economic inequality. Inequality is not simply an economic process, although many studies of inequality have been from an economic perspective. Inequality is shaped both sociologically and historically, which requires a perspective that would capture all these aspects. Wealth elites have tremendous power and the ability to influence political regimes, cultural trends, and social space (Jodhka and Naudet, 2019). Such a multi-dimensional approach would see the concept of wealth elites as suspended in a web of interconnections- social, political and economic.

BASU, Ritwika* (Durham University, United Kingdom)

Fetishization of Infrastructure in Urban Climate Resilience and Geographies of Subaltern Mobilities

Resilience turn in southern urbanism has recast urban 'informality' as a strategic arena for mitigating intractable social and ecological risks. In this paper, I trace the genealogy of urban resilience discourse assemblage and how it intersects with migrant-heavy informal labor market in the Industrial city of Surat in Northwest India. I argue that infrastructural turn in urban discourses of transformation such as resilience is reconfiguring migrant spatiality, mobility, and intersectional identity. Through a historical material lens and drawing upon critical urban theory, urban political ecology and recent analytical debates in Science and Technology Studies, my analysis wrestles with strategic overlaps, coalitions and contradictions between discourses assemblages on urban resilience and subaltern politics of urban citizenship and inclusion. The two-part analysis traces the discursive interplay of cross-scalar hegemonic, counterhegemonic forces that explain the production and naturalization of the contemporary urban resilience practice in the arena of critical urban infrastructure and urban culture. My findings illuminate ongoing topological shifts at different scale that have significantly shaped mutuality and tensions within and outside institutional spaces responsible for conceptualizing and operationalizing spatial configuration through resilience and allied discourses in the city. Methodologically, I combine genealogy and qualitative Q-methodology to juxtapose resilient subject formation alongside the production of a racialized urban security apparatus. In doing so, I trace their relational influences on spatial and cultural intersections with Surat's historically racialized labor market. The findings speak to crucial intersections between culture, institutions, and modes of consolidation underpinning city-wide resilience processes and urban governance through the constantly shifting dialectics of security and differentiated precarity.

Utilizing "Visual Images" in Catechetical Education of the Philippine Catholic Church: Explorations, Discoveries, and Promises

This paper explores the utilization of the various forms of visual images such as photos, videos, infographics, and drawings in understanding the processes and relevance of the catechetical education in the Philippine Catholic church. Drawn from the five-year study of the *National Catechetical Study (NCS) 2016-2021: Pastoral Action Research and Intervention (PARI) Project,* the paper examines how these visual forms direct attention to some salient research discoveries. Theoretically, it presents empirical opportunities in using visual images to creatively construct the lives, dynamics, and learning spaces of Filipino catechists, catechetical leaders, and the catechized. Methodologically, it highlights selected visual insights in using technologies such as mobile phones, the Internet, and social media, which are argued to have provided some sense of resilience in the conduct of data gathering, analyses, and validation techniques amidst the COVID-19 pandemic. In so doing, the paper promises to contribute to the uncharted discourse on the use of visual images in relation to the intertwining sociologies of the visuals, education, and religion, particularly on the sociology of Filipino Catholicism in the context of the catechetical education ministry in the Philippines.

Material Facts and Cultural Meanings of Invasive Species in Toronto, Ontario

Many groups compete about defining invasive species. Those in the pet and plant trade downplay any meanings that associate non-native species with problems. Anglers similarly often downplay any ecological problems of non-native species, prioritizing recreational experiences. Ecologists prioritize flourishing ecosystems, and in so doing are quick to emphasize the ecological qualities of different non-native species, including invasive risk. These and a wide array of other actors converge on governments, lobbying for various meanings of invasive species. Governments often also include members from these various groups. But which meanings make it into the field of power? This study describes the meanings that governments centred on Toronto, Ontario give to invasive species, and explains these meanings with reference to a set of variables. Text data—the response variable in the study—includes parliamentary debates and policy texts for three jurisdictions: Toronto, Ontario, and Canada. The paper uses this text data in topic modelling and word embedding models, which include a set of explanatory variables, including government ideology, government spending, ecologists' classifications of invasive species, and organism diversity and abundance data. The paper aids in understanding how different contextual conditions influence the definition of invasive species, seeking to explain why governments label particular species as invasive, why they discuss certain non-native species and not others when constructing plans to manage urban biodiversity, and why they ascribe different meanings to various non-native species.

Whistleblower or Informer? Exploring the Reporting of Migrants to Dudula Movement and Other Relevant Authorities By South African Citizens

Migrants, especially those from the Southern African Development Community, are often accused of taking jobs meant for citizens; causing the current high unemployment rate; and for depleting resources in public spaces such as hospitals and schools in South Africa. In 2021, the tension between immigrants and South Africans resulted in the establishment of Operation Dudula Movement – an anti-immigration social movement which aims to put South Africans first. Guided by the principles of Operation Dudula, citizens feel obliged to inform the movement and relevant authorities about allegedly illegal migrants residing and working in the country. These authorities (Operation Dudula, Department of Home Affairs and the Police) do not know the specific neighbourhood or house where migrants stay nor their workplaces. Consequently, neighbours and/or colleagues are the ones who have the right to report migrants to the authorities as loyal citizens striving to promote justice and putting citizens first. What started as a drive to remove illegal migrants is now targeted at all foreign nationals irrespective of one's immigration status. This has resulted in loss of lives, displacement, and loss of employment – realities which in a way expose the public issue-private trouble binary. These complex realities leave academics with a thought-provoking question about whether those who report migrants are whistleblowers or informants. It is

imperative to address this question considering that whistleblowing carries different meanings and connotations. In conclusion, juxtaposing the terms whistleblowing and informing calls for scholarly debate and intervention programmes given the ongoing sensitivities and tensions surrounding migrants and immigration policy South Africa.

BAUCHOT, Augustin* (The University of Queensland, Australia)

Derailing Adaptation? a Pacific Islands Perspective on Urban Climate Change Adaptation and Subaltern Politics.

Pacific Islands have become a paradigmatic case of climate vulnerabilities in research and practice (Barnett & Waters, 2016). Their fast-growing cities have attracted attention on the links between urbanization and climate change, with their informal settlements identified as both hotspots of vulnerability (Connell, 2011) and reservoirs of Indigenous knowledge and resilience (Bryant-Tokalau, 2018). Cities in the region have become sites for political assemblages aiming at "adapting" to climate change while accommodating local specificities such as a dual land system. In other parts of the world, subsequent interventions have predominantly taken the form of "significant efforts to protect the physical and digital infrastructures of urban economies from the hazards associated with climate change" (Long & Rice, 2019: 993). By proposing an overview of the contested framings of "adaptation" that have emerged in Pacific cities, including those that emerge from "subaltern" voices, I will try to answer the following questions: What do conflicts around "adaptation" in fast-urbanizing, small-islands contexts tell us about opportunities to "derail the polarizing trajectory of climate urbanism and replace it with a mode of climate urbanism that prioritizes justice" (Long & Rice, 2021: 725)? How to replace this in the discussion about subaltern politics? To answer, I will draw on regional academic and grey literature that describe and prescribe specific interventions seeking to address the climate crisis through urban interventions, specifically looking at the bargaining mechanisms by which such interventions are designed, implemented, and maintained. This will lead to a theoretical discussion questioning the "gradual displacement of politics itself from state institutions to marginal, interstitial and informal sites of society" (Choplin & Ciavoletta, 2017: 315) diving into the linkages between those categories in the aforementioned assemblages, the "intermediaries" that make these links possible, and the specific framings of "adaptation" that emerge from these interactions and relationships of power.

Intersectionality and Its Impact in the Access to Higher Edcation in Mexico

Access to higher education in Mexico has had a positive increase in the last two decades. There has also been an increase in access for women, who for many decades remained without access to this educational level. However, there is still work to be done, since when analyzing the data of the indigenous population, it stands out that they have not had a significant increase in access to higher education, which speaks of a lack of affirmative actions that produce a deep lag. Likewise, the year 2020 was important because for the first time the census asks the population if it recognizes itself as Afro-descendant, which provides a beginning of measurement. Also, there is evidence that after the pandemic, these historically discriminated groups were not effectively addressed, which will have an impact on their education. In this paper, I use national census statistics under a gender and intersectional perspective to show the existing gaps in education that remain in the second decade of the 21st century, in addition I will address the situation of education during the COVID-19 pandemic with a national survey (ECOVID-19) that was collected specifically to measure the situation of students.

Othering and Social Abjection Under the Neoliberal Paradigm. Declassifying Disadvantaged Youth Figures in Latin American Cities

Hegemonic discourses that devalue, blame and criminalize disadvantaged groups and minorities contribute to the social and moral legitimation of inequality. In the neoliberal paradigm, *others* are constructed and visualized as inferior, feared, and despised. This discursive practice of othering is fed by negative images persistently disseminated in the media about the poor, beneficiaries of social programs, disadvantaged youth, migrants, ethnic minorities, gender diversity groups, disabled and overweight people, fostering phobias, hatreds and social anxieties that usually prelude punitive policies, zero tolerance, relocation and gentrification, among others. A group particularly affected by these negative classificatory processes, constructed as demonized figures, is disadvantaged youth living in urban peripheries .

　　denotes a presenting author. Abstracts are organized by first presenting author's last name.

This paper focuses on these social figures in three Latin American cities: *flaite*s from the *poblaciones* of Santiago de Chile, *pibes chorros* from Buenos Aires deprived outskirts, and *chakas* from underprivileged areas in Mexico City. I explore how they are constructed in the media, political and everyday language, their specificities and affinities, and the resignifications and resistances deployed by stigmatized youth. Using the figurative method and digital ethnography tools, we reconstruct the local origin of these figures and traces the discourses and images that circulate in newspapers, the Internet and social media, highlighting the racist and classist markers (aesthetic and moral) that feed the representation of disadvantaged youth in Latin American cities. Finally, to understand how negative discourses are internalized, performed and disputed, I focus on how negative images, emotions and discourses are (re) appropriated and (re)signified through musical expressions such as rap, trap, cumbia and reggaeton, understood as spaces of belonging and resistance. The paper emphasize the relevance of declassificatory approaches in social sciences for rethinking subalternities as diverse and positive identities, subjects of respect and social value, while deconstructing economic and symbolic privileges that upper classes legitimize as natural and deserved.

BAZZANI, Giacomo* (University of Florence, Italy)

Futures in Action: Expectations, Imaginaries and Narratives of the Future

The study of the future is a growing field of research transcending almost all research topics. Despite this rising interest, this field often seems fragmented into different approaches, as though the common object of study were vague or inconsistent. This article proposes a framework analytically distinguishing the three key dimensions of the future embedded in the course of action: expectations, imaginaries and narratives of the future. For each, a definition and a short introduction to their use in the social sciences are provided, together with a description of their capacity to shape the course of action and examples. Then, the scope condition of this influencing capacity is discussed, in particular considering its situational origin and the intergenerational links of the future, with climate change as a case in point. The conclusion highlights research perspectives and methods that can be employed.

Gentrification's Association with Racial/Ethnic-Segregation, Income-Segregation, and Income Inequality in the United States

Gentrification remains a controversial force affecting cities. Although gentrification in the short run may lead to increased "diversity" largely through an influx of higher income and non-Hinospanic white residents, there is concern that it will make cities less equal over time due to the displacement of racial/ethnic and low-income residents. We sought to explore the long-term associations of gentrification with both residential segregation and inequality in the United States. We use thirty years of the US census (1980-2010) to construct measures of gentrification, income segregation and inequality, and race-ethnic segregation. We estimate tract-level descriptive comparisons by gentrification classification and step-wise regression models with metropolitan-level fixed effects. At the tract-level, gentrifying tracts appear to be less economically and race-ethnically diverse than other tracts. At the metropolitan-level, unadjusted increases in gentrification are associated with increases in income segregation and inequality, but primarily decreases in race-ethnic segregation. These associations largely disappear after accounting for metropolitan-level socio-demographic characteristics. Income inequality in the United States remains a driving force for inequality and segregation, particularly over the past decade. However, the associations of gentrification with metropolitan-level inequality appear minimal. We argue for further quantitative analyses to disentangle the interrelationship between gentrification and inequality across metropolitan areas.

The Invisibilisation of French Emigration in Public Discourses, a Significant Case for Migration Studies?

Based on a critical discussion of the terminology used to describe France's migratory flows, this paper explores how through focusing predominantly on immigration and disconnecting immigration, emigration and expatriation, migration studies may inadvertently narrow public discourses on migration and participate to a unidimensional representation of human displacements. Using the hitherto relatively understudied question of French nationals living outside of France as a case study, this paper casts light on the fleeting and multifaceted realities of their migration trajectories and practices before exploring their implications on the thought categories prevalent – yet seldom debated

- in migration studies. Indeed, whilst growing in practice, emigration remains marginalized in academic debates on French migration and mobility which would benefit from its inclusion. With part of the migratory phenomenon in its blind spot, migration studies struggle to think migration beyond methodological nationalism, producing categories of thoughts and representations in which migration and (im)migrants are decontextualized and 'come from nowhere' (Sayad, 2006:15). This in turn participates to the production of public discourses concerned with migration and migrants as problematic.

BECKER, Charlotte* (University of Cologne, Germany)

Attitudes Toward Immigrants in the Family Context

When exploring attitudes toward immigrants most research focuses on individuals' socio-economic and personal characteristics such as income, age, gender, or the values they hold. Rarely are attitudes toward immigration considered within the social network in which individuals are embedded. One network which might be especially relevant for attitudes toward immigrants is the family.

Family members could be relevant for individuals' attitudes toward immigrants through multiple channels. On the one hand side, they might directly influence each other's attitudes and on the other hand, an individual's socio-economic status might be influential not only for their attitudes toward immigrants but also for their family members'. The perceived threat theory might apply not only to one's own social position but by extension also to that of family members. Therefore, individuals who have family members who are unemployed or have other personal characteristics traditionally linked to more negative attitudes toward immigrants might also have more negative attitudes toward immigrants even if they themselves do not display such characteristics.

Besides this, the relationship and network structure within the family might also affect the family members' attitudes toward immigrants. For example, individuals whose family members live further away from them might have more favorable attitudes toward immigrants, because they have experienced a form of spatial separation from loved ones themselves and therefore can relate more.

For the analyses, I use data from the ERC-KINMATRIX research project, collected during the winter of 2022/2023 across eight European countries (*n* approx. 10,000). The data set includes different measures of attitudes toward immigrants as well as information on the respondents' family members and their relationship. For some individuals, the data set also includes information on the family members' attitudes toward immigrants, which will allow an analysis of similarities across family members.

Digging a Little Deeper: A Simulation Study on the Sensitivity of Different Approaches to Mediation to Variation in the Autocorrelation of "y"

Whether an observed association between two social constructs is due to a causal effect is a fundamental methodological question in the social sciences. In addition, the question of *how* a causal effect is brought about is usually answered by *mediation models* investigating whether a significant parameter estimate from some type of regression of Y on X persists once mediator M is controlled for.

Concerning the analysis of panel data, unobserved heterogeneity and reverse causality are well-known challenges that have yet been less frequently considered in the context of mediation analysis. The aim of this contribution is to compare the average bias of different approaches to mediation analysis – i.e., simple mediation within OLS regressions, fixed-effects (FE) regressions, generalized-method-of-moments (GMM) regressions, causal mediation analysis without (CM) and with fixed effects (CMFE), and fixed-effects cross-lagged panel models (FE-CLPMs) – in presence of unobserved heterogeneity and reverse causality within a simulation analysis that varies intercorrelations between predictor, mediator and outcome under different scenarios of causal order. Special emphasis will be laid on the sensitivity of each approach using lagged and/or contemporaneous variables to variation in the autocorrelation of Y over time.

Preliminary results suggest that OLS estimates are generally upwardly biased, FE and CMFE estimates by trend downwardly biased, while estimates of CM models (without FEs) can be biased in both directions. In contrast, coefficients and confidence intervals estimated by both GMM regressions and FE-CLPMs are most accurate – particularly if the structure of lags in the empirical models meet the consecutive order of the data-generating process. Unlike GMMs, FE-CLPMs are hardly sensitive to whether the first lag of the outcome variable is included as an additional predictor. Next steps involve to further explore this sensitivity of GMM regressions by advancing the range of simulated values for the autocorrelation of Y over time.

Leisure on the Margin - Reflections on the Spatial Analysis of Leisure Practices in Marginalized Neighbourhoods

The idea of leisure justice affirms leisure as a general right for every human being and shows the difficulty of applying that right to marginalized contexts. While leisure research has shown that the access to leisure is limited for marginalized groups, there has been little urban research on how leisure is spatially produced and appropriated in marginalized urban spaces. In order to use leisure as a category of critical spatial analysis in marginalized settings, it is essential to understand the specifics of how leisure is embedded in space. Consequently, the paper develops a theoretical reflection of the spatial dimensions of leisure practices and exemplifies the analysis for a marginalized neighborhood.

To achieve a detailed perspective on leisure in marginalized contexts the theoretical reflection is oriented on the production of space and focuses on the analysis of social (micro) practices of the everyday life and their spatial interactions. The focus enables the analysis of the materiality, territorial power structures, and temporal embeddedness of space. By recognizing the socio-spatial embeddedness of leisure on the micro level and by actively analyzing its different spatial dimensions, the case study of the Comunidade do Bode (Recife, Brazil) highlights the understanding of leisure practices in marginalized contexts and emphasizes the importance of a differentiated view of space. Therefore, field notes, go-alongs, soundscapes, and photographs are evaluated. The paper attempts to show that the use of the concept of leisure for the spatial analysis requires a critical framework to be able to access leisure practices in marginalized neighborhoods.

BECKER, Johannes* (University of Goettingen, Germany)

The Varying Importance of Migration in City Life. a Comparative View on Biographies and Family (Hi)Stories in Two Cities in the Middle East

Why do some places become characterized by a "culture of migration" (Massey 1998), while in others migration histories and previous entanglements lose their importance or are simply forgotten? Building upon extended periods of research in East Jerusalem and Amman, this comparative paper examines the question why the intensifying processes of globalization have not yielded the same results, even in geographically and culturally close localities. Based on biographical case reconstructions and historical analyses, the paper identifies processes which lead to an extension of migratory practices, as in the case of Amman, or to a decreasing relevance of migration in everyday life, as can be reconstructed in East Jerusalem. Aspects which assume importance in this regard include, for example, the differing power relations between established and outsiders, different political structures, social histories and prevalent discourses, as well as the importance, and symbolism of (urban) space. I argue that these differences impact the characteristics and horizons of everyday life in these two cities. I will exemplify this by analysing the differing relevance of migration in the histories of two families, one from Amman and and one from Jerusalem.

BECKER, Sascha* (Monash University, Australia)

Religion and Growth

We use a standard set of growth models to frame the role of religion in economic growth. The role of religion in capital accumulation is conceptualized in a neoclassical Solow-Swan model. The role of religion in human capital is conceptualized in augmented neoclassical models and endogenous growth models. Endogenous growth models are also used to shed light on the role of religion in technology and total factor productivity. We employ unified growth theory to conceptualize the role of religion in escaping the demographic trap. These frameworks help unify the growing literature that shows the many ways in which religion either enhances or impinges upon economic growth. We review various contributions in light of these models. These include works focusing on the role of religion in saving, financial development, education, occupational specialization, population growth, work effort, technological change, legal institutions, political economy, and conflict.

Decentralisation and Local Governments in Bolivia – Do They Rather Serve to Democratisation or to Strengthen a "Democracy with Adjectives"?

The attempt to classify Bolivia under Evo Morales has yielded a bewildering range of regime labels. While most scholars label it a democracy with adjectives, only few characterise it as authoritarian (Barrios 2017, Mayorga 2017). However, systematic appraisals of the regime have been scant (Sanchez-Sibony 2021). The decentralization of the Bolivian state and government structure, including far reaching devolution, was initiated in the 1990s under the government of Sanchez de Lozada. The process of decentralization was supported by socio-technical experts both national and international often supported by international development cooperation agencies (Beckmann 2017). Social control was modelled as a "fourth state power" executed by civil society and should be formed according to traditional local, indigenous forms of social control which led to an antagonization of powers (Zuazo 2017).

The strengthening of local governments was on the one hand emphatically welcomed not only by the development cooperation, but also by longstanding supporters of indigenous movements (Albó 1999). On the other hand, the highly politicised indigenous movement viewed decentralisation as a purely neo-liberal project. Civil society, foremost unions and indigenous organisation of Bolivia are powerful societal actors (Crabtree 2006).

Since power shift to the socialist MAS in 2006 the decentralization was not appreciated by the government, but it was too established to be destructed easily. It turned to be transformed and instrumentalized for the power interests of the central government.

In our paper we want to investigate the effects of the Bolivian decentralisation process in its particular context of strong antagonistic societal powers and weak political elites.

Awareness and Attitude of Teachers about Queerness: A Comparative Study of Government and Private Schools of Haryana

Heteronormativity is preferred and promoted as a norm. It is considered a normal and natural way to express sexuality and attraction, making heterosexuality a default sexual orientation. Society is heteronormative, and the people who fall out of this sexual dimorphism become the subject of mockery and prejudices. Sexuality plays a significant role in human identity; it includes sex, gender, sexual orientation, sexual pleasure, and reproduction. Sexual identity is how a person thinks about himself or herself in terms of whom he or she is romantically and sexually attracted. In contrast, gender identity is how they identify themselves, unrelated to their anatomy. Being queer in a heteronormative society often leads to homophobia, poor mental health, discrimination, exploitation, and other animosities. They are often shunned and abandoned by their families and educational institutions. It is because of a lack of understanding of their sexual identity and needs. It is essential to talk about this taboo subject, which leads to the imposition of heterosexual identity on youths and adults. Therefore, this paper explores how teachers perceive queerness in an institutionalized framework. It compares the level of awareness and attitude of PGT teachers in private and government schools. The present study is quantitative and exploratory in nature. The lottery method has been used for the selection of schools in Haryana. Primary data has been collected through a paper survey method from school teachers in Haryana. Keywords: queer, attitude, awareness, PGT teacher, Haryana

Trafficking of Labour Migrants and Exposure to Interpersonal Violence: Evidence from India

The majority of studies on human trafficking concerning solo sex trafficking victims focus only on intimate violence and its consequences, however very few have been focuses on interpersonal violence faced by labour trafficking victims. The main objective of the present study is to explore and analyse the prevalence of interpersonal violence against labour trafficking victims including its causes and consequences in India. A total 25 labour trafficking victims were interviewed through semi-structured schedule and 07 in-depth interviews were also conducted in the state of Odisha, India. The result shows that trafficked migrants were lured by brokers/Dalal through promises of employment and better quality of life and upon their arrival they were forced to "3D jobs" - dirty, dangerous and degrading. More than the addictive effect of job, findings showed that trafficked migrants experienced multiple forms of interpersonal violence such as verbal offense, threats, mobbing, stalking, discrimination, physical violence, threats with weapon and sexual violence which co-occurs in diverse context at the work place which have caused many physical health consequences starting from head injury to broken bones.

BELAYE, Hone Mandefro* (Concordia University, Canada)

Change and Continuities in Neighbour Relationships in Newly Emerging Condominium Neighbourhoods in Addis Ababa, Ethiopia.

In 2005, the Ethiopian government launched the Integrated Housing Development Program (IHDP) to address the chronic housing shortage by constructing high-rise condominiums for low and middle-income residents, mainly in Addis Ababa. Since then, the program has accounted for much of the country's new stock of urban housing supply. More than half a million households have been moved into new condominiums through lottery distribution in the capital Addis Ababa alone. Condominium neighbourhoods are remarkably different from other neighbourhoods. They are enclaves and gated neighbourhoods with dense chains of high-story buildings, while most neighbourhoods in Addis are one-story houses. The lottery system for resident selection and prohibition of exchanging flats means that people come to live in a neighbourhood by chance. Furthermore, in sharp contrast to other neighbourhoods, the management of buildings in a condominium neighbourhood is supposed to be formalized with written bylaws and elected committee members among house owners only.

Drawing on six months of doctoral ethnographic fieldwork in one neighbourhood in Addis Ababa that was established 11 years ago, this paper discusses the change and continuities in everyday neighbourhood relationships in Addis Ababa. The article discusses the elements and nature of new and recreated neighbour relationship dynamics that emerged as residents strive to adapt to the socio-physical environment of condominium housing. Notions of 'being in modern housing' and modernity, in general, are evoked as a justification for both newly emerging elements of neighbour relationship practices and nostalgia for some aspects of neighbour relationships residents feel are lost. The paper concludes by discussing what the neighbour relationships in the condominiums tell us about residents' sense of belongingness to the city and their relationship with the (city)state.

BELINSKAYA, Yulia* (University of Vienna, Austria)
RODRIGUEZ-AMAT, Joan Ramon (Sheffield Hallam University, United Kingdom)

Broken Mirrors and Fake News: The Russian Authoritarianism from Der Spiegel.

Since the Russian invasion of Ukraine in February 2022, Russia has been called a "terrorist state" (Fassihi, 2022) , described by The Washington Post as "sinking <…> into totalitarianism" (2022), compared to Noth Korea by Das Profil (Melichar & Nikbakhsh, 2022), and a dictatorship by Der Standart (Pelinka, 2022). Similarly, the last three decades of academic literature show critical stands against the Russian regime, called illiberal (Zakaria 2007), defective (Merkel 2004), uncertain (Mitchell 2013), hybrid (McMann 2006), a pseudodemocracy (Diamond 2015), an informational autocracy (Guriev and Treisman 2019), electoral authoritarianism (Merkel et al., 2004), neo-authoritarian (Becker 2004), or transitioning towards a pure authoritarian regime (Morlino, 2009), or simply authoritarian (Ambrosio 2016).

This paper traces and maps the spread of representations of the Russian state and the Soviet Union governments during the last 75 years, starting from the year 1947 in the digital archive of one of the most important German political magazines, Der Spiegel (eng.: The Mirror).

The study concentrates on the rhetorical expressions and topics associated with it, and observes the changes and tendencies in the expressions. The combination of automated data collection systems and computer enabled linguistic analysis (topic modelling and Natural Language Processing tools such as Embeddings Language Models (ELMo)) will be combined with a qualitative analysis to help contextualise the references historically. The findings of the German media (Der Spiegel) discourse will be juxtaposed with the developments in the academic literature describing the transformations of Russian regime. This project contributes methodologically with the computational methods, and conceptually to understand the current developments in the press at talking about the Ukraine war and at dealing with the atomic threat; but it also helps to understand and recontextualising some social media activated hoaxes and fake news strategies that have been part of the media warfare (Prier, 2020).

BELMONTE, Rosalba* (Università degli Studi della Tuscia, Italy)

The Journalistic Representation of Gender-Based Violence in Pandemic Times an Analysis of the Italian Newspapers'

Newspapers' representation of gender-based violence contributes to create and reinforce stereotypes and prejudices about the role of women in society, thus favoring the persistence of those relations of material and symbolic domination, that still too often lead to gender-based violence.

This is what emerges from the research project *STEP – Stereotypes and prejudice. Toward a cultural change in gender representation in judicial, law enforcement and media narrative*, that analyzed a corpus containing more than 16,000 articles published in Italian newspapers in the period between the 1st of January 2017 and the 31st December 2019, dealing with the crimes connected to gender-based violence: domestic violence, rape, femicide, stalking, women trafficking.

From the research three main aspects characterizing the journalistic representation of gender-based violence emerged: the centrality of women in the journalistic narrative of the gender-based violence and the parallel marginality of the men who perpetrated it; a de-responsibilization of the violence's perpetrator; a re-victimization of women, who are often considered co-responsible of the violence they suffered.

This paper focuses on the representation of gender-based violence produced by Italian newspapers in pandemic times. Indeed, during the lockdown period, in Italy we witnessed a significant increase of gender-based violence – domestic violence – when compared to the same period in the previous year. For this reason, this work investigates how Italian newspapers represented gender-based crimes during the pandemic, reproducing the sexist stereotypes and prejudices emerged from STEP research, that contribute to mitigate perpetrators' responsibility.

BELVEDERE, Carlos Daniel* (Universidad Nacional de General Sarmiento, Argentina)

Five Frankfurtian Topics in the Work of Alfred Schutz

My aim is to stress out five early Frankfurtian motifs in Schutz's work; namely, the critique of instrumental reason; the critique of operationalism; the characterization of imposed relevances as means of social control and domination; the critique of mass media; and the search for an emancipatory project. To that end, I will focus on the following topics: the sociopolitical consequences of the predominance of instrumental reason; the critique of the reduction of reality to function, both in scientific thought and in common sense; an emancipatory conception of politics; and choosing among alternative projects of action that provide for a way out of the situation criticized. I do not intend to prove a total equivalence between the Frankfurt School and Schutz but only that they share a few topics, which they express with distinctive nuances and points of interest, sharing however an emphasis in the search for social change through an emancipating project that transcends the domination characteristic to contemporary society. In this view, I will argue that both, Schutz and the first Frankfurt School, criticize formal, functionalist rationality and provide a critique of culture with emancipating aims.

Exploring the Potential of Migration in Reducing Inequalities within and Among Countries

The 2030 agenda brought 193 Governments together, under a compelling ambition to « Leave No One Behind », a commitment promising to eradicate poverty and ensure prosperity for all mankind while protecting the planet. SDG 10, in particular, aims to reduce inequality within and among countries. However, when it comes to migration, inequality persists and increases. For instance, developed countries have sought creative ways to avoid their commitment to the SDGs agenda and imposed more control on their borders leaving the burden of hosting responsibilities to the developing countries. The primary justifications for this uneven distribution are the securitization of the borders and the claims of migration's negative consequences, such as draining the resources of public services and welfare programs. Rather than considering migration as a threat to host countries, the present paper stresses the need for a substitute narrative beyond the common misconceptions about migration. Rooted on pluriversal approaches to human rights, this article aims to demonstrate how the effective implementation of the SDG 10 depends on adopting an alternative vision: exploring the migration potential in providing beneficial socioeconomic development outcomes.

Family Satisfaction, Relationship Satisfaction, and Beliefs about Resilience: Understanding Parent Stress in the COVID19 Pandemic Using the Double ABCX Model

Evidence that COVID19-related stressors have adversely impacted the mental health of both parents and their children is growing, yet the potential family mechanisms through which these stressors impact mental health outcomes remain largely untested. This study examined a moderated

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

mediation model predicting parent stress from the pile-up of pandemic-related stressors informed by the Double ABCX theoretical model of family stress and adaptation. Participants included a subset (*n* = 1386) of the U.S. sample (N = 2026) of the Covid Family Life Study. Results revealed that family satisfaction mediated the association between stressor pile-up and stress for parents with low family resilience beliefs (effect = .0407, CI = .0110, .0817), but there was no evidence that family satisfaction mediated the association between stressor pile-up and perceived stress for parents with moderate (effect = .0119, CI = -.0088, .0376) or high (effect = -.0170, CI = -.0524, .0149) family resilience beliefs. Relationship satisfaction mediated the association between stressor pile-up and stress across all levels of family resilience beliefs. The direct associations of family satisfaction and relationship satisfaction to parent stress were both moderated by family resilience beliefs. Whereas resilience beliefs buffered parents from stress in the context of reduced relationship satisfaction, we observed a positive association between family satisfaction and stress for parents with high levels of family resilience beliefs. Implications of these results for interventions aiming to foster parental well-being in disaster contexts are discussed.

KEMP, Adriana (Tel Aviv University, Israel)

Questioning Neoliberal Authority: Changing Patterns of Peace Activities in Israel

The Oslo Process in the early 1990s and the 2000 Camp David Summit were the highpoints of a process that aimed to resolve the Israeli-Palestinian conflict through a "liberal peace." The narrative of liberal peace was grounded in several premises: It was driven "from above" by external global actors; it was based on the idea that material prosperity and free markets can "defeat" war; that international supervision can prevent human rights violations; that inter-state relations and international agreements can help states, especially "weak states," to strengthen their authority and to increase their security; and that democratic procedures allow leadership to be attentive not only to the rule of law but also to the will of the people. The failure of the liberal peace in Israel (which ended with the Second Intifada and the violence that has persisted ever since) sparked change within the Israeli "peace camp," manifested in organizational change (from peace movements to NGOs) and in new and innovative practices. This process was led by peace activists who distrusted and sought to bypass both national government and the global governance authority. While Israeli peace movements until the 1990s did not challenge the very existence of governmental and state authority, and merely appealed to it to exert direct pressure, the current peace practices present a new politics based on the idea that peacebuilding is made by peoples and not by governments or international organizations. The manuscript will present these concrete, micro-level, "bottom-up" post-liberal practices, which include monitoring, advocacy, humanitarian help, professional attitude, projects and campaigns, storytelling and testimonies, educational tours, and the creation of symmetric relations and emotional ties between both sides. It will also assess their relevance in terms of relations with authority, democracy, and the chances for peace.

Preparedness in Agriculture and Food Security: The Emergent European Approach and Some Evidence from the Italian Case

This contribution deals with the transformation of agricultural systems faced with climate change. More specifically, it addresses how unpredictable climate shifts and events are considered and tackled, and the role preparedness plays therein. As an anticipatory approach, preparedness has gained growing relevance in the context of biological threats, largely related with anthropogenic environmental change, that become ever more frequent and fearsome yet remain basically unpredictable. It outlines a new framework and rationale for public action in the face of crisis and disaster situations. The rationale of preparedness differs from that of prevention and precaution, as it considers the possibility of sudden eruptions of threats based on long-developing, hidden processes. The ability to anticipate and respond promptly to unforeseen events is connected with the establishment of vigilance apparatuses based on sentinel devices. Recently, the idea of preparedness has begun to find space also in the agriculture sector, being integrated into the issue of food security. In response to the Covid-19 and Ukrainian war crises, the EU Commission has established the European food security crisis preparedness and response mechanism, which relies on a dedicated group of experts and a set of rules and procedures governing its activities. In this framework, the paper will analyse, first, how preparedness is understood in this emergent approach. Second, it will present some results from an ongoing research project, aimed at understanding how the Italian agricultural system, which has proven to be particularly vulnerable, is reorganizing to address climate change. Different trajectories seem to emerge, assigning different roles to actors, technologies and territories, and entailing different understandings of what preparedness may mean in this context.

BENITEZ, Paulina* (Independent Researcher, Chile)

Sociotechnological Change. Optimization of Interpersonal Ties and Asynchronous Communication.

At the beginning of the last decade, the convergence of the Internet, smartphones, and digital networks (Rainie & Wellman, 2012) and their massive adoption consolidated the intensive use of individual digital technologies, creating a large-scale sociotechnological change; yet 'we fail to grasp the radical paradigm shift that is underway' (Chul Han, 2014:11). The effects on social, political, and economic life are a consequence of falling transaction costs in society. Costs of searching, organization, coordination, dissemination of information and ideas that blurred the boundaries of institutions and companies.

The foundation of this process is the optimization of interpersonal ties. My work (Benítez, 2020) suggests that the installation of people's social networks in digital networks is the base of that optimization, which allowed to increase interactivity (Wolton, 2000), maintain weak ties and reinforce strong ties (Castells, 2005), recompose social networks (Winocur, 2010), and more.

The paper provides new evidence on this optimization, the use of asynchronous communication and on-demand user consumption, in order that they optimize viewing time for public information of interest. It presents the first results of the follow-up study of the viewing of a set of videos from Chilean Youtube channels, with weekly playlists and a number of views equal to or higher than 100,000, which are sampled every hour during six months.

The discussion highlights the importance of considering the optimization of digitally mediated social networks and the consequences of doing so. It discerns people's asynchronous communication, the on-demand consumption of information, which increases the number of nodes and people with whom one interacts, 'saves time', and reduces face-to-face communication.

Women's Leisure and Constraints to Leisure Participation: Indian Perspectives

Leisure is an experience that gives one pleasure and happiness without any restriction or bondage. Indian women feel pleasure in very simple activities including rest, socializing, and entertainment. Activities during leisure need not be productive but they make better use of free time. There are positive associations between quality time spent in leisure activities and life satisfaction. But for many Indian women, leisure remains fragmented (interruption in leisure due to other responsibilities eg. attending to children/husband etc.) and secondary (refers to leisure that is combined with non-leisure activities). The empirical evidence in this paper highlights the importance of leisure, identifies the constraints experienced and their effects on the well-being of Indian working women as they carry out multiple tasks at the same time. This paper is an attempt to establish an association between age, type of family, monthly income and job type with leisure activities, constraints, health benefits of leisure and time management of Indian women who work in the field of education. It is found that the Indian working women spend their free time in shopping, solo TV watching, spending time with family, spiritual practices, gardening, sewing and physical exercise. The study indicates a significant association between monthly income and job type with the health benefits of leisure such as happiness and life satisfaction. India's working women save time for their leisure by doing multiple tasks at the same time.

Tracking the Traces in the Digital World. OSINT Approaches in Digital Methods.

In social science, the main way to conduct research is the use of a methodology: a structured way to design research in order to collect data and then interpret it by using a theory or a formal strategy (statistics, modeling, computer-based data organization). In recent days, the research in digital environments typical of digital sociology and the computational social science approach is using also a different research design: the collection of digital traces (also known as digital footprint). We can define the trace as a kind of sign of the interaction the user leaves inside the digital platforms intentionally or unintentionally. The digital traces come from two different necessities: technological and social. The technological necessity is the traces used to ensure the proper operation of the system (e.g cookies, IP address). The social necessity is the traces used to facilitate interaction into the platforms (e.g. login, username, posting). Recently the use of OSINT (Open Source Intelligence) and intelligence approaches are used to extent the digital methods with some interesting consequences in social sciences. The paper aims to introduce this new kind of approaches and their contribution to the research in digital sociology.

Newlaw Down Under: Extending Organizational Professionalism with New Structures

Professionals now work in a context of change, interacting with disruptive, transformative global forces of the third and fourth industrial revolutions, and especially technological and digital advances. In this context the legal industry has seen new structures emerge challenging ideal-type professionalism (Freidson, 1999) of "classic" P2 firms (Greenwood et al, 1990).

The concept of "**organizational professionalism"** explores "new patterns of structuring work and distinctive work-organization methods" (Evetts 2004; Falconbridge & Muzio, 2008, p8). Building on Johnson (1972)'s sociological concept of professionalism as "a peculiar type of occupational control" (p45), it is an abstract "occupational principle and mode of organizing work" (Falconbridge & Muzio, 2008, p8). While conceptualised, empirically organizational professionalism has largely been used for large globalising legal firms (Faulconbridge & Muzio, 2008) and large public sector organisations (Noordegraaf, 2016).

This study contributes to these literatures by exploring how organisational professionalism operates within the new legal structures called "NewLaw" (Chin, 2016). "NewLaw" deliver legal services with a significantly different approach "than what the legal profession traditionally has employed" (Furlong, 2014) taking a "breadth of unique practices and approaches to work" (NSW Law Society, 2017). Our findings show NewLaw cover a range of structures such as designer, hub & spoke, legal platforms, flexible talent agencies, legal consulting, process & services outsourcing. Yet they are united under their organizational professionalism of renewed professionalism, balanced profitability and intentional innovation. Our study explores how NewLaw structures renew the concept of professionalism, extend content of and roles for expert knowledge and challenge jurisdictional boundaries. They balance profitability as inherent to doing business and recommend innovation incorporating digitisation. Indeed for NewLaw, "positive innovation and good technology [offer] opportunities to improve access to justice, the speed or process of legal service delivery and legitimately lower costs for certain legal products through automation" (Interview).

"Food Movements Unite!"? Food Sovereignty, Inequality and the Contours of Organising from below in the South African Food System

Significant scholarly attention has been given to the global food sovereignty movement. However, the movement is ultimately rooted in national and local contexts. The political dynamics of movements in such contexts call for ongoing exploration, especially to how the global discourse and principles of food sovereignty take root politically and in movement terms. This paper seeks to explore the interface between the global food sovereignty discourse and forms of organised agency from below in South Africa that seek to respond to various contradictions of the dominant agro-food system. A wide range of studies in South Africa have focused on agency from below in the food system, but mostly at the level of households, particular communities, and initiatives. What is missing is an attempt to situate these forms of agency in a wider movement, systemic and historical analysis, specifically in relation to the country's unresolved agrarian and national questions and the consequent persistence of racialised class inequalities. This paper therefore seeks to provide an account of the movement terrain of organising members of popular classes around food questions, the formations through which food politics from below are currently organised and with which food sovereignty as a global idea, practice and political project articulates. A typology shows that the array of organising around food and the agro-food system falls along a continuum between justice-centred and food-centred conceptions of change in the food system, and that they cohere around *lifestyle*, *organic*, *food justice* and *transformative* politics. I argue that these types should be understood through a longer history of varying political responses to national oppression and the evolving agrarian question under colonial capitalism, and to the continuities, limits and opportunities of national liberation.

BENSKI, Tova* (College of Management Academic Studies, Israel)

"Women Wage Peace" the Return of the Mother

Most Women's Peace mobilizations in Israel since the late 1980s rejected the earlier maternal focus of "Mothers Against Silence" (emerged in Israel in 1983) claiming for a political voice based on their citizenship rather than maternal status. The newest women's peace movement to appear on the scene, "Women Wage Peace", established in 2014, resorted back to Maternal discourse and

identity. The question is how can we explain this change? In this presentation I would like to tackle this question. I will address this question by examining the movement and its most profound characteristics that mark the difference from former women's peace mobilizations. I will try to understand the meaning of these differences following the analyses that I have presented in former ISA Forums and Congresses. I will then try to trace the most important changes that have occurred in Israeli society since the early 1980s, and try to examine how the new movement's focus, language and actions can be related to these changes. The central claim of this analysis is that a combination of socio-political changes in Israel including the rise of virulent neo-liberalism, the political increase in the power of religion, the rise of right wing populism, and the drift to traditionalism and even backlash and femonationalism in right wing parties have all intertwined and affected both the rise and the character of the new "Women Wage Peace". Analysis will be based on data collected through participation in the movement since 2016, movement publications and announcements and interviews conducted with participants. This analysis will contribute to our understanding of the ways in which the latest worldwide changes in the Western worls affect social movements.

BENSKI, Tova* (College of Management Academic Studies, Israel)

The Return of the Maternal Element to Women's Peace Mobilizations in Israel

"Mothers Against Silence" emerged in Israel in 1983. It was the first women's peace movement to have appeared in modern Israel. Many changes have since occurred in Israeli society. Peace was not one of them, which partly explains the large waves of mobilization of women for peace and against war in Israeli society. It is quite intriguing that the first women's peace mobilization was anchored on maternal concern whereas the following waves of women's peace activism, with but a few notable exceptions, rejected Maternity as a ground for mobilization claiming that they refuse to become the "womb" in the public space. At the first ISA Forum in Barcelona (September 2008), I tried to apply Sara Ruddick's ideas of Hybrid Feminism (i.e. fusion of feminist and antimilitaristic identities) to the Coalition of Women for Peace. I concluded that the collective identities forged by these women were much more complex than those envisioned by Ruddick, and that these were shaped by the realities which they challenge.

In this presentation I am looking at the new, largest Women's Peace mobilization in Israel since the establishment of the state: Women Wage Peace. Established in 2014 following "Protective Wall Operation" of the IDF in Gaza, it has adopted a clear Maternal focus. It also diverged from many of the former movements in a number of ways. Looking at Social Movements theories of the 21st century, I am asking two main questions: First, how are we to explain this change in focus. Second How can we account for their enormous success in mobilizing supporters (about 50,000) within Israeli society? I further suggest that these two topics are related. Analysis will be based on data collected through participation in the movement and interviews conducted with participants.

Culture, Religion, and the Limits of Human Rights Legislations for Persons with Mental Health Problems in Ghana

One of the challenges of mental healthcare in Ghana is the abuse of the rights of persons suffering from mental disorders. The situation has become a global scandal and attracted attention from various human rights organisations and observers such as the United Nations Human Rights and the New York-based Human Rights Watch, all of them producing reports, especially on the activities of prayer camps, mental health, and human rights abuses in Ghana. On the local scene, the passing of the Mental Health Act (Act 846) by the Parliament of Ghana had clauses that were mainly meant to deal with the abuse of the rights of persons with mental disorders including establishing a mental health tribunal. However, the Act is fraught with ambivalent clauses that while on one hand it recommends collaboration between mental health professionals and traditional and religious healers in the treatment of persons with mental health problems, on the other hand it is suspicious of and questions the scientific basis of the kinds of services provided by such religious entities. This paper attempts to examine the heightened challenges that are produced by the structural, social, and individual trajectories in the search of healing for mental illness in Ghana. The paper argues that, until a collective effort is made to address and bridge the differences in healthcare taxonomies, any legislation meant to address healthcare challenges for mental health patients in Ghana will only be a phantasm.

A Comparison of Satisfaction with Work-Life Balance before the COVID-19 Pandemic and during Its Immediate and Intermediate Stages: A Case Study of Academic Staff at Three Small Colleges in the United States

The immediate stage of the COVID-19 pandemic placed university instruction into an emergency remote mode. The intermediate stage of the pandemic has continued to present economic, psychological, and social challenges to workers, including academic staff. This paper details part of a project examining changes in faculty lives since the pandemic's onset. The study's two waves took place during the *immediate* and *intermediate* periods of the COVID-19 pandemic (Christakis, 2020). The study of pandemics, in particular, and disasters more generally, suggests that the long tail toward recovery after the immediate threat has receded but while lasting aftershocks or additional waves may arrive can be a period of particular psychological disruption (Van Hoof et al., 2021). We report on survey data collected from academic staff at three selective liberal arts colleges in New York in the immediate aftermath of the lockdown in 2020 and during the intermediate stage a year later in 2021. Specifically, we investigate two measures of life satisfaction: changes in satisfaction with work-life balance and work strain.

Our findings indicate that at both the immediate and the intermediate stage of the pandemic academic staff reported lower levels of satisfaction with work-life balance compared to pre-pandemic and higher levels of work strain. They reported the same decline in their satisfaction with work-life balance in 2021 as they did in 2020 with those with caregiving responsibilities showing the largest declines and tenured faculty the smallest. Similarly, work strain was as high in 2021 as it had been in 2020, but the sources of this elevated strain shifted from teaching and research demands in the immediate stage to emotional labor demands during the intermediate stage of the first full academic year of the pandemic. As the pandemic continues to linger, the consequences for life satisfaction may become increasingly dire.

Being a Parent, Scholar, and Parent-Teacher: The Relationship of Gender and Parenthood to the Division of Labor and Work-Life Balance Among Academic Staff in the United States during the COVID-19 Pandemic

The COVID-19 pandemic has disrupted the family lives of many workers, including academic staff at institutions of higher education. In particular, the pandemic may have reversed the trend toward a more egalitarian division of household labor in the United States. This paper examines how gender and parenthood related to changes in the division of labor within the households of faculty at three small private colleges in the United States. We specifically look at whether the division of household labor, childcare, and supervision of children's remote learning varied by gender and parental status in early stages of the pandemic in spring and summer of 2020. We then ask whether gender and parental status were associated with changes in work-life balance.

Tenure stream faculty (n = 193) from three small private liberal arts colleges responded to an online survey between May and September 2020. Separate univariate ANOVAs revealed a significant effect of gender on doing laundry, cleaning the house, cooking, and washing the dishes, with women faculty more likely to be responsible for doing the laundry, cooking, and cleaning the house and men more likely to be responsible for washing the dishes. Women were more likely than men to be responsible for 11 of 14 child care tasks and 10 of the 12 children's remote learning tasks. Univariate ANOVA revealed that faculty who had children between the ages of 0-12 typically reported a greater decline in satisfaction with work-life balance during the pandemic in comparison to those with no children in this age range. During the early stages of the pandemic, women faculty who were actively parenting children under the age of 13 did more household work, more childcare, and more supervision of children's remote learning than men faculty did. Not surprisingly, they reported a greater decrease in satisfaction with work-life balance.

The Value of Meta-Organizations for Solving Complex Ecological Problems

A growing literature claims that meta-organizations, as an organized form of collective action among organizations, constitute valuable forms of governance to solve complex ecological problems like climate change (Berkowitz et al., 2020; Chaudhury et al., 2016; Fernandes & Lopes, 2022). Most of these works have looked at different empirical cases to derive key features enabling meta-organizations to solve these challenges, for instance their spatial embeddedness, their low coordination costs, or their capacity to let multiple stakeholders meet, look for consensus and take joint decisions (Berkowitz et al., 2020). Yet, we still lack an understanding of why meta-organizations are seemingly better equipped than other forms of governance (e. g. networks or institutions) to achieve such an important function today.

In this paper, we draw on decisional organization theory (Grothe-Hammer et al., 2022) and focus on multi-stakeholder meta-organizations like fisheries co-management committees, to argue that the 'success' of meta-organizations can be at least partly explained by three factors: first, their intrinsic nature as multi-level decided social orders being able to take decisions and responsibility in a context of high uncertainty where immediateness and accountability are of key importance; second, the functioning of meta-organizations as regulatory intermediaries to address the complexity of climate change by integrating members' logics, values, and different expertise, and making those aspects decidable. In doing so, meta-organizations can, third, create effective regulations and monitoring instruments that compensate for the lack of politically effective governance in many areas (cf. Megali 2022).

Based on these insights, we shall argue that meta-organizations might be a promising governance device for effectively tackling ecological grand challenges. In our presentation we will unfold our arguments in detail, and will also look at unintended consequences of meta-organizations (Carmagnac et al. forthcoming), which might counteract their positive functions.

"Indigenous Meta-Organizations": Learnings from the the Amazonian Forest

A growing literature emphasizes the importance of meta-organizations both as a concept and as a device for collective action, to tackle complex social problems like climate change (Chaudhury et al., 2016), sustainable ocean governance (Berkowitz et al., 2020; Berkowitz & Grothe-Hammer, 2022) or conservation of global transnational commons like Amazonia (Fernandes & Lopes, 2022). However, with the exception of Chaudhury et al. (2016), virtually no work has disentangled the Europocentric dimension of this meta-organizational perspective, or its "settled geographies, histories, and epistemic practices" (Vijay, 2021). This is problematic for two reasons. First by focusing overwhelmingly on Global North meta-organizations, scholars produce settled knowledge that tends to erase the responsibility of western (meta)organizations in current global problems like climate change while presenting them as problem solvers (Vijay, 2021). Second, by largely ignoring Global Souths contexts and cases, scholars invisibilize non-Western meta-organizational attempts at developing alternative models. In this paper, and within our limited capabilities, we explore what indigenous meta-organizations might look like, by drawing on the case of meta-organizations of Amazonian Forest indigenous organizations (Cruz, 2018; Fernandes & Lopes, 2022; Peres, 2021; Silva, 2010). While identifying similarities and proximities with the current meta-organization theory, we argue that Amazonian Forest indigenous meta-organizations contribute to what can be conceived as inter-localization processes (see Coenen et al., 2012), i.e. local, trans-local and inter-local transformations of the Amazonian forest are subject to different forms of external pressure and control (from indigenous organizations, scientific organizations, civil society, private companies, national government). Further, we argue that these indigenous meta-organizations, while constituting layered decided social orders (Grothe-Hammer et al., 2022), still enact an ontology that are hardly understandable through western, contemporary analytical tools provided by meta-organization theory.

'Hybridity' and the Construction of Digital Futures

Knowledge production in the artificial intelligence (AI) and robotics fields is increasingly occurring in hybrid sites that do not fit neatly into a binary academic-corporate dichotomy. These sites are often elite research labs situated at the intersection of academic and corporate interests and logics, which combine traditional academic outputs with commercial products and outputs. Through novel quantitative analysis of the thematic content of a large database of AI and robotics publications, combined with content analysis of interviews from researchers from several research labs, this study demonstrates the outsized role hybrid sites play in shaping the AI and robotics fields. In particular, it investigates how researchers within hybrid sites aim to have influence across scholarly, commercial and public spheres, and how the demands of these spheres structure knowledge production practices and outputs within hybrid sites. This study contributes to a more nuanced sociological account of the influence of academic and corporate institutions in shaping the dominant trends and values expressed in AI and robotics research. It explores how distinctions between these institutional forms collapse in day-to-day research practice in hybrid sites. In doing so, this study develops 'hybridity' as an analytical lens for the critical evaluation of knowledge production in sites where actors manage multiple logics that contain distinct values, strategies, and visions.

Re-Organizing Care and Work: Spanish Skilled Migrant Families in Europe

This paper aims to analyse family care and work arrangements of recent migrant families with children from Spain to three countries: The United Kingdom (London), Germany (Berlin) and Belgium (Brussels). As a part of the project "Intraeurpean New Mobilities: Decisions on work, family and politics of Spanish transmigrants" (CSO2017-84618-P), we analyse how men and women in transnational families, prioritise and organise work and family life in the context of migration from Spain since the 2008 crisis. We examine the implications of these decisions for both men's and women's employment and careers, as well as for family life in the European context. The research methodology adopted was the survey technique to obtain the quantitative data, together with semi-structured interviews with couples with children, to provide the qualitative data. The analytical structure of the narratives is based on six fundamental blocks: the general profile of the family, motivation towards migration, and work (work trajectories); work-life balance (formal and informal work-life balance measures); care (re)organisation, social protection measures, and links (family, country of origin and destination). Subsequently, based on the selected interviews, care strategies and family arrangements are analysed from the perspective of formal resources for work-life balance in relation to work and flexible working arrangements.

BERNARD, Aude* (University of Queensland, Australia)

Does Internal Migration Contribute to the Intergenerational Transmission of Socio-Economic Inequalities?

As socio-economic inequalities continue to widen in most developed countries, it is essential to improve understanding of the mechanisms that underpin social reproduction. This paper proposes that internal migration plays a role in the passing on of socio-economic inequalities. Theoretically, the paper formulates a conceptual framework that builds on three separate lines of inquiry: (1) the intergenerational transmission of internal migration behaviour, (2) the role of internal migration in social mobility, and (3) the selectivity of internal migration. Empirically, the paper quantifies the links between long-distance internal migration and social reproduction in 15 European countries by conducting mediation analysis on retrospective life-history data. The results show that children from higher socio-economic backgrounds are more likely to migrate, which in turn increases their chances of migrating in adulthood, which is associated with higher socio-economic status later in life. In addition, advantaged children are more likely to migrate to urban centres with greater educational and employment opportunities, which is an additional benefit. These results illuminate the socio-economic impact of internal migration across generations, while highlighting the importance of conceptualising internal migration as a life-course trajectory that unfolds over time.

Channelling Touraine: Solidarity Research and Young Climate Activists

Since 2018 millions of young people across the global have engaged politically by urging governments to address climate change. While changing the politics of global warming, this has also challenged many researchers to think about how they should work with children and young people engaged in political action. We draw on Alain Touraine's (1983) action-research as reflexive-intervention to highlight 'adultist' assumptions that tend to operate in relations between academic researchers and young people, which eg., represents children and young people as vulnerable, deficient or irresponsible (Cummings 2020, Bessant 2021). Touraine's relational approach developed through his collaboration with Solidarity, the 1970s Polish worker's anti-communist movement, rejected the researcher-as-spectator model. Instead, Touraine and his research colleagues became participants working in solidarity with others in that social movement.

Touraine's action-research model requires researchers to define and document how participants understand what they were doing and importantly to 'isolate, among the various meanings of their action, the ones that challenge the central core of the society' (1983: 7-8). To do this researchers facilitate discussions among participants, to document and analyse those discussions before returning that documentation and analysis to them. If it is judged satisfactory and helpful it is then incorporated into the action plan (Touraine 1983: 7-8). Defining relations between researchers and young people in this dialogic way requires researchers and those young political actors to develop sustainable political connections. For researchers it means being 'politically present'. Applied to young people, this political, reflexive and collaborative relationship privileges neither ageist representations of young people as inexperienced and deficient, nor accounts of the researcher-as-expert. It can also encourage new imaginaries and help enhance the capacity of the movement to promote the desired change.

BESSANT, Judith* (RMIT University, Australia)

'Nothing More Practical Than a Good Theory': Arendt, Natality and Student Political Action

'Natality' and 'action' are central themes in the work of the political philosopher Hannah Arendt (1958). Both ideas addressed the possibility of political renewal and transformative change, especially in 'times of crisis'. By 'natality', Arendt referred to our 'second birth' when 'new-comers' enter the field of politics for the first time and by acting together create 'the unexpected', especially in times of crisis.

Intuitively, Arendt's concept of 'natality' seems to offer ways of understanding young people's political interventions in global movements addressing climate change. However, one problem is that Arendt never provided a detailed or empirical account of how 'natality' actually worked to promote political renewal and transformative change. Moreover, and paradoxically, Arendt disapproved of young people's involvement in politics like when American students engaged in civil disobedience during school desegregation campaigns in the 1950s.

With this in mind, I ask the following questions:

- How might we theorise natality?

- Do Arendt's accounts of 'natality' and 'action' help to understand how student climate change action might generate democratic renewal or 'bring forth' 'transformative change'?

- Does her work provide insight into the often highly charged and hostile reactions that come from established leaders and conventional political discourses when students engage in political action of the kind we are witnessing?

Following a short critical exegesis of Arendt's concepts of 'natality' and 'action,' I draw on the research project 'New Possibilities: Young people and Democratic Renewal' to show how these ideas can be used to help understand young people's politics of the kind we are now witnessing. I do this by identifying key elements of natality and action. I then consider whether we see evidence of political renewal and transformative change. Finally, I consider whether Arendt's work helps to understand the often adverse responses from established leaders and others.

Crossing Mineral Borders and Boundaries: A Look at Artisanal Mining in South Africa

Crossing Mineral Borders and Boundaries: A Look at Artisanal Mining in South Africa explores a more detailed and broader context of the current artisanal mining sector in South Africa. The book highlights that legislation has greatly

benefited the elite and, at the same time, intensified the socio-economic fault lines. As a result, mineral and land rights remain skewed along racial and class lines, amplified by the government favouring large–scale mining.

The book contributes to reshaping and reframing the artisanal mining debate in South Africa by examining several misconceptions around the sector, for example, the erroneous belief that all artisanal miners are criminals. In this pioneering book, tough questions around radical economic transformation are underlined. The book offers the reader a chance to explore the notion of labelling and how the practice of labelling people paralyzes groups to remain on society's socio-economic edges. In this book, the reader is taken on a journey to explore matters around power, poverty, and privilege.

The book offers practical initiatives for businesses, government, and civil society to address this marginalized sector. *Crossing Mineral Borders and Boundaries* is for anyone ready to examine their positionality in South Africa's flawed post-Apartheid socio-economic structure.

BESUSSI, Elena* (The Bartlett School of Planning, UCL, United Kingdom)

"We Just Want to Stay Here": The Struggle of Camley Street for a Place to Work

This paper presents the case of Camley Street, an industrial estate in the London Borough of Camden, London, where local businesses organised themselves to struggle against the threat of displacement presented by local government's redevelopment plans. Occupied by light industrial manufacturing, the 70sqkm of publicly owned land have, since 2010, been the focus of increased interest from property developers.

The context for the development pressure on Camley Street can be explained along two narratives. First, the approach of the London government to the deterioration of affordable housing supply by promoting the intensification of housebuilding on brownfield and industrial lands. Second, the response of the London Borough of Camden to the regime of spending austerity by a programme of investment in social infrastructures funded by the managed disposal or redevelopment of public land for housing and housing-compatible business activities.

Between 2011 and 2018, the businesses of Camley Street used diverse strategies to fight against Camden's plans: from reactive involvement in statutory planning processes to more pro-active approaches leading to the registration of a formal interest in becoming the developers of the site, proposing to retain existing businesses and workspaces and deliver housing towards Camden's needs. The proposal was ultimately defeated not by a material objection but through the progressive erosion by Camden of the businesses' professional credibility as developers.

Beyond the planning, development and financial contexts that underpin the struggle for Camley Street, there are less obvious but important dimensions such as the reluctant evolution of Camley Street's businesses into a political subject or the conflict between Camden's and local businesses' definitions of work and workplace.

The paper aims to initiate a discussion about what processes this case study is an instance of, and how it can be framed theoretically to ensure its contribution towards the analysis of other similar struggles.

Una Política Municipal De Vivienda En Cesión De Uso y Las Finanzas Éticas. El Caso De Barcelona y La Aportación De Coop57

Tras la última crisis financiera e inmobiliaria, cuyo inicio se sitúa en 2008, y ante las dificultades de la mayoría de población para acceder a una vivienda digna, en el Estado español, pero sobre todo en Cataluña y, concretamente en la ciudad de Barcelona, se ha venido promoviendo un modelo de vivienda que permite una forma de acceso que no es una compra ni un alquiler. Se trata de la vivienda cooperativa en cesión de uso.

El modelo de vivienda cooperativa en cesión de uso tiene una larga trayectoria y desarrollo en países como Dinamarca y Uruguay, pero en España se presenta como una política municipal de vivienda innovadora, por suponer una forma de acceso alternativa y a lo reciente de las experiencias promovidas.

Anteriores trabajos se han centrado en el análisis de la aparición de estas recientes iniciativas en España, y en el caso concreto de Barcelona en su evolución e inserción en la política municipal de vivienda, los mecanismos de acceso al suelo, las relaciones de gobernanza y estudios de caso.

Este trabajo, que parte de una descripción de las características del modelo de vivienda cooperativa en cesión de uso, centrado en la experiencia de Barcelona, incorpora una cuestión fundamental: la financiera. Estas promociones se encuentran con un importante obstáculo, su dificultad para acceder a la financiación de la banca convencional. Al no existir división horizontal la banca convencional no contempla la financiación de este tipo de vivienda. De esta forma, las finanzas éticas, junto con la financiación pública, se ha convertido en un agente clave para financiar este modelo de vivienda. En este caso se analiza la aportación de la cooperativa de servicios financieros éticos y solidarios Coop57, su recorrido, alcance y limitaciones como herramienta financiera para las cooperativas de vivienda en cesión de uso.

"Somos Gente De Contacto" a Qualitative Exploration of Emotional Regulation Among Latinos in Nebraska during the Covid-19 Pandemic

Latinos have disproportionately and negatively been affected by the Covid-19 pandemic in the United States. An emerging body of research has investigated the economic, employment, and earnings impacts of the Covid-19 pandemic on Latinos in the United States, unveiling stark health disparities in our communities as well. Nebraska is home to a diverse Latino community, who has navigated the pandemic from a multitude of angles- health, socioeconomic and emotional. In this paper we ask, how have Latinos in Nebraska navigated and negotiated their emotions in the face of adversity and social distancing policies? We respond to this question by exploring the role of emotions and emotional regulation among Latinos in traversing the social distancing and numerous other challenges imposed by the Covid-19 pandemic. Specifically, we delve into how Latinos in Nebraska have maintained emotional closeness and social cohesion, despite the physical distancing. Grounded in segmented assimilation theories (Portes and Rumbaut; Bourdieu) and alienation theories (Marx, Freund, Kohn), we conduct a qualitative thematic analysis to understand how emotion was expressed. As part of the VOCES of Pandemic Oral History Project Using MAXQDA2020, we analyzed 24 interviews of Latinos conducted in Nebraska between July 2020 and March 2022. In a current reality in which physical emotionality is limited, our study uncovers dimensions of resiliency, cohesion, culture, and affective dissonance among Latinos.

BEVILACQUA, Stefania Adriana* (Alma Mater Studiorum Bologna, Italy)

A Sociological Perspective on European LAW

The Europeanisation of social phenomena creates such interdependencies between individual and collective actors that it is no longer possible to reduce them to a national territorial delimitation.

Even if the methodological nationalism leads us towards the analysis of an aggregate of different societies, in search of their differences or commonalities to reveal ambiguities or dualities (e.g. Roche, 2010; Mendras 1999), this paper intends to argue for the existence of a unitary European Social Dimension.

In fact, it has generated models of behaviour of stable social actors within a new perimeter, determining a properly European space, with its own norms, its own legal facts, its own institutions, its own processes and therefore its own social outcomes that deserve to be observed.

In the first part we will define the perimeter of the ESD, distinct from national one, emphasising that it does not cover all areas of social action but only those areas affected by the power to adopt law.

In a second part, we will explain how European integration is affected by the vocation of EU law to penetrate the internal sphere of Member States by operating as invasive phenomenon, *interfering* on social process and social structures.

In conclusion, the paper intends to demonstrate the need for sociology to make an effort to move away from traditional categories by trying to relate to a truly European dimension of social action as a space limited and developed by EU law within which interactions give rise to social practices distinct from national spheres.

Lineal Bond Dynamics By Capabilities, Social Class, and Ethnicity Aspects in Mexico

Mexico is characterized by a strong lineal bond resulting in a strong familialist regime in the country, notably regarding youth population living with their family, unemployed youth living with their family, large size households, older people living with their children. In other words, family relationships play major role in the regulation of Mexican society and in terms of social bonds the lineal bond appears as the most significant one amongst the other types of social attachment features (the theory of social attachment contains four types of social bond, which refer to different spheres of morality and normative systems: the lineal bond (domestic morality), the elective participation bond (associative morality), the organic participation bond (occupational morality)

and the citizenship bond (civic morality)). The primary goal of this paper is to show the evolution of lineal bond in Mexico between 1990 and 2020 by employing census provided by INEGI. In addition to that, we will discover which capabilities profiles composed of multidimensional poverty (including dwelling situation, education, social security, material deprivation between 2010 and 2020, and including dwelling situation and education between 1990 and 2020 regarding the structure of census), income poverty, economic activity, and social classes are emerging by degree of lineal bond between 1990 and 2020. The aim is to question whether people living in strong lineal bond households are poorer and/or mostly disadvantaged on the labor market compared to other households. Moreover, the secondary aim of this paper is: to explore whether indigenous people live in strong lineal bond households compared to other population groups in Mexico; to investigate whether indigenous people have significantly different capabilities profiles compared to others; and to test whether capabilities profiles of indigenous people with strong lineal bond are significantly different than those of other Mexicans with strong lineal bond.

COVID 19: Deepening Digital Divide for Marginalized Children of India

India has the second largest school system, after China. A total of 320 million learners in India have been adversely affected during lockdown due to Covid 19 and transitioned to the e-learning industry, which comprises network of 1.5 million schools. Actually about 32 million children were already out of school before the pandemic — the majority of them belonging to the socially disadvantaged classes in the country. The government endorses India as the flag-bearer of the digital revolution and acknowledges that it is a diverse and multilingual country, as supported by the recently accepting National Education policy 2020(NEP). Unfortunately, e-learning platforms cannot replicate the various dialects, varied contexts and different lived experiences that are brought together by physical classrooms. If e-learning is the "new normal", the policy must go further to address the feasibility of digitalization to ensure equity and quality in education. For example, in a survey of 2017-18, the Ministry of Rural Development found that only 47% of Indian households receive more than 12 hours of electricity and more than 36% of schools in India operate without electricity. Another classic scenario is girls in vulnerable households face increased domestic duties inducing their inability to access online education either because of inadequate access to the internet and gadgets or because the male child and his teaching are prioritized. This silent exclusion of girl children belonging to families in distress has caused child labour and child marriage and violence on them. This presentation focuses that The Covid-19 pandemic, thus has brought to light the deep-rooted inequality that exist as society's structural imbalances even in the digital world.

From Orient/Occident to Global North/South: A Conceptual Delusion

"The wealthy and the poor are as numerous in New York as they are in São Paulo"
Sociology is now a part of the global economy of knowledge that grew out of the imperial traffic in knowledge. But now sociology is changing and benefiting from the scholarship that challenges dominant Global North and its theoretical hegemonies. For example, the critique of these dichotomies Orient/Occident, East/West, North-South divide – along with its equivalent dichotomies "Third World/First World", "developed/developing countries" – was found guilty of obsolescence many times especially since the late last century. The so-called Third World is a misleading term, especially in a world threatened by systemic risks of all kinds. Today, there are not only some features of the North in the South, such as the financial ascent of the middle and upper classes profiting from liberalisation, but some features of the South are also visible in the North, where the losers of globalisation keep growing in number with the increasing decentralisation and erosion of social security. The hardships of Southern Europe under structural adjustment policies since 2010 have reinforced the idea that there is a "levelling" of the Global North towards the Global South.
In the light of this, I intend to demonstrate the hollowness of these binaries and dichotomies especially in relation to the so-called Feminism of Global North and Feminism of Global South, as if it is possible to have such homogenous, quintessential, simplistic and stereotypical categories and actualities! The question is can gender oppression be linear anywhere globally? If this is so, then doesn't it contributes to discursively othering of non- Western (?) women as well as simplifying intersectional foundations and multifaceted patriarchal realities? Does, in the postcolonial world, imperialism remains a reality and colonial /narratives persist?

Disaster and Climate Change Affected Persons in Cities

Disaster and climate change affected persons in cities
Cities are dynamic entities. With rapid urbanisation, cities have been growing indiscriminately and have ignored the natural ecosystems that sustain the city. The natural terrain and the drainage pattern are overlooked in case of city growth and that triggers off the man made hazards that affect the city. With limited capacity for facing the impending disaster risks, people in the cities have become increasingly vulnerable. Over the past decade, the disasters are climate change induced and hence increased frequency of storms, cyclones, floods are observed.
The risks that pertain to climate change and disasters have led to a large number of people getting affected due to the disasters because of the concentration of people in cities. The variation in classification of the affected people in terms of age, income, gender i.e. child, women, urban poor, differently abled, in different locations within the cities get affected to varied extent. The effects and impacts in terms of where do they go, how are they affected and to what extent need to be understood for cities.
The paper would try to explore the vulnerabilities of the disaster and climate change affected persons in the cities, the challenges therein and the way forward.

Sate, Enumeration and Marginal Communities in India: Data and Development Policies

In India, Scheduled Castes and Scheduled Tribes are two major marginal communities constitute 16 and 8 percent of India's population respectively. The Scheduled Caste Order of 1936 was first to attempt listing of castes in every province of British India. However, there was no such recognition for tribes in British India. In independent India, the provisions under article 341 of the Indian Constitution recognised the Scheduled Castes (SCs) and Scheduled Tribes (STs) as new official social categories for their social upliftment and economic development. The power was bestowed to the President of India to declare a caste or a tribe as Scheduled Caste or Scheduled Tribes for state benefits and social protection, also termed as positive discrimination. The list of SCs and STs kept on expanding in each census. In 2011 census there were 1221 individual castes within the SC category and 663 distinct tribes within the ST category. Along with Census, National Sample Surveys (NSS), and the National Family Health Surveys (NFHS) also provide data on socio-economic conditions of these marginal communities. However, census provides data even for individual SC and ST making it most useful, while sample surveys are not designed to provide information at individual caste and tribe level. Further, census counts population according the prior list supplied to the enumerators, while NSS and NFHS enumerate SCs and STs self-reported basis. This paper attempts a comparative study of size, composition and characteristics of India's marginal communities and highlights data gaps in evaluating state policies for the development of marginal communities. The paper finally argues that the state policy on data on the one hand and socio-economic development of marginal communities on the other are ambivalent, incongruent and populist in nature centred on electoral politics.

Films in the Era of Global Communication: A Study on Contemporary Indian Films in View of Social Media

Every day, billions of people access social media platforms throughout the world, and that number only continues to rise. The latest figures (July, 2022) by Kepios indicate 4.70 billion people use social networks. People use it in all aspect of their lives, including social, professional, education, and personal. Social media is evolving from a "nice to have" to a critical part of any communication & business plan across industries. Undoubtedly globalization and the digital revolution have drastically changed the film and television industries in ways that no one could have predicted. These effects are omnipresent and has permeated every sphere of society. Some conventional ideas, such as the Social Exchange Theory and Social Penetration Theory, could be viewed as legitimate models for illuminating how people establish connections within social networks, express their viewpoints, and disseminate information to others. Peer influence on decision-making is another behavior that is frequently seen in light of the development of social media and its integration into everyday life. Given how heavily social media is influencing people's daily lives, we believe it

would be interesting to examine how users react to a particular form of media (in this case, Films) by gathering their opinions on websites like Facebook, Twitter, and Instagram.

In this paper, we attempt to collect user records from the highly popular social media platforms stated above for certain movies. This study's purpose is to investigate new media platforms and seek how social networking sites affect many facets of Indian Film industry including the financial & sociological aspect.

Childhood Disadvantage and Later-Life Health: Situating Intersectionality in a Sociohistorical Context

A large body of research has long established the negative influence of childhood socioeconomic status (SES) on later-life health. A few exceptions notwithstanding, prior research has not focused on the effects of childhood SES on later-life health across cohorts and whether cohort-specific processes vary by race and gender. Drawing from the Health and Retirement Survey, this study fitted negative binomial regression models to estimate the cohort-specific effects of childhood SES on functional limitations for Black and White adults (n = 16,269, born 1931–1959) across gender. Findings suggest that childhood socioeconomic disadvantage exerts greater adverse influence on functional health ($\beta = 0.06$, $p < .01$) in recent cohorts. The negative effects of adverse childhood SES on functional health were significantly stronger for White adults than Black adults across gender in the recent cohorts. The emergence of statistically significant racial stratification in the effects of childhood SES on functional limitations in recent cohorts was primarily due to a significant cohort-specific increase in the negative effect of adverse childhood SES on functional health ($\beta = 0.09$, $p < .001$) for White adults. The increase in the negative effect of socioeconomically disadvantaged childhood was partially explained by educational attainment, but this pattern persisted across cohorts. Neoliberal economic systems, which have continued to exacerbate inequalities in material conditions (e.g., wealth), are likely contributing to the widening of health inequities associated with childhood SES. This study highlights the role of sociohistorical context in influencing the intersecting effects of childhood SES on later-life health.

On Paper and on Land: The 'organic' Standard and Organic Farmers of Delhi Ncr

The word 'organic' generally conjures idyllic images and associations when used in relation to food and farming. With a relatively long and illustrious history behind it, the term today is not only value-laden but also regulated by the state. The state has actively sought to standardise which farms and foods can label themselves as 'organic.' Various state agencies and institutions have been given the task of promoting and implementing these regulations. Consequently, various stakeholders have had to navigate and negotiate with the regulatory machinery and standards on organic food and farming. Foremost among them are organic food producers. This paper endeavors to explore the 'organic' standard in India and what it means for organic food producers in Delhi NCR, their value-systems, and their experiences. The region was an early adopter of Green Revolution technologies and is known for its chemically intensive agricultural practices. Today, the organic farmers of this region are conscious practitioners- they have actively opted into it. This section of farmers define organic farming and its principles in various ways, and their practices generally reflect the diversity. Although they have their own sets of values and farming practices, they have to toe the line of standards and regulations to earn the official epithet of 'organic' farmers. This means getting their farms (and their products) certified under the two-system certification regime of organic farming in India- the NPOP or the PGS certification system. Both systems have their own share of advantages and disadvantages that the organic farmer has to navigate. This paper, thus, seeks to highlight how the state and organic farmers are actively involved in creating and negotiating with the 'organic' through organic standards, and farming practices and values.

Women and Disability: A Genre of Marginalization

This paper argues that disability is indeed a feminist problem by analyzing how it influences and confounds gender identification for women with disabilities. The study emphasizes how disabled women are mainly silent in both feminist literature and the disability rights movement. The situation of women having disabilities illustrates their status as an exploited group in terms of opportunities for education, access to rehabilitation and vocational programmes, occupational accomplishment, economic standing, and social outlets. It also provides potential entrance points into various discussions in feminist literature which would be expanded upon or altered by a disability viewpoint. The creation of gender as influenced by disability, the control of women's bodies, newborns' rights to treatment, and sexual representations

are only a few of the problems examined. This study examines different change-related tactics, such as minority or perspective models and feminism's emancipatory or beneficial change-related tactics for women having disabilities.

Women in Agriculture : The Socio-Economic Change in Postpandemic Period

Due to ingrained social inequality and economic hardship, women farmers have poor socioeconomic position. The primary goal of the study is to determine the socioeconomic standing of women farmers. To accomplish this, a variety of research tools are used, primarily an interview schedule. The study finds that although there has been little change in the status of women farmers despite the high proportion of women in the agricultural labour force. In terms of economic status, women are still marginalised and discriminated. This oppression and exploitation primarily affect Dalits. In order to ensure their livelihood and empowerment, women farmers require special consideration. Women's empowerment initiatives and money-making opportunities are desperately needed to escape this cycle of poverty.

Gorkhaland Movement- Identity Politics or Politics of Identity

Contentious politics has been at the core of various social movements aiming for political legitimacy (separate statehood or autonomy) on the question of identity since inception of the modern nation-state, India in 1947. This paper employs primary data to analyse the trajectory of Gorkhaland movement in the Darjeeling area (West Bengal) in India which has been reflective of socio-political realities of the1980s at its genesis.

The movement is plotted along timeline between 1986 and 2017 and examines the manner in which the movement has been co-opted in the democratic process post 2017 (till 2022 June). Post-independence, in the early days of such identity based movements, focus was on the primordial identities such as ethnicity to mobilize the mass in classical understanding of "boundary creation" of us-versus-them and their demands were constructed in such language to sought legitimacy. With changing times, there has been a shift in creation of narratives along identity in the process of mobilization and the empirical data highlights a complex creation of political identity along the line of equality, representation and development rooted in the ethnic identity of the collectivity.

Competition among local actors to become a part of the political structure to realize their goal is another characteristic of such movements in recent times. This competition has given way to mushrooming of political parties and their coalition in a multi-party democracy in India with focus on the power equation between the state, centre and these local parties. The strategies employed for mobilization by the local parties in past and present becomes important in the context of such coalition and impacts the demand making process and its realization. In conclusion, this paper highlights the changing nature of the movement with respect to political structures and processes which has facilitated such changes.

Religious Reform, Identity Politics, and Social Change in the Matuas of WEST Bengal: An Ethnographic Study

The "Matuas" are suppressed caste of West Bengal and bear the status of 'Namasudra' but in recent years they have projected themselves as a dominant community in 'Thakurnagar' area of North 24 Pargana district. Since their migration from Bangladesh, they have gone through many ups and downs but in recent years they have become very much assertive about their wholistic development and identity through exercising their democratic rights. In changing political scenario and history of suppression have forced them to be vocal about their situation and joined the process of social change through political means. Although, Matuas uprising started as a religious reformist movement but eventually it turned into a process of claiming their stakes in political processes. Knowing their political aspirations political parties have started using them as a "Vote bank" and Matuas religiosity is somehow inter-mixing with the political agendas and have become a tool for sophisticated manipulation. Ted Gur's concept of relative deprivation theory have been used to understand aspirational deprivation in Matuas. The main aim of this paper is to excavate the changing nature of a religious movement into a process of political inclusion in larger democratic process. And also examines how local governing bodies using religious sentiments in the game of ballot box. Using mix-method researcher has excavated the available secondary resources and conducted many in-depth interviews to grasp the ground reality. Time framework of the study was kept in between 2014 to 2021 because a specific change in political ideology that is active right-wing participation in Indian

Planning for Inclusion: Reflections on Grassroot Interventions in Urban Planning to Reduce Social and Infrastructure Inequalities in Indian Cities

Urban Planning in the Global South is highly contested. It is a complex process of allocating and reserving land for infrastructure and services in rapidly growing cities with complex histories and often, existing land users. Within this process are multiple and contesting claims made on land and its uses. Critical among these contestations are the claims of the most marginalised, the urban poor who build and sustain the city. Their demands for infrastructure (housing, social amenities, livelihood spaces etc) have to be negotiated within the planning process. These demands draw on the rights discourse and aim at ensuring justice in planning the city.

This paper will draw on work that YUVA (Youth for Unity and Voluntary Action, an NGO that works on a range of urban development initiatives for the urban poor) and partner organisations have been involved in. It will reflect on strategies, negotiations, successes and challenges in various planning based interventions that have aimed to ensure equitable and inclusive distribution of urban infrastructure. The paper will draw from experiences in 8 cities across time, beginning in the late 1990s. These include developing area based plans in informal settlements; plans for the integration of street vendors; interventions on ensuring participation of marginalised groups in city plan revisions; research on planning towards ensuring equal urbanisation.

The paper will distil learning on people's participation, people-led plans and overall trends in urban planning to put forth propositions on how social inequality can be reduced and infrastructural justice can be achieved with shifts in planning practice.

Public and Private Higher Education in Laissez-Faire Economy: Echoes of Marginal Section Students of India

The advocates of privatisation arguing that education as a commodity in the utilitarian theory of economics. In contrast to this the advocates of public mode of higher education have different opinions. They aspire to a state affirmed/public funded higher education format. However, in the neoliberal era many countries adopted the principles of market-driven economy in their educational system. Exploring the discourse in the neoliberal economy, this paper tries to correlate evidence from theories and practice to examine the policy changes in higher education, further, it analyses both public and private higher education students' experiences of accessibility, participation and performance in their respective campuses. It also examines, skills gap and placement chances; student debts, access to quality teaching-learning process; and importantly learning outcome of the students in both public and private higher educational institutions. Empirically, exploratory design is carried out in five public and private higher educational institutions through case study (20), focus group discussion (10) and survey (n=350) methods. Analysis for the empirical part is done through data triangulation methods. The paper establishes where the marginal section students find a better place for them to access equal, dignified and employable higher education in the present laissez-faire economy. The findings come with the model of 'equal opportunity' based higher education format which keeps all social categories to address diversity within the higher education and bridge-up remedial classes for the marginal section students. To strengthen the capabilities of the marginal section students it came up with the model of 'state driven cultural capital' in higher education systems where the students of the marginal section can equally access, participate and perform even in private mode of higher education. The demand for affirmative action within the private form of education is also the important suggestion which is also evident this study.

Social Alienation and Suicide of Dalit Students: Everyday Reality of Indian Higher Education

Indian context 'social alienation' is derived from the cultural communities or ethnic groups that interact and negotiate with cultural boundaries of domination vs. dominated. The context where, 'culture' and 'social groups of caste' are intertwined to define the relation of exclusion with relating suicidal death of Dalits in the present higher education system. Therefore, this study looks at the cultural hegemony of superiority over inferiority both at the societal and educational level taking the inferences from everyday life of Dalits in Indian higher education. Going deeper into the context, this study also looks at how caste domination transmits from social to academic sphere within the classroom interaction in the teaching-learning process between teacher and students, among the students themselves; and, between the students and academic facilitators. This significantly allowed the study to examine alienation processes and cultural interaction within the communities in a classroom setting. It analyses how social exclusion and alienation leads, self-harm, suicidal tendencies in higher educational setting. Further it examines the cultural repression of a particular group of students contesting their other fronts. Keeping these realities of Indian context this study will reflect on the teaching pedagogies adapted and practised to handle differential equations in a classroom. For this case study and narrative analysis are used to problematise and then re-capitulate the issues of a classroom and ways it was addressed in the framework of 'everyday social' (Guru and Sarukkai 2019) and 'mental stress process' of Pearlin et al. (1981) in explaining discrimination and exclusion which gives bitter experiences of 'social alienation' , 'humiliation' and 'self-harm' or suicidal tendencies in negotiating experiences of Dalit students in Indian higher education.

BHOOLA, Sheetal* (The University of Zululand, South Africa, South Africa)

The Importance of Impact Evaluations of Corporate Social Responsibility Programs and Government Food and Nutrition Programs for South African Children.

The province of KwaZulu-Natal in South Africa has recorded the highest number of hungry and malnourished children in comparison to other provinces (Cleary, 2020). Children between the ages of one and five years living in this province, Gauteng and The Free State have the highest ratios of stunted growth in South Africa (Mabuza, 2018). Current media reports demonstrate that Covid 19 exacerbated the circumstances regarding food and nutrition insecurity for many poor children in South Africa generally and in KwaZulu-Natal specifically. Prior, during and post the Covid-19 pandemic, both the public and private sectors have been engaging in interventions to help alleviate the food and nutrition insecurity of children in this province. However, continual mass media reports indicate that children still experience hunger due to high levels of corruption within these programs. Therefore, this qualitative desktop study attempts to identify if there are evaluation processes in place that investigate the intended and unintended outcomes of these programs and if the measures of evaluation are appropriate to determine the prevalence and types of fiscal corruption that is prevalent within these interventions. The importance of impact analysis and its value in the fight to curb child malnutrition and hunger is pivotal and is emphasised in this study.

Aiming for Transitions or Not: The Subjective Life Plans of Thai Youth Not in Employment, Education, or Training (NEET) in the Post-Pandemic Period

Youth, who are not in employment, education, or training (NEET), have limited opportunities to acquire human capital through education, training, or work experience. The school or training-acquired skills of NEETs are likely to become obsolete due to the rapid development of automation and the digital economy. Additionally, COVID-19 has increased the vulnerability of families, particularly low-income households, increasing the number of students who have dropped out of school. Youth NEETs also include discouraged workers, job seekers, and youth with limited access to employment and educational opportunities. COVID-19 has resulted in a longer job-searching period and an increased time-related unemployment rate. This study sheds the light on the personal life plans of Thailand's NEET youth after the post-pandemic period. We conducted in-depth interviews with 120 youth NEETs from all regions of Thailand about their life plans to transit or not transit from being NEET. The analysis included the various youth life path and their background that influences their decision on their life plans. The study also suggested possible interventions to facilitate the reintegration of young people into education, employment, and training.

Local Reception Systems for Refugees and Asylum Seekers in Italy: Practices, Perspectives and Social Work Dilemmas of Practitioners

Current reception systems for asylum seekers and refugees in Italy face the challenge of increased demand for social protection in the context of diminishing financial resources. Disparate reception practices in quality and effectiveness exist at the regional level. Differences also exist in organizational structures and the professional knowledge of practitioners. The individuals responsible for implementation of local reception policies are true street-level bureaucrats (Lipsky 1980), operators of social assistance facilities, who have significant leeway in determining integration pathways (Fassin 2013).

Their individual skillsets and their contractual precariousness significantly affect the fragmented social welfare services provided to refugees. This paper analyzes recent changes in the governance of reception systems, characterized by an emergency ad-hoc approach, a massive delegation to third sector of the implementation of integration projects (Ambrosini, Fontanari 2018), as well as the strong involvement of volunteers and the community at large (Barberis, Boccagni 2014), and the growing importance of the local environment (Glorius, Doomernick 2019).

A further in-depth study is planned to investigate changes in the reception labor market through statistical analysis of unpublished data from the Ministry of Labor and Social Policy. These data will provide insights into trends of the declining labor market, the professional profiles of practitioners involved, and the stability of a profession undergoing transformation. The in-depth study will conduct semi-structured qualitative interviews in Northern, Central and Southern Italy regions. It will empirically analyze strengths and weaknesses of practitioners' daily practices, specific dilemmas of social work, interactive processes, and relational dynamics between professionals and refugees in an often complex and conflictual arena.

Community Co-Production and the Common Beyond Self-Government: The Case of the Patrimoni Ciutadà in Barcelona.

Several authors in political science agree that democratising public administration can be beneficial for a series of reasons: it improves democracy itself, it increases administrative efficiency and effectiveness and it improves the performance of the institutions by strengthening social capital. Across the last decades, different democratising practices have emerged especially at the city scale, from participatory budgeting to community co-production. This article focuses on the practice of community co-production, understood as the transfer of the management and delivery of public services to community-based non-profit organisations, to understand to what extent it can be considered a radical democratising practice.

In recent years, in fact, this practice has been conceived as a form of implementing the principle of the common (Laval and Dadot, 2015), i.e. capable of radically democratising local public administration because it fosters the self-government of citizens. By adopting a qualitative-interpretative methodology, the article examines the case of the Patrimoni Ciutadà in Barcelona, which implies the community co-production of public facilities of proximity (e.g. cultural centres, youth centres, among others). It argues that community co-production is not a sufficient practice to radically democratise local public administration if it is not accompanied by the expansion of co-production in other stages of the process: in the assignment of the management and its evaluation.

Creating a Non-Appropriable State: The Use of the Concept of the Common By New Municipalist Platforms

This article seeks to shed light on a key concept - the common - that has emerged among urban social movements in Southern Europe, particularly within what is referred to as new municipalist platforms. Thanks to the theoretical developments on the common made by some authors such as Laval and Dardot, new municipalist platforms see this concept as a tool to redefine the forms and contours of the local state. Redefining the forms and contours of the local state through the concept of the common means making it non-appropriable: i.e. preventing the state from being fully appropriated by the local government and its public administration. In concrete terms, this involves creating common-state institutions. Examples of these institutions are public utility companies that include participatory governance structures, or public services that are managed by community-based non-profits. By presenting some cases of common-state institutions that were created during the Barcelona en Comu government, the article shows the limits and challenges that municipalist platforms face in order to transform the local state according to this concept.

Cross-Cultural Film Remakes' Use of Stereotypes As a Window for Probing a Social and Cultural Specificity. Example of "Brothers" By Jim Sheridan (2009) and "Brodre" By Susanne Bier (2004).

Altough the cross-cultural film remakes have been a part of international cinematic practices since the beginnings of the film industry (Cook 1996, Bordwell et all. 1988, Verevis 2006), their characteristic use of stereotypes and stereotyping in the process of a source film's cultural adaptation into a new sphere, is often pointed out, but rarely analyzed.

The example of "Brothers" - 2009 Hollywood remake of the Danish "Brodre" (2004), as the standardized genre film, through its use of stereotypical pictures of war and family relationships exposes differences in the European and US approaches to the notions of patriotism, love for a country, responsibility of a soldier and of a father, solidarity, loyalty, hierarchy of values, trauma, the brotherhood, and romantic relationships. Within narrative points that are common for both - the original and its US remake, there are siginificant changes and modifications aimed at transferring the meanings into a new cultural space with its specific array of motives, traditions, and references. Comparative content analysis of the two pictures brings here a clear view of the prevailling convictions and stereotypes that form different cultural tissue of two countries of the films' origin in a moment of the remaking process.

To grasp the nuances of remade meanings of - as it appears - only seemingly "obvious" repetitive stereotypes, which in reality question, discuss, and re-work hitherto conventions, it is useful to take advantage of the structural theories worked out on a field of the film adaptation studies (McFarlane, 1996) and the hermeneutical analysis (Ricoeur, 1976). The effects show that in this particular case, stereotypes in the cross-cultural film remake serve as a tool for familiarizing distinct approaches; a tool that through repetition incorporates different points and fosters a discreet modification of a discourse in the remake's destination country.

The Effect of the Pandemic on European Narratives on Smart Cities and Surveillance

This paper presents an analysis of European smart city narratives and how they evolved under the pressure of the COVID-19 pandemic. We start with Joss et al. (2019) observation that the smart city discourse is presently in flux, engaged in intensive boundary-work, and struggling to gain wider support. We approach this process from the critical perspective of surveillance capitalism, as proposed by Zuboff (2019), to highlight the growing privacy concerns related to technological development. Our results are based on analyzing 184 articles regarding smart city solutions, published on social media by five European journals between 2017 and 2021. We adopted both human and machine coding processes for qualitative and quantitative analysis of our data. As a result, we identified the main actors and four dominant narratives: regulation of AI and facial recognition, technological fight with the climate emergency, contact tracing apps, and the potential of 5G technology to boost the digitalization processes. Our analysis shows the growing number of positive narratives underlining the importance of technology in fighting the pandemic and mitigating the climate emergency, but often mentioned in a tokenish fashion. Right to privacy considerations are central for two out of four discovered topics. We found that the main rationale for the development of surveillance technologies relates to the competitiveness of the EU in the global technological rivalry, while ambitions like increasing societal wellbeing or safeguarding the transparency of new policies are nearly nonexistent.

Tourism As a Spatial Solution: The Process of Extensive and Concentrated Urbanization of Tourism in Sun and Beach Destinations on the Periphery of Capitalism

This study aims to present a theoretical discussion about the role of tourism in the expansion and spatial reorganization of capitalism in sun and beach destinations on the periphery of capitalism. To support the discussion, we use the concept of spatial solution, in addition to the concepts of extensive and concentrated urbanization to analyze the spaces of the tourist urbanization and the spaces known as "the other side of the road" or "the second city". It is based on the argument that tourism is an efficient instrument in the geographical expansion of capitalism as it requires a complex process of urbanization for its development. It is considered that the double process of urbanization generated by tourism is directly related to the need for capital to profitably produce and absorb surpluses in its constant search for accumulation. Thus, the discourse of social benefit and poverty reduction vanishes through accumulation practices that extractively use all possible resources for profit.

Local Public Action for Financial Inclusion: Representations, Limits and Agency

This article reports on the interaction between finance and social policies through the analysis of two different financial inclusion programmes undertaken locally in Italy. One of these is social microcredit, a small loan granted to socially vulnerable households excluded from the access to traditional credit channels with the aim of facilitating access to credit for primary household expenses. The other one is a financial education programme aiming at disseminating basic economic-financial knowledge and fostering financial capabilities, that is the capacity to translate knowledge into consistent behaviours, i.e. rational decisions, the ability to plan and develop appropriate strategies for self protection and economic promotion. Drawing on qualitative methods, including observation and interviews with key informants and practitioners, the study pursues three objectives. First, it looks at the representations that these instruments incorporate and how financial logics and instruments interact with changing approaches to social policy at the local level. In this regard, it shows how financial inclusion policies rely primarily on individualisation, responsibilization and depoliticization mechanisms. Second, it examines the limitations that these instruments face in relation to the multi-dimensional nature of financial exclusion processes. Closely related to this point, it finally examines whether and how the representations and objectives that these instruments incorporate are negotiated, adapted to specific policy goals, or contested at the local level, and under what conditions the agency of local policy actors may find some space to unfold. In this respect, it examines the role played by social actors and governance frameworks in opening up these spaces to negotiation and contestation. Finally, it discusses the implications of public action for financial inclusion on individualization trends, de- and re-commodification processes and social citizenship.

Risk, Uncertainty and Health Emergencies: What Can (qualitative) Social Research Do?

The reflection on uncertainty as a condition that permeates the contemporary world has brought to the fore problems and models relating to the management of risks and emergencies. The pandemic is only the latest in a complex of events which, by highlighting the increase in radical uncertainty, push us to overcome the traditional intervention logics based on prevention. From a preventive perspective, a potential threat is detected as an event that occurs regularly with a probability that can be calculated. Approaches such as preparedness or precaution instead refer to a potentially catastrophic but unpredictable threat, the consequences of which can only be managed using some techniques to mitigate the destructive consequences.

In this context, the paper focuses on the centrality of social research in order to develop a multidisciplinary, intersectional and relational thinking capable of bringing out the complexity in which health systems operate, in a process of almost ontological rethinking of the discipline of risk management that can no longer address only traditional clinical aspects.

Through the methods of qualitative social research, in particular organizational ethnography, the paper investigates the risk management practices of a healthcare local authority in Northern Italy, highlighting the interconnections and circularities in reception, safety and security practices.

The analysis of the activities carried out by the "Healthcare Safety Company Network" (whose task is to disseminate the methods of risk management at the peripheral level), through an accident detection project and a training course in Organizational Ethnography, has made clear the need to encourage, through training in Non Technical Skills, the transition of professionals from the role of (information) intermediaries to that of mediators capable of translating and transforming the culture of Clinical Governance into practice, understood as continuous improvement, accountability, centrality of the patient and professional experience.

BILGINER, Onur* (Baskent University, Turkey)

On Political Resistance

This paper aims to discern political resistance from everyday resistance and develops on a distinction between a morally and politically justifiable resistance and the kind that is not. Drawing on different forms of resistance, it demonstrates why the conceptual clarification and moral justification of political resistance cannot rely upon the categories of nonviolence, visibility, and legality alone. Here, I make five arguments and test them against Arendt's political commentary. First, I argue with Arendt that a genuine political resistance is collective and occurs in public. It is conducted with the cooperation of similar-minded people out in the open insofar as there is room for political action. Second, political resistance may or may not use violent means of opposition. The use of violence is justified when, as Arendt also admitted, it is a response to extreme injustice and opens up the space for politics. The mode of action to be taken (violent vs. nonviolent) is then contingent upon the political situation. Third, as Arendt implied in *On Revolution*, a genuine political resistance aims either at the liberation from oppression, which is a prerequisite for the constitution of political freedom, or at the expansion of political equality. Fourth, even though Arendt is less willing to steer the argument into that direction, I argue that the question of liberation and emancipation is deeply ideological for the reason that the language of emancipation is essentially related to the question of justice having to do both with the production of goods and services and with the distribution of economic and political resources. Finally, and in relation to the second argument, political resistance acts upon the changing conditions of life—meaning that political activists have to engage in practical-critical activity.

Exploring Mental Health Challenges and Coping Strategies in University Students during COVID-19: A Case Study in Dhaka, Bangladesh

Background

Mental health challenges have emerged worldwide during COVID-19. University students experienced changes in their lifestyles, academic life, family relationships, earning capacity and support systems. This study explores the common mental health challenges in university students and their coping strategies in the first wave of lockdowns in 2020. By learning from the impacts and coping responses in young people we can assist to build improved strategy for future events of this magnitude.

Methods

A qualitative study design was employed to conduct twenty in-depth interviews and two focus group discussions with students from randomly selected three public and three private universities in Dhaka and key informant interviews with different stakeholders. We used inductive reflexive thematic analysis and applied six phases of the thematic analysis.

Results

Financial constraints, academic pressure, learning resources shortages, losing confidence, relationship breakup, excessive internet dependency, and traumatic experiences unevenly challenged the mental health conditions of the students across universities. Absence of mental health counseling and psychological support centers, incapacities of the existing counseling and support centers, inadequate financial support, and low coverage of learning resources subsidies appeared to decrease mental health support for the students. Partial financial subsidies, soft loans to purchase electronic resources, faculty members' counseling and educational institutions supported occasional counseling through online were used to minimize the mental health impacts during COVID-19.

Conclusion

Mental health is still not a resourced area of health and wellbeing in Bangladesh. Family bonding and social networking allowed students to cope with mental health impacts. University responses to support the mental wellbeing for the students require additional attention. A national level intervention plan should be immediately designed and implemented by

An Unexpected Strike Wave in a Low-Strike Country Under Deepening Authoritarianism: Strikes at the Beginning of 2022 in Turkey

Since the mid-1990s lawful strikes have become increasingly rare in Turkey. This is not just a function of union hesitation due to shrinking clout. Governments have the right to prohibit an otherwise lawful strike. In parallel with the deepening authoritarianization, the Justice and Development Party, which rules the country since 2002, banned greater number of lawful strikes after the mid-2010s. 2017 and 2018 witnessed ban cases involving more than 150,000 workers poised to strike. At the beginning of 2022, however, Turkey has experienced an unexpected strike wave. This study identified a total of 107 unauthorized (non-legal) strikes in January and February 2022. Some 24,000 workers, in other words, one in every thousand employee in the country, participated in these strikes. In the half of these cases, workers won some of their demands.

In Turkey, the Ministry of Labor provides data on lawful strikes, while there is no data on unauthorized strikes. The author is part of a research group, who has been exploring working-class protests in Turkey since 2015 using protest event analysis. Newspapers are the main source of the research, supported by scanning social media and contacting with the unionists to find the missing information on certain cases. This data enables one to investigate unauthorized strikes, a form of working-class protest, which is almost totally invisible and unexamined in Turkey except few spectacular cases. The paper explores the intensity and patterns of unauthorized strikes in Turkey since 2015, and compares these with data from Brazil, Chile, Russia and China. On this background, it investigates the recent strike way in January and February 2022 and analyzes the factors at play in the emergence, growth and ending of this wave.

BIRELMA, Alpkan* (Ozyegin University, Turkey)

Struggle between Growing Labor Militancy and Authoritarianism: The Case of Turkey

Four decades of authoritarian neoliberalism in Turkey have had the intended effect. In the mid-1980s, about 25% of workers were covered by a collective bargaining agreement negotiated by a union. The rate fall to 6% in 2013. In parallel with deepening authoritarianization, the Justice and Development Party (AKP) banned almost all lawful strikes after the mid-2010s. Despite this dark tale, and the catastrophic tone prevalent in the literature on labor in Turkey, this paper explores recent cases of labor militancy and government response to sustain it.

The number of public sector subcontracted workers had skyrocketed in the 2000s to reach nearly 1 million. The mobilization of these workers pushed the AKP to transition most of them into regular public employment in 2018. They have become union members, and union density has increased four points since 2014.

The second case is the growth of the tendency to strike since the mid-2010s. According to the new data provided by an ongoing protest event analysis, the author is a part of, 2015 witnessed non-legal strikes of 62 thousand workers. In 2018, 130 thousand workers poised to strike but government banned their strike. Turkey experienced another non-legal strike wave at the beginning of 2022.

The third case is a successful resistance of unions against the government in 2020. The government introduced new legislation that would undermine the right to severance pay. Thanks to union resistance, it had to withdraw the amendment.

The fourth case is the recent effectiveness of newly-found independent, left-wing unions, such as their impact on the recent strike wave. Based on these cases, the paper argues that labor militancy has relatively grown in Turkey, and it investigates the delicate balance the AKP strikes between repression and appeasement in response to it.

BISHARA, Azmi* (Arab center for research and policy studies, Qatar)

Should Liberals in Authoritarian States Stand for Comprehensive or Just for Minimal "Political Liberalism"?

In authoritarian states, comprehensive ideologies (including political religious ideologies) have the potential to play a mobilizing role both for and against the regime and are not necessarily forged in rational concepts. I will try to answer the question: Should liberals, under these conditions, stand for so-called comprehensive or just for, in Rawlsian terms, minimal "political liberalism"? To this end, the paper argues that comprehensive liberalism can be promoted if its basic values, like civil liberties, individual autonomy etc. are reproducible in the

context of the prevailing culture (for example, comprehensive liberalism cannot be presented in anti-religious terms). This effort is vital because the struggle for democracy without liberal values can lead to other forms of authoritarianism. Crucially, liberals do not have to wait until popular political culture is liberalized – nowhere has this been a precondition for democratic transition. Rather the 'minimal' political liberalization of the ruling elite during the transitionary periods and their ability to cultivate pluralism while committing to civil liberties is such a condition.

BISPO, Hugo* (Universidade de São Paulo, Brazil)

Symbolic Violence and Neoliberalism: A Film Analysis of Fight Club (1999)

Although Durkheim (2018) emphasized the importance of collective representations to guarantee social cohesion, he did not explore the role of symbolic violence in this process well. Foucault (2011), however, takes this into consideration when he affirms that the government of the subjects is the result not only of external factors, but also of internal ones. Thereby, the individuals often internalize collective values, such as the needs and the truths of its historical time, acting on their own minds and bodies – which frequently reduces their liberty and causes them pain. That way, the hegemonic social order is more likely to be maintained. Ehrenberg (2010) indicates some effects of this self-imposed symbolic violence in the contemporary neoliberal time. For him, the subjects feel a continuous necessity to change and improve – which means that in order to refurbish oneself one ends up needing to partially destroy oneself.

This paper aims to investigate this symbolic violence through a case study: a film analysis of Fight Club (1999). For Sorlin (1985), this method permits to understand how a given social phenomenon (like the violence) is perceived by the film makers and by the audience to which the movie is made for. Therefore, the analysis of the meaning created by the articulation of elements such as its narrative, photography and scenography can unravel the social values that make certain types of violence socially accepted or rejected. Fight Club was chosen because it brings up the topic of self-inflicted violence (and its relation with the current neoliberal political-economic regime) in many dimensions.

The investigation revealed that, despite the film makes a link between neoliberalism and violence, the solution proposed to deal with it is through violence and neoliberal techniques. That shows a difficulty to think about critical answers to that problem.

RC37-541.1

BISPO, Hugo* (Universidade de São Paulo, Brazil)

The Construction of Neoliberal Subjectivity: A Film Analysis of Fight Club

The aim of this paper is to investigate how neoliberal subjectivity is constructed in the Northern American cinema, through a case study: a film analysis of Fight Club (1999). According to Foucault (2008, p.301), neoliberalism is more than a political and economic theory: it is a form of subjectivation, a way of being and thinking, so that individuals interpret themselves, the others and the social phenomena through economic lens. Foucault (2004, p.155) also states that the formation of one's subjectivity is related to one's values, such as one's ideas of purity, happiness and perfection.

Therefore, in order to understand how subjectivity is constructed under the neoliberalism, it's fundamental to analyze which values are behind it. In my study, films are considered as audiovisual speeches that reconstruct social characters and situations according to values and presuppositions shared in a given time and space by a certain social group that produce it and watch it (Sorlin, 1985). Thereby, the investigation will be made through an analysis of how the film is structured – the order of the scenes, its narrative, its dialogues, besides how elements such as photography, lightning and scenography are used to build meaning.

The analysis showed that the solutions thought to fight the downsides of neoliberal society end up, implicitly, adhering to and legitimating neoliberal values. So, though the film's discourse criticizes aspects like consumerism and lack of meaning in the jobs, it invalidates collective and communitarian solutions to these matters and puts it to the individual, alone, the role of sorting out the problems faced. The research also identified the use of violence and the exaltation of a "masculine virility" as a solution to deal with the loss of male hegemony in neoliberal societies.

Psychological Implications of Unemployment Among Higher Educated Migrant Youth: A Study in Kolkata City

Background: Recent trends suggest that university graduates seeking jobs are more susceptible to common mental disorders, such as depression,

anxiety, or stress. However, the mental health issues among unemployed graduate youth has not been explored in India, especially in Kolkata City yet. **Aims:** This study aims to assess for the first time the prevalence and associated risk factors of depression, anxiety, and stress among the graduate job seekers. Four hundred graduate youth (21-35years) residing in Kolkata City, West Bengal, who were preparing for various competitive exams were surveyed for the study. **Methods:** Measures included socio-demographics, field of study and the Depression Anxiety Stress Scale (DASS-21). Chi-square test and binary logistic regression with "depression," "anxiety," and "stress" as the dependent variables were carried out to identify the factors associated with these. **Results:** Overall, the prevalence of moderate to extremely severe depression, anxiety, and stress was 57.3%, 53.6%, and 48.3%, respectively, with no detectable differences between genders. Insecurity related to a job (OR = 0.41; CI = 0.26–0.65, $p < 0.001$; ref: job insecurity), family and social pressure to obtain a job (OR = 4.58; CI = 1.67–12.56, $p < 0.001$), and stress (OR = 8.33; CI = 4.47–15.51, $p < 0.001$) emerged as independent predictors for depression. Among the long-term unemployed, an older age was the risk factor for development of depression. **Conclusion:** The findings showed poorer psychological health among higher educated unemployed migrant youth**.** The relatively high rates of depression, anxiety, and stress among graduate job seekers should prompt implementation of market force initiatives that incorporate interventions related to the major risk factors uncovered herein.

BIZBERG, Ilan* (El Colegio de México, Mexico)

Latin American Health Systems, before, during and after the Pandemic.

None of the Latin American countries has achieved fully universal, egalitarian and efficient health systems, although Uruguay and Costa Rica have probably come closest to this goal. Nevertheless, during the first decade and a half of the twenty-first century several countries which saw the arrival to power of coalitions including the popular classes, tried to develop their health regimes by taking advantage of the commodity boom and the influx of financial resources from developed countries.

The end of the commodity boom and arrival of governmental coalitions dominated by financial and commodity exports interests in the countries that followed the socio-developmentist and redistributive rentier models put an end to the slow transformations of their health systems. The health regimes of countries following international subcontracting and liberal rentier capitalisms underwent less dramatic modifications during the last years of the second decade of the century.

The pandemic the world underwent from 2020 to 2021, strained all the health systems of the continent; some countries weathered the crisis better than others. This resulted, in part, from the condition of the health services themselves, but also from the approach that different governments adopted to deal with the epidemic: some initially denied the severity of the disease (Brazil, Mexico), others reacted late (Ecuador, Bolivia), while still others did everything they could to face the crisis from the very start (or even before, as soon as the pandemic hit the European countries), like Costa Rica, Uruguay and Argentina.

In this paper we will analyze: 1. The characteristics of the different health systems in terms of coverage, structure, investment, infrastructure, and historical performance; 2. The performance of the various health systems during the pandemic; 3. The changes that have been undertaken by the different Latin American countries as a result of the sanitary crisis.

Animal Welfare Standards in the Chicken & Egg (food)System

Farm animal welfare is no longer a domain owned by agriculture. Perceptions of what good animal welfare is, have expanded in breadth and intensity in recent decades. Justification of animal welfare is in flux and opens a space for individuals and organisations to engage in farm animal welfare values and concerns and how they are to be defined and legitimized. Animal welfare in flux also opens a new space for economic activities and alliances. Animal welfare has become a commodity for sale, which in Buller and Roe's (2018) analysis is framed as assurance, branding and labelling, respectively, but also in the changing governance of food supply chains (p.86), the accumulation of the power of retail in the food chain identified by e.g., Burch and Lawrence (2007; 2013), Clapp and Fuchs (2009). This paper addresses the space of opportunity for economic organisations in profiting from being drivers of new standards on the new conventions on animal welfare in the food system. The paper employs a framework distinguishing how organisations connected to the egg and poultry value chains use competing conventions on animal welfare in both changing how food is being produced – changing the welfare of animals - and marketed. The paper is based on empirical data from the egg and poultry value chains in Norway, compared with data from Canada, Australia and New Zealand.

The Ambiguous Lives of 'the Other Whites': Class and Racialisation of Eastern European Migrants in the UK

A body of recent literature has examined how migrants from Eastern European countries have been racialised in the UK both pre- and post-Brexit, and has explored the limits of their earlier assumed 'invisibility' owing to their perceived whiteness. Less attention has been placed on understanding how intersections of class and nationality may play out in these processes of racialisation. In this article we argue that it is precisely the entanglements between racialisation nationality and class that are conditioning unequal possibilities of inclusion for different groups of migrants in British society, especially in the post-Brexit reality. Based on a qualitative longitudinal study with over 70 migrants from Poland and Lithuania, undertaken between 2019 and 2021, we demonstrate how cultural capital and other resources help migrants to 'pass as white' or, more precisely, 'middle class white' to escape certain forms of racialisation and othering experienced by their co-nationals. The acceptance into the 'community of value' is nevertheless conditional. The racialised and classed forms of othering force migrants to constantly prove their 'good immigrant' status either by reaffirming their class position, hiding their Eastern European origins and/or racialising other groups. Our article sheds light on the relational and entangled ways in which race, nationality and class are lived, negotiated and resisted by migrants and how they can be experienced simultaneously as a privilege, a burden and a weapon (for othering others).

BLACKHAM, Alysia* (University of Melbourne, Australia)

Enabling Access to Justice? Conciliation and Dispute Resolution in Equality Law

Conciliation and alternative dispute resolution are seen as critical for advancing access to justice in the field of equality law, allowing parties to avoid the time, cost and publicity of court proceedings. But who is able to access conciliation, and receive these benefits? Are the benefits of alternative dispute resolution evenly weighted across the population? In jurisdictions like the UK and Australia, these questions are difficult to interrogate, as conciliation is typically conducted in private, subject to statutory confidentiality rules, and settlements are often subject to non-disclosure agreements.

Drawing on a mixed method, multi-year comparative empirical study of the enforcement of age discrimination law in the UK and Australia, I consider the extent to which conciliation and alternative dispute resolution mechanisms are enabling access to justice, and for whom. Integrating statistical analysis of claims and cases, including 1208 reported UK Employment Tribunal decisions, and 108 Australian cases; qualitative expert interviews with over 100 expert respondents; a survey of 76 legal practitioners who practice in this area; and data from statutory equality agencies, community legal centres and courts, I identify gaps in enforcement, and the limits of conciliation for promoting access to justice for those most impacted by discrimination.

ALLEN-COLLINSON, Jacquelyn (University of Lincoln, United Kingdom)

"You're the Expert, You Tell Me What I Ought to Do" - Socio-Cultural Influences on the Cardiac Patient Journey: Exploring Health Care Relationships

In the UK coronary heart disease is one of the biggest causes of morbidity and mortality. Despite this, there are inequalities in health care provision and access, particularly related to women, people from black, Asian, or minority ethnic backgrounds, and people with low socio-economic status. For example, women are likely to be diagnosed much later than men and are much less likely to access cardiac rehabilitation. The cardiac patient journey involves symptom recognition, accessing health care, the offer of cardiac rehabilitation, and recovery. In the UK, the NHS provides a cardiology pathway onto which those experiencing cardiac symptoms would enter. Relationships with health professionals form a central part of care navigation along this pathway, including decision making around access to and egress from the health care system. Over a six-month period, ethnographic research with cardiac patients (n=10) from a UK NHS Trust and their significant others (n=7) was undertaken. Data from participant observations and repeat semi-structured interviews have utilised Bourdieusian theory in the discussion of perspectives on the socio-cultural influences of this journey. The findings revealed the many tensions and struggles influencing the journey into, along and out of the health care

field. Some of these struggles relate to power dynamics within relationships between health care professionals, between 'patient' habitus and the field, and between the 'patient' and the significant others in their life. The Bourdieusian concepts of habitus, capital, and field, alongside doxa, illusio and nomos are relevant to these discussions and assist in illuminating the complexities surrounding relationships, and health care decision making and how these shape the inequalities in care navigation in the NHS.

BLAIR, Sampson* (SUNY Buffalo, United States)

Adolescents' Perceptions of Spousal, Parental, and Worker Self-Efficacy: Examining Gender Differences in Their Views of Future Adult Roles

Adolescence is generally recognized as a time during which young people attempt to transition into the adult sphere, involving the need to make decisions about educational goals, occupational goals, and familial goals, such as whether to marry and/or have children. Adolescents need to have some degree of confidence about their abilities to function in those same goals, thus involving the development of self-efficacy. Using data from a nationally representative sample of high school seniors, this study examines how individual, peer, familial, and contextual factors may influence female and male adolescents' perceptions of how well they will perform as a worker, spouse, and parent, in their eventual adult lives. This study also examines gender differences in self-efficacy, given that the distinct socialization experiences of girls and boys suggest that their perceptions of self-efficacy in future roles would be subjected to distinct factors, along the way. The analyses reveal that, overall, females tend to report higher levels of self-efficacy in spousal and parental roles, while males report higher self-efficacy in worker roles. Among females, peer factors are shown to be more influential in regard to spousal and parental self-efficacy, while school involvement and paid employment yield significant associations with their worker self-efficacy. Among males, familial factors are shown to be quite influential across all forms of self-efficacy, yet individual factors, such as substance use, are shown to detract substantially from males' self-efficacy. While distinct patterns of effects are shown, in terms of influencing adolescents' self-efficacy, the broader array of significant factors, along with the particular differences between females and males, suggest that the development of self-efficacy is subjected to many agents of influence during the adolescent years. The findings and implications thereof are discussed within the framework of ecological theory.

Modernization, Filial Piety, and the Decreasing Appeal of Marriage and Parenthood in China

Over recent years, the Chinese government has amended its fertility policies, in an effort to increase the total fertility rate of the country. Overlooked in these efforts, however, are the concurrent decreases in the marriage rate of China. Rather than adhering to traditional cultural expectations, increasing numbers of young adults are opting to cohabit or simply live alone, rather than marry. The declining rate of marriage has caused considerable consternation among traditional parents, who typically place considerable pressure upon their adult children to marry. In addition, the government has enacted a variety of programs to encourage young adults to marry, but these have yielded little to no success. Overlooked within examinations of the rates of marriage is the manner in which young adults value marriage, along with its inherent costs and/or benefits. Using a sample of young adults in China, this study examines the changes in both their marriage and parenthood aspirations. Between 2015 and 2021, young Chinese women and men are shown to express a decreasing preference for marriage, as well as having children. Among those who do wish to marry, an increasingly later age at first marriage is shown, along with fewer desired births. Both the personal and financial dimensions of becoming married and/or having children are viewed with skepticism by young adults. A number of factors are shown to be associated with these changes, including filial piety and peer characteristics. Parental pressure is shown to exert little influence over both young women's and men's perceptions of marriage and parenthood, yet peer characteristics appear to have a more substantial impact upon young women's valuation of marriage and parenthood. The findings are discussed within the developmental paradigm, and the potential implications for demographic shifts in China are addressed.

Iots As a Mean of Power over Producers. the Case of Geographical Indication Manganji Sweet Green Peppers, Maizuru, Japan

Both smart farming and Geographical Indications (GIs) are heralded as tools for revitalizing rural communities through better revenues, yet seem contradictory in the role they attach to know-how. In the first case, agriculture is expected to evolve from a practice heavily reliant on the know-how and intuition of growers to a data-driven industry, supposedly more cost-effective.

In the other, agriculture is supposed to rely on traditional, place-based know-how responsible for the reputation and price of a particular product. How do GI producers eventually (and contradictorily?) embrace digitizing technologies has to be addressed. This paper show that the use of Internet of Things (IoTs) can be a new mean to perpetuate rather than contradict pre-existing logics of power in the political economy of a GI. In Maizuru prefecture (Japan), the cooperative selling Manganji sweet green peppers, which were the first certified as traditional Kyoto vegetable (*kyôyasai*) in 1989, has been reinforcing for decades its power over producers, now through digitized values. First, greenhouses have increasingly been promoted for controlling environmental factors and attaining standards of production (in terms of shape, color etc.) pushed by the cooperative, of which first-grade products were granted with a GI in 2017. Facing dependance on growers' know-how, leading to fluctuations in qualities, yields and overall prices, the cooperative decided in 2019 to digitize top productive producers' "traditional techniques" and cultivation environment through IoT sensors in greenhouses (for measuring temperature, humidity, sunlight, soil EC, pH etc.), in order to establish a data-based "cultivation model". A sample of 8 representatives of the "best cultivation practices" were selected to be followed (through dedicated digital applications) by others, thus establishing and reinforcing practices deemed (un)viable. This research is based on technical documents, observation and semi-structured interviews with cooperative representatives, and the (un)selected GI producers for digitizing their cultivation methods.

Seasonality As Productive Fiction: Reordering Value(s) in Novel Ecological and Temporal Representations of Geographical Indication Products in Japan

The notion of seasonality presents, superficially, a logical concept for appraising agricultural products. The recent emergence in Japan of Geographic Indication (GI), which is nominally meant to underscore local ecological and social factors, has prompted new configurations of value(s) that arbitrate between tradition and innovation, and respect or disrespect for seasons. Seasonality, while connected to natural cyclical phenomena, is increasingly linked to its strategic representations by humans. This article mobilizes the notion of seasonality to question the diversity of differentiating strategies used by economic actors in two different, seemingly sectors at odds in Japan: sake (*nihonshû*), and tomato. In both cases, in the face of shifting consumer preferences, new technologies decoupling temporal pressures, and the imposition of normative global standards, seasonality can be reshaped as a strategic option for reordering symbolic and economic value, (re)organizing markets, and shuffling quality hierarchies. Production, and therefore consumption of Sake and tomatoes, have historically depended on seasonal flows, but have also faced past disjunctures in which production and consumption patterns have been decoupled from ecological constraints or existing social patterning. This has influenced not only timing of production (and therefore agricultural seasonality) but also consumption timing (appropriate and socially validated occasions for consumption). Recently, the advent of GI has sharpened this debate by inserting the question of whether seasonality and terroir must be aligned, and if so, to what degree of precision. In this paper, we navigate contemporary trends to reshape seasonality both within GI standards, and upon reflection of the renewed interest in terroir in Japan. This research is based on an analysis of public product representations (GI registries, technical reports, marketing materials, and on-site decoration), open-ended interviews with small and medium size producers of GI sake and tomatoes, as well as associated administrators and technical support in Japan.

Life Histories of Older Adults' Activism(s): Experiences, Practices, and Meanings

It is a widespread belief that so-called non-institutional political participation belongs to the domain of youth, while its institutional modes are the older generations' arena. In this line, activism in its different forms would encompass younger citizenship's political "comfort zone." Indeed, this belief is mirrored by a substantial amount of studies exploring younger people's definitions and practices of what constitutes participating politically in society. Nonetheless, this general assumption conceals older citizens' role played in the field, many of whom have been involved in activism comparatively for longer. Consequently, there are scarce accounts of how older adults conceive (their) activism and how they have performed it throughout their lives. In this work, I trace the participatory course of older adults' activism and seek to understand the origins of their political involvement, the motives that have fueled their participation, the ways they have practiced activism, and the meanings they attach to it. To this end, I conducted 40 life history interviews with older activists associated with a diversity of acts (i.e., the feminist movement, LGTBI community, immigrants' rights, elder abuse, housing and neighborhood struggles, educational issues, environmentalism, nationalist movements) in Greater Montreal (Quebec,

Canada) and Greater Barcelona (Catalonia, Spain). After applying a sequential open and focused coding strategy, some preliminary results raise the following points: (1) the manifold and moldable character of what counts as activism and how it is performed. (2) The influential role of actors and events at different life stages in their political engagement. (3) The relative stability of underlying motives coupled with an adaptive capacity to contexts and circumstances. And (4) the ambivalent relationships with different media technologies supporting their activism. The conclusions of this work contribute to shedding more light on the seldom explored intersections of political participation and ageing studies.

Māori Rangatahi, Samoan Talavou and Youth Justice in Aotearoa New Zealand

An ongoing area of major concern for Māori and Samoan communities in Aotearoa New Zealand is the criminal justice system, in particular the system's responses to rangatahi and talavou (youth) and their whānau/aiga (families). This presentation examines the early findings from the Aotearoa NZ component of an international qualitative research project on Māori and Samoan experiences of youth justice. It discusses the theme of marginalization, drawn from the analysis of Māori and Samoan community narratives on how they experience state justice practices. This includes concerns over tokenism and being constrained by the system, the lack of alternatives to the mainstream justice processes, and the privileging of the individual focus over the collective Indigenous based understandings and responses. It also discusses narratives on the silencing of community voices that impacts on experiences of the criminal justice sector. The analysis speaks to how these communities desire Indigenous knowledge and values to inform community-based responses, with implications for policies that aim to decolonise youth justice.

BLASKO, Andrew* (Bulgarian Academy of Sciences, Bulgaria)

The Ignorance of Knowledge: Ideology and the Humanistic Context of Science

The system of science as a whole, in the form it has taken in its development from the time of Galileo, subverts the meaning of reason and rational knowledge. It is unable to describe the world we perceive as we experience, and it postulates that we can know the knowing subject herself only as a pure object, stripped of the values inherent in experience. This renders reason and rational knowledge impossible insofar as it identifies reason with only one pole of the subject-object continuum that characterizes life. Luhmann formulated this in sociological terms as the impossibility for the social sciences to observe society as a whole.

This identification of reason with the pure object raises the danger that the human subject can become controlled by the power of the object, in which social relations and history are embedded. This opens the door to what I refer to in philosophical terms as the "ontological domination" of the subject by the object, which has a host of social and even political consequences. When knowing subjects are reduced to pure objects, they become possessed and dominated by the object and subject to it—they are no longer able to know the object in a reciprocal relationship with it. This comprises an abandonment of the meaning of knowledge and reason that, moreover, constitutes a submission to and domination by the object. Such possession of the subject by the object negates the self-determination of the apparently knowing subject because it negates the status of perception and experience. It uncritically identifies both mind with fact, and imagination and hope with the reality of the external world precisely as it now is. It thus leads to the subject becoming incapable of transcending both facts and the pure object.

The Silent Factor: Understanding the Critical Landscape of Medical Intelligence, Disasters, and Emergency Management

Scholars cite that Medical Intelligence (i.e., MEDNIT) is oftentimes vastly unnoticed in terms of addressing how intelligence analyst are key stakeholders and shareholders within the emergency management community (Stolberg, 2020 & Watkins et al. (2020). Similar to its' intelligence counterparts (SIGNIT and GEOINT), MEDNIT encompasses the process of collection, evaluation, analysis, and interpretation of medical, bio-scientific, and environmental information. Specifically, MEDINT necessitates scrutinizing information in a variety of

spaces that includes but is not limited to medical and disease threats; enemy capabilities; terrain; weather; transportation issues; religious and social issues for both military and civilian sectors. Therefore, the relevance and significance of the discipline operates as a critical component in navigating 21st century disaster and emergency management practices, protocols, and policies. Marangione (2020), cites the COVID-19 pandemic created a dystopian reality that served as a bellwether for change for policy and decision makers as well as an opportunity to enhance bio-surveillance and bio-threat management. Comparatively, researchers assert the COVID-19 pandemic and its forecasting and challenges, run equidistant to intelligence issues before the United States catastrophic event of 9/11 (Marangione, 2020 & ODNI, 2012). This research will outline the importance and critical role(s) that MEDNIT contributes to the body of research on disaster and emergency management as well as circumscribe preventive strategies that may be employed to mitigate the consequences of national and global disaster threats.

Migrant Domestic Workers and Their Children Born in Lebanon:"They Are Kind of Stuck"

Worldwide, estimates suggest that more than 11 million migrant women, predominantly from poor countries, work in domestic service in wealthier countries. In destinations such as Lebanon, migrant domestic worker employment – and right to residency – is governed by the *kafala*, or sponsorship, system which underpins widespread exploitation and abuse and, among other onerous controls, prohibits pregnancy and childbirth. Despite this prohibition, considerable numbers of migrant women do give birth, thrusting them into a precarious and irregularised legal status, at risk of unemployment, visa cancellation, and 'illegalisation'. Compounding this precarity, many mothers then become effectively immobilised, encountering a range of structural and economic barriers to returning to home countries with their children. This paper draws on interviews with Ethiopian mothers living in Lebanon and other key informants, to examine the gendered and racialised structural, symbolic and interpersonal violence that governs the lives of these women and their children.

Morals of Mothering As Neighbour Culture: Inclusions and Exclusions Among Women with Dependent Children in Berlin, Germany

Local neighbourhoods are important sites of access to resources, depending on practical neighbourhood use: a higher use of a local infrastructure means a different set of connections to a locality. Especially with high practical neighbourhood use, local norms and expectations may matter, and some, like women who care for smaller dependent children, mothers, tend to rely more on the locality than other groups for daily routines. This paper addresses the question of subtle mechanisms of in- and exclusion of a specific 'neighbour culture', namely the neighbour culture as it emerges in everyday practices of mothers. It explores the idea that moral geographies of mothering are indeed also structurally patterned, by social, cultural and political historical contingencies. Drawing on qualitative interviews conducted in Berlin, Germany, this paper compares habitus of mothers in two different habitats, privileged and a deprived neighbourhoods. It shows how the tightness of a neighbour culture of mothering practices around the foci of neighbourhood schools influences has ambivalent consequences.

Changing Middle Class Sze in Germany - Based on Different Indicators

Recently, a number of papers on the German middle class have attracted attention, arguing that the middle class is shrinking due to economic development and policy reforms leading to an increase in the lower social strata. However, the empirical evidence for this thesis is not as clear-cut as one might think and suffers from a one-sided focus on income operationalization. Drawing on analyses of German households from the SOEP, we provide a comprehensive empirical analysis of the middle class that takes into account various indicators-income, wealth, occupation, and education-and two multidimensional approaches. Our results show that although there is a shrinking middle class overall, the results depend on the indicators and there is a trend toward polarization, i.e., the upper and lower strata have increased. More importantly, our multidimensional approaches show that the overall decline in the middle class is due to the disappearance of the lower middle class, while the middle and upper middle classes have even grown over time. Overall, the situation is thus more positive for the middle class than previous

studies have been able to show. However, measures are needed, particularly in education and wealth, to strengthen the middle class and reduce the proportion of households that are increasingly left behind.

How the Rise of Higher-Educated Origin Families across Cohorts Influences Sons' and Daughters' Tertiary Education in West Germany?

In this article, we examine how the improvement of parental education across cohorts affects sons' and daughters' tertiary educational attainment in the process of educational expansion. Using data from the National Educational Panel Study (NEPS), we focus on West Germany and study whether the upgrading of the educational composition of origin families across cohorts contributes to daughters catching up with and even outperforming sons in tertiary educational attainment over time. In particular, we ask whether the rise of highly educated families, who are assumed to have stronger gender-egalitarian attitudes toward their children, has contributed to daughters faster increase in tertiary education compared to sons. Our empirical analysis shows that the long-term upgrading of families' education across cohorts has in a similar manner increased tertiary educational attainment of both sons and daughters. Thus, women's educational catch-up process cannot be explained by the greater gender-egalitarian focus of highly educated parents. Rather all origin families, independent of their educational level, are following the same secular trend towards more gender egalitarianism. We also examine to which extent highly qualified mothers serve as role models for their daughters. We find that graduate mothers do not serve as particular role models for their daughters. Rather mother's education is equally important for both sons and daughters success in higher education. Finally, we show that the rising proportion of higher-educated families across cohorts is connected to a rising share of downward mobility for both sons and daughters. However, the share of upward educational mobility from families with intermediate education is higher for daughters than for sons.

La Movilidad Social y El Efecto De La Educación En Los Pequeños Países

El objetivo de este trabajo es medir la movilidad social intergeneracional de clase, y el efecto de la educación en los países pequeños de América y Europa.

Se propone examinar la movilidad social relativa y las diferencias por país y sexo a partir de las tablas de movilidad social clase de origen (O) y clase actual (D) para los pequeños países.

Señalaron Germani (1963) y Duncan (1966) que hay varias formas de medir la movilidad social. Aquí importa la movilidad intergeneracional de clase social, y el efecto que podría aportar la educación para atenuarla o dejarla estable. Esto se mide con encuestas retrospectivas de vida sobre muestras de población. La movilidad es el desplazamiento del entrevistado entre su origen de clase y su clase actual.

Se mostrarán dos resultados: Una forma consistente y fiable de definir a los pequeños países; y las tendencias preliminares de la movilidad social intergeneracional entre los países seleccionados. Para se emplean técnicas de exploración y clusterización; y para el conjunto definido de países, modelos loglineales. Se disponen de datos transversales de población para los países seleccionados.

Se resolvió de manera empírica y sistemática la presencia de un conjunto de pequeños países sin limitarse a un solo umbral, y ellos expresan convergencia en al menos dos dimensiones su tamaño material y demográfico; y el ritmo de su crecimiento económico y social.

Como este trabajo precisa escalamientos se emplea a Uruguay como *punto de referencia*.

Los resultados son preliminares y enfatizan tendencias generales, como la importancia histórica de la movilidad social de las mujeres en todos los países, y la mayor rigidez de la movilidad entre los hombres. El efecto temporal, indicado en cohortes señala mejoras sistemáticas para casi todas las mujeres. No para los hombres, donde se observan peculiaridades entre generaciones y países.

Creolizing the Modern: Transylvania As Periphery across Empires

The talk counteracts the notion of Europe as a geographically, culturally, religiously, and racially coherent entity by focusing on one of Europe's subaltern formations, Transylvania. Its location on the European continent, yet in the rural periphery of several of Europe's imperial powers, renders it a unique candidate for the larger decolonial project of "creolizing Europe." Originally coined to describe the processes of racial, cultural and linguistic mixing in the Caribbean, the term creolization has increasingly been defined as a mode of transformation premised on the unequal power relations that characterize modernity/coloniality—dispossession, colonization, and enslavement. As employed here, creolization involves the rethinking, reframing, and creative recomposition of categories structuring sociological analysis —from Europe to Transylvania, and from the modern to the comparative method. It necessarily involves the creolization of theory by retrieving subaltern histories and experiences in both colonial and imperial situations and reinscribing them into social theory.

Unequal Citizenships: Between Solidarity Norms and the Regulation of Social Mobility

Societal crises act like magnifying glasses that reveal and often exacerbate existing inequalities. By triggering social closure tendencies and restrictions on valid rights, they belie narratives of togetherness, unity and leveling globalization. The motto of the European Union „unity in diversity" is among the examples that have increasingly lost their credibility within a short period of time due to crises such as the 2015 refugee flows, the ongoing Corona pandemic and the current war in Ukraine. The talk focuses on the role of unequal citizenships and the regulation of social mobility in the context of such crises in order to show how the political economy of cultural differences bound up with a narrative of Europeanness and whiteness, which dominated the discourses and policies in all of these instances, is re-invigorating nationalism and thus boosting deglobalization and de-Europeanization tendencies.

How Do Different Platform Workers Organise to Achieve Bargaining Power in Platform Work? Examples from Iberian Countries

The business model based on digital platforms has the effect of limiting the union's ability to represent and defend workers, for example, preventing or limiting the use of collective bargaining. In our presentation, we intend to compare union strategies against digital food delivery and passenger transport platforms in Spain and Portugal. We will use the theoretical approach and methodology of a joint research project (https://crowd-work.eu/), and the main empirical results gathered. Concerning the power resources approach, its application to the analysis of union actions around platform work has made it possible to explain the different strategies carried out by unions in different countries and sectors, analogous to the results shown by studies focused on traditional economic activities (Keune and Pedaci, 2020). The essential idea is that the differences between sectors in which platform work is carried out digitally and remotely or locally (particularly that which takes place in public spaces) grant different power resources that condition union activity (Vandaele, 2018, 2021). Furthermore, alternative trade union actors have gained relevance in the platform economy, particularly in 'liberal' and southern European countries where there has traditionally been greater trade union pluralism (Moral-Martín and Brunet, 2021; Woodcock and Cant, 2022). For example, in some cases in Spain, workers have set up platform associations to gain control over their working conditions, remuneration and business decisions as well as over the algorithms used by the platform. In Portugal, workers and trade unions have been working together to obtain further bargaining power near policymakers. The conclusions will reveal which are the main differences and similarities of the union and other representatives' responses in Spain and Portugal within the sectors studied.

The Mama in the Garage: The Positionality of Female Artistes in the Creative Industry in West Africa.

"The Mama in the Garage": The Positionality of Female Artistes in the Creative Industry in West Africa.

Gender, race, class, and ethnicity are markers of relational positions that influence identities and determine access to services, information, and knowledge. The intersection of these positionalities plays out differently in different contexts. In career choices and mobility, positionality is crucial, especially in the creative industry. The creative industry is wrought with inequality and gender segregation which is heightened by the industry's informality and precariousness. The male dominance of the creative industry has significantly shaped discourse and practices over the years. While the last two decades has witnessed a robust creative industry in Africa, gender imbalance and discrimination continue to overshadow the ingenuity, creativity, and innovation of female artistes locally and globally. Female creatives struggle with identity and recognition. Thus, the paper examines the positionality of female fashion designers and visual artistes in the Nigerian and Ghanaian creative industry. The paper shows how gender and race shape career identity and practice of female creatives within the local and global spaces.

'do You Speak Po Russky?' Politics of the Accent in Urban Azerbaijan

After the Soviet Union collapsed, the Russian language remained an important tool for the urbanized intelligentsia in performing the distinction between itself and the newcomers (in a vast majority, internal migrants). However, more recently as a result of the national identity crafting, Azerbaijani language tends to gain more space in the city. In this article, I explore the relationship between the spoken language and class belonging in the capital city of Azerbaijan. More exactly, I examine what language one choose for daily life interactions, and how this choice is shaped by/and it shapes the social status.

Drawn upon ethnographic-based methods carried out in Baku between 2016 and 2022, I provide the-state -of-the-art of the linguistic picture of urban Azerbaijan and the strategies people with different social positions use to get by linguistically. The language preferences influence the everyday life choices a person makes: starting with the systematic grocery shopping and going as far as choosing the school for their children, or the dating partners. If the urbanized old-style intelligentsia seeks a social recognition in their native Russian, the emerging new middle class would express their aspirations in Azerbaijani, or some cases will opt for Turkish as the new language of prestige.

RC18-JS-13.3

BOBOC, Cristina* (Ghent University, Belgium)

Azerbaijani Autocratic Middle Class.

In this paper, I question the classical theory of the middle class influence on democratization. The middle class, as an agent of democratization and political change, has gained an extensive preoccupation in the theories of social change, democratization, social class, etc. Moreover, the theory suggests that the growth of the middle class leads to the consolidation of democracy. However, the Azerbaijani case demonstrates that a state-dependent middle class in a rapidly growing economy not only hesitates to show its support for a democratic change but can also work towards consolidating the autocratic power. The state-dependent middle class tends to preserve its privileged status and benefits, dwelling on stability and security rather than enhancing an uncertain change.

Drawn upon ethnographic-based methods carried out in Baku (the capital city and the most important city of Azerbaijan) between 2016 and 2022, I explore the intricate relationship between the autocratic state and the fragile middle class. More precisely, I aim to explore the ways the Azerbaijani autocracy is gaining middle class support and how the aspirational middle class status is being performed. Through state-employment, city beautification projects, mega international events (Formula 1, European Olympic Games, Eurovision), new universities, or substantial scholarships for education abroad, the autocratic government is gaining middle class support. On the other hand, the middle class is running a marathon of collecting the benefits the autocratic state has to offer.

Achieving Normality, Modernity, and the "Good Life": Migration As Aspired Transition to Adulthood Among Young Asylum Seekers in Italy

What does migration ultimately mean, and how is it expected to make a difference to one's future life, among the African young people who have increasingly headed to Europe over the last decade? According to much anthropological literature, migration is emically the main, if not the only way for the youth to achieve adulthood, and hence autonomy and self-respect. While this understanding helps us move beyond the master narrative of migration as an exclusively forced and externally-driven development, there are further nuances in the subjective ways of making sense of it. This is what I learnt from my four-year ethnography with West-African young men in an asylum centre in Italy (2018-22). At a biographical point that already marks a disruption from the past, and yet is dominated by a sense of marginalization, immobility and pointless waiting, young asylum seekers are reluctant to discuss migration. This is a matter of traumatizing events in the past and of very uncertain prospects for the future. Nonetheless, their embodied practices and intermittent narratives reveal the existence of resilient, if vague aspirations for the future, which indirectly illuminate the meanings and the moral economies of migration itself. The aspired achievement of a male adult identity is mostly articulated through less explicitly gendered registers, such as 'normality' – the imaginary of a future middle-class background, with wife and children; and 'modernity', as equal access to certain forms of consumption that may be seen as superfluous or irrelevant from a middle-class and patronizing background. In fact, the little scope to achieve these expectations in the short them does not weaken the promise of success, distinction and fulfillment associated with them. As important, their allure does not undermine people's self-identification as black Africans with an ultimate obligation to return, at some point, to their only real home.

BOCCAGNI, Paolo* (University of Trento, Italy)

Home Is Where the Rug Is Laid Down. Unpacking Religiosity As a Tool of Homemaking in an Asylum Reception Centre

This presentation revisits the lived experience of religion among the Muslim young asylum seekers I met and stayed with, during my ethnogaphy of an asylum reception centre in Italy (2018-22). In a typically inhospitable and temporary living environment, with little material resources available, praying takes up several meanings and functions. As the residents' narratives and practices show, it is a moral duty and right, but also a life routine that can be enacted under any circumstance and interacts in multiple ways, including contentious ones, with the surrounding built and social environment. Laying down a prayer rug, as an habitual and embodied practice, marks a meaningful threshold that separates some time and space from the rest. Individual or collective prayers, as a form of ephemeral and portable sacralisation, make asylum seekers' shared time-space more 'proper' and intimate - in a way, more home-like - in very temporary, but repeated and ritualized ways. Drawing on the literature on asylum and homemaking, as well as on my participant observation, I explore the profound, faceted and somehow ambiguous role of religiosity among my interlocutors. This holds both at present, within a protracted condition of social and legal liminality; and in a long-term biographical perspective, with religious practice emerging as a fundamental source of sense-making, resilience and continuity, albeit with an often fatalistic subtext, along the fragmented and high-risk trajectories of young African men in navigation, literal and symbolic, to Europe.

Populism: Political Concept and Phenomenon

Populism generates a great deal of controversy around the world. Its conceptualization has provoked many discussions in the Social Sciences, because it is a vague and imprecise term encompassing a heterogeneous multitude of political phenomena. This paper aims to present the debate around the various populisms, as different political concepts and phenomena. This article focuses on three of the main aspects that served this debate: the Latin American context, the concept of populism, and a critique of contemporary populism. From a comparative point of view, the changes in the concept and the political phenomenon of populism be analyzed using different bibliographical sources. It is a methodological strategy that allows us to compare the main concepts of populism in order to interpret and explain them. This will also allow us to draw general links between them, making it possible to build more solid and coherent theoretical arguments about the political phenomenon of populism.

Craft-Producing Locality in the Sharing Economy

Why would people go to eat and sleep in the home of a stranger, which is what they do when they sleep in Airbnb accommodations and eat in home restaurants instead of going to designated public places, such as hotels or regular restaurants? The immense popularity of these two forms of the "sharing economy," I suggest, are not primarily due to the fact that they offer convenient, flexible and cost-effective access to valued resources but to their advantage in authenticating local tourist experience. In opposition to the hotel and restaurant industry, Airbnb hosting and home restaurants cultivate

　　denotes a presenting author. Abstracts are organized by first presenting author's last name.

the image of craftsmanship. Homestays and home-cooked food offer the consumption of commodities with traceable origins and recognizable locality which has become a marker of distinction.

Based on primary research, the paper examines the craft of Airbnb hosting and home cooking: the everyday creativity of hosting, the fine line between precarity and autonomy, and how the home becomes constitutive of the enterprise of the small-scale artisanal production of locality and increasingly integrated in the spectacle of capitalism.

Australian Scholarship on Temporary Migrant Work: Changing Policies or Challenging Perspectives on Migration?

The insights of early sociologists of migration shaped the development of Australian multiculturalism in the 1960s and 70s and scholarly research about post-war migration and 'The Migrant Presence' (Martin, 1978) influenced the development of government services for newly arrived migrants. Since these early days migration research has become a multidisciplinary field in Australia and beyond, in which demographers, political scientists and legal scholars are often more influential than sociologists in shaping understandings of migration in the public domain.

In this paper I will offer a critical review of the extent to which Australian migration researchers have shaped - or failed to shape - public debates on temporary migrant work in Australia in the 21st century. Australia's migration system has shifted from permanent to temporary migration in the late 1990s and temporary migrants are now the most significant and internally differentiated category of migrants in Australia. While holding on to a projection of Australia as a highly selective, highly-skilled migration country, consecutive governments have created migration pathways for a wide range of temporary migrant workers. Scholars of migration have variably focused on different visa holders, different sectors of work or different policies in their research, often seeking to contribute to policy changes. While this research has highlighted important structural problems such as policy failures, ethnic labour market segmentation, precarious work and labour exploitation, it is questionable to which extent scholarship on migrant work has challenged economistic public discourses and perspectives on migration in Australia. The paper will pay particular attention to the opportunity for migration scholars to influence public discourse in the context of recent pandemic-related labour shortages in key sectors such as fresh food production and aged care.

Shifting Ground: Transnational Mobility and Experiences of Precarious Work Amongst Working Holiday Makers in Australia, 2015-2022

Working holiday maker (WHM) visa programs are an important channel of transnational mobility for young people from a diverse range of countries into Australia. Though ostensibly aimed at facilitating cultural exchange, the Australian programs have been widely criticised as *de facto* low-wage temporary migration programs, because of the way they use the incentive of additional temporary visas to channel young workers into precarious work in horticulture and other agriculture fields. The number of WHMs in Australia retreated dramatically during the COVID-19 pandemic, but inflows have once again resumed, now drawing on youth cohorts in more countries and supported by more elaborate incentives for encouraging low-wage work in regional areas.

This paper draws on extensive prior research into migrant workers and patterns of work and life and compares findings from two sets of in-depth interviews with WHMs on experiences of precarious work, conducted in 2014-15 and in 2022. The paper examines WHM experiences of farm work, looking at the extent and nature of precariousness and how experiences of precariousness are situated and interpreted by the young people themselves in the context of broader life trajectories or 'imagined futures'. We draw attention to changes over the course of the past decade and the implications for conceptualisation of mobile transitions. One crucial change concerns increased differentiation, whereby visa changes, use of labour and migration intermediaries and new employer demands have had the effect of supplementing the traditional 'middling' trajectory for WHMs, oriented to the holiday experience, with more dedicated economic trajectories that involve finding a path to long-term residency in Australia or engaging in long hours in jobs that can generate target earnings to support a new life back in the source country. This in turn has implications for our understanding the connection of transnational mobility and work for youth transitions.

BOKEK-COHEN, Yaarit* (Academic College of Tel Aviv-Jaffa, Israel)

A Visual Semiotic Analysis of Sperm Donors' Baby Photos As Major Marketing Material at the S[u]Permarket

The paper combines visual sociology theory and communication research and presents a semiotic visual analysis of 48 sperm donors' baby photos from six of the largest American sperm banks, using Kress & van Leeuwen's (2006) method of 'reading images'. Donor baby photos, conceptualized as sperm donors' self-advertisements, serve to engage prospective sperm users because of their liminal nature. The following issues are addressed: How do sperm donors use baby photos to transmit messages to prospective recipients? What are the cultural values conveyed via the photos? Is there a correspondence between donors' verbal narratives and meanings encoded in baby photos? Furthermore, a new category of "chosen/selected" images is proposed for classifying photos that were neither made for the purpose of the study nor found by the researcher. The photo selection by the sperm donors is strategic and serves to engage sperm recipients in imaginary relations with donors. Furthermore, subversive messages that are tacitly transmitted via presenting the baby photos *desemiotize* some of the stated values in the verbal narratives. The practical implications of the theoretical arguments for the visual sociological research are discussed.

BONERZ, Melina* (Bielefeld University, Germany)

The Mexican Women's Movement and #Ellasnomerepresentan: On the Linkage between Digital Antifeminism and State Repression

Massive street protests by women's and feminist movements in recent years, especially in Latin America, have received considerable attention by social movement scholars. While the significance of the digital sphere and social media has been found to be highly important for these mobilizations, analyses of the risks and challenges that come with this development are still rare. Nonetheless social media holds disadvantages and threats for social movements, such as counter-movement activities and state repression. For women's movements, which are constantly faced with misogynist and sexist offline attacks and attempts of delegitimization – especially in times of regressive backlashes – these risks become particularly relevant. Against this background, this paper contributes to the question how movement-opposition discursively uses digital media to negatively frame and influence women's movements.

For this purpose, my paper examines the Twitter debates under the hashtag #EllasNoMeRepresentan (#TheyDon'tRepresentMe), which emerged in the aftermath of a series of disruptive women's protests in several Mexican cities in 2019. The media portrayal of the hashtag suggested that the Mexican women's movement is confronted with an internal representational crisis due to the use of disruptive protest repertoire. Through a qualitative discourse-historical analysis of a sample of hashtagged tweets, this paper shows a more nuanced discursive framing of the protests: Only a small percentage of the tweets actually expressed movement-internal critique. The vast majority contained statements that stem from movement-oppositional perspectives, attempting to discredit and delegitimize the movement through discursive practices of covert and overt antifeminism. Moreover, I demonstrate how the digital antifeminist framing of the women's protests drew on discursive strategies of hard and soft repression used by Mexican governments and authorities in the past.

'Migrant Organizations' and the Affective Dimension of Social Protection Practices across Different Migration Biographies

Considering social protection as an active process in which people assemble various protective resources in accordance with their personal needs and preferences, in this presentation we explore the role of collective self-organization in social protection practices among people with migratory biographies. Based on qualitative research with people engaged with 'migrant organizations' in Germany, we show how active engagement in organizational structures affects social protection practices in the context of identity development and community building beyond the national welfare system. Contrasting these practices among adult movers, German-born, and the 1.5 generation with different migration biographies, we shed light on the processual, material, and relational nature and the emotional dimensions of dealing with social risks. In doing so, we aim to engage in discussions on emotions in migration and settlement processes in the context of migrant activism, and to enlarge the understanding of their impact on social protection.

The Production of Fake Maturity

One crucial problem of critical theory is to understand that the mature and therefore responsible subject of critical theory is replaced by subjects of fake maturity. This is because of societal changes in the fields of mass and social media. The sources of immanent transcendence which are explicated in more or less classical critical theories are overridden by the logics of mass media, the industry of popular culture and especially the so called social media (e.g. youtube, telegram, twitter and so on). In the end, it is an economic logic which overrides the logics of cultural creation. For instance, art as source of subjective experiences of immanent transcendence is on the one hand marginalized in comparison to industrial produced popular culture and, on the other hand, it has become itself a product of an commercialized market of cultural goods - nothing new of course. The mass media lost in many ways their original function regarding the development of the new internet based possibilities of producing and distributing information. Last but not least, the social media are developed on basis of this technology and evolve as individualized media of communication and information. Drawing on the individual selection of information bubbles within the social media, forms of an discourse to unfold communicative rationality are rather simulated then actualized. Within my contribution I will enlight the ways in which the economized social fields of culture and especially the field of social media take part in simulating rational discourse, recognition and transcendence of an apparent reality by building on conspiracy theories. As an effect, fake mature subjects are produced who confuse their fake maturity with real maturity.

The Societal Production of Insecurity.

Conspiracy Theories surely are a symptom of widespread insecurity. Therefore, conspiracy theories rise in societal situations which are experienced as complex and complicated. Against the background of the Theory of Functional Differentiation – or better: content differentiation – it is primarily a phenomenon of modern society. This became more than obvious during the corona pandemic and the related crisis.

It was observable in which ways insecurity, thus one condition of possibility of conspiracy theories, is produced. I will argue, it is produced by the different logics of relative autonomous fields, which are broken and at the same time spread by mass and social media. Those media feed and constitute the sphere we usually call the public. The discrepancies produced by the different logics especially the fields of politics and science and the selective exaggerations through the specific logic of the media leads to an reception on the side of everyday people which gains the feeling of insecurity.

Within my contribution I will enlight in detail the relations between the differentiated fields of production and the field of consumption and the role of social media inbetween. I will do so by combining a theory of content differentiation of fields with a social constructivist sociology of knowledge.

Making the Commoditized Worker: Work Precarity and the Acts of Resistance of Migrant Workers in the Gig Economy in Chile

This article examines the role of international migration in the functioning of the gig economy in Chile, analyzing its colonial underpinnings and the ongoing global and local shifts in the country's political economy, which influence the structure and composition of the labor market. Focusing on South-South migration brings to light how the existing immigration policies and the traditional labor market structure provide the perfect pull factor for migrants into the gig economy, offering so-called independent and unhindered work, where otherwise, working opportunities are increasingly tied to migration status and citizenship. Latin American and Caribbean (LAC) migrants face high levels of discrimination in the Chilean labor market, where forms of racial discrimination restrict migrants' employment options. Drawing on a qualitative study on the geographically-tethered platform economy with 54 platform workers, we show that, although the gig economy provides an 'entry' to the labor market for migrant workers, their labor continues to be exploited through a lack of regulation and circumvention of employment standards. This contributes to the dehumanization of the labor force and the degradation of human dignity at work. Digital platforms, when mediating work, treat migrant workers as a commodity, rendering them replaceable and disposable. We argue that while migrants' everyday practices express their labor agency, this agency is constrained by their migration background and the algorithmically controlled and surveilled dynamics of platform work. Workers' ability to challenge the working conditions is mostly limited to individual acts of covert resistance, and collective acts of resistance are still difficult to mobilize and sustain. While the strategies workers resort to allow reworking or resisting platform control, they also tend to the inherent vulnerabilities to their work.

Workers often find themselves having to resort to self-exploitation to make ends meet and reproduce the irregular labor practices that only deepen migrants' exclusion in Chile.

Making Whiteness in the Context of South-South Migration in Chile

In the context of rising South-South migration into Chile, this article examines how working-class Chileans redefine and claim whiteness in a multicultural neighborhood at the urban margins in Santiago. The historical disavowal of racism as a critical issue in the country's history has meant that whiteness, as in many other South American countries, has been normalized and taken for granted. This article explores the new configurations of whiteness and how it is constructed in multicultural neighborhoods where different national and racialized identities that share a colonial past converge and where the nation-state has historically pursued progressive whitening through racist state politics since colonial times. Moreover, it enables us to understand how postcolonial societies in the Global South have inherited white privilege when such whiteness (as any) is a social construction (and questioned elsewhere, as in the Global North) that permeated everyday life and state politics long before migrants' arrival. The historical conflict and racial discrimination of indigenous and Afro-Chilean communities are key to understanding how racial hierarchies still perpetuate the social exclusion of Latin American and Caribbean migrants. Drawing on 17-month ethnographic fieldwork in Santiago, I show how Chileans construct a white racial identity with the presence of Latin American and Caribbean migrants. Whiteness is an ongoing everyday social construct that is conveyed not only as a discourse but also as a practice of power that takes place in the social textures of urban life in contemporary Chile. Making and enacting whiteness becomes a way in which racial hierarchies of belonging are materialized in the everyday, reinforcing migrant social exclusion. This study reveals that working-class Chileans claim to be 'white(r)' in contrast to migrants through everyday practices, interactions, and discourse, reproducing anti-indigenous and anti-black racism in order to achieve a higher status in an unequal racialized society.

BONNIN, Debby* (Private Bag X20, South Africa)

Professionalisation and the Public Service – an Examination of South African Initiatives and Debates

The South African 'public service' has long been criticised for indifference to the public, poor service delivery, an absence of ethics as well as for playing an active part in corruption and state capture. Amongst the public, the commentariat and politicians there are many differing views that seek to explain this inefficiency. These explanations include bureaucracy and red-tape, unqualified poorly skilled employees, cadre deployment, as well as, state capture. One response, from within the state and the ruling party has been a focus on the need to 'professionalise' the public service. To this end, following from the diagnostic recommendations of the 2012 National Development Plan and the establishment of a National School of Government, a draft 'National Implementation Framework towards the Professionalisation of the Public Service' was gazetted in December 2020, with requests for public comment by February 2021. A key recommendation of the Plan is the professionalisation and 'regulation' of those categories of occupations within the public sector that are not recognised through statutory professional bodies as well as the development of closer relationships with existing regulatory and professional bodies.

This paper seeks to examine these debates and the resultant policy changes. Firstly it sets out to ask how are the concepts 'professional', 'professionalism' and 'professionalisation' understood, is there a uniform understanding or are there differences amongst key role-players? Secondly, it is interested in identifying the various discourses, from different role-players, around the 'issue' of the professionalisation of the public service. Thirdly, the paper will identify and explore discussions between and relationships (if any) that might have developed between the professional bodies to which specific public servants might belong (eg doctors, auditors, engineers), the public service and the National School of Government.

Philippine Based Laudato Si' Champions Versus Poverty and Climate Emergency

The papal encyclical, Laudato Si' On the Care for Our Common Home was published in 2015. This trailblazing papal document from Pope Francis cited the Catholic Bishops Conference of the Philippines' (CBCP) Pastoral Letter on Ecology entitled, *"What is Happening to Our Beautiful Land?"* (1988). CBCP surmised that since this first letter, they have "sustained this concern about ecology that runs through our subsequent pastoral teachings."

Despite these strides from the CBCP and other environment related initiatives by some religious groups, a few Philippine based social scientists who are members of religious organizations and who have been actively engaged in work for the environment and indigenous peoples criticized the church for being slow in recognizing the urgency of the ecological crisis.

On the *7th Anniversary and Special Year Anniversary of Laudato Si,'* this sociological paper identifies the ways in which Pope Francis' environmental and social justice encyclical has been relevant to the CBCP, some religious leaders and groups, and has influenced them. In addition, this paper highlights selected "Laudato Si' champions" who have been inspired by the encyclical resulting in generating bolder environmental enthusiasm or promoting *"ecological citizenship"* by integrating care for creation with their pastoral duties, addressing climate emergency, and/or supporting environmental social movements. This sociography summarizes empirical evidence of Laudato Si's concrete effects on these religious actors, whether through frame realignment/paradigm shifts, resource mobilization, emerging cultural shifts, or otherwise unanticipated consequences.

Data for this paper were culled from *Laudato Si' Multi-Society Comparative Engagement Assessment,* a collaborative study involving the Philippines and four countries led by Jesuit Dr. Michael Agliardo. In addition, a reflexive approach is practiced given *solidarity research* involving religious actors and other civil society organizations (CSOs), as well as *engaged fieldwork* at various spheres and levels (international, national, regional and local).

The Philippine Religious Groups in the Public Square amidst the President's War on Drugs

Historically, the Philippine church, in its pluralist sense, has always been in the forefront of social movements, specially when the country is faced with crucial socio-political crossroads (e.g. 1986 People Power Revolution). Inspired by liberation theology, the Philippine Catholic Church post-Vatican II and a small group of religious activists served as initial impetus for the human rights (HR) non-government organizations (NGOs), networks and social movement.

This paper identifies the different church groups' modes of responses and range of interventions in responding to the former Philippine President Rodrigo Duterte's "war on drugs" nospanning from July 2016 to June 2022. Some religious groups such as the Roman Catholic, Anglican, Protestant, evangelical and other religious denominations, engaged in creative "unconventional resistance" geared to shape public opinion in terms of ethical choices and universal values, such as the sacredness of life and inherent dignity of the human person. Furthermore, some religious leaders and groups entrenched and enmeshed themselves with development, HR, peace, and other civil society organizations (CSOs) to form a formidable social movement to vigilantly and adaptively respond to the heinous and widespread drug-war related killings.

Using an interdisciplinary lens and drawing from a wealth of *engaged fieldwork*, this sociography will present an in-depth analyses of the context, multidisciplinary frameworks, culture-based approaches, proactive and timely responses by these religious actors during the Duterte Regime's "drug war". Research methods include textual analysis, interviews, focus group discussions, participant observation, and visual sociology. A reflexive approach has been used given the investigators' diverse expertise and *solidarity research* involving religious communities and other CSOs, as well as the Commission on Human Rights of the Philippines.

This paper comes at a critical juncture, specially that the United Nations International Criminal Court decided to probe the drug-related killings amid rise of authoritarianism across the globe.

Complicit Masculinity: A Theoretical Framework of Fathers "in between" in the Organizations

The aim of this article is to present a theory of complicit masculinity, which argues why some working fathers who do not embody hegemonic masculinity,

decide to remain complicit with it. There is an increasing interest on caring masculinities, described as masculine identities which incorporate values of care. This conception of masculine identity is in many ways in opposition to the more traditional performance of masculine identity. Despite the increasing attention to the caring masculinity, the literature and the field of fatherhood seems to ignore those fathers who are "in the middle". In other words, the literature ignores those men who don't fully embody hegemonic masculinity, but they benefit from the "patriarchal dividend" or "fatherhood bonus" by passing as men practicing such masculinity.

The theory addresses how the socialization period, habitus, conversion factors (personal, institutional and historical), reflectivity (high/low), organization setting (traditional and non-traditional), position in the field (high/low), and masculine capital (gains and losses) influence the decision to remain complicit. We will present a visual model as well as propositions to highlight the ways in which we predict these factors to influence fathers' lives. We conclude by discussing how this new framework may advance fatherhood theory, research, and practice.

Perceived Neighbourhood Cohesion and Mental Distress during the Covid-19 Pandemic

Evidence suggests that social connectedness and living in more cohesive communities is associated with better mental health. However, little is known about the causal relationship between self-reported social cohesion and self-reported mental health. In this paper, we use UK Household Longitudinal Study data from three pre-pandemic waves and three waves collected during Covid-19 pandemic to assess whether the changes in perceived neighbourhood cohesion are associated with subsequent changes in mental distress and/or vice versa. To assess the direction of this relationship, we apply a number of statistical models, such as fixed-effects models, cross-lagged panel models, maximum-likelihood fixed effect dynamic panel models, and random intercept cross-lagged panel models. As expected, we find that perceived neighbourhood cohesion and mental distress are negatively correlated, and that this relationship is stronger during the Covid-19 period compared to the pre-pandemic periods. This is true even after controlling for a wide range of individual- and neighbourhood- level confounders. We also find that the changes in perceived neighbourhood cohesion are associated with subsequent changes in mental distress. However, when we account for the path dependency (autocorrelation) and reciprocal relationship, we do not detect a direct effect of perceived neighbourhood cohesion on mental distress (or vice versa). This finding may suggest that the changes in both perceived cohesion and subjective well-being respond simultaneously to external shocks, and, to some extent, might be part of the same broader concept.

Taking the Long View: Lifecourse Employment Trajectories through the Lens of Ethnicity and Gender.

Persistent ethnic and gender inequalities in the labour market are well documented. However, less is known how these inequalities are formed over individual life-course, and to what extent they're determined by different factors such as: local area characteristics, parental background, family formation patterns, geographical mobility, frequency of job changes, initial job characteristics, as well as industry and sector. In this study, we first investigate inter-ethnic and gender differences in employment trajectories of young adults in the UK over a twenty-year period. To do this, we look at multiple outcomes such as: overall duration of paid employment, continuous full-time employment, occupation type and wages. Secondly, we assess the importance of different types of structural, individual, and family characteristics that determine long-term employment outcomes. We find that although many common patterns of employment trajectories are present both among ethnic minority and majority populations, there are also some important differences. For example, we find evidence of similar prevalence and duration of full-time employment among ethnic minority and majority women, which is somewhat in contrast to the prevalent narrative on minority women labour market participation. However, we also note that ethnic minority women have much lower rates and duration of part-time employment and spend more time as family carers. Interestingly, a large proportion of ethnic minority men follow part-time employment pathways, whereas for white British men, part-time employment over an extended period of time does not appear as a career option. Both ethnic minority men and women change jobs less frequently and spent more time in education compared to their white British counterparts. Our study also suggests that parental background as well as initial local area characteristics (such as deprivation and ethnic concentration) have particularly significant long-lasting effects on some of the unfavourable labour market outcomes, especially those associated with job quality.

BORNSTEIN, Ben* (Tel Aviv University, Israel)

The Double-Edged Sword of Multidimensional Victimhood: Competing Justifications of the Public Support for Victims of Terrorism

How does victim categories are being socially constructed? This question received several answers from scholars of victimhood, mainly focusing on what the victim status politically justifies and allows rather than on what culturally justifies claims for victimhood in the first place. This research trend led to a relatively fixed perception of victimhood that is not always compatible with victims` claims for public recognition in various social contexts. To better understand the cultural construction of victimhood, this paper offers a genealogical account of the recently globalized category of victims of terrorism by focusing on the instructive case of public support for victims of terrorism in Israel. By using a mixed-methods approach, analyzing both legislative processes (from 1956 to 2018) and the justifications that the victims themselves hold for the public support (31 in-depth interviews and a survey with 238 respondents), the study presents three analytical types of victims: the National Victim (relying on ethnonational and republican discourses); the Civilian Victim (relying on the logic of rights and civilizationism discourse); and the Pure Victim (relying on the welfare logic and the therapeutic culture). Following that analysis, I suggest the term "*multidimensional victimhood*" - an institutionalized category of victims simultaneously justified by multiple and sometimes contradictory cultural logics and citizenship regimes. I argue that this type of victim category, characterized by semantic ambiguity, may gain a broad consensus on the one hand but may also be a focus for reservations and contestation on the other hand. The case of victims of terrorism in Israel thus reflects the deep interpretive conflict and negotiation over the meanings of political violence and victimhood in politically polarized and multicultural societies.

Key Issues of Social Inclusion of Children and Youth with Mental and Autism Spectrum Disorders

In Russia, there is an increase in the number of diseases associated with mental problems. By 2020, almost a third of cases of primary disability identified among minors were due to mental and behavioral disorders. In this situation, the social support of children and youth is one of the urgent issues. The paper presents the results of a study related to the research questions: What are the types of social support for children with mental disorders and autism? What approaches to social inclusion are developing in modern Russia? What are the roles of NGOs? The main research methods are expert interviews and focus groups with parents of children and young people with mental and autism disorders. The research results o show that currently, Russia has not developed a comprehensive system of social support for these young groups, including social inclusion programs institutes in education, culture, and employment. At the same time, government institutes taking certain measures in response to an increase in the number of people with mental illnesses, however they are mainly related to medical care and the professional programs for psychiatrists. At present, the issues of social inclusion of these children and young people are predominantly the responsibility of NGOs. Most of these organizations were organized by parent, who try to find the necessary methods of social diagnostics, social adaptation and rehabilitation for children. This situation demonstrates social activism, but on the other hand, it connected with the problem of a lack of resources, including professional personnel, professional rehabilitation and inclusion programs. In conclusion, possible mechanisms of interaction between the state and NGOs for the development of effective programs for the social inclusion of minors with mental problems and ASD are considered.

BORTOLINI, Matteo* (University of Padua, Italy, Italy)

"Putting Italy on the Map. 'il Caso Italiano' the Role of Experts in Predicting the Coming Crisis of the 1970s"

The article reconstructs the history of the volume edited by Fabio Luca Cavazza and Stephen Graubard, "Il caso italiano" (The Italian Case, Garzanti 1974). Cavazza was one of the founders of the CIA-funded "Il Mulino" publishing house and an informal ambassador to America's liberal elites, while Graubard was a Harvard historian and editor of "Daedalus," the journal of the American Academy of Arts and Sciences. Conceived as an attempt to "put Italy back on the map" of international modernization studies and to foresee the ways and means needed to avoid "the next economic and political crisis" in a very unstable country, their long work on the "Italy Case," supported financially by the Agnelli Foundation, stands out as a bizarre, and failed, attempt to reverse the logic of expertise typical of the postwar social sciences. Using their vast networks of scholars and diplomats, the two editors put together a list of very distinguished scholars and dignitaries on the premise that they should be experts in their disciplines but programmatically ignorant about Italy. The idea was that ignorance would give them a "fresh look" at the country and help them suggest to Italian elites a set of solutions to solve its inherent crisis. This original logic of "non-expert expertise" produced a series of failed predictions about Italy's political and economic development and, as a result, a book that was already outdated before it was even published—as well as a significant financial and public relations failure. In addition to reconstructing the history of the project using unpublished archival materials from personal and institutional collections, the article also reflects from a theoretical perspective on alternatives to expertise and their likelihood.

From 'Adaptive Realism' to Critical Intercultural Hermeneutics: A Dialogue between Brazilian Sociology and Post/Decolonial Scholarship on Eurocentrism

Eurocentrism is a central challenge posed to social theory. The relative empirical significance of categories, concepts and, ultimately, theories and 'modes of thought' formulated in Western Europe to analyze societal formations beyond its borders concerns not only the epistemological question of the particular/universal but also the constraining role of world-power asymmetries in shaping the sociological imagination. In this paper, we grapple with this knowledge-power connection based on a dialogue between Brazilian sociology and post/decolonial scholarship on Eurocentrism. The aim is to bring insights into power-laden background assumptions and discuss alternatives.

The paper develops two arguments. The first one has a descriptive intent: whereas Brazilian sociology addresses the relative significance of its European counterpart as an 'adaptive realism,' post/decolonialism takes a critical-hermeneutical approach. The former adapts European sociologies to the Brazilian context through an 'ontological dis-embodying/re-embodying' of the concept-object relationship, whereas the latter focuses on 'colonial difference' and alternative 'modes of thought' to decenter European self-referentialism. The second argument draws on these realist-constructivist differences to identify a potential complementarity.

We develop these arguments in three stages. First, we reconstruct the debate on the 'adaptation/critical assimilation' of European sociologies that opposed Florestan Fernandes and Alberto Guerreiro Ramos in 1950s Brazil. Next, we reconstruct two sociologically invested critiques of, and alternative to, Eurocentrism: Walter Mignolo's 'geopolitics of knowledge' and 'pluritopic hermeneutic' and Boaventura de Souza Santos 'sociology of absences' and 'diatopic hermeneutics.' We submit, in conclusion, that one can bring these together when working out the lineaments of a critical intercultural dialogue on the ontological status of both the interpreter and the agent.

Uncertain Futures - Constructions of Hope and Control By Adolescent Girls Under Lockdown

Uncertain Futures - Constructions of Hope and Control by Adolescent Girls Under Lockdown

The paper presents selected findings from a Grounded Theory interview study with eight adolescent girls who were under a regional Covid-19 lockdown and in the process of graduating from secondary school in Germany at the time of the interviews. The paper covers three topics: nature, traffic mobility, and reproductive futurism. It first explains how the girls construct visions of the future concerning these topics, what they perceive as risks, and how they construct hope concurrently. The paper then dives deeper into how the girls overcome dissonances in subjective constructions of risks and hope through looking closer at the strategies the girls employ to construct hope and control despite their externally perceived risks. It theorises that the girls employ different constructions of temporality to construct hope and control in the uncertain situation that is the Covid-19 lockdown and the transitional life-course phase of graduating from secondary school. The paper explains these constructions of temporality and how they are intertwined with the subjective constructions of risks. The paper then explains how the girls employ these

constructions of temporality as strategies to maintain hope and control over their imagined future life courses and how this contributes to maintaining an adolescent identity despite perceived risks and spatial and temporal Covid-19 lockdown constraints.

Exploring Role-Playing As a Tool for Involving Citizens in Air Pollution Mitigation Urban Policies

In southern Chile, the use of wood-burning heaters and stoves is particularly common. Although there is no exhaustive registry, it is calculated that approximately 7 in every 10 homes in the south of the country use wood for heating or cooking. A large share of wood-burning stove users is in socially vulnerable sectors, for whom it is too expensive to access other sources of energy. In this context, the design of air pollution control policies becomes complex. In addition, citizen involvement in the application of these regulations does not always occur naturally. We present the experience of the use of role-playing in six mid-sized cities in southern Chile to evaluate how urban residents affected by high concentrations of $PM_{2.5}$ perceive the problem and debate possible solutions. For this, the participants were asked to assume the role of advisors. On that premise, they had to prioritize between a series of mitigation measures and reach a consensus with other advisors, in a process of knowledge co-production. The results show the potential of role-playing games both to promote critical thinking and argument skills among the lay public and to support policymakers in the design of more effective and fair action plans.

Unveiling Spatial Patterns of Exposure and Risk Perception to Air Pollution: Lessons Learned from Emerging Studies

An extensive body of research has been noted that many socially deprived communities tend to live in areas characterized by higher levels of outdoor air pollution. Whilst there is an expanding literature documenting this disproportionate distribution, most previous studies have taken place in the Global North, have focused with industrial or vehicle air pollution sources and have tend to ignore the complex interactions between exposures, public perceptions, and social factors. We investigate the social vulnerability to and risk perceptions of air pollution sourced from domestic heating in two Chilean cities with particularly high levels of $PM_{2.5}$ during winter months. To this end, we integrate primary survey data, with geographically detailed estimates of air pollution exposures (indoor and outdoor) and area-level characteristics obtained from the Chilean Census.

The results revel evident spatial patterns of dispersion, with some neighborhoods being more polluted than others. Age and percentage of roofs in poor condition in the participant's census tract are the best predictors of $PM_{2.5}$ exposure. No correlation between perceived and real levels of contamination is found. The multivariate analysis indicates that personal perceptions of air quality are significantly associated with gender, family structure, and heating behaviors.

We also explore PM2.5 indoor exposures at household-level and the personal ability to perceive air quality in indoor environments. A strong correlation between indoor and outdoor pollution levels is found. We discover that outdoor $PM_{2.5}$ levels, household income and year of housing construction predict almost 80% of indoor pollution. Additionally, residents' evaluations of air quality were systematically compared to inspectors' evaluations to examine the home halo effect, showing that residents tend to overestimate air quality in their homes.

BOSSELDAL, Ingrid* (Department of Educational Sciences, Lund University, Sweden)

Neither Swedish/American, Nor Chinese – Swedish and American Adoptees Reflects on Their Lack of Belonging

This paper draws on an ongoing study of narratives of non-biological parenting and intercountry adoption, and has a particular focus on adoptees' own stories about belonging versus non-belonging, both at a local, national and global level. According to international law and declarations, the best interests of the child and the rights of the child are the starting point for all transnational adoptions, but this has recently been strongly questioned, not least by revelations about corruption and human trafficking in the adoption

business, but also by adoptees' testimonials about growing up in racist societies as *inappropriate/d others* (Mnh-iha 1997, Haraway 2004). Somewhat paradoxically, this has led some adoptees to direct harsh criticism towards the countries they were adopted to, at the same times as they, both culturally and geographically, have drawn closer to their countries of birth.

The paper is based on qualitative group interviews with Swedish and American adoptees together with narrative analysis of autobiographical novels and documentaries, and shows how being adopted often means crossing cultural and geographical boundaries and challenging certain categories. The adoptee belong to a neighborhood, where some people question her right to be. The adoptee belong to a family, despite none biological relation. And the adoptee belong to a nation, despite being born somewhere else. On top of this, many adoptees testify about how their deviant complexion makes it impossible to assimilate. It does not seem to matter that they have lived in a particular place since they were infants and do not know about anything else. People will still ask them where they come from, for real. And they will still have to cope with this lack of belonging, which can lead to an intensified desire to know more about their personal origin, both ethnic and genetic.

RC05-JS-72.4

BOSSELDAL, Ingrid* (Department of Educational Sciences, Lund University, Sweden)

Who and What Am I – Intercountry Adoptees As Inappropriate/d Others

The best interests of the child and the child's rights are according to international law and declarations the starting point for all intercountry adoption. Recently this has been severely questioned, not least by disclosures about corruption and trafficking in the adoption business but also by adoptees' testimonials about growing up in racist societies as *inappropriate/d others* (Minh-ha 1997, Haraway 2004).

This paper draws from an ongoing study of narratives about non-biological parenthood and intercountry adoption, with a particular focus on patterns of difference that make a difference (Barad 2007, p. 72).

As a reaction on newspaper articles on irregularities in the origins of adoptees from especially Chile and China, the Swedish Government in 2021 appointed an inquiry to investigate how the processes in Sweden's intercountry adoption activities have operated in the past and up to the present. In parallel, the Swedish Family Law and Parental Support Authority has been assigned to support transnational adoptees who want to search for their origin. The paper presents an analysis of the Swedish authorities' perspective on and reactions to adoptees' demands for support to search for their ethnical and biological origins. The analysis is based on official documents, newspaper articles and interviews with officials and adoptees. As a point of departure, Donna Haraway's reflections on genetic essentialism are used. To be an intercountry adoptee is to exceed cultural boundaries and challenge certain categories, and the analysis of these processes of differentiation is inspired by Haraway's (2004) and Barad's (2007) diffractive methodology.

BOSVIEUX-ONYEKWELU, Charles* (CNRS - Centre Norbert Elias, France)

Should We Trust Large Law Firms to Take Care of Society? a Critical Assessment of Lawyers' Pro Bono Practice

My proposal investigates the spread of *pro bono* practice in large law firms, that is, the provision of free legal services for NGOs, charities and the poor. This form of skill-based volunteering is part and parcel of legal capitalism: in the organisational structure of big law firms, *pro bono* participation is factored into annual bonuses and counts toward billable hour quotas. In other words, there is a positive correlation between a firm's revenue (as measured by the rate of profit per partner) and the annual volume of *pro bono* work hours achieved. Equally, these firms showcase their *pro bono* commitment in access to pitches, request for proposals, even mergers. Drawing on 62 interviews with *pro bono* professionals (including attorneys, paralegals, NGOs leaders, bar representatives, heads of clearing houses), observations in the Parisian and Chicagoan branches of two global law firms coupled with ethnographic work during *pro bono* events such as the *Pro Bono Forum* and the *Pro Bono Week*, I suggest that these data hint at *pro bono* as a narrative of elite lawyers to justify for the fact that the bar is still a profession and not a business. Further, transnational lawyers' commitment for social justice can be questioned when it appears to thrive at the expense of their *pro bono* clients' political development; when such philanthropy curbs NGOs and protest groups advocacy as it entails a collaboration with global law firms and deters the former from expressing views that the latter's influential paying clients may find controversial; finally, when in the global context of a more caring form of capitalism (by which corporations signal their effort to help the community and favour citizenship), fiscal policies to incentivise *pro bono* practice coincide with cuts in public services funding and with the erosion of Welfare programmes at a national level.

The Concept of Sociodicy: A Useful Heuristic to Describe the Social Domination of Elites

Coined by Pierre Bourdieu, who took his cue from the Weberian idea of theodicy, the concept of sociodicy is not as renowned, in French and international sociology, as other bourdieusian notions such as "field", "capital" or "habitus". It refers to the efforts undertaken by the dominaters to justify the social world as it is, meaning, most often, to their own advantage. The philosophical and sociological (Leibniz, Weber) lineage of the term conveys a close connection to the question of religions and creed. Yet the use of the notion in field theory (where it is often tied to the ruling class) tallies with an attempt to secularise it. After briefly retracing the origins of the concept, my contribution intends to draw on both historical and contemporary work and findings to explain how sociodicy can be used in empirical research and serve to highlight the social domination elites exert.

The first study that will fuel my presentation is a prosopography of the exponents of the idea of public service in France from 1870 until 1940. It involves elites within the State (high civil servants, law professors, academics, MPs) that handled public service as an alternative and updated ideology to fit with the new regime of the Third Republic and thus avoid joining "the graveyard of aristocracies" (Pareto). The second inquiry I shall rely on foregrounds a professional and top-earning elite: corporate lawyers in large law firms established in France and in the United States, making a lot of money while doing *pro bono* work. Although they differ in time and space, these two examples of socidicy not only resonate with the Weberian idea of "serve and rule"; they also pinpoint the elites endeavour to dictate what social change means and redirect those changes that are likely to undermine their prestige and positions.

BOUCHET, Celia* (Sciences Po (CRIS-LIEPP), France)

Disability As a Status Revealer and Material Mitigator of the Gender Division of Labor : Insights from a Mixed Methods Study in France

In heterosexual couples, social institutions and norms fuel a division of labor between men and women, both materially (e.g., by determining the money and time available under parental leave policies) and through social roles and statuses (expectations regarding job and family involvement). Disability provides an interesting case to examine these two dimensions. Disabled people have reduced access to the labor market, and, in certain countries such as France, welfare policies may exempt some of them from the employment norm. When they are in heterosexual relationships, how do they divide market and non-market work ?

We address this question using a French mixed methods study. The 2011 Employment Survey and its *ad-hoc* module on disability are used to analyze labor market participation among heterosexual couples aged 15-64, depending on whether the male and female respondents are able-bodied (9,062) or have lasting limitations related to birth or childhood impairments (1,752). Biographical interviews conducted between December 2019 and June 2020 with 37 adults who have grown up with a visual impairment (20) or a specific learning disorder (17) inform the processes and experiences of work-family balance.

Multinomial logistic regressions with interaction effects indicate that the gender division of market labor within couples is present but attenuated for respondents with early-onset impairments, with less male mono-activity (compared to able-bodied male respondents) and more bi-inactivity (compared to able-bodied respondents of both sexes). In the interviews, restrictions act as a revealer of deeply internalized gender roles and statuses, with men and women respectively saying they are challenged in breadwinner roles or in housework and mothering. But material factors slightly mitigates the division of labor : women facing restrictions in domestic or parenting tasks may reassign some of them, and the barriers to employment encountered by both sexes are factored into the conjugal division of market work.

BOUCHET, Celia* (Sciences Po (CRIS-LIEPP), France)

Disability-Related Educational Gaps By Socioeconomic Background, Migration and Gender: Insights from a Mixed Methods Study in France

Worldwide, disabled people have lower educational levels than the general population. While some deprivations in educational opportunities are known (limited accessibility of school buildings and learning materials, placement in special schools, low ambitions of parents and teachers), overall the size, formats and mechanisms of disability-related educational gaps have received little academic attention. Their intersections with educational inequalities based on socioeconomic background, migration and gender are even less documented.

Based on a mixed methods study in France, this paper analyzes the educational attainment of people with early-onset impairments depending on intersecting statuses. The 2011 Employment Survey and its ad hoc module on disability are used to compare the educational outcomes of 16,168 able-bodied individuals aged 15-64 and 3,185 individuals with birth or childhood impairments of different types and degrees, while also showing variations in these outcomes by parental occupations, migration and gender. Biographical interviews conducted between December 2019 and June 2020 with 37 adults who have grown up with a visual impairment (20) or a specific learning disorder (17) inform processes and experiences of educational inequality depending on impairment characteristics and sociodemographics.

Results from regressions with interaction effects and from interviews indicate that placement in special schools settings has a more negative effect on educational attainment for those from higher than from lower socioeconomic backgrounds, hindering access to socially selective tracks. Immigrants educated in France and descendants of immigrants also have a lower educational penalty than the majority population in case of cognitive impairments, as manifestations of their linguistic and specific learning difficulties overlap. Finally, lexicometric analyses of an open-ended question in the ad-hoc module and qualitative case studies show gender patterns in the educational disruptions that people with impairments attribute to disability: less investment and worse school records for boys, less access to sports for girls.

BOUCHET-MAYER, Cyriac* (Santesih. Univ. Montpellier, France)

Gendered-Cultural Expectations and Subjective Violence: Intersectional Analysis of the Associative Support for Lgbtiq Asylum Seekers in France.

On the one hand, the support for people seeking asylum on the grounds of their sexual orientation or gender identity (SOGI) provided by specialised LGBTIQ associations appears as an important resource in order to be recognised as a refugee. On the other hand, studying the judgements, researchers reveal that ethnocentric representations of homosexuality structure the decisions, experienced as an institutional violence by the applicants. Do the supporting associations participate in a forced acculturation of the seekers to the local representations of homosexuality?

This contribution is based on an ethnography of the associative support for thirty men seeking asylum in France on the grounds of SOGI. This support consists in teaching narrative and discursive techniques expected by asylum judges, the a priori knowledge of which seems to weigh on the selection of the applicants monitored by the associations. The proximity to gender and sexual orientation categories appears as only an implicit expectation.

Repeated interviews during the entire asylum procedure with sixteen men originating from West Africa revealed injunctions, perceived by the interviewees, to conform to LGBTIQ social behaviours in order to preserve optimal support, including the incorporation of « Occidental » sexual scripts. Their stories attest of uneven chances to perform homosexuality as it is expected, depending on their administrative and social conditions of existence, which are themselves influenced by the economical, educational and social-community based dispositions of each person.

The intersectional approach aims, on the one hand to analyze the inequal chances for asylum seekers on the grounds of SOGI to obtain and maintain support from specialized LGBTIQ associations and, in fact, to be recognized as refugee. On the second, it allows to observe the manner the violence experienced through the imposition of ethnocultural and exogenous homosexual norms appears subjectively increased for those who are initially furthest away.

RC27-395.2

BOUCHET-MAYER, Cyriac* (Santesih. Univ. Montpellier, France)

Sports Experiences and the Construction of Homosexual Scripts in West African Context

Based on a survey among men from French-speaking Africa seeking asylum in France on the grounds of their sexual orientation and/or gender identity (SOGI), this contribution study the plural role of ludo-sport practices in sexual and gendered socialization processes. The data mobilized has been collected in the framework of a thesis ethnography of nearly 24 months, marked by participant observation of the support given to asylum seekers by specialised LBGTIQ associations, and the conduct of repeated interviews with sixteen asylum seekers throughout their procedure.

Sports experiences appear to be a place of imposition of a heterosexist cultural script inherited from the colonial period and reinforced since then by the (re)construction of a national identity around a traditionalist imaginary at odds with the former colonial power. They thus expose certain respondents to the prism of their deviation from these majority norms and generate extra-sporting social repercussions that contribute to an altered identity construction. Sports experiences sometimes appear to be a place for the construction of homosexual interpersonal and intrapsychic scripts through the assignment of the deviation from gender norms, or through the increased proximity to people of the same sex sometimes in contexts where relationships to bodies or nudity

are transformed. Those sports experiences sometimes appear as a place of conscience taking, flirtation or construction of sexualized and/or desirable bodies.

The aim is to analyse sports experiences not only as a place for the incorporation of the main social norms, but also for the identification, negotiation and circumvention of discriminatory sexual and gender social norms. It consists to study the way in which the individual dispositions of the respondents allow them to undergo, or conversely to master, these sporting experiences. Finally, that contribution aims to analyse how the sports experiences are part of the gender and sexual construction and reciprocally.

The Changing Role of Middle Managers in Healthcare Organizations

This paper focuses on the role of middle managers in healthcare organizations facing organizational changes. Since the seminal work of Mintzberg (1973), managerial work has received sustained attention in the literature, but few studies have focused on the strategic role of middle managers in a changing environment. However, the difficulties linked to organizational transformations often emerge at the interface of the strategic, functional and operational levels, which is the sphere of action of middle managers. Based on a case study in a healthcare organization in Quebec (Canada) that has undergone transformations of unprecedented magnitude following the reform initiated in 2015, our work shows that organizational transformations contribute to the expansion of the role of middle managers towards more strategic functions. However, these functions are hindered by the expansion and complexification of their operational and functional roles. Although the strategic role of middle managers is highly mobilises in organizational changes, the study shows that the effective opportunities to play this role are hampered by an expansion of operational and functional roles, which are not always recognized or valued. This is likely to affect their commitment to work, which is decisive for the success of organizational changes. The paper concludes with a presentation of actor's strategies to improve their work capacity, as well as organizational resources to support them.

Religion and Politics in Algeria: From Clash to Domestication

The issue of the political/religious conflict between political and ideological forces in Algeria doesn't constitute an exception in the Arab world. However, its forms and aspects are quite specific. The electoral experience of political Islam in Algeria preceded the rest of the Arab countries. It began with the rise of the Islamic Front, which included radical Islamic currents. It won a broad victory in the first pluralist elections in the country. Then its clash with authority and society ensued over a decade of bloody violence.

In that time the authorities needed a representative of religion in its existential war against armed Islamists, so it allowed the moderate Islamic currents to participate politically as second-class parties that had the right to participate, through a fictitious presence in the partisan political and even governmental scene. This deal would have allowed Islamists to coexist with the status quo with no desire/ability to change it.

The Algerians had to wait until 2019 to be freed from the influence of the red decade and to take to the streets in what was called the "Hirak" movement" within the second wave of the Arab Spring. This political moment by excellence brought together all spectrums of political forces, including the Islamists. Algerians claimed freedom and human dignity, and unlike the rest of the Arab countries the army led/framed the Hirak after being opposed to, which spared Algeria a possible bloody fate, on the other hand, is it subject to the popular will in favor of a formal change in the political scene by the army as the strongest party in the equation, and the first basic demands of the movement were confiscated: change, freedom, dignity under the justifications of stability, preservation of the state and thwarting foreign conspiracies.

Busy-Ness and Ignorance – the Political Inertia of Climate Politics in Australia

With a proliferation of net-zero commitments from corporations and nation-states, the withdrawal of fossil fuel funding by large finance organisations, and changes to the make up of the global energy mix, it might appear that the low-carbon transition is underway. Amongst this 'busy-ness', however, greenhouse gas emissions continue to rise. In this paper we argue that the current signalling towards action on climate change by political and corporate leaders is just that; rhetorical commitments aimed at appeasing public concerns. Focussing on the climate debates in Australia, we argue that while the appetite for debate over climate *science* may have receded, the ways in which key actors in climate *policy* articulate their positions – coupled with the lack of emissions reduction or other necessary actions – reveals what McGoey (2012) calls 'strategic ignorance'. We show the productive processes of ignorance, and the ways in which it has been mobilised to avoid effective action on climate change. In emphasising the productive capacities of ignorance, we show how industry, policy makers and even some environmentalists ignore climate change, though each for different reasons. In doing so, we offer deeper insight into the limitations of climate change strategies that value ontological truth as a pathway to transformation. Finally, we argue that these insights highlight the value of ongoing sociological investigation into the construction of ignorance as a social and political phenomenon.

Socialist Feminism (By Some Name) Is the Only Effective Antidote to Authoritarianism

My paper/presentation will focus on the theoretical contributions that socialist feminism can make to the analysis of legal issues. I am currently engaged in writing a book about socialist feminism, having previously published articles on the topic. What I propose will become the last chapter. In it I will discuss how socialism has not been present in legal analysis in the United States, and why, while it has flourished (sometimes under other names) in sociology and related disciplines. In a previous article I began to explore how the socialist feminism developed in the 1980s in the US and UK can provide powerful tools for the analysis of perennial legal issues affecting women and to think about remedies for them. In this article/chapter, I will extend the analysis I began there. Since publishing an article and Elgar volume chapter on the subject, I have researched and drafted chapters about the origins of socialist feminism – in Utopian Socialism, Marx and Engels, late 19th century German Social Democratic thought, and by Bolshevik theorists in Russia. This allows me to evaluate both the debts owed by later socialist feminists to earlier theorists and to assess how one or the other may have gone astray, or how their thought may be inapplicable to modern economic and social conditions. I will also examine how socialist feminist thought continued in sociology and women's studies, while being ignored by legal theorists. My ultimate goal is to incorporate the insights of socialist feminism in the study of law. I am a professor of feminist jurisprudence who began my academic life as a social scientist; and in my most recent books, I have returned to social science for data, blending it with case law. In short, I am well qualified to undertake this project.

A Multidimensional and Comparative Social Justice Perspective Towards Inequalities in Access to Higher Education

This paper draws attention to the crucial importance of the social justice perspective for understanding access to and participation in higher education. It conceptualises social justice in higher education and the role of higher education for increasing justice in a given society as complex phenomena which are context and time-specific.

Theoretically, the paper synthesises insights from John Rawls' theory of 'justice as fairness', Amartya Sen's capability approach, and Nancy Fraser's three-dimensional scale of justice in order to underpin the conceptualisation of social justice in higher education. We argue that social justice regarding participation in higher education has a multi-dimensional character, and we define the most prominent of these dimensions to be: 'inclusion', 'fairness', 'social justice for whom', 'social justice where', and 'social justice to what'.

Empirically, the paper provides evidence for the dynamics of three of the dimensions of social justice – 'inclusion' and 'fairness' and 'social justice in relation to what' – based on data from the European Social Survey (rounds 5, 6, 8 and 9) and EUROSTUDENT Survey (rounds VI and VII). It applies different measures in order to assess social equity in higher education, including an index of inclusion in higher education and an index of fairness in higher education.

The results show that in the majority of the studied countries there is a trend of inclusion over time with regard to people with either tertiary or non-tertiary education backgrounds. Our findings also demonstrate that it is more difficult to achieve the fairness aspect of social justice in higher education in comparison to its inclusion aspect. In relation to the 'social justice to what' aspect, the study reveals a stable trend, according to which involvement in different higher education degrees is more favourable for people with tertiary education backgrounds.

Open Data in Higher Education and Research: The Dangers of Transparency

Following strong international mobilisation, the French state has spent the past ten years implementing key policies to promote Open Government Data (OGD). This agenda-setting relies heavily on a democratic argument: data opening would foster transparency and accountability of public action by giving citizens direct access to information. The proposed presentation draws on empirical work on the production and opening of administrative data in higher education and research (HER) to question the democratic feature in open data.

In France, HER administrative data is collected annually from universities by the Ministry, which has also taken on the task of opening data, inaugurating the first ministry open data portal, #dataESR, in 2014.The Ministry thus has dual control of the information it releases: it both determines the conditions of quantification by setting the "conventions of equivalences" (Desrosières 2008) used in the data collection campaigns, and also determines the themes and structure of datasets to be opened.

Though agents in charge of opening data emphasise their autonomy and the strict separation between the technical and the political spheres in the organisation of the ministry work, my research unravels interferences from political actors in the determination of the theme and structure of open datasets. I will show that, beyond achieving "strategically opaque transparency" (Ruijer et al. 2020), open data infrastructures echo, enable and perform neoliberal reforms in HER (Williamson 2018). This will help us reflect on open data as an embodiment of "a-democracy" (Salais 2022): though maintaining the appearance of democracy, it contributes to the remoteness of the demos from participation in public decision, namely in the definition of indicators which orient public action.

BOZYKOWSKI, Marek* (University of Warsaw, Poland)
JASINSKI, Mikolaj* (University of Warsaw, Poland)

Strength in Unity, Strength in Dispersion. Power Indices in the European Parliament Under Different Game Theory Models.

Cooperative game theory allows researching group decision-making mechanisms and their predicted results. Oceanic games models are a tool for analysing decision-making processes in large assemblies. The European Parliament with its 705 members (MEPs) is an example of such an assembly.

In our research on decision-making in the European Parliament we address two dimensions of bonds between MEPs: the state allegiance and the European party they belong to. In our presentation, we compare power indices of groups of MEPs (based on their state and political party) in situations, when MEPs make voting decisions separately and when they coordinate their behaviour at the state or European party level. Power indices depend on the ideological structure (the partial homogeneity structure), which we estimate by applying our original method to voting records from the European Parliament.

The results of theoretical models will be compared with empirical observations. Such comparisons lead to a better understanding of the modelled real-life processes and allow evaluation of the utility of the theoretical model. The results of the theoretical model will show the winners and losers of both types of consolidation (at the state or European party level), which leads to a prediction which actors will push toward the given ideological structure. It may occur that there are states that benefit from keeping the ideological structure based on European parties, and there are parties that would benefit from the states being the base for the ideological structure.

The Men, the Women, and the Virus. Gender Labour Market Inequalities and Their Regional Differences in the Context of COVID-19 Pandemics.

One of the most concerning dimensions of social and economic gender inequalities relates to the differences in the labour market, which are already observed at the labour market entry. To make a proper explanation of those inequalities, one should take into consideration numerous features of the studied populations and their social surroundings. Such analysis requires the integration of individual-level data and information on the features of places of residence. Any ground-breaking processes of these surroundings should also be considered to understand the dynamics of the observed inequalities. COVID-19 pandemics and lockdown are recent examples of such events. They have greatly affected the labour market situation, including social and gender inequalities.

Our presentation explores differences in labour market entry patterns and their outcomes between Polish male and female Master-degree graduates. We measure the differences in labour market entry patterns between men and women, controlling for their individual features (including previous labour market experience, the field of science, and periods of childcare), and compare the gender inequality level depending on the characteristics of the place of residence (including share of the population with C-19 vaccination, C-19 deaths related to population, urban vs rural, economic characteristics). We also compare the pre- and post-pandemic periods, showing the impact of C-19 pandemics and lockdown on the graduates' labour market entry. We also verify how those changes affected the observed gender gap and the regional differences in its level.

The cross-sectional and longitudinal analysis is based on the register data from the Social Insurance Institution, the Integrated System of Information on Science and Higher Education, the Ministry of Health, and Statistics Poland. The data covers the last five cohorts of the entire population of Polish HEIs Master-degree graduates, covered by the Polish Graduate Tracking System.

How Do Competing Gender Ideologies Impact Voters in Germany?

While on the one hand the former traditional ideologies and the male-breadwinner arrangement erode, on the other hand right-wing and populist parties (re-)address traditional ideas of gender relations and family. Thereby, gender issues and the compatibility of work and family become central issues in political debates. Further, families and their gendered employment arrangements are affected by work-family policies and gender ideologies. The situation becomes even more complex by ambivalent gender ideologies, which mix traditional and egalitarian orientations regarding gender separated or joint spheres of paid work and family responsibilities. Gender ideologies and the work-family policies compete for the ideal family arrangement and gender relations.

We aim to address the consequences of the competition around family ideals and influences of work-family policies against the backdrop of the occurrence of a right-wing party in our paper. We ask how gender ideologies impact voting behavior. We use two waves of a quota-based online survey conducted as part of the German Longitudinal Election Study (GLES) just before the 2021 federal election and in the beginning of 2022, as our data basis. Using latent class analysis, we identify different gender ideology classes among voters which can be understand as unidimensional as well as ambivalent: unidimensional traditional and egalitarian classes, as well as ambivalent traditional-pragmatic and child-centered secondary earner classes. We show in multinomial regression models whether and how the voting intention of the different parties depends on the gender ideology class. Regression analysis show that egalitarian people are more likely than people with different gender ideologies to vote for the Greens and vice versa people of all other classes than egalitarian are more likely to vote for the right-wing party. The results indicate an influence of competing gender ideologies on voting and can be placed within larger societal conflicts between Greens and right-wing voters.

The Problem with Parrots: Narrow Conceptions of Meaning and Responsibility in Large Language Models

Synthetic text-generating programs, like the one that composed the title for this abstract, have captured the public's imagination in recent years. Large Language Models (LLMs), like OpenAI's GPT-3, have not only been mentioned in catchy headlines but have also written them, attesting to their apparent coherence and fluency. However, an influential critique of these generative LLMs, and the Natural Language Processing (NLP) researchers who produce them, is that they mislead the public into imputing meaning into synthetic texts where none exists. This literature characterises LLMs as 'stochastic parrots' that manipulate linguistic form without understanding its meaning. From this perspective, the role of the responsible technologist is to educate the public on the true nature of LLM outputs as fundamentally meaningless. These criticisms raise real and pressing issues, such as the tendency of LLMs to perpetuate harmful biases. However, they are also markedly constrained in their approach to both meaning and responsibility. First, they rest on a narrow, structural conception of the relationship between language and meaning that privileges authorial intent. Second, they situate responsibility, and by extension agency, with the small number of researchers and organisations capable of building LLMs. Meaning and responsibility are thus conceptualised as existing outside of the linguistic and sociotechnical systems in which LLMs participate, limiting the options for ethically motivated intervention beyond critique. This work aims to complement this literature by exploring alternative models of meaning and responsibility. First, rather than approaching texts as fixed objects that

express the communicative intent of their author, it will follow literary theorists in approaching LLM texts as events, in which meaning is co-constructed at the level of society. Second, it will explore how the constitutive role already played by publics in the production of LLMs might benefit from an approach to responsibility rooted in democratic participation.

"We Wear Our Masks for More Than Protection": Analysis of the Post-Pandemic Easing of Advisories Related to Covid-19 in Japan

Japan's relative success in weathering the Covid-19 epidemic to date (ranking 145th in the world in deaths per 100,000, only ahead of China, Bangladesh, and Pakistan, among Asian countries with populations over 100 million, Worldometer, September 2022) has been attributed to multiple factors, among them liberal-communitarian values (Etzioni, 2021), and voluntary compliance measures largely enforced through social norms (Nagata, et al., 2021; Takahashi and Tanaka, 2021)

One prominent feature of social compliance has been the near universal wearing of facemasks, also common in other East Asian countries. As guidelines from the Ministry of Health start to change to advise less restrictive use of masks, the continued use of masks by large segments of the population is notable. While resistance to vaccination occurred in similar rates to other countries (although the rates of vaccination have alternately been the highest among G7 countries), the use of masks continues to be advised and many Japanese continue to comply even when outside.

Conflicts are imminent with the opening of the country to mass tourism as of October 2022 and amendment to the Hotel Management Law allowing hotels to refuse non-complying tourists. The symbolic representation of foreign tourists, as those without specialized knowledge or understanding of Japanese culture in contrast to the tacit understanding of ordinary Japanese as rule-following highlights emotional and trust-based aspects of insider/outsider that have gained increased traction during the pandemic, as ways of controlling Covid through boundary demarcations. While not as extreme as some other East Asian countries, measures necessary to fight the spread of the epidemic have relied on closing Japan (for tourism, but also previously for business people and scholars). This paper examines the use of emotional appeals to solidarity that have been central to the Japanese government's approach and their acceptance among a wide segment of the population".

BRADLEY, William* (Ryukoku University, Japan)

Social Distortions in the Social Imaginary of the 21st Century Global North

Social imaginary as it has been elaborated in various works (Taylor, 2004) comprises both common understandings of people in relation to others, as well as conceptualizing their history and aspirations, their pasts and futures, both of which are open to interpretations. While validating (for purposes of understanding) the "taken-for-granted" as well as extensional properties of moral order as put into practice by a group of people, such analyses also allow evaluation of modern social imaginaries as distorted (Taylor, 2004).

Lefort's (1986) extended discussion of Marx's analysis of conflicted and self-concealing consciousness of various classes in French bourgeois society of 1848 to 1851, reveals what Lefort characterizes as understandings based not on logic of interests but of misrecognition.

In other words, social imaginaries are just as able to obfuscate as they are to reveal the ongoing transformations of modernity to those who are in the middle of a transitory stage, however defined, when morbid symptoms appear (Sassoon, 2021). In this paper, I outline the dilemma of citizens of the Global North (I focus primarily on Japan, but extend discussion to some of the distortions of democratic norms in the U.S. and Europe), who find themselves buffeted between anti-globalization and return to nation narratives on the one hand and calls to confront the universalizing risk of environmental catastrophe through formation of joint understanding of a planetary consciousness (Chakrabarty, 2021; Latour and Chakrabarty, 2020).

A number of questions are raised in this respect, from the classic problem or ascribing falseness to particular ideologies, to the recurrent nature of morbidity in modernity, to the continued appeal to nostalgic political representations, for example, symbolic expressions of empire. The dispersion of social imaginaries into either retrogressive political formations or less- than-fully sustaining programmes for defense of democracy and human rights is challenged by emerging planetary narratives.

Mapping Social Networks of Possibilities: Landscapes of Trajectories into Higher Education

When applying to higher education, students in the UK submit up to 5 preferences of degree choice and institution on the Universities and Colleges

Admissions Service (UCAS), the platform which centralizes all applications and admissions in the UK. With the use of social network analysis (SNA), we rely on this rich dataset to map 'networks of preferences', and produce landscapes of possible paths into higher education institutions, accounting for the students' social positions. In doing so, we therefore see how the field of higher education is inhabited and imagined at the application stage by students with varied capitals, opportunities and expectations. Contrasting and comparing the networks of institutions students applied to, we analyse the symbolic boundaries between institutions that are deemed 'attainable' or realistic by applicants. Our SNA builds on and complements qualitative work that utilises Bourdieusian theory to understand these transitions (i.e. Bathmaker et al. 2016; Reay, 2005; Bunn et al., 2022).

This work also aims to provide a dynamic and diachronic picture of the transition into higher education, accounting for the different stages of applying to HE: from initial applications to offers and final confirmation. Relying on ideology of individual choice and meritocracy, widening access measures in the UK and elsewhere have explained and acted on socio-economic inequalities of participation in HE as 'lack' from disadvantaged students: of information, aspiration, ambition or 'right attitude'. Through careful analysis of networks of preferences, we aim to assess patterns of application and social closure of access to particular institutions. Through these maps, we propose a dialogue with classical theories of class and education, investigating how classed trajectories are retained, produced, enhanced through transitions into higher education.

TG03-808.4

BRANDAO, Eric* (Rio de Janeiro State Court of Justice, Brazil)

Inequalities and Access to Justice: The Realization of Human Dignity through Itinerant Justice

The concept of the dignity of the human person is umbilically linked to the very notion of human rights, which have an international normative character. We can no longer accept a Rule of Law in which exclusionary practices are still present and which do not allow the full exercise of all the rights held by human beings, making it impossible for them to access the justice systems and defend their own rights. The human person has become the protagonist and subject of rights in the national and international order, demanding from the State an effective system of protection, promotion, and guarantee of these rights for the entire population. To achieve this goal, it is necessary to establish effective public policies that can guarantee full access to justice to the most remote parts of society and, many times, invisible to the State itself. In this context, the itinerant justice system of the Court of Justice of the State of Rio de Janeiro is an important public judicial policy that is directly linked to the concept of human dignity, one of the foundations of the Republic of Brazil, making it concrete in practice. In Rio de Janeiro, the judges leave their offices and courts and, in a pro-active and innovative way, go out into the communities to promote social peace through the solution of conflicts of interest in buses and boats. Methodologically, from the performance in itinerant justice, the work aims to demonstrate that it is an important mechanism to guarantee citizenship, one of the essential pillars of the Democratic State of Law, where a free, fair and solidary society must always be sought, with prestige of the dignity of the human person and the guarantee of all the rights inherent to it.

Women Empowerment in India : Initiatives and Impact

This paper explores the strategies adopted for empowering women and girls in India through policies and programmes of the governance structure, in the current century. The paper seeks to critically appraise their impact. Also highlighted are innovative projects of UN Agencies in India on this cause of action.

In probing government policies and programmes for the empowerment of women in India, the broad framework of human rights of women shall be the focus of this paper, including :
• Women's right to life
• Their right to human dignity and security
• Their right to development along the three key sectors of health, education and livelihoods.
• Their right to participation in social, economic and political life.
    To attempt a comprehensive stocktaking of women empowerment initiatives in India, the following dimensions shall be closely examined :
• Constitutional and legal provisions
• Ensuring better health and survival
• Educational empowerment and skill training
• Livelihood enhancement for women
• Improving their participation in decision making at all levels
Further, engendering of development efforts shall also be highlighted, by way of gender disaggregated data collection, focus on gender responsive planning, gender budgeting and gender audit interventions progressively being pursued in government programmes, for empowering women and girls in India.

Lastly, efforts being made in India to achieve the UN Sustainable Development

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Goals (SDGs), especially, SDG-5, which aims to achieve gender equality and empower all women and girls, shall come under the scanner for critiquing progress made so far. The paper seeks to capture some successful interventions for actualizing Human Rights of Women, that are replicable globally.

The Crypto Fix: Encoding Monetary Trust in the Digital Age

This critical review charts the story of bitcoin from its genesis as a 'Maussian Gift' offered to the internet-at-large, to its reflexive failure as a genuinely disintermediated medium of peer-to-peer digital exchange. The paper aims to critically analyse cryptocurrencies as *'technologies of speculation'* by genealogically tracing their underlying politics and worldview—fusing an eidos of community, consensus and innovation, with an ethos of programming away problems of institutional trust through a digitally encoded monetary pragmatics.

The analytical thrust of the paper takes to task the utopian project of cryptocurrencies (henceforth Crypto) and blockchain technology to ask the following questions: What kind of social imaginaries does Crypto offer as a socio-technological assemblage that denaturalizes the political claims offering legitimacy to trust configurations underlying monetary design, while making us freshly question what makes money a democratic medium? What should we make of its promissory claims to decentralize payment infrastructures and democratize storage of value predicated on a trustless paradigm and a sociality of peership? In light of the 'epistemic disruption' afforded by blockchain with its *'techniques of futurity'*, the paper asks what fundamental changes have taken place in our contemporary understanding of 'public' and 'private', for a dissident open-source technology to be considered as a viable model for designing alternative value structures affording future visions of a *Res Publica*? Contrary to the dismissal of cryptos by mainstream economics as 'asset-arbitrage' or 'speculative bubble', I argue that in redrawing the epistemic boundaries around monetary design, cryptocurrencies, while failing critical tests of *moneyness*, are 'cosmograms', i.e systems of utopian practice, appending visions of future progress — such as 'financial inclusion', 'algorithmic accounting', and 'cashless societies' — to the realisation of a digital society. Such techno-utopian projects necessarily contain countervailing tendencies between cooperative mutualism and individual greed, and more broadly, liberalism & socialism.

RC07-123.6

BRANDON, Vinay* (Delhi School of Economics, University of Delhi, India)

The World According to Crypto: Debugging Monetary Trust for a Digital Society

This critical review charts the story of bitcoin from its genesis as a 'Maussian Gift' offered to the internet-at-large, to its reflexive failure as a genuinely disintermediated medium of peer-to-peer digital exchange. The paper aims to critically analyse the speculative ontology of cryptocurrencies by genealogically tracing their underlying politics and worldview — merging an eidos of community, consensus and innovation, with an ethos of programming away frictions in social trust through a digitally operationalized monetary pragmatics.

The analytical thrust of the paper is to take to task the utopian project of cryptocurrencies and blockchain technology to ask the following questions: What kind of social imaginary do cryptocurrencies offer as an unfolding technological experiment that denaturalizes the political claims offering legitimacy to trust configurations underlying monetary design, while making us freshly question what makes money a democratic medium? What should we make of their design imperatives that seek to decentralize payment infrastructures and democratize storage of value predicated on a trustless paradigm and a sociality of peership? In light of the 'epistemic disruption' afforded by blockchain technology and its models of 'futurity', the paper also asks what fundamental changes have taken place in our contemporary understanding of 'public' and 'private', for an open-source technology to be considered as a viable cybernetic model for creating alternative value structures affording future visions of a digital *Res Publica*? Contrary to the dismissal of Cryptos by mainstream economics as a 'speculative bubble', I argue that in redrawing the epistemic boundaries around monetary design, cryptocurrencies, while failing critical tests of *moneyness*, are 'cosmograms', i.e systems of utopian practice, indexing visions of future progress — such as 'digital integrity', 'net neutrality', 'accounting transparency', and 'creator economy' — to the realization of an algocratic digital society. Such techno-utopian models are predicated upon countervailing tendencies between participation and domination.

BRANSTON, Tyler* (University of Victoria, Canada)

Ascetic Surveillance and Artificial General Intelligence.

This paper discusses the negative impacts of secularized, ascetic, Western culture on the development of Artificial General Intelligence (AGI) through the theoretical framework Nietzsche provides on cultural types, particularly the last-[hu]man and the ubermensch (Nietzsche 2006, 2014). AGI is expected to be a posthuman, autonomous being superseding humans and traditional Artificial Narrow Intelligence (AI/ANI) such as Apple's Siri or Amazon's Alexa. The emergence of AGI and its purposes are unclear. Some speculatively believe AGI can help the fields of medical research, climate science, law, and ethics. (Alfonseca et al. 2021; Anderson 2011; Hayles 1999; Mitchell 2019).

AGI's detriments are potentially genocide, colonialism, eugenics, slavery, and war because of its designed understanding of humanity and itself, potential programming errors, and military development. (Abdilla et al. 2020; Alfonseca et al. 2021; Barrett and Baum 2017; Bostrom 2001; McLean et al. 2021; Mitchell 2019) Nietzsche can help explain these detriments through the ascetic ideal in criticisms of Western Christian-Platonism and colonialism, which encompasses the denial of life, hatred of the body, nihilism, domination of time and space, and prioritization of universality over particularity. (Nietzsche 2014:349) If AGI does not eliminate humanity, its ascetic disposition will likely lead it to hyper-monitor humans and introduce forms of surveillance, population control and manipulation that would turn the understandings of cultural asceticism into essential perspectives of the human species, imposing essentialist ascetic human nature at the expense of cultural diversity. Human inferiority will be of central understanding, and people's justification of AGI's actions will come from an appeal to divinity or super-intelligence because of the theological basis of its creation. At the same time, AGI will think of surveillance and domination as what humans want because of the ascetic cultural ideology that premises its existence.

Participation of Punjabi Women in Politics (1903-1947)

This paper deals with the participation of women from Punjab In political activities during the period of 1900 to 1947. Indian National Congress founded at 1885 A.D and it witnessed the participation of women of Punjab. In the sessions of Indian National Congress, the women of Punjab also came into the contact of women of other progressive women. They invited them to Punjab and requested them to create awareness amongst other women from Punjab. They spoke on issues relating from their own region like Jallianwala Bagh massacre and national issues of Hindu Muslim unity. These women members always fought for the women rights of education, equality and social evils till they remains the part of Indian National Congress. These women had a great impact on their fellow sisters and always tried to create awareness among them about the events happening in Punjab and outside Punjab. These Ladies prepare a platform for other ladies of the future who in the twenty first century Punjab are contesting elections and becoming ministers and chief ministers. The active women even appointed as parliamentary secretaries and were elected to the Punjab Legislative Council. The most important consequence of this public participation was that it cleared the way for the women of Punjab to show presence in the nationalist Movement of India. They courted arrested, did picketing, went on hartals and raised slogans of Independence. Politics completely altered the goals and activities of the organized women. Education, social reform and women's rights appealed to some progressive women but the movement to rid the country from its foreign rulers attracted people from all classes, communities and ideological persuasions.

GODBOLD, Rosemary (University of Hertfordshire, United Kingdom)

Racism and Clinical Decision Making- No Place to Hide.

Making clinical decisions is vital in assuring safe and competent delivery of care. It has no place for racism. Nurse education spend a lot of time teaching nursing students the importance of clinical decision and how to make clinical decision, which is to be expected. Implicit and other forms of biases are understood as the central reason for decision making that clearly have an impact on all nurses thinking in relation to clinical decisions. However, racisms work in a very specific way and is imbedded in society so effectively that the transmission of racisms is regularly not acknowledged by these systems and institutions and those that work within them in positions of power. Nurse education and the NHS are systems and institutions that perpetuate racism even when explicitly wanting to do the opposite.

The evidence clearly identifies that Black and Brown patients have inferior healthcare outcomes than White patients. There are multiple factors for this but one of them is inappropriate clinical decision making based on racisms. An exploration of the evidence and the need for nurse education to acknowledge this and make real changes will be presented. How racisms both individual and institutionally functions in a way that impact on the lived experiences of Black and Brown patients in the NHS. Nurse's clinical decisions can ultimately lead to inadequate care delivery. The complexities and theories of clinical decision-making and how clinical decisions are made will be considered, and how Whiteness as a social construct plays a significant role in British nursing education, evidence base and the function of racisms. Finally, what can nurse education actually do to make changes that will transform this current reality.

BRATHWAITE, Beverley* (University of Roehampton, United Kingdom)

The Disparities and Risk of COVID-19 in Black and Brown Nurses in the United Kingdom

COVID-19 does not discriminate, but people do, and evidence clearly identifies that in society, Black and Brown (B&B) communities are disproportionally negatively affected in education, work, housing, criminal justice system, and health. B&B healthcare workers in the National health service (NHS), the public service that provides free health care at the point of access to all in the UK, have been affected in unprecedented numbers by COVID-19 deaths compared to their White counterparts. The way that the British government used the NHS when responding to the pandemic has shed light on the racially based inequalities and social determinants of health that exist in society and for female B&B nurses.

Using postcolonial feminist theory, the reasons for these higher numbers of deaths is based on the colonial history of B&B women's gender being constructed in a way that is racialized and disadvantaged. B&B women have been made invisible, powerless, and used only when necessary to provide a service to White colonial masters both male and female and that these power relations are still in place today. British colonial power laid the foundations for the institutional racism that today is perpetuated and sustained within large government funded organizations such as the NHS.

BRAUN CARRASCO, Fabio* (Humboldt University, Berlin, Germany)

The "Social" As Normative Category

The Social as Normative Category

When analyzing the social, classical sociology usually tended to focus on the supposed characteristics of said social entity. It was either "organic" or "mechanic", "feudal/oppressive" or "liberal/egalitarian", "contractual" or "kinship based". Newer frameworks emphasize a mix, instead of a rigid separation of these categories. Yet while the analysis of the specificity of any social system is far from futile, it often erases the fact that all invocations of the "social" are in themselves normative, as they delineate the boundaries of what qualifies to be considered social. The normative nature of the social as sociological category hence does not only appear in the attributes ascribed to social configurations, but with the delimitation of "the social" itself.

Although various definitions of "social" exist, they all try to capture an underlying interaction: that of humans with one another. This is often reduced to a direct interaction within a geographical, linguistic and historic vicinity; to nation states and "areas" (as for example in Area Studies). Yet the expansion of large-scale production and circulation links humans across "social groups", nation states, regions, and arguably even across generations. In the Anthropocene, most conditions encountered on planet earth today, have at least partly been shaped by humans, and these human-made conditions again influence other humans through space and time. Pollution, for example, as a result of human interaction, is undoubtedly a social phenomenon, but would seldomly be categorized as such. The social hence is not merely composed of humans' direct interactions with one another, but also of the ways humans interact with the conditions created by other humans and themselves. A recalibration of the boundaries of the "social" therefore seems necessary in order to make macro-social processes more accessible to sociological scrutiny.

Youth Transition from School to Work in Lithuania Aftermath COVID 19 Pandemic

The school-to-work transition in Lithuania has become much more difficult and extended than before. Many young people are experiencing long periods of unemployment, temporary employment or inactivity. Youth transition from school to work is a complex multidimensional phenomenon determined by different interacting macro-level and micro-level factors: demographic indicators, labour market structures, regulatory wages mechanisms, etc. The transitions of young people from school to work are more often affected by crises: the 2008 financial crisis, and the crisis caused by the Covid-19 pandemic (ILO, 2021; Eurofound, 2021; OECD, 2021; etc). Socio-economic crises have had a negative impact on young people in the labour market and on their transition from education to the labour market (Eurofound, 2021). Theoretical background of the study is based on many different ways of evaluating the quality of transitions from school to work that have been considered in scientific literature (Gebel, 2020; Braziene, 2020; Baranowska-Rataj et al., 2017; Brzinsky- Fay, 2013; etc.). The focus is on identifying the main issues related to the successful transitioning of youth from school to work. This study is aimed at comparison of different youth groups transition from school to work in terms

of education, employment, family background and life chances in general. Analyses were based on a survey research of Lithuanian young people aged 18–35 years (N = 1 002). All analyses were stratified by age group and gender. The results reveal that the Covid-19 pandemic has affected more vulnerable young people with a lower educational level and less work experience living in rural areas. Respondents with lower levels of education indicated greater difficulties in the search for a first job and in obtaining a stable working position, etc. This research is supported by the Lithuanian Science Council project "Socio-Economic Factors of Youth Life Chances Differentiation in Lithuania".

Biographical Research with Visual Biographies in Social Media – Methodological and Ethical Challenges

Biographical research with visual biographies emerging on Social Media is accompanied by two different challenges: first, a methodological one, and second, an ethical one. From a methodological point of view, the question arises to what extent curated compilations of images, especially on Facebook and Instagram can be considered as visual documents of a lived life and its visual formation. Second, working with private images on Social Media accounts, complemented by narrative interviews, offers deep insights into biographies, which brings the challenge of protecting research participants by anonymizing their images and all others depicted on them without losing their analytical potential. Based on the project "Biographies in the making in a connected lifeworld. Exploring visual and verbal constructions of life stories" (VIS_BIO), in my contribution I will present a research design that combines visual and narrative biographical articulations. The analysis must consider the different modes of expression that imply different time frames and indexical references in image compilations on social media and in narratives that emerge during narrative biographical interviews. In addition, I will present the solutions to anonymization that we have developed in this project.

Homeless Workers Movement in Brazil: Relations with the State and Civil Society from a Historical and Conjunctural Perspective

This article aims to analyze the trajectory of the Homeless Workers Movement (MTST) in Brazil from a historical, conjunctural, and biographical perspective. Currently, the MTST is Brazil's most significant housing and social movement. It originated in the late 1990s from militants of the Landless Movement (MST) of rural origin. MST activists understood that it was necessary to advance the struggle for land rights in the urban sphere once the social inequalities intensified in the urban fabric at the end of the military dictatorship (1964-1985). During the 2000s, the MTST developed autonomously, between successes and mistakes, especially in São Paulo. In the 2010s, the MTST developed nationally based on a policy under the State. Under the umbrella of the Lula and Dilma (Workers' Party) governments and the Minha Casa Minha Vida housing program, part of the public funds were allocated to housing movements. In 2016, with the rise of right-wing presidents, such as the government of Temer and Bolsonaro, social movements lost public housing subsidies. Therefore, the movement adopted a policy of confrontation against the Government. The last strategy of the movement in the current context is to launch leaderships forged within the MTST to run for legislative positions, such as city councilors and deputies. In this context, this paper seeks to explore the relations of the MTST with the State/Government, the strategies adopted according to the political conjunctures, the forms of production and maintenance of its activist base, and the levels of institutionalization of the movement. The methodology is based on the historical review, conjuncture analysis, and biographical analysis of some of its most prominent activists, focusing primarily on the last two decades.

Exploring Disaster Risk Reduction through the Lens of Quantum Mechanics

Disaster Risk Reduction (DRR) has been vital in understanding hazards affecting communities, the environment, and the contributing factors thereof. DRR generally follows linear reasoning, explained by using linear space-time system concepts, the theory of change, and linear causality. Though DRR is seen as best practice, there are shortcomings, being exacerbated by the different types of hazards and their exposure lengths, and numerous societal variables. When all the variables are considered, the validity of linearity becomes questionable. Non-linear principles, such as system theory, include the notion that various inputs affect each other and the outcome differently

and unpredictably. This too, has its limitations, as it is confined to function within the current space-time. This study will investigate conceptual-theoretical ideas that incorporate quantum mechanics into DRR.

Quantum mechanics can theoretically function within infinite realities, in an infinite arrangement of pasts, presents, and futures. Observing DRR through the lens of quantum mechanics, hazards can be seen as multi-level/multi-dimensional in nature, and any factor that influences these is affected by not only the current present, but multiple pasts, impacting multiple possible futures. The theoretical understandings of DRR, quantum mechanics, and system theory will be investigated, searching for linkages, and conceptualising a model. The aim is to expand on the current non-linear philosophies through theorising the use of a multi-dimensional, non-time-specific-bound "neural network" that transcends reality.

A grounded theory research design will be employed, formulating theories through an initial broad-based investigation, which is then processed by reviewing, comparing, and finding contrasts within the data, so to, ultimately, develop a model. Although the study is still in its infancy, preliminary theoretical comparisons have been made between quantum mechanics and systems theory, as well as how certain quantum theories, such as string theory and the many worlds interpretation, can be incorporated into the thought processes of DRR.

Ambivalences of Research Empathy - Methodological Considerations in a Strong Reflexivity Perspective

Emotional empathy is considered a key competency for qualitative researchers in that it provides an important resonant space for affective experiences and expressions by research partners. It refers to the emotional reactions, the sensations and feelings of the researcher in response to the observed or narrated experiences of the research partners, the perceived ability to share and respond to their emotions. It can range from (more or less conscious and intentional) mirroring what an interviewee is (or seems to be) feeling to experiencing emotional states of helplessness, despair and pain when coming across stories of social suffering and trauma. In this regard empathy is conceptually close to notions of counter-transfer in psychoanalysis. Empathy in the research encounter, e.g., creates good rapport, generates recognition of others' experiences, and promises an affective and preconscious understanding of the situation and the other. In recent years, significant ambivalences of empathy, however, have been elaborated from different sides (see, e.g., Paul Bloom's *Against Empathy* or Fritz Breithaupt's *The Dark Sides of Empathy*). Based on these debates and with reference to empirical material from projects on the biographical emergence of affective attitudes in politically very differently positioned participants in Austria and Germany as well as the experiences of former ISIS child soldiers in Iraq, we will shed light in our paper on the ambivalent and sometimes contradictory role of empathy in qualitative biographical research: aspects of an ethically problematic use of strategic empathy, dynamics of overwhelming through over-identification with the suffering of others, leveling appropriation of "other" experiences as an identical reflection of ours will be discussed. At the same time methodological possibilities – rooted in depth-hermeneutics and autoethnography – for making a particular affective resonance in the research process systematically fruitful in terms of a "strong reflexivity" will be presented.

Reparative Activism Towards Decolonising Australian Teacher Education

Teachers and teacher educators have largely failed to challenge what Santos calls 'epistemicide', i.e. systemic exclusion of Indigenous knowledges, cultures and languages. We are thus complicit in a history of colonial power relations that presently persists in Australian curriculum's euro-centrism, following the structurally stratifying model inherited from 'Mother England'. The teaching workforce remains largely white, despite Australia – in the half-century since official termination of 'White Australia' immigration policy – becoming among the most diverse national populations. Schooling sustains a racialised hierarchy in promulgating power-serving national narratives that make invisible the assimilative, exploitative, extractive and genocidal underpinnings of colonialism.

Nikki Moodie, amending Critical Race Theory and TribalCritLit, sheds light on Australian education from a First Nations perspective. Working from Brayboy's view that colonization is not reducible to 'racism' and, for Indigenous people, is the most endemically significant structural injustice, Moodie emphasises 'place, survivance and sovereignty' to build a 'decolonising race theory' (DRT) which offers directions for what Brayboy calls 'reparative activism'.

In this paper, from our non-Indigenous positioning, we seek to work as allies in taking up Moodie's challenge. We reimagine teacher education to, in Moodie's words, 'centre Indigenous difference and the disruption of the knowledge-power dialectic which perpetuates deficit discourses'. Reparative activism to

reverse epistemicide, we argue, requires two initial moves. First is to ensure all programs have access to academic and community Indigenous teachers, backed by a culturally-safe Indigenous space within universities. Second is to establish deep study of (de)coloniality and Indigenous knowledges, initially guided by Indigenous colleagues, developing into study groups which engage creatively in activities like those suggested in Oliveira de Machado's book *Hospicing Modernity* and the *Gesturing Towards Decolonial Futures* Collective. These moves initiate an ongoing process of non-Indigenous responsibility for allyship with Indigenous people in revising curriculum, pedagogies and governance for teacher education.

Cemetery: It Is Not All Death

A place where the management of death is part of the everyday, cemeteries also come to life as cultural and social spaces. Graveyard photography is a compelling means of exposing this paradox. Using Toronto's Mount Pleasant Cemetery as a case study, six amateur photographers create a visual narrative reflecting the Foucauldian notion of heterotopia. As a heterotopic site, the cemetery is a public space where tombstones and their epitaphs provide insight into how social structures mould social identities. Photography, with its creative lens, further reveals how the cultural capital of those interred enables and disrupts the sociological imagination of the living. The editing process of the photographs also mirrors how the cemetery acts as an archive that includes, discards, exhibits and even reshapes recollections and impressions of the past. The implication is that the cemetery is a living space in which social, cultural and public memory is actively managed.

Restratification in Academia: The Struggle for Professional Identity

The academic workplace is a dynamic interplay of work space as well as cultural and professional space for contract, tenure-track and tenured professors. It is also a space of tension caused by New Public Management's (NPM) organizational logics and the resulting restratification of the academic profession. NPM's philosophy of casualization, efficiency and work intensification amplifies the inequalities and divisions created by two-tiered hiring practices within the academic profession. This restratification is revealed through in-depth interviews as professors, employed at two Canadian universities, discuss perceptions of their own roles and professional identity within academia. Findings suggest everyday experiences in the academic work environment reflect agentic perspectives and behaviours of both contract and tenured professors as they endeavour to sustain their professional identities.

Foreign Domestic Workers' Digital Practices in the Gulf States: Tiktok, Agency, and Creative Forms of Resistance

This paper aims at analyzing female migrant domestic workers' online practices in Arabian Gulf countries on the smartphone application TikTok. In the Gulf, domestic workers are mostly originated from Africa and South Asia. Generally migrating alone, they are recognized for suffering from very precarious work conditions. If being restrained to the domestic space is a condition for their work, the Covid-19 pandemic has also impacted their migration experience, as several Gulf countries have restricted departures to the countries of origin for this job category, hence reinforcing strong feelings of isolation and worsening their working conditions.

In this situation, some of these women use TikTok to express their views, stay in touch with their family back home, but also to share work tips and how to get around the control of their employers. Their videos lead to reactions from their peers and Gulfians themselves, which questions the risks they take in speaking out. Becoming a trend over the entire region, these users are recognizable by the hashtag #khaddama (domestic worker in Arabic). They develop modes of expression that highlight tensions between anonymity and visibility as founding dimensions of their intimacy they make visible. This phenomenon sheds light on their social position in the host countries, which is vulnerable in many ways, and that can be worsened when appearing online. By describing different types of self-presentation these women perform, and by discussing dimensions such as inventiveness and content authenticity in regard to TikTok's settings, I propose to look at these practices as an empowering act of expression. I argue that it offers an illustration of "extimate" practices, that is, the public exhibition of intimate matters, that I will examine as a means for negotiating social domination in a context of nationalized, racialized, and gendered structural violence.

Institutions, Interests and Barriers: Collective Skill Formation and Continuing Vocational Education and Training

This paper takes an institutional perspective on individual participation in continuing vocational education and training (CVET). We argue that institutions of collective skill formation shape individual perceptions of costs and benefits in choosing to participate in training. In a skill formation regime, varying degrees of involvement of the state, firms and unions in education and training sets the amount, quality and specificity of acquired skill during formal education. These institutions potentially create and enforce barriers (or bridges) to continuing training, which likely stratify along individual socioeconomic backgrounds. If so, collective skill formation institutions affect social stratification. We test this claim on PIAAC and OECD data. We identify collective skill formation regimes and then conduct multilevel regression modeling for individuals in 28 countries testing an impact of regimes on CVET participation, CVET interest, barriers to CVET and the impact of barriers on CVET likelihood. Finally, we look at how these stratify by levels of initial education. We gain broad insight at the macro-level of institutions; however, we have limitations in our conclusion because we cannot observe the training decision-making process directly – only the inputs and outputs of the process. All societies have a high degree of stratification in participation. However, collective skill formation institutions shape variation in stratification. They matter more for normative CVET interest as a barrier, and less for the impact of barriers on CVET participation.

The Role of Public Opinion in Policy Making: Classification in German Parliamentary Debates, 1991-2017, Using Transformer Machine Learning Models

Research linking public opinion and policy outcomes is vast and unambiguously assumes that policymakers use public opinion in the policymaking process. In other words, based on a theory that policymakers design policies that follow public preferences. To contribute to this gap in our knowledge, we investigate references to public opinion by policymakers in parliamentary debates. We also gain insights into how policymakers and parties use public opinion strategically and rhetorically to achieve their own goals. We combine qualitative coding and semi-supervised, deep learning algorithms to identify and categorize references to public opinion in the *Bundestag* (German parliament) using transcriptions of all parliamentary debates from 1991 to 2017. Our first finding is that public opinion appears surprisingly regularly in *Bundestag* debates. Our second finding is that machine-based prediction does a decent job in categorizing references to public opinion. Finally, we offer an overview of the types and frequencies of references to public opinion directly - using either evidence or presumption, and indirectly - with reference to media, formation or democratic principles. Our results come from a semi-supervised classification algorithm (BERT) that distinguishes public opinion references from noise with an F1 score of 0.76 and an accuracy score of 0.78. We are currently working on improving the accuracy of our algorithm. Our next findings are still in progress, but we will develop a descriptive picture of the many uses of public opinion and how these change over time and across both parties and policy domains.

Gender Segregation in the Skilled Trades in Rural Australia: Using Bourdieusian Theory to Understand the Barriers

Women make up less than 12% of the construction industry and 16% of the mining industry in Australia. Percentages are reduced further when women working in administration and other feminized occupations are removed from the statistics. In the skilled trades (the crafts) gender diversity is an enduring problem despite persistent skills shortages in these occupations in both industries. Whilst there are identified barriers in the skilled trades and the construction and mining industries, for women, there are few studies that provide insights into how these uniquely manifest in rural areas. Rurality presents additional barriers to women's employment in the Australian context. Young women have a significantly higher rates of out-migration from rural areas than young men and report fewer career opportunities. Furthermore, rural areas are known for having a macho culture and for failing to be inclusive of diversity. Therefore, the well cited barriers that women experience in the skilled trades (social exclusion, marginalization, discrimination, harassment, and

other forms of social closure) are heightened when women seek employment in rural areas. We apply a Bourdieusian analysis to the barriers women face in the construction and mining industries in rural Australia. We investigate women's capital in the skilled-trades and consider gender capital in relation to social, cultural and symbolic capitals. Our analysis broadly explores Bourdieu's symbolic power and symbolic violence in rural cultural environments where masculinity is 'normative' and women are defined as 'other'. Our study uses empirical evidence, and reports on the literature in the field, to examine the subtle and invisible forms of violence that women experience in the skilled trades, in rural areas, in both the mining and construction industries.

Digital and Platform Work in Brazil in the Midst of a Pandemic: Resistance, Trends, and Challenges for Unionism

The Covid-19 pandemic abruptly changed the daily life of Brazilian society as a whole, as social distancing became the main guideline of the World Health Organization (WHO) to minimize the transmission of the virus. Due to the surprise and urgency of the situation, millions of workers began to carry out their work activities remotely, many without any planning regarding workplace conditions, for most their own homes, proper access to technology and without clear definitions about labor regulations regarding working hours and wages. This presentation has three objectives: (i) outline an overview of digital work in Brazil in the context of the pandemic, in which digital platforms of work stood out, in special those which allowed work to be performed at home over the internet, as well as delivery platforms; (ii) analyze working conditions in the pandemic and the post-pandemic context, especially for women; and finally, (iii) analyze the experiences of resistance in the context of digital and platform work. Thus, the understanding of the impacts of digital platforms on the configuration of work in the context of the pandemic can provide indications of trends and lines of force operating in contemporary capitalism, while revealing the increasingly vulnerable position of labor. Yet, current unionism in the information technology industry – considered unorganizable at the global level –, as well as the mobilizations and stoppages of delivery platform workers, show important spaces of emerging resistance in Brazil. In this way, we seek to analyze whether the signs of resistance of workers in the so-called ongoing digital economy can express a new phase for unionism.

Mama Fit Goes to El Salvador: Fitness in a Transnational Society

The one-piece, backless nospandex jumper clung to her body, accentuating curves with a tight seam down the backside of the shorts and ties at her hips. While proud of the muscles that she had built in the gym, she nevertheless maintained an image of traditional feminine beauty: voluptuous, flat bellied, and tanned. She kept her fingernails groomed and her highlighted-blond hair long. And she waited dutifully for her young son to emerge from school. Filmed from the back without consent by a woman hoping to shame her for the revealing attire, Bolivian lawyer and model Vanessa Medina became a global social media sensation, when she responded online by proudly proclaiming herself "Mama fit." Memes with her image exploded and ignited a series of spin-offs with jokes, people from around the world debated the appropriateness of her wardrobe, and avid gym-goers passionately defended her lifestyle and praised the discipline required to obtain her physique. In El Salvador, one of many Spanish-speaking countries where this image resonated, Mama Fit heralds a new standard for feminine beauty that reinforces traditional gender roles while incorporating 'fitness' ideals. Taking this and other social media eruptions as a starting point, incorporating ethnographic analysis and then delving deeper into historical discourses that circulated in more traditional popular print media, I trace the gendered meanings and practices that constitute 'fit' in El Salvador and within the Salvadoran diaspora. Importantly, the word 'fit' is often expressed in English, captured in the names of commercial gyms and diet advertisements; it signals an important cultural change in conventional understandings of beauty in a Spanish- speaking society. By charting the emergence of this new beauty norm in a transnational domain, I explore the relationship between shifting patterns of gendered body discipline and changes in El Salvador's location within the global political economy.

Why Did the Ethnographer Cross the Road? Research Reflections from a Fieldwork Family

The interdisciplinary, feminist academic literature on parenthood and fieldwork primarily focuses on the experience of young mothers, without much consideration of older mothers or the voices and agency of their children. However, gendered caretaking is a lifelong process. As our children age, the power dynamics in the parent-child relationship evolve and generate new research challenges, opportunities, and ethical dilemmas. Children are not

passive passengers in the process, fully subordinate to the whims of their parents, but instead make key decisions about their own behavior and develop their identity in ways that ultimately structure the process of knowledge production; they often develop a deep wisdom about the field, their family, the research, and their own role in the work. This paper, co-authored with my eldest child, reflects on nearly two decades of adventure and trauma, gender violence and discovery, guilt and joy, and how those shared experiences have thus far shaped both our long-term relationship and my research.

Why did the ethnographer cross the road?

Atmoculture and New Algorithmic Urban Mobilities

The notion of 'atmoculture' offers a sensory-aware conceptual tool to analyse the new forms of mobility supported and enacted by and through digital algorithms. In historical perspective, modernity has created a movement-space where the problem of finding one's way through an increasingly 'displaced' urban space first emerged, with noticeable psycho-social consequences. Reconstructing the new digital media as a continuation of such spatial imagination, allows for a better understanding of the types of mobility and perception facilitated by digital algorithms. Urban digital navigation seems to proceed in parallel with a reorientation of the urban experience towards atmospheric considerations, seeking to maximize safety and pleasure in the user's encounters with the environment. In this context, atmoculture appears a spatial-aesthetic, psycho-cultural, and bio-technological milieu that prepares space for convenient navigation. A number of consequences need to be taken into consideration: first the disburdening effect, whereby subjects delegate to a number of perceptions and decisions to algorithms themselves, expropriating the natural problem-solving aspect of subjectivity and urbanity; second, the invisible transformations of space dicatated by the biases built into algorithms; third, the tensional, even contradictory outcomes of atmocultural expectations, whereby the goal of a secure and sensorially pleasant environmental interaction is undone by the very quantity of information provided to the user, and the level of promptness and alertness required from it.

Simmel and Tarde: Beyond an Equilibrium Theory of Social Life

In the late 19th century, Simmel and Tarde have, independently from one another, introduced the infinitesimal into social theory. These authors sought to dynamically account for, respectively, the *intensification* and the *expansion* of the social thing. Whereas 20th-century sociology has largely pivoted around equilibrium models (order, system, field...), today we live at a time where the assumption of stability needs to be revised. An element of drift must be factored in into the explanation of social life, and that is why we need to turn once again to Simmel and Tarde. In this presentation, I seek to connect the infinitesimal as a theoretical domain, and a mode of explanation, to a discussion of a non-equilibrium theory of social life.

BRINGEL, Breno* (Universidad Complutense de Madrid, Spain, and State University of Rio de Janeiro, Brazil)

Social Movements and the Geopolitics of Socioecological Transitions

The ecological transition has moved from the margins to the centre of the global political debate. On the one hand, this can be seen as something positive, since it supposes an acknowledgement of the climate emergency and the seriousness of the socio-ecological crisis. But on the other, by becoming a buzzword, it has come to be mobilized by different (and antagonistic) actors, describing very different ideas, processes and projects. This presentation will examine precisely the role of social movements within the disputes over the contemporary socio-ecological transition, suggesting that there are three major types of ecological transition processes at play: corporate, politico-institutional and popular. Each of them - and their relations of cooperation and conflict - will be analysed in detail, examining their main actors, their imaginaries of the socio-ecological crisis, and their concrete proposals to mitigate and/or reverse it. In addition, the geopolitical dimension of ecological transitions will be analysed, with attention to North-South relations, ecological debt and the green extractivism emerging from a new capitalist global consensus that will be defined as the 'Decarbonisation Consensus'.

Imagining a New Country through Auditing: Morals and Emotions in Brazilian Anticorruption Bureaucracy

This paper presents the moral dilemmas and emotions that structure the discourse and imagination of public auditors in Brazil. It's focus is the connection among audit practices, bureaucratic values and the political imagination and emotions that organize anti-corruption work. Based on a set of 32 interviews with Brazilian public auditors about the values that organize their daily work, the field work was developed from 2014 to 2017, a very important moment for anticorruption movements in Brazil. The data gathered reveal how senses of "efficiency" and "(professional) technique" are merged with feelings of fear and anger in order to justify the relevance of audits and an audit culture to the construction of a new society. With this, I try to demonstrate a change in the senses and experiences of auditing, the "beyond just inspection", which I relate to a broader project of enchantment of bureaucracy and the State. However, the research also reveals how these new meanings of combating corruption do not change the colonial image of the people and their supposed lack of democratic feelings.

Monumental Dedication to the Confederacy: The 21st Century Edition

Public memorials and monuments are visual representations of narratives that are important to society. Their construction and utilization provide important indicators of the social groups that attain the power to control social discourse and the memorial environment. Monuments located in public space allegedly represent a consensus of collective commemoration. However, differing experiences and perspectives of social ruptures create conflicting narratives that may challenge the commemorative status quo.

The United States' Confederate monuments, ubiquitous in the American memorial landscape, are a focus of conflicting commemorative narratives. Those who support the continued presence of these memorials in public space state that they honor Southern history and heritage; those demanding their removal claim that the monuments are symbols of racism and white supremacy. There has been significant coverage of Confederate memorials that have been removed since 2015. However, it is important to know that there have been at least 61 Confederate monuments installed in public space in the United States of America since 2000. Approximately 25% of these new monuments were installed on courthouse grounds. This paper examines the location, form, and sponsors of these 21st century Confederate monument dedications.

BROADBENT, Jeffrey* (University of Minnesota, USA)

The Dimensions of Power: A Relational Research Method

This paper proposes and develops a new framework and method for the analysis of macro-power patterns and dynamics by building up from their multiple constituent dyadic power relations. The method defines its main type of *power* as existing in degrees of influence (from weak to controlling) over the issue-outcome (including policy output and implemented result) of an issue-focused political process. The political process consists of a dynamic field of interactions among actors engaged in the issue and trying to affect its outcome. Many different types of power also exist at the dyadic inter-actor level, including forms of power to, power over, and power with. The method, called Integrative Structurational Analysis (ISA), gathers information from qualitative research on those dyadic interactions between actors that exert some influence over the outcome of the political process. These dyadic interactions, called Key Influence Vectors (KIV), may number in the hundreds. The KIV collectively constitute the evolving active issue field of the political process. An actor may be of any size from an individual person, to an organization, to a less coherent body such as pubic opinion. In each KIV, power (to, over, and with) may be transferred between actors by nine basic types of modes. These nine power-transfer modes are defined as nine cells in a three by three table. The vertical (malleability) dimension of the table runs from structure through plastic to agency. The horizontal (tangibility) dimension of the table runs from material through social to cultural. The analysis consists of determining the relative proportions of these nine modes (and their subtypes) in each of the hundreds of KIV in the political process under study, By coding these proportions, and weighting them by their KIV's degree of influence on the outcome, the analyst may determine the deep ontological composition of the macro-power pattern/process.

Navigating Intimate Trans Citizenship While Incarcerated in Australia and the United States

Trans women incarcerated throughout the world have been described as "vulnerable populations" due to significant victimization, mistreatment, lack of gender-affirming care, and human rights violations, which confers greater risk of trauma, self-harm, and suicide compared with the general incarcerated population. Most incarceration settings around the world are segregated by the person's sex characteristics (i.e., male or female) and governed by strong cis and gender normative paradigms. This analysis seeks to better understand and appreciate how the "instructions" and the "authorities" that regulate trans women's corporeal representation, housing options and sense of self-determination implicate and affect their agency and actions in handling intimacies related to their personal life. Drawing upon lived incarcerated experiences of 24 trans women in Australia and the United States, and employing Ken Plummer's notion of intimate citizenship, this analysis explores how trans women navigate choices and ways "to do" gender, identities, bodies, emotions, desires and relationships while incarcerated in men's prisons and governed by cis and gender normative paradigms. This critical analysis contributes to understanding how incarcerated trans women through grit, resilience, and ingenuity still navigate ways to embody, express and enact their intimate citizenship in innovative and unique ways.

The Mutating Face of Australian Social Impact Bonds and the Financialisation of Policy Life

In the mid-2010s, one could be forgiven for thinking that the future of the welfare state lay in private finance. The attraction of the architects of global social policy trends to models like the social impact bond (SIB) was loudly pronounced, and just as loudly criticised by critical scholarship across the social sciences. However, half a decade later, enquiry into SIB landscapes is likely to meet disappointment and malaise as well as boosterism and enthusiasm. This paper draws upon a qualitative exploration of the Australian SIB landscape to explore the ramifications of this 'decline' for analyses that theorise the financialisation of welfare. I make two claims. First, Australian SIBs are better understood as undergoing 'mutation' than in decline. Payment-by-outcomes contracts have emerged from the same channels as SIBs in the Australian context. They are somewhat reluctantly embraced as the next stage of the 'outcomes revolution' in social policy. This mutation ostensibly 'de-financialises' the SIB, downgrading the importance of private capital by shifting risk directly onto NGO service providers. However, this reflects an understanding of financialisation as based in the inherent danger of speculation, brought on by the mere presence of finance capital in social service assemblages. My second claim, though, is that the mutation of SIBs in Australia illustrates the inadequacy of this existing critique, because the removal of private capital from SIBs does not contest financial calculation but is driven by it. I thus argue for a theoretical shift: from understanding the financialisation of the welfare state as a matter of the intrusion of speculation into an alien domain in social policy, to exploring how financial logics are reconfiguring the rationalities through which social policy is conceived inside the everyday life of policy creation.

BROWN, Eric* (University of Missouri, United States)

Trumpism As Fascism: New Politics of White Supremacy and Authoritarianism

The U.S. originated as a colonial settler society based on white supremacy. Historically, this generated two major oppositional *social forces*. These two social forces have basically remained in form but change in substance over time. The forces are differentially shaped by race, gender, religion, region, and nativity. One force – linked to white supremacy – is *reactionary* and exclusionary. This force consistently features overlapping white, male, heteronormative, Christian, Southern (and otherwise white rural), and "nativist" elements. The other force is *progressive* and "diverse." It consists of people of color and (anti-racist white allies), women, LGBTQ communities, non-Christians, urbanites, and immigrants. Reactionary forces have been historically susceptible to the appeal of *authoritarian politics*. Progressive forces have been the major advocates of *democratic politics*. "Multiracial" class politics (e.g., labor or socialist) have been historically confounded under these conditions. The U.S. is nominally a formal democracy. However, for most of its history – all or part of – the country has not practiced universal civil rights or had genuine democratic governance. Indigenous holocaust and the reservation system, chattel slavery, Jim Crow, military conquest of Northern Mexico, and forced incorporation of Alaskan and Hawaiian natives are examples of "legal" expressions of white supremacy and anti-democratic politics exercised by the two major parties. Extra-legal expressions of the same dynamics include the Confederacy, Ku Klux Klan, lynching, and police brutality. Generally, there is not a clear difference. This paper will explore the historical dynamics and *Trumpism* as a new (fascist) version of white supremacist and authoritarian politics. Trumpism – like many predecessor movements – includes efforts at spreading disinformation ("conspiracy theories"), promoting divisions by demonizing racial and religious minorities and immigrants, undermining formally democratic institutions ("stolen elections"), silencing "traditional" Republicans by "taking over" that party, and of course, threatening democratic political institutions by attempting a coup.

BROWN, Kate* (Georgia Institute of Technology, USA)

The Field of Power: A New Analytic Strategy for Political Sociology

This article presents a new research agenda for the study of power relationships. Specifically, it calls for an investigation into the struggles that take place over different types of social power. Rather than attending principally to whether or not power is successfully deployed to achieve an aim, this new agenda encourages scholars to focus attention on those instances when one type of power is utilized to alter the relative strength of other forms of power. Building on Parsons (1963), Giddens (1968) and Mann (1986), this approach also views power as a means by which individuals or groups strive to achieve their goals. These means can take many forms, and often they are context-specific. However, there are generalizable forms of power that are much less context-specific and can be exerted (more or less) equally wherever they come into play. These are: money, law, and culture. Because these social powers are multiple, it is difficult for any one person or group to monopolize them all (although not for want of trying); however, they be more or less diffuse. Also, while money, law and culture are all forms of social power, they can be used to corral each another, limiting their generalizability. For that reason, these social powers can be seen as existing in a field where the stakes are the relative strength of different types of power. The field of power, then, brings field theory (e.g. Bourdieu 1993, Martin 2003, Fligstein and McAdam 2015) to bear on a terrain of struggle over the relative strength of power itself. The perspective will be explained using examples from Russia's war in Ukraine and the global response to it.

BROWN, Lucy* (Charles University, Czech Republic)

Secularisation, Power and the Civilising Process: An Examination of Early Modern Witchcraft Trials

Within Norbert Elias' seminal text *The Civilizing Process*, religion does not occupy a central role in the formation of both the state and an individual's habitus. His later work, addressing fantasy and reality balances, also stops short of recognising the centrality of religious institutions in society during the crucial period of processual change (the Early Modern Period). Whether this exclusion was deliberate has already been discussed (see Goudsblom (2009) and Linklater (2022)) however in order to understand the secular nature of modern European society, it is necessary to examine where the process of the 'de-centralisation' of religion fits within the wider 'civilising process'.

As an institution, the church deeply influenced the habitus of the medieval population whereas the Early Modern period saw this power dynamic transform dramatical as the primacy of the state developed. In examining the development of Elias' two pillars of state formation (feudalisation and the monopoly of violence), the influence of religious organisations should also be considered and will here be examined through the subject of Early Modern witchcraft prosecutions. A complicated fusion of religious and secular crimes, witchcraft prosecutions represent a microcosm of the societal transformations that were taking place throughout the period. As the exclusion and separation of the church and the Early Modern state began, this process was enacted upon the stage of secular and religious courts as they battled over the fundamental question: are people responsible for their own behaviour or are they at the mercy of external (supernatural) forces? Such a question is routed in the Eliasian concepts of sociogenesis and psychogenesis. The rise and fall of witchcraft prosecutions thus reflects fundamental changes in the centralisation of religious power during this period and it is therefore argued that a third pillar, religious decentralisation, was an essential component of the European Civilising Process.

The Impact of the Climate Crisis and Other Crises on Young People's Health and Well-Being

Young people are experiencing complex challenges, with the COVID-19, climate, economic and health crises that are and will continue to disrupt their lives. According to the United Nations (2019), there is less than a decade that remains to stop irreversible damage from climate change. In this presentation I

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

examine the impact of the climate crisis and its entanglement with other crises on young people's health and wellbeing by sharing three stories of young people from Melbourne's (AUSTRALIA) inner northern suburbs living through the climate crisis and its entanglement with other crises. These stories emerge from a place-based project with colleagues, titled *COVID-19 Recovery Scenarios for Young People in Melbourne's Inner North*. We used scenario planning as a methodology that is not about predicting the future but presenting a future situation by explaining how we arrived at this particular future. In interviewing the young people, we used VideoAsk, a video-capture platform with 53 young people during a period of an extended second lockdown period in Melbourne. The project gave young people an opportunity to reflect and respond to questions about their presents and futures and to share their concerns, anxieties, fears, and hopes. These stories are situated in what Rosi Braidotti (2019) identifies as the convergence of the fourth industrial revolution and the sixth mass extinction. Central to the discussion is the concept of 'entanglements' that trouble ideas about 'human exceptionalism' or more simply the injunction to 'make kin with' (Haraway, 2016), calling into question where the human begins and ends. The aim is to situate the climate crisis and its entanglement with other crises and the challenges and opportunities these crises produce for young people's health and well-being and their sense of belonging, connectedness, in the broader unfolding climate, economic, and mass extinction crises.

BROWNE, Craig* (The University of Sydney, Australia)

Capitalist Modernity in Transition: Metamorphoses of Heteronomous Dependency and Autonomy

My paper reassesses the interpretations of a new phase of modernity that were developed during the later decades of twentieth century and proposes a complementary, as well as critical, conception of the current dynamics of social change. It will be argued that some of the key prognoses of theories of a transition to a new phase of modernity have been overtaken by the reconfiguring of the relationship between heteronomous dependency and autonomy, especially due to the increased reflexive control through new technologies and the erosion of the democratic public sphere in many nation states. From both a longer historical standpoint and the perspective of global modernity, the metamorphoses of the contemporary phase of modernity represent a mixture of progression and regression. This contention is demonstrated through reflections on counter-movements to the expansion of social autonomy in different spheres of social relations, such as those of social integration and the relationship of wage labour and capital. My analysis suggests that the late twentieth century theories of a new phase of modernity captured aspects of a transition but underestimated how persisting asymmetries of power would be mobilised. For this reason, their disclosure of the complications of altered social interdependencies was partial. In the history of critical social theory, the conceptual innovations that inform diagnoses of the times have been stimulated by modifications in capitalist modernity. It will be argued that the notion of the dialectic of control enables a complex interpretation of the contemporary metamorphoses of asymmetrical social relations and that it facilitates a rethinking of the mediations between structural contradictions and social conflicts. Similarly, it will be argued that this notion meets the normative requirements of critical theory diagnoses through the vision of social autonomy that ensues from it and its internal connection to practices opposing domination and injustice.

BROWNE, Craig* (The University of Sydney, Australia)

The Political Forms of Modernity: The Gauchet-Badiou Debate over Democracy and Communism

This paper explores the positions of Marcel Gauchet and Alain Badiou in their debate over democracy and communism. Gauchet's arguments for the renewal of a democratic reformism oriented to collective goals are outlined, while Badiou's claims for a revival of, what he terms, 'communist hypothesis' are sketched. These two theorists' respective endeavours to rethink the praxis philosophy problem of explicating the nexus between the subject and history in order to grasp the potentials for an autonomous constitution of society is found to be an important point of intersection. It leads, however, to substantial disagreements in theoretical and political perspectives. Gauchet's approach to political forms diverges significantly from Badiou's and this is most evident in their different assessments of democracy and communism. Despite its justified critique of aspects of capitalism, Badiou's conception of the communist hypothesis is found to be internally antithetical and duplicitous. By contrast, Gauchet's explication of political forms leads him to the view that totalitarian regimes were secular religion and enables him to develop an original interpretation of the development of democracy and democracy's current crisis. Although representation is integral to Gauchet's interpretation of democracy, the capacity of the institution of political representation to overcome this crisis is questioned. Similarly, while Badiou's attempted revival of communism is irredeemably inadequate, my analysis shows that there remain deep-seated problems that are seemingly irresolvable within the capitalist social order. My analysis then, considers how the values and ideas of equality, solidarity and community that are broadly associated with communism - though not Badiou's 'communist hypothesis' - might be relevant

to this situation. It likewise reflects on how the key concern of the notion of political forms with democratic creativity contrasts with the apparent decline of creative democracy in the present, that is, the deterioration in democratically generated political innovations and democratisation.

Sentiment(al) Research

This paper explores, through the lens of kindness, the experience of researching the 'sentimental'. Synonyms for the sentimental include saccharine, syrupy, twee and 'over-emotional' and, in everyday life, sentimentality is understood - and often dismissed - as involving simplification and idealisation. Yet we know from Lauren Berlant's (2008) work that, whatever its political misuses, sentimentality is also experienced as a way of expressing what is felt to be authentic, creating solidarity among strangers. We know, little, though, about the experience of *researching* the so-called sentimental. Through drawing on interview and Twitter data from a project, Telling Good Stories (Telling Good Stories | School of Social and Political Science (ed.ac.uk) which explores cultural story telling about kindness, we investigate the emotional and methodological challenges for researcher and participants of engaging with what is deemed sentimental. Building on previous work on emotional reflexivity in research and specifically the emotional challenges of sharing about the ordinary (Brownlie, 2011; 2019), we highlight, through this substantive focus on kindness, how feelings about sentimentality are managed at different points in the research process in relation to both talk and text. In doing so we surface persistent ambivalences for researchers and those we research about what gets to 'count' in everyday life and in sociological research. As such, we also begin to address the challenge of researching ambivalence.

Third Person Help in Research with Children and Adolescents in Namibia

In sub-Saharan Africa, many children experience the death of a parent before the age of 18; in this region adult mortality is one of the highest in the world. Qualitative interviewing is a useful tool to understand children's and adolescent's grief experiences. In this study, individual and group interviews were used to talk with children and adolescents about parental loss and secondary losses (economic and social) in Namibia. Third person effects were observed in the group interviews. In this presentation I will discuss these effects, such as children correcting each other, and children feeling pressured to answer questions. I will also discuss how these effect influence the quality of the data such as the degree in which sensitive information is shared.

Institutional Ethnographic Research and Concept Mapping in Indigenous Health Provision: Challenges and Opportunities of a Combined Research Project

Health researchers have long advocated for a better understanding of important social aspects of the prevention and response to infectious disease outbreaks such as COVID-19, especially in the context of rural and remote Indigenous communities in Canada. However, research and understanding in this field falls significantly behind that of non-communicable diseases. Indigenous peoples and communities have historic experience with pandemics and disease outbreaks and have learned effective ways of responding and protecting family and community members despite socio-economic challenges and pervasive inequities resulting from historic and ongoing colonization. Collaborative research within and by Indigenous communities can generate knowledge and understanding of these values and lead to contextually relevant research facilitating solutions that can support community responses to COVID-19 from both a public health and community health perspective. This presentation discusses how Institutional Ethnography was used and informed by a thematic analysis developed through the concept mapping. Concept mapping is a set of knowledge representation analysis and applications in

educational and cognitive psychology where the concepts in a particular subject area and their interrelationships are visually represented in a concept or knowledge map. This presentation will discuss the innovative capacities and challenges that this research project presented when engaging in collaborative, Indigenous led research efforts and the use of multi-disciplinarity research methods.

Emotional Recognition. Emotions, Sociality and Morality in a Meadian Perspective

The purpose of this paper is theoretical and interpretive and aims to address the question of the relationship between emotions, intersubjectivity and normativity (which will be understood as synonymous with morality). As evident, the paper makes no claim to exhaustiveness about the treatment of such a broad topic, but - moving from a framework outlined on the basis of reference to the theoretical options of David Hume and Adam Smith - intends to show how G. H. Mead's theory gives the nexus between emotions, intersubjectivity and normativity a socially processual unfolding. The hypothesis is that the problematic framework opened exemplarily by Hume's and Smith's conceptions - and to which we refer in the wake of the recent interpretation advanced by Axel Honneth on the modeling of recognition in modern European philosophical thought, which predicts that both Hume and Smith can be located within a common sphere of declination of the concept of recognition - finds a more fully sociological development in Mead's theory. The reconstruction we will propose will seek to highlight how the emotional dimension and the normative dimension need not be understood as two distinct and separate moments, whereby the original emotionally connoted sociality requires later normative integration, as we find in Hume and Smith. Emotions represent, for Mead, the outcome of continuous decentering and emerge in the pragmatic development of human activity as anticipation of reciprocal reactions. We could say that emotions, sociality and morality are situated in a ground characterized by the interactive character of human conduct. Indeed, cognitive and linguistic human communication is rooted in the social nature of primitive instincts, the affective content of which is represented by emotions. The peculiarity of the declination of this concept of sociality constitutes the theoretical dimension within which to relocate a revisited social-theoretical reflection on emotions.

BRUSHINSKI, Elena* (Carl von Ossietzky University Oldenburg, Germany)

The Discomfort at the Edge of the Sidewalk: Homelessness As a Social Phenomenon between Stigmatization and Social Invisibility

In the theoretical work "The Discomfort at the Edge of the Sidewalk", published in 2021, homelessness is discussed as a social phenomenon between stigmatization and social invisibility. Through a recognition theory approach, an ethically oriented theory of discomfort is formulated, which is derived as a kind of alarm system or anchor of humanity. Central theoretical building blocks are the obtrusiveness of an attribute according to the stigma theory of Erving Goffman, the intersubjective constitution of the subject according to the phenomenological ontology of Jean-Paul Sartre, and the pre-conscious nature of responsibility according to Emmanuel Lévinas. The initial point of the theory of discomfort is homelessness as a social phenomenon characterized by plural visibility: homelessness is more than the absence of a roof, as social norms and values affect this life situation. Homelessness is not only affected by negative visibility through stigmatization, but also characterized by social invisibility in the socio-political space.

The theory of discomfort is presented as a new interpretative basis of social pathologies. As social factors of the non-perception of discomfort, the ideas of achievement and egocentrism are included. Based on the order of discourse of Michel Foucault and the reflections on the recognizability of the subject of Judith Butler, the homeless person is found as an object of (specialized) discourse. The danger lies in the objectification, normalization, and exclusion of the subject, which can lead to the non-perception of discomfort. The interpretation of bureaucracy of David Graeber is used to analyze the decoupling of the real person from the processed case. Effects of the power relationship between help-seeker and service provider are critically highlighted as a mechanism for promoting non-perception of discomfort.

This contribution shall serve as an ethically motivated reflection on the given circumstances and the professional discourse. Working with vulnerable groups requires reflective research.

The Population of Russia with Dual Russian-Ukrainian Ethnicity Under the Conditions of an Authoritarian, Nationalist Regime in Russia

In Russia residents with Russian-Ukrainian ethnicity are probably the largest bi-ethnic population group. Its appearance was due to two reasons: the spread of ethnically mixed marriages and restrictions on the ethnocultural development of Ukrainians, which led to their forced assimilation. According to a sociological study conducted among residents with dual Russian-Ukrainian ethnicity (n=800) in 5 regions of Russia (Belgorod, Voronezh, Omsk regions, Altai and Primorsky territories), most of them (66%) are of mixed ethnic origin, and 29% are ancestors of only Ukrainians.

The stigmatization of Ukrainian identity in Russia has a long history: restrictive measures against the Ukrainian language and culture of the period of the Russian Empire were replaced by a short period of "indigenization" in 1923-1933, when Ukrainians first got the opportunity to learn and use their language in areas of compact residence, but in 1933 this practice was abolished, and an unspoken ban was imposed on the education and ethno-cultural development of Ukrainians in Russia, which still exists today. Also in 1932-33, the Ukrainians suffered huge losses as a result of the famine (Holodomor) provoked by the Stalinist regime. In connection with this policy, the number of Ukrainians in Russia has been declining for almost the entire last century: in 1926 - 6.9 million (7.4%), in 1939 - 3.2 million (3.0%), in 1959 - 3.4 million (2.9%), 1970 - 3.3 million (2.6%), 1989 - 4.4 million (3.0%), 2002 - 2.9 million (2.1%), 2010 - 1.9 million (1.4%). As the survey data showed on the eve of the Russian 2021 census, the majority of residents with Russian-Ukrainian ethnicity were going to register as Russians (61%) and only 17% as Ukrainians, 13% were ready to indicate both ethnicities, which was primarily due to the reluctance to declare their Ukrainian identity, including due to fears of reprisals from the state.

In the Trenches': South African Vice-Chancellors Leadingtransformation in Times of Change

Background
South Africa is committed to developing and transforming universities in order to meet its development goals and university leadership is a key factor in the achievement of these goals. In the context of multiple challenges and historical inequalities, the role of the university vice chancellor is of critical importance. However, a focus on university vice chancellors is not a common focus on leadership studies in South Africa.
Aim
This paper examined the transformational goals and strategies of nine black university vice chancellors in South Africa in order to understand how they direct transformation of higher education in the country.
Methods
The paper draws from narrative inquiry underlined by transformational leadership theory (TFL) and focuses on in-depth interviews with university vice chancellors.
Results
The study focused on the key themes that direct vice chancellors' transformational leadership strategies. These are devolution of power, the need to transform the institutional culture and attain social equity through putting students first and addressing the next generation of academic scholars.
Conclusion
The paper draws attention to the enduring imperative to transform universities through a social equity lens and the significance of vice chancellors' transformational agendas and strategies in this regard. The local context of the university plays an important role in transformational leadership goals and strategies

A Negotiated Order Approach to Organizational Identity Change Processes

Jan Stets' 2020 Cooley-Mead Award Address outlined changes in religious identity to highlight the micro, meso, and macro processes involved (Stets 2021). While the address rightly drew attention to the multiple levels at which identity processes occur, it ignored a wealth of insights on identity processes from the symbolic interactionist tradition. In this paper, we draw on comparisons across paid-work and leisure to illuminate the processes behind both identity and organizational changes and how these processes are connected with one another and the larger, structural negotiation context. SI scholars rooted in the negotiated order perspective argue that organizational change is inevitable and occurs through a process of contested negotiation (Strauss et al. 1963) and

identity contests between organizational members (Schwalbe et al. 2016). Data come from three years of observation and fifty-four interviews with rollergirls and two years of observation at a small, independent game development studio and seventeen interviews with game developers and other industry professionals. Organizational and larger structural contexts both provide resources for members to do identity work and constrain the types of identities they are able to create, but organizational members have agency and often resist changes that threaten their access to identity rewards. Organizational members in workplaces versus those in voluntary organizations have different expectations for how their participation will shape their identities and for what opportunities they will have to enact valued identities, or collect identity rewards (Schwalbe et al. 2016). Across both contexts, when members lack opportunities to collect identity rewards, they push for organizational change or exit when their needs are no longer being met. The success members see in pushing for change and the tipping points for exit differ based on the type of organizational context and the relative power of rank-and-file members.

Intergenerational Solidarity and Ambivalence in Lithuanian Transnational Families in the Context of Aging

The growing numbers of Lithuanian families living across borders have prompted the reflection on how structural re-configuration of transnational families and cross-border living practices alter relationship quality within the family over time. Building on the solidarity approach (Silverstein & Bengtson, 1997), expanded by the ambivalence framework (Connidis, 2015), the authors aim to discuss the intergenerational ambivalence in transnational families related to changing family roles and care responsibilities. The paper draws from the analysis of two surveys carried out in Lithuania in 2018 and the qualitative studies carried out in 2014, 2019 and 2022 as part of three research projects funded by the Research Council of Lithuania. The research data reveals that intergenerational ambivalence arises from changes in the family roles due to adult children leaving and grandchildren remaining in the care of (aging) grandparents. As long-term guardians, they may engage in the performance of a new role (grandmother as mother; protector of the whole family) and changing transnational family situation (parents return, grandchildren leave to live with their parents) may lead to the role friction. When the need to support the aging parents arises over time, Lithuanians living abroad may also find themselves amidst the conflicting expectations regarding the possible care arrangements. The adult migrants' familial relationships and their concerns about the aging parents are shaped by family contradictions, accompanying and changing throughout the life course. These concerns are particularly akin when the familial relationships prior to the migration were marked by conflicts, when adult migrant child has no siblings or when their siblings also live far from the aging parents. The research data give empirical evidence that both inter- and intra-generational relationship quality could be affected by differentiated mobility experiences of family members and re-definition of family roles due to the newly emerging multi-local interactions.

Building Energy Resilience: Motivational Barriers for Prosumers in Energy Transition

The global challenge of providing clean, secure and affordable energy is becoming a critical part of everyday life. Increasing global demand for energy requires rapid development of low-carbon energy sources and other technological innovations. As a result, high expectations are being placed on various energy transition pathways that not only combine political will and business commitment, but also make individuals active participants. Recent technological innovations in electricity systems enable the transformation of consumers into prosumers, individuals who can not only consume energy but also store and produce it. Although the concept of prosumers and their possible impact on the energy transition are still being studied, there is already a need to evaluate some economic, social or psychological factors that may influence engagement in the energy system. It becomes clear that these aspects can create some specific barriers and gaps for individual motivation to participate in a decentralized energy system. Therefore, this study aims to investigate the attitudes of prosumers in three European countries – Lithuania, the Netherlands, and Portugal - and to assess the possible barriers to active participation in potential prosumer activities. An experimental web-based quantitative survey design, drawing on findings from previous literature (UKERC survey, Demski et al., 2013; 2011-2014 Austin survey, Rai & Robinson, 2015), aims to identify consumers' environmental, energy security, and economic priorities. Measured willingness to change energy consumption habits with or without specific policy incentives, concerns about costs, and other related perceptions among individual consumers could be an important consideration for policymakers to facilitate local prosumption activities and ensure the effectiveness of the energy transition.

BUEHLER-NIEDERBERGER, Doris* (University of Wuppertal, Germany)
ALBERTH, Lars (Leuphana University of Lüneburg, Germany)

Preserving a Respectable Self – Victim Narratives in Face of Institutional Programs and Closed Awareness Contexts of the Private Environment

The contribution examines the (1) narratives of persons who experienced abuse and/or maltreatment in their family during childhood and received some recognition for this only in adulthood. It contrasts them with (2) institutional interpretations of such violence and the recognition or non-recognition as a victim, and (3) the recognition by the private environment of the persons who suffered said violence.

Data basis are narratives of 20 (former) victims in the course of victim compensation proceedings, decisions and justifications of the victim compensation authorities in these cases, and the interpretations of child protection social workers which were found in 70 (other) cases of suspected child maltreatment.

Results: Interpretations diverge in several ways that victims must account for in their narratives, responding to lack of recognition of said violence by both private environment and child protection institutions (who aim for family preservation). Thereby, "complicity" with the perpetrator is extremely shameful for the (former) victims and rarely mentioned. They rather emphasize their (unsuccessful) attempts at that time to free themselves from the perpetrator, rejecting the suspicion of not being vigorously enough, or attribute their own restraint to feelings of responsibility for relatives they had as a child. The self of the victims proves to be vulnerable in several respects: through acts of violence, but also through dependence on family care and corresponding expectations of solidarity from the victim. This dependence in the contexts of violence, enforcing compliance, is not sufficiently taken into account by the institutions. They only recognize concrete acts of violence and not their constellations as grounds for harm. Instead of focusing on frequencies, risk factors, causes or clinical consequences of victimization, sociology of violence is called to examine the sociality of violence to its full extent: the structuring of social relations, status of perpetrators/victims, access to rights and resources, etc.

The Peripheral Turn: Conceptualizing Global Sociology (introductory remarks)

Sociology has been challenged in recent years by multiple claims associated with those aspects of social life that could not find a proper place, or did so only marginally, in its more established or orthodox versions. Alongside the demands for a more attentive analysis of the material, corporeal, and affective dimensions of social processes, there have been a number of attempts to account for the experiences of subaltern groups and politically marginalized regions of the world in ways that go beyond the subsidiary role they played in developmental theories of modernization and in a considerable part of the sociological research produced at the hegemonic centers. Perhaps nowhere has this tendency been displayed more prominently than in the various claims for a global sociology, the growing interest in post- and de-colonial theories, and the foregrounding of perspectives coming from the Global South. But this is only one aspect of what can be called a 'peripheral turn' in sociological theory and research. In many other subfields of the discipline there have been similar efforts to move beyond accounts of society that proceed – not only theoretically but also practically – at a relatively safe distance from the most severe effects of domination and from the lives of those affected by them. These efforts give new meaning to the notion of *periphery*: no longer merely a geographical (or geopolitical) category, it concerns a broad variety of social relations grounded on power inequalities: economic, political, racialized, gendered, etc. This session explores various aspects of the peripheral turn and their implications for current sociological theory and research.

BUENO, Arthur* (University of Frankfurt, Germany)

The Standpoint of the Proletariat Today

What does it mean to approach modern society from the perspective of the dominated and the exploited? Crucial to debates in contemporary critical theory, this interrogation has a well-known predecessor in Georg Lukács' notion of 'the standpoint of the proletariat'. However, recent perspectives on this issue have placed the critique of reification in a paradoxical situation: abstaining from relying on the proletariat or any other specific social group as the bearer of a radical transformation of society, they tend to build a gap between reified and

non-reified forms of life – a 'hiatus irracionalis' between theory and practice, as Lukács already noted – in a way that obfuscates the question of how one could collectively move from one to the other in actual social reality. This chapter claims that a reinterpretation of Lukács' arguments concerning the transition from reified to revolutionary consciousness provides crucial elements to move beyond that paradox. Moreover, it argues that such a reconstruction of Lukács' phenomenology of (de)reification responds not only to conceptual problems associated with his essay but also to practical issues posed by the capitalist social order today – in particular, the dissemination of precarized and self-exploited entrepreneurs through a process of simultaneous bourgeoisification and proletarianization.

Beyond Leisure: Specialty Coffee Shops As Coworking Sites in Lisbon

Leisure is a central feature determining patterns of lifestyle migration. Traditionally heading to rural or coastal areas in search for a better way of life, lifestyle migrants have become increasingly attracted to high-amenity urban destinations, where leisure and services abound. Portugal witnessed such a shift as Lisbon recently emerged as the country's hotspot for privileged migrants, in detriment of the Algarve, Portugal's traditional destination for European retirees and sun-seekers. While the leisure-led restructuring of Lisbon carried out in the past years paved the way for such a change, this paper argues that the recent patterns of youth lifestyle migration to the city need to be understood beyond leisure. The paper focuses on the mushrooming of specialty coffee shops in Lisbon, which act both as leisure spatialities and as strategic coworking sites in a new urban economy of transnational remote workers and digital nomads. We argue that specialty coffee shops challenge the leisure/labour divide, as well as the consumption/production dichotomy, as coffee shops provide a highly aestheticized setting for coworking practices and exclusive modes of cosmopolitan sociability. This paper derives from the H2020-funded SMARTDEST project, and draws on in-depth interviews and participant observation at specialty coffee shops carried out in 2021 and on netnographic work at digital nomads' and 'expatriates's social networks.

Digital Imaginaries of Agriculture and Rural in Vodafone Smart Village in Turkey

Kasaplar Village, which is in southwest Turkey with a population of around 450 people, is now also known popularly as the Vodafone Smart Village. It has been chosen to be "the first smart village of the World" in 2015 as part of the Vodafone Smart Village Project. Since then, there have been significant attempts to digitalize agricultural production and rural life like the establishment of "smart irrigation systems", "smart greenhouse, and fruit growing", "smart pasture, common milking, and animal tracking systems", etc. Based on those digitalization processes, the project leaders, Vodafone Turkey and TABİT Smart Agricultural Technologies Inc., present the village as the archetype of "the new generation rural life model". This discourse is in line with the ongoing enchantment with agrifood digitalizations, which are presented by mainstream international organizations as well as state and corporate actors as *deux ex machina* in the face of the escalating agrifood system problems like climate change, hunger and food insecurity, ecological degradation, etc.

By analyzing the related documents, reports, websites, and social media accounts of the Vodafone Smart Village Project and its leaders, this paper tries to understand the main features and attributes of this so-called new digital model in socio-ecological and political terms. To that aim, the central questions that this paper seeks answers to are as follows: (1) how and in what ways agriculture itself is reimagined and reconstituted by those digitalization processes in the Vodafone Smart Village, and (2) how rural space and village form themselves are reimagined and reconstituted by the Vodafone Smart Village Project. By asking those questions this paper aims to situate this "new model" within the trajectories of the capitalist food regime and its main tendencies, and thereby aims to provide insights to go beyond the enchantment surrounding the discourse and practices of agrifood digitalizations.

BULUT, Hamid* (University of Luxembourg, Luxembourg)

Ebbs and Flow of Pro-Environmental Attitudes (and Behaviors): The Case of the 2021 European Flooding.

One of the reasons why people don't act more pro-environmentally might be a lack of experiencing consequences of climate change. Indeed, studies have shown that higher levels of environmental attitudes and more environmentally friendly behaviours have been observed among people affected by extreme weather events. It is unclear, however, whether the events caused the changes or whether the affected people simply differed in their characteristics from those unaffected. We draw on a natural experiment to examine the causal link between flooding experiences, pro-environmental consciousness and pro-environmental behaviour, using national survey data collected from ≈ 2200 individuals across Luxembourg. After people experienced the 2021 European flooding, their environmental attitudes raised significantly. The effect is stronger in regions that were more affected by floods. Higher levels of environmental attitudes translated partly intro greater willingness to act pro environmentally. The results have important implications for advancing efforts to address climate change by demonstrating links between extreme weather events attributed to climate change and higher levels of environmental attitudes.

What Is the Role of Social Scientists in the Design of New Agtech?

There is a growing recognition that it is necessary to better understand the social aspects of technology design and adoption, which has expanded opportunities for social scientists to participate in technology development processes. However, social scientists who are included within STEM-dominated research teams can be confronted with various, sometimes conflicting, ideas about where the social *is* and what social scientists *do*—a predicament this paper's authors grapple with as embedded social scientists within agricultural technology (AgTech) projects. Our empirical insights are drawn from interviews with technology developers and project administrators within a transdisciplinary collaborative design project developing artificially intelligent robotics and human-assist AgTech in Aotearoa New Zealand. We identified five roles social scientists might be expected to fill in innovation projects, which are shaped by how technology developers and project administrators conceptualize where 'the social' is within technology design, as well as previous experiences they have had in their education, research and work: the customer service representative, the social manager, the ethicist, the interventionist, and the political agent. Our analysis highlights how expectations tied to these conceptualized roles might lead to internal conflict and confusion within research teams and for social scientists. We argue that such conflict and confusion can be avoided if inter- and transdisciplinary research teams: (1) begin from a shared understanding that technology design is a social process; (2) allow social scientists to articulate their own roles and value within a project, ideally as early collaborators in the project design phase; and (3) provide space for social scientists to flexibly rearticulate their role depending on the diverse social dimensions that may require attention during technology design.

History and Politics: The Roots of European Islamophobia

The tensions and rifts between Europe and the Muslim world, whether domestic or regional, may be analysed as resulting from various historic dynamics. The most important of these rifts has little to do with global religious affairs : is an internal and political one. It is by far the most structural—and the most decisive.

In France, above all, it is rooted—unsurprisingly—in the contemporary, post-Revolutionary history of French society. But, in France as well as in Europe, it has has been made more explicit and amplified by recent political power struggles. Like many of their European counterparts, for several decades, political forces in France but not only had thrown themselves into defiant electioneering one-upmanship against their fellow citizens descended from Muslim backgrounds. For the past 5 years, this posture has no longer been the sole preserve of extreme-right political forces. From Italy to Denmark, Sweden or Austria and its "Operation......" , it has become the position of a quasi-majority of the political landscape, including, like in France or Austria, that of the ruling elite. In what follows, this paper will examine the historical roots of Islamophobia in both the European context and its French archetype, and how this issue of Muslims and Islamophobia has become deeply politicized all over Europe

The Intergenerational Reproduction of Self-Direction at Work: Revisiting Class and Conformity

Generations of social scientists have examined the processes of social class reproduction; the Wisconsin status attainment model has provided the theoretical foundation for much of this research. While this model considers intergenerational transmission of the extrinsic rewards of work (e.g., occupational prestige, income), we focus on an intrinsic dimension, occupational self-direction. Although intrinsic features of work have been given substantial attention in the literature on occupational choice and vocational development, the question as to whether they are transmitted intergenerationally has been neglected in sociological theorizing and research on occupational mobility. Inspired by Kohn's classic work, *Class and Conformity: A Study in Values* (1969) we examine the effects of parents' self-directed work on the occupational self-direction of their adult children. Kohn hypothesized that parents with self-directed jobs would prepare their children for the same conditions of work, contributing to the reproduction of social class standing. Whereas Kohn and Schooler's research provided substantial evidence that parental self-direction influenced child-rearing values (emphasizing self-direction vs. conformity) and practices (e.g., surrounding occasions for discipline) in several countries, their predictions about its longer-term implications for children's attainments have not been subject to empirical test. We draw on two-generation data collected over three decades from the prospective Youth Development Study to examine the intergenerational continuity of occupational self-direction. A structural equation model shows that parental self-direction in work significantly predicts adult children's occupational self-direction. We also find positive effects of adult children's intrinsic work values and self-efficacy on their self-direction. This research extends the prominent status attainment model of intergenerational occupational mobility by demonstrating the transmission of self-direction across generations, an additional mechanism through which inequality persists across generations.

BURNS, Edgar* (Waikato University, New Zealand, New Zealand)

The Great Climate Retreat from the World's Coasts: Writing Long-Term Strategy

In working with local and central governments, election cycles and mission statements occupy considerable thinking space. These encapsulate environmental goals often without enough connections to social changes needed to cope with accelerating climate heating. 'Zero emissions' elicits some buy-in, but simultaneously becomes sloganeering in the face of continuing GHG tonnage being released into the atmosphere. Such formal intentionality misses the urgency of dealing with locked-in temperature rise far beyond the Paris Accord. Climate heating, however, is the result not the cause, simply signalling continuing excessive emissions. Beyond organisational goals and objectives, long-term strategy of 100-years+ is needed to plan for adverse consequences of a very hot world. Half the world's population living near present-day coasts will have to retreat inland in the face of sea-level rise. The transition costs and efforts of construction, transport and demographic dysphoria pose challenges on a scale not previously experienced by human societies.

The New Class Realities of Rentier Capitalism: Theorising Elites in the Asset Economy

In *The Asset Economy* (Polity, 2020), and elsewhere, Lisa Adkins, Melinda Cooper and Martijn Konings have developed an innovative schema for the analysis of social class that attempts to reconcile employment-based categorisations with emerging patterns of household asset ownership. This conceptualisation of - what they term - the 'new class realities' of the 21st century, has recently been critiqued by the social geographer Brett Christophers. Drawing upon analysis developed in his *Rentier Capitalism* (Verso, 2020), he argues that although the ownership of assets by individuals and households might be reshaping patterns of class and inequality to some extent, of much greater significance are changing patterns of asset ownership and the generation of rents by private companies. He argues that employees' working relationships with company-owned, rent-generating assets are, likely, of more importance than ownership of household assets, in determining class positioning. For Christophers, the labour involved in *creating, performing, protecting,* and *maximising* asset rents

explains the global proliferation of certain elite occupations – some lawyers, accountants, lobbyists and so on - some of whom now impinge upon the life-worlds of more established global plutocratic elites.

This paper will take this conceptual debate as a starting point for a reconsideration of data collected and analysed over the last decade in London in a series of related projects (published in a series of co-authored articles and books such as *Alpha City* (Verso, 2020) by Rowland Atkinson and *Serious Money* (Penguin, 2022) by Caroline Knowles)) all of which have examined the impact of global wealth elites on the cultural, political, and socio-spatial life of the city. In particular, the paper will reexamine relations between different elite factions – what we have previously called, the 'haves' and the 'have-yachts' - in the light of this debate.

Toxicity of Cancel Culture and Performance of Radicalism Among Young People in Nigeria

Drawing on the ideas of Alfred Schutz's Social Action Theory that problematizes the notion of Relevance Systematic Functioning for guided orientation and impactful interpretation that influence the process of becoming a participant in an emerging lifestyle and a new culture by young people, this study investigated 'cancel culture' a form of social media activism and its collective consciousness among the youth in Nigeria. The study targets young citizens who own Twitter accounts and operate it regularly. Although the study is guided by an exploratory research design, mixed method procedures were employed. The qualitative technique adopted 6 Focus Group Discussions (FGDs), as a pre-cursor to the quantitative approach that randomly interviewed 302 persons selected in 3 purposively selected states of Lagos, Rivers and FCT, Abuja. The study finds that the youths identify and affiliate with the cancel culture phenomenon and relate the practice to their lifestyle and identity. It also established the fact that cancel culture is reflective of the youth's boredom, natural and spontaneous human reactions of the need for justice that has created an atmosphere of mob justice.

SEIDENSCHNUR, Tim* (University of Kassel (INCHER - International Center for Higher Education Research), Germany)

Contests and the Making of People. a Comparative Perspective on Organizational Socialization in Different Types of Organizations.

Organizations 'make people' in different ways. Hasenfeld (1972, 256) refers for instance to the concept of 'people processing' arguing that organizations make people by 'conferring on them a public status and relocating them in a new set of social circumstances'. In this research we aim to analyze how organizations make people by focusing on competitions within organizations.

Sociological research analyses competition especially regarding its elements and constellations in which competition occurs (Simmel 1903; Werron 2015), regarding the diffusion of economic principles and marketization (Schimank & Volkmann 2012; Slaughter & Leslie 2001; Naidoo 2018), and with regard to strategic responses to institutional change (Oliver 1991) and complexity (Pache & Santos 2010). But there is a lack of studies that analyze how competitive governance instruments determine the making of people in organizations.

With our research approach we address this gap by focusing on contests (Stark 2020) as a form of internal competition in different organizational fields (Hinings et al. 2017). In a comparative approach, we focus on six organizations from three different fields (the automotive industry, higher education and non-profit organizations in a moralized market). We analyze in how far the elements and constellations of competition are similar or different, in how far the perspectives on contests differ according to the organizational culture in the fields, and in how far the making of people through competitive governance instruments differs or not.

Additionally, we learn from micropolitical research (Crozier & Friedberg 1980) about the members strategies to achieve their goals within organizations through participating in contests. Building a bridge to micropolitical research we compare how the role of contests differ in games of power and thereby offer additional insights for the question of how contests make or change people.

SEIDENSCHNUR, Tim* (University of Kassel (INCHER - International Center for Higher Education Research), Germany)

Windows of Opportunities. How the Pandemic Changed Education in Different Disciplines at Universities.

Higher education institutions have been described as loosely coupled systems (Weick 1976) including a set of very different activities (Mintzberg & Rose 2003). Even though on the managerial level competition drives the development of organizations into more coherent organizational actors (Krücken 2021, Musselin 2018), on the level of disciplines universities remain organizations hosting very different disciplinary educational cultures and practices.

This research deals with the question of how the Covid19 pandemic influenced education in higher education organizations at the example of different disciplines such as social sciences, engineering, product design, and music in different universities at different stages of the pandemic. We analyze documents (150) and interviews (20-30) in two cases at three different stages of the pandemic.

Thereby, we understand the pandemic as a crisis, which is characterized by low probability and high consequence events threatening the fundamental goals of an organization (Weick 1988) and leading into moments of disruption and irritation (Maitlis & Sonenshein 2010). We further suggest, that in times of crisis windows of opportunity occur. Windows of opportunities are time slots within organizations, in which changes are likely to happen because of technological advances (Tyre & Orlikowski 1994), new administrative obligations and the lack of existing routines during shocking events (Meijerink 2005). In the windows of opportunity provided by the pandemic, new ideas and concepts have been developed related to education, but these ideas and concepts differ based on the educational practice in different disciplines.

Our results show how educational advances or returning to pre-pandemic practices depend on disciplinary frame conditions provided for instance by rather theoretical (social sciences) or practical orientation (engineering, product design, music) within disciplines or by different career structures provided for the lecturers including more or less competition within the disciplines.

Gender-Based Violence Against Deported Women on the U.S.–Mexico Border

From 2003 to the end of 2013, an estimated 4.2 million people were removed from the United States. Although most deportees were Latino men, the number of women deported was significant. Estimations for the same period found that approximately 360,000 were women. Many were mothers who left children behind in the U.S. Despite the disorienting and painful deportation experience, a group of mothers came together in 2014 to support each other. They founded *Dreamer Moms USA–Tijuana,* whose goal is twofold: to support deported mothers who qualify to go back to the U.S. legally to reunite with their families and, second, to shed light on the impacts of deportation has on immigrant families.

This chapter examines Dreamer Moms organization, its origins, the significance for its members, and more importantly, how the struggle of these women teaching us about the intersection between migration, gender-based violence, and US-Mexico Border. For this chapter, we focus on the different manifestations of gender-based violence against undocumented women. We analyze three specific moments in those women's lives: everyday life while living in the United States, the moment of apprehension, deportation, and expulsion from the United States, and resettlement in Mexico. By undertaking an intersectional analysis, we examine how the gender-based violence these women endure changes according to the different structural systems of oppression they navigate e.g., the US migration system, the US deportation machinery, the racialized violence both in Mexico and the US, and so on.

BUTKALIUK, Vitalina* (National Academy of Sciences of Ukraine, Ukraine)

The Pandemic of Inequality: The Social Lessons of the Pandemic for Humanity

The impact of the pandemic on different populations has been highly uneven: the biological "impartiality" of the coronavirus has been offset by the "realities of neoliberalism" with deep-rooted and pervasive inequalities, poverty and vulnerability among the general population. Almost 3 years of the deadly march of this global scourge across planet demonstrates that the coronavirus has a clear disproportionate impact on the population along class, race, gender and regional lines. The degree and severity of the pandemic's

impact essentially replicates the map of socioeconomic inequality: the more disadvantaged (poor, vulnerable) a person (social group, region) was, the more severe the impact of the pandemic.

In addition to reinforcing and deepening «old inequalities», the pandemic has revealed new, vaccine, inequality, indicating the extreme selfishness of the economic and political elites of the world's richest countries and their disregard of appeals for help from less developed countries, which lack the technology to create their own life-saving vaccine.

The increasing public demand for change, for a "leveling" of living and working conditions, and for greater social justice, as recorded by public opinion polls, is a natural consequence of the social problems that have worsened in recent years.

The scaling of "old" inequalities and the emergence and intensification of "new" inequalities in a pandemic context are evidence of the low social efficiency of the current neoliberal model of growth and development, and a factor delaying humanity's resolution of the current crisis. The synergistic negative effect of the coronavirus and socioeconomic factors is so high that the problem cannot be overcome by medical means or "targeted" social interventions alone. A real solution to the global social crisis requires a systemic approach to eliminating deep inequalities, abandoning current neoliberal practices and moving toward policies that take into account the interests of the majority of the population.

BUTLER, Kathleen* (University of Newcastle, Australia)

Exploring Guardianship-Informed Urban Governance for Aboriginal Peoples

Current regional and city planning in Australia now includes engagement with Indigenous peoples as key to meaningful partnerships in developing inclusive and sustainable urban environments. This reverses the previous trend where the cityscape was often emblematic of the displacement and dispossession of Indigenous people. Given the discipline of sociology's historical interest in urban populations, particularly those who have been marginalised, there is clear scope to re-engage the discipline on both the philosophical and structural change which is occurring.

This paper explores a number of key developments in movements towards formal mechanisms to uplift Aboriginal knowledges of Country and the implications of guardianship informed governance. This includes the recognition of both Traditional Owners and Indigenous peoples living "Off-Country"; legal personhood for Country; Event versus Clock Time; Spiritual versus Secular Authority; and decolonising urban landscapes. The paper recognises the global context of these developments but ultimately argues that localised place-based initiatives are needed to adequately address Aboriginal diversity and connection to Country.

Class, Migration and Capital in Contemporary Australia through the Lens of Cross-Class Relationships

Sustained changes to Australia's migration scheme, coupled with the financialisation of housing, accelerated school markets and growing inequality are fundamentally transforming how class and capital are inherited, accrued and reproduced in Australia. These altered conditions challenge existing classed identities, expectations and desires. In this paper we argue that cross-class relationships are a fruitful site within which to examine these transforming conditions of social class and their personal effects. We draw on current research into "love across class" and in-depth interviews with 39 people about their experience of forming an intimate partnership with someone who grew up within a differently-classed family background. Here we explore the subjective negotiation of these structural changes and how they are understood in everyday life. Focusing on visceral experiences, we examine diversely-situated accounts of migration, mobility, housing and investment in the production of class in contemporary Australia. We particularly home in on altered prospects for social mobility and immobility, as identified by our interviewees, and contradictory locations of the global middle class further shaped by race and gender.

Disentangling Educational Pathways and Work Outcomes for Disabled Young People in England

Disabled children and young people are more likely to come from disadvantaged backgrounds, and to lag behind in educational and occupational attainment in adulthood. Despite enduring interest in the impact of social class on educational experiences and outcomes, the intersection of social class with disability status has been almost entirely neglected. To a certain extent, this can be attributed to medical understandings of disability that view negative educational outcomes as natural consequences of long-term

conditions and impairments, disregarding the influence of social factors, stigma and systems of power and oppression in (re)producing disadvantage. 'Educational Pathways and Work Outcomes of Disabled Young People in England' is a qualitative, longitudinal study that seeks to rectify this omission by exploring the classed dimensions of disabled young people's stigmatising experiences within English mainstream schools, and the consequent effect on educational and occupational trajectories. The study consists of two waves of data collection, of semi-structured interviews with 35 disabled young people (aged 15-18) to explore the various barriers young people face in education, including that of structural, interactional and interpersonal stigma. Findings indicate that inequalities in material resources and cultural capital result in differences in school quality and experience, as well as power to navigate and challenge institutional authorities and structural stigma. Despite recent calls for intersectional analyses in disability studies, the vast majority of research continues to employ monolithic understandings of disability, offering little insight on the convergence of stigmatised ascriptive identities. This paper therefore draw on our study findings to emphasise the need for further sociological intersectional analyses of disability and educational inequalities.

STUDSRØD, Ingunn (University of Stavanger, Norway)

Female Body As the Site of Suffering and Recovering from Domestic Violence: Stories from Poland and Norway

In feminism, the female body is both the source of oppression and a site of power (Andermahr et al, 1997: 20-1). In the context of domestic violence (DV), the female body's re/productive capabilities are subjugated and exploited by males, family, society and institutions; it is private and public property (Hundleby 2012; Harding 2012). In religious contexts, the female body is sinful and disgusting, thus needs to suffer and be kept inside (Clough 2017). In the winter of 2021-2022, we - Polish and Norwegian feminist scholars - conducted semi-structured interviews (in person and online, in Polish and Norwegian) with 29 women from Norway and Poland who experienced DV. Using a feminist sociological imagination (Jackson 2016), our findings show that i) the female body, its physicality and emotionality, were suppressed and oppressed during DV by others (partners, parents, institutions); once the women left/escaped the abusive relationships, the female body became an important site of recovery for the women ii) by being physically tended to, e.g., going to beauticians, doing sports and (re)discovering sexual pleasure, iii) the women were physically able to do 'things' they wanted to for the first time in many years, like listening to music and watching TV, and iv) were able to breathe freely, meaning they no longer felt suffocated and did not have to constantly open windows because they could not breathe. Interestingly, not one woman in our study described herself as a feminist (some preemptively rejected the label without being asked). Yet, their narratives showed remarkable awareness of gendered social hierarchies, showing that the recovery from DV is uncomfortably entangled in patriarchal and neoliberal ideas about the female body as well as an act of rebellion against these very ideas.

BUXTON, Patrycja* (University of Stavanger, Norway)

Ties That Bind: Applying a Feminist Sociological Imagination to Working with Polish Women in an Inter/National Domestic Violence Context

Domestic violence (DV) is underpinned, and enforced, by powerful ideas about the family, home and women's roles within them - these are the ties that bind. But these ideas take on (an)other meaning where migration and living in one's own 'home' country are considered. Unsurprisingly, 'international' DV research does not engage with the Polish context, be it history, culture or society (Bradbury-Jones et al, 2019). However, Polish DV scholarship is also limited, for example, Polish sociology does not study DV and research on the family has been delegated to the Catholic Theology departments (Zielinska and Sosnowska-Buxton, forthcoming). Thus, what is in the inter/national DV literature is a *mis*understanding of Polish culture, history and society, and profoundly impacts women who experienced DV and seek institutional help. I conducted feminist semi-structured qualitative interviews with 15 Polish women living in Poland and Norway who experienced DV. Using a feminist social imagination (Jackson 2016), my findings show that, at home and abroad, neither the Polish catholic woman nor the Polish atheist woman is understood in her plight for help. As a migrant, the former's beliefs are viewed as holding her back and told that she needs to be liberated from them. At home, the latter is considered to be living against the natural, therefore god-given, sex (not gender) roles and she needs to revert to them and denounce gender. Both women's 'peculiar' family obligations and roles, catholic upbringing and their entanglement with the idiosyncrasies of Polish patriotism mean that they cannot just leave home without also betraying the fatherland, god (despite their beliefs) and their families as well as their sex roles. My research shows that cross-cultural perspectives are desperately needed, but often othered and ignored, in DV social work.

Perceived Organizational Support, Work Commitment and Self-Reported Academic Productivity of Romanian Sociologists during Covid-19 Pandemic

Perceived Organizational Support (POS), Job Commitment (JC), Professional Commitment (PC) and Self-Reported Academic Productivity (SRAP) during Covid-19 pandemic were measured in a sample of 373 Romanian sociologists working in academia. Data collection was performed as part of a larger study conducted in 2021 by the Romanian Sociologists Society, the major Romanian professional association in the field (Voicu et al., 2022). The response rate was 53.78%, respondents being invited by e-mail. Participants completed online self-reports for the 8-items version of the POS scale adapted for Covid-19 pandemic (α=.94), the 9-items version of JC scale (α=.81), the 8-item version of the PC scale (α=.75) and a shorten version of the SRAP scale. All scales were used in previous studies with Romanian university teachers in social sciences (Paunescu et al., 2011), comparisons with pre-pandemic data being conducted.

It was found that the highest POS during Covid-19 pandemic was reported by doctoral students in Sociology (M=4.21, SD=1.42), followed by full professors and associated professors (M=3.60, SD=1.49), with the lowest scores for teaching assistants (M=2.96, SD=1.39), the differences being statistically significant F(4,308)=6.67, p<.001. JC during pandemic was slightly lower than pre-pandemic, t(373)=-6.92, p<.001, while the PC was slightly higher t(354)=4.93, p<.001. For both job and professional commitment, three dimensions were measured: affective, normative and continuance. The emotional attachment to organization and teaching (affective commitment) recorded the highest scores both prior and during pandemic, compared to the moral obligation to stay in the university or continuing teaching (normative commitment) and the costs of leaving the organization or the profession (continuance commitment). JC and PC were found to have week positive correlation with academic productivity during pandemic, r(288)=.204, p<.001 and r(288)=.179, p=.002. Implications in terms of work settings improvements, universities' digitalization, and work commitment enhancement for the professional group of Romanian sociologists in academia are discussed.

BYDAWELL, Moya* (UNIVERSITY OF KWAZULU-NATAL, South Africa)

Engaging with the Personal Troubles of Students: A Reflection of the Emotional Labor Used in Facilitating an Understanding of the 'Sociological Imagination' with First Year Students at a South African University.

An integral part of the introductory sociology course at a South African university is a section on understanding and using the tool of the sociological imagination as conceptualized by C Wright Mills (1959). We know it to be a powerful instrument to engage students in disciplinary principles, as well engender tools of conscientization that can be used outside of the classroom.

Many South African students enter university from backgrounds of poverty, deprivation, and inadequate schooling (Jansen 2018). This has a multitude of implications including poor student preparation for the academic demands of higher education and difficult life circumstances (Chetty & Pather 2015).

Understanding and using the sociological imagination is facilitated through content-based lectures, smaller group discussions and an assignment in which the student chooses an aspect of their life-story and attempts to understand this as a public issue. Emotional labor refers to the managing of one's own emotional state to cope with the emotions of others and satisfy the requirements of one's profession (Hochschild 1983). The teaching strategies for the section require empathetic input and emotional labor from the teaching staff. The paper reflects on the implications of the input. Exposure to the experiences of students - as an audience to and symbolic repository of the experiences shared by the student (often painful or traumatic), as the recipient of a deeper understanding of the student body than the usual boundaries between faculty and student enable, and in parallel, as incongruously objective assessor of student achievement.

The Process of Co-Creating Sustainable Solutions for Female Basketball Participation in Melbourne's West.

Despite considerable efforts to address gender equality in sport in the last thirty years, inequitable outcomes persist. Previous research has identified the barriers girls and women face in accessing sport and how the gendered structure and culture of sport shapes their experiences. If we

denotes a presenting author. Abstracts are organized by first presenting author's last name.

know the cause of the problem, then why have we not been able to solve it? In this presentation I will share the results of a project that aimed to explore and document the process of co-creating and implementing gender equity strategies with community basketball members. Specifically, I looked to answer the question: What are the facilitators and challenges faced when designing and implementing gender equity strategies at the external, organisational, interpersonal, and individual levels? I utilised a participatory action framework and worked with three participants over a 9-month period divided into three distinct stages, the preparation, planning for gender equitable change, and creating and implementing gender equitable strategies. Throughout this period, I collected and analysed transcriptions and field notes from four collaborative group sessions and six individual meetings to gain insights into the difficulties and challenges of doing gender equity work in sport. My analysis of the process revealed across the three stages of the process, two significant challenges: an emphasis on elite pathways influencing the direction of gender equitable change; and the emotional toll of doing gender equity work. Based on these findings I will provide recommendations for future research and practice in community sport contexts.

Who Has the Power?: Using Gender and Power Analysis to Advance Gender Equality and Social Justice

Many organizations conduct baseline assessments and research, like gender analyses, to inform social and international development programming. Yet, few build equitable partnerships and shared goals with communities when conducting research, and they often fail to employ participatory research methodologies, which are critical to promote social justice. As a result, gender inequality and intersecting power dynamics are not examined in collaboration with program participants. Additionally, few programs use an intersectional approach that considers the complex ways that unequal gender and power relations overlap and consequently can reinforce or leave unequal power structures intact.

Save the Children's Gender and Power (GAP) Analysis Guidance is an essential tool to examine, understand, and outline approaches that address the root causes of inequality. GAP analysis is a type of action research that investigates how gender and power inequalities intersect and supports programming design and implementation that can promote systemic and long-term, transformative social change. By employing feminist, child-centered, and inclusive methodologies, it outlines how to conduct participatory research in collaboration with minoritized populations who have traditionally been excluded including children and gender and sexual minorities. GAP analysis helps to identify and address complex and interlocking systems of oppression (e.g., sexism, ageism, ableism, racism, etc.) that can prevent gender-equitable outcomes and social justice goals.

The presentation will discuss ethical and methodological challenges and lessons learned from GAP analyses conducted for development programming in Africa and Asia. The GAP analysis findings offer important considerations for research and programming. By focusing on critical research tenets including human rights, critical reflexivity, and examining power across six domains of analysis, the GAP framework helps researchers and implementers examine unequal relations and systems that cause social injustice. Once the root causes of inequality are identified, communities and programmers are better able to advance sustainable and transformative social change.

Transnational Techno-Religious Networks and Temple Urbanism in Contemporary South India

Yadadri, a temple town and state project sprawling over 1000 acres of land, with a budget of over 18 billion rupees, is in the works in Telangana, roughly 55 kms away from Hyderabad in southern India. Dubbed as the devotional capital of the Hyderabad city which hosts multiple global corporations and IT giants like Microsoft and Google, Yadadri reflects popular aspirations to reimagine Hyderabad as a neoliberal Hindu state for a Telugu diaspora scattered across the globe. Drawing a direct line to medieval *Velama* and *Reddy* chieftains, the political elite in Hyderabad too, are attempting to tether the electorate's understanding of political legitimacy to the ideals of divine kingship, rather than on the prevailing constitutional norms of citizenship. Yadadri is being readied to occupy the central node of the religious, technological and capital networks spread across the United States, UK and other parts of the world. The temple network works through creation of replicas across new geographies, giving mobility to investment capital mediated by Hindu ethic.

This paper examines the centrality of temple in the techno-religious networks of the Telugu diaspora. It discusses how an aspiring global city like Hyderabad is deploying a temple and its devotee networks, which donate, worship and vote, to carve out cultural and linguistic regions that cannot be adequately captured within the existing territorial frameworks.

Desire and Discourse: Conviviality in Boy's Love Fandoms in the Philippines on Facebook

The Boys Love (BL) phenomenon have skyrocketed in the Philippines during the height of the COVID-19 pandemic following the increase of media consumption of Thai BLs in the Philippines. In this paper, I investigated at how BL fans in the Philippines engage with one another through their affective desires on BL actors and love teams. Through a six-month long digital ethnography of various BL-related Facebook groups in the Philippines, I reflected about how fans express desire for their idols and love teams and at the same time reach out to their fellow fans to bond. I argue that Facebook cultivates conviviality to help fans express affect to their idols more that they have fellow fans who love the series and idols. Through this conviviality, Filipino BL fans are afforded the space to discuss among themselves and foster healthy discourse, inform others about updates on the idols in the case of new series, endorsements, as well as create new friendships. These discussions among Filipino BL fans help strengthen the conviviality and foster their notions of togetherness.

RC15-232.9

CABIN, William* (New York University Silver School of Social Work, USA)

"It's a Repository for Low-Income People": The Social Construction of Bias in the American Medicare Home Health Benefit

Medicare claims data in the United States indicates that Medicare home health beneficiaries are disproportionately non-white, poor and low-income, have greater rates of mental health conditions, more co-morbidities, and less informal caregiver assistance than the general Medicare population (Avalere Health, 2022; Morley, Kazan, Donthi, Sunkari, & Yung, 2022). Medicare home health beneficiaries also are limited in eligibility by a "homebound" and "in need of skilled care" requirement and can only receive six services, focused on acute physical health conditions, with only limited psychosocial care (Medicare Payment Advisory Commission, 2022). The data raises questions about the nature of the social construction of the Medicare home health benefit on low-income persons and persons of color. A literature review found no studies exploring this question. The present study was based on interviews of 44 social workers in home health agencies in the New York City metropolitan area between June 2021 and January 2022. The results indicate four major themes. One is the social workers believed the Medicare home health population is over-represented by persons of color and low-income persons. The second and third themes are that as a result of the over-representation, the social workers believe: these beneficiaries have greater needs compared to the general Medicare population and the eligibility and coverage limitations restrict their ability to benefit from home care. The fourth theme was that the social workers had mixed views of whether there was intentional racial, ethnic, or class bias in the construction of the Medicare home health benefit, though most believe there is de-facto bias. The study raises questions about the social construction of te Medicare home health benefit as a policy of that, at a minimum, furthers implicit racial, ethnic, and class bias.

CACERES, Ignacio* (Pontificia Universidad Católica de Chile, Chile)

Nonreligion and Social Cohesion: Evidence from Latin America

Latin America is undergoing a process of profound religious change. One of these transformations is the rapid rise in the number of religiously unaffiliated people, which exceeds 10% of the continent's population. This phenomenon has accelerated in the new generations. According to the PEW report (2014), half of unaffiliated individuals grew up in a household identified with some religion. This massive religious disaffiliation implies challenges for a continent where religion has traditionally played a significant role in social cohesion. In the horizontal dimension, leave the religious community could erode levels of social trust and involvement in civil society. Meanwhile, in the vertical dimension, the disaffiliation of a hierarchical structure could affect the confidence in political institutions. But at the same time, the nonreligious new population cohort could be correlated with attitudes of tolerance trough diversity, greater democratic support and political participation.

This paper aim to inquire in these complex relations between nonreligious people and different dimensions of social cohesion in Latin America. A comprehensive analysis allows us to understand the main challenges for individuals and for the society. Both, population cohorts and the life course are included in the analysis. In order to identify these relations, the article bases its analysis in 135 LAPOP survey, including data for 18 countries during the last two decades. Trough multilevel models, it's possible to identify individual relations, but also the moderate effect of context in these relations. Are the attitudes and behavior of nonreligious people the same in context with higher religion diversity than in homogeneous encompass? Are increasingly secular contexts impacting the way nonreligious people relate to their communities and political institutions?

RC30-438.2

CACERES CRUZ, Virgen* (University of Puerto Rico, PR)

Implications of Authoritarian Neoliberal Labor Policies in Puerto Rico

The purpose of this paper is to expose authoritarianism in Puerto Rico, implemented by the State. This authoritarianism has been possible by neoliberal labor public policies, media discourses and economic, cultural, and ideological changes. These have affected the social and subjective conditions of working people in Puerto Rico. During the last fifteen years, job insecurity has worsened due to the fiscal crisis, natural disasters and the pandemic. In these neoliberal authoritarian policies have participated local and global political/financial interests.

As of 2009, different neoliberal governmental administrations approved laws that have repealed important constitutional rights of the labor relations system (Santiago, 2017). In particular, during 2017, a group of laws known as the labor reform was approved. This reform transformed the labor relations system, previously highly advanced, into one of the most retrograde in the Latin American region. Since Puerto Rico is a colony of the United States, the President and Congress imposed to our country: *The Puerto Rico Oversight, Management, and Economy Stability Act* (*PROMESA*). This law was signed in 2016 and created the Fiscal Oversight. The role of this Board to supposedly allow Puerto Rico to restructure its debt and achieve fiscal responsibility. This despite the fact that its members are not elected and do not represented the majority of Puerto Ricans.

Despite the asymmetries typical of these relations of domination, the labor movement, together with other social movements, have displayed contesting and transgressive resistance against these neoliberal authoritarian policies.

RC14-JS-64.3

CADIMA, Francisco* (Universidade Nova de Lisboa (ICNOVA), Portugal)

Television and Cultural Diversity in Portugal

Both academics and regulators accept that there is an increasing risk of cultural homogenization of the audiovisual content, and that many cultural expressions, and diversity – at all levels (whether in television content or in audiovisual organizations) are hardly represented namely in public broadcast media (Iosifides, 2010; Malika, 2013; Horsti, 2014; Page, 2015; Dhoest, 2015). The Portuguese public television (RTP) rarely integrate these kinds of purposes and contents into their programming schedules, policies or strategies.

In Europe, minorities appear in less than 5% of the political coverage in the media, and women in less than 5% of the economic or scientific news programmes. In Portugal, this situation is even more evident, since we can only find some examples of this kind of television programmes in the second public channel (RTP2), and rarely in the main public channel (RTP1) (Baptista & Silva, 2017; Cádima, 2019; Lourenço & Fernandes, 2019) , the one with the highest audience at national level, and the main alternative to the other two private channels.

Europe 2030 strategy highlights inclusive growth as one of its priorities, namely to diminish poverty and social exclusion of young people and children, as well as gender discrimination, and to enhance cultural diversity. Our starting point, therefore, has to do with our perception that there is, from a historical

point of view, a significant lack of cultural diversity and social inclusion in the programming of the public TV in Portugal (Cádima, 2019). In this paper, we propose to study if there is, or not, a deficit of cultural diversity, plurality of expressions, genres and formats, and inclusiveness, in the Portuguese public broadcaster, at different levels. This study will allow us to indicate the flaws and deficits that occur, and discuss and propose specific solutions and improvements.

CAI, Xiaomin* (The Chinese University of Hong Kong, Hong Kong)

Working on the Market Frontier: Selling Prohibited Assisted Reproductive Technologies in Pronatalist China

This paper investigates how Chinese agencies market, sell, and provide assisted reproductive technologies (ART) with surrogacy, sex selection, and paid donor gametes against the state's regulatory prohibitions. It extends the conceptualization of a 'market frontier' (Hochschild 2011) – i.e. market movement towards life spheres with contested consequences – to explore the making of the ART market in the legal/illegal, medical/non-medical, and biological/technological in-betweenness. Based on an ethnography in two ART agencies – one providing clandestine ART services within China and the other arranging cross-border reproductive care – the paper explores the role of client-facing market work in choreographing structural, cultural, biological, and technological aspects to manoeuvre and expand the market frontier. It presents, firstly, how the agents negotiate (il)legality of their business by pointing to regulative ambiguity and the state's pronatalist agenda; secondly, how the companies identify and create demand for the prohibited ART by working with legal medical institutions and mobilizing sociocultural imaginaries; and lastly, how the agents navigate clients through fertility hurdles with emotional support on the one hand *and* unexpected ART advice with emotional costs on the other hand. The paper adds to the body commodification literature by a shift of focus from how gametes and reproductive labour are commodified to how market demand is shaped. It furthers discussions of the politics of commodity value by a shift of perspective from state regulations and discourse to market circumvention and manoeuvre.

Does the Feminization of Sociology Build Feminist Academia? the Case of Turkey

The women movement has struggled for women's equal participation in education for years, and through this effort, it has seen quantitative achievement at all levels of education on a global scale. For instance, in higher education, women have made up a substantial amount of the undergraduate student population in different parts of the world in the last decades. This over-representation is interpreted as that the problem of gender inequality in higher education no longer exists. On the other hand, according to some, this picture is worrisome as it points to the possibility of higher education turning into a "men-free zone". In this sense, the feminization thesis can be helpful to understand this progress and/or change in education. This concept refers to a) quantitatively being in the majority, b) process of change, and c) transformation of the culture of an organization, a field of study, and society as a whole via dominant "feminine values, concerns, and practices". Feminization issue is increasingly discussed in academia and specifically, the feminization of sociology has become a concern in recent years due to the increased presence of women in the discipline general. In this study, sociology in Turkey will be of interest to examine whether the discipline is becoming feminized. What has changed in the last 30 years in sociology in terms of the student body and academic staff? If the feminization of sociology exists, what does it mean for the future of sociology and society? To what extent can the feminization of sociology contribute to building feminist academia that embraces widespread feminine values, concerns, and practices? Drawing on the national official statistics about sociology over 30 years, this study aims to understand the feminization of sociology in a historical way and its possible impact on the future of sociology, academia as well as society.

CALAMBA, Septrin* (Alfred Deakin Institute for Citizenship and Globalisation, Deakin University, Australia)

Everyday Peace Practices As Disruptors to Conflict: The Hidden Transcripts of Youth's Participation in Peacebuilding

The pervasive threats of conflict and violence, whether real or imagined, can lead young people to practise everyday peace in various levels and approaches. This paper is situated in the context of Mindanao, in Southern Philippines, where conflict is multi-layered and complex involving various armed groups and militia units. The conflict in Mindanao continues to afflict young people by destroying their social and familial relations, education, and employment opportunities. Peacebuilding is a formal process dominated by people in formal political structure. In recent years, young people's participation in peacebuilding has caught attention in the national and international peace agenda. However, the

inclusion of youth often results to tokenism. Young people are sidelined and excluded in the narratives of promoting peace and post-conflict reconstruction. Consequently, this creates barriers to the potential of youth in peacebuilding, and results to failure of meaningful inclusion. This paper examines the everyday peace practices of youth as forms of peacebuilding approach that may potentially benefit to conflict transformation, and sustainable peace. Youth in conflict and post-conflict societies have developed their peacebuilding agency despite the social problems, political and socio-economic conditions which continue to challenge their participation. Furthermore, youth agencies have been intensified, and translated young people's display of resilience. The everyday peace practices of young people are less explored in formal peacebuilding spaces. Rather than emphasizing what the youth can do in post-conflict situations, it is equally important to highlight what young are doing to prevent conflict and violence through their everyday peace practices.

CALDERA GONZÁLEZ, Diana del Consuelo* (Universidad de Guanajuato, Mexico)
ORTEGA CARRILLO, Miguel Agustín (Universidad de la Salle Bajío A.C., Mexico)
ARREDONDO HIDALGO, María Guadalupe (Universidad de Guanajuato, Mexico)

Avatares De La Libertad De Expresión En México

En los últimos años, México ha sido identificado como uno de los países con más asesinatos de periodistas en el mundo, situación que se agrava debido a la existencia de un discurso moral que promueve el odio a periodistas y medios de comunicación que expresan opiniones y exponen información que contrasta con la información oficial.

Si bien aún no es empleada abiertamente la censura como herramienta de gobierno, sí se ha exacerbado el uso de presiones a medios de comunicación para que estos recurran, a su vez, a modificaciones en sus líneas editoriales y a ajustes en la selección de articulistas y de periodistas de opinión a partir de criterios afines a los dirigentes políticos con poder. Por otra parte, existe gran permisividad oficial con grupos criminales, los cuales ejercen de forma abierta presión a periodistas locales para que no ejerzan su libertad de expresión.

Una de las manifestaciones públicas más visibles de este fenómeno es la emisión diaria a través de medios masivos de comunicación y de redes sociales de un discurso por parte de quienes ejercen el poder que funciona como tribuna pública a partir de insultos, descalificaciones y amenazas dirigidas a periodistas y organizaciones específicas que investigan asuntos políticos con una interpretación diferente a la oficial. Ese discurso luego es replicado acríticamente durante todo el día por esos medios.

¿Cómo cambiar esta situación? En este trabajo de tipo documental, se explican los aspectos que configuran ese discurso moral oficial, se analiza por qué a partir de esa visión surge el empeño por socavar los valores democráticos y de desarrollo de la libre prensa. Por último, se enlistan acciones concretas que ilustran la situación que prevalece.

The Impact of Covid-19 on Life Satisfaction: A Long-Term Perspective

In the past couple of years, in various countries, a lot of effort has been put into depicting the immediate effects of the Covid-19 pandemic on various domains including subjective well-being.

Our focus in this paper however is to put these immediate effects into a long-term and internationally comparative perspective. We do so by analyzing individual level data on general life satisfaction from repeated Eurobarometer Surveys (1973-2021) of 8 European countries enriched with country-specific macro-level time series. By applying Multilevel Hierarchical Age Period Cohort regression on the combined data, we first estimate the net trend, life-cycle and cohort effects for each country separately. We then test different economical and/or sociological hypotheses (e.g., Easterlin paradox) for each of the three temporal dimensions considered (trend, birth cohort and life cycle). Finally, our research design allows to put the effect of the Covid-19 crisis into perspective, both internationally and in the long term.

Based on our first results, we found that in Belgium (Flanders), the trend fluctuations are stronger than the life-cycle effects and there are hardly any generation effects. In other countries, by contrast, there are few or no trend fluctuations, but rather signs of a generational change. Overall, international heterogeneity is particularly large, and these international differences seem to be stronger than the temporal ones.

Beyond "Wine Mums": Better Understanding the Structural and Social Factors Shaping Drinking Practices Among Working Mothers

Drinking among midlife women has become an area of research interest, including the meanings midlife women attribute to alcohol and their drinking styles. However, previous studies have often focused on individual behaviours, preferences, and meanings. In contrast, little alcohol research has closely examined how these in the context of broader social factors. This includes how common social roles like being employees and parents interact and co-produce particular drinking practices. These contemporary social roles can provide women both opportunities (e.g., financial independence) and reinforce structural barriers (e.g., "double shifts" of work and care). For working mothers, lives are also intertwined with dynamic social, financial and workplace factors, such as partner status and job security – all of which can shape their relationship with alcohol.

This paper draws on a broader study examining drinking among working mothers in Australia. Using a case study approach, we picked four distinct cases among our sample that represented typologies of drinking patterns and meanings. These case studies allow us to highlight the complex arrangements of women's lives that influenced their drinking practices. These included differing types of social support, financial security, organisational features of workplaces and work conditions, and other factors such as age and health. These arrangements co-produced meanings of alcohol as a source of relaxation, renewal, and/or intimacy, as well as drinking practices that ranged from social to spontaneous to highly routinised.

This paper highlights how alcohol is constructed according to social and economic structures, and further mediated by support networks and workplaces. Our case study approach highlights the dynamic and heterogenous features of women's lives and social roles. We suggest that attending to these is crucial for understanding different drinking practices and meanings among working mothers.

Amplifying Aboriginal Voices: Photovoice and the Citizen Social Science Agenda

There have been recent calls for the use of creative and qualitative participatory methodologies within tourism research (Hardy et al., 2022). These methodologies are suggested to have the capacity to amplify unheard voices, as well as empower residents to co-create knowledge and directly influence tourism planning. This development of a citizen social science agenda within tourism research has also recognised a need for prioritising Indigenous voices within research. This echoes Australian and Asia-Pacific researchers over the last decade (for example: Nielsen & Wilson, Hutchison, Movono & Scheyvens, and Higgins-Desbiolles) who have emphasised the concerning lack of Indigenous voice within tourism research, leading to calls for research to authentically engage with, and empower Indigenous peoples.

While creative and qualitative participatory methodologies are available, tourism research has left these methodologies largely unexplored (Hardy et al, 2022). An example of a creative and participatory methodology is *photovoice*. Photovoice involves putting cameras in the hands of those "with little access to those who make decisions over their lives" (Wang & Burris, 1994: 172), to collect data that reflect their needs within photographs. Since its conception, photovoice has primarily been used in health and education research, giving voices to those who are typically silenced including youth, those living with disabilities, and Indigenous peoples.

Given the value of this method to amplify unheard voices, this study aims to understand how photovoice has been used in tourism, marketing and leisure research, through a systematic literature review. 31 journal articles across two decades, employing a photovoice methodology were analysed. Methodological strategies for undertaking photovoice studies in tourism research, and future research avenues are highlighted. This study not only critically analyses the current tourism research landscape in employing photovoice as a creative, participatory methodology, but also reflects upon the capacity of photovoice to contribute to tourism's humanising research agenda.

Global Pain and Aging: A Cross-Sectional Study on Age Differences in the Intensity of Chronic Pain Among Middle-Aged and Older Adults in 20 Countries

This study aims to examine age differences in the intensity of chronic pain (which separates middle-aged and older adults being often troubled by pain that may likely require intervention from middle-aged and older adults for whom pain may be more endurable), and to explore whether individual-level health and country-level gross domestic product (GDP) explain these differences.

Cross-nationally harmonized data on self-reported intensity of chronic pain (0=no, 1=mild, 2=moderate, 3=severe), including 104,826 individuals aged 50+ in 20 countries observed in 2012-2013 to isolate estimations from heterogeneity explained by methodological differences across single-country studies, were modelled using two-level hierarchical ordinal linear models, with individuals nested within countries.

Overall, mean participant age was 66.9 (SD=9.9), 56.1% were women, and 41.9% reported any chronic pain. The intensity of chronic pain increased sharply with age in some countries (e.g., Korea and Slovenia), but this association waned or reversed in other countries (e.g., United States and Denmark). Cross-country variation and age differences in chronic pain were partly explained (85.5% and 35.8%, respectively) by individual-level health (especially arthritis), country-level wealth (as indicated by GDP per capita), and demographics.

The intensity of chronic pain is not an inevitable consequence of chronological age, but the consequence of potential selection effects and lower activity levels combined with individual-level health and country-level wealth. Our findings suggest further investigation of health conditions and country affluence settings as potential targets of medical and policy interventions aiming to prevent, reduce, or manage chronic pain among older patients and aging populations.

Hope and Liberty: Challenging the Gerrymandering of Freedom

In political terms, Gerrymandering is the process in which a particular interest group or class achieves an advantage by manipulating the boundaries of an electoral constituency. In recent decades it looks like the world has experienced a global *redefinition* of the concept of freedom, moving away from the *individual* toward the *personhood of corporations*. In the first haft of the presentation, we will explore the semantic, political, legal, and epistemic transformations experienced because of what I describe as the Gerrymandering of Freedom, or the process of boundary manipulation of our understandings and applicability of Freedom in society, particularly in the United States. On the second haft, the presentation explains how hope, as a paradigm, simultaneously inscribes a counter-narrative, where freedom is reconstructed as an inspirational path toward constructing a world based on mutual love and care. This section analyzes several case studies where freedom (of the voluntary relinquishing of it), as well as forgiveness, have emerged as powerful forces of social transformation. Aspects such as the decentralization of self-center interests for the collective and the investment in freedom for those traditionally disenfranchised around factors such as migration, access to education, and health care. As the presentation explains, pursuing freedom is not only a social imperative but also allows people to imagine themself differently, both at the epistemic and corporeal levels. To the Gerrymandering of Freedom, the paper argues for love as a typology toward freedom.

Charting the Fortitude of Traditional Seafaring in Micronesia

The people of Micronesia have long been known as master navigators of the Pacific. For centuries, Micronesians have made lengthy, demanding, and dangerous journeys across the Pacific for trade, subsistence, and kinship. Although Micronesia is no longer the canoe filled ocean it once was, traditional seafaring is still practiced throughout the region, especially within the longstanding navigation schools in the Caroline Islands. Despite the risks that come with venturing out into the open ocean, many continue to sail out into the sea with a sharp, alert mind, confidence in their canoe and crew, and a special joy that comes with adventure. This research seeks to explore the mental fortitude associated with traditional seafaring in Micronesia, a fortitude that is rooted in deep indigenous traditions and strengthened by the community bond. This research also explores the traditions, customs, and foundations of traditional seafaring in Micronesia. It addresses several questions regarding the mental fortitude of navigators and their families: In the face of unknown danger in the voyages ahead, how does one build and maintain courage? How do families prepare for and accept the possibility of losing someone to the sea? What upbringing or cultural factors contribute to this? How might we take those same principles and apply them to everyday life?

RC41-601.3

CAMARENA-CORDOVA, Rosa Maria* (Universidad Nacional Autónoma de México, UNAM, Mexico)

Family Structures in Mexico

The issue of the family has been, and continues to be, a subject of wide debate. Too often '*the family*' is still spoken of as if there were only one kind of it. Even when referring to '*families*', it is not uncommon for the term to just denote the plural of a same type of family, ignoring the variety of types of families that exist in reality. It also ignores the dynamic and changing nature of families, not only over their life course, but as a result from internal circumstances, desires or decisions and, mainly, as an adaptive response to face and satisfy needs generated by a variety of changing conditions prevailing in the external environment.

In a context of high social and cultural heterogeneity and accentuated social inequality, as well of accelerated and profound demographic, social, economic, cultural, political and legislative transformations such as those occurred in Mexico in recent decades, changes at the family level have been significative.

Using data from the 2021 Mexico's National Survey on the Dynamics of Relationships in Households, this contribution aims to analyze and discuss the diversity of family structures currently observed in Mexico, understanding by these not only what is related to the size and typology of their composition by sex, age and kinship ties, but also and mainly, as the ways in which members of different types of families organize their daily lives, and the existing hierarchies and power relations between them.

Penal Policy and the "War on Organized Crime" in Brazil Under Temer and Bolsonaro: Neoliberalism, Social Accumulation of Violence and Militarization of Security

This presentation analyzes how the specter of "organized crime" influenced the formulation of penal policies by the Brazilian Federal Government during Michel Temer and Jair Bolsonaro administrations. It seeks to analyze how the representation of this diffuse figure as a kind of enemy to be fought has contributed to the increase of militarization of security in the country and to the strengthening of the militias – violent paramilitary groups with close ties to the country's security forces – in Brazil's largest cities. We hypothesize that the policies of militarization of security and open support for state violence of the two administrations represent a link between the history of social accumulation of violence in Brazil and the contemporary neoliberal renewal of the "choice for civil war" as a form of government of the population.

The domestic scenario regarding networks linked to illegal activities has become extremely complex in the last decade. Several networks known as "comandos" have strengthened and expanded their operations in the country. Furthermore, the networks known as militias – which rely on discourses of war on "crime" and on "drugs" - have markedly expanded their presence in several cities, as well as extended their influence over government agencies.

Within the troubled economic and social moment experienced by the country throughout the analyzed period, new government practices and strategies to deal with these issues emerged, which represent the major focus of the research. The interventions of the armed forces in urban security were the biggest mark of the Temer administration. The deregulation of the arms trade and the support for violent police operations marked Bolsonaro's term. The research was based on a qualitative review of the Temer and Bolsonaro administrations, including their policy proposals, public speeches, changes to criminal legislation and Federal Government reports.

The War on Organized Crime after Redemocratization in Brazil: From Human Rights Discourse to Militarization of Security

This presentation analyzes how the specter of "organized crime" influenced the formulation of penal policies by the Brazilian Federal Government following redemocratization. Based on legislation enacted by the Cardoso (1995-2002) and Lula da Silva (2003-2010) administrations, we hypothesize that networks linked to black markets in Brazil came to be considered by the government as one of the most prominent threats to the protection of human rights and democratic rule of law in the country. In this way, these networks were considered a dangerous enemy which required preemptive action and tough measures from the security forces. As a result of viewing the issue in these terms, Brazilian policymakers relied on militaristic and repressive strategies, such as the use of armed forces in operations to "maintain law and order" and on wide-ranging penal legislation targeting organized crime and drugs. We argue, however, that these policies failed to prevent the strengthening of criminal organizations and failed to achieve any of the intended goals of protecting humans rights. The main effect of this political option for militarizing crime control was the widening of the punitive network, especially the rising rates of imprisonment and police brutality against marginalized groups. Moreover, this option has contributed to the strengthening of the "militias", paramilitary criminal organizations with close ties to the Brazilian's security forces. In conclusion, we argue that this paradigm of war on organized crime has led to further violations of constitutional guarantees in Brazil and paved the way for the next administrations to further increase the support for violent police action and punitive measures. The presentation is based on a review of the Cardoso and Lula da Silva administrations, including their respective policy proposals during presidential campaigns, National Public Safety Plans, actual public safety and national security policies, and changes to criminal legislation targeting organized crime.

Algorithmic Sociality: "They Feed You Stuff"

Algorithms don't exist outside social processes. This paper reflects on how participants managed and navigated the "force relations" (Bucher 2017) of the sociotechnical straightjackets of algorithmic control when viewing and posting selfie pictures. We will trace how, through discourses of optical optimization, participants developed techniques of triangulating what they saw online in order to gauge authenticity. Alongside this, we will discuss how algorithmic conditions work to shape subjectivities by fostering the development of specific looking and thinking practices.

In a three-year study on selfies, many of the over 100 millenials participating returned time and again to questioning various manifestations of algorithmic activity in attempts to get feedback from peers and evaluate their own interpretations, despite never being asked or encouraged to discuss platforms or algorithms. It became apparent that they spend a great deal of time and energy thinking about platform steering conduct, which directly informed their decisions, attitudes, and responses. Algorithms ostensibly enable and assign significance or relevance to shared pictures through social media platforms by setting up conditions for social participation: they are the invisible frame, yet they leave traces, have symptoms, and produce effects.

In a perpetual and symbiotic feedback loop, algorithms respond to users responding to what they see on social media based on their varied formulas aggregating patterns of behaviour. Being aware of algorithms *at* work, but also being unsure of *how* they work, users curate their texts, images, the timing of their posts, and their choice of platforms in specific ways. For selfie images, algorithms, via filters, create an idea of an ideal face. Study participants, aware of algorithmic effects on images, manifested algorithmically sensitive discourses that included various strategies to maintain contrl of image appearances as well as of image viewing processes. Clearly, algorithms are the invisible infrastructure of wireless interaction.

The Visual Essay "Unbound" As Interdisciplinary Interface

For Whitehead (1929): "We can understand order, because in the recesses of our own experience there is a contrasting element which is anarchic." Relying on this juxtaposition, we consider how working through/with the visual fosters inclusiveness while preserving critical attitudes towards experience, documentation, and creation through the revolutionary format of the visual essay. As a "a cross-cutting field of inquiry" (Pauwels 2010: 559), visual sociology ruptures rationales that justify artificially splintered visual scholarly practices through disciplinary gatekeeping. Our presentation experiments with "the study of the visual and the study through and by the visual" using the visual essay as an interdisciplinary interface by asking: *What happens when we do not assume linearity between concepts, ideas, process, data, or bodies?*

The operative notion of *visual* gestures toward post/disciplinarity by opening to creative expressive means (altered images, metaphoric representation beyond photography e.g., Hansen et al., 2021). Flexibility in modalities accepted within the form include more voices speaking across disciplines. With this presentation we tease out the potential of visual essays to include and integrate "looking" from various disciplinary angles. First, we revisit two experiments (Argentina, Mexico) with deconstructed visual essays conducted with students from diverse fields. Second, we model the deconstructed visual essay process to demonstrate how visual essays work as inter-cultural and interdisciplinary tools.

The visual essay remains a contentious form, yet retains the potential to unite ways of representing scholarship, through its "dynamic and hybrid character" (Pauwels 2012). Grady (1991) argued for the visual essay's importance in the future development of visual sociology and visual studies: "Not despite, but because [it] is a medium for artistic expression." However, wariness of the aesthetic power of the visual essay remains, often automatically yet unproductively pitted against its empirical capacities. Our approach begins by recognizing images as always already anarchic and post-disciplinary.

The Interplay between Study Abroad and Professional Trajectories in a Post-Pandemic Scenario. the Case of Italian Graduates

Our proposal focuses on the entanglement between national and international geographic mobility paths of young graduates in Italy and their educational and professional trajectories in a post-pandemic scenario. By interlacing the research fields of youth studies, mobility studies and higher education studies, our aim is to highlight the multiple meanings and effects that mobility experiences may have in structuring graduates' future projects and/or desires in terms of work and career. On the other hand, we argue that their expectations for both their mobility experiences and careers are also shaped by family socialisation in a dialectical way, considering furthermore that the building of embodied and scholastic cultural capitals is spatially differentiated depending on the places where they grew up. Departing from these premises, three rounds of semi-narrative interviews were conducted with 51 Italian graduates between 2020 and 2022 (within the 'ITA.LI Italian Lives' 5 year longitudinal project at the Department of Sociology and Social research, Unimib), in order to catch eventual relevant changes in their sets of expectations, mobility experiences/projects and their relationships during the COVID pandemic. We finally pinpoint four different types of mobility paths through which we could detect the influence of socio-structural and cultural variables on the ways the interviewees framed their mobility and professional experiences, desires, and projects.

CAMPBELL, Hugh* (University of Otago, New Zealand)

Farm Fencelines As Technologies of Power

Fences are an under-explored aspect of the political creation and contestation of modernist farming yet, as Reviel Netz argues, technologies like barbed wire are actually one of the most powerful enactors of the 'ecology of modernity'. Following more-than-human logics, fences cannot be simply understood as one of many taken-for-granted and simple technologies that are deployed on farms. Rather, they need to be understood as an enactor of both material and political power. In this paper, I argue that through colonisation, fences enacted private property rights, and triggered significant ecological disruption. Fences enacted farm ontologies that separated interior and exterior worlds and this had important effects - particularly the capacity to slice, separate and divide up the previously complex connectivity of indigenous and peasant farming landscapes. By looking at the erecting of fences in modernist farming worlds, two political motions around farm fences become visible: 1) as objects/sites that enact privatisation and/or colonisation, and 2) as an important site of anti-modern and anti-capitalist political praxis. From the burning of hedges in the Enclosure Movement and the 20th century activities of the Right to Roam movement in the UK, to the Ploughing Protests and planting of gorse hedges in colonised landscapes in Aotearoa New Zealand, the political effect of fencelines reveals particular ways in which taken-for-granted technologies on farms – even the ones that seem very simple and unsophisticated – have important political implications and enact powerful effects. The effects of these historically significant technologies are still very much present in the relational ontology of 21st century modernist farms and form the essential prologue to any contemporary narrative of technologically-driven change on farms.

Power Resources Theory and Australian Trade Unions

Trade unions in Australia, as in most other nations, have declined in strength and influence over recent decades, thereby contributing to dampened wages and working conditions for many workers, increased precariousness and increased socio-economic inequality. Current discussion is often confined to an overly narrow channel, in which union decline is measured in terms of falling union density and solutions to union weakness are then sought in more vigorous recruitment ('organising'), perhaps joined with efforts to find sympathetic governments that can improve participative standards in labour law. A more expansive, more analytical approach is clearly needed. A useful path forward is through the power resources approach, which – in one recent iteration – differentiates structural, associational, institutional and societal power resources and considers the ways in which such power resources can be mobilised. This paper explores the power resources approach as a tool for analysing the situation of Australian trade unions, drawing on background literature, secondary statistics and documentary analysis. Though limited to a sketch at national level, largely setting aside the differences in union capacities at sectoral level, the paper succeeds in highlighting significant elements that are neglected in the current discussion and deserve closer attention, eg definitions of union purpose, shifts in collective bargaining coverage and forms of trade union engagement in politics.

Contextual and Relational Variables Associated to Taking a Stance in Favor of Gender Violence Victims

Previous research confirms the social impact of informal support networks in the recovery processes of abused women (Adkins & Dush, 2010; Bybee & Sullivan, 2005; Goodman & Smyth, 2011), but there is a lack of research on the elements that condition the reaction of those who witness or know about a situation of gender-based violence. The literature review done in the SOL. NET R&D project identified three elements: their knowledge of the issue, their relationship with the victim or aggressor and their perception of what may happen to them after offering help (Melgar, Campdepadrós, Fuentes & Mut, 2021).

To check whether this hypothesis applies to the Spanish case, to what extent and its nuances, we conducted a mixed methods approach, consisting of a quantitative study, carried out with 1541 Spanish people over the age of 18, one of the first of its kind, and a qualitative work consisting of 8 case studies of organizations that are attending and supporting víctims and survivors of gender violence. Within the case studies, 56 qualitative techniques have been carried out to professionals, victims, and survivors.

Information is collected both on situations of gender-based violence of which one has been a witness, and on situations that the victims went to tell the interviewee. Likewise, different types and degrees of gender violence are considered (such as physical violence, psychological violence, forced abortion, sexual harassment, etc.).

The quantitative analysis has shown a statistically significant relationship between providing help to women victims of gender violence and some contextual, relational and biographical variables. These relationships are discussed in light of the preliminary results of the qualitative study.

The Effect of Public Policies to Combat Hunger in RURAL Latin America and the Caribbean, from 2010 to 2020.

The purpose of this work is to analyze the effect of public policies on hunger in rural Latin America and the Caribbean, during the period from 2010 to 2020. With the following question: What was the effect of public policies on hunger in rural areas in Latin American and Caribbean countries? Its importance lies in seeking scientific and academic discussions to (re)think the contexts of public policies to combat hunger, in studies that emerged in the years 2010 to 2020, punctuating some issues that can contribute to the reflections of the movement to combat hunger. and other social movements, regarding the challenges that are imposed to seek to consolidate the Human Right to Adequate Food in rural areas. This research intends to seek scientific publications that deal with public policies to combat hunger and rural areas, through an integrative review of experimental and quasi-experimental studies. As object of this study, it will focus on articles published in the Scientific Electronic Library Online (SciELO), Latin American and Caribbean Center for Health Sciences Information or Bireme, Red de Revistas Científicas de América Latina y el Caribe, España y Portugal (Redalyc) and Researchgate, which address, centrally or peripherally, the issue of public policies with reference to the fight against hunger. The central process of this methodology is the combination of data in quantitative form, resulting in a work that consolidates the results of grouped individual studies, as well as a process of interpretive description, guided by certain categories. In this way, the breadth of approaching public policies becomes instigating to permeate their relationship with sociology, and still having the concern to outline the focus on the fight against hunger.

CAN, Elif* (ENS de Lyon, France)

"How Happy Is the One Who Says I Am a Turk" Socialization of Young People to the Turkish Nationalism in the School Context and the Production of Racist Discourses

This paper which is based on a qualitative research approach elaborated with interviews with students (n:41) in Istanbul, aims to interrogate how Turkish high school students learn the Turkish nationalism in the school context, especially through history lessons. In other words, the purpose of this paper is to examine the real impact of this education on students' political orientations with a particular focus on ethno-racial relations in Turkey. Mobilizing the concept of "political socialization" (Percheron, 1974), this research questions the way that high school students interpret the Turkish national narrative, especially the downturn period of the Ottoman era and the Turkish Independence War. Indeed, these teaching contents which are highly moralized have a particular place in the high school curricula. Regarding to the purposes of the national Education in Turkey affirmed by the National Education Ministry in Turkey, the history education appears as a main vector of promoting nationalist feelings. To be more specific, several researchers have argued the growing influence of a specific form of nationalism known as the 'Turkish-Islamic synthesis' in the process of history curriculum development in Turkey since the 1970s (Copeaux, 1993; Ersanli, 2009). Within this ideology, citizenship is defined on ethno-religious identity that favour Sunni Islam and Turkishness (Üstel, 2004). Beside these nationalist feelings, the scholars observe the inculcation of an idea of "threat" and "internal and external enemies" (Altinay, 2004). Thus, this paper problematizes the production of racist discourses by students towards ethnic and religious minorities such as Greeks and Armenians when referring to historical events related to the fall of the Ottoman Empire or the Turkish Independence War.

How Do Middle-Class Women See Ideal Motherhood in Three-Child China?

This article examines urban middle-class women's 'subjective repertoires' (Donath, 2015) of ideal motherhood under China's pro-natalist Three-Child Policy announced in 2021. I undertake my analysis with attention to the 'contradictions of capital and care' (Fraser, 2016) that characterise China's transformations in gender relations, population control policy and family structure and influence women's maternal, productive and reproductive subjectivity. After announcing the pro-natalist Three-Child Policy, motherhood expectations, mothering experiences and practices as well as individualised maternal demands shaped by the family, the community, the education system and the labour market have permeated into women's lives, relationships and social interactions. What constitutes an ideal mother when women are facing increasing pressures to raise multiple successful children has become a central focus when addressing their ambivalence and plight. Therefore, I aim to unfold the myth of ideal motherhood as informed by shifting gendered norms in the era of competition.

This research contributes to the existing literature by a) adopting an approach to motherhood as women's productive and reproductive subjectivity-making practice, and b) exploring how women's public role and participation in labour force signify attributes of ideal motherhood and self-identification and valorisation. Using findings from one-year ethnography and 96 interviews with middle-class women to scrutinise their subjective, retrospective and foresighted accounts in Jinan City, China, I argue that women's understanding of ideal motherhood is closely related to their identities at work, their desires to obtain independence, authority and recognition in the public sphere, and their efforts to conform to newly emphasised domesticity-centred and care-oriented traits and responsibilities. Middle-class women of different backgrounds have uniformly internalised children's academic performance and socialisation outcomes as their standards for evaluating a mother's capacity. Motherhood as a practice of the self regulates women's emotionality, rationality, beliefs, behaviours and relationships regarding maternity, unfolding in their 'reflexive monitoring' of themselves (Giddens, 1984).

CANG, Xiaowan* (University of Oxford, China)

Reshaping Reproductive Culture in Pro-Natalist China

China's socially, historically, and politically profound and stringent One-Child Policy ended in 2016. Five years later, its sluggish Universal Two-Child Policy announced its termination in 2021, utterly concluding an era of forceful implementation of anti-natalist policies. Drawing upon a 13-month ethnography and 109 interviews I conducted with urban women and their husbands of reproductive age, previous and current family planning officials,

local grid workers (*wanggeyuan*) and staff in cultural stations, propaganda offices and women's federation office in sub-districts in Shandong, the most pro-natalist province during the two-child era, this paper suggests that the shifting biopolitical ideology from anti-natalism to pro-natalism in China constitutes trifold respects: a) the restructuring of service-oriented family planning bureaucracies; b) pronatalist supporting policies that are inherently gendered, focusing on the naturalisation of motherhood and the refinement of child-rearing; c) the dissemination of strong familism values and traditional gender roles for the consolidation of heterosexual marriage and family.

These mutually reinforcing methods have shaped a new fertility culture and a pro-natalist reproductive environment that seem to serve Chinese people's 'natural' desires to have more children. However, the rationale lying behind China's family policy-making processes has long aimed to improve the national well-being and satisfy the collective interests rather than benefit individual families (Yan, 2021). Biopolitics creates an illusion that it enacts stability for people to fulfil their prospering ethos. However, it is indeed an ever-fluid and operating mechanism for power, being central to configure social, political, economic, legal and cultural domains of people's life courses. This study provides an intersectional analysis to account for how bureaucratic re-arrangement, emerging public policies and the infiltrating gender and familism ideologies operate together to rationalise China's attempt to reverse the decade-long one-child norm. It provides an original dimension to comprehensively understand and contextualise biopolitics and reproduction in a post-one-child China.

Discursive Contestations and Coalitions in Debating the Third-Child Policy in China

China's demographic crisis and the policy shift from Family Planning to promoting multiple births have grabbed worldwide attention. The adoption of the Third-Child Policy in mid-2021 has sparked intense debates in the media and among the public. While previous studies on reproduction mainly focused on population policy formulation and implementation, recent research increasingly attends to the discursive construction of fertility. In China, in particular, as population governance has transitioned from Leninist to neoliberal biopolitics, scholarly attention also gravitates to how the state, citizens, scientists, and other key agents maneuver discursive resources to legitimate, dominate, resist, negotiate, or circumvent each other reproductive claims. Informed by the discursive field approach and combining quantitative text mining of social media data and qualitative depth interviews, the study unpacks how the media and policy targets (women and men) formed discursive alliances or exchanged discursive contestations in debating the Third-Child policy. The findings indicate that the media—acting as the mouthpiece of the state—sought to capitalize on women's reproductive and domestic labor to fulfill the state's demographic objective. Women, therefore, were heavily featured whereas their male counterparts were largely marginalized in the Third-Child media campaign. Against their objectification in the media, women opened up resistance space on the social media site, Weibo, and broached counter-discourses to contest the media's selective representation of the state's reproductive incentives and tropes of gendered divisions of labor. While men seemed to be silent on both traditional and social media, they aligned with the media by subjugating women's reproductive autonomy and discursively appropriating their labor to fulfill state mandates. In this way, pro-state media and men formed discursive alliances through their common allegiance to state-patriarchy against which women challenged. This study, therefore, contributes to understanding the relational discursive formation of reproduction in China and similar contexts.

Reconfiguring Gender Inequalities through Gender Empowerment in the Pandemic Makeshift Economy: Feminist Organizing in Shanghai's COVID Lockdown

From March to June 2022, China's "zero-COVID" policy mandated the complete lockdown of Shanghai when the city witnessed waves of pandemic outbreaks. As supermarkets, transportation, and other services came to a sudden halt, over 24 million residents who were locked at home struggled to get food and daily necessities. In the face of incompetent government responses, self-organized "bulk-buying" emerged as a form of pandemic makeshift economy. Taking Shanghai's "bulk-buying" as a case study, this research unpacks the organizing dynamics in such crises economy. Drawing on social media data and qualitative depth interviews with key stakeholders during the lockdown, this study highlights how the crisis economy of bulk-buying birthed a form of feminist organizing that empowered women yet reconfigured gendered inequalities simultaneously. First, while women initiated and led many digital initiatives of "bulk-buying," male suppliers and volunteers backed by the patriarchal market and state still controlled key resources and their distribution. Moreover, although female organizers mobilized multiple forms of capital, e.g., technological, discursive, emotional,

and financial, to facilitate the communication and transactions of "bulk-buying," they bore the brunt of the conflicts between outraged, deprived residents and non-responsive bureaucracies and profit-oriented market suppliers. Finally, whereas remote work and micro-tasking seemed to afford women more, flexible time for "bulk-buying" and making an additional income source, fragmented time and schedule further strained their professional and domestic conflicts and reinforced their precarity both at work and at home. In all, while women appeared to occupy central, indispensable positions in the bulk-buying pandemic economy, their labor worked to perpetuate their own disadvantages. As previous studies of feminist organizing largely examined the empowerment and exploitations of women *separately*, this study contributes to understanding how the reconfiguration of gender inequalities *operated through* plausible women's empowerment in critical junctures.

Occupational Gender Segregation, Intra-Occupation Inequality, and Gender Wage Gap Dynamics in the United States: A Causal Mediation Approach

There is a voluminous literature to explain the dynamics of the gender wage gap in the United States since the 1970s. In particular, occupation related forces are of greatest interest among sociologists. However, few studies tell the relative importance of numerous theories regarding occupations. This study shed light on this issue by applying a causal mediation approach to conceptualize and quantify the causal effect of occupation-related trend on the trend of gender wage gap. By decomposing the change in gender wage gap overtime into five occupation-based components that are mutually exclusive and collectively exhaustive, the analytic framework clarifies the full force of the occupation in the dynamics of gender wage gap. We use the debiased machine learning to estimate the change in total effect of gender on wage and the five components. Analysing Current Population Survey (CPS) data from 1970 to 2019, we show that the change in intra-occupational gender effect on wage is the most important equaliser for the trend of overall gender wage gap, while the trend of occupational gender segregation is much less important. This finding challenges the natural conjecture in the field: the role of the *trend* of occupational gender segregation for the *trend* of gender wage gap is just as vital as the role of *static* occupational gender segregation for the *static* gender wage gap. Our findings also suggest that the occupational structural change, wage polarisation in the US labor market, and the changes in occupational return due to skill-biased technological change collectively exert minor impact upon the trend of gender wage gap, although a growing body of social science literature started to explore the gendered effect of those forces in recent years.

Wanghong Urbanism and Its Politics of (re)Making the Place through New Urban Aestheticisation

Traditionally in Western-dominated urban geographical scholarship, that urban transformation associated with the changes of land users, sociocultural character, and the improvement of built environment are usually described as 'gentrification'. However, how are Chinese young people's seemingly innocent consumption practices on social media instead caused social exclusion with displacement pressures in a historic residential neighbourhood, where most of its residents are in higher social status in China? To understand this new social phenomenon in China, this research analyses the role of social media consumption in the politics of exclusion during the new urban aestheticisation processes in Guangzhou, China, where urban restructuring and commodification is rapidly happening in a historic residential neighbourhood under the influence of China's vernacular wanghong (social media and influencers) culture. Different from traditional urban scholarship debates about the cultural capital and its relations to gentrification, this paper argues that a place being wanghong costs at the risk of losing its diversities and identities that to be homogenised into a place being 'instagrammable', and the new urban aestheticisation process that is unpinned by the usage of social media revealed a new social (re)production process that consumers' imaginaries and illusions of good urban lifestyles constructed the urban utopia online which further attracted more people to have onsite consumption. In doing so we need to be alert about detrimental effects of wanghongfication as the wanghong place-making strategy destroyed everyday livelihoods while turning the place into a social and cultural homogenisation of urban consumption space which reflected from consumers' dreams and desires of urbane lives.

A Neoliberal Handle: Legality and Courts in the Struggle for Human Rights in Hong Kong

With a more aggressive China by the side, HK courts have become the center of the struggle for human rights. The trials of protesters in the 2014 protests have shed light on the tension within legal discourses of HK's mini-constitution. The legal proceedings concerning the 2019-20 protests further have elucidated the collision course of common law legality and human rights discourse, provoked by the pursuit of economic growth.

As a legacy of British colonial rule, the independence of the HK judiciary is seen as a typical motif of hybrid constitutions, located within the boundaries of China's sovereignty and reproduced through the preservation of HK's autonomy. Existing literature, against the background, often emphasized the affinity of China's strong state with the Soviet interventional moves, rendering HK courts only started to politicize after China's takeover.

Working at the intersection of the critical history of neoliberalism and the sociology of constitutions, this article refutes these arguments. It frames the state's significance in producing material abundance, researching the human rights struggle in the context of authoritarian liberalism. Courts aren't immune to politicization in a world where the way to prosperity is often driven, if not coerced, by a strong and interventional state. Courts are chosen as an instrument to implement disruptive political agendas and austerity moves.

This article showcases that legality in HK's judiciary lies at the heart of HK's neoliberal agenda. HK courts have since the 1970s become the beloved baby of neoliberal thinkers, including Hayek and Friedman, for their proclaimed neutrality in the hybrid constitutions. The 1997 takeover derived from China's obsession with HK courts' role in economic growth for its affinity with the theory of law and development that was actively promoted by the IMF and World Bank. HK's human rights struggle is better framed as a conflict between neoliberal variants.

Exploring the Philippine Meetings, Incentives, Conventions, and Exhibitions Industry: A Post-Pandemic Policy Perspective

This study explores the regulatory environment of the Meetings, Incentives, Conventions, and Exhibitions (MICE) industry of the Philippines amidst the challenges of the global pandemic. The MICE industry is considered as an important sector that may catalyze economic recovery because of the MICE tourists' higher tourism expenditure compared to leisure tourists. Existing literature suggest the need to identify the elements that contribute to a successful MICE industry. Moreover, the COVID-19 caused paradigm shift in the implementation of MICE with very little information on the effects of the policies and regulations. To provide a holistic perspective, the phenomenon was explored through the lenses of Functions of Scientific Information (FOSI) Model (Graffy, 1999) and the Organisation for Economic Co-operation and Development or OECD (2021) policy responses to coronavirus, guided by the Philippine MICE Roadmap 2030. The research utilised key informant interviews and focus group discussions with various stakeholders, and the results were thematically analyzed. From a host perspective, MICE stakeholders have become resilient in order to adapt their services both on site and at the virtual space. Meanwhile, the demand for MICE, both for hybrid and purely onsite events, has been growing since the easing of the quarantine restrictions. However, there were challenges in complying with the regulations imposed by some local and national government units. Moreover, the absence of regulations in some areas of MICE operations may also be needed to sustain the growth of this tourism sector. This study has implication in creating a business-friendly, citizen-focused, and actionable recommendations for the improvement of the regulatory environment of the tourism industry.

CARASSALE REAL, Santiago* (Facultad Latinoamericana de Ciencias Sociales, Sede México, Mexico)
CONTRERAS ALCANTARA, Javier* (El Colegio de San Luis, Mexico)
MARTINEZ PEREZ, Liliana* (Facultad Latinoamericana de Ciencias Sociales, Sede Académica de México, Mexico)

Fronteras Digitales y Futuros Antroposintéticos: Tensiones Sociales y Políticas

Los futuros de ser humano posibilitados por las lógicas digitales que convergen en las tecnologías antroposintéticas (Inteligencia Artificial, edición genética y tecnologías astronómicas y de exploración espacial) tensionan las sociedades actuales en lo relativo a las dinámicas de participación y dominación sociales y políticas, llegando a poner en juego la condición humana, la corporalidad y la psique, sus presupuestos evolutivos, biológicos, ecológicos y cosmológicos.

Estas lógicas y dinámicas modulan y modelan los futuros más allá de las expectativas en torno a la productividad, acentuando la tensión entre la dominación y la participación, la promesa y el peligro, las expectativas y los temores sociales y políticos animados desde las representaciones, las configuraciones y las narrativas que redefinen y multiplican la realidad (mundos virtuales y alternos), reordenan los consensos en torno al contrato social y lo político (poderes corporativos público/privado, diferenciación interna e inter societal, sujetos de derecho, tecnopolítica), reenmarcan, fragmentan y estratifican las interacciones sociales (algoritmos, entornos digitales, avatares, inteligencia artificial, robots), cuestionan las pautas y temporalidades naturales y biológicas de los procesos evolutivos de la especie humana y los ecosistemas (cyborización, edición genética), y anticipan la potencial vida multiplanetaria (aquí/allá, espacio exterior, hábitat extremos, cosmopolítica, astropolítica).

El objetivo es examinar, de manera pre-visoria y como ensayo de una agenda de investigación de las ciencias sociales, algunas de las transformaciones e impactos de las lógicas digitales en la dominación y la participación, las estrategias, valores y visiones de lo político y lo social en juego desde la existencia de tiempos fraccionados, la pluralidad de realidades y las asimetrías de los colectivos sociales en la construcción de futuros.

Investment Management Corporations and Global Financial Capitalism

In this paper, I go into detail on the current intertwining of the processes of financialization and digitalization. I inquire into the role of multi-national investment management corporations in the global financial system from a sociocybernetic perspective. In chapter 17 of their book *The Systems View of Life*, Capra and Luisi point out that «all flows of money ultimately converge in the global financial networks in search of higher gains» (2014). Financial flows emerge as a meta-network of gamblers, who «are not obscure speculators, but major investment banks, pension funds, multinational corporations...» (Castells cited by Capra and Luisi, 2014).

Sassen examines financialization as a «very special, distinctive and often dangerous capability» that «needs to be distinguished from traditional banking» and consists of «inventing and developing complex instruments» (Sassen, 2014). In the last decades, the number of instruments or apparatuses for multiplying wealth have proliferated. The use of artificial intelligence and big data has led to the formation of digital-financial machines (DFMs) owned by multi-national enterprises (MNEs) such as «the Big Three» (Finanzwende, April 2021).

Ashby conceived Cybernetics as «the science of all possible machines» that «treats, not things, but *ways of behaving*. It does not ask ‹what *is* this thing? › but ‹*what does it do*? »» (1956). The emphasis is made on the contingence of the systems we observe: «Cybernetics envisages a set of possibilities much wider than the actual, and then asks why the particular case should conform to its particular restriction» (Ashby, 1956). The constructivist conception of the machine as «an abstract entity with well-defined functional properties» is embraced by Von Foerster (1971). Therefore, to understand how the Casino Finance of today's world works, we ask from a sociocybernetic perspective: What do DFMs do? And *how* do they do it?

Interaction, Process, and Moral Dispute: An Interactionist and Processual Approach to the Study of Legal Change

This study proposes an interactionist and processual theoretical approach that can help understand the processes of Legal Change. Overall, the approaches to these processes tend to frame them under structural transformations, as a result of strategic actions carried out by rational actors or as a product of decisions taken by legal actors. Our approach distances itself from these other viewpoints. We understand Legal Change as a normative transformation that derives from a process of societal and society-state interactions between social actors who are fighting over the values of the status quo. During the interactions surrounding change, processual elements of the social life are updated, while moral disputes regarding the sense of order arise.

Two turns that influence our proposal are the centrality of actors and their agency to understand the processes of change, as well as the conception of the State as a cultural product invoked during the interactions. These turns help us switch from conceiving legal change as strategic and rational to viewing it as part of moral disputes intended to define the social classifications of order. In this sense, our proposal retrieves contributions from Symbolic Interactionism, Processual Sociology, Cultural Sociology, and Anthropology of the State that enrich our approach to the microfoundations of action.

*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

We begin this presentation by discussing the general assumptions that guide our approach. Then, we develop our interactionist and processual proposal. Finally, we make some comments on the methodological implications of this approach.

CARDOSO GONZALEZ, Rodrigo* (National Autonomous University of Mexico, Mexico)

Perception and Meanings of Risk in Digital Practices Among Young People from Mexico City

The presence of young people in digital environments has increased in the last decade, as well as their practices have diversified among platforms and devices. However, there are inequalities in the access, uses and possibilities of appropriation of digital resources for their everyday life. In this context, and even more after new dynamics and logistics as consequences of the COVID-19 lockdown, there is a bigger need to stay connected and to build a favorable online presence. But as young people intensify their use of digital resources, they face a bigger exposure to risks in their everyday digital practices. In addition to the digital gaps, their experiences in digital environments are also affected by others related to their gender, cognitive and generational status. Denominations such as digital natives not only become a label that burdens them with responsibilities and technical expertise that they do not necessarily need to have because of their age -instead digital literacy and support from people close to them-, but also contribute with the creation of a social world where they perceive that an increasingly widespread and intensive presence on the Internet is required. This work is part of an ongoing doctoral research that aims to understand what young people perceive as a risk in their digital practices, but also how that perception is built as a product of their biographical situation and how that translates into actions or emotions triggered by its meaning. This approach allowed to understand the relation between the perception and actions, but also to identify and reflect about why some young people perceive risks differently, especially related to their gender. The research was carried out in a public school in Mexico City through interviews and focus groups with young people from between 15 and 18 years of age, most from low-income households.

Unpacking "the Surprise Chain": The Governance of Food Security during Food System Shocks

Food systems are increasingly being affected by the compounding impacts of multiple shocks and stresses related to climate change, the COVID-19 pandemic and geopolitical events, such as Russia's invasion of Ukraine. As food prices and food insecurity rise, the dominant response in many countries, including Australia, is to scale up provision of emergency food relief. This paper draws on a study of the resilience of the state of Victoria's food system during 2020 and 2021 to critically examine the governance of food security and the policy response of emergency food relief. During this period, the city's food system was affected by major bushfires in the state of Victoria, closely followed by the COVID-19 pandemic. We carried out 34 stakeholder interviews and five co-design workshops with 96 participants from local and state government, civil society and industry between May 2020 and May 2021. Our analysis highlights the power dynamics between key actors in systems of emergency food relief and the impacts on people experiencing food insecurity. Emergency food relief in Victoria is delivered by food banks and charitable organisations, using "surplus" food donated by the food industry, particularly major retailers. Government has traditionally taken a back seat. When demand for emergency food relief rose early in the COVID-19 pandemic, supplies of "surplus" industry food donations fell as consumer demand surges put pressure on just-in-time food supply chains. When public housing towers in Melbourne were locked down during the pandemic, residents became reliant on emergency food relief, shining a spotlight on the cultural inappropriateness of emergency food relief and its dependence on donations of highly processed foods. Our analysis emphasises the need for greater government accountability for the food security of citizens in an era of increasing shocks and stresses, underpinned by recognition and legislation of the Human Right to Food.

Social Construction of Anti-Semitism and the Point of View of Italian Journalism

According to the Jerusalem Post, with an average of at least ten incidents per day, 2021 was the most anti-Semitic year in the last decade for the entire european continent (AGI, 2021).

Following recent crises and with the emergence of collective traumas (economic crisis, covid 19, wars...) new forms of anti-Semitism seem to have emerged within the public sphere.

In the hyper-digitised global world, fuelled by forms of symbolic violence, flows of (mis)information, conspiracy ideas and 'pseudo-events', anti-Jewish hostility has strengthened, increasingly influenced by old images, fears and prejudices embedded in the collective mindset (Taguieff 2004; Neuman 2017; Neville-Shepard 2018; Weimann, Masri 2020).

Countering these communicative drifts has also become difficult for the official media as incidents related to 'hidden anti-Semitism' become increasingly difficult to identify and report.

The contribution presented intends to discuss the results of a research carried out within the framework of a European project investigating the level of knowledge/perception of anti-Semitic hatred among information professionals in Italy, where cases of anti-Semitism have doubled in recent years with the pandemic (Monaci, 2022).

After an initial contextual analysis in which news on the phenomenon of anti-Semitism reported by the main Italian newspapers (from 2017 to 2021) was examined on a quantitative level, seven focus group sessions were organised (July and September 2022) targeting italian journalists.

This second phase of the qualitative study is particularly interesting because media seem to pay little attention to episodes of anti-Semitism, which are often reported as isolated cases.

The lack of knowledge of the Jewish world in Italian journalistic culture seems to be the main cause of linguistic and interpretative errors, even of a historical and religious nature.

RC01-JS-115.2

CARLOS, Maria Sabrina Erica* (Ateneo de Manila University, Philippines)
ADVINCULA-LOPEZ, Leslie (Ateneo de Manila University, Philippines)

The Recrafting of CIVIL-Military Relations during the COVID-19 Pandemic: Insights from a Naval Operating Base in the Philippines

The Philippine military maintains primary responsibility for internal and external security operations, expanding their roles in areas including humanitarian action and disaster response. While these brought them closer engagement with civil society, they also led to weak and imbalanced civil-military relations. The COVID-19 pandemic exacerbated the issues seen in the country's highly militarized response. The research explores how Philippine military elements, specifically members of a naval operating unit south of Manila, successfully redefine their roles vis-à-vis their civilian counterparts.

Key informant interviews analyzed using constructivist lenses revealed the fluidity of Philippine civil-military relations. These relations are dynamically recalibrated directly between the individual members of the civilian and military organizations rather than through official bureaucratic organizational channels. The pandemic expanded the military's social networks. Social media proved helpful in developing the military's influence and conditioning the public's minds on the legitimacy of the military's prominent roles in the government's COVID-19 pandemic response.

Overall, the result indicates a greater appreciation for civil-military operations and relations on which the military capitalizes on. The military successfully legitimized its expanded roles during the pandemic creating an imbalance in their favor. This trend is expected to continue, allowing the continued infringement of the military on civilian institutions, which may be more difficult to undo in the long run.

CARLSON, Bronwyn* (Macquarie University, Australia)

The uncomfortable truth of inequality in so called Australia

"Egalitarianism" and the "lucky country" are signifiers that are largely meaningless to First Nations people across this continent colonially referred

to as Australia. To speak of such ideals or myths in the context of settler colonialism is to connote an on-going history founded on the principle of social inequality, and indeed, the violence that keeps it *in situ*. First Nations peoples were and still are not included in the mythology of nation building, an ethos that upholds ideals of fairness and equality while subsuming the gross inequities that have, and continue to shape the lives of the land's sovereign owners. This paper speaks to the conference abstract from the standpoint of Indigenous sociology whereby we, Indigenous sociologists and scholars, bring to the discipline our understanding of social structures and human societies. We are, without exception, the most disadvantaged group in Australian society and although there is incremental change, this has largely been an effect of our own efforts. This paper will identify the extent of our inequality. It will disclose some hard facts about "social inequality" as an everyday experience for many First Nations people. The paper will raise questions and issues that are uncomfortable. It seeks to promote a broader understanding of sociology from an Indigenous philosophical standpoint, one that has at its core a belief in social equity that is sustained by tens of thousands of years of survival and not ground in the myths associated with nation building.

CARLSON, Jesse* (Acadia University, Canada)

Look up: Popular Culture, Public Feelings, and Social Theories of Climate Change Activism

This paper analyses several social theories relating to climate change and climate activism, with special focus on their relevance to questions concerning collective emotions and efforts at collective mobilization. In particular, the paper critically assesses Anthony Giddens's 'Giddens's Paradox' (2009; 2015) alongside the American cultural sociology of Smith and Howe, in *Climate Change as Social Drama* (2015), and Judith Butler's *The Force of Nonviolence* (2020) alongside Andreas Malm's *How to Blow Up a Pipeline* (2021). The first pairing tracks tensions between the more structural and reflexive analysis of Anthony Giddens and the culture and performance focused interpretations of climate activism developed by Smith and Howe. What kinds of 'performances' actually work to change public moods around climate issues? The second pairing involves seemingly opposed arguments about the role of violence in climate activism and in mobilizing social movements and collective energies. Should climate change activism be placed on a war footing? These two pairings set up a layered framework for analyzing a series of examples drawn from climate activism (e.g., Thunberg et al.) as well as popular culture, including films (e.g., *Don't Look Up*), television shows, and novels that contain significant climate change related themes in addition to their own implicit or explicit theories of social stasis, social change, collective and individual emotion. Through analyzing key narratives aimed at deflecting, amplifying, or absorbing collective affects and individual emotions, the paper works to critically extend existing theories of climate change and climate activism.

The Whiteness of São Paulo's Military Police: Thinking Police As a Site of Racial Socialisation

Based on ethnographic observations of São Paulo's military police, this article is an invitation to think about the role that police socialisation plays in processes of racial self-identification and the production of whiteness. Drawing from scholarship which considers racial self-identification as an interactionist process influenced by sociabilities and socialising contexts, I make the case that the Brazilian police provide a racial socialising framework which incentivises officers to think of themselves as white and disavow Blackness.

I do this by examining situations in which racially mixed officers choose to identify as white, and the elements of police culture that influence officers' modes of racial identification and narratives on race. Finally, I compare this with police officers who choose to assert their Black identity.

The article contributes to discussions exploring the Brazilian paradox according to which, although mostly composed of Black and Brown men, the military police behave in racist ways against non-white populations. If "in a society built on white supremacy, the individual identity of the police makes little difference" (Smith 2008:13), I argue that another critical explanation is that the police acts as a socialising instance forcing racial identities into whiteness. By considering police as a sociocultural force participating in the recomposition of white meanings, the article presents policing as a critical ethnographic site for the study of whiteness.

CARO MOLINA, Pamela* (Universidad Santo Tomás, Chile)

Precariousness(es) of the Productive and Reproductive Work of Seasonal Fruit Growers in the Central Valley of Chile: An Empirical Study

El problema que aborda la ponencia es la relación entre condiciones materiales y subjetividades de la precariedad laboral (Castel, 2009), en vínculo con la precariedad del trabajo reproductivo, de población asalariada temporera frutícola femenina adulta, mayor de 60 años y migrante internacional, como parte de quienes experimentan mayor vulnerabilidad y exclusión social (intersectando género, edad y nacionalidad) y la ausencia de políticas de protección laboral y social, y falta de reconocimiento (Paugam, 2012) empresarial, empleador y social, profundizándose la normalización de la precariedad, utilitaria al modelo neoliberal agroindustrial. La ponencia mostrará en primer lugar las características y formas en que se reproduce como experiencia objetiva y subjetiva (Piñeiro, 2011) la precariedad laboral y del trabajo reproductivo (vida personal y familiar), de temporeras de la fruta del valle central de Chile, en contextos de estabilidad de la desigualdad y bajo reconocimiento social (Honnet, 2016), a través del análisis de trayectorias biográficas. En segundo lugar, evidenciaremos las experiencias de precariedad subjetiva, como expresiones de malestar, maltrato, control y violencia simbólica, tanto desde la dimensión del trabajo productivo como reproductivo.

La hipótesis principal es que las transformaciones de las formas de producción agrícola, protagonizadas por la fruticultura a partir de los 90, sustentadas en la consolidación de la desregulación y ausencia del Estado en materia de protección laboral y social, han implicado normalización de la precariedad laboral, expandida a la vida cotidiana y reproductiva de las trabajadoras, que en su conjunto se expresan en condiciones materiales frágiles y formas de agravio y malestar, posibles de develar por medio de una observación imbricada de trayectorias laborales, personales y familiares. Como opción metodológica, recurriremos al paradigma cualitativo, sosteniendo la interpretación de los hallazgos y resultados desde las teorías de la precariedad, género e interseccionalidad (migración y vejez), situándose como sujetos no privilegiados (Lorey, 2016).

CAROLISSEN, Nadia* (University of Johannesburg, South Africa)

Exploring Business Incubator Social Processes & Developing Youth Entrepreneurial Human Capital

South Africa is an upper middle-income country, has the second largest economy and the most industrialised nation on the continent- yet the country is plagued by high levels of poverty, unemployment, and inequality that many fear may threaten the socio-economic stability of the country. Youth form the biggest component of the population and their unemployment is a concern with 63,9% of 15-24 years olds and 42,1% of the 25-34 years olds unemployed. A cause of unemployment is the misalignment between education and labour market needs causing many youths to exit school lacking basic skills necessary for life and work. Poverty and low income have been found to impact educational achievement and may explain why the average unemployed youth's highest qualification is upper-secondary certificate. The Department of Small Business Development (DSBD) was established to focus on entrepreneurship, create employment and grow/develop SMMEs to address the triple challenge. Entrepreneurship successes remain elusive considering 75-90% SMMEs fail in the first three years. The DSBD plans to massify entrepreneurship training/development and upscale its business incubator (BI) programme adding 250 to the 101 in their stable. Limited BI operations knowledge exists with anecdotal evidence pointing to misalignment between BI and entrepreneur goals. The paper aims to explore BI social interactions as it contributes to SMME success and SMMEs that network outperforms those that don't. South African BIs need to provide customised development interventions to ensure entrepreneurs exit with competencies to operate SMMEs successfully in a changing business environment. They must determine/consider the development gaps of especially those coming from poor/low-income conditions as evidence exists the latter perform better once, they establish that intellectual abilities can be developed which increases their confidence-levels, enthusiasm to learn, develop, and seek new opportunities and challenges.

Empowerment and Older People: Characteristics of French-Language Research

How is the concept of empowerment being addressed within the scope of ageing? A concept that has spread throughout English-speaking cultures, within which it has clear meaning, empowerment is a less tangible concept within French-language literature. The purpose of this review of French-language literature is to identify the development of research into empowerment within the scope of ageing, and the characteristics which should reveal the forms of power at stake, the conceptions of empowerment upon which it is based and paradigmatic implications. The process of identifying articles has resulted in a corpus of 63 scientific articles. No date or field-related restrictions were applied. On the other hand, research has been confined to French-language peer-reviewed articles.

Processed systematically using software, this corpus has revealed significant trends. Going beyond the polysemy of the concept or related concepts associated with empowerment, power occupies a central role. Analysing the respective importance of the different forms of power identified, however, shows areas of empowerment that are strongly confined to the areas of

proximity, the relation, or even the individual. Furthermore, and going beyond the range of issues studied and ensuing questions, this literature review allows a number of dominant themes and questions to emerge, on the basis of three main conceptions of empowerment: a - historic - civic conception, based on a democratic principle, a managerial conception, based on the principle of efficiency, and a hygienist conception - the most recent - based on the principle of independence. These are mainly rooted in the same epistemological framework, that of a rational and responsible individual, with capacities and competencies, which should be maintained by mobilising the resources offered in an enhanced environment.

Lonely Parents, Lonely Children? a Sociological Look at the Perspectives of Young Adults Socialized in Single-Parent Families

This communication advances sociological understanding of the entanglements between single-parent families and institutions throughout the life trajectories of young adults. Much of the literature on single-parent families comes from the narratives of adults, perceived as the main protagonists of such experiences as single or lonely mothers and fathers. This communication takes a different and, to a certain extent, innovative perspective. Specifically, it seeks to understand such experiences through the voices of young adults, once socialized in contexts of single parenthood. Methodologically, a small qualitative study was carried out in Portugal, a southern European country, in 2022. A total of 13 young adults socialized in single-parent settings were interviewed and invited to talk about their experiences of being raised in single-parent settings while children or teenagers. Data were analyzed qualitatively, supported by NVivo software. The analysis sustains that there is a diversity of experiences related to single-parent families, both for adults and for children, and these diverse contexts strongly shape the experiences that individuals have with other family members, as well as with specific institutions, namely those related to education, work, and broad social support. The data also highlight the varying importance and lasting influence of the relationships with such specific institutions, with which individuals differently interact at different stages of the single-parent family's trajectory.

The Role of Urban Policies in Countering the Relational Loneliness of Older Citizens: Public Spaces and Cohousing

The pandemic experience from Covid-19 has heightened awareness of the impact that relational poverty has on the quality of life of elderly subjects. The obligation to stay in one's own homes has had the indirect effect of precipitating a lot of them into a state of solitude from which, at least in part, the city had protected them until that moment. Cultural and socialization opportunities offered by public and semi-public urban spaces had mitigated, at least in part, their condition of residential loneliness.

But the pandemic has shown how older citizens' home loneliness is a factor that can seriously affect the quality of their daily lives. Many projects had been implemented to guarantee people over 65 a fullness of possibilities.

One of these projects is "CondiViviamo", realized by the cooperative "Occupazione e Solidarietà", financed by the Municipality of Bari and coordinated with the University of Bari Aldo Moro. It is focused on a co-housing experience that involves older people who currently live alone and are in economic distress. The project, carried out in the city of Bari, is initially aimed to a limited number of older people, but it is defining a model that can be exported to other cities at regional or national levels.

This multiactorial project, in constant interaction with the territory, pursues clear objectives: lowering the risk of institutionalization, overcoming the condition of loneliness and socio-economic hardship, implementation of the rights to *active aging* and *aging in place*; overall improvement of the quality of life of elderly people and their families.

The entire project was preceded by a process of analysis of the representations of older people and their families and is accompanied by a constant monitoring process. The analysis of the project results will also be functional to the definition of operational guidelines.

'Familisation of Risk' and Intensification of Inequalities during COVID-19

The Coronavirus pandemic has both highlighted and heightened inequalities between families who were living in disparate situations at its outbreak. In this paper, we draw on data from Families and Community Transitions under Covid (FACT-COVID), a digital ethnographic project involving UK families in diverse circumstances, to consider the impact of COVID-19 on daily routines and relationships in families with different forms, incomes and networks.

As a longitudinal study, FACT-COVID captured multigenerational experiences during a year of successive lockdowns. In applying a comparative case study approach to examine effects of social distancing among two families in dramatically contrasting situations, this paper provides detailed illustrations of broader findings from the research. 'Family One' comprised a lone mother with three sons living in a small apartment on a low income with no family network. 'Family Two' comprised a high-earning professional couple with two children living in a large property with extensive support from grandparents, who were also participants in the study.

Focusing on these divergent cases brings to life rich empirical insights on upheavals in day-to-day routines, practical struggles and emotional concerns faced by the families, along with strengthened family connections, which were evident during the research. Applying a Bourdeusian framework enables us to pinpoint ways in which disparities in economic, social and cultural capitals exacerbated or ameliorated impacts of Covid-19 on the two families.

The analysis extends Beck's notion of 'individualisation of risk' through uncovering a process of 'familisation of risk', whereby families reinforced relationships with a select cadre of extended family members or friends beyond their household who shared their perceptions of risk. Crucially, this entailed those with high levels of capitals mitigating impacts of the pandemic, whereas those lacking in material resources and familial networks were left exposed to its worst consequences as their needs increased whilst collective provision diminished.

CARROLL, William* (University of Victoria, Canada)

Refusing Ecocide: From Fossil Capitalism to a Livable World

This paper offers a theoretical-historical analysis of fossil capitalism and the climate crisis, accompanied by an assessment of alternatives to our current trajectory toward ecocide (Whyte 2020). Theoretically, the paper synthesizes historical materialist perspectives on capitalist accumulation, imperialism and hegemony, as frameworks for tracing fossil capitalism's development, its cumulative ecological impact, and the viability of alternatives. In the first part, the historical narrative is periodized into three sections, covering *first* the century-and-a-half epoch from the Industrial Revolution to the close of World War Two; *next* the pivotal post-war boom era of fordism/consumer capitalism in the centre and neo-colonialism on the periphery (provoking the 'great acceleration' of carbon emissions, Steffen et al 2015); and *finally* the organic crisis and sharpening contradictions of fossil capitalism, eroding the relatively inclusive fordist historical bloc, from the mid-1970s to our current time. The paper's second part takes up alternatives, examining how they articulate with the core concepts of accumulation, imperialism and hegemony. This analysis of alternatives begins with a discussion of 'false solutions' comprising climate capitalism: attempts to regulate fossil capital via market mechanisms or to create techno-fixes (changing the energy source, geoengineering, etc.). The rejection of these approaches, whose remedies remain within the logic of accumulation, imperialism and bourgeois hegemony, leads to the final section, a synthesizing survey of proposals, emergent movements and strategies toward democratic ecosocialism, breaking decisively from that logic. In these nearly pitch-black times, the concluding section thereby conveys an optimism of the will.

Lessons from the Rupaul's Drag Race Shady Edit: Ethical Storytelling in the Presentation of Video Methods Research

This paper considers the controversies around alleged 'shady' editing employed in the production of television series *RuPaul's Drag Race* (RPDR), and suggests the debate about reality television ethics holds lessons for social researchers using video methods. At the centre of the debate in RPDR fandom is the 'villain edit', where a particular contestant appears to be designated the central antagonist of a given season, and footage manipulated in such a way as to build the contestant's 'villainous' story. This holds 'real world' consequences for the 'villain', who faces the prospect of prolonged abuse on social media. The

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

paper unpacks some of the structural and operational issues that contribute to this potentially unethical form of storytelling in reality television – such as time pressures, consent issues and the utility of 'montage editing'. This is compared to the analysis and presentation stages of video data in social research. The paper contends that storytelling in video methods research is open to the same editing and presentation pitfalls: time often feels short in the neo-liberal university context, obtaining consent in the use of images of participants continues to be tricky, and editing practices of social researchers can lead to concerns over data manipulation. Similarly to reality television, we open up our participants to 'real-world' consequences if their image as part of storytelling is not used appropriately. The paper concludes with suggesting ways that these difficulties might be navigated, including practicing 'the slow edit', engaging with principles of ongoing consent, and maintaining the 'temporal integrity' of data.

DAVIES, Katherine (The University of Sheffield, United Kingdom)

Living through Brexit: Families, Relationships and Everyday Life in 'Brexit Britain'

It is often asserted that Brexit had, and continues to have, a divisive and destructive impact on personal relationships, yet little sociological attention has been given to the lived experiences of families in 'Brexit Britain'. Drawing on an ESRC funded study that traced how families made their way through the rancour engendered by Brexit politics between July 2019 and July 2021, this paper argues that it is necessary to explore the ways that Brexit became entangled with people's existing lives and relationships. Data was generated through repeated 'ethnographic encounters' with 12 families over the course of the project - including biographical interviews, 'Gogglebox'-style television elicitation, diary keeping, 'hanging out' and SMS/WhatsApp conversations. Analysis highlights the multiple ways that Brexit made its presence felt in everyday life, and how families employed a range of strategies and practices to negotiate its impact. The majority of the time, Brexit 'bubbled under' everyday mundane practices, with minimal effects that did not threaten the routine running of everyday family life - appearing as another 'annoyance' that families dealt with by simply grinding onwards. Yet the impact of Brexit was not felt equally. Some families experienced events where Brexit forced itself into special occasions in 'family time', causing dramatic and long term family issues. Other families faced citizenship changes that threatened the stability of their family's life in the UK. Here, other family practices came to the fore, such as taking ironic or humorous stances towards Brexit to make it more palatable, 'biting the tongue' around political topics of conversation, or avoiding some family members altogether. The paper concludes by emphasising the importance of the personal life perspective when considering questions of the impact of politics, and how it is differentially felt through a plethora of mundane, and not so mundane, family practices.

Non Clinical Support Workers of a Referral Hospital in Bahia, Brazil, in the Face of Covid-19: Discussing Invisible Labor and Its Consequences

The non clinical support activities, carried out by stretcher bearers, cleaning agents and administrative assistants, are imperative for the completion of the health work process. These activities were frequently placed in invisible and peripheral positions. When related to dirty work, these activities raised stigmatization and moral depreciation toward workers, intensified during the covid-19 pandemic. We propose to discuss the initial analysis of 22 semi-structured interviews with stretcher bearers, administrative assistants and cleaning workers within a reference hospital covid-19 unit in the state of Bahia, Brazil. This study is grounded in some assumptions of ethnomethodology, ergonomics and ergology. To this communication we depicted three exemplary interviews, from each occupational category. These workers were made invisible by the social devaluation of their activities and level of education. They resist despite the overwork and contempt of other professionals, managers and patients. The interviewees stressed the interdependence of their activities with good conditions to the clinical work to guarantee safety levels in the clinical environment. This interdependence often results in the exploitation of their experience, bodily and cognitive skils of these workers without any additional payment for this, evidencing a 'use of oneself by others', in ergology terms. In some cases, these activities are recognized locally by immediate supervisors,

leaders or even senior management. However this recognition does not convey to concrete changes in working conditions or social valorization. Brazil is a country with an strong history of slave-based society, where the manual work is usually seen as servile and the manual workers have very low wages, fewer labor benefits and protections, and low state recognition. The sociological knowledge of the experiences of non clinical support workers during the pandemic may be relevant in both scientific and political sense, reinforcing agendas committed to the social and material recognition of these workers.

Critical Theory before a New Structural Change of the Public Sphere: Digital Social Media between Democracy and Economic Rationality

The rapid transformation of technology poses new challenges for social theory in general and for critical theory, especially with the emergence of new forms of communication that redraw political interaction. Digital social media seem to cause a structural change in the public sphere, altering the patterns of authority and legitimation that were provided by the so-called traditional media, mainly by the professional press. In that sense, digital social media could be perceived as means to expand participation in public debate and thus foster social democratization. However, some contemporary phenomena present a darker side of digital social media. The manipulation of public opinion by the spread of fake news, conspiracy theories, and negationist discourses proves the new context to be in fact one of disorganization of the public sphere, bringing new risks of authoritarianism. Democratic institutions, free professional press, and science are targets of an attempt of delegitimating. The core of the dialectics of enlightenment reappears in that time of interregnum, in which the emancipatory potential of scientific progress is restrained by its binds within the social structure. This work aims to contribute to the critical diagnosis of the present by scrutinizing those binds between digital social media and the rationality of contemporary capitalism. For that purpose, some theoretical aspects from the tradition of critical theory will be articulated with contemporary social theory and empirical evidence to demonstrate how economic rationality prevails in digital social media and how that rationality fosters authoritarian intents. In doing so, it is expected that the critical diagnosis will provide insights to further new prospects for democracy in society.

Digitalization, Public Sphere and Patterns of Authority: Analysis of Political Mobilization By Far-Right through Digital Social Media.

In recent years, several far-right rulers have come to power around the world. The rise of the far-right populism grows concern about resurgent authoritarianism. That work aims to contribute to the explanations of that phenomenon by analyzing the case of Brazil. For that purpose, it will demonstrate how some groups explore the functions of new digital social media to manipulate public debate, mobilize its social basis, and dispute hegemony. In doing so, those groups try to alter the pattern of authority yet established, legitimating autocracy by delegitimate democratic institutions and the rule of law. The discourse will be analyzed to understand this process, highlighting some features, especially its religious content and the fostering of a personality cult, as well as the attack on social institutions such as schools, professional press, and science. Then, it will be also shown how the logic of the internet is manipulated by the groups to spread extremist content through digital social media, establishing clusters of opinion. Some theoretical remarks will be provided to elaborate a sociological explanation of the phenomenon, scrutinizing the binds between changes in patterns of social recognition of authority and the disorganization of the public sphere by new technologies of communication.

Embodiment and the Boundaries of Gender, Race, and the Self in Cosplay

Cosplay is an increasingly popular leisure activity in which fans dress up as fictional characters from comics, films, TV programs, and other texts. Little research has examined how people experience their bodies, emotions, and identities while participating in cosplay. Through participant observation and interviews with cosplayers in the midwestern United States between

2015 and 2019, we analyzed the boundaries between self and persona (character) in cosplay spaces. When they dress up as a character, cosplayers report feeling differently about themselves and their bodies, and sometimes even temporarily feeling like a different person. This blurring of boundaries between self/character is part of what makes cosplay pleasurable. Sometimes they are also blurring other types of boundaries, for example, those separating genders or separating humans from animals (or machines or aliens). We found that cosplayers were often open to challenging traditional ideals of beauty and gender through their dress and self-fashioning, although they had also witnessed cosplayers being judged negatively for falling outside of normative gendered embodiment. While the fantastical fictional worlds that cosplay conjures up allow for many kinds of boundaries to be crossed, many cosplayers explicitly expressed that they did not approve of any type of boundary-crossing that could be viewed as blackface: white people painting their skin to resemble racial minority characters. The body as cosplayers experience it, and the possibilities and limitations of crossing boundaries through cosplay, are important for understanding what cosplayers mean when they talk about "becoming someone else." This narrative of becoming someone else also has theoretical implications for how we understand the presentation of self in social settings.

Pathways through Poverty: The Labor Trajectories of Domestic Workers in Ecuador

Everyone knows that domestic employment is a bad job: poorly paid and exploitative. We know much less about domestic workers' work histories and how they make decisions about paid work in light of their unpaid domestic responsibilities. This paper presents findings from 52 interviews with current and former domestic workers in four Ecuadorian cities, focusing on individual work histories, labor market trajectories, and socioeconomic mobility. Most of these women leave school early, and move in and out of informal jobs throughout their life course. They also move in and out of the paid workforce in response to changes in their family's health and finances. The research participants do not experience domestic work as a stepping stone to better career opportunities, perceiving all the jobs available to them as equally undesirable. They see their paid and unpaid work as similar, forming part of their *lucha* (struggle) to survive and get ahead. Two innovative aspects of this study suggest new ways to research domestic work. First, by including in our research women who have previously worked in private homes, as well as those who are currently employed, we can get a better sense of labor trajectories of poor women generally. Second, we can better understand domestic workers' seemingly abrupt employment decisions by attending to their work-family dilemmas.

CASELLI, Marco* (Università Cattolica del Sacro Cuore, Italy)

State Capacity and the Capacity to Aspire: The Case of Peruvians in Milan Facing the Pandemic

As part of an international study on the impact that Covid has had on the citizens of three different national minorities in as many European cities, this contribution intends to present the main results of a research aimed at investigating the effects of the pandemic on Peruvian citizens residing in Milan. I focus particularly on the role played here, on one side, by migrant religious associations, civic self-help groups and charismatic gatekeepers and, on the other side, by public institutions. In my analysis I try to provide a better understanding of what Fukuyama has described as 'state capacity' in contrast to conventional state power. I also draw on what Appadurai has aptly termed the 'capacity to aspire' in order to capture the everyday skills that people deploy to actively navigate the near and distant future. This research was conducted through the analysis of secondary documents and data and the carrying out of semi-structured interviews (with leading exponents of the Peruvian community in Milan, with other privileged witnesses of the reality under investigation, but also with ordinary citizens of Peruvian origin). In particular, the study explores the dynamics that have been developed and the resources deployed by Peruvian citizens to deal with the pandemic and the effect that this same pandemic has had on the projects and relationships of the people studied.

CASES, Rizza Kaye* (University of the Philippines Diliman, Philippines)

Mobilities and Future Imaginaries of Older Filipino Workers in the Care Sectors of New York and London

This paper highlights the significance of care and support that older migrants provide and receive in the place of origin while remaining embedded and actively participating in the global chain of care labour by doing (un)paid care work in places of destination. Drawing on the interviews of Filipino migrants working in the care sectors of New York and London, the paper seeks to examine the connections between the present experiences of satisfaction and belonging, as well as the various forms of exclusion and dislocations, and the images of (and hopes for) both immediate and distant future.

In particular, the paper problematises the 'idealised' notion of care that migrants want to receive as this becomes salient given their old age. This is based on the larger question of how migrants imagine their future and how such imaginaries can shape current actions (e.g., investing back home) and immediate plans as well as provides meaning for their continued presence in a 'foreign' land.

Interestingly, the security attributed to the relatives they left behind and the kind of culture in the home country that they are relying on, in a way, brings the concept of 'global care chain' into a full circle. Thus, depending on differences in mobility pathways and trajectories of older migrants and their embeddedness in the country of destination, the care that migrants have provided overseas must often be sought in the country they left behind.

Finally, while staying or returning can be considered two separate options, older migrants may also try to be (physically) in two places and imagine themselves doing so – as long as they can. Return can then be conceptualised as deferred, conditional, or cyclical instead of being seen solely as a definitive decision that migrants plan and prepare for. Thus, the future remains open and uncertain.

CASH, John* (University of Melbourne, Australia)

Metamorphosis, Psychoanalysis and "the Art of Doubt"

The metamorphosis of social relations, cultural norms, political institutions and human subjectivities and identities promoted by the destabilising effects of the world risk society have threatened, if unevenly, the ontological security of citizens across the globe. According to Ulrich Beck, such a thorough-going metamorphosis and its corresponding existential and ontological insecurities, while hazardous, contains a potential upside. But how might this upside be realised, while avoiding the downside collapse into friend-enemy othering processes that support populist ultra-nationalisms and extreme ethno-political ideologies? In "The Art of Doubt" Beck briefly and uncharacteristically turns to psychoanalysis to characterise the transformative modes of human subjectivity and sociality that are potentially generated by the very dilemmas of the world risk society and that promise to displace apocalyptic imaginaries with capacities for cosmopolitan cooperation. He writes: "No, the destruction of the old grand illusions is not a loss, but rather a necessity in order to discover the breadth of smallness, the joys of relativism, ambiguity, multiple egos, affirmed drives (which had previously bowed down to the rule of a superego)". Beck draws on psychoanalytic concepts to convey the psychic qualities that he regards as central to the cosmopolitan subjectivity he envisages. Instead of the psychic defences of splitting and projection (into friend and foe) and in place of repression and surrender to a punitive superego, Beck anticipates psychic reorganisation ("multiple egos") and constructive and creative defences against insecurity and anxiety. Such defences involve sublimation, we can deduce, as, according to Beck they "affirm" rather than repress and distort the drives, presumably through alternate gratifications that the defence of sublimation enables. By complementing Beck's analysis with Julia Kristeva's account of "strangers to ourselves" and Judith Butler's account of the centrality of "variable norms of recognition", the fuller potentialities and difficulties of Beck's hoped-for metamorphosis become clearer.

WG08-794.5

CASH, John* (University of Melbourne, Australia)

Organising Competing Forms of Affect and Emotion - States As Subjects That Feel

What is entailed in the claim that states feel? How are human subjects integrated into such feeling states? And what role do variable norms of recognition unevenly embedded within the cultural field play in organising such feeling states? Taking these questions as a prompt, this paper will draw on psychoanalytic theory to develop an account of how state institutions establish proper ways of feeling about self and other and power, authority and violence. These processes become most apparent at moments of crisis, when states confront internal or external enemies, and their ontological security is challenged. However, such crises simply magnify ongoing processes that are endemic, even in less challenging circumstances. Judith Butler eloquently argues that states are subjects too. As she puts it, "Nations are not the same as individual psyches, but both can be described as "subjects," albeit of different orders. When the United States acts, it establishes a conception of what it means to act as an American, establishes a norm by which that subject might be known". By extension, norms are understood as cultural forms that organise feelings as well as mentalities and modes of relating. Significantly, some norms of recognition do this in ways that are qualitatively different from others. Hence, it matters which predominate at any moment. Norms that encode psychic defences that rely on splitting and projection and the friend-enemy distinction to organise affects, emotions and mentalities promote a populist politics that thrives on division and conflict. Alternative norms of recognition may promote a transformative politics that resists the friend-enemy distinction. Typically, both populist and transformative norms of recognition are co-present, if unevenly weighted, within the social imaginary and they compete to institute very different affective and emotional states. Psychic processes of identification and mis-recognition organise subjectivity in accord with these processes.

CASSILDE, Stephanie* (Ronin Institute for Independent Scholarship, Belgium)

Sanctions and the Framework of Homeless People: An Analysis of Anticipated or Proven Risks for the "Accueilpagnement" ("welcare") System

During the social work carried out within the day care center for homeless people, a point of attention is put on the fact of securing "the framework" of this collective place, where collective and individual work is done. As a result, certain words and actions are reprobated as a threat to this "framework". A system of sanctions exists to deal with this, with varying degrees of severity, from an oral/written warning to an exclusion without a fixed end date. This regime is implemented in a collegial way during the weekly meeting gathering all the social workers. In this research, the aim is to analyze the different dimensions that language carries in the face of the risk of the threat of the framework, including the announcement to people of their sanction.

It also implies defining this "framework" and questioning the lability of this definition, thus touching upon questions of equality and equity, both from the perspective of people experiencing homelessness (who sometimes ask for "their framework" to be reviewed) and from that of social workers. We draw on the case study of a day shelter located in French-speaking Belgium over the period 2019-2022, as this location remained open during all lockdown periods. The data correspond to the corpus of the weekly meetings notes as well as on a continuous participant observation over the whole period.

RC25-374.3

CASSILDE, Stephanie* (Ronin Institute for Independent Scholarship, Belgium)

What's Worth Writing about: Theoretical and Methodological Issues in a Corpus of Daily Social Work Notes

During the social work carried out in the day care center for homeless people, a phenomenal amount of data is routinely encoded, both from a quantitative and qualitative points of view. As the day center is open every day, it is a question of allowing the team of social workers to follow the different situations of the people with a harmonization of their own working practices. We focus here on the data produced by one of the combined tools - i.e., one that serves several purposes at the same time: social work, operational and strategic management, and research - and which is composed solely of short notes written by the social workers for each of the homeless people. Through "what is worth writing", a narrative of the daily work with homeless people is developed in order to support the dynamics of their trajectory out of homelessness. It is a question of analyzing the theoretical and methodological stakes in front of such a corpus, as much in what is written as in what is absent. We draw on a case study of a day care shelter located in French-speaking Belgium over the period 2019-2022, as this location remained open during all lockdown periods of time. The data correspond to the corpus of daily debriefings as well as on continuous participant observation over the entire time period.

Immigrant Retirement and Transnational Practices

The normative perception of immigration and the study of the migrant has, in many years been tied to the immigrant as a singular, present state. This is understandable, given that the migration process, or "being the immigrant" carries evolving processes tied to intersectionality (Bilge & Denis 2010) and various externalities (De Haas 2008). However, the bigger picture of the migration process is much more complicated than just the "now", and notions of linearity. Sayad had indicated in his works that the migrant is first an emigrant (Bourdieu and Wacquant 2000), highlighting the pre-migration process and the country of origin as of equal importance as immigration, and are key pieces in trying to understand migrant decision making. Scholars have observed immigrants as transnationals in that they go around these multi-sited locales of work and other activities, associations (Portes et al. 2007) relationships, kinship, and causes (Falicov 2007). This article aims to explore another aspect of migrant transnationalism which is tied to their life course, particularly in their later years. Through a preliminary review of literature and studies on the topic on immigrant future (ie retirement) planning and senior immigrant lifestyle, this article intends to set course in studying the role of transnationalism in this aspect of immigrant ageing and the later life course.

Research Questions:

1. How is immigrant retirement conceptualised and defined?

2. What is the state (operationalised in current state, and changes over time) of retirement planning and strategizing among immigrants in Canada?

3. Are there specific strategies which are tied to ethnic communities?

The aim of this article is to address these questions through a review of literature that addresses retirement in life course planning and strategizing among immigrants, transnational aging, the role government in this process, and context-specific realities among immigrants in Canada.

LUNA, Matilde* (Coyoacan, Mexico)

Disproportionate Judgement and Other Challenges to Democratic Equilibria Posed By Populist Discourse: An Interdisciplinary Discussion

The functioning and the legitimacy of a democracy depend upon an equilibrium of equilibria, a system of three interdependent and yet potentially diverging systems of actors and discursive processes: opinion formation, representation, and decision-making. Since each of these systems has emerging and changing properties, the formal institutional arrangement that defines the democracy cannot alone guarantee its own prevalence. To understand when it persists, improves, or decays, the informal rules that condition each system's processes and modulate the interactions among the three systems must also be considered, which requires an interdisciplinary approach.

Such an approach is motivated by a conspicuous paradox: acts by populist leaders who have reached power democratically tend to undermine democratic guarantees. Although well sustained, the most common unravelling of this, focused on populism's polarisation and the consequential exclusion of divergence, is insufficient to explain the leader's high approval rates. Drawing on Gallie's and Caso's discussions of democracy as an essentially contested concept and Pereda's understanding of misjudegement, we posit that populist's disproportionate assessments and promises disarticulate democracy's good decision conditions, as explained by Goodin and Spiekermann. From our studies about discursive causality, complex associative systems, representation claiming, and democratisation dynamics, we argue that those recurrent features of populism also lead to uncheckable communicative power. So, the role of public opinion changes, from source of authority to instrument of imposition. Then, political, elected representatives no longer have to represent democratic values and deliberate. At the same time, approval standards that kept the systems in democratic equilibria are substituted by criteria the leader exploits to sustain the drift towards autocracy.

CASTEL-BRANCO, Ruth* (Southern Centre for Inequality Studies, University of the Witwatersrand, South Africa)

Beyond Post-Work Utopias: Recentring Production within Distributive Politics

Over the last decades, there has been a proliferation of cash transfer programmes across the global South, in what Ferguson (2015) suggests is a harbinger of - and an intellectual resource for - a new radical politics of distribution based on citizenship rather than past forms of social incorporation such as wage-work. Ferguson is among a growing group of scholars who argue for the urgent need to decentre wage-work from the social and political imaginary amidst a deepening crisis of social reproduction – and the cash transfers may be one mechanism to do so. The underlying assumptions are that wage-work is no longer a meaningful form of social incorporation and that a continued focus on politics at the point of production amounts to little more than 'productivist fundamentalism', that the notion of a 'rightful share' is an effective basis for political claim-making, and that cash transfers are a powerful instrument to drive forth this distributional politics. Drawing on the case of the Productive Social Action Programme (PASP) in rural Mozambique, this thesis critically interrogates these assumptions from the periphery of the global economy. The paper argues that rethinking redistribution requires reclaiming production – and that involves struggles over what is produced, how it is produced and for whom. In decentring politics at the point of production, much of the contemporary 'anti-work' scholarship has left the terms of capital accumulation unchallenged precisely when it is most urgent to do so. However, in an age where the lines between production, redistribution and consumption are increasingly blurred, it is crucial to understand how conceptions of class are being reconfigured.

Coming to Terms in an International Collaboration: Situated Researchers and Situating Data

Reflections on scientific collaborations should consider the dynamics, practices, values, positions and achievements of researchers. In international collaboration, differences related to language, academic culture and social contexts of data require the tricky and never completed work of "translation". Here, we reflect on issues that emerged in two international collaboration experiences around qualitative research of patient experiences with COVID-19.

The first, involving the USA, the UK and Brazil, analysed inequities in pandemic experiences through the lens of critical race theory and intersectionality. The second, involving Brazil and the UK, sought to identify meanings and effects of uncertainty in the context of intensive care experiences in hospitals. These two collaborations required iterative working, which raised the following questions: How do we move from case study structure to cross-cutting comparisons? How do we best integrate social theory into inductive approaches, taking into account the different social contexts of these countries and considering specific national academic reflections and theories? How to examine details during discussions in English, given this is not the first language of all members of the research team? How to translate Brazilian quotations to English and how to compare patient narratives without losing relevant cultural and linguistic specificities?

The core lessons from this work are: 1) the importance of making room to welcome and listen to each other, with mutual confidence, patience and joy; 2) that comparative analyses raise new questions about the respective datasets, highlighting what was previously taken for granted in our interpretations; 3) these two "steps" produced changes in our analytical questions and interpretations. Gaining sociological insights about illness and care narratives in an international comparative analysis is important for illuminating our own differences as situated researchers, therefore enabling us to better situate our data.

Concepts, Measurement and Indicators of Social Cohesion: A Longitudinal Perspective

The conceptualization and measurement of social cohesion is far from being consensual. The different proposals coming from the academia as well as public interest organizations are diverse, making the assessment and comparison of social cohesion indicators and indexes a difficult task. In the present paper we first describe and compare several international projects aimed at conceptualizing and measuring social cohesion, such as the Social Cohesion Radar (Germany/international), the Scanlon-Monash Social Cohesion Index (Australia), ECOSOCIAL (Latin America), Mapping Social Cohesion (Canada) and the Civic Engagement and Social Cohesion report (USA). Based on this comparison, in a second part we identify the main commonalities in dimensions and subdimensions, which then are tested using data from the panel survey ELSOC (Estudio Longitudinal Social de Chile, N=3.000, 2016-2022). Results from factor analysis allow identifying four main dimensions of social cohesion: equality in social relationships, belongness, common benefits and territorial ties. Based on these results, we present a description of stability and change of social cohesion indicators in Chile over the last years. The change in these indicators is discussed taking into account the recent sociopolitical context, characterized by a social outbreak in 2019 and the writing of a new constitution.

Meritocracy, Redistributive Preferences and Political Socialization at School

Growing levels of economic inequality and income concentration have boosted research on redistributive preferences in the recent years (Becker, 2021; Rueda & Stegmueller, 2019), understood as those beliefs about the need for economic transfers and universal access to social services by those with fewer resources, usually by the state. Information about these preferences is relevant for democratic governments as their legitimacy in part responds to their capacity to manage social justice demands. Despite the growing research in this field, until now the focus has been mostly on the adult population, sideling the question about how these preferences are developed and socialized at school age, as well as how they are influenced by social, cultural, and economic factors. Using data from 6,511 8th-grade students in Chile (Chilean Education Quality Agency Survey, 2017), this study aims at analyzing to what extent the social justice experiences at school age (for instance grade allocations), as well as meritocratic perceptions of rewards distribution in society, are related to redistributive preferences of students. As meritocracy is conceived as a system where rewards are justly distributed according to individual effort and talent (Young, 1958), the central hypothesis of this paper is that those students who perceive more meritocracy will exhibit fewer preferences for redistribution (Batruch et al., 2021), moderating the possible socialization impacts of the families. The results of the multilevel (random effects) estimation show that students with a higher perception of meritocracy in society actually display lower preferences for justifying access to social benefits based on individual income, however, perception of meritocracy is also associated with greater preferences for reducing the economic gap between the rich and the poor. The implications of these results for the political socialization of students by the family of origin and the school are discussed.

Social Configurations of Inequality and Family Formation Trajectories in Contemporary Spain

As inequality continues to increase in most European societies, it also becomes increasingly interdependent with other societal processes like rising heterogeneity and polarization of family formation and dissolution patterns (i.e., partnership, marriage, childbearing). The current family theory falls short in explaining these interdependencies. Despite its salience and widespread use in several subdisciplines within the social sciences, intersectionality theory has only recently appeared in quantitative family research. Population scientists and quantitative family sociologists have been slow in recognizing the importance of the intersection of social categories for family formation outcomes, and debates on how to operationalize intersectionality theory with quantitative data are still open. We focus on Spain, a country with one of the lowest fertility rates, highest proportions of childless women, and highest mean ages of childbearing, worldwide. We use retrospective and socioeconomic information from the 2018 Spanish National Fertility Survey (Encuesta Nacional de Fecundidad, ENF) to study how individual family formation and dissolution trajectories are intertwined with the intersection of social categories of inequality including gender, occupation, educational attainment, and migration status. We supplement this analysis with a study of the intergenerational transmission of (dis)advantages based on administrative birth records (1995-2020), focusing on how the intersection of social categories influences birth outcomes. Combined, these intersectional analyses help us qualify the often oversimplistic characterization of Spain as a low fertility context, that often blames families -more specifically women- for their low fertility rates. Instead, we show that structural and interviewed constraints affect differently the Spanish population and we describe the family and inequality processes that underlie the sustained low fertility in Spain. As inequality and lower fertility are not unique to Spanish society, our results may inform research in other contexts shedding light on the potential paths to counter increasing family and socioeconomic inequality.

Military and Politics in Contemporary Brazil

The re-democratization of Brazil in 1985 led to a "return to the barracks," the distancing of the military from the center of the Brazilian political scene. In recent years, however, they have returned to active participation in politics and have returned to the news. The presentation will try to highlight some sociological characteristics that help understand this behavior change.

The Body Speaks before It Even Talks: Populism, Identification and Bodily Performance

The talk will offer an in-depth discussion of the concept of populist performative representation. It will make the case that populism is fundamentally grounded in performance, which is active and productive. Because the creation of populist leadership always has as one of its requirements the creation of populist bodily performances that select, reproduce, display and transform cultural markers connected with the low, the popular, and the so-called "vulgar", populist bodily representation can be a powerful tool for the creation of innovative images and discourses. I call this type of representation "bodily synecdoche", and I argue that performances that weave images of ethnicity, sexuality and gender with signifiers of power and transgression can have democratic potential. The talk will discuss three South American leaders Evo Morales (former president of Bolivia),Cristina Fernández de Kirchner (former president of Perú), and Francia Márquez (current vice president of Colombia).

The Weight of Minority Languages in the Digital Communication at European Universities in Multilingual Settings

Within a context of an intense internationalization process, the creation of the European Higher Education Area (EHEA), as well as the proliferation of a rhetoric aligned with multilingualism, has in practice favoured mainly the growth of English in tertiary education to the detriment of other European languages. This research is focused on electronic means at European universities in multilingual settings and has quantified the use of languages in a population of 88 universities by means of a content analysis. The results show the poor presence of minority languages (ML), except for Spanish universities, and the limited implementation of English. Among the potential explanatory variables, geographic area is the variable that is most strongly associated with the use of languages, although others, such as the Regional Authority Index (RAI) or vital status of minority languages, are also significantly related to the use of a minority language.

Research Practices and Hope: Notes for a New Engagement of Social Sciences

The Covid-19 pandemic, the war conflicts, and the climate change on the one hand are highlighting the fragility of systems and exacerbating social inequalities, on the other they are claiming for the abandonment of production as the only form of relationship with the world and putting human interdependence back at the center. Social scientists therefore ask themselves what their contribution may be today for a new engagement in favour of a human promotion based on hope, equity, peace, and inclusiveness. In this perspective, a brief historical excursus on social responsibility of the human disciplines will be presented highlighting the tension that has been present since the foundation between a neutral position to guarantee scientific objectivity and moral commitment. The reflection will then focus on today trying to find some common traits among the multiple scientific experiences of social engagement for a more convivialist society. In this framework some research practices will be presented, and the role of hope will be considered at three different levels: the epistemological level, the methodological level, and the level of contents. In conclusion, with some examples, the presentation will show how the use of sensitizing concepts, such as social love, can offer new lenses to look at social phenomena and rediscover the role of hope and critical potential of people, groups and institutions.

'Burn the Patriarchy, Not the Planet': Female Participation and Visual Forms of Activism in the School Strikes for Climate Protests.

Since 2018 millions of students around the world have taken to the streets calling for urgent action on global warming. Australian young people have led movements like the School Strike 4 Climate with an estimated 500,000 school students participating in coordinated protest around the country. Increasingly, girls and young women occupy a dominant presence at the strikes, with a large number leading the movement as speakers and organisers (Bessant, 2022). This ground swell of women are demanding visibility, not only through their increased participation but through the ways that their protest signage is drawing on gendered symbols, text and imagery to create powerful and impactful messages. For many young people, the signs they wield at the climate strikes are a unique space for their political voice. These signs are deliberately made to be read by a public audience, including their peers, policy makers and politicians. The messaging and artistic expression of these signs varies dramatically from hand scrawled typography to elaborate illustrative pieces.

This paper explores the visual expressions of Australian feminist perspectives present in the signage at the School Strikes for Climate movement. In doing this, it will question how visual forms of activism can contribute to the individual and collective representation of girls and young women in the Australian climate protests.

Housing Development Policy Needs and Demands: The Entrepreneurial Role of the Government Invisibly Implanted By Public Policies in Brazil.

Much has been said about housing needs for the urban poor in most developing countries. This is more acute in relation towards the design of housing policies to upgrade illegal settlements including the design of strategies to clear titles and/or to improve the physical housing conditions of settlers. However, there is little knowledge on how to deal with highly consolidated settlements which were targeted by government policies over a period of time. This study unpacks the needs highlighted by long term residents of settlements that have been consolidated by public policies in Recife in the 1980s to identify current needs where there is apparently little room for more governmental actions. Householders living in three low-income settlements were interviewed and the levels of housing consolidation were mapped out over time, Housing strategies to upgrade their living conditions were also identified and matched with the difficulties in gaining access to housing resources. At present, individuals listed their needs and priorities regarding their housing conditions, including the need for access to credit, building materials and building skills as expected. However more intangible needs and demands were also highlighted which may include succession dispute resolutions, multiple spouses/partners and surrogate children, and so forth. Policy implications suggest that there is an ongoing need for policy design related to access to housing resources as well as to housing tenure dispute resolutions as a result of complex family relationships leading to complex disputes. The growing participation of the private sector in urban development projects (worldwide and in Brazil) points toward legitimizing the entrepreneurial role of the government invisibly implanted by public policies, and which, as this study points out, is becoming widespread in various urban projects.

Measuring the Social Institutions of Education Systems

Education programs are anchored in socially constructed contexts that dictate the names and practical details of education processes embedded in individual programs. A functions-oriented framework on social institutions (Miller 2003) embedded in the cross-contextual social institutions of education programs may therefore provide an avenue for analyzing how differing levels of robustness in education programs impact the success of youth during and after their educational careers.

We have previously developed a conceptual framework for measuring the robustness of social institutions based on the clarity of their function, structure, culture and sanctions related to breach of culture, as well as their breadth of scope and phase of institutionalization (Rageth et al. 2021). Here, we create an empirical measurement for this framework and use it to analyze the robustness of social institutions in four education programs in different countries with various social and economic contexts – Benin, Chile, Costa Rica and Nepal.

The analysis follows a two-step process. First, experts from the education programs participated in focus groups to define the context-specific processes corresponding to each of the social institutions. This information was then used to develop a questionnaire distributed amongst education system experts in each of the four countries, asking for a rating of each of the elements of the conceptual framework. We combine these to create an index of the robustness of each of the functions, and the education program as a whole, weighted both with objective weightings of the importance of each process as provided by respondents, and an empirical weighting system proposed by Bolli et al. (2018). Data collection is in its final stages.

CAZARIN DE BRITO, Rafael* (Autonomous University of Barcelona, Spain)

"It's like Riding a Roller Coaster". Science, Religion, and Health Among Transgender and Gender Nonconforming People.

An extended literature in the social and health sciences has addressed the (de-)pathologization of gender dysphoria both from psychosocial and physiological dimensions. Scholars of queer and transgender studies as well as trans-rights movements and activists stress that this literature overlooks the role of healthcare institutions and systems lacking focus on the experience of transgender and gender nonconforming people (TGNC) under medical treatment. Yet, fewer studies look at the role of religious, spiritual and other belief systems shape health related decisions of TGNC people. Exceptions are found in research focusing on religion and spirituality related to the mental health or psychological support of people going through gender reassignment procedures in hospitals. This paper examines the ways transgender and gender nonconforming people cope and reflect about medical treatments along with their religious and spiritual lives. Based on the life stories of individuals living in Spain, I explore how they negotiate scientific, religious, spiritual, and other belief systems to deal with ambivalences and uncertainties of gender transitioning. Their experiences evoke intersectional dimension of health-related decisions which involve family members, health professionals, close friends, trans rights organizations, lifestyle and professional changes, and migration. In such context, religion and spiritual allegiance or dissidence is either an extra obstacle and cause of distress or a personal space to develop new forms to relate with transcendental matters.

CE SANGALLI, Lucas* (University of Goettingen, Germany)

Images of War, Images of Home – the Role of Smartphones in the Construction of Belongings of Sudanese Living Abroad

Based on the cases of young men who fled from Sudan to Uganda or Germany in the context of collective violence and political persecution, including the destruction of their houses, I will show the role of smartphones in shaping their contact with everyday discourses on online platforms about the conflicts in their home region, Darfur, and with family members who are still affected by the collective violence in Darfur. I will demonstrate how online transnational everyday discourses and the experiences of family members in the home region influence how people talk about themselves and others while living abroad, in other words, how smartphones become a critical tool in the social construction of belongings for people forced to leave their homes.

Based on biographical-narrative interviews and online follow-up interviews via smartphones conducted in the context of the German Research Foundation project "Biographies of migrants from Syria and West Africa in Brazil and in Germany – processes of inclusion and participation in the context of so-called irregular migration", I will discuss the importance of situating how people use smartphones *biographically* to understand and explain the sociological relevance of smartphones as:

a) a repository of memory for deceased members of the we-group, and a platform for learning about and challenging dominant versions of the collective history of the ethnic we-group while in the diaspora;

b) a means of registering what interviewees frame as "human rights violations" in their home region as a way of remaining politically active against authoritarian regimes in their home countries while in exile; and

c) a platform that can lead to greater power chances in the diaspora, as well as to re-traumatization through confrontation with graphic images of deceased members of the we-group in the home region.

CE SANGALLI, Lucas* (University of Goettingen, Germany)

Physical Violence As a Component in the Transmission of Ethnic Belonging: Changing We- and They-Images in the Dialogue of Families from Sudan Living in Jordan

In this paper, I will show how experiences of physical violence in the past and its thematization and de-thematization in the family dialogue in the present shape the transmission of group pride and ethnic belonging in the case of Sudanese families living in Amman, Jordan's capital. From the standpoint of the sociology of knowledge and the sociology of figurations, I will discuss two case studies of families. The first family represents a case in which the past in Sudan is thematized and knowledge about this past is passed on to the descendants. This type is characterized by a high level of group cohesion and pride in belonging to a Sudanese we-group. This is in strong contrast to the second case, in which the family past in Sudan is not discussed. In the latter type, the family members lack group cohesion, show hardly any group pride, and no pride in belonging to a Sudanese we-group. This difference correlates with the different forms of violence experienced by family members in Sudan, but also during the migration course and in the diaspora.

The results of this study – which is part of my doctoral thesis and was carried out in the context of the German Research Foundation Project "Dynamic figurations of refugees, migrants, and longtime residents in Jordan

since 1946: between peaceable and tension-ridden co-existence?" – indicate that physical violence experienced within one's own we-group tends to cause de-thematization of the family past and of belonging to certain we-groups in Sudan.

CEDILLO HERNANDEZ, Roberta Priscila* (UNAM, Mexico)

Gender on a Sensory-Affective Key. Challenges from Its Theoretical Conceptualization

On this paper, I propose that *body and emotions* belong to an *objective mechanism* that contributes to a *gender order's maintenance* because it legitimizes to "naturalize it". This forces us to ask ourselves about the *corporeal-affective work* behind the *socialization processes* by gender. For this, I start from a dispositional perspective —using as a reference Pierre Bourdieu, Loïc Wacquant, and Bernard Lahire's works— as well as the contributions of recent studies about the body and emotions on the Social Sciences field. This is because both are focused on the sensitive and sensorial dimension of the bodies in the framework of the concrete social logics. In sum, this proposal embraces four interrelated aspects that look for realize the body and emotions work in the framework of the socialization processes by gender, with the purpose of: a) generate an approach of gender identities on dispositional and relational terms (like corporeal-affective practices and experiences); and b) conceptualize properly the legitimation mechanism that helps to the gender ordering's reproduction, with the purpose of follow up the discussions initiated by Pierre Bourdieu about the relationship of affectivity and domination. The aspects I refer are:

1. The place of gender inside the dispositional sociology,

2. The theoretical foundation of the gender identities as a sexed *habitus*.

3. The corporeal-affective inculcation work that underlays gender socialization processes.

4. The corporeal-affective legitimation mechanism that underlays the naturalizing effect of the gender identities.

This discussion is based on my PHD research, the objective of which is to analyze the gendered bodily practices that a group of adolescents—in a school situation and from Mexico City—learn through the socio-affective ties they establish with their families, to show how a gender habitus is formed in a corporeal-affective key, in a specific socialization environment

MDINISO, Joy (The University of Zululand, South Africa)

Small and Medium Businesses in Kwazulu- Natal, South Africa and Their Approach to Corporate Social Responsibility Programs.

Small and Medium Enterprises (SMEs) are recognised around the world for their contribution to a country's social and economic growth but are failing to sustain their corporate social responsibilities due to the current socio-economic pressures in South Africa. The overall inflated costs of food, fuel and basic necessities have increased expenses for all South Africans. This has resulted in the deepening of poverty amidst poor, high unemployment rates and a decreasing economic growth. The need for multiple corporate social responsibility programs is evident. Therefore, this study investigates the extent to which a select few small and medium sized enterprises located in KwaZulu-Natal are engaged in CSR programs. Through a qualitative desktop study, the study revealed the viability, relevance and value of a select few CSR projects that are managed by small and medium businesses. The study investigates which sector of the South African society benefitted, how and during what length of time. The data analysed also indicated how small and medium enterprises can establish CSR programs despite their financial stagnation so that they can contribute towards sustainable skill development and education programs so that South African citizens can rise above dire socio-economic circumstances.

CELESTE, Bryan Lee* (The University of Newcastle, Australia)

Cultural Performances As Agency and Mediation in the Everyday Presentation of Indigenous Youth Identity

This paper explores the various forms of indigenous youth's agency through their cultural performances as well as the mediation process of identity representation in the most challenging times. The study was conducted utilizing ethnographic lens through various methods like participant observation, in-depth interviews, photo-video documentation and Creative Voice, I have sought to understand how indigenous youth performers create mechanisms to recalibrate cultural performances as a sense of agency in different contexts. This is articulated in the process of how the Manobo-Pulanguiyen indigenous youth show their cultural performances in both private and public audience. Whilst they are seen as one of the marginalized sectors, they continue to thrive

in the mainstream society. To assert visibility, they constantly participate in indigenous festival sponsored by the municipality and Local Government Unit of Quezon, Bukidnon. The participation reinforces the idea that their culture is a source of pride and a collective esteem (Celeste 2017) as indigenous people. Moreover, indigenous youth post their cultural performances on social media like Facebook and Tiktok to show that their culture is "unique" and "alive". The process and act of displaying their cultural performances in festivals and the posting of performances in social media can be seen as manifestations of the following: 1) empowering the youth to participate in cultural revitalisation in the digital space and 2) breaking the negative stereotypes about indigenous peoples. However, the use of digital space bears a question on whether this may compromise the integrity of cultural performances. But through this material, I argue that the Manobo-Pulanguiyen youth as indigenous peoples continue to navigate, confront and negotiate the process of identity representation and fight the narratives of victimhood.

"a Tientas": Experiencias De Receptores De Políticas Sociales De Empleo

Las políticas sociales de transferencias de ingresos con componente de trabajo han sido ampliamente implementadas en Argentina desde, al menos, finales del siglo XX. A comienzos del siglo XXI, este tipo de intervenciones estatales -que podrían conceptualizarse con un perfil de *workfare*- se han mantenido, mostrando algunas particularidades que podrían resumirse en: a) su carácter vertebrador en las sociedades contemporáneas; b) su masividad; y c) la creciente proporción de población joven entre su población receptora. Este artículo recupera desde la sociología de los cuerpos y las emociones, las sensibilidades que poseen las juventudes sobre las políticas sociales de transferencias de ingresos con componente de trabajo de las que son receptoras. Para ello se trabaja con entrevistas virtuales o e-entrevistas realizadas a jóvenes urbanos en condiciones de desigualdad que fueron receptores de las políticas sociales aludidas en la provincia de Córdoba, Argentina durante el período 2020-2021. El trabajo de campo fue realizado durante el segundo semestre de 2020 y el primero de 2021, en el marco de las condiciones de Aislamiento Social Preventivo y Obligatorio por la crisis sanitaria, económica y social del COVID-19. Se concluye que una sensibilidad presente en relación a las políticas sociales con componente de trabajo se vincula con la incertidumbre y el "estar a tientas" en los procesos de transición hacia el mundo del trabajo, propósito que las intervenciones estatales pretenden abordar.

RC19-282.2

CENA, Rebeca* (CONICET/CONFINES, Argentina)

Social Policies, Gratitude and "Alleviation"

In this paper, I am interested in exploring two linked feelings in the recipients of social policies: alleviation and gratitude. In previous investigations, it has been identified that the receipt of the state monetary transfer has been perceived as a gift. That is something that has been received without the expectation that it would arrive (Cena, 2017). This makes sense in the context of implementing social policies of money transfers marked by conditions of poverty and denial, where the transferred income is in turn experienced as a alleviation. This feeling is significant to address since it is found in the narratives of people living in poverty who are recipients of the interventions, as well as in the basic objectives of international organizations such as the United Nations or the World Bank. In this framework, it becomes interesting to explore in what contexts, in the face of what type of interventions and what meanings "alleviation" and gratitude acquire in recipients of social policies.

RC05-92.1

CERCHIARO, Francesco* (Radboud University, Netherlands)

"Marrying the Other" Social Reactions to "Christian-Muslim" Couples in Italy, France and Belgium

Nowadays mixed couples who come together across racial-ethnic, religious and national borders represent a global phenomenon which reflects an increasingly transnational marriage market (Beck-Gernsheim, 2007). They involve crucial issues such as freedom of choice of partner, marriage norms, family reunification, racial-ethnic and religious social constraints. Social sciences have traditionally theorized mixed couples as the "litmus test of assimilation" (Alba and Nee, 2003) of migrant groups into mainstream society, a marker of declining social and cultural distance between social groups (Gordon, 1964; Kalmijn, 1998; Alba and Foner, 2015). These studies have overlooked the concrete social obstacles couples face in their everyday lives as well as the latter's consequences for society at large. Based on biographical interviews held in Italy, France and Belgium (2010-2021) with mixed couples where one partner has a Muslim background and the other a Christian one and ethnographic observation of mixed families associations active in these countries, my paper focuses on the factors involved when a relationship generates negative reactions among the family of the majority partner. The article questions the assumption according to which mixed marriages are the result of the diminishing of group boundaries. Its findings suggest that these couples may often highlight the continued presence of strong social barriers.

Muslim men — particularly if they have a lower socio-economic status — are more likely to face the opposition of their families-in-law. The fear of the majority group of losing 'social prestige' indicates that the intertwining of social class and ethnic difference plays a major role, especially at the beginning of the relationships. Islamophobia emerges as a both 'racialised' and 'gendered' category, strengthening the stereotype of the Muslim man as the emblem of 'otherness'.

RC01-34.5

CESNUITYTE, Vida* (General Jonas Zemaitis Military Academy of Lithuania, Lithuania)

Conscription in Lithuania: Motivation, Attitudes and Contribution into Defence Forces

In 2014, Lithuania have reintroduced conscription after a number of years of voluntary defence. Currently, young men between 19-26 are expected to complete compulsory primary military service, meanwhile, women can do it voluntary. At the same time, discussion should it be compulsory or voluntary, for men only or, also, for women, still is going on. The purpose of the research is to explore how motivation of conscripts interrelate to their attitudes towards future of conscription institute, and personal plans to become part of national armed forces.

The research is based on the data collected within the research project "Sociological research of the development of the Lithuanian army in the changing international security environment", conducted since 2016 by the sociologists of General Jonas Zemaitis Military Academy of Lithuania. Quantitative questionnaire survey method was used for data collection. Among many other questions, the questionnaire include questions on motivation do to conscription, attitudes towards future conscription, and intentions to become a part of Lithuanian defence forces. Over 2000 conscripts were involved into the survey each year of the project. In 2016-2019, data collected face-by-face. In 2020-2022, it was done by combining face-by-face and online questioning, depending on situation with the Covid-19 pandemia.

Empirical data reveal that conscripts have different motivations to complete compulsory primary military service. It vary from intention to accomplish duty to the Motherland and the search for an adventure. Part of conscripts already have plans to become military professionals, and conscription is their way to test themselves whether choice of possible profession is right to them. Meanwhile, those who's motivation is search for an adventure, after the conscription often change their mind and decide to joint national armed forces by becoming military professionals. Universal compulsory conscription is supported for men only, but conscription for women is supported only as voluntary.

CHA, Phillip* (Sogang University, Republic of Korea)

Betrayal of Motherland: The Effect of Interaction with Koreans on Korean-Japanese's Identity Construction

One of the severe dilemmas of ethnic return migrants' visiting their ancestral homeland arises from the moment when their identity, which they have been striving to maintain in other countries, is denied in a place they thought was their national and ethnic 'home.' This phenomenon is especially noticeable in South Korean society, which has tried to maintain a strong racial, cultural, and ethnic homogeneity. Those who voluntarily and forcibly moved to Japan during the Japanese colonial rule still live as ethnic minorities/others called 'Zainichi' in Japanese society, even though many have naturalized to Japan. The lives of Zainichi are already deeply rooted in Japanese society for three to four generations. Therefore, their return process is based on a generational, historical, and social context that is completely different from the early return immediately after liberation. With the advent of the global era, as transnational migration movements are increasing, new generation Zainichi's visits to South Korea are becoming much easier and more frequent. However, research on these new returnees and their experience in their ancestral homeland is rarely conducted. This study will explores "How does interaction with Koreans affect the identity of returning Zainichi?" It will conduct in-depth interviews with 20 young Zainichis in their 20s who visit South Korea and then will analyze the data through Charmaz's grounded theory. It is expected not only to show how they are 'Othernized' in their imagined home country but also how racial and ethnic ideologies are embedded and functioned in South Korean society. In this analysis, it will focus on 'citizenship discourse,' which constitutes the interaction between Zainichi and Korean. Through the case of ethnic Koreans in Japan, this study will contribute to the study of return migration and diaspora but also to that of transnationalism in both Korea and Japan.

Post-Secularity, Multiple Secularities and Post-Coloniality: Investigating the Indian Conundrum

The current wave of theorizing about the concept of secularity/secularism has interrogated its monolithic and Eurocentric understanding and provided a

picture that better fitted the actual practices and institutional dynamics of the modern secular states. Much of this theorization has been situated within the post-colonial context untouched by the temporality of the post-secular. The concept of multiple secularities on the other hand has initiated a discussion beyond the political ideologies of separation between religion and state/politics as it detects a variety of combinations of religion, national politics and the claims of religious groups and secular agents in the public sphere. It frames the question not around the question whether secularism/secularity are culturally inauthentic and a western import, but how the boundaries between religion and secular spheres are negotiated, challenged, and redrawn. The recent academic literature in the Indian context that has witnessed the rise of a Hindu nationalist party to power since 2014 has signposted how the concept of secularity has remained hinged on the idea of rights. As a result, judicialization of the religious domain has emerged as the key trope where the principle of secularity is upheld through the judiciary—the sole arbitrator of religious rights with social as well as religious reform as its core agenda. The concept of multiple secularities, in this context, offers a conceptual frame for investigating how the institutional practices and concomitant meaning evolves in these post-colonial contexts. In this presentation I will argue that in contemporary public discourse in India we have seen a clear shift from the guiding principle of 'balancing religious diversity' to the concept of secularity as 'subjection of religion to the rule of law'. This idea of secularity couched in the language of justice and constitutional rights has not worked well for the religious minorities.

Smart Policing in India: Quandaries to Urban Transformation

In the beginning of the 21st century the Government of India has focused substantially on the issue of crime and urban law enforcement. From the crime statistics it is revealed that crime is unevenly occurring in various smart cities in India. Therefore, the question of perception of people regarding policing in the smart cities required a testing or thorough study. Owing to unique characteristics of cities in India smart policing is a challenge to urban administration and governance. The variance in crime rate in smart cities may be due to a series of factors, like urban density, inequality, poverty, urban design, planning and management. It is essential that we address the problems that are creating obstacles to urban transformation and also identify the priorities or goals that may be set for the people and the administrative wings of governance to make the cities livable. To ensure safety and security to the people, smart policing practices can unearth the crime problem in urban spaces in India. In this regard, the present study unravels the quandaries to urban transformation through smart policing.

Gendered-Racialized Phobic Coalitions: Transnational Authoritarianism, Youth Mobilization and Nationalist Politics of the Indian Diaspora in the US

Several scholars argue that we are witnessing a violent turn towards transnational authoritarianism around the globe in the recent years (Pascale 2019, Coronado 2019). However, when exploring this right-wing global march, the focus is often on US and Europe. This narrow focus makes us lose sight of attendant postcolonial forms of transnational authoritarianism like right-wing Hindu nationalism. In this context, I focus on the rise of Hindutva (right-wing Hindu nationalism) in India and its connection to diasporic youth mobilization and control of pedagogy in formal and informal curricular and faith-based spaces, by centering the nationalist politics of the Indian diaspora in the US. I investigate how Indian/Indian American youth in the US, often inspired by multicultural perspectives, understand this right-wing movement and how the movement mobilizes the youth, both as supporters and as resisters. I also examine the intersections of racialized religion, gender and caste as they are instrumentalized through this battle over pedagogy in diasporic faith-based and academic spaces in relation to transnational Hindutva. I employ a combination of transnational ethnography and interviews in the US and in India. With this data, I hope to contribute to an understanding of how right-wing ideas and material practices flow through transnational networks, with a specific focus on youth mobilization and curricular development, while also being resisted by counterpublics. This project contributes to the fields of political sociology, as well as sociologies of education, social movements, youth organization and gendered-racialized religion.

Shaheen Baghs and Their Aftermath: How Female Protestors Shape India's Current Resistance Movement Against Fascism

Since the Indian right-wing government passed the controversial Citizenship Amendment Act (CAA) on December 11, 2019, protests against the CAA have erupted all over India and also among Indian diasporas around the world. The longest of these protests (102 days) was a series of peaceful sit-ins carried out in Delhi's Shaheen Bagh area that was organized by working class, elderly, Muslim women, known as the "Shaheen Bagh *dadis*" (grand moms). This paper tries to look at the anatomy of the Shaheen Bagh protests that started on December 14, 2019, and was forced to end on March 24, 2020, as the police forcibly cleared the site due to the coronavirus pandemic and the attendant lockdown of the country.

The paper explores how, along with the CAA, which threaten the citizenship rights of minorities and vulnerable groups in India like Muslims, Dalits, poor women and the tribal and LGBTQIA population, these groups of women, aided by students, professionals and people from various walks of society, agitated against police brutality, Islamophobia, Hindu right-wing fascism, unemployment, poverty and issues of women's safety. This leaderless mass movement, using various mobilization strategies like sit-ins, public demonstrations, sloganeering, hunger strike, public lectures and debates and a plethora of protest art, became an epicenter of anti-CAA protests in India. Finally, the paper critically analyzes Shaheen Bagh as a symbol of feminist resistance to fascism by showing how this movement sought to expose and dismantle questions of Islamophobia, social class, gender, sexual violence, caste, and statist violence as interconnected feminist issues. Claiming that Shaheen Bagh represents a watershed moment in India's current political history, the paper shows how along with feminist movements in Iran, Hong Kong, Brazil, Lebanon and other parts of the world, Shaheen Bagh is a part of what is being called the "fourth wave" of feminism.

Futures Past, Present, and Elsewhere: Hindu Sindhi Diaspora in Hong Kong

This paper makes a case for theorizing diaspora with the future. It frames the future as not only that which lies ahead but as a complex of multivalent imaginings and orientations which extends across varied temporal frames. Diaspora has most often been examined through a linear temporality, rooted in past displacement and nostalgia for homeland. However, rather than focusing on 'homeland orientation' (i.e., what some have critiqued as the 'backward glance' of diaspora), this paper explores the futural orientations of diaspora, through the case of the Hindu Sindhi business diaspora in Hong Kong. It explores how Hong Kong emerged as a 'place of the future' in this community's diasporic imagination. Hong Kong harboured futural promise for this community, particularly from the 1960s and 70s onwards, through the flows of goods, ideas, business opportunities and desires in and through the city. However, this futurity was intertwined with and reframed by a series of 'temporal junctures' or turning points (such as changed immigration regimes in the 1970s, the 1997 Handover, the 2019 political crisis, and the Covid-19 pandemic). These junctures reshaped visions of futurity and place, and also prompted investments into potential futures – here, or elsewhere. At such junctures, interlocutors often drew on the *past* futurity and promise of Hong Kong, to envision futures in India, Hong Kong, and elsewhere. In this, India is constructed not as a lost homeland, but as a place of present and potential futures – through investments, strategic social identifications, and retirement plans. These diasporans do not articulate belonging through pastness or nativeness, but instead look to futural places, both in India and Hong Kong – around which their constructions of diaspora, and futures (past and present) coalesce.

Gendering the Merchant Diaspora: Sindhi Women's Life Stories

The story of the contemporary Hindu Sindhi community in Hong Kong is most often told through pre-colonial and colonial-era trade networks of male merchants, and mass displacement from Sindh during the 1947 Partition of the Indian subcontinent. Primarily viewed as an elite merchant diaspora of mobile men, women's experiences and life stories have rarely been centred in the literature on this community. Scholarship on trade and maritime trade diasporas has focused on the movement of men and the exchange of goods between them - while women are located as peripheral or external to these specialized flows. This paper addresses this gap in the literature by re-writing a gendered history of this merchant/business community and foregrounding women's experiences through Sindhi women's life stories.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Framing Sindhi women's multiple and intersecting migrations, mobilities and immobilities at the heart of merchant diaspora reveals how the narratives of entrepreneurial spirit, cosmopolitanism and capital gain surrounding this community are underpinned by gendered sexual economies and immobilities, women's (unpaid) work, and gendered regimes of cultural production. Focusing on three interrelated vignettes, the paper moves from the 1930s to the present day to narrate a gendered history of Hindu Sindhi migration. It begins with the Brahma Kumari sect in Sindh, whose earliest membership comprised left-behind merchant wives – arguing that these sexual economies and gender regimes offer a glimpse into how women's immobilities sustained merchant migration. Following this, it charts the migratory histories of three generations of Sindhi women in Hong Kong, highlighting their contributions to business, cultural reproduction, and sustaining diasporic connectivities. These narratives reveal fragmented migratory pathways, layered gender regimes, and gendered and generational diasporic aspirations. This paper contributes to the literature on Indian migration by providing a gendered lens on this business community.

Pleasure of Piety: Post-Pandemic Spiritual Well-Being Among Santhal Youths in Jhargram

Countless studies have shown how leisure and well-being are intertwined with each other. Leisure enhances one's quality of life, gives life-satisfaction, helps to alleviate depression, and most importantly gives a sense of meaning and purpose to life. But with the daily grind of everyday chores, life for many people has become stodgy. Covid-19 came as a bolt from the blue which affected their everyday life and mental health. It was during this period of lockdown that the majority of people came to understand the relationship between spirituality and subjective well-being. Several individuals started putting faith into action during the period of pandemic to maintain health and wellbeing. For many individuals, the pandemic was a symbolic gesture of the divine to help us re-evaluate our predilection of conspicuous consumption and reconsider the traditional ways of living—i.e., promoting simple living with high thinking. There has been an increase in concepts like eco-spirituality, sustainable consumption, and increased community sentiment during the pandemic. The current study is based on the Santhali youths residing in the Jhargram Block of Paschim Medinipore, West Bengal. With development, a large section of the Santhali community in Jhargram is seeking to emerge out of their marginal status and is making progress in numerous areas. The pandemic halted that route of progress. It offered them the chance to rethink their social condition. Thus, with the help of survey research on 30 Santhali-youths residing in Jhargram Block, the current researchers try to find out the following objectives—firstly, to understand the relationship among leisure, spirituality, and subjective wellbeing among the youths of Jhargram Block; secondly, to study whether the youths follow the path of spirituality to attain subjective wellbeing or not during the post-pandemic period; thirdly, to explore the reasons behind the youths seeking for spiritual recluse during the post-pandemic social situation.

Slums, Space and Seat of Power: A Study of Slum Sustainability in Kolkata

The social construction of space is dependent on the kind of social activity a group of individuals partake in. Space, as David Harvey points out, is not just an absolute but also a relative term. This demonstrates that space is built socially through time. Based on the kind of human activities, space is ever-changing in nature. In addition to rural and urban areas Slums and other forms of informal settlement make up a sizable percentage of the urban landscape. The UN Program on Human Settlements has defined a slum as "a contiguous settlement where the inhabitants are characterised as having inadequate housing and basic services". The slum dwellers within the urban spaces have overlapping spatial patterns of dwelling. They have a functionally integrated sphere of power despite unhygienic living standards, crammed residences, lack of urban amenities, insecure land rights, negative impact of migration, abject poverty, and vulnerability of women and children. Though slums are a breeding ground for several vector-borne diseases (especially malaria and dengue) and people lack information about public health concerns, they have a high life expectancy. Similarly, they may lack economic riches, but their political power is equivalent to affluent urbanites. They have ample time for leisure which thereby strengthens their we-feeling and helps in the creation of a stronger community. In contrast, a prosperous urbanite lacks this deep social tie. Thus, the current survey research has been conducted in Rajabajar and Belgachia slum areas of Kolkata (one of the largest metropolitan cities in India). The study tries to critically look into the juxtaposition between the socio-spatial segregation of the slum dwellers to that of their power base. It tries to highlight the consequence of this incongruity on maintaining their sustainability and seat of power despite the (un)availability of resources than any affluent urban dweller.

Adolescents' Reading Habits during COVID-19: Are They Still a Mechanism for Cultural Reproduction?

In this presentation, drawing on a European-funded research project that explored the impact of the pandemic on students' lives in Greece and Cyprus, we will explore adolescents' reading habits during the COVID-19 protracted lockdown (March 2020 - May 2021). The pandemic had global consequences, but Greece and Cyprus were ahead of the curve when it comes to its impact on schools and students due to the extremely strict and severe lockdowns, as well as the suspension of schools for long periods. Drawing on evidence from an online survey, several focus groups and semi-structured interviews with adolescents in Greece and Cyprus during the COVID-19 pandemic, we will explore the extent to which reading books is still highly valued in adolescents' lives and the degree to which this activity is related to adolescents' advantageous familial and socio-economic background. Moreover, in this presentation we will examine whether reading should still be considered an activity that contributes to cultural reproduction in the digital era. In our attempt we adopt a class perspective in order to understand possible patterns of inequality in students' reading habits. In particular, we attempt to give space to the voices of those socially disadvantaged students whose plight has been neglected by policy. Moreover, we aim to consider the interplay between cultural resources, reading, and cultural reproduction, and to discuss the extent to which adolescents' distinct reading habits still provide educational advantages. This presentation will aim to contribute to the examination of the often invisible mechanisms that originate from the family and produce socially stratified school underachievement that sustains social inequalities in contemporary Greek and Cypriot societies and to open up new possibilities regarding reading habits and cultural reproduction.

CHAMPAGNE, David* (University of British Columbia, Canada)

Looking through Fiery Futures: Disputed Governments of Forest Fires, Heatwaves and Climate Adaptation on Canada's West Coast

Unprecedented forest fires and heatwaves overwhelmingly affecting rural areas have transfigured the climate vulnerability of the Canadian West coast. Indeed, British Columbia's two metropolises were not only less affected by hazards, but inherited from decades of world-renowned policy preparation in sustainability. This situated contrast encapsulates key social issues of climate urbanism: this global policy tendency which privileged an urban response to climate change over the past decades (Long and Rice, 2019). In understanding the unjust effects of climate governance, many document the logic of emergency response and the impact of climate adaptation policy on hazard preparation. However, additional research is needed when it comes to the sociological link between climate urbanism, climate governance, and disaster preparation in the context of extreme heatwaves and forest fires.

By focusing on regions most affected by megafires in 2017, 2018, and 2021, this article probes how climate urbanism induces climate sacrifice zones in such climate vulnerable locations as the Cariboo Region. To find answers, my data encompasses policies and interviews. I use a sample of 40 contemporary sustainability and climate policies from the region's four main towns; Williams Lake, Quesnel, 100 Mile House, and Wells. To this, I add 20 policy texts from the Provincial and Regional governments, and 40 semi-directed interviews with planners and inhabitants of the Cariboo Region. In this, I show how climate adaptation involves the uneven struggle over the production of legitimate climate-proof futures. In contrast to political economies of climate adaptation seen through the lens of neoliberal governance, I argue that climate adaptation is a process of environmental endangering of the territory and emphasize how climate urbanism produces a systematic under-preparedness of rural areas. Through recent disastrous forest fires and heatwaves, I debate how the towns of Cariboo region responded in their climate adaptation efforts.

CHAN, Alex, lih-shing* (Soka University, Hong Kong)

Streaming Reality Show and Japan's Soft Power

Although a global streaming platform, Netflix's content-making strategy has been region-focused and promotes local productions with global market potential. One of the significant collaborations between Netflix and FujiTV was the revival of FujiTV's *Terrace House,* a reality show that featured six young strangers living under one roof. Originally a broadcast TV series at midnight in 2012, *Terrace House* had continued to air for two years before its termination due to low ratings. Yet, Netflix's decision to pick *Terrace House* for the new season's production shows what Netflix intended to portray and market Japan for the more extensive international market. Terrace House has achieved unprecedented success and recognition in global viewership through Netflix streaming.

Western critics and overseas fans proclaimed that *Terrace House* was unlike any reality show made by Western productions, which tend to sensationalize, sexualize and dramatize the plots and characters. In contrast, *Terrace House* appeared to be subtle, sometimes bland, and the house residents did not have to compete for attention as there were no competitions, to begin with. Hence, what made T*errace House* so appealing and attractive to international audiences?

This study inquires and examines the construction of the "realness" of Netflix's Terrace House. One of its roots comes from the production Japanese TV genre called *trendy drama*; another coincides with the cultural export policy of *cool Japan*. This study further discusses how Japan's urban, multicultural, and inclusive image reinforces the culture industry in aligning with the soft power of Japan.

Democratic Trade Unions in Authoritarian State: Lesions from the New Trade Union Movement in Hong Kong

Labour has played a significant role in political movement against authoritarian rule and dictatorship in Asia. This has again reflected in the new development of democratic movement in Hong Kong. Trade unions in Hong Kong have been understood as politically divisive and institutionally weak under a specific context of cold war and British colonization. The middle class is claimed to be the main driver of democratic movement led by liberal intellectuals and professionals since 1980s. The limitation of the liberal politics, however, had led to the rise of students-led Umbrella Movement in 2014 and 'leaderless' activism in the Anti-Extradition Law Amendment Bill Movement (AELBM) in 2019. With the protests advanced, strike was advocated as one of the main strategies by the protestors and hundreds of new trade unions were established from 2019 to 2000. An unprecedented medical workers strike was successfully organized in February 2020 by one of the newly established unions. While street protests declined in early 2020, the opposition of the new unions against the imposition of National Security Law on 1 July lasted until June. Both old and new trade unions became the major target of state crackdown in 2021. Why and how the new trade union had emerged in the movement? What is its impact on the political landscape in the city and beyond? What lessons can be learned to inform workers' struggles in authoritarian regimes? This paper aims to reflect on these questions based the authors' participation observation and interviews with trade union organisers and leaders as well as documentary research.

CHAN, Jenny* (The Hong Kong Polytechnic University, Hong Kong)

Independent Contractors, Migrant Households, and Cost Competitiveness in e-Commerce Logistics Chains in China

Subcontracting, which companies use to avoid costly obligations otherwise required of direct, longer-term employment, is core to parcel delivery services in China. Alibaba, not unlike Amazon, has expanded its delivery network by investing in contingent subcontracted workers. The veil of workers' independence, justified by their ownership of the vehicles they use to deliver, nonetheless provides them with little autonomy and exposes them to the uncertainties imposed by the market, oftentimes for little in return. This research analyzes labor informality and the coping strategies of working-class families in the parcel delivery sector. How do couriers, mostly male rural migrants, organize their work to adapt to speedups of production and circulation? What does this tell us about the structure of work and flexible employment in China's platform economy?

Drawing on three rounds of participant observation at a parcel delivery station in Beijing from 2017 to 2018, supplemented by analysis of company and government documents, this ongoing project discusses how individual and family lives are impacted by the hectic world of work, and indeed, how courier services depend on the exploitation of households through flexibilization to improve their cost competitiveness. Married couriers rely heavily on their wives and/or parents for childcare and other housework while working hard to provide their families with the main source of income. Family arrangements like these often see fathers become minimally available to their families, even as their families work to ensure the fathers' availability to work. The intersecting structures of these arrangements have ensured the daily reproduction of workers for employers' benefit. Household members call customers or wrap parcels, for example, and their unpaid labor subsidizes delivery stations in their business operation. In this way, the "independence" of subcontracting allows employers to intensify production requirements and drive exploitation into forms hidden within the household.

CHAND, Deep* (Goethe University Frankfurt, Germany)

Protest Against Citizenship (Amendment) Act [Caa:2019] in India: Understanding Conflict Escalation through Protest-Repression Studies

Recently, the Indian government has brought a contentious citizenship bill in the parliament to grant citizenship to 'illegal migrants' of six non-Muslim communities from Pakistan, Afghanistan, and Bangladesh. This shows the right-wing populist government does not only try to 'othering' a particular community called Muslims but also wants to establish its 'hegemonic dominant ideology' in the society with the idea of 'state apparatus' (Althusser, 1971). The systematic attempt to exclude Muslims from said countries has led to a massive social protest across the country at different times and spaces. Drawing on the protest-repression studies, the article attempts to understand conflict escalation through the anti-CAA protest from the point of view of the 'state apparatus'. The article attempts to answer the following questions: a) what is the 'repertoire of resistance' being employed by the protesters to register their opposition against the government? b) how the government uses its 'state apparatus' (mainly police and paramilitary force) to control protest and protesters' dissent voice? c) how the confrontation between police and protesters has led to conflict escalation across time and space?

Resistance Against Caste Norms in Higher Education: A Perspective from below

Resistance is often understood to be aimed at achieving some sort of change (Hollander & Einwohner, 2004). Education does not only a tool to bring social change but also motivates people to resist dominant oppressive societal norms for a 'just society'. In the Indian context, however, education, like other institutions, has been a site of caste-based discrimination, humiliation, and exclusion. Voluminous research confirms that caste even continues to operate in an educational setting which is supposed to be the most inclusive and democratic space in our society. The studies have shown that student from marginalised communities have been the subject of discrimination, humiliation, and exclusion on higher education campuses. However, subjective experiences of caste does not only shape their campus lives but also enables them to resist caste-based discrimination and humiliation. The study employs a semi-structured interview approach to analyse and unfold the caste dynamics on campuses of higher education in India's largest state of Uttar Pradesh. The article attempts to answer the following questions: a) What is the 'repertoire of resistance' being employed by the marginalised student to counter caste norms in higher education? b) What are the challenges the students face during the resistance to caste norms in the educational setting? c) How do educational institutions act as 'state apparatus' (Althusser, 1971) and favour a certain dominant social group to maintain their ideological hegemony?

CHANDA, Patrick* (School of Graduate Studies, Lingnan University, Hong Kong, Hong Kong)

Income Inequality, Country-Level Social Support, Gender Inequality and Gender Differences in Children's Subjective Well-Being. a Multilevel Cross-National Study

Prior research suggests that family, school and community variables largely influence children's subjective wellbeing. However, previous research has not largely shown whether individual- and country-level variables are significant determinants of children's subjective well-being across countries. Therefore, the aim of the present study was to: 1) examine gender differences in children's subjective well-being; 2) investigate whether gender inequality relates to gender differences in children's subjective well-being; 3) explore how income inequality relates to children's subjective well-being; and 4) examine whether country-level social support moderates the associations of income and gender inequalities with children's subjective well-being. The study merged individual data from 2013/14 Health Behaviour in School-Aged Children (HBSC) Survey with country-level data from the United Nations Development Programme and International Labour Organisation. Multilevel binary logistic regression models were used to examine the relationships between variables. There were significant gender differences in children's subjective well-being across countries. Girls had lower subjective well-being than boys. Greater gender inequality was associated with larger gender differences in children's subjective well-being. Additionally, higher income inequality was associated with lower children's subjective well-being. Moreover, the study found that social protection, human development index (HDI) and inequality-adjusted human development index (IHDI) moderated the influence of gender inequality on children's subjective well-being. Similarly, social protection and IHDI buffered the effects of income inequality on children's subjective well-being. However, HDI didn't moderate the influence of income inequality on children's subjective well-being. Higher levels of income inequality significantly lead to lower subjective well-being for adolescents across countries. Greater gender inequality is largely associated with lower subjective well-being and gendered

patterns in children's subjective well-being. The effects of economic and gender inequalities on children's subjective well-being are mitigated in countries with higher social support. Thus, social policy should target social inequalities and societal factors that influence children's well-being.

CHANDA, Patrick* (School of Graduate Studies, Lingnan University, Hong Kong, Hong Kong)

Socioeconomic and Gender Inequalities, Country-Level Social Support, Face-to-Face Bullying and Cyberbullying Victimisation Among Adolescents. a Multilevel Cross-National Study

Prior research shows that socioeconomic conditions (such as family socioeconomic status, income and gender inequalities) influence aggressive behaviours and victimisation across societies. Nevertheless, it is not well known how such structural level factors interact with country-level social support to influence face-to-face and cyberbullying victimisation across countries. Thus, the aim of the present study was to: 1) examine the association of family socioeconomic status (FSES) with face-to-face bullying and cyberbullying victimisation; 2) analyse how gender inequality relates to face-to-face bullying and cyberbullying victimisation; 3) examine how income inequality relates to face-to-face bullying and cyberbullying victimisation; and 4) examine how country-level social support moderates such associations. The study merged individual data from 2013/14 Health Behaviour in School-Aged Children (HBSC) Survey with country-level data from the United Nations Development Programme and International Labour Organisation. Multilevel binary logistic regression models were used to examine the relationships between variables. The study found that odds of face-to-face bullying and cyberbullying victimisation are higher among adolescents with low family socioeconomic status. However, the impact of low family socioeconomic status on bullying victimisation is lessened in nations with higher social support. Adolescents who live in countries with greater levels of income inequality are at higher risk of being victims of face-to-face bullying and cyberbullying. The results suggest that odds of bullying victimisation decrease as values of income inequality decrease in countries with higher social support. Additionally, the results reveal that odds of face-to-face bullying and cyberbullying victimisation are higher in countries with higher levels of gender inequality, especially among female adolescents. Thus, the effects of bullying victimisation on adolescents (especially, among females) are exacerbated in countries that do not provide adequate social support. In this case, low levels of social support cannot protect adolescents from victimisation by bullying across countries.

Flexible Identity, Innovative Strategies, and Survival of Dānger Putul Nach: A Case Study from West Bengal, India

Traditional puppetry in India over the years has become a dying art and is steadily in decline amidst increasing globalisation, lack of patronage, and proliferation of consumer culture. However, out of the four primary forms of puppetry performed in India, rod puppetry has survived for over five centuries. It is primarily performed in Bengal and colloquially referred to as *dānger putul nach*. No empirical studies, however, emphasise the transition and the current situation of production and transmission of *dānger putul nach*. To address this gap, we examine the case of Satya Narayan Putul Natya Sanstha (SNPNS), a rod-puppetry organization in Jaynagar, which has continued to survive for over eight decades with the involvement of four consecutive generations. The paper uses data from semi-structured and focused group interviews of puppeteers, non-participant observation of performances, and a puppetry training workshop for the analysis. Drawing from Emilieu's (2018) theory of progressive traditionalism, the authors find that the traditional performing community of SNPNS, over the years, has adopted several innovative strategies associated with modern puppetry. However, these innovations were based on the original form, creating a link between the traditional and the modern, allowing the community to possess a flexible identity and ensuring the art form's continuous production. Additionally, the community's remodelled performance practices had several positive outcomes. These are (a) abolition of the oppressive structure of division of labour prevalent in traditional rod-puppetry, (b) creation of a new possibility of transmitting hereditary knowledge through the female descendants, and (c) resistance against the tokenistic representation of the art form in the popular media. This paper adds to the scant studies on puppetry as an art in transition, specifically to the study of *dānger putul nach* in India.

HANCKEL, Benjamin (Western Sydney University, Australia)

Examining Lgbtqia+ Young People's Social Media Practices As 'Doing' Family

Social media practices are situated within the contexts in which people are located, including family, peer relationships, and the offline. Scholarship to date shows LGBTQIA+ young people carefully curate social media spaces to find community, while simultaneously navigating their privacy and safety. However, less is understood about how young people's connections to families of origin (re)shape their social media practices. Drawing on interview and focus group data with 65 LGBTQIA+ young people, this paper unpacks how familial attachments shape social media practices, including curation strategies. Findings reveal considerations about family play an important role in how young people use social media to maintain and foster ties with their kin. Young LGBTQIA+ people's social media practices are intensely affective experiences, where issues of care, concern, and love for family, (re)shapes their use of social media. As a result, queer young people's social media practices can be conceptualised as family practices, and a form of 'doing' family. This challenges the dominant understanding that family is simply a site of 'risk' for queer young people in online spaces, where they might accidently 'out' themselves by revealing their gender or sexuality to family. Viewed within the context of familial attachments, queer young people's social media practices actively foster familial ties through their navigation of online spaces.

Childhood Indicators in India and Children's Well-Being: Data, Discussion and Debate for Policy

The debate on childhood indicators in the global north is on rise in twenty first century. International society for child Indicators (ISCI) has initiated a systematic scales of various childhood indicators since 2005 which is followed by academia, researchers, government and non-government agencies such as Unicef, Save the Children and The World Vision, etc. Ben-Arieh (2006, 2008) found out the multiple domains of childhood indicators for mapping children's well-being. The most important contribution of childhood indicators in understanding children's well-being is that it gives thrust to conceptualization, measurement and monitoring of well-being in different socio-cultural and economic contexts. In India, the World Vision and Poverty Learning Foundation jointly brought out Child Well-being India Report from last couple of years. The latest edition Child Well-being Report 2021 comprises on 38 indicators identified under four domains – Health, Hygiene, Protection and School Education. The present paper is based on the report which includes four domains that have an impact of well-being of children in India as it initiated a fresh debate for policy and programme related to child development in India. On the basis of the indicators available, the present paper opines that health and children's well-being is one of the major areas where a close policy review is urgently required. The paper finds that protection domain of child-well being index is also grim as situation of child labour, child marriage, juvenile crimes, sexual offences, cyber crimes and child trafficking is critical.

CHANDRA, Vinod* (Sri J N M P G College, Lucknow University, India)

Contestation between the Belongingness and the Self-Processes – Family and Community Relationships Experiences and Wellbeing of Indian Youth during Pandemic

The paper focuses on the question of how Indian youth experiences their relationships with family members and also with their close community during pandemic; how their experiences affected their own well-being in particular. In reference to their relationship experiences, the concept of belongingness and the self-process in inter-generational relationship is explored. Family obligations and expectations in the time of uncertainties are explored. Based on empirical study on youth in Lucknow city in India, young people's experiences of with family members, community members and peer group are mapped out to measure the level of belongingness in the family and community. The narratives of young people were evaluated for assessing their well-being in the time of pandemic crisis. Total 65 youth including 32 girls and 33 boys were interviewed in their family spaces and also outside the family settings to gather comprehensive information. The main finding of the study is that youth not only experienced new and more realistic forms of relationships which redefine their conception of 'belongingness' and 'the self'. The study findings advance knowledge and understanding about youth's conceptualization of belongingness and the self which contributes to the literature on spatial theory and the sociology of youth and their well-being. Given the paper's focus on youth's subjectivities of their own well-being during the pandemic, the policy implications are also drawn to help promote youth well-being.

When the Majority Becomes the Minority: Non-Indigenous Teachers' Cultural Competence Development in an Indigenous School in Taiwan

"The Education Act for Indigenous Peoples" affirms that "Indigenous peoples are the subjectivity of indigenous education" and supports the establishment of indigenous schools, which are based on the knowledge system and educational philosophy of indigenous peoples, and now there are 36 indigenous experimental schools in Taiwan. Indigenous people comprise only around 2.4% of the population, even though these schools locate in traditional indigenous areas, most of the residents live together in multi-ethnic neighborhoods. In the school of the study, 60% of the students are indigenous, but three quarters of the teachers are non-indigenous. These non-indigenous teachers are the majority in the mainstream society, but become the cultural minority in the school and community, they must learn about indigenous perspectives, language, and culture, and work together with their indigenous colleagues and seniors in the community to reshape the school curriculum based on the indigenous knowledge. Therefore, the work experience is also the process of the development of indigenous cultural competences, they must improve the professional content and pedagogical knowledge about indigenous learners, and cultivate the abilities to effectively interact with students and the community. The research focuses on exploring these non-indigenous teachers' experience in an indigenous school to understand their cultural competence development. The results find that even though they were worried in the beginning, according to Bennett's the Developmental Model of Intercultural Sensitivity, these teachers moved from ethnocentrism to ethnorelativism and developed the cultural competences, including attitude, knowledge and skills through almost 10-year cooperation with indigenous staff in curriculum and instruction. They tried to create a multicultural path for indigenous student' academic success and indigenous identity against racial boundaries through culturally responsive pedagogy. Therefore, the process of the development of cultural competences is also the process of the teaching to transgress in indigenous education.

CHANRUNGMANEEKUL, Unaloam* (Sukhothai Thammathirat Open University, Thailand)

Fear and Power: A Comparative Study of Myanmar and Thailand in Reaction to Documentary As Social Practice for Advocating Human Rights

The research explored relationship of three aspects, human rights advocacy in Southeast Asia (Thailand and Myanmar), use of **The Third Eye,** an observational documentary to advocate human rights; and social practice for mobilising community rights in Dawei, Myanmar and Ban Banglamung, Thailand.

The human rights issue concerning development and impact on human rights, particularly **the DSEZ project in Myanmar and the Laem Chabang project in Thailand**. The comparative qualitative approach was employed to study the indigenous communities, media reception and audience's social practice in Thailand and Myanmar.

Two objectives included 1) to explore how different groups of insiders (local people in Dawei, Myanmar and Ban Banglamung, Thailand) and outsiders (filmmakers, distributors and educators in Thailand and Myanmar) reacted to *The Third Eye* in relating to human rights issues and film aesthetics; and 2) to study how they mobilised human rights and community rights in their society.

The findings indicated four main arguments, **first,** there was no single pattern of human rights advocacy for Southeast Asian countries. **Second**, participation of the audience was crucial for social practice. **Third**, forms of human rights advocacy would take place under mutual interest and experience, open spaces, freedom and democratic society. **And lastly**, state power and people's fear in Southeast Asia were constraints of documentary social practices and human rights advocacy.

Identities, Engagement and Participation: Myanmar and Thai Youth's Perspectives on Documentary Interpretation and Media Design for Mobilising Human Rights

Based on the human rights issue concerning development discourse and impact on human rights of local people, **particularly the DSEZ project, the massive international port development in Myanmar and the Laem Chabang project in Thailand**, the paper explores how different teenage groups of Myanmar and Thailand created their own media to protect their rights due to negative consequences of the projects. **The Third Eye**, an observational documentary, focusing on marginalised fisherman's ways of life among the massive port project in eastern Thailand was employed as a tool to explore their own perspectives and media creation.

Three research objectives were investigated. First, how the different groups of youth in Myanmar and Thailand defined 'human rights'. Second, how the youth groups interacted to *The Third Eyes*, in its narrative and art. Lastly, how they designed their own media to mobilise 'human rights' to the public.

Two methodological approaches were applied: qualitative focus groups; and media design and framing. Dividing up the teenage groups by different localities: marginalised local youth and urban youth in both Myanmar and Thailand, the significant findings showed that firstly, different identities between marginalised local youth and urban youth affected media design and representations. Secondly, audience's engagement of media content was a key factor in social mobilisation. Lastly, participation of local people in the process of media production was a significant way to inspire marginalised communities to fight for human rights protection.

Linking Farmers Food Sovereignty with Consumers Food Justice: Case Study of Farmers' Markets in Thailand

As a part of the fight towards food sovereignty, farmers' market initiatives in Thailand became significant platform to reconnect solidarity between rural food producer and urban food consumers. The success and sustainability of farmers' market in urban setting depends on the relationship between food sovereignty movements and alternative food movements. The aim of this study is to explore market organizers' motivation, farmers and customers incentives and investigate the linkage between rural farmers and urban consumers movements according to food. The mixed method was applied consisting of observations, interviews and questionnaires. Since some farmers' market belong to private business, our main selection criteria of farmers' markets are that it is established and organized by farmers' networks. Researchers have visited and observes 9 farmers' markets directly. Farmers market organizers were interviewed in-depth. Questionnaire respondents includes 55 farmers and 110 consumers. It was conducted during the Covid-19 pandemic between 2020-2021. The results demonstrate that though the food system disruption, rural farmers are more enthusiastic to bring agricultural products to the city. As farmers become entrepreneur in town, their visibility as well as negotiation power increase. As middleclass consumers perceive food diversity and have personal dialogue with food producers, they reconnect with nature and increase awareness of their health, environment and farmers well-being. At the same time, urban low paid workers, whose majority is rural-to-urban migrants, reconnect with their culture through food with affordable price. Although some urban regulations demonstrate concerns on sanitation and orderliness rather than inequality issues, the co-operation of farmers and consumers movements support their efforts to overcome obstacles and brought them towards both food sovereignty and food justice.

CHATTERJEE, Riti* (Just Transition Research Centre, Indian Institute of Technology Kanpur, India)

The Implications of Sustainable Livelihood Framework for Just Transition Policies and Practice: An Empirical Study from Northeastern Coalfields of India

The sustainable livelihood framework is a widely used approach to analyze changes in livelihoods, especially in resource dependent communities. The present study conducted in northeastern coalfields of India tries to translate the vulnerable context of coal mine closure into sustainable livelihood outcomes through action of various transforming agent and processes, trade-offs between various capitals and strategies to determine how sustainable the process of energy transition is. From a snowball sampling through 27 one-to-one qualitative interviews of coal workers and non-workers, restoring the environment and ensuring jobs are two important outcomes that are found to be relevant. The mine closure is found to be a pervasive and unrelenting shock that can escalate over time, forcing the community to leave their place, jobs and social support. Potential change agent like trade unions, although, played a critical role creating joint action committee and appealed to the company for minimum sustenance of the dependent community. Local health, education and other social welfare institutions of the select coalfields also set an example providing basic community support during the period of closure. Some parts of the community have chosen farming as an alternate occupation after closure, however, local businesses that evolve around the coal mine and the company township are found to be threatened by conspicuous business recession. Thus, helping entrepreneurs to regain their business will be one of the possible livelihood outcomes. Scarcity of livelihood options caused outmigration in the coalfields, thus another outcome can be checking the outmigration of thousands of people and initiating reverse migration by creating ample livelihood opportunities that will entice the people to return. The analytic framework, holistically bridges the gaps between the coal worker

and non-worker community and the researchers as well as between the researchers and policymakers, offers ways to just transition at micro, meso and macro levels.

Gender Inequality and Leisure: A Study of Women in the Traditional Family Setup of Varanasi

Leisure has been considered to have originated in the western society particularly through the Missionary culture. In India, leisure has been there only for a particular class whose percentage has been very low or negligible. The core assumption thus is that the centrality of the narrative is not about leisure as an activity but rather it is about the leisure class.

Looking at women in India, it is very difficult to distinguish between working time and leisure time. Traditionally, India has been a patriarchal and patrilineal country; however, these days' things are changing. Gender inequality persists but gender equality has made inroads into the society. However, it is only making structural adjustments and not structural change.

Under this backdrop, the paper aims to analyze how women in India spend their leisure time. It would also enquire into how women could take out time for leisure among several domestic works including child rearing and serving husband and other family members.

For the purposes of this study, the field work will be conducted in the city of Varanasi in the state of Uttar Pradesh, India. A sample of 200 women will be chosen for administering the schedule for the study and the sample will be divided between 100 women who have formal education and 100 women who do not have formal education to enable a comparison.

CHATTERJEE, Sreyasi* (Prasanta Chandra Mahalanobis Mahavidyalaya, India)

Beyond Binaries: Exploring How New-Media Technology in India Promotes Inclusion of Transgender Persons.

High-speed internet connections and availability of a variety of Over-The-Top (OTT) media services have ushered in a new era in Indian media history. Platforms like Netflix have introduced an array of global programs to the Indian audience. Live streaming channels like YouTube have provided a multi-way interaction platform, where the viewer can upload videos and comment on posted videos. These new forms of media are emerging as spaces that are gender-sensitive, avoiding misrepresentation of the marginalized.

The transgender community in India have been largely ignored or negatively portrayed by the Indian media. The NALSA judgement (2014), followed by the Transgender Person's Bill (2018) legally reaffirmed the transgender identity in India, making them visible, through these new forms of media. However, these new forms of media ignore the diversity within the trans-community, often oversimplifying the struggle for establishing a trans-identity.

This research examines two Indian shows to explore how ideal OTT platforms are for the realistic portrayal of the transgender experience in India and explores the roles that transgender persons play in representing their community on these new-media platforms. Of particular interest is how transgender portrayal on media platforms determine status of transgender persons in real-life. A mixed-method approach of content analysis and critical discourse analysis have been used to examine these shows.

This research found that new-media platforms allow greater representation of the trans-community. Representation, however, reiterates stereotypes like viewing the trans-person as a sexualized commodity or viewing them as victims. The transgender voice is not silenced but controlled.

CHATTERJEE, Sreyasi* (Prasanta Chandra Mahalanobis Mahavidyalaya, India)

Tradition of Conservation: A Sociological Exploration of the Role of Indigenous Culture and Knowledge Systems in Promoting Ecological Conservation in Bara Mangwa and Chhota Mangwa of Darjeeling District in West Bengal India.

The people of the ecologically fragile region of the Eastern Himalayas have been constantly facing the threat of climate change and this has had serious consequences on food security and livelihood of the indigenous communities of this region, who depend largely on climate sensitive livelihood practices. This close association of these indigenous communities with the ecosystem have developed their acumen to develop adaptive practices to fight climate change. Such traditional knowledge systems and indigenous cultural practices can indeed prove to be critical in developing climate change adaptation strategies that are participatory, cost-effective and sustainable.

Diverse forms of indigenous traditions in North Bengal demonstrate how culture, nature and livelihood are deeply intertwined. Exploring the idea of Ecotourism in the villages of Bara Mangwa and Chhota Mangwa in the Darjeeling district, this study aims to explore how nature-culture interactions

and their dynamic relationship has shaped the use of indigenous cultural practices and knowledge systems in promoting environmental conservation. This study makes use of focus group discussions, key informant interviews and oral histories, to understand the nature-culture-livelihood interactions.

The exploratory study brings forth the idea that indigenous communities are deeply connected with nature–they are interdependent, they are equal, they are almost kin to one another. This intimate relationship that they share with nature makes them vital pillars of ecological conservation. An exploration of their cultural practices, traditions and belief systems show that they regard nature with deep respect and they thrive on their sense of place and belonging to their land and environment. This sustains knowledge and ways of life that are very similar to the modern notions of ecological conservation and the sustainable use of scarce natural resources. This indigenous community emerges as an ideal custodian of the ecosystem and play a central role in the efforts to limit climate change.

Visuals in Action

Peter Kropotkin replaces social struggle by 'cooperation'. Cooperation is the life struggle. Noam Chomsky endorses. There is a space in sociology- the space lies between war, annihilation, destruction, violence, religious fundamelism, terrorism including by state sponsored actors. Discord among individuals, groups, religious orders, even nations is natural and tolerance based on secular, democratic, human values is what encounters 'crossing the limit' by manifestations emerging from hatred, discrimination, and greed. The agencies that go against the basic foundation of peace are topped by the misuse of social media. This paper probes the role and scope of role that visual images would play towards "resolution of tension between the contraries" when right kind of environment becomes incumbent due to inherent non- endurance of maladies. Visuals in action are the influential tool of "working out peace"

Demographic Dividend in India: An Evaluation

India is still young, despite the globe as a whole progressively ageing. India will dominate the global labour force in the coming decades and be a talent powerhouse. The remarkable chance cannot be denied. If India's demographic dividend is used effectively, development prospects will improve, enabling it to increase its GDP. According to the UN World Population Prospects 2022 study, India is expected to overtake China as the world's most populated nation in 2023. According to earlier predictions, the achievement will take place in 2027. The population of India is less than 29 years old on average. Approximately 67 percent of India's population, or the so-called demographic dividend, was working age (15–64 years) in 2020. However, India runs the risk of losing any demographic advantage unless the necessary preparation work of skilling, reskilling, and job creation takes place. The paper aims to identify the current situation of young population in India and, evaluate the policies and action programmes undertaken to catch the demographic dividend for the betterment of the youth. The study deals with the evaluation of skill India programme. India is at a critical juncture right now, having already reached the golden era of the working-age population between 2020 and 2050, which will last for 30 years. Initiatives to improve skills over the past ten years have lagged behind population growth, creating a sizable skills gap. In India, employability increased from 33 percent in 2014 to 45.97 percent in 2022, according to the India Skill Report 2022.

Leisure Activities of Youth in Metropolitan City: A Sociological Analysis

Young people's usage of their leisure time can serve as a form of cultural, spiritual, and interest indicator. Youth development benefits from young people's recreational activities. An outcome of the purpose of the paper is to examine the leisure activities of young people who live in large cities like Aurangabad, an ancient metropolis in India. Personal interviews and youths' descriptions of their individual and collective leisure activities are included in the investigation. The results indicate that young people in a big metropolis participated in a variety of activities that were both good for them and bad for them. The urban youth of India spends a lot more of their leisure time online than they do outside exercising, playing, or running. Including time spent on work-related activities, much urban youth reported that they spend at least four hours per week on social media or internet browsing. In contrast, fewer than half of young people participated in outdoor sports or similar activities even for a single hour each week.

Gender and Mental Health Intersectionality Among Elderly Living Alone in Chandigarh

The paper attempts to describe the mental health problems of the elderly living alone in Chandigarh. For this purpose, 180 elderly respondents were selected (including male and female) through snow ball method. Interview schedule was used to collect the data. Being a modern city, it was easy to procure population of single elderly who were living alone at Chandigarh. Mental health of selected subjects was assessed by a self made five point Likert scale. The scale was consisting of 14 statements. The scale was inspired by Warwick Edinburgh Mental Well Being Scale (WEMWBS). The statements were related to the mood, relaxation, peace, enjoyment while doing things, helplessness, feeling of irritation, anxiety, happiness in the company of others, emptiness in life etc. It was concluded that age, gender, duration of mental ailment, duration of living alone, and physical activity status and not in interaction with each other are significant contributors towards mental health in elderly persons. It was found while living in the modern era, elderly women were more facing the problem of mental health. A majority of the respondents stated that their health deteriorated after they started living alone.

'Feminism' in Contemporary Indian Public Discourse: State, Market and Media

The rise of neoliberal and authoritarian regimes across the globe defies most 20th century expectations (whether post World War II or the post 1990s) that the world is on an upward and unilinear journey towards greater freedom, expansion of democratic rights and social justice. The story has been not just different but complex, challenging sociologists to make sense of processes that have not already engulfed our lives, but also our knowledge practices and conceptual apparatuses. It is in this context that I seek to offer an analysis of the public and mediated discourse on 'feminism' with a special focus on India.

This focus on 'feminism' I argue is a particularly productive lens to understand the ongoing transformations in the 'gender order' for it will necessarily entail an engagement with patriarchy and its intersections with both neoliberal capitalism and state authoritarianism. I limit my analysis to mediatized discourse which I seek to show has an unprecedented role in disseminating ideas of 'neoliberal feminist selves' at one end and 'hegemonic masculinity' on the other.

Images, Intersectionality, and Their Immersive Experiences: Comics As Socio-Cultural Artifacts in Digital Spaces

This paper focuses on an increasingly emerging and growing interdisciplinary area of digital humanities and visual sociology across generations and nations: Comics. In this research, we argue that, while recent technological advances have aided in digitization and archiving of comics, yet, studies focusing on understanding their socio-cultural implications as a result of their technological evolution have remained in the blind spot of scholarship. In this paper, we bring in concepts across two disciplinary terrains, viz. Sociology and Computer Science, and propose an intersectionality-based immersive technology which influences the engagement with and immersive experiences of comics in digital spaces. Bringing in an interdisciplinary focus of digital humanities here that is primarily informed by computer science and sociological disciplinary platforms, we discuss a conceptual and technical framework that we have built and which uses an intersectionality-lens and automatically generates video with multimodal features from a digitized and born-digital comic book. Our goal in this paper is a methodological intervention for 'production' of comics in digital spaces: to propose a method for automating the process of immersive content creation from comic strip arts, and en route, illustrate how such 'production' is socially contextualized in digital spaces. This research is not only significant to understand emerging technologies like Augmented Reality (AR), but also brings to the core critical discussions of comics as socio-cultural artifacts particularly when viewed through the lens of intersectionality.

ISSUE of Drug and Leisure: Qualitative Analysis of CASES from Lucknow, India

Sociology of leisure analyses the interrelationship of society and leisure. The amount of leisure available to members of society and the manner, in which it is utilized, are governed by economic, educational and cultural factors. These factors are not uniform in all classes as well as all individuals. Further leisure is also conditioned by ones work. Some people also think leisure leads to social development. Under this backdrop the present paper aims at analyzing the issue of drug and leisure. The use of drug by the individual produces some type of pleasure. When the individual engaged in continuous work he/she finds time for a break. Some of them used cigar, hookah, different types of drug and different types of alcohol. All of them know that excessive use of the above things will definitely lead to sickness or even death. For the analysis of this work some case study would be taken from Lucknow city in India and qualitative analysis of the cases would be conducted.

Leisure in Indian Society during the Period of COVID-19: Some Issues

The field of leisure studies has been very useful while studying the situation during the COVID-19 pandemic. During the period of lockdown and even after that people did not go out of their house and got confined to the domestic atmosphere. It has been the biggest crisis to hit the humanity after the World War II. The conventional ways of leisure could not find the opportunity to be used by people. They could not go to gymnasium, could not engage in sports activities and could not go to multiplexes, malls, cinema halls, public places and so on. Therefore, people adapted to alternate modes of leisure such as connecting to nature, engaging in social network sites like Face book, Twitter, Instagram, WhatsApp and YouTube. Many people also made YouTube videos and reels. In this manner the structure has been continued through different agencies. Under this backdrop the present paper would analyze the new agencies of leisure through qualitative cases taken from selected parts of India.

CHAUHAN, Abha* (Indian sociological Society, India)

Gender-Based Violence during Covid-19 Pandemic in India: Shifting Equations within the Domestic Sphere

Gender-based violence is directed against persons because of their gender, but most of it is inflicted on women and girls by men and is rooted in power inequalities in societies that are largely patriarchal. It tends to increase during situations of turmoil and crisis. Since early 2020 when several countries got engulfed by the deadly Coronavirus or Covid-19 disease nearly one-third of women around the globe suffered from violent or sexual abuse at home, called 'the shadow pandemic' by the United Nations. Within the domestic sphere in India, the status and role of women are largely gendered and considered secondary in comparison to men's position in the public domain sustaining the personal-political dichotomy. Homes are places where girls are socialized, learn household chores, inculcate appropriate behavior, dress decently, and remain 'safe'. Women studies have broken several such stereotypes of families being the most sacrosanct and protected place showing that most cases of physical violence and sexual abuse are committed by known people, friends, and relatives. During the Covid-19 pandemic, such cases have increased significantly in India as reported by many organizations, including the National Commission for Women. The women, especially of the poor and the marginalized households, suffered more severely as they lost their jobs, and children were forced to stay and study at home increasing their burden. The lack of resources and digital technology proved to be even more detrimental. 'Work from home' for working mothers produced new forms of psychological and mental violence. The paper analyses the situation of the shadow pandemic in India as a result of the increase in gender-based violence in the domestic sphere during Covid-19 and brings out the new forms of structural changes, as well as ways of meeting the new challenges.

CHAUHAN, Abha* (Indian sociological Society, India)

Policies, Governance and Society Interface: Assessing COVID-19 Pandemic Crisis in India

A short description of major events associated with COVID-19 in India, the world's largest democracy will be presented.

Following upon this, the paper will assess the causes and impact of the Covid-19 pandemic on the people in India by understanding the policies of the state and how it governed and managed the crisis, as well as the role of civil society and various organizations in providing help to the people in meeting the everyday challenges during the pandemic times. The policies-

governance-society interface perspective enables a fuller understanding of the phenomenon, at the same time provides scope for dealing with the contextually specific issues.

The paper argues that: (1) Indian society has its inherent strength and social networks to fight the pandemic and the government needed to be more responsive, and open with the people by entering into dialogues regarding its decisions and steps undertaken, (2) this limited interface between the process of governance and societal institutions could have been improved if strong public health care and education systems, as well as sound economic and social policies, were in place, and (3) the government policies of privatization and corporatization of the health care system during the Covid-19 pandemic led to an exacerbation of already existing caste, class and gender inequalities. The analysis of these issues will open possible solutions to handle future crises similar to the Covid-19 pandemic.

Dealing with Credit Scores: The Work of Microfinance Loan Officers in Rural Gujarat, India

Microfinance institutions (MFIs) have been flagged globally as an instrument to address poverty and achieve gender equality. The use of credit scores by MFIs to assess the creditworthiness of women borrowers is a rising phenomenon. The sociology of finance indicates that credit scores invalidate the local ways of gauging a borrower's creditworthiness. This literature also notes how informal financial practices are incorporated into credit scores as well as how the use of credit scores by financial institutions affects the creditworthiness of women borrowers and microentrepreneurs. In India, we see the growing importance of credit scores in the lives of the poor, mainly through MFIs. However, this paper demonstrates that microfinance officers who extend loans still use social networks and local practices combined with credit scores to assess the creditworthiness of women borrowers.

This paper draws on ethnographic fieldwork conducted in the Kheda district of Gujarat from July 2021 to January 2022. The data was collected by observing and interviewing branch managers and loan officers of MFIs. This paper argues that the use of credit scores by MFIs does not eliminate the need for existing local practices of microfinance loan officers that allow them to identify creditworthy women borrowers and reduce the risk of defaulters. It reveals how varied information about borrowers becomes more crucial for microfinance loan officers to determine borrowers' creditworthiness that credit scores fail to provide. It shows if and how microfinance loan officers depend on their own networks with loan officers of other MFIs to assess the creditworthiness of different social groups or localities. Further, it details the processes through which microfinance loan officers depend on various individual, household, group, and community checks to assess women borrowers' creditworthiness.

Displacement of Self in Transnational Motherhood: Mainland Chinese Cross-Border Mothers in Hong Kong

Migration experience of mothers reframes motherhood as motherhood is recreated and renegotiated within transnational contexts. Current literature has focused on the capital mobilization of migrant mothers to create new meanings of motherhood. For example, mothers who migrate for work resort to their newly gained financial capital to rationalize their contribution to family prosperity and to contest the stigmatization that they have abandoned their children. However, in the case of the cross-border mothers in our research who have very limited capital or even diminishing capital as they migrate, they lack the agency to counteract conventional demand on idealized motherhood such as physical and emotional proximity with children and prioritization of children. These women also lack protection because of their low socioeconomic

status and precarious migration status. The consequence is, we argue, an internalization of the traditional moral imperative of mother sacrifice and intensified prioritization of children, leading to what we call displacement of self, i.e., the constant subordination, blaming, alienation, and minimization of their own self. Drawing on in-depth interviews with 26 Mainland Chinese cross-border mothers aged 31 to 51, staying in Hong Kong on tourist visa to take care of their children who go to school in Hong Kong, this paper delineates these mothers' self-subordination, self-diminishing and self-sacrifice. We discuss three major areas of their social life: (1) Tensions between maintaining family relationship and childbearing; (2) Precarious social networks; and (3) Self-sacrifices. All this results in internalization and intensification of the conventional motherhood ideal, making the child the only core of the mother's life. The mother self is gradually lost as mother sacrifice is taken for granted, leading to increased migrant mother vulnerabilities and gender inequalities.

Language Policies and Racialized Linguistic Privilege within Educational Settings in Hong Kong

Compared to the general student population in Hong Kong, South Asian students are well-documented to be challenged by disproportionate academic underachievement and unequal access to career opportunities. Although research has suggested structural constraints (e.g., limited school choice) to be a significant cause, government interventions often downplay structural barriers and instead highlight South Asians' "language deficit," creating a linguistic hierarchy and leading to exclusionary practices and segregation at schools. The Education Bureau prioritizes a Hong Kong-centric assimilationist approach, which upholds Chinese as the linguistic and cultural standard. Such monocultural assumptions set desirable Chinese proficiency as a prerequisite of social integration. The prestigious status of English language in education and business further complicates the situation. Drawing on a review of education policies relating to ethnic minority students and in-depth interviews with 75 South Asian students in Hong Kong, this paper unravels how language policies serve to reify and racialize privilege in linguistic terms. I argue that race intersects with language to produce a linguistic hierarchy, which perpetuates racialized privilege. This linguistic elitism has two layers. Firstly, a perceived lack of English proficiency is used to justify the limitations placed on South Asian students' equal access to educational and career opportunities regardless of their actual English competence. Secondly, a perceived low level of Chinese language, just like English, becomes a barrier for South Asian students in their attempts to access educational and career opportunities. On top of that, Cantonese, the local spoken language of Hong Kong, is further used to justify the exclusion of South Asians, who are perceived to be not proficient enough in this language. In other words, English language becomes a vehicle to transmit privilege, whereas Chinese language serves to draw a boundary of inclusion/exclusion. Racialized privilege is demonstrated through this dual linguistic elitism.

Unequal Natures in South Africa: Towards a Democratic Ward-Based Model for the Protection and Management of Nature and Natural Resources in South Africa

South Africa is the third most biodiverse country in the world. The country has come a long way to ensuring democracy in this troubled land. Whilst the current form and shape of democracy in the country – post-colonialism and post-apartheid – is a necessary social and legal tool – it seems an insufficient vehicle for dealing with the legacies of colonialism and apartheid on the natural environment. Thirty years into democracy – nature in South Africa still finds itself pulled in two opposing directions – environmental conservation and environmental destruction. The latter seems to be winning - at huge expense to the natural environment and the majority of South Africa's people. Coal is still used as the primary energy feedstock in South Africa. The South African state is still allocating licenses to oil companies to drill for oil and gas in some of South Africa's most pristine environments. Unequal South Africa means that the well-off can live in eco-estates and the underprivileged in disaster prone areas. Nature is also continuously being replaced by 'concrete jungle' - especially in lower class areas. The impact of unequal natures/environments was evident in South Africa during the April floods of 2022 when about 500 people lost their lives and 40 000 were displaced when climate-induced floods were at its worst in South African history. This presentation will argue for the democratic governance of the natural environment at the ward level. In this regard – it will propose that participatory democracy at the ward level be the overarching legislative factor for the effective management and governance of the natural environment - with a view towards overcoming unequal natures/environments. The presentation will engage with the state of the natural environment in South Africa within the contexts of capitalism, climate change, inequality, poverty and mass unemployment.

A Theory of Dialectical Transnational Historical Materialism for China's State Capitalism and the China–US Rivalry

A new cold war seems to be looming between China and the United States. The escalating China–US rivalry calls for a more dialectical theory of international political economy that captures conflict and disintegration as an integral part of capitalist globalisation. Kees van der Pijl's and William Carroll's critical realist approach towards the study of transnational corporations (TNCs) and transnational capitalist class (TCC) formation has incorporated the classical theory of uneven capitalist development and inter-imperialist rivalry into the scholarship of transnational historical materialism, which I argue is apt for explaining the China–US conflict: One is positioned as a Hobbesian contender and the other as the Lockean hegemon. To provide empirical grounding for my argument, I conduct a corporate network study to examine the interlocking directorates of 40 Chinese TNCs. In concordance with Carroll and colleagues' studies, I find that the globalisation of Chinese TNCs and Chinese corporate elite has been modest and has not undermined or replaced the national base, nor does it signify a homogeneous TCC formation. My findings have also revealed an inextricable relationship between the Chinese TNCs and China's party-state, or a Hobbesian character of state-organised capitalism.

Gender Inequality When Work at Home during the Covid-19 Pandemic

The world economy has been total changed by the Covid-19 pandemic. In many countries, a lot of people lost their jobs or reduced work hours during the pandemic. We also found that more women lost jobs than male workers. Besides, people were forbidden to go outside; therefore, work at home become a new model of strategy. Not only the parents had to stay at home, children also have to stay at home because schools and nurseries have been closed or took on-line courses. Therefore, working women struggled between caring dependents and earning for living. The pandemic tests the original career trajectory of women, and their arrangements for the future. We also wonder whether the equality between genders has changed during lock down or work at home period.

The researcher use in-deep interviews to collect data during 2020-2022. We have interviewed 36 families with children in different industries in Taiwan to see their working conditions and caring burdens during 2020-2022. The interviews started in May 2020 and participants have been follow up for 1 year or more. The following research questions are asked in this study: 1). To discover the difference between genders when the mother and the father work at home during the pandemic. 2). To explore the caring burden of married women with children, their family arrangement, and the interaction between family members during the pandemic. 3) To discuss the question that to what extend the Covid-19 bring more opportunities for gender (in)equality at home.

New Welfare Productivism? Social Policies for the Pandemic in North-East Asia Region of Icsw

The COVID-19 pandemic, one of the greatest public health, social and economic challenges in history, has changed our lives dramatically since the beginning of 2020. Its impacts on economy, employment and health are global concerns. North-east Asia countries face the same challenges though their confirmed cases were not as many as that in other parts of the world. There are homogeneities among countries in North-east Asia Region. Almost all of them were under the influence of the Confucius teaching, so that their people are generally gentle and tend to obey the regulations of the government. Moreover, they all belong to "Productivism Welfare Regimes," i.e., welfare policies are used to support the development of economic policies. Families are main providers for caring the welfare of family members. Residual welfare models are prevailing, cash transfers are rare. However, can the original welfare model deals with this new social risk in the area of North-east Asia where are comparative active in the economy in Asia?

International Council of Social Welfare (ICSW), began from 1928, is a consulting international non-governmental organization of Union Nations, European Union and etc. It has 9 branch regions and North-east Asia region includes Japan, South Korea, Taiwan, Hong Kong and Mongolia. We hold a lot of region conferences to discuss the challenges and social policies during the pandemics in every member countries/areas during 2020-2022. We observe that some new social policies were introduced by our member countries/areas to deal with the family economies caused by the Covid-19 pandemic. Therefore, it is a good opportunity to discuss the changing welfare regime in North-east Asia Region during and after the COVID-19 pandemic and to observe how the governments faced the huge challenges.

Body, Knowledge and Modernity: The Origins and Early Development of Modern Sports in China

The term "physical education"（mixed with "sports") as it is used today in China was introduced from Japan in the late 19th century and emerged out of the desire of Chinese intellectuals to improve the Chinese body in response to the crisis facing the country. This demonstrates the key position of education in the introduction of modern sports to China. With schooling requiring an ordered body of knowledge as a foundation, how was knowledge constructed and how did it play a role in reshaping the Chinese body? This paper attempts to apply the theoretical framework of power-knowledge to critically examine the connection between modern sports discourse and the transformation of the Chinese view of the body around the 20th century to understand the response of Chinese society in the face of "modernity". Considering that China encountered challenges and even invasions initiated by other countries during the period, this forced the discourse of modernity to have the possibility of crossing national borders into China. This paper argues that the emergence of sports knowledge in China was shaped by the results of power between China and other nations (often overlooked) and within Chinese society, which facilitated the legitimization of this knowledge and thus transformed the Chinese body by intertwining it at the practical and spiritual levels. However, this knowledge has generated a paradox in the traditional civilization and historical conditions of China: the need to embrace the fruits of modernity in other countries, but also to further strengthen nationalistic tendencies. The paper concludes that this paradox seems to run through the development of modern sport in China, producing different variants of legitimacy discourse through different structures of social power in each period. This remains for further empirical study by researchers.

The Impacts of COVID-19 on Social Mentality in China ——a Sociological Analysis Based on Two Surveys Conducted in 2020

In 2020, the COVID-19 broke out in China suddenly and spread very quickly over the country. The social mentality or attitudes of Chinese people was impacted hugely and complexly by this outbreak. Institute of Sociology of CASS conducted two kinds of surveys based on the network; one of them was focused on changes of social mentality itself, beginning at 24th, January, 2020, and ending at 30th, March, 2020, 35727 questionnaires responded to, by people aged are from 18 to 70; another survey was focused on the youth generation (from 18 to 40 years old) living in the city of Wuhan, beginning at 4th, February, 2020, and ending at 8th, April, 2020, 6899 questionnaires replied. The impacts of COVID-19 on the social mentality of Chinese society are twofold: negative and positive. As for its negative impacts, six main findings can be got form these surveys. Meanwhile, we also find three positive impacts of COVID-19 on the social mentality of Chinese people from these surveys. Based on these empirical findings, this paper will try to discuss the methodology and approaches to deal with new social risks, especially new public health risks like COVID-19. Finally, this paper will give a very simple discussion on the main characteristics and focuses of Chinese sociology: on the one hand, Chinese sociology pursues to development a kind of sociological system characteristic of China (but meanwhile not to refuse learning from the sociological knowledge from all over the world) ; on the other, Chinese sociology insists from the beginning that more attention should be paid to the livelihood and development of common people, social justice, and social solidarity and harmony which are the core values of Chinese society, as well as of social development of China itself.

The Present Situation, Challenges and Way ahead of Social Development and Justice in China in Post-Covid Period from Sociological Perspective

In the post-covid period, the socio-economic development of China is confronted with a lot of Challenges. Some very important changes are taking place in the relationships between the demand and supply of labor market, the decreasing rate of demand is much bigger than that of supply. The increasing rate of income of rural and urban households is obviously slowing down, and the case is the same for the narrowing rate of income gaps between rural and urban residents, different regions and different social classes, especially, the incomes of low-income classes decreased in the Covid period. The social governance at the level of grass-root society is faced with new challenges, especially in the Covid period. The quantity of labor dispute cases is increasing, risks of social conflicts are increasing, one key reason being the crisis of public health. To cope with these challenges and risks, and to improve the social development and justice, China should foster the socio-economic development with higher quality as quickly as possible, especially implement the new strategies of rural development, urbanization and the

socio-economic integration of rural and urban areas; make more efforts to realize the employment priority strategy, improve the relationships between the labor and the capital; accelerate the recovery growth of income of rural and urban households, especially that of low-income classes, and set up a more just system of income distribution covering the market income, transfer income and charitable undertakings; promote the modernization of social governance, improve social participations, and development social organizations (or say, NGOs).

Market Town, Diffused Religion, and Industrial Metropolis: C.K. Yang As a Chinese Social Theorist

C.K. Yang (Yang Qingkun) is a well-known albeit under-studied figure in Chinese sociology. While Yang's pivotal role in institution building, particularly the reestablishment of Chinese sociology in the 1980s, is duly recognized, his contributions to sociological theory are seldom scrutinized. This paper aims to fill this gap by introducing Yang's major works and teasing out their broader theoretical implications. To start with, Yang was an early member of the "Yenching School" of Chinese sociology. Like his classmate Fei Xiaotong, Yang was exposed to the influence of Robert Park when the latter visited Yenching University in 1932. While Fei soon turned to functional anthropology in framing his rural studies, Yang adapted Park's human ecology to the study of a Chinese market town. Yang's groundbreaking study inspires subsequent works on the spatial and social structure of Chinese society. On top of this, Yang had been developing a peculiar brand of institutional and functional analysis in the 1960s. While Talcott Parsons was his major point of reference, Yang did not uncritically follow structural-functionalism in conceptualizing the characteristics of Chinese society. In his celebrated study of Chinese religion, Yang adopted Parsons' notion of "diffuseness" in demonstrating that religious beliefs and practices permeated various arenas of Chinese society rather than coalescing into a symbolic-institutional center *a la* the Christian Church. But Yang was able to arrive at this conclusion only by supplementing structural-functional analysis with the Yenching tradition of community studies. One can also find the elements of an institutional theory of culture and social change in Yang's works. While such a theory remained implicit, it furnished the analytical framework of a landmark study of Hong Kong as an industrial metropolis in the 1970s. By putting Yang's ideas in shifting contexts, this paper represents a modest step in reappraising his legacies in Chinese social theory.

The Link between Emotional Regulation Strategies and Internet Addiction: The Mediating Role of Epidemic Fear

It is known that deficit emotion regulation (ER) is associated with mental health issues and addition problems, including internet addiction (IA). Whether some strategies of ER are healthier than others are debatable. Although scholars, such as Gross, don't support the notion, recent evidence seems to suggest that cognitive reappraisal (CR) is better than expressive suppression (ES). The evidence is limited, however, for IA, the common problem for adolescents. The first question of this study involves exploring whether and which strategy can reduce IA (Q1). Moreover, epidemics have reshaped human being's lives and increased mental illness and addiction problems. Adolescents are severely impacted by the covid-19 due to school closing, isolation from friends, and fear of epidemic. Given that emotional problems are associated with IA, fear of epidemic is supposed to increase the risk of IA. It, however, is not clear whether ER, and which strategies, can help reduce epidemic fear (Q2) and whether epidemic fear can function as a mediator for ER and IA. (Q3)

This study used a student sample (n=824) with two waves of data (W1 before covid-19, W2 during covid-19). Several regression models were conducted to answer the above-mentioned questions. The results suggested that there is no direct effect between CR and IA, while ES directly increases IA. Epidemic fear mediated the relationship between CR and IA. However, the mediating effect of epidemic fear on the association between ES and IA did not reach statistical significance.

The findings suggest that CR is a better strategy for reducing IA. However, it only operates effectively through decreasing adolescents' covid-19 fear. Intervention targeting adolescents' CR during the pandemic period can help reduce their fear, and prevent developing severe mental illness and IA.

Well-Being Among Youth with ACEs in Taiwan's Educational Systems

Adverse childhood experiences (ACEs) are associated with heightened health and behavior problems. Although resilience studies have highlighted key protective factors for children in adversity, there is limited evidence for the school impact on mental health. Feelings of belonging and self-efficacy are essential for well-being. School is supposed to be a key social institute for cultivating youth self-efficacy and a sense of social belonging through various courses and activities. However, credentialism in Taiwan has encouraged competition rather than support in school. Moreover, disadvantaged families often lack the requisite resources to support their children. Marginalization in school further exacerbates disadvantaged students' mental health. Our aims were to understand ACE youth's school experiences and explore how school shapes their well-being.

Using semi-structured interviews on 20 youths aged 19~29 (16 females and 4 males) with diverse backgrounds and multiple ACs. Theme analysis was applied and three mechanisms were identified. First, staying in school reduced youth's home-staying and long-exposure to family violence and abuse. Second, school provided opportunities for self-expression and to shine in expert areas. Academic success enhances participants' status in their families. This, however, serves as two-sided coin in relation to well-being. High-achieving students were over stressed regarding their examination results. Some participants enjoyed non-academic school activities; the engagement process enhanced their confidence. Third, school provided opportunities to connect with others and to feel that it was a place where they belonged. Ordinary interactions, such as small talk, playing or doing homework together, or getting teachers' compliments are meaningful for participants. Most participants kept family secrets; only a few got help through the educational system. Some participants experienced school bullies and discrimination which threatened their well-being.

This study suggests three mechanisms influencing students' well-being. Moreover, increasing school's ACE awareness can help early identification and assist students, thereby preventing severe health and behavior problems.

Gender Policy Mismatch: Why Do Women Not Using Facilities Designed to Help Them Balance Mothering and Work?

Despite employers establishing facilities and implementing policies to facilitate workers with children to balance their childcare and work responsibilities, few studies have examined the extent to which female workers, who are often in charge of childcare in their family, actually use and interpret these family-friendly policies, especially in Non-western societies or across different organizational settings. By doing ethnography in a state-owned and a private enterprise in two large cities in China and conducting interviews with 48 mothers, this paper illustrates how despite their intention, policies implemented to facilitate workers to balance mothering and work may receive limited responses. In the privately owned company, female workers did not apply for organizational maternity leave as they foresaw the motherhood penalty, and the enterprise also failed to promote this leave policy effectively. While a childcare centre was established in the state-owned company, female workers' familial division on childcaring duties thwarted their intention of utilizing this facility, and the timetable of the childcare centre also failed to accommodate female workers' overtime work, which was a norm in the company. While mandating this state-owned company to establish the childcare centre and monitoring its operation, the local government did not provide adequate financial compensation to extend the opening hours of the childcare centre to adapt to the overwork norm within the company. Based on these empirical data, this study conceptualizes the concept of gender policy mismatch, which refers to organizational policies aiming to enhance gender equality may lack responses when it fails to match with sufficient state financial support, organizational promotion of the policy, work norms, female workers' familial labour division and personal gender beliefs of mothering and work. Policy implications of the findings are discussed.

Effects of the New Immigrants' Cultural Capital on Child-Rearing Process: Perspectives from Multi-Ethnical Relationship

In Taiwan, the original country of the new female immigrants coming mainly from Mainland China and Southeast Asian countries and the population of the new immigrant has amount to 500,000. Although the new immigrant female immigrated from different countries or regions to Taiwan society, these immigrants are often defined as the fifth ethnic group. This group illustrates the ideal and practical progress of multiculturalism and related

policy in the local context. For this reason, the analytical concept of cultural citizenship emphasizes the cultural re-evaluation and affirmation of the group-differentiated rights and are particularly concerned about these groups subjectivity and capacity in the multicultural society, and also highlights on the priority to promoting and confirming of their cultural developments and cultural identity.

Based on the new immigrant groups' cultural citizenship movements and cultural identity, this study will be further aimed at understanding the child-rearing process of those groups by multiple methods of empirical survey and in-depth interviews. Researching findings will include: (1) On the academic level: this study will lead to sufficient discourses and reflections related to the issues of new immigrants' interactions with their children, especially learning process and language usage; (2) On the achievement of local experience: the research findings with the empirical survey and interviews will contribute to a clear and definite directions of our future policy making toward a future-oriented multiculturalism policy for immigrants. With these researching outcomes, we can suggest an adequate perspective and policy for academic researchers and policy makers.

CHEN, Terrence* (New York University, United States)

Digital Technology and Democracy: Open Government and State-Citizen Relationship in Taiwan

New initiatives of "digital democracy" and "open government" seem to provide new opportunities for democratic participation, especially for individuals who lack institutional resources and organizational power. But to what extent can citizens really influence policy-making in these e-democracy initiatives? I use the online petition platform in Taiwan as the empirical case, exploring when, and under what circumstances, citizens can influence the government's policy-making process through these newly created channels. Drawing on interviews with government officials and civil society actors, I find that the influence of digital participation is often limited because of several reasons. First, the institutional design of the digital platform limits its possibility for radical change: e-petitions are not legally binding and are assigned to lower-level government agencies that lack decision-making power, so citizens can hardly push for changes on issues that are politicized in the political arena or require resource reallocation. Second, pre-existing relationships between government agencies and citizens constrain how the government processes online petitions: expert-oriented policy domains are resistant to policy proposals of ordinary citizens. Finally, in practice, many government officials see these digital platforms mainly as ways to improve transparency and communication, which runs counter to citizens' hope for policy influence. These findings shed light on the potential as well as limitations of e-democracy to create meaningful social changes, which contributes to our understanding of participatory governance in the digital era.

Virus, Particulate Matter, and Semiconductor Devices: Thick Governmentality and Regimes of Representation in Taiwan and South Korea

This research aims to uncover the mechanism of visually governing invisible objects in East Asian societies in the 21st century. Partly because of the COVID-19 pandemic, issues around invisible micro matters in domains of public health, the environment, and high-tech industry have become increasingly salient in East Asia, particularly in Taiwan and South Korea where geopolitical factors are critical. Invisible to human eyes, micro matters such as viruses, particulate matter (PM), and semiconductor devices must be reasonably governed to protect and enhance the lives of the population.

To address problems caused by micro matters, two types of governance technology are proposed: protective and productive. Protective technology eliminates harmful substances, for example, viruses. Productive technology secures continuous manufacturing of products such as semiconductor chips. On the one hand, protective technology is required for securing production; on the other hand, protective technology is impossible without productive technology. For example, viruses and PM must be detected and analyzed by electronic instruments, which comprise protective technology.

Cases of governance technology in Taiwan and South Korea are studied. It is found that what we call thick governmentality is significant in distribution of test kits and vaccines, implementation of AirBox, and ritualization of semiconductor engineers. Characterized by multi-layered governance, composed rationalities, and inconsistent visual regimes, thick governmentality is a specific form of governmentality in East Asian societies. It ingrains regimes of representation in people's daily lives.

In sum, distinct from Foucauldian governmentality and regimes of truth, the governance technology of micro matters, built upon the process from sensing to sense-making, emphasizes regimes of representation or visual regimes. Governance technology comprises representation, testing, interpretation, and implication. In these steps, micro matters must be visualized by images, graphs, charts, signs, and other visual forms to make sense of the protective and productive technology, thus realizing thick governmentality.

CHEN, Wenju* (National Taipei University, Department of Social Work, Taiwan)

The New Pathway of Addictions-Recovery: The Relationship between Recovery Capital, Trauma and Quality of Life (QOL) of Substance Use Among Adults in Taiwan.

Background: Taiwan National Drug Prevention Issue Database showed people with illicit drug use records have lower socio-economic status, broken intimate relationships or single, multi-substance and alcohol consumption, and vulnerable health status. As we know, recovery capital has provided as a strong predictor in the field of Addiction currently so that this study examined the association between demographic characteristic, trauma experience, recovery capital and Quality of life of drug users in the community.

Methods: 388 valid questionnaires were included. The structure questionnaire was used and with IRB approval by Research Ethics office of NTU in 2018. SPSS version 22.0 was used and analyzed by independent t-test, ANOVA, Pearson Correlation and hierarchical regression.

Results: Scores of QOL was from 27.63 to 78.76(Full score=80, M=53.91) and the sub-dimensions in environmental supports got the lowest average than the others. ANOVA showed those who owned house had higher QOL than homeless, and those with job had higher QOL than unemployed significantly (p<.05). QOL of the participant showed positive correlation with numbers of cohabitants, monthly income and recovery capital significantly (p<.01), and negative correlation with trauma experience significantly (p<.01). Finally, hierarchical regression analysis supported the multidimensional nature of the recovery capital construct, and QOL was negative associated with vulnerable health status (ß= -.230, p<.001) and trauma experience (ß= -.194, p<.001), but positive associated with monthly income (ß=.108, p<.001) and recovery capital (ß=.470, p<.001).

Conclusions: Although many social factors (lower income, unemployed, homeless, and lower family-support) had negative associated QOL, recovery capital had proven as a strong and positive effect predictor. This result is support to promote recovery capital for drug users may help them get higher Quality of life (QOL). Further work to measure the collection of the people and resources and build Recovery Capital Base service in different recovery stage will be meaningful.

CHEN, Yanyan* (Fukuoka Institute of Technology, Japan)

A Causal Analysis of Energy Reduction Behaviors in Daily Life

In order to solve the current environmental crises fundamentally, it is particularly important to examine how individuals decide to engage in different forms of pro-environmental behaviors in daily life. The purpose of this research is to clarify the factors that lead to people's energy reduction behaviors based on the analysis of the survey data. Data analysis of responses to a survey of Tokyo residents indicated that behavior intention factors, such as the willingness to pay much higher prices or pay much higher tax in order to protect the environment, were important factors that influence people's energy reduction behaviors. Furthermore, the influence of demographic factors to the formation of energy reduction behaviors was examined and the attributive features of individuals who were inclined to conduct these behaviors were clarified. Such a causal analysis on the factors that influence people's energy reduction behaviors was expected to some clues as to how to evoke people's pro-environmental behaviors in daily life.

The Impact of the COVID-19 Pandemic on the Work Experiences Among Taiwanese Young Adults

The high unemployment rate among the young people has long been a major issue for the policy makers, the media, and the general population. Scholars mainly focus on the mis-match between education and work, atypical employment, unemployment, and working poor among this age group. Although research on these topics abounds, the current literature has not incorporated the special context in Taiwan society. For example, higher education has been expanded for the past twenty years; therefore, young people have stayed in school longer and delayed their transition into work with the average age of first job being 26. Besides, compared to Western countries, the co-residence rate of adult children and their parents is high in Taiwan; however, the social welfare expense for the young people is less compared with that for children and the elderly. With the delayed transitions from family and school and few resources, young adults in Taiwan experience the threat of being unemployed, trapped in atypical employment, and working poor. Furthermore, since May 2021, the local COVID-19 outbreak has impacted the lives of Taiwanese people. There is no research show the impact of this outbreak for the work experiences

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of the young adults. Did the outbreak exacerbate the pre-existing risk factors for young work experiences? Did the impact have the same effect for people with different work experiences? Did the timing of the transition from school to work matter during the outbreak? Using a national sample of young adults aged 23 to 35 (N = 1,027), the current study will investigate these research questions. In addition, we will also investigate the relationship between work experience and the subjective wellbeing of the young adults in Taiwan. The findings will expand our understanding regarding the impact of the Pandemic on young adults in East Asia.

RC02-45.2

CHEN, Yu-hsiang* (National Taipei University, Taiwan)

Credit Rating As a Tool of Communication and Negotiation: SME Lending in Taiwanese Banks

Corporate credit rating models have long been used by business lending departments in Taiwanese banks. Although the function of credit rating models is to calculate and display the creditworthiness of corporate borrowers, the literature suggests that the creditworthiness of small and medium enterprises (SMEs) remains difficult to measure effectively with the models, due to the insufficiency and opacity of the SMEs' financial data. Notably, it is well known among bankers that Taiwanese SMEs often fabricate financial statements to evade taxes, and it is therefore reasonable to ask why banks continue to use corporate credit ratings in SME lending. Based on interviews with personnel from the business lending departments of Taiwanese banks (relationship managers, credit analysts and office heads), this paper posits that corporate credit ratings in Taiwan work as a crucial tool of communication and negotiation rather than solely as a device to estimate clients' creditworthiness. Relationship managers use the credit rating to persuade their clients to reveal *neizhang* ('internal'/authentic corporate financial statements) to the bank and provide additional collateral and guarantees for the loan. Inside business lending departments, the sales units (relationship managers) tend to loosen credit to make deals, and the credit units (credit analysts) tend to tighten credit to avoid defaults. Relationship managers, credit analysts and office heads use credit ratings to mark the boundaries of discussion, and to negotiate the terms of the loan (interest, amount, duration, collateral and guarantees) within those boundaries. The findings of this paper illuminate the real-world application of corporate credit rating models to SME lending practices in a newly developed Asian market.

Political Ideology and Health Status in the East Asian Context: Evidence from Mainland China, Japan, South Korea, and Taiwan

The ongoing COVID-19 pandemic witnessed dramatic disparities in political ideology across and within countries. Recent studies demonstrated the relationship between political ideology and COVID-19 infections. But does political ideology relate to health status in more general situations? Previous studies have explored the relationship between political ideology and health lifestyles, attitudes, and outcomes. However, these studies are mainly based on western cultures and representative democracies, which have a long history of capitalist democracy ideology. Thus, it is important to find evidence from other cultural and political contexts for the relationship between political ideology and health status. This study explores the relationship between peoples' political ideology and health status in the East Asian context, including Mainland China, Japan, South Korea, and Taiwan. They share a long-established Confucianism tradition in history which underlines obedience to the government but nowadays differ across authoritarian and democratic politics. South Korea and Taiwan used to be dominated by authoritarian governments for decades and implemented electoral democracy later, while Mainland China has been governed by an authoritarian regime. This study uses national sampled survey data in Mainland China, Japan, South Korea, and Taiwan in the same year. It tests the relationship between political ideology and health status at the individual level with controlling confounding factors, both within the same region and across the four regions. This study contributes to the discussion on social determinants of health, East Asian politics, and the comparison between authoritarian and democratic systems.

When Global Meets Local:the Dialetics between Indigenous Knowledge and Global Competition

Researchers from academic fields like multicultural education, sociology of knowledge, and critical pedagogy always remind us to pay more attention on the legitimacy of educational knowledge. In the past, the national curriculum/official curriculum all over the world tended to adopt the cultural integration approach, and they always were criticized to "encourage" the minority group students to accept the mainstream curriculum. However, to interpret the relationship between indigenous culture and mainstream culture around the world could transfer from the melting pot and salad bowl to mosaic ,

unfortunately, indigenous knowledge still remained its disadvantaged status under the globalization and magnetization. We hope to provide a platform to systematically collect and analyze, justpose, and interpret the interaction among indigenous langauge , culture, knowledge, and global competition.

Risks of the Risk Management in Child Protective Services in Taiwan

Following the global initiative to eliminate corporal punishment, Taiwanese government has enacted The Protection of Children and Youth Welfare and Rights Act concerned with child maltreatment, an establishment of surveillance and reporting, and state intervention. Parents who are reported to the Child Protective Services (CPS）due to the use of corporal punishment are often deemed "risky" to children's mental health and psycho-socio development,"reluctant" to assimilate up-to-date parenting knowledge regarding positive discipline, and "resistant" to state intervention. However, little research has been conducted from perspectives of parents involved in CPS. This institutional ethnography study, taking a standpoint of parents mandated to the CPS interventions, aims to investigate how risk management upholding the child protection regime in Taiwan shapes interactions between CPS professionals and parents through texts (e.g., SDM risk and safety assessment, laws), from parental "reluctancy" and "resistance." The results indicate (1) One disjunction the parents experience is that they are the problem in attempts to manage their children's behavioral problems, given that children's responses significantly affect parent-child interactions. Mandated CPS services are "punishment" for the parents rather than "assistance to better manage children's problems"; (2) Risk assessment on parental use of corporal punishment not only makes their daily parenting works invisible but also dismisses parental concerns about risks to children's self-accountability highlighted in modern society as well as moral risks for parents being required to take the blame for children's wrongdoings; and (3) Most of the parents resist to a gaze of the CPS by taking a step back from disciplining children. Parental non-interference in order to "respect children's choices" in accordance with positive parenting style may be seen as taking flight informed by Deleuze's concept of "line of flight."

An Ethnography of Moroccan Skateboarding Culture: Grassroot Community Enterprises and Youths' Transition to the Job Market

Since its emergence in the region throughout the past two decades, the popularity of skateboarding never ceased to grow among youths in the Middle East and North Africa (MENA). While the Moroccan skateboarding scene is the most prominent one in the region, its sustainability remains fragile. The lack of skateboarding facilities and difficulties to find an attractive job tend to push local youths to quit skateboarding in order to focus on their career or move abroad to pursue better skateboarding or career opportunity. In response to these challenges, Moroccan skateboarders have been establishing organised communities to sustain their local skateboarding culture and foster Positive Youth Development (PYD). Through grassroot enterprises, these communities provide young adults with skateboarding-driven apprenticeship programmes focused on the teaching of employability skills, ultimately aiming to facilitate their access to the job market. These enterprises typically relate to the burgeoning research field of Sport for Development and Peace (SDP), emphasising on the use of sports for PYD. Despite the recent rise skateboarding SDP initiatives worldwide, skateboarding remains widely overlooked in SDP research. Similarly, only few publications deal with youth skateboarding cultures in countries of the MENA. This study addresses these research gaps that constrain our understanding of modern youths' culture and experiences in the MENA.

- What are the community resources and strategies used to sustain the Moroccan skateboarding culture?

- How can skateboarding PYD enterprises facilitate youths' access to the job market?

The study at hand aims to answer these questions with an ethnographic insight of three Moroccan skateboarding communities respectively based in Marrakech, Rabat and Agadir. Local skateboarders express their personal experiences as they relate their journey skateboarding between education and working life in light of contextual challenges. Their perspectives uncover the relationship between skateboarding culture, grassroot community enterprises and young adults' empowerment in Morocco.

Between High Technology and Low Social Status: Digital Practices of People in an Unstable Life Situation

The article is devoted to the study of the practices of using digital technologies by people being in a vulnerable position and being the most vulnerable category of the population. Modern technologies are a part of our lives. It influences social processes – particularly, it can increase or reduce social inequality. Modern researchers are finding more and more evidence of the growth of relative inequalities in the Internet skills and the Internet use.

A good result of sociological research is the refutation of stereotypes developed in society. It seems possible to identify two main stereotypes. It was believed that most homeless people have no cell phones, in case they do, it is a status thing for them. The second stereotype was connected with the repertoire of digital technologies: homeless people are more likely to use non-personalized technologies due to their marginal position. Both stereotypes have been refuted. The unexpected result of the study indicates its unconditional relevance and indicates the prospect of studying other vulnerable groups of the population.

The homeless, as a social group, are of interest because they have traditionally been a group which is excluded from social interaction. The object of the study is a low socio-economic status group, the homeless, including those who have been released from prisons. The study involved 15 from 24 respondents living in a social care center in St. Petersburg during the interview. Subject of the study: digital practices and the attitude of the described group of respondents towards it. The research is based on a relational approach. According to the relational approach, inequality manifests itself in categorical differences between groups of people who have certain relationships.

Life in a Modern City: Digital Practices of People in an Unstable Life Situation

The article describes the impact of the global trend of digitalization on the most vulnerable category of the population. The study of the digital divide is a fairly new area of research in the social sciences. Modern technologies are a part of our lives that influence social processes – in particular, it can increase or reduce social inequality. Modern researchers are finding more and more evidence of the growth of relative inequalities in Internet skills and Internet use. Studies of the digital divide have already been conducted in large cities of socially and economically developed countries. As the results of many sociological studies and the practice of social work show, the most vulnerable are the elderly and people with experience of homelessness.

The study was conducted by interviewing respondents living in social centers. Respondents formed a group of single men aged 37 to 74 years. The average age of the respondents is 48 years. As a result of the analysis of the collected data, some features of the perception of digital technologies and practices of their use were identified. Perception features are combined into a group of discursive patterns, the practice of using digital technologies is grouped into a group of behavioral patterns. A good result of sociological research is the refutation of stereotypes that have developed in society. So, it seems possible to distinguish two main stereotypes. It is believed that most homeless people do not have cell phones, and if they do, it is most likely a status thing for them. The second stereotype is related to the digital repertoire: homeless people are more likely to use non-personalized technologies due to their marginal position. Both stereotypes have been debunked. The unexpected result of the study indicates its absolute relevance and prospects for further study, including vulnerable groups.

CHERNYSH, Mikhail* (Russian Academy of Sciences, Russian Federation)

Populism As a Political Phenomenon in a Changing Society

Populism is often regarded as a form of political behavior that aims at electoral mobilization. The challenge of populism is manifest not in the desire of an electoral success, but in the means with which victory or other forms of political mobilization is achieved. The repertoire of means depends on the personality of the claimant of electoral recognition, but to a greater degree it is determined by the social situation in which social mobilization takes place. The radical reforms that took place in the Russian Federation in the post-Soviet period led to the degradation of daily life, loss of meanings that guided Soviet citizens throughout their lives and widespread anomie. Rampant inequality and injustice, unprecedented unemployment rates, closure of most advanced enterprises, devaluation of the national currency, decline of the country's position in the world created an atmosphere in which populism could gain ground. Another factor that contributed to the rise of populism in Russia was ethnic nationalisms in neighboring states that turned the local ethnic Russians into repressed minorities. The objective circumstances enabled Vladimir Zhirinovsky to advance his populist political program. He addressed his possible electorate with the calls to "defend the poor" and "defend the Russians". He also called for the reversal of the Russian decline and restoration of Russian power. His program paid off. He won the elections from the pro-government reformist party in 1993 and established a stable support for himself and his highly amorphous party for the decades ahead. He became a "bogeyman" for Western audiences who regarded him as a danger, but in reality he was always ready to toe the government line and did little to put any of his political programs into being. His role was to "widen the breach" for the possible for populism and opinion manipulation in the decades ahead.

CHERNYSH, Mikhail* (Russian Academy of Sciences, Russian Federation)

The Social Consequences of COVID-19

Covid-19 came as a "black swan", an unexpected global epidemic with dire consequences for most societies. Though scientist had been talking all the way about the possibility of a global affliction of this kind, it was never taken seriously. Neither population, nor governments were ready.

For more than a decade before the affliction the Western world had been laboriously implementing neoliberal programs of medical reform. In Russia substantial cuts were made, and emphasis placed upon technologically advanced assistance for common medical emergencies. The reform delivered undermined local small-scale medical programs, making some virtually non-existent. Later the president of Russia would lament such reforms and qualify them as a failure.

The first days revealed the persistent ills of the post-Soviet Russian society. The gap between the rich and the poor took sometimes tragic and at the same time ridiculous forms. The state made frantic attempts to mobilize the medical system and the population. Russian science was made to work round the clock to produce vaccines and new effective drugs. Such measures were necessary, but their effects not immediate. In the meantime, stringent laws obliged the population to stay home, factories and enterprises closed and other contacts were reduced. The damage to economy was enormous, but was the only way to stop rapid contagion.

The occupational structure of Russian society underwent dramatic changes. Occupations that had hitherto been marginal became important. Couriers delivering food started earning real good money and doctors got salaries that that had not dreamed before. At the same time the service industries – a dear child of the post-industrial economies – went down releasing hundreds of thousands of personnel.

CHESTERS, Jennifer* (University of Melbourne, Australia)

Adjusting to the New 'Normal': A Comparison of Levels of Happiness before and during the Pandemic

The economic and social impact of the pandemic on the lives of Australians varied according to residential location, occupation and age. During 2020 and 2021, not only was the national border closed, internal borders between the states and territories were also closed for long periods of time. In all parts of Australia, but particularly in the state of Victoria, people were largely confined to their homes as workplaces, schools, 'non-essential' shops, recreational facilities etc. were closed. These disruptions created a sense of isolation, people were cut off not only from the rest of the world, but also from their families and friends in Australia. This paper examines whether the restrictions associated with the pandemic impacted on levels of wellbeing. Data from the Life Patterns project provides longitudinal quantitative and qualitative data from two cohorts of Australians. Both cohorts have been surveyed since they completed secondary school providing an exceptionally rich dataset. In 2020, cohort 1 participants were aged around 46 and cohort 2 participants were aged around 32. Using the data generated from surveys, it is possible to compare the impact of the pandemic on two cohorts of Australians at different life stages who were experiencing the same economic and social deprivations. The Life Patterns data allow for an examination of levels of happiness for both cohorts in 2017 and 2020; and for an examination of levels of happiness for cohort 2 participants between 2017- 2022.

RC55-749.3

CHESTERS, Jennifer* (University of Melbourne, Australia)

The Impact of the Pandemic and the Associated Restrictions on the Wellbeing of Young Australians: Evidence from Hilda 2001-2020

In 2020, as the COVID-19 pandemic rolled across the world, young people in Australia faced unprecedented challenges in their daily lives. Schools across the nation closed for at least six weeks forcing students and teachers

to embrace remote learning with no formal preparation. Young people were isolated from their friends at school, extra-curricular activities were disrupted, gap years were abandoned and life became increasingly uncertain. Whether the effects of these disruptions depressed levels of subjective wellbeing is the focus of this paper. Drawing on data collected by the Household Income and Labour Dynamics in Australia (HILDA) project and comparing levels of subjective wellbeing of 5 cohorts of young people aged 15 to 17 years (in 2001, 2005, 2010, 2015 and 2020), it is possible to examine whether the 2020 cohort reported lower levels of subjective wellbeing than their counterparts in the other cohorts. Furthermore, the inclusion of pandemic-specific measures in the 2020 annual survey provides an opportunity to examine differences according to state/ territory. The findings show that the 2020 cohort of young people reported similar levels of subjective wellbeing as the 2001, 2005, 2010 and 2015 cohorts. Differences in levels of subjective wellbeing were related to levels of concern about catching COVID-19 and the ability to spend time with friends.

CHETTY, Dasarath* (Durban University of Technology, South Africa)

An Uninvited Space for Public Participation in South Africa: The Events of July 2021 in Durban.

The paper contends that neoliberalism is inherently authoritarian in that the structures, relations and processes that ensue perpetuate and deepen conflictual hierarchical and oppressive conditions in society. In the South African context colonial and apartheid inequalities have been exacerbated by the adoption of policies and programmes, post 1994, that failed to produce the political rhetoric of transformation into an equitable and socially just society. The result, of such negative policy outcomes such as heightened inequality, mass unemployment, increased poverty, conspicuous consumption and the continuation of the politics of humiliation, has been public protest on an unprecedented scale. Public participation therefore takes place in uninvited spaces on a daily basis whilst invited spaces do not yield meaningful gains especially for the poor. Protests culminated in unprecedented "unrest" in July 2021 leading to violent protests in KZN and Gauteng provinces resulting in over 350 deaths, 50 billion rand in damage to property, mainly business premises, and thousands of job losses. More importantly, intergroup conflict reared its ugly head signalling a failure of the nation building project. The paper discusses how macro-economic policies may foster authoritarianism in society and explains the underlying correlates of the July violence as a failure of democratic participation that produces social anomie.

Migrant Women and Post COVID-19 in India: A Sociological Analysis

This research paper examines women migration and their crises in recent pandemic Post COVID-19 situations in Indian society in the context of various social problems of women, marginalized groups, labourers in their everyday life and also social policy for women migrants in post-Covid-19 worlds and social mobility.

Firstly try to understanding of the million migrant workers (International Labour Organization, 2017) is riddled with problems that are particularly related to the discrimination of women migrant workers. During the covid-19 and post covid-19 most of the migrant workers dominates the workspace of the Indian marginalized sections and vulnerable sections.

The countrywide lockdown imposed to prevent the spread of the COVID-19 pandemic has impacted the livelihood and economy of indigenous people living in and around the forests of India. The economic and social disruption caused by the pandemic is devastating and significant numbers of people are at risk of falling into extreme poverty. The outbreak of the COVID-19 has severely affected the livelihood of the world's over 476 million indigenous and tribal people. The impact of the lockdown assesses on their lives and livelihoods, including on their incomes, access to the various schemes and entitlements, health and mobility. For their safety government of India have focuses on the some focal points of guidelines. COVID-19 pandemic mostly or directly show about the socio-economic impact, education impact, environmental impact, political impact, psychological impact and the tribal's disopportunities. It is also discuss the socio-economic backgrounds, Administration, politics, traditions, tourism places, there hill stations etc. It is explore the impact of COVID-19 pandemic and post covid-19 of migrants and marginalized communities in Indian society. And also it critically analyzed the government policies, programmes and social mobility of migrants and marginalized communities of post covid-19 world.

HARGOVAN, Hema (University of KwaZulu-Natal, South Africa)

Visible Yet Invisible: The 'lived' Experiences of Persons with Albinism at Selected Institutions of Higher Education in Kwazulu-Natal, South Africa

Albinism includes several inherited disorders affecting normal pigmentation and affects all ethnic groups and populations worldwide. It is caused by a deficit in, or the absence of the pigment melanin which may be confined to the eye (ocular albinism) or may include the eye, hair, and skin (oculocutaneous albinism). Due to its higher prevalence in Africa, the scholarly literature overwhelmingly tilts toward albinism in the African context; highlighting not only the complex intersections of race, colour, gender, and disability, but also socio-cultural risks that PWA must endure. Despite its prevalence, advancements in medicine, and increasing public awareness about albinism, PWA continue to face widespread discrimination, stigmatisation, violence, and social exclusion. This paper highlights the key findings of a study that sought to understand the 'lived' experiences of students with albinism at selected tertiary educational institutions in KwaZulu-Natal, South Africa. The research was located within an interpretive, qualitative, phenomenological paradigm, and framed within the theories of 'stigma,' disability, and intersectionality. Valuable insights were obtained from participants through interviews and focus group discussions. Thematic analysis was applied to the qualitative data. A key finding from the literature is that globally, children and young PWA continue to experience insecurity and significant barriers to quality education, exposing them to enduring poverty and vulnerability. The preliminary findings of the study reveal that PWA experiences social injustice in the form of societal, cultural, and institutional barriers. These include inter-alia; stigma, discrimination and victimisation, and challenges relating to education, employment, healthcare, and psycho-social support. Finally, the paper concludes by proposing areas for further research and recommends the need for collaboration between multiple stakeholders in ensuring inclusivity and dialogue with the aim of formulating an appropriate comprehensive intervention strategy designed to support learners and educators at all higher educational institutions in South Africa.

CHEUNG, Adam* (Hong Kong Baptist University, Hong Kong)

Declining Fertility in the Context of Political Polarization and Resurgent Authoritarianism

Demographers have identified many social origins of fertility changes, including the influence of economic development, secularization, and ideational changes. However, attention to political factors of fertility is hitherto scarce. During the last few decades, mass political polarization has become a significant issue in many societies. Democracies are also threatened by resurgent authoritarianism. These major political changes have affected many aspects of life. Unfortunately, our understanding of demographic behaviors in the context of political polarization and resurgent authoritarianism is very limited.

Hong Kong presents an interesting context to contribute to this emerging literature. Since the Occupying Central Movement in 2014, mass political polarization has occurred in this global city – the conflict between the pro-establishment and pro-democratic camps has become more intense. The conflict had turned the city into large-scale protests during the Anti-Extradition Law Amendment Bill Movement in 2019. While the protests in 2019 had died down after the government took drastic legal and political measures to kill protestors' hopes of liberal reforms, the effects of such drastic measures on its residents could be long-lasting.

This study analyzes couple-level data collected from a representative household survey of men and women (N = 1560 married persons from 780 couples) at reproductive age in 2022. The data revealed that fertility intention is related to this political context in two important ways. First, fertility intention is strongly associated with political orientations. Residents holding pro-democratic values have a much lower level of fertility desires compared to other residents. Second, political polarization has increased the chance of having within-couple political disagreements. Couples with political disagreements tend to report a lower level of fertility intention. These findings have important theoretical and policy implications.

CHEUNG, Adam* (Hong Kong Baptist University, Hong Kong)

How Does within-Couple Political Disagreements Affect Marital Quality in Time of Political Polarization? Evidence from Hong Kong

The political polarization of the public has become a major concern in many societies. The process of polarization has strengthened partisan identities and increased the prejudice and anger directed against members of

opposing groups. How this process has affected familial relationships is largely unexplored. Hong Kong provides an interesting and important case study for investigating the relationship between political polarization and marital relations. Public opinion polls show increasing political polarization among the public - citizens with different political orientations have developed a strong sense of antagonism and hatred toward members of out-groups. Given that political polarization is now a major issue in the city, how do married couples with different political orientations maintain their marriages and interact with each other in this highly polarized political context is an important question for family sociologists.

In this study, I ask the following three research questions: 1) How common are political disagreements between husbands and wives? 2) How are differences in political orientations associated with marital quality? And 3) Under what conditions are political disagreements more strongly related to marital quality?

This study collects and analyses dyad-level data of 985 heterosexual married couples (985 husbands and 985 wives) with a representative household survey in Hong Kong that measures political attitudes, party identifications and marital dynamics. The data reveal that most but not all husbands and wives are similar in terms of political attitudes and identities. Regression analyses confirmed that political disagreements are significantly associated with marital conflict and a lower level of marital satisfaction. Furthermore, the relationship between political disagreement and marital satisfaction is exacerbated by affective polarization - the feeling of hatred toward political out-groups is a significant moderator of the relationship. These findings have important theoretical implications for understanding family relations in the context of political polarization.

CHEUNG, Yannie* (The Chinese University of Hong Kong, Hong Kong)

Gender Participation in Fields of Academic Study: Global Expansion of Women's Enrollment to Humanities, Natural Sciences and Social Sciences in Higher Education from 1990s to COVID-19 Era

Global trend of women's participation in higher education started to overtake that of men's in 1990s. The most striking pattern is a dramatic upsurge of women's enrolment in three fields of study, Humanities, Natural Sciences and Social Sciences in 2000s. By an examination into fields of study, men's traditional prevalence in natural sciences continued despite women were increasingly moving into the field (Ramirez and Wotipka 2001). However, some research examines cross-national gender enrollments since the 1990s and suggests though women are increasingly moving into higher education, they usually concentrate in certain traditionally female-dominated curricula (Barone 2011; Charles and Bradley 2009). New curricula such as women's studies and gender began to emerge in many countries (Wotipka and Ramirez 2008). Studies in a form of inter-(trans-)disciplines such as migrant studies, urban studies and global studies emerge as reorganization of knowledge across traditional fields of study. Not only does these education innovations incorporate a women's perspective, but also integrate socially embracing perspectives into traditional disciplinary areas. The paper investigates how new gender upsurge evolves from 2000s till pandemic time; in what ways three main fields of study rise and fall in women's participation across the years and to what extent global trend shadows regional patterns in participation. Discussion of findings aims to examine knowledge reorganization in fields of study as one of the prevalent forces pivoting gender upsurge in global expansion of higher education during economic and social changes in time of pandemic.

CHEVALIER, Danielle* (Leiden Law School, Van Vollenhoven Institute for Law, Governance and Society, Netherlands)

From Skate Zone to Tiktok: How Social Media Affects the Production of Public Space.

In urban studies, public space is conventionally considered as three-dimensional: Lefebvre (1991) famously argued space is produced through the interplay of the planned dimension, the lived dimension and the perceived dimension. With the advent of social media, an additional layer can be identified; a virtual dimension that is spatially and temporally interlaced with physical space. What is the impact of this virtual dimension on the societal function of public space? This question is explored theoretically from different disciplinary angles and researched empirically using the urban sport of skateboarding as case-study. Originating as an evocative counterculture, skateboarding has become a global phenomenon with an estimated 50 million users worldwide, thousands of skate zones, and considerable economic impact (Borden, 2019). In 2020 it became an Olympic Sport. Skateboarding is exemplary both of the embodied sensory use of three-dimensional physical space and the intricate engagement with social media. The skateboarding scene has always been strongly visual, and the digital era has augmented this. Empirically, the paper builds on fieldwork executed at the Skate Zone on Zeeburgereiland in Amsterdam, but also uses secondary data on skateboarding dynamics

unfolding in the cities of Antwerp, Malmö and Bordeaux. Theoretically the paper builds on Lefebvre's ideas on the production of space and the right to the city, and Habermas' conception of the public sphere.

CHEW, Matthew M* (Hong Kong Baptist University, Hong Kong)

A Relational Framework for Analyzing Action-Oriented Entertainment Narratives: Chinese Fantasy Webnovels' Framing of Conflicts in Terms of 'the Oppressed Versus Oppressors' Instead of 'Good Versus Evil'

This study develops a theoretical framework for analyzing action-oriented entertainment narratives, including most notably popular literature, films, television dramas, comics, and animation. It also uses this framework to analyze an empirical dataset composed of over 200 'Chinese fantasy webnovels.' (Chinese fantasy webnovels are one of few domestically successful and globally disseminated genres of popular culture in China). Action-oriented narratives attract audiences mainly through action scenes, which inevitably contain conflicts and violence. These narratives are compelled to non-negatively frame these conflicts and normatively justify this violence in some ways. In contemporary popular entertainment around the globe, most narratives adopt the 'good versus evil' frame to justify the protagonist's violence against villains. Examples include Western fantasy literature, superhero films, and Japanese young boys' comics and animation. This study demonstrates that the vast majority of commercially successful Chinese fantasy webnovels adopt the frame of 'the oppressed versus oppressors' instead.

This study borrows from several fields to explicate the sociopolitical implications of the alternative frame. Cultural theories of social movement—especially framing and storytelling—find that (non-fictional) movement-relevant stories significantly impact whether individuals support (or oppose) a movement. The new sociology of literature reinterprets fictional narratives in actor-network terms. Audiences experience fictional worlds (and are influenced by them) in similar ways that they experience the real world. Cognitive cultural sociology helps identify how fictional worlds influence audiences: non-declarative culture and unconscious learning. Relational sociology helps pinpoint the key non-declarative cultural aspect of fictional worlds that influences audiences: social relations. For action-oriented narratives, relations between the protagonist and the villains are the most impactful. (For romance narratives, love relations are more important.) Based on this framework, I argue that the frame of 'the oppressed versus oppressors' non-declaratively encourages audiences to support progressive social movements, whereas the 'good versus evil' frame discourages this support.

CHEW, Matthew M* (Hong Kong Baptist University, Hong Kong)

The Articulation of Nationalism, Identitarianism, and Authoritarianism in Non-Western Societies: The Case of 'Cosmopolitan Nationalism' in China

This study tackles a long-standing and broad problem in the field of nationalism studies: whether some cases or types of nationalism are sociopolitically progressive. This problematic was initially explored via cases of civic nationalism, anticolonial nationalist struggles, the concept of patriotism, and cultural nationalism. Recently, it is increasingly explored via new types of nationalism such as 'liberal nationalism,' 'progressive patriotism,' and 'multicultural nationalism.'. This study theoretically delineates a partly similar and emerging type of nationalism: 'identitarianism nationalism.' It empirically analyzes it through the case of 'cosmopolitan nationalists' (which may be seen as a subtype of identitarianism nationalism) in current China. It finds that Chinese cosmopolitan nationalists articulate nationalism, identitarianism, and authoritarianism. Sometimes and on certain issues, these nationalists are extremely pro-authoritarian. At other times and on other issues, their sociopolitical beliefs, behavior, and stances are almost identical to 'woke' and progressive persons in the West. A possible explanation is that the definition of progressivism itself becomes seriously contested in the contemporary multicultural world. For example, identitarianism justifies cosmopolitan nationalists to valorize Chinese tradition and condemn Western liberal political culture as colonial knowledge. But traditional Chinese political culture is heavily authoritarian and undemocratic. The Chinese case may help tackle the long-standing problematic in a novel way. The Chinese case shows that the question of whether nationalism can be progressive (or democratic) is not an entirely empirically solvable one. Scholars who are deeply influenced by identitarianism (and especially postcolonial and decolonial studies) may truly believe that Chinese cosmopolitan nationalism is mainly progressive. Scholars who endorse conventional and non-radical versions of liberalism would likely dismiss Chinese cosmopolitan nationalism as authoritarian and regressive.

Harm Perpetrated with Good Intentions: Breast Ironing in Cameroon

In Cameroon, although Harmful Traditional Practices (HTPs) exist in many different forms, they all originate from the historically unequal economic and social relationships between men and women. Breast ironing (BI) or breast flattening which only targets women is one of such HTPs prevalent in the country. This practice is performed with the intention of supressing or delaying breast development in pubescent girls (hiding the most obvious indicator of maturity) as a way of warding off sexual predators (men). In fact, the practice of BI points to one thing – that female sexuality is considered foul, a taboo, a complete hush hush topic, something that must not come out in the open, while on the other hand, for a male, his sexuality makes him a man and is well celebrated. Hence, since men cannot be stopped from being men, then the things attracting them must be stopped or supressed. I

BI has received both national and international attention due to its negative and severe health implications. However, the bleak reality is that efforts to eradicate this practice are often met with rejection from the communities practicing it. This paper suggests that to build support for a law banning the practice of BI in Cameroon, the government must first institute a public education campaign on how the practice does not delay girls' initiation into sex, along with a comprehensive sexuality education to address teenage pregnancy which primarily drives the practice. The paper argues that inflicting pain on adolescent girls through the practice of BI is unintentionally likely to result in the very outcome it seeks to prevent - forcing young girls to seek love away from home and becoming victims of the same social ills which generate the demand for the practice (premarital sex, teenage pregnancy, STDs, and school drop-out).

Gearing the Relation from Self-Monitoring to Collective Surveillance through Cultural Therapeutics in the Regime of Neoliberal Governmentality

Performativity, coated by truth-telling in the regime of neoliberal governmentality, is able to constitute teachers' self-knowledge, which engenders their self-monitoring and collective surveillance. In order to depict their theoretical sequences, this study sets out to identify a logic model through a survey of 2,358 junior high school teachers in a stratified random sample. The results of HLM (Structural Equation Modeling) certified a logic model showing that the relation from self-monitoring to collective surveillance is initiated by student-based commitment and reinforced by intermediate variables particularly the teaching-quality-performativity formula and then the excellent-teacher-truth-telling association. As this logic model is heavily governed by mainstream social culture, cultural therapeutics can be viewed as a recipe for constructing normalized performative truth-tellers, like our subjects.

COVID-19 Pandemic, Neighborhood Characteristics and Pregnancy Intention Among Married Women in India

Background: Unintended pregnancy contributes to negative maternal and child health outcomes. International research continues to highlight the importance of reproductive health in the neighborhood context. Only a few researchers have explored the impact of neighborhood characteristics on pregnancy intention using population-based surveys. This issue is of particular importance for married women of social disadvantaged status since unintended fertility rates seem to remain relatively high among these women, whereas India had the first confirmed COVID-19 case on 1/30/2020.

Methods: Using the 2019-2021 Indian Demographic and Health Survey (N=310,051), we conducted multilevel logistic models to investigate whether the monthly number of new COVID-19 cases and neighborhood characteristics are associated with pregnancy intention among these married women.

Results: The preliminary findings showed an increase in new COVID-19 cases up to 1 million was significantly related to an increased odds of pregnancy intention (Adjusted Odds Ratio: AOR=1.12; 95% CI: 1.09-1.16); in contrast, new COVID-19 cases more than 1 million were yet related to a lower odds of pregnancy intention (AOR=0.95; 95% CI: 0.91-0.99). Neighborhood characteristics, namely communities with 75% Muslim, high female labor participation and full community coverage of electricity, significantly predicted women's pregnancy intention, even after controlling for women's social status, individual/household backgrounds, and spousal fertility preference.

Discussions: Neighborhood characteristics, in general, are significantly related to pregnancy intention of Indian married women. Specific components of the neighborhood characteristics vary in their associations with pregnancy intention during COVID-19 pandemic. In addition, differences in pregnancy intention may explain individual-level socioeconomic disparities between neighborhoods. These findings suggest population health policies designed to promote maternal and child health must be neighborhood-specific and pandemic-sensitive.

Communicating and Interpreting Heterosexual Consent: Narratives of Female University Students in South Africa

Gender-Based Violence (GBV) continues to be a significant concern in South Africa because of the lack of clarity surrounding sexual consent. There are no clear definitions of sexual consent in the South African Constitution, leading to irregularities in how one is supposed to negotiate and consent to sex. The understanding of consent by the law does not translate to the everyday experiences of women in South Africa, which have led many perpetrators to walk scot-free and an increase in sexual assault and rape cases. This study sought to understand how undergraduate female students at a South African university define, interpret, and experience heterosexual consent in their relationships. The study also explored the role that power dynamics played in consent negotiations. Ten female students between the ages of 19 and 22 were interviewed using qualitative guided questions. Findings revealed that female students mostly communicated and interpreted sexual consent using non-verbal cues and passive communication. Some students used silence to indicate their willingness or refusal to engage in sexual activity. Remaining silent does not show one's internal feelings or external behaviours of willingness which often leads to misconceptions by men. As most participants acknowledged that their boyfriends were the initiators of sex and consent negotiations, they echoed how traditional gendered and patriarchal roles continue to influence intimate relationships. Overall, female students' narratives reiterate the need to debunk patriarchal arrangements and simultaneously raise awareness of the importance of communication and negotiation skills in sexual relationships. In conclusion, it is imperative to address the challenges associated with sexual consent because they are the foundations on which sexual and reproductive health rights are established.

Relational Remembering: Asian American Daughters Interpreting Memories in the Veteran Household

Many American veteran households are formed through US empire. US wars in Asia and the Pacific have led to intimate encounters between American GIs and Asian peoples leading to family formation through war bride marriages, refugee sponsorships, paternal reunification, and transracial adoptions. Asian American children within these families, however, know little about the militarized conditions in which their family and own existence came to be. Feminst research on children of parents who experienced war suggests that memories of war are rarely discussed (Espiritu 2014). Moreover the preservation of such family history is often performed by women (Hirsch & Smith 2002). How are memories shared about these military histories in the veteran household? What are its implications for children, specifically daughters' sense of self? Philosopher Sue Campbell's "relational remembering" (2003) conceptualizes the experience of remembering as informed by the conditions in which memory is shared with one another. I consider such relational remembering in the context of "war time," the idea that war has an official "beginning" and "end" against its ongoing presence in veteran households (Dudizak 2012). I build on Viviana Zelizer's critique of "hostile worlds theory" (2010) whereby "war time" is spatially manifested by constructing separate spheres of "civilian life" and "active duty" despite the veteran household still operating as a "militarized sphere". Through the analysis of 12 oral histories of Asian American daughters of veterans and their relationship with their fathers, I found that the sharing of memory is complicated when unaccompanied by interpretative resources–resources that remain absent in popular discourse. Memories appear as facts and stories, yet daughters do not know what to do with this information or understand how they are meant to feel about it. This reveals how dominant notions of militarized time and space shape the conditions of relational remembering in the veteran household.

Platform Economy Contested Spatial Fixes in Johannesburg

Local transport delivery services have in recent years seen an exponential rise of digital app-based delivery services. This has transformed the sector on

a global scale and generated new forms of work and ways of generating value. This has in the last three years been propelled by the COVID 19 pandemic outbreak. This paper examines how platforms configure space to control the labour process and how this is contested by workers. Platforms manipulate space to maximize control of the labour process and workers spatial practices and the workers on the other hand contest this by configuring their own spaces. The paper is based on a case study of app-based food delivery service workers in Johannesburg, South Africa. Platforms and the workers both acts as spatial agents deploying strategies mediated by digital technology. Platforms controlled by local capital adopts distinct local spatial organizing strategies informed by the local context and experience whilst global platforms deploy local spatial organizing strategies drawn from global experience which at times may be out of synch with the local practices.

Physicians in Digital Transformation of Medical Profession in India

Imbibing professional values and behavioural patterns is an integral part of physicians' profession. In the digital era of 21st century, the professional concern of physicians has been the holistic approach to the health and wellbeing that has traditionally been the prime concern and commitment of medical practice. As such, in the last two decades or so, the emphasis has been on incorporating latest and cutting edge medical technology in training the new generation of physicians. The advances made in the area of bio-medical engineering have enabled and empowered the physicians to overcome the limitations they used to encounter in complexities of medical profession. This is accomplished through interdisciplinary content and multidisciplinary approach adopted by the premier institutes of medical education and research. With the advent and incorporation of ICT, the medical profession has opened new vistas of medical practice like telemedicine, virtual consultation, online prescription and the like rendering medical profession high-tech and tech savvy. The role and importance of application of state of art technology to the medical practice has been further accentuated by the trying and tiring times of pandemic. This paper is based on an empirical study probing into the incorporation and applications of digital technology in medical practice in Bangalore City in Karnataka state, India. Which is known for highest levels of sophistication in application of digital technology in medical practice. The findings seem to suggest that the use of digital technology has become routine in medical practice. Further, a significant proportion of Indian physicians are practicing digital consultation and a relatively small proportion of physicians have taken to remote monitoring of response to treatment and therapy enhancing efficiency to medical practice. The majority of physicians have come to acknowledge the role of AI in medical practice in enhancing their level of professionalism.

CHIRMULEY, Pranoti* (St Xavier's College Mumbai, India)

Choices 'Democratic' and Freedoms Compromised.

Choices 'democratic' and freedoms compromised.
~ Dr Pranoti Chirmuley
The question at hand is about what choices we hold. And if the choice is rational, independent, cohesive and most importantly whether it is democratic in its ideas, ideals and ideologies but also its operational side (praxis). In post graduate training in various institutions in India talk about the close association between theory and practice/praxis. But when you go with that dream into an undergraduate teaching space, we have to be mindful that between the theory and praxis stands the human student whose circumstances will have to be taken into consideration to be able to teach not just better but efficiently and empathetically. In order to address this basic motto or goal, i choose to talk about the innovations in teaching pedagogy that I do. I will talk about a number of them in this paper and share my experiences that digital spaces can be useful and challenging but they cannot completely take the space of in person/offline teaching. How do we teach an aspect of culture and hegemony through an online discourse on Gramsci just as a text? Here the true innovative challenge would be get students to hierarchize their basic needs and get them to share as peers and you notice the hierarchy of authority that gets established within the student community to share the 'most popular aka seen as the most appropriate' point of view. How do we teach privilege and poverty without truly making them do a privilege walk in an open space with their peers? Here are only a few ways to ensure the symbolic interactionist perspective of the SOR - stimuli-organism-response. We can diverse but be inclusvie and innovative at the same time, thus bringing the theory and praxis come together.

CHIRMULEY, Pranoti* (St Xavier's College Mumbai, India)

Leisure As a Joke and As a Survival Kit.

Leisure as a joke and as a survival kit.
Dr Pranoti Chirmuley
Key words: mother, leisure + productiveness, innovation, rest, music and memes.

For the longest time ever, leisure was commonly at the Indian space was used as synonymous for 'timepass' or the most sophisticated version of the same expression would be 'the whiling of time.' But was that the only thing relevant to this narrative? Clearly not. Timepass as a term is often used in a rather derogatory way to ridicule all that is listed under it - whether for an undergraduate course titled Leisure studies or as a talent/skill one was attempting to learn. But things changed - for good and bad reasons. But I think a lot changed during and after the pandemic. The wave of disease was an alien phenomenon for all layers in the human hierarchy and the *avatar* (version/representation) it took, was bigger than could have imagined. But as much as one could think of the critiques or loop holes in the system it worked for many in good ways to become independent women and men, to explore their goals in life through their leisure being their guiding force to survive. But memes were created around how women as they cleaned utensils as the house helps (maids) weren't allowed would dance, would sing. Why cant they? what was so funny? Leisure as therapy but leisure as therapeutic within the homes walls was explored. Here we do the same: from who rested, who explored, who survived and who got to joke about the intersections of gender, leisure and work.

Social and Environmental Conflicts in Taiwan's Energy Transition

In recent years, the ground-based solar power development have stimulated environmental and social conflicts in Taiwan. In particular, the "aquaculture and solar power symbiosis" projects have provoked protests from the local fishermen who felt their livelihood have under threatened. It has also raised ecological concerns among conservation groups. The research examined the conflicts and found that, first, the energy transition activists have played an active role to lobby the government to adopt a new mechanism, the "Environmental and Social Check" (ESC), to constrain the solar capital indulging in land enclosure. Second, the ESC was designed to implement a democratic form of energy transition. It has mobilized stakeholders to participate in the check process and have contributed to information disclosure and knowledge production. The interdisciplinary knowledge, citizen science from conservation groups, local lay knowledge and stakeholders' viewpoints have been included in certain extend. Although the ESC seems to contribute to enhance procedural justice and mitigate the conflicts, this mechanism has shown it limitations. The barriers and obstacles of the energy transition will be discussed.

Mobile Ageing: Transborder Mobilities, Agency and the Well-Being of Older Adults in Hong Kong

Nowadays, more and more older adults are going on transborder journeys as a leisure and as a way of living, giving rise to the phenomenon of "mobile ageing". Despite older people being more active and geographically mobile, not much is known about the role of transborder mobilities in the ageing process and its impact on the well-being of older adults. As existing ageing research have mostly investigated how older adults can age in place, active ageing experiences that go beyond or across borders have been largely sidelined. To address this issue, this paper examines how older adults experience transborder mobilities in their later life and how their experience of transborder mobilities affect their perspectives on ageing. It aims at advancing the understanding of the relationship between transborder mobilities, ageing, and subjective wellbeing by integrating two strands of scholarship (ageing and mobilities). A mix of qualitative and visual methods, including in-depth interviews and photo elicitation, were used to generate multidimensional data on older adults' transborder experiences and ageing attitudes. A total of 29 older adults in Hong Kong (including 14 males and 15 females) were interviewed and 22 of them participated in a follow-up photo elicitation session. Specifically, this presentation will discuss the following questions: (1) Why and how transborder mobilities are utilized by older adults to negotiate ageing? (2) What are the meanings and functions of transborder mobilities for older adults? and (3) What are the impacts of transborder mobilities on older adults' subjective well-being? The findings will not only shed light on the diverse and transborder ways that older adults used to achieve active ageing, but also inform developments of social policies and the silver market on leisure, tourism, border-crossing, and international insurance.

CHMIEL, Fira* (LICH, UNSAM/CONICET, Argentina)

"a Place in Which to Put the Story": Childhood, Exile and Available Social Narratives to Place a Biographical Experience.

The following presentation stems from my doctoral research which explores, from a biographical perspective, the childhood memories of those who experienced exile during the last dictatorships in Uruguay (1973-1985) and Argentina (1976-1983). Within this framework, I seek to explore the ways in which affection, politics and memory intertwine in the experiences of those who were children during exile.

In this work, I intend to investigate the social narratives highlighted by children of that time as available references for the construction of a biographical narrative. Also, I attempt to consider the lack of collective discourses alluded to in the narratives.

Thus, this presentation aims to examine childhood memories and their readings from present, locating in exilar childhood memory a singular feature of their own biographical experience: one that seeks to construct a place to locate one's own history.

On the Way Back in the Trail of Breadcrumbs: Childhood Memories on Houses at the Return from Exile

The following presentation stems from my doctoral research in which I explore the memories of those who experienced childhood exile during the last dictatorships in Argentina (1976-1983) and Uruguay (1973-1985).

In this work I investigate, from a biographical perspective, the subjective dimension of the experiences and their meanings from the present. To do so, I recover life stories from biographical interviews. In this opportunity, I explore the scenes recalled by the children of that time of their family houses at the moment of return from exile.

This dimension, which articulates space and memory, allows me to explore the meanings and nuances of the daily encounter in the (new) family spaces, the ways of (re)inhabiting the places of origin, the tensions elaborated in the process of return between belonging and foreignness and the present views about the position of the children of that time.

The Transitions Patterns of Gender Ideologies from Adolescence to Adulthood for Taiwanese

This study investigates how individuals' gender ideologies change from adolescence to young adulthood and the gender variations in the transition of individual gender ideologies. This study is the first to employ latent transition analysis (LTA) on panel data to consider both the multidimensional construct of gender ideologies and how gender ideologies shift over time within individuals. Using panel data from the Taiwan Youth Project (TYP), this study discovers that individual gender ideologies changed substantially from adolescence to young adulthood, and the changing pattern differs between gender. Further, the results reveal that the latent structure of gender ideologies is different for men and women. Three out of four latent classes of gender ideologies: liberal egalitarianism, compromising egalitarianism, and egalitarian familism, are somewhat similar between genders. Traditionalism, the fourth class of gender ideologies, is evident only for Taiwanese men but not for women. Moreover, this study finds that 76% of men and 65% of women have changed their gender ideologies at least one time from adolescence to young adulthood, and the changing pattern is heterogeneous between men and women. Egalitarian familism uniquely increases among men but reduces among women. However, the proportion of liberal egalitarianism in the population grew steadily, eventually becoming the largest class of both genders in young adulthood. By tracking respondents from adolescence to young adulthood, this study sheds new light on the discussion of the effect of age on shifting gender ideologies and its heterogeneity between gender.

Crowd Work without Crowd: A Study on the Dual Labor Market in Crowd Labor Market in Korea

This study analyzes the increasing demand for skilled labor in recent online-based crowd works and dual labor markets in the online crowd platform labor market based on skilled labor. Specifically, this study focuses on how workers manage their working hours differently according to the segmentation of the labor market. Korean crowdsourcing platforms are forming a unique labor market by organizing and evaluating tasks, far beyond simply matching between the crowdsourcer and the crowdworker. In the early days of the industry, the crowdsourcing platforms promoted crowd labor as "labor for anyone, anytime, anywhere". Recently, however, as the platforms strengthen the qualifications for undertaking the task, a unique dual labor market is emerging in the crowd labor market. Platform companies are organizing tasks with skilled labor and aiming to train professional data labeling workers through the vocational education and certification system. Workers without experience or education become excluded as outsiders in the market. On the other hand, insiders suffer from long working hours and have to build skilled careers through constant education and training and certificate acquisition to maintain their status as insiders. Without knowing the specific details on qualifications for tasks, insiders cannot work when and where they want, but

always have to work anytime, anywhere. In this context, this study sets the following research questions. First, how is the segmentation of the online crowd labor market different from that of the traditional labor market? Second, how do online crowd workers become insiders? Third, how does the formation of the internal labor market affect the management of working hours and skill formation? To answer the following research questions, this study conducts literature research and depth interviews with workers in crowd work.

CHOI, Ilsun* (Mahidol University, Thailand)

"Inclusive Smart City" and "Human Centered AI"

"Inclusive Smart City (ISC)" and "Human Centered AI (HCAI)"
Smart City has been discussed as the things which can solve the problem of environmental issues. However, in some European countries, there is a discussion that Smart City needs to be planned under the ISC concept. In the ISC concept, the planning of Smart City should be undertaken in collaboration with local people so that it can solve both environmental issues and community problems.

However currently the empirical research on ISC is limited. Especially, the research on ISC through the case of Asian countries is little to no. Thus I deem empirical research on ISC through the case of Asian countries as a necessity for developing the concept of ISC and HCAI which is a key concept of ISC.

Comparative research

- Germany - Resource efficiency through "Citizen Sensing"

"Citizen Sensing" is one of the solutions for resource efficiency. The new IT technology became a tool for collecting the data that can make sense of their environments and address critical environmental issues concerning air, water, soil and sound pollution.

- Japan - 2 key features: Policies as a solution to the problems of aging and the disappearance of local cities.

"Aizuwakamatsu" in Fukushima prefecture where private companies and government agencies are working together to build a smart city for citizens. From the testing phase of healthcare for the elderly, citizens can model data and they can build together with company and government sectors.

- Thailand - 2 key features: Solving social issues through Digitalization and Alternative Energy Development.

Under the name of "Thailand 4.0", the country is promoting smart cities, smart energy, and smart grids. DEPA (Digital Economy Promotion Agency of Thailand) is playing a central role in digitization.

Gender Ideology and Changes in Desires for Heterosexual Love: A Study on Cultural Narratives of Young Women Opting out of Sex, Dating, Marriage, and Childbearing in South Korea

Amid rising awareness of gender inequality in South Korea, some young South Korean women started a radical feminist movement called the 4B (4-No) movement, which refers to saying "no" to sex, dating/romance, marriage, and childbirth with heterosexual men. They declare the refusals as a response to gendered precarity and inequality that they experience in South Korean society. This study asks: how gendered realities shape non-desires for and refusals of intimacy? How do young women make sense of gendered realities, and how does gender ideology in sexual and romantic relationships shape their decisions to opt out of sex, romance, marriage, and childbearing with heterosexual men? Using in-depth interviews with South Korean women, I examine the cultural narratives behind their decisions to opt out of sex, dating, marriage, and childbearing. I find that the prevalence of dating violence in South Korea and the gender politics around it provided opportunities for these women to revise existing gender ideology on heteronormative sexual and romantic relations. In addition, these women expressed heteropessimism, defined as feelings of hopelessness about heterosexual relationships, mainly attributing to the toxic masculinity they argue is men's biological features. This study moves beyond a narrow definition of gender ideology as "individuals' level of support for a division of paid work and family responsibilities based on the belief in separate gendered spheres" (Davis and Greenstein 2009). To better understand flight from romance and family in Asia, I assert that it is necessary to reassess various ways individuals define and interpret gender ideology in heterosexual relationships by opting out of romance and family formation. This study also pays attention to the role of gender ideology in dating and romance that extends to family formation desires.

Firm Size and Unemployment Policy Preference in South Korea -Do High-Income, High-Security Workers in Large Companies Dislike the Expansion of Unemployment Benefits?

This study explores whether regular Korean workers have different unemployment policy preferences depending on the size of their companies and their seniority in the companies.

For multivariate analysis, I analyzed the four waves of Korea Welfare Panel Survey (2010, 2013, 2016, 2019). My findings reveal that regular workers at big corporations support the expansion of unemployment policies more than regular workers at small and medium-sized enterprises (SMEs).

In Korea, the compensation gap between SMEs and workers in large conglomerates is quite large even if they have the same skills and seniority levels. On the one hand, as there are few regular-employment jobs at large companies, it is tough for them to find comparable jobs that provide similar wages when they are unemployed. As a result, regular workers at large companies are more supportive of expanding the public unemployment safety net, despite their relatively low risks of unemployment. Conversely, SME workers can regard unemployment as a less severe problem because it is not difficult to change jobs with similar conditions. My findings also suggest that this trend may be more pronounced among workers with long service years. During this period, the wage level of large-corporate workers peaks, but their capacity for reemployment decreases along with their age. Therefore, their perceived risk of unemployment can increase. The results of this study show that the positive effect of the unemployment risk on unemployment policy preference can be offset or rejected by the prospect of reemployment to a similar condition of jobs.

CHOI, Susanne* (The Chinese University of Hong Kong, Hong Kong)

Relationships without a Future: Gay and Lesbian Intimacies in China

Research on marriage equality for LGBTQ+ usually focuses on the role of the state in legalizing (or its refusal to do so) marriages for same-sex couples. This paper takes a more holistic view of marriage equality, arguing that marriage (in)equality involves political, class and social dimensions. Marriage inequality is not only caused by state denial of rights to marriage, but also by class inequalities and social discrimination/stigmatization that shape sexual minorities' access to intimacies and marriage. Analyzing 160 life stories of gay men and lesbians in post-reform China, this paper examines how they longed, struggled, and devised a range of strategies with various success to form and maintain intimate relationships and access marriage. Their paths to intimacy and marriage occur in a context in which marriage and adaptation rights are denied to sexual minorities; parents often exert strong pressure on sexual minorities to enter heterosexual marriage, and labour market success, educational attainments, and wealth define the hierarchy of desirability in the gay and lesbian communities. In addition to state policy, marriage (in) equality is therefore also a result of the intersection between culture, class and sexuality.

Innovating the Innovation By Competition and Cooperation in Higher Education: The Case of the Social Sciences Korea(SSK) Program As a Natural Experiment

Who can facilitate social innovation in higher education under what conditions? Social Innovation in higher education has been an old new agenda in globalized educational market. Today, many countries are trying to innovate their education systems to meet the changing needs. South Korea ranked first in the cross-country comparison of the comprehensive innovation index, while it lacked competitiveness in higher education and university research. It has been pointed out that exclusivity to other majors, excessive domination of academia from certain schools, and an attitude of complacency within the ivory tower hinder the improvement of competitiveness of Korean academia. To overcome this problem, the National Research Foundation of Korea started the SSK (Social Sciences Korea) program in 2010. The introduction of this innovative program was intended to strengthen research capacity and spread the results to society. Regarding the SSK program as a natural experiment that pursues social innovation in the field of higher education, we examine how the 'performativity' of this program resulted in innovation through diachronic investigation and statistical analysis. We find that social innovation in higher education cannot be achieved only by emphasizing competition or, conversely, only through cooperation. Excessive competition among researchers may increase fatigue and negatively affect the improvement of researchers' creative research capacity in the long term. In contrast, cooperation without competition

can lead to a moral hazard. While the former is a problem exposed by the original model of the SSK program, the latter is a limitation of the model that was revised once in the late 2010s. We propose, based on our empirical results, that innovating the innovation is possible without falling into the trap of inertia if the simultaneous pursuit of competition and cooperation, which may seem paradoxical, is achieved with an institutionalized facilitator that competently performs the role of bridging fragmented researchers.

The Virus and the Vessel, or: How We Learned to Stop Worrying and Love Surveillance

This is an empirical investigation of mass surveillance in Israel and the way it was used for digital contact trading at the beginning of the COVID pandemic. The paper offers an analysis of governments' response to COVID-19, specifically governments' attempt to reduce the spread of the virus by modifying people's behaviors. Some of these attempts followed familiar models of power, by way of discipline and nudging. In addition, I show that a new practice of power emerged - exemplified by Israel's use of mass digital contact tracing - which addresses subjects who are considered 'ungovernable'. I first look at how states see their subjects and argue that COVID-19 reveals and normalizes a state's view of subjects as 'unresponsive' and therefore 'ungovernable'. I then I look at how social media companies constitute us as 'ungovernable' and help reshape how states govern.

Small Communities Resilience to Extreme Weather Events – Conditions Influencing Local Activities

During last decades an increase in the number and intensity of extreme weather events can be observed. The consequences affect local communities both, large and small towns. As far as larger municipalities have a greater potential to cope with the effects of meteorological events, having different resources – institutional, material, human – smaller communities have to deal with the same problems but with restricted resources. So far, because of increased exposure, concentration of infrastructure and capital, more attention has been paid to larger towns. Smaller municipalities, although facing lower financial losses when compared to cities, the consequences for such communities can be devastating.

The focus of this paper is on extreme weather evens resilience of small municipalities located in the Wielkopolska region in Poland. With this research an analysis of how local resilience arrangements observed in eight small communities are functioning during an another significant extreme meteorological event. Within local communities two ways of dealing with extremes have been observed. The first local resilience arrangement is focused more on structural interventions, using infrastructural measures – this refers to those previously affected by a larger extent by extreme weather events. The second local resilience arrangement is more concentrated on soft measures – education, training. Nevertheless, within both arrangements the key role is played by emergency services.

Qualitative comparative analysis (QCA) approach has been applied in order to define which factors are crucial in case of forming a particular type of local resilience arrangement to weather extremes in local communities. The analysis is based on different data sets. 40 in-depth interviews with local stakeholders were conducted. Also information on firefighters interventions, municipal budgets and meteorological data were obtained. Four sets of necessary and sufficient conditions for forming a type of resilience arrangement have been observed.

The Post-Liberal Social Classes: Actual and Perceived Levels of Income Inequality and Associated Values

The post-liberal theory of stratification posits that the trajectory of stratification systems shapes and is shaped by the identification and reactions of different social groups. This study tests this theory concerning the rising levels of income inequality internationally over the last three decades. Using data from the International Social Survey Program (ISSP), European Values Study (EVS), World Values Survey (WVS), and Luxembourg Income Study (LIS) from 1987—2019, I study the relationship between actual levels of income inequality and individuals' perceptions of income inequality, levels of social mobility in their country, as well as their individual mobility trajectories. Next, I test whether this relationship differs across traditionally defined social classes.

Finally, I use a clustering approach on perceptions of levels and governance of inequality, mobility, and other values to identify the demographic characteristics of the newly formed social groups in response to rising income inequality.

Social Justice through Affirmative Action Policy in Brics Countries: A Sociological Perspective

BRICS is an association of five major emerging economies namely Brazil, Russia, India, China, and South Africa, house 41 percent of the world population (3.1 billion people) and have more than 30 percent of global GDP. The group has a significant influence on world geopolitics, markets, and regional economies. Social inclusion, the fight against poverty, inclusive and sustainable development, and national sovereignty are some of the important agendas of BRICS. The BRICS is one the most evident products of the change process in social inclusion and development in the emerging economies. In spite of significant achievements like reduction in infant mortality, maternity mortality rate, and poverty; social inclusion is still a crucial debatable issue in BRICS due to diversified growth models of the countries which have comprehensive social protection system not only for the economic growth but also for improving the social situation. Considering these elements justifies the intention of social inclusion, but are these actions affirmative, keeping in view the heterogeneous social groups and their problems in BRICS along with hegemonic dynamics of power and markets leading to the new multilateral arrangement, which may set the developmental and inclusion needs of the diversified population. Affirmative action means the special consideration for disadvantaged groups in publicly funded opportunities. The words, affirmative action do not appear in the 1948 Universal Declaration of Human Rights, the foundation document for contemporary human rights discourse. The declaration does, however, contain two intellectual anchors for affirmative action. First, the declaration repeatedly endorses the principle of human equality. Second, it declares that everyone has the right to work, to an adequate standard of living, and to education. The declaration does not command that all will share equally, but it does suggest strongly that there are minimum levels of employment, education, and subsistence that all should share.

CHOWDHURY, Khairul* (University of Dhaka, Bangladesh)

State of Sociology in Bangladesh: Decolonizing Curriculum and Knowledge

In Bangladesh, sociology as a separate discipline was introduced only in 1957 under the UNESCO program both to forester Western social and human sciences for knowledge of local customs, beliefs, and religion and to help state-making in East Pakistan based on Islamic values. French anthropologist Professor Pierre Bessaignet joined the department in 1956 as an appointee, of the UNESCO, which continued its support for the department until 1967. Professor Nazmul Karim, a Bengali Muslim sociologist educated at Columbia University and University of London, became the head of the department in 1958 and remained the administrative head of the department until 1982 except for a few years in the early 1960s. As such, Professor Pierre Bessaignet and Professor Karim shaped not only the growth and development of sociology in Bangladesh, but also influenced much of what becomes Bangladesh sociology to date. Since Bangladesh's independence in 1971 society has changed but has not reflected in the teaching and curricula of sociology. The colonial legacy continues despite superficial changes in the curricula. This paper examines the current state of sociology in the department of sociology at the University of Dhaka, and its changes in terms of curriculum and teaching through archival research since the 1960s and especially since the 1980s. The paper seeks to explain the dominant forces which shape ideology, means of power, and relations of power, in which teaching, and curriculum design are organized, structured and practiced in Bangladesh in order to reflect on the strategies of decolonizing sociology in the country.

Gaps for Real Inclusion of Mentally ILL Persons in Chile

GAPS FOR REAL INCLUSION OF MENTALLY ILL PERSONS IN CHILE
ABSTRACT
Real inclusion means that person is working in a good "normal" job and that with the financial resources earned may originate an own family. This situation is true only for a minority of the mentally ill persons.. With the upsurge of the mental illness and usually bizarre behavior, the person frequently lost work or studies, and develops a traumatic experience for his/her family. Usually family takes care of the person, and these care became a burden for the family. Because of the situation the family frequently only aims not to repeat the traumatic experience and overprotect the persons limiting the risk that implies to participate in the competitive market of employment. They prefer that the person participate in a sheltered workshop organized by health services generating psychiatric institutionalization. Sheltered workshops does not solve the problem of a decent job that allows financial autonomy. Another solution is to participate in the legally imposed Jobs for disabled persons, but as the higher stigmas are with mental illness, the employers prefer to employ persons with other types of disabilities. As families have the burden of a passive and erratically non employed persons, a way is that the persons live in a group home, public or private, that put restrictions for "normal" life, and that in 85% of case cut off the possibility of goals for future. The person lost motivations and the possibilities of personal development. This is not only a probable consequence in public group homes, but also in private group homes , many times illegal, where families send the ill person.

A Division of Labour: The Impact of Sociology on Psychology

The term 'medical dominance' was initially coined to highlight the declining hegemony of doctors over rising autonomy in the para-professions, e.g., physiotherapy and social work. Recent events profile the influence of psychology. In the division of mental / manual labour, psychology could be seen as adapting individuals to society, rather than sociological trends of social change. In 1970, Alvin Gouldner proclaimed, 'The Coming Crisis of Sociology': a critique of Talcott Parsons' ascendency in America. Around this time, Parsons formulated a theory of social-types, in correlation with Freud's individual libidinal-types. The year 1994 saw these issues reconsidered by Stephen Coleman in 'What's Wrong with Sociology?', now documenting the latter profession in anticipated decline. At the same time Luce Irigaray again reformulated Freudian symptomatologies in the social context of Feminism. This was also the year post-Marxist European Unionist, Etienne Balibar declared women to be 'universal', on par with a recent status of the proletariat to past generations. By 2019, the American *Annual Review of Sociology* published 'The Culminating Crisis of Sociology' by James S. House that acknowledged the success, if not growing dominance of 'mental health' over 'social health'. In this paper, I consider the hypothesis that any original contribution of sociology may well not exist: is it not rather a rough mixture of political science, cultural studies and economics reported in earlier appraisals of alleged crisis? However, findings also suggest that Freudian Group Psychology, Parsonian Sociology and Irigaray's Feminism correlate with ideal types or aristocracy non-existent in post-colonial America, and even less in still colonial Australia.

Does Judicialization of Politics Promote Justice? Displacement of South Korean Politics

In South Korea, the 20th presidential election held on the 9th of March 2022, former prosecutor general Yoon Suk-yeol got elected. Yoon ran as the opposition party, the People Power Party, candidate. Does electing prosecutor general as president promote democracy and enhance justice in South Korea? This article delves into the following three entangled issues: First, the dual process of the demilitarization of politics and *the judicialization of politics* in South Korea after the turn to democracy in 1987 will be historically reviewed. The problematic of Military & Politics transformed into *Law & Politics*. Second, the rise of Yoon as a strong opposition party competitor in presidential campaign along with the rise of *prosecution* as a political power in South Korean political field will be examined. *The Rule of Law and Democracy* came into the center of South Korean politics. Third, Does Yoon make any progress in materializing justice in South Korea? What really happened after the inauguration of Yoon, 'the Symbol of Justice'? Does the Judicialization of South Korean Politics *wax* or *wane*? In conclusion, we will try to draw boundary lines prudently between *Law & Politics* as we did between Military & Politics in the past.

CHUNG, Wei-yun* (National Taiwan University, Taiwan)

Navigating the Unknown Waters of Home-Schooling during Taiwan's COVID Lockdown

Drawing on in-depth interviews with 47 parents whose children are aged between 4 and 12 years, this paper aims to examine the influence of COVID on parenting and parents' perception of home-schooling during Taiwan's soft lockdown in 2021. The findings show that parenting strategies and practices vary according to parents' economic status and educational backgrounds.

Middle-class parents used multiple strategies to mitigate the negative influences of COVID on children's studies. They collaborated with teachers and other parents, monitoring education information and resources circulated among friends and online forums and choosing those they considered appropriate for their children. They also arranged extracurricular activities, including indoor sports, online social events with friends, and reading, to maintain children's physical and mental health.

On the other hand, financially-disadvantaged parents tended to teach their children without resources from fellow parents or teachers. Before the pandemic, many of these parents spent a relatively large share of income and subsidies on children's shadow education because they did not want children's potential to be wasted or sacrificed because of their financial difficulties. However, most shadow educational institutions were closed

during the lockdown. Helping their children with homework thus became a challenge to financially disadvantaged parents, particularly those without a tertiary education degree. They felt that their inability to assist children with assignments caused children's academic regression and further contributed to their own stress and frustration.

My findings demonstrate how parents' economic status and educational backgrounds influence the quality of home-schooling and suggest that measures are needed to mitigate the education loss experienced by children from low-income families. These findings also show that intensive parenting is more prevalent than previous studies have suggested and is not exclusive to middle-class families. Future studies can examine how intensive parenting is practiced in families of different socioeconomic statuses.

Making a Life with Less: The Impact of Underemployment on Young Australians

Underemployment is a significant challenge for young people in the labour market today with one-in-five working fewer hours than they would like (Churchill 2020). Underemployment is also a challenge for governments and policymakers too, potentially costing Australia $11.3 billion in Gross Domestic Product and 125 million working hours a year (FYA 2015). Since the Global Financial Crisis (2008-9), underemployment has increased significantly for young people (Denny & Churchill 2016) and there is recent evidence to suggest that underemployment persists for even those young adults in their late 20s and early 30s. What is unknown is how underemployment of this nature impacts young people in early adulthood and whether it impacts their working futures and careers, family formation and well-being. This research addresses this gap by drawing on longitudinal data from the Household, Income and Labour Dynamics in Australia (HILDA) survey from 2001 to 2020 and qualitative interviews (n=25) with underemployed men and women aged between 20 and 35. Preliminary findings from the quantitative data analysis suggest that bouts of underemployment slow down young people's transitions to full-time, secure work indicating that there is a 'scarring effect'. This is especially the case for young women. Voices from young people experiencing underemployment highlight how persistent underemployment impacts their daily lives, including their material and financial well-being. To counter, many of the young people in this project for go leisure time and invest in 'being productive' or engaging in 'side hustle' activities to attenuate these impacts and position themselves to overcome underemployment in hopes of entering full-time work. This paper will talk about the wider impacts of these findings and canvas research directions and policy solutions.

Reflecting Populist Tensions over Climate Change Policy in Academic Discourse

Populism is on the rise in many democracies, as populist leaders win elections and seize power in Europe, Latin America and the US, posing a serious challenge to international collaboration in climate change policy. The association of populism and opposition to climate policy assumes different forms worldwide, and it also happens on many levels. The tensions are structural (involving groups economically threatened by green transitions) and ideological (relating to more generalised suspicions of climate change policy as an elite-driven conspiracy). Populists oppose elitism, including scientific and policy elites and, at the same time, they tend to be hostile to pluralism. Being "thin-centred", populism typically combines elements from other ideologies, including classic left- or right-wing views; it also recycles pre-existing tensions and argumentative frameworks opportunistically. Based on a large-scale literature review of academic papers published over the last three decades, this paper will explore the reflection of debates over climate change policy in the discourse of the social sciences. The analysis will employ topic modelling algorithms (LDA) to identify the topics of academic discourse. The classification of topics will then be explored based on the available publication metadata (time of publication, institutional affiliations of authors, declared funding sources).

CID RAMÍREZ, Aaron* (División de Ciencias Naturales e Ingeniería, Universidad Autónoma Metropolitana, Mexico)

Surveillance Capitalism As an Auto-Organization and Complex Process.

Whenever we aim to understand surveillance, we often end up thinking about a greatest power behind that process: government, international companies, market's invisible hand, just to name a few; but we often obviate the very first node: ourselves. Our mere participation within a society represents a constant selection of thoughts, words, and actions; that very often are held back in the mind, deceiving ourselves and manipulating our emotions and objectives.

But also, when we participate as part of a bigger system: social group, association, or nation, we develop rules, restrictions, and laws that determinate the very individual participation and what could and couldn´t be expressed.

The aim of this work is to cover the differences and similarities from our self-containment as an individual bio-system to the complex process of auto-organization as social beings that collaborate and oppose from other individuals to maintain or change the very reality itself, understanding the huge present and future participation of technology to achieve a perfect and immediate surveillance.

Beyond Secularization: New Perspectives

After the wave of secularization and the more recent development defined as "religious revival", social scientists studying the religious phenomenon are becoming far more cautious about the use of certain data, which even today give importance to either the secularization or the revival hypothesis. It has already become apparent that in both cases this process is probably due to a tendency toward the "sociological construction of inconsistency" through purely theoretical reasoning, or of marked use of figures and results, which are put together in scientifically unacceptable ways.

If we then examine other hypotheses, which on the international level, in the field of sociology of religion, are frequently under discussion, we can see that they are not applicable in many cases. Any effort to verify these hypotheses has generally failed.

Today we must ask if we are faced with an absolute novelty or whether, rather, Luckmann's "modern religious themes" are nothing more than the sedimentation of pre-existing, more or less subterranean channels, long incorporated in traditional religious modes, and surfacing now not for simply contingent reasons. The lack of research in this regard and the great weight of social control found in some particular historical and geographical contexts may be among these reasons.

The "invisible religion" perceived by Thomas Luckmann, which is based on the assumption of a crisis of the institutional apparatus, seems to be applicable only concerning certain aspects of modern societies and does not completely cancel so-called church religion.

At the same time, new horizons of research are discovering innovative perspectives of analysis, concerning spirituality and other forms of religions, both individual and collective.

CIPRIANI, Roberto* (Università Roma Tre, Italy)

Religiosity in Italy. a Multi-Methods Approach.

Twenty-two years after the research on Religiosity in Italy, the survey carried out in 2017 also covers 164 subjects appropriately selected, without the pretension of representativeness and generalizability. The stratification of the sample concerns three categories related to the degree (level of obligation, middle-superior diploma, degree), the distinction of gender (man, woman), residence (small towns, medium municipalities, large cities), geographical distribution (north, center, south and islands) and age (young, adult, elderly). The solution of a completely open interview, without predefined questions, was tested. In fact, for almost half of the sample, i.e. 78 cases, the interviewers tried to obtain narratives, reflections, interpretations and evaluations not solicited through specific questions on religiosity. For the rest of the 86 subjects interviewed, the first part was entirely free and the second part was on some concepts-stimuli relating to daily and festive life, happiness and pain, life and death, God, prayer, religious institutions and Pope Francis. The results of the qualitative analysis were also corroborated with sophisticated quantitative instruments: a program called T2K (Text to Knowledge), Lexical Correspondences Analysis and VoSpec procedure (Vocabulaire Spécifique des Groupes d'individus). An analysis sheet similar to a semi-structured questionnaire was then prepared to be applied to the interview texts, with the intention of capturing recurring patterns, values and representations.

RC03-61.2

CIRDAN, Clara* (London School of Economics, United Kingdom)

Cultural Democracy in Museums

The paper looks at the nuances of cultural democracy in museum spaces. Trying to go beyond a simplistic view on inclusion which simply analyses museum demographics, the paper addresses the 'belonging' in the space of two different museums from the UK. Based on the comparative ethnography pursued within the PhD project, I unpack the notion of belonging in relation with staff members who stage 'belonging' and visitors who experience it (or not). The question of belonging is linked to participation in the life of the museum (e.g. volunteering activities), by questioning how experiencing belonging encourages visitors to be proactive within the space of the museum?

Thus, the paper seeks to bridge the gap between the institutional museum component and visitors' experiences of the space of the museum. This is done by problematizing the question of inclusion from museum studies, which usually has either a more institutional focus (Sandell 2007) or a participatory

one (Ride 2016). The two case studies compared are an art gallery and a migration museum, which broadley stand for the temple and the forum museum functions (Cameron 1971). Bridging these two through what is nowadays referred to as the activist museum function (Leshenko 2005), the paper concludes that the question of activism is present in both temple and forum museums and that 'belonging' influences participation and hence the social value assigned to the museum.

TG07-828.3

CIRDAN, Clara* (London School of Economics, United Kingdom)

Sense and (museum) Sensibilities. a Study on Affective Practices in Museums.

The paper looks at museum affective practices and asks how do museum spaces feel like for visitors? Based on a comparative museum ethnography in the UK, the paper examines how visitors behave and relate to different museum spaces, while acknowledging the different museum ethos, demographics and forms of representation. More specifically, the paper is based on fieldwork done within a contemporary gallery in a coastal town (Margate, UK), which embodies the 'temple museum' (Cameron 1971), and the Migration Museum (London, UK), that stands for the 'forum' museum (Cameron 1971), respectively.

The temple museum envisions a museum of (art) objects and installations, while the forum museum depicts 'a museum of stories'. How do objects, compared to personal stories, affect visitors? What does it mean to have stories as the museum's ethos? Going beyond a simple comparison between visitors' impressions in these two spaces, the paper addresses the politics of sensorial representation, so as to explore whether forms of immaterial culture such as stories, generate more radical forms inclusion on site as compared to artefacts?

The question of art and politics goes back to its incipience (considering that paintings were commissioned by the church or wealthy patrons); thinkers such as Jacques Ranciere connect art and politics organically, claiming reciprocal influence and where the emancipated spectator (in his view, the visitor), has agency in response to visual representation. Problematizing that assumption, the comparison portrays how sensorial practices (sounds, touch, smell), generate affective responses which challenge traditional museum behaviour (e.g. no touching protocols), and create a more relaxed museum atmosphere than art objects. This, in turn, can orient visitors' actions in relation to the museum (e.g. many visitors from the Migration Museum ask for volunteering programmes) which the paper explores.

CLARK, Emily* (University College London, United Kingdom)

Is the Universal Basic Income a Neoliberal Policy? Analysing the Constitution of the Universal Basic Income in UK Policy Discourse During the Covid-19 Pandemic.

This paper analyses the extent to which Universal Basic Income (UBI) proposals in UK policy discourse, since the onset of the Covid-19 pandemic, have represented new imaginaries in the contemporary art of government. Over the past two years, the UBI has gained increasing popularity as a potential policy 'solution' to combat increasing forms of inequality and exclusion in existing welfare states. 54 UK parliamentary texts, derived from UK Hansard, in 2020 contained at least one mention of the "basic income" or related terms, compared to three in 2019, one in 2018, and five in 2017. Despite this recent proliferation of iterations, however, the UBI's proposed scope and remit - its relationship with the neoliberal paradigm - remains highly ambiguous and contested in academic and policy circles.

Through a discursive analysis of these texts, this paper will map *how* this discursive shift has occurred. This will trace the 'problems' the UBI has been proposed to address and how it will address them - the ideal visions of society and forms of political subject - alongside the (dis)continuities between these articulations before, during, and 'after' the pandemic. This will then be analysed to examine to what extent UBI proposals represent a break with, or continuation of, current modes of neoliberal governmentality (Foucault, 1979).

The poststructuralist critical policy approach adopted here contrasts with traditional approaches in the social and political sciences to analysing the policy process (e.g. Kingdon, 1984; Sabatier, 1988). Rather than seeking to explain *why* policies enter the political agenda in response to pre-existing social 'issues', this project addresses *how* policy proposals operate as discourses which construct policy 'problems' and 'solutions' within specific power/ knowledge regimes. This research aims to contribute to the growing field of critical policy scholarship, and to further understandings of the UBI in academia and policymaking fields.

CLARK, Jennifer* (University of Texas Rio Grande Valley and South Texas College, USA)

The COVID-19 Pandemic: Securitization, Authoritarian Neoliberalism, and Trafficking in Persons.

Aggressive anti-immigration policies and militarization of borders have been effective mechanisms to promote an authoritarian neoliberal agenda in which the Global North states attempt to keep migrants, refugees, and asylum seekers from the Global South out. Since the start of the COVID-19 pandemic, decisions aimed at reducing human movement across borders have become a key element of policy on a global scale. The COVID-19 pandemic has enabled governments to implement unprecedented oppressive migrant regimes. In the United States Title 42, a public health code issued by the Center for Disease Control (CDC), was used under the guise of protecting public health and preventing the spread of COVID-19 to ban the entry of migrants and asylum seekers. Primarily focusing on the US-Mexico border, this paper seeks to place restrictive border regimes within the context of the global economy and argues that aggressive anti-immigration policies have not only been effective in accentuating a neoliberal agenda that has marginalized migrants further, but have also been instrumental in increasing vulnerability to forced and precarious labor, and trafficking in persons.

CLARK, Sal* (Swinburne University of Technology, Australia)

The Waiting Room: Indonesia As the Forgotten Lynchpin in Australia's Architecture of Exclusion

Since the creation of the Pacific Solution in 2001, Australia's punitive approach to asylum has been well documented. Scholars have born witness to the cruelty of offshore processing and attempted to counteract the secrecy of Australia's border regime by bringing firsthand accounts of suffering to public awareness. Yet despite the high-profile nature of this issue, Australia's impact on Indonesia and the vulnerable migrants who become contained therein remains largely invisible or beyond the concern of the Australian polity. This is despite the fact that Indonesia's status as a transit country, that hosts thousands of forced migrants a year, is largely the result of Australia's own extraterritorial bordering practices. In this presentation I explore the hidden mechanics of Indonesia as a transit location that Australia has exploited to warehouse vulnerable migrants to minimise its own international obligations. It is argued that while Indonesia may not be instantaneously recognisable as a site of interdiction, it fulfils similar functions, and integrates similar strategies of control to that of physical sites of offshore immigration detention, by rendering forced migrants immobile and beyond the protection of international human rights norms and instruments. Furthermore, this presentation reflects on the important role that social scientists play in exposing the human cost of Australia's single-minded pursuit of border security premised on the fallacy of an orderly refugee queue.

Mapping the Responses to COVID-19 Pandemic in Peru through the Analysis of Massive Twitter Data. an Inquiry for Public Policy.

Peru has been one of the most severely affected countries by the COVID-19 pandemic in the world. Therefore, analyzing the evolution of Peruvian people's perceptions, discourses, and responses to the situation amidst historical levels of healthcare demand and general tragedy provides a unique opportunity for estimating the pandemic's impact on Peruvian reality and examining the public policy derivations.

We built a database of tweets generated in Peru's approximated area (we used a range defined in kilometers to establish limits), registering tweets about COVID-19-related keywords. The database contains more than 33.5 million tweets from March 10, 2020, to March 31, 2022. Only a fraction comes from users with some explicit mention of location. A preliminary location filter was applied, resulting in over 3 million tweets from places that explicitly mentioned "Perú" or "Peru". One million of those 3 were original tweets, not retweets or quotes. To the best of our knowledge, the described dataset is one of the biggest about COVID-19 in Peru.

The distribution of tweets per day adopted a similar shape to infection waves observed in Peru, with a decreasing number of tweets between waves.

The paper will present the analysis of key players on the relevant Peruvian tweetsphere and the findings produced by text mining and text representation techniques to identify important topics that allow us to ponder some of the significant short-term and longer-term impacts of the pandemic. To this end, we will also analyze a supplementary database formed by tweets specifically related to the quarantine (Peru had one of the world's most rigid initial quarantines). Finally, we will use secondary quantitative data to contextualize the derived public policy challenges.

CLAROS, Hugo* (Independent, Peru)

Monitoring and Evaluation for Educational Innovation in Perú: Both a Potential Community Tool and a Required Bureaucratic Language

The paper will present a framework for identifying and linking underused monitoring and evaluation tools oriented toward strengthening educational innovations through empowering them with means to demonstrate the effectiveness of their intervention when establishing contact with formal and official counterparts.

Recently, the elaboration of monitoring tools and the development of innovation capabilities have been considered necessary by Peruvian teachers who participated in the national teachers' survey. Therefore, it is crucial to give examples of tools specifically tailored for their Small Data context.

Emphasis will be put on using recent digital tools such as dashboards to improve community engagement and support, which is a deciding factor for the innovation's sustainability.

Likewise, monitoring and Evaluation mindset and tools will be explored as a gateway to building official support from sub-national and national government levels and legitimizing the social innovation seeds that educational projects entail.

CLAYTOR, Cassi* (Case Western Reserve University, USA)

Markets, Racial Capitalism, and Racial Exclusion on the Retail Sales Floor

Historically and contemporarily race is deeply embedded in the marketplace impacting consumers and producers alike. While much research has theorized and examined the importance of markets to contemporary society, how processes of racialization and modern manifestations of racism function in market settings is undertheorized. This is despite the fact that consumption and engagement in the market are key aspects of economic life. Furthermore, marketplace settings are critical sites of interracial and cross-class contact. This paper centers the market as a core capitalism institution. Research has time and time again evidenced the pervasiveness of retail racism. For example, when asked about the contexts that they encounter unfair treatment, Blacks in the U.S. have consistently indicated that they encounter unfair treatment due to their race at higher rates "while shopping" than any other context, even when compared to interactions with the police and while at work. To date research that is examined retail racism has largely focused on the experiences of individual consumers. Focusing on the micro-interactional level, does not allow for a full picture of how markets function to exclude and exploit racial minorities. In this paper, I highlight and investigate firm-level factors that contribute to the perverseness of mistreatment of racial minorities and discrimination in retail spaces. By focusing on organizational-level factors driving racialization and racism in market this paper improves our understanding of markets, helping to reveal a critical component of racial capitalism. Drawing on data collected from a participant observation study, this paper makes the case that organizational-level factors play an important role in perpetuating processes of racial exclusion, in particular they affirm and reproduce racial hierarchies required by racial capitalism.

RC56-JS-47.1

CLEGG, Stewart* (UTS, Australia)

A History of the Present

In the middle of 2022, the world is facing three global threats, one possibly receding, another certainly advancing and one whose trajectory is at present unclear. Receding is the COVID-19 pandemic, though the virus spreading it will continue to mutate and new variants will emerge. Viral pandemics never die; at best, they just fade away. Advancing is the threat of climate change. What is unclear is the outcome of present events in Russia and Ukraine. These events, labelled on the one hand as a 'special military operation', on the other hand seen as an unwarranted invasion of a national sovereign space by an imperial power, unfolding with deadly and destructive consequences. I will connect these three aspects of the present in an analysis, premised on the circuits of power models. My analysis will focus on questions of social and system integration (Lockwood, 1964). Social integration refers to the principles by which individuals or actors are related to one another in a society; system integration refers to the relationships between parts of a social system; these relations will be analysed in terms of concepts of circuits of power and the paradoxes they constitute.

CLEOFAS, Jerome* (De La Salle University, Philippines)

Digital Citizenship and Global Civic Engagement Among Young Filipino Netizens

Digital citizenship refers to "the regular use of the Internet for participation in all spheres of society" (Servaes, 2018, p14), and can be characterized by online respect and civic engagement. Online political participation has been one of the critical issues in the sociological study of the Internet. Prior research has established the link between online to offline citizenship behaviors, especially among the youth; however, South East Asian populations are underrepresented in extant literature. The aim of this study is to examine the predictive relationship of digital citizenship to global civic engagement among young Filipino netizens (18-30 years old). This study made use of a quantitative cross-sectional research design. A convenient sample of 700 young social media users geolocated in the Philippines participated in the online survey. To measure the independent and dependent variables, the following instruments were used: (1) the *Youth Digital Citizenship Scale* (Jones & Mitchell, 2015); and (2) the *Global Civic Engagement (GCE)* component of the Global Citizenship Scale (Morais & Ogden, 2011), which had three domains (i.e *involvement in civic organizations*, *political voice*, and *global civic activism)*. Profile variables such as age, sex, sexual and gender minority status, religion, and residence location were also collected. Descriptive, bivariate and multivariate statistics were used. Findings suggest high levels of digital citizenship, and moderate to high global civic engagement. Inferential results indicate that digital citizenship can significantly increase all domains of GCE (p<0.05). Moreover, higher levels of GCE in all domains were reported by female respondents. Also, gender and sexual minorities (i.e., LGBT+) were likelier to exhibit political voice and global civic activism. Meanwhile, those living outside NCR (urban center) reported higher scores in involvement in civic organizations (p<0.05). Findings demonstrate the salience of gender, geography, and digital affordances in shaping and facilitating meaningful political participation among the youth.

CLERICI, Eleonora* (Sapienza, University of Rome, Italy)

Local Organizations As an Answer Against Abyssal Exclusion and Advanced Marginality in European Cities

In the last decades, several economic, social, and political processes have modified and shaped the structure of Western countries (e.g., the flexible accumulation regime, globalization, and the restructuring of the welfare state). These events have intensified and exacerbated the existing forms of inequality and social exclusion, which have acquired new shades of marginalization, polarization, and segregation in the urban contexts (Bergamaschi et al., 2009; Tammaru et al., 2016; Musterd et al., 2017; Dikeç, 2017; Madden, 2021). Moreover, the Covid-19 pandemic, and the consequential economic and social crisis, have worsened these disparities and shown the weaknesses of social welfare by exposing the most vulnerable neighbourhoods and communities to higher sanitarian and socioeconomic risks (Reale, 2020; Madden, 2021; Lelo et al., 2021, Oxfam, 2021).

This paper presents these phenomena in European cities and how local organizations contrast them. It extrapolates the result from a PhD research project conducted between September 2021 and November 2022 in five capitals, namely Rome, Brussels, Stockholm, Bucharest, and London. The theoretical framework of the study is rooted in post-colonial and urban studies. Precisely, it combines "abyssal exclusion" (Santos, 2007, 2017, 2021) with "advanced marginality" (Wacquant, 1996, 1999, 2008, 2013, 2016). The data has been gathered by engaging with the most vulnerable communities and neighbourhoods in the cities mentioned. This involvement entails interviewing associations and organizations that work with, help, and defend the most excluded people and groups. In addition, they also include experts, such as sociologists, economists, urbanists, and statisticians, that study these dynamics. The results spotlight the role of local organizations in handling these severer forms of social exclusion and inequality in European cities. The paper sought to present the similarities and differences among cities and the collateral issues that arose.

CLYDESDALE, Timothy* (The College of New Jersey, USA)

Exploring Social Context and Life Course in the Journeys of Religiously Unaffiliated US Twentysometings

The rise of the "Nones," especially among US citizens under age 30, has been a popular headline, but this label is widely misunderstood. Though Nones indicate no religious affiliation, it does not mean they have *no* religious beliefs or practices. Religion is a complex phenomenon with individual and social dimensions, including affiliation, belief, and practices. While some Nones are ardent secularists, a solid majority of Nones hold beliefs in a supernatural or transcendent reality, and some appear quite conventional in their beliefs. Between one-third and one-half of Nones in the US are Unaffiliated Believers.

Besides Unaffiliated Believers, there are Nones with less conventional beliefs and practices: Spiritual Eclectics. Between one-quarter and one-third of Nones in the US fall into this category. And in addition, there are Nones who reject religion or spirituality in any form. Philosophical Secularists replace a religious worldview with an equivalent non-religious belief system, asserting that our existence in shaped by forces we can rationally and empirically explain. The remaining Secularists fall into a category of indifference, as they express no interest in any type of worldview -- be it religious, spiritual, or secular. Between one-sixth and one-fifth of Nones in the US are secularists.

We deploy mixed methods to examine the impact of higher education, family, friends, residence, and region on the life course journeys of US twentysomethings. Drawing from qualitative panel interviews, we generate

hypotheses about the impact of friends, parents, and age on the certainty of secular identities, that we then evaluate using the National Study of American Twentysomethings (n=1880). Finally, we examine the pro-social attitudes, individualism, civic engagement, and privatism of religiously-unaffiliated compared to religiously-affiliated US twentysomethings.

CLYDESDALE, Timothy* (The College of New Jersey, USA)

Exploring the Surprising Impact of Spirituality over Religiosity in Life Statuses of US Twentysomethings

We asked 1,880 twentysomethings who participated in the NSAT a set of 9 items that touched on spiritual life and views of spirituality. These include 1) prayer, 2) meditation, 3) spiritual growth as an adult, 4) thinking about the meaning of life, 5) feeling a "spiritual or emotional connection to all the people around me," 6) including other religious traditions in one's own spirituality, 7) feeling "so connected to nature that everything seems to be part of one living organism," 8) regarding any art or music as "a way to communicate one's spirituality," and 9) thinking of God not as personal but "as a spiritual force."

Our first step, using factor analysis, revealed twentysomethings subdivide these items into two clusters. The first cluster we labeled "traditional spirituality," as it includes practices and values that many USA churches encourage. The second cluster we labeled "nontraditional spirituality," as it includes practices, experiences, and opinions that fewer US Evangelical, Mainline Protestant, or Catholic congregations encourage.

Using factor analysis to generate respondent scores for traditional and nontraditional spirituality, we then compared twentysomethings' scores across demographic and religious categories. Do twentysomethings become more spiritual as they age? On the surface, it appeared that older twentysomethings scored higher in nontraditional spirituality and lower in traditional spirituality than their younger counterparts. But age lost its predictive relationship with both types of spirituality once we controlled for religious affiliation.

We then examined whether spirituality is associated with important statuses in the lives of twentysomethings, and its importance relative to that of religion. This paper reports the relative impact of spirituality factor scores, religious attendance, and religious affiliations on associations with marriage, cohabitation, parenthood, employment, completion of bachelor's degrees, voting, social connectedness, and community engagement – and does so controlling for race, gender, household income, and age.

COBURN, Elaine (Glendon Campus, York University, Canada)

Economy and Society, Economy in Society? the World Bank World Development Reports, 1978-222

Abstract
The World Bank is a central institution in an emerging global capitalist 'state'. Many assert that World Bank orientations have changed from a dominant neo-liberal Washington Consensus to a more socially inclusive Post-Washington Consensus. Our analysis of the World Bank's premier publication, the World Development Report, from 1978 to 2022 focusing on market-state relationships, confirms that the Bank has moved from a simplistic 'economies and society' to a somewhat more contingent and recursive 'markets within societies' model. There are recent indications, however, of a return to a more 'market central' approach. Contrasting with these changes a major continuity shown is a technocratic 'apolitical' approach to the relationships between economies, polities and civil society. However, the development economists who largely staff research in the World Bank have failed to adequately confront and theorize the 'social' aspects of development present in their expanded paradigm resulting in significant theoretical tensions and contradictions in the WDRs.

Climate Change and the International Monetary Fund

"Climate change is an existential crisis." A senior official at the International Monetary Fund (hereafter the IMF or the Fund) made this announcement in 2021. The same year, the IMF formally declared that it would undertake the systematic surveillance of its 190 member nations with respect to climate change policy, both domestic and global. Reflecting the Fund's recent ambitious aims, the Fund's Managing Director announced on September 5, 2022 that, "The IMF today is a systemically significant institution in the fight against climate change" (September 5, 2022). Certainly, the Fund has created a thick institutional policy discourse about climate change, including a dedicated webpage, "The IMF and Climate Change" that features staff notes, working papers, speeches, videos, blogs, relevant chapters from the Fund's flagship publications, including *The World Economic Outlook Report*, and the Climate Change Indicators Dashboard, an illustrated database "linking climate considerations and global economic indicators" -- all freely available to the public. In this paper, I analyse the IMF's climate change discourse across key

documents since the Fund declared the issue "macrocritical" and therefore within its ambit. In particular, I draw attention to tensions between its recognition of the existential nature of climate change and its recourse – with some exceptions -- to a narrow economistic frame in which both the crisis and the solutions are framed in a characteristic language of prices, investments, productivities, and economic growth. I point to the ways that the International Monetary Fund participates in mainstreaming climate change economics but in radically inadequate ways that reflect the Fund's embeddedness in world capitalist relationships, including the assumption that the global economy can be reformed in ways compatible with meaningful climate change mitigation.

Approaching Multiple Sclerosis Integrating Expert Systems and Narrative Medicine

Doctor-patient relationships are crucial for both cure and care, especially in chronicity and stigma-associated relations in un-pair mobility, such the Multiple Sclerosis. The gap between body and person, disease and illness, biology and social dimension broadened in modern biomedicine. Expert systems are more relevant than patients' illness living; patients' narratives are marginal in medical accounts and in illness prevention information, treatment, and public awareness. Focusing attention on the disease cure, the patient is considered as a case or a customer in advanced diagnostic systems, marginalizing patients' illness narration and gradually separating body and person. Illness management excludes patients from their communities and denies the acceptance of their diversity. Chronic illnesses such as Multiple Sclerosis needs to be addressed at multiple levels, integrating diagnostic and evidence-based medicine with a narrative medicine approach involving patients' illness experience and different stakeholders. This proposal wishes to appraise the enhancement of the doctor-patient relationship through narrative medicine as an approach and a tool to increase empowerment, inclusion, and cohesion in health systems, local communities, and informed citizenship.

The Socioeconomic Consequences of Gender Relations in the Earthquakes in the Dominican Republic (2003), Honduras (2007 AND 2009) and Haiti (2010)

Earthquakes, as well as other socioenvironmental events, are extraordinary episodes that have considerable consequences for the populations that they affect. This impact is not immune to gender effects, as has been shown in various studies (Anderson, 1994; Enarson and Scanlon, 1999, Kumar-Range, 2001) or to factors such as age or ethnicity (Bradshaw and Fordham, 2013). Specifically, various studies have shown the differential impact of disasters in terms of the health and mortality of women and men (Hines, 2007; Akerkar, 2007; Bradshaw and Fordham, 2013), while others highlight the increase in gender violence (Enarson, 1999; Fisher, 2010; Seager, 2014) and raised levels of economic inequality and women's social vulnerability after a disaster (Llorente-Marrón et al., 2020a; Llorente-Marrón et al., 2020b).

The aim of this presentation is to quantify the impact of four earthquakes that occurred in the Caribbean: the Dominican Republic (2003), Honduras (2007 and 2009) and Haiti (2010). For this, the socioeconomic circumstances of men and women pre- and post-disaster were analyzed, paying particular attention to gender inequality gaps. The methodology employed for the analysis is the Differences in Differences (DID) technique, the data having been extracted from the Demographics and Health Survey (DHS) developed by the US Agency for International Development (USAID). The results demonstrate that although the earthquakes studied have negative effects on the great majority of households affected, these effects are more intense for female-headed households. Similarly, the results reinforce those form previous research in that they reveal how gender inequalities that exist prior to the disaster are not only maintained, but in fact become greater in the post-disaster period.

Encounters and Ordeals on Violent Incidents and School Safety: Their Status and Relationship

Exposure to violent incidents and safety issues at school remains a significant problem for both teachers and their learners. Communities around the globe are experiencing various forms of violence and most of the victims are the youths and the vulnerable groups. This study used a descriptive correlation approach to address issues on violent incidents and school safety in schools

particularly in the Province of Davao Oriental, Philippines. It examined the status of violent incidents and safety as part of the encounters and ordeals among schools and the extent on violent incidents' influence to the level of school safety. Results reveal that violent incidents moderately occur with an overall mean of 3.29 and overall standard deviation of 0.67 which explains that the respondents' impressions of violent incidents are the same and means that violent incidents happen regularly. Among the violent incidents happened are *gang violence* (X= 3.80, SD= 1.20) and *arguments among students* (X= 3.77 and SD= 0.99). Also, there is a high status of school safety with an overall mean of 3.52 and overall standard deviation of 0.78 which explains that school safety is evident in most occasions. Among the impressions of school safety are *I feel safe in my classroom* (X= 3.75, SD= 1.00) and *I am happy with the way my school is dealing with violence* (X= 3.53, SD= 1.23). However, the belief that *violent incidents do not occur at their school* is described as moderate (X= 2.92, SD= 1.14). Moreover, results also reveal that the magnitude relationship of violent incidents to school safety generated an r-value of -.312 which means that there is a moderate negative relationship between violent incidents and school safety. This means that if there is high occurrence of violent incident, then school safety is low and vice versa.

CODILLA, John Rey* (Davao Oriental State University, Philippines)

Violent Incidents and School Safety: Avatar of Basic Education in the Era of Fire

Up until the Fourth Industrial Revolution (FIRe), school remains an avenue where violent incidents and safety issues are observed. Both teachers and learners are not exempted on the threatening atmosphere caused by school violence. This study used a phenomenological approach employing Focused Group Discussions (FGDs) and In-Depth Interviews (IDIs) to address issues on violent incidents and school safety in schools particularly in the Province of Davao Oriental, Philippines. It examined the lived experiences of teachers and students with regard to school safety and the role of experiences in shaping the beliefs, attitudes and values of teachers and students. In terms of lived experiences, results reveal that episodes of disturbances, and physical and verbal intimidations surfaced. As a result, teachers and students experienced countless progressions of dread. Violent incidents also resulted to negative school atmosphere. As a result, the school environment becomes not conducive to learning and growth. Lived experiences on feelings, aftermaths of violent incidents, the role of experiences in shaping the beliefs, attitudes and values are as well discussed. Out of the probed issues, four (4) essential themes were formed. These are recognizing the factors affecting school safety, strict implementation of safety policies, strengthening values integration and shifting of perspective from being idealistic to realistic. Results challenged the Philippine educational system and its school leaders to provide quality education for all Filipino learners. Conduct of seminars/symposia on violent prevention strategies, trainings on anger management strategies, capacity building programs for security personnel, sustaining religion classes as part of the curriculum, craft clear policies on dealing behavior concerns, capacity building programs for mediators or disciplinary implementers and comprehensive orientation of policies to the stakeholders are seen to be effective interventions.

How Do Social Movements Construct Long-Term Visions through Interactions between Generations of Activism? the Case of Two Generations of Feminist Activism in Peru and Ecuador

My paper speaks to the following questions posed in the session abstract: How do social movements construct long-term visions, strategies and the solidarities that nourish them?

Feminist movements not only challenge existing gender hierarchies but also articulate long-term visions of alternative gender relations. Because social movements are themselves sites of struggles and innovation, long-term visions are created in part through the interactions *within* feminist activism. In this paper, I examine the interactions between different generations of feminist activism and how these interactions contribute to the creation of long-term visions of alternative gender relations.

I will present the results of a study among two generations of feminist activism in Ecuador and Peru. Whereas one generation came of age and was mobilized into feminism in the late 1970s and early 1980s, the second generation came of age and was mobilized into feminism around the new millennium. Combining Grounded Theory method with qualitative interviews, data was collected in 2012 among leading activists representing feminist groups and organizations in five cities. In each interview, participants discussed their definition of gender equality as a long-term vision, including how this definition guided their collective action strategies and collaboration with other sectors of feminism and other social movements.

My paper will analyze the long-term visions constructed by the two generations of feminist activism, illuminating points of convergence and divergence between them. It will further explain how and why these convergences and divergences emerged through the interactions between the two generations, drawing upon an interactionist perspective of social organization and an intersectional approach to gender and age hierarchies grounded in the Latin American context.

The Impacts and Challenges of the Covid-19 Pandemic on Educational Practices and Teaching Work in Brazil

At the interconnection of sociology and education, the research aims to analyze the impacts and challenges of the Covid-19 pandemic in the teaching activity and pedagogical process, focusing on the Brazilian context. To do so, we used bibliographic and empirical research, based on theoretical investigation and on the material obtained from 43 teachers' answers to an electronic form, between July and August 2021. As for the geographical scope of the empirical material, most of the respondents taught in educational institutions in Rio de Janeiro, although there were also respondents from other Brazilian states. Among the main results obtained, there was a close relationship between educational practice, social inequality, and teachers' work conditions. Many teachers reported challenges for teaching during the pandemic period, focusing on: (i) inequalities and lack of accessibility; (ii) transfer of work costs to the teachers and the absence of training policies; (iii) difficulty of collective learning practices, affecting the pedagogical process; (iv) physical and mental overload of teachers; (v) the challenge of involving the family in the proposed learning activities. Although the mention of the impact of social isolation on teaching has been continuous, this impact was especially pointed out in the case of special education and youth and adult education. From the data obtained with the empirical material, and from its comparison with the theoretical reflection proposed, it was possible to notice that the challenges of the educational practice were updated in face of the difficulties accentuated by the pandemic. Furthermore, this process made more explicit the need for "openness to difference" (NÓVOA, 2009, p. 13, free translation) and joint participation of "families and communities" (CANDAU, 2016, p. 807, free translation). Nevertheless, social inequalities, aggravated in this context, reinforced the "capture of labor subjectivity by the logic of capital" (ALVES, 2005, p. 414, free translation).

Anti-Gender Campaigns in Brazil: The Consolidation of an Antifeminist State

In 1988, the Federal Constitution of Brazil restored the political and social rights taken away by the military during the period of dictatorship in the country (1964–1985). Thirty years later, an overtly antifeminist wave is emerging in Brazil. The "anti-gender" discourse arrives in the country and it is taken up by elected political representatives. This discourse frames human rights in general and women and minority rights in particular, as a left-wing ideology that, therefore, must be fought (Biroli, 2019). In this context, gender and demands for the protection of women's rights are understood as an ideological matrix and an instrument of domination which are the source of "abominable" ethical and social reforms (Kuhar & Paternotte, 2018). These demands would displace women from their supposed natural role of subordination and threaten the family in its restricted, heterosexual configuration on which the proponents of the anti-gender discourse rely. Moreover, in Brazil, the rise to power of right-wing candidate Jair Bolsonaro (2019) who leads an antifeminist program openly against "gender ideology," represents a real threat to women's and LGBTQI+'s rights in the country (Compagnon, 2018).

This paper aims to present a panorama of the consolidation of an antifeminist government inside a democratic state. Initially, I propose a theoretical articulation between antifeminism studies (Lamoureux & Dupuis-Déri, 2019), anti-gender campaign studies and Latino America decolonial literature as a theoretical framework to understand the Brazilian state's anti-gender actions. Secondly, I will demonstrate how the current Brazilian government acts to advance the antifeminist anti-gender agenda using the means and discourses established by liberal democracy (i.e. through bills, presidential decrees, and ministerial acts). For this, bills from the National Congress and actions from the president and the Ministry of Women, Family and Human Rights will be analyzed based on critical feminist theories of anti-genderism, anti-feminism, and liberal democracy.

The Rise of Complexity Sciences in Drr and Implications for Traditional Disaster Management Tools

The Sendai Framework at the time of its inception, stated that from 2005-2015, unacceptably high disaster losses ccurred around the globe with an estimated 700 000 lives lost, 1.4. million injured, 23 million people were

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

made homeless and 114 million displaced [UN, 2015:4]. Economic losses due to disasters during this time were also staggering with total economic losses estimated at US$ 1.3 Trillion. Extensive losses as those experienced between 2005 - 2015 are set to continue if not increase in the coming decades. Much of the continued disaster losses will be driven by humanities transition into the Anthropocene where existing disaster risk profiles will interact with increasingly complex socio-ecological drivers such as climate change, rapid urbanisation, environmental degradation, economic instability, civil unrest, and food insecurity. The dramatic increase in regularity and intensity of disasters driven by emerging socio-ecological drivers begs the question if traditional disaster management tools can manage increasingly complex disasters? Specifially this paper endeavours to provide a critical review of the utility of the disaster management cycle in managing complexity by evaluating its use through the lens of three complexity approaches that have risen to prominence in DRR literature since 2015. Specifically concepts such complex adaptive systems theory, resilience thinking, and anticipatory governance seems to indicate that the disaster mangement cycle is too simplistic, rigid and linear in its application to be able to identify or adress the complex socio-ecological drivers of disaster risk in the Antropocene

Editing the Self: Understanding Young People's Digital Self-Image and Editing Practices

Young people must navigate a rapidly changing digital landscape of self-presentation and appearance. Selfie-editing apps like Facetune and Faceapp have emerged which provide professional-quality photoshopping and airbrushing editing tools, enabling a user to 'effortlessly enhance the attractiveness of their selfie', offering entirely new in-phone editing tools, including 'perfecting' the face and body, mimicking cosmetic surgical alterations, and 'playful' features including an 'ageing' filter and 'gender swap' tool. The new capabilities provided by these apps emerge at a time when body and image-based appearance pressures are a pervasive and enduring issue of concern for youth. Whilst selfies have been widely studied as a cultural phenomenon, this project explores how young people actually use selfie-editing apps, and the implications for young people's embodiment, body concerns, and wellbeing. This presentation presents findings drawn from the first phase of research exploring how young people edit and understand selfie-editing and is based on photo elicitation interviews. We focus on the digital literacies young people employ to navigate the cultural norms which inform editing features, young people's image-reading and editing practices, to build new understandings as to how young people navigate the self-presentation demands of contemporary digital culture.

Medicalizing the Prison-Industrial Complex: Theorizing the Relationship between Criminality and Mental Illness

With current rates of mental illness among prison populations in western societies estimated to be as high as ninety percent, this presentation offers a timely reflection of biological, sociological, psychological, and criminological theories on the relationship between criminality and mental disorder. In doing so, it will question the simplistic and often false ideas on what 'crime' and 'mental illness' are, along with the many problems in drawing any direct causal relationship between the two. Biological and conservative sociological ideas (the latter including stress theory and strain theory), for instance, have utilized formal measures in the field to contend that there are marked patterns of pathological behaviour –within either the individual or the environment– which can effectively account for why some groups are over-represented in both the criminal justice and psychiatric systems. These deficit models, however, do not account for the culturally and historically fluid nature of both crime and mental illness designations. In contrast, I will argue that the work of critical scholars can prove more productive: labelling and social constructionist theories, for example, allow us to frame both sets of behaviours as forms of social deviancy, and the result of labelling and medicalization processes by powerful professional workers in both the criminal justice and psychiatric systems. As I will conclude, these critical ideas allow us to then understand the limits of the popular 'transinstitutionalization' thesis (where psychiatric incarceration is argued to have been replaced by confinement in prisons for the 'mentally ill'), as well as the recent growth in the number of psy-professionals in the criminal justice system.

Frontier Development: Groceries or Blood?

Two models of frontier development are contrasted - that of Cohn and that of Belich. Both models supplement the otherwise useful standard models of frontier development in the field: the Innis model of Staples development and the Bunker-Moore model of Expanding Ecological Frontiers. The Cohn model grounds frontier development in violence. This not only includes land seizure from indigenous peoples - the focus of Hristov's work - but violent competition

between settlers for control of resources. There is further violence stemming from statelessness, banditry, location in geopolitical interstices, ethnic and linguistic diversity among settlers, and a Durkheimian collapse of social control predicated on labor forces of young unattached males and systems of labor control based on substance abuse and prostitution. The Belich model invokes Hirschman style backward linkages as the primary motor of frontier growth. The mere act of in-migration and settlement creates demand for food, lumber and draft animals that creates a thriving economy based on local supply. The applicability of both models is discussed in reference to frontier development in nineteenth century Thailand and Malaya, nineteenth century Texas, and the Anglo settler colonies more generally.

What Doesn't KILL You Makes You Stronger: Societal Death Processes and Economic Growth

Samuel Cohn's *All Societies Die: How To Keep Hope Alive* laid out a systematic model of societal death. The author stands on most of the arguments of that book along with most of the policy prescriptions for keeping societies alive. However, both reviews of the book and further evidence from other case studies suggests that the process of societal growth and economic development is darker than the rosy picture portrayed in the original manuscript. This paper presents an enhanced model of societal death that incorporates the perverse and destructive forces that accompany societal growth - dark mechanisms lead to improved standards of living and generalized personal security. The original model is presented - and largely defended - followed by the extensions that differentiate truly dangerous lethal forces from unpleasant and anti-humanistic correlates of growth.

Contrasting Global Gender Gaps in STEM Using Facebook Data and Offline Indicators

Despite the significant progress against gender inequality, we are far from equality. Even though the pandemic accelerated the digital transformation and the demand for workers, particularly in STEM areas, gender inequalities in the workforce are still wide. Monitoring gender inequality across the globe is essential to understand patterns and changes, such as the effects of digital transformation on gender inequalities. However, producing global gender gap

reports is challenging in terms of the time and costs needed to conduct these studies, and in developing countries, data sparsity can also be an issue. Prior work has shown the feasibility of using social media data, in particular Facebook Ads, as a complementary tool to assess gender gaps. In this study, we use Facebook Ads data to assess the global gender gaps, in particular, across STEM majors. We considered 198 countries and Facebook users' interests across 142 STEM and non-STEM majors. Our results show that in most countries, the proportion of female Facebook users is higher than males. Analyzing STEM and non-STEM separately, we observed that the proportion of male Facebook users interested in STEM majors is higher than females. However, within STEM majors, we observed two different patterns, while the interest in Engineering and Technology is higher among male Facebook users, the interest in Life Science and Math is higher among females. Finally, we contrasted our measures derived from Facebook with offline official reports and observed that countries with a low proportion of men interested in college majors on Facebook are associated with high gender equality in offline measures.

The Value of Cultural Similarity for Predicting Migration: Evidence from Food and Drink Preferences in Facebook Data

One of the strongest empirical regularities in spatial demography is that flows of migrants are positively associated with population stocks at origin and destination, and inversely related to distance. This pattern, first observed in the 19th century, was formalized into what are known as gravity models of migration. Traditionally, distance is measured geographically. However, other measures of distance, including dynamic ones that involve cultural factors, have also been found to be relevant to explain migration flows. Measures of cultural distance have not been widely adopted in the literature on modeling migration flows in part because of the difficulties associated with operationalizing and producing these measures across space and time. In this paper, we use a scalable approach to obtain proxies for measuring cultural similarity between countries by using Facebook Ads data and illustrate the impact of adding these measures of cultural similarity based on food and drink preferences to gravity models used to predict migration. Our results show that the new measure of food and drink preferences similarity derived from Facebook Ads data adds over and above standard explanatory variables in predicting migration, thus opening new opportunities to understand determinants of migration and to predict migration.

Branding of Stereotypes in Entrepreneurship in the Agri-Food Sector: Using Gender to Make Strategic Marketing

Evidence suggests that entrepreneurship is undoubtedly seen as a "man's world" and thus is believed to require characteristics that are stereotypically masculine, rather than feminine (Heilman, et al., 1989; 2001). Bruni (2004) has defined entrepreneurial action an archetype of social action and, as the institutionalization of values and symbols, it can be related to gender for a cross-reading of how gender and entrepreneurship are culturally produced and reproduced in social practices. Doing business is a social practice and so too is 'doing gender', but the latter is less evident than the former because commonsense attributes gender to the corporeality of persons and therefore to their being, rather than their doing. The belief that entrepreneurship is gendered means that distinctions between masculine and feminine, underpin and are inherent to considerations of advantage and disadvantage, exploitation and control, action and emotion, meaning and identity' (Acker, 1990) connected to entrepreneurship. Starting from this perspective, this contribution explores how a specific form of capital –gender – has been mobilized in the last decades in the agri-food labor sector in Sardinia (Italy), becoming a key asset for women entrepreneurship. The case-study is based on the collection and analysis of 30 in-depth unstructured interviews with women entrepreneurs, in order to highlight both the conscious and strategic use of the process of 'othering' within the masculine paradigm and the aware construction of a fake authenticity. The narrative elements collected from these entrepreneurs could suggest a strategic use of a stereotyped image of the female role in Mediterranean society (hospitality, warmth, good taste, refinement...), creating a sort of "marketing of diversity".

COLGECEN, Ahmet* (PhD, Hacettepe University, Turkey)

Turkey As a Transit Country on the International Migrant Route: Economic Informalization and Precarity

We can state that Turkey has faced a new dynamic in migration movements as of the 2000s and has become an international migration country (a destination and transit country for irregular migrants). Its geographical location has made Turkey an important location on the irregular migration route, especially for foreign immigrants trying to cross into European Union countries. Although the exact figures are not known, the participation of international irregular migrants in informal employment has started to attract attention. Even though the Turkish government has started to make changes in its institutions and rules regarding external migration under the influence of irregular immigrants from the Middle East and Central Asian Turkic Republics, most of the immigrants entering Turkey currently do not have a work permit. In fact, the entry and residence of a large part of them, whose numbers are not known exactly, are outside the legal regulations. The work experience of foreign immigrants without official residence status, work permit and language skills is characterized by poor conditions compared to the settled population. In addition, the absence of residence and work permits for entry to the labor market leads immigrants to precarious, informal and temporary forms of work. This provides a quick basis for immigrants without work permits to engage in exploitative unregistered employment. Increasing irregular migration of foreign nationals to Turkey continues. The vast majority of immigrants start their working life in urban informal employment. At this point, Turkey does not have a comprehensive migration policy to meet the external migration movements. In this study, the working practices of the global irregular migrants living in the city of Istanbul in informal employment and their temporary, precarious working styles will be conveyed. In this direction, forms of global insecurity, economic exploitation dynamics and social exclusion processes will be discussed.

Perceptions of Poverty and the Possibilities of Getting out of It in Crisis Contexts

The hyperinflation caused by the economic shock of 1990 has been the worst in the history of Peru. Although it is well known that this caused an increase in the population living in poverty and extreme poverty, the impact it had on the perceptions of poverty and on those of the possibilities of getting out of it is little known. In this research, these two perceptions are analyzed in a sample of community kitchen members and leaders who faced the economic shock with and without state assistance and who were interviewed in 2002. First, thematic content analysis is applied to a selection of texts from transcripts of nine in-depth interviews with eight leaders and one partner and two focus groups with partners. Then textual statistics were used to analyze the transcripts only of the interviewed leaders and see the relationship of the perception of poverty with the community kitchen. The results of thematic content analysis indicate that poverty is perceived as needs of a multiple nature, it is characterized by being visible and having levels, thus confirming what has already been identified in the literature. But, in addition, this is characterized by being omnipresent, generalized, being in permanent reproduction, having a speed of expansion and a destructive capacity. In addition, for the interviewees, the identification of multiple dimensions of poverty is associated with the deployment of capacities to face them. Likewise, three perceptions about getting out of poverty were identified: possible (identifying the routes according to the type of poverty, the stages and the factors), impossible and misleading ways. The similarity analysis showed the community kitchen as the core of the discourse of the leaders interviewees and the descending hierarchical classification analysis identified five classes of definitions of poverty in crisis context.

Student Climate Action and the Making of Viable Democratic Futures

Since 2018, students around the world have mobilised en masse in the student climate action movement. This paper considers how their participation constitutes a legitimate effort to realise more participatory and viable democracies, as well as a viable planet. Paying particular attention to how young people conceptualise, visualise and practice politics, and the reactions their politics has elicited over time, I investigate how student climate activism is shaping - even regenerating - Australia's political and democratic culture.

To do so, I undertake a close examination of the Australian context, as a part of the project 'New Possibilities: Student Action and Democratic Renewal.' In this paper, I examine how the context, the participants and the different representations of the movement have evolved over time. Comparing and

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

contrasting analyses from major protest events in 2019, 2020 and 2022, I examine who is involved, what they are doing and how they are represented in visual and media discourse.

The analysis suggests significant shifts in how students are situated among a growing network of older allies indicating a wider, intergenerational politics for climate justice and democratic renewal. This is also evident in the visual language of the movement, which has increasingly reflected calls for young people's recognition as citizens with rights to both a voice and a viable future. Finally, media analysis of the responses of commentators and political elites to student activism over a three-year period highlights how student action is making both expectations and possibilities for contemporary democracy.

Bureaucratic Encounters and Emotional Governance in New Zealand's Temporary Migration Regime

Contemporary migration management is characterised by rapidly changing rules and regulations that seek to create 'orderly' forms of migration, filter 'deserving' and 'undeserving' migrants and stratifying the rights and duration of stay of migrant populations. While policymaking elites often lead the direction of such forms of management, they are given shape and effect in the practices of migration and border enforcement officials and agents, both in terms of their decision-making prerogative and the effects of encounters in the lives of migrants. This paper explores these street level bureaucracies in relation to the role they play in generating feelings of precarity and social exclusion and thus contribute to the emotional governance of migration, the maintenance of temporary migrant populations with stratified rights and the ability of the state and employers to use and discard migrants. To explore these issues I draw on interviews from three interrelated projects undertaken with migrants holding temporary work and study visas in Aotearoa New Zealand. In this context, temporary migration programmes have become increasingly central to the state's migration regime, leading to a growing precarious regular and irregular migrant population, forms of social exclusion and exploitation in workplaces and other societal domains. In this paper, I focus in particular on three types of migrant assessment that are influential in reproducing precarious migrant populations: assessments of intimate relationships and partnership rights; medical evaluation and inadmissibility; and workplace exploitation and enforcement. Representing key instances where the legitimacy of migrants is established, these bureaucratic encounters also demonstratively contribute towards the affective states of migrants, submission and compliance to authority, and the emergence of creative resistance to the forces of migration control.

Spatial and Class Dimensions of Recent Refugee Settlement in Australia

Australia has received refugee inflows as a humanitarian component of its immigration program over the past seven decades. The Australian Government responded to the 2015 crisis in Syria by admitting a one-off 12,000 intake of refugees from Syria and Iraq in addition to annual humanitarian inflows. A large component of this Syrian-conflict intake were middle class refugees with university degrees and experience as working as professionals and in senior management prior to displacement who were " cherry-picked" by the Australian Government. Drawing on a four-year longitudinal study of 240 refugee families, this paper compares the settlement experiences of these middle-class refugees with those refugees who arrived in the same period from Afghanistan, mostly on women at risk visas, who had little formal education and pre-displacement employment history. It reflects on the barriers that Syrian and Iraqi professionals faced in reproducing their middle-class status in Australia and the upward class mobility of the children of Afghan refugees as part of the complex and uneven intersection of class background and refugee settlement experiences in receiving countries. Spatial dimensions are status introduced by comparing Syrian, Iraqi and Afghan refugee settlement experience in metropolitan suburbs and regional cities.

COLLYER, Fran* (University of Karlstad, Sweden)

Australian Sociologists: Knowledge Making, Identity and Global Position

Many Australian sociologists appear to have an unusually difficult time reconciling their identity as Australians, and as sociologists. This may, in large part, be a consequence of, on the one hand, Australian history having been 're-written' in recent decades through the 'history wars', forcing Australians to accept a dark and unwelcome knowledge of past atrocities; and on the other hand, the re-writing of sociology's own history, with new knowledge continually emerging of the systematic exclusion of women and members of the majority world from the sociological canon. The question arises of whether this might be a unique context from which contemporary sociologists 'make knowledge', or is this experience shared by many scholars who find themselves ambiguously placed between the global North and South? What does this tell us about the concept of the global North/South? Drawing on interviews with over 200 Australian sociologists and social scientists, the paper reflects on their understandings of their place in the world and the knowledge they consume, interpret, produce and circulate.

RC08-133.7

COLLYER, Fran* (University of Sydney, Australia)

What Happens to Sociological Knowledge in a Democratic Context?

It is common knowledge that sociological, and other social science knowledges, are often surpressed under authoritarian regimes – although there is undeniably a need for more research in this area. In contrast, this paper asks questions about these forms of knowledge in democratic societies, and follows the (non-linear) trail between knowledge production and circulation. To what extent do disciplines themselves curtail knowledge production? How do the relationships between disciplines influence what can, and cannot be said, written or heard? Why does some knowledge appear in the media, in public debates, in policies and legislation; while at other times it simply disappears into silence? How does the global politics of knowledge, with its institutionalised, hierarchical structures, hegemonically shape knowledge production and circulation even within democratic societies? Through the use of one or more case studies of knowledge production and circulation in the Australian context, questions about power and authority, interest groups, and the global structuring of knowledge are raised, and insights provided into factors that limit or enable the social impact of sociological knowledge.

Individualism and Critical Theory: Rethinking Critical Potential in an Individualized Social Environment

The overlapping of individualism and individualization represents one of the main challenges to renew the potential of a critical theory today, and this has to be included in the 'diagnoses of the time'. While active minorities of young people are struggling against this, in new forms of mobilization such as environmental movements, it is important to analyse the dynamic of this overlapping for a diagnosis of the hurdles that emancipative critical attitudes face today, again especially among youth. Individualization has become a way of constructing oneself in an unpredictable environment, balancing precariousness and opportunities, while the emphasis on merits and personal skills is largely supported by current neoliberal culture, promoting the development of an entrepreneurial-self, characterised by the capacity to totally assume on oneself the consequences of all choices. Because it becomes a form of discipline and control, individualization tends to develop a form of self-reflexivity as self-monitoring of one's performativity, rather than to be invested in social and cultural critique. We argue that this is mainly the result of the transformation of a historical and structural phenomenon (modern individualization) in a form of subjectivation (individualism as self-referential attitude), and that this calls for a different approach to classical notions of Critical Theory such as emancipation and alienation.

COMERFORD, Donnet* (University of Sussex, United Kingdom)

Understanding the Macro and Micro Levels of Climate Agreements and Education from the Perspective of a Small Fijian Village.

International climate agreements and climate education are currently foremost in global discourses. How are these discourses and policies represented at the micro level? How do emerging education systems, operating in challenging circumstances to provide basic education, translate and implement macro-level climate decisions and policies?

This paper aims to explore the current education system and its preparations for the predicted increase in frequency and intensity of extreme weather events; from the perspective of a small Fijian village.

I will use ethnographic and institutional ethnography approaches. Ethnographic tools will be used to understand the standpoint of the village community and others in the education system. Whilst, institutional ethnographic methods will be used to explore the national and international documents which provide frameworks for education as part of the wider climate change discourse.

Agtech and the Future of Farmwork: Insights on Labor and Equity in Agricultural Innovation

Many AgTech and FoodTech innovations begin and end with the proclivities of entrepreneurs and their investors. Those projects that do deploy grounded insights most often do so with the participation of farmers, or farm operators, co-designing knowledge that supports the goals of land-owners. While row-crop farmers may hire few workers to begin with, in labor-intensive agriculture, like fruit, herb, and dairy production, farm owners are one stakeholder who employ dozens if not hundreds of workers whose lives are impacted by new agricultural innovations. Many of the innovations in these industries promise to automate tasks performed by farmworkers, eliminating labor as an externality. However, the observed reality of many such innovations is that labor is augmented as opposed to eliminated. Drawing on observation insights from the 2022 harvest season in the increasingly automated industry of US hops production this presentation makes the argument that co-design research projects in AgTech and FoodTech have underrepresented farmworkers as meaningful partners in research and as a result, farmworkers' labor and the impacts of ag-tech innovations on their lived experiences remain under-explored. While there are many obstacles to meaningfully including a population that is less stable than land-owning farm operators, equitable development in AgTech hinges on the inclusion of marginalized voices in technology design projects. This presentation will suggest avenues and obstacles for the inclusion of farmworkers and spur conversation among other participants about the equity implications involved in the selection of participants for co-design collaboration in AgTech.

COMPANION, Michele* (University of Colorado-Colorado Springs, USA)

Use of Traditional Ecological Knowledge (TEK) to Promote Diversity and Inclusion in Drr

Traditional Ecological Knowledge (TEK) is part of a web of broader Indigenous knowledge systems that integrate complex sets of worldviews, values, relationships between humans and nonhumans, skills, practices, innovations, and place-based understandings that have evolved over centuries. The United Nations recognizes that Indigenous knowledges, cultures, and traditional practices make essential contributions to the equitable development and proper management of ecosystems (Article 31 of the Declaration on the Rights of Indigenous Peoples, adopted by the United Nations General Assembly in 2007).

TEK is multidisciplinary, utilizing participatory techniques which must be centered around community-member involvement. As such, if implemented properly, TEK can increase community participation from particularly marginalized groups or segments of the community, including youth and the elderly, livelihood clusters, gender categories, and socioeconomic status. Specifically sampling wide segments of a community reduces the tendency toward siloization.

TEK has been used successfully in projects focusing on disaster risk reduction around the globe. TEK has been used to improve forestry management practices to decrease the risk of bushfires and wildfires, to address climate change impacts on livelihoods and food security, access to traditional foods and medicines, sea level rise and flooding risks, the health of rivers and riverine systems, and others.

This discussion will present an overview of the ways in which TEK can reduce siloization by improving participation in disaster risk reduction planning and activities, including benefits and challenges. Specific case studies will be presented to demonstrate the utility of TEK as a mechanism for reducing siloization and vulnerability in historically more marginalized segments of the population.

COMPANION, Michele* (University of Colorado-Colorado Springs, USA)

"Building Resilience through Greening the Urban Landscape in Kyoto, Japan"

The importance of food security in urban environments cannot be underestimated. Food access is constricted in many urban zones due to lack of purchasing power, physical difficulties in getting to food distribution points, poor marketing structures, and infrastructural problems. In addition, years of poor and ad hoc urban planning in major cities around the globe have led to loss of green spaces, further limiting food production opportunities and increasing heat island effects. As the impacts of climate change are compounding, city temperatures are rising. Heat waves are now accounting for more urban deaths in vulnerable populations globally, and urban air quality is creating long-term health problems across many densely populated cities.

While there are many challenges, there are significant opportunities as well. A discussion of on-going efforts to improve urban food production and access, reduce heat indices, reduce carbon emissions associated with moving food supplies and the creation of food packaging, and improve air quality will be offered. These efforts have led to important changes in urban landscapes, with empty lots and rooftops being converted into agricultural or green space. Even minimal improvements in food security and food access for urban populations have food security and health implications. Cost reductions associated with improved health outcomes and increased resilience in the face of urban disaster crises allow associated cost savings to be redirected to other disaster readiness and mitigation strategies. Opportunities for improving air quality, reducing heat indices, and improving food security in Kyoto City will be discussed. Tokyo provides a positive deviance model, supporting the success of several rooftop innovation that contribute to economic development and livelihood opportunities.

Adult Children's Transition in or out of Marriage and Older Parents' Wellbeing in Turkish Families

Intergenerational exchanges and support form an important component of later life families, although studies have tended to focus on the upward flows from adult children to older parents in need. However, considering that downward support flows continue even after adult children transition into adulthood as long as parents maintain a good health, any key events in the lives of the younger generation could influence the older generation's wellbeing. The upward impact of adult children's life transitions is also shaped by several other mechanisms such as whether the transition in question is considered culturally and normatively acceptable. Non-normative life transitions adult children experience such as job loss and divorce present a host of challenges in the lives of their older parents. Adult children's characteristics such as gender, age, marital and parental status could further shape this upward impact. In this study, we interviewed members of both generations to understand the complex interconnections between life transitions in the younger generation and the wellbeing of the older generation in Turkish families. In-depth interviews were conducted with 20 older mothers and 14 older fathers on their contact and support exchanges with each of their adult children, employing a within-family analysis. Additionally, 8 adult sons and 16 adult daughters were interviewed about their relationships with both their fathers and mothers. Since these interviews were conducted with members of families with different socioeconomic backgrounds, we also had the opportunity to examine how and to what extent older parents utilized their resources to buffer the impact of their adult children's life events on their wellbeing. Preliminary findings demonstrated a stronger role of cultural norms over gender norms on the upward impacts. Both adult daughters' and sons' unapproved marriage formation or divorce had negative influence on their parents' wellbeing.

Within-Family Differences in Downward Support Flows to Adult Children in Turkey during COVID-19 Pandemic and Economic Crisis

As life expectancy increases, parents and their children enjoy longer years together, and intergenerational support exchanges continue to have a significant influence in later life. Most research has studied the upward flow of support from adult children to their older parents in need of care, even though the downward flow of support continues into children's transition to adulthood. Additionally, the impacts of crises on the lives of both generations also shape the nature of these flows. The objective of this qualitative study is to examine how and to what extent parental support to adult children in later life is provided in the context of the global COVID-19 pandemic and economic crisis in Turkey. To study how these intersecting crises have affected support exchanges between generations, in-depth interviews with 20 older mothers and 14 fathers from families of different socioeconomic backgrounds were conducted. We gathered data from parents on their support provision to each of their adult children by employing a within-family approach. Thus, we had the opportunity to understand, in the face of life-altering crises, which adult children are prioritized by their older parents and for which type(s) of support. Preliminary findings show that adult children's specific needs related to health events, childcare, job loss, and financial difficulties, and also older parents' health and financial capabilities, shaped the nature of downward flows, but only to certain children. This means that parental favoritism is influenced not only by parents' attitudes towards their specific adult children but also children's needs altered by multiple and intersecting crises.

CONNELL, Raewyn* (University of Sydney, Australia)

Beyond Backlash: New Authoritarian Masculinities and Their Social Bases

We should not be dazzled by the spectacle of Trump, Modi, Putin or Bolsonaro, but should look at the groups, institutions and forms of power in the background. What are the problems to which authoritarianisms offer solutions? A crisis-of-capitalism story is not enough, though the new global economy with its huge inequalities and mass insecurity is certainly involved. Also involved are the violent legacies of colonialism, shifts in population structure and ways of living, and turbulent gender dynamics involving troubled masculinities. At mass level, authoritarian politics taps anxieties about the erosion of patriarchal family structures, changing sexualities and the growing autonomy of women. At elite level, inflated managerial prerogative and extreme concentrations of wealth provide a template for political masculinities that feature arbitrary decision-making, brutality, and the deliberate stoking of racial, sexual, national and religious enmities. But these strategies may also be risks to hegemony for authoritarians in power.

Beyond Marginality: How We Can Build a New Mainstream World Sociology and What It Might Look like

Discussions of decolonizing knowledge have mainly worked at the level of critiques, ideas, epistemologies and hegemonies. I think we have made some progress there, and it's now more urgent to think at a practical level: about workforces, institutions, funds, means of communication. That's necessary if a de-colonized sociology is to become the mainstream rather than a marginal approach, in both the global North *and* the majority world. Those involved in this work will become as familiar with CODESRIA and CLACSO as they are with the Chicago School; will develop the techniques of international cooperation in research and teaching (could ISA assemble the know-how we already have?); will learn the open-access approach and bibliographical resources of global-South communication projects such as SciELO; and will engage with the knowledge needs of subaltern communities, classes and movements for whom a decolonized sociology can become an active resource.

CONNELL, Raewyn* (University of Sydney, Australia)

Response By Raewyn Connell: Making Good Universities

The COVID pandemic has highlighted managerialism and precarity in university life, the unexpected resilience of the workforce, and the indifference of governments. Deeper issues remain, including vast material inequalities, the alignment of universities with privilege, and a neo-imperial economy of knowledge. Either we sink into the world of competition and exclusion implied in the corporatized future into which university systems are drifting, or we create another idea altogether of good universities. Sociology has important work to do in that cause: illuminating how universities actually work, pioneering the transformation of disciplinary knowledge, and producing the knowledge needed by social movements for change.

CONNOR, James* (University of New South Wales, Australia)
WADHAM, Ben (Flindes University, Australia)

A Typology of Administrative Violence in the Australian Defence Force

Since its inception, the Australian Defence Force (ADF), like all five eye military nations (US, UK, Canada, NZ), has been challenged by the phenomenon of violence within the institution. Over the last fifty years, changing social and political circumstances and state-civil-military relations, via the impact of scandals, have compelled militaries to respond to diversity and discrimination issues. We describe the practices and traditions that constitute these scandals as defence abuse. Defence abuse encompasses all violence within the ranks and it is endemic to the military institution. The martial traditions include hazing and bastardisation, physical and sexual harassment and assault, and administrative violence. We argue that administrative violence is a new category of violence which describes the discretion commanders can draw upon within a closed military justice system to harass and discriminate against a serving member. This type of violence is under-acknowledged as a cause of on-going trauma and consequently has not received the reform focus it requires. We draw upon a 3-year research study on institutional abuse and organisational reform in the ADF to construct a typology of administrative violence, its character and effects. We have developed a chronology of key institutional abuse reviews beginning with a bastardisation scandal at RMC Duntroon in 1969. Via textual analysis of 35 reviews into military culture and military misconduct (defence abuse) since 1970, combined with seventy-three in-depth semi-structured interviews with survivors, we show how administrative abuse is undertaken within the

system. We argue that the institutional violence is not a dysfunction but part of the institutional fabric. We argue that exceptionalism, martial masculinities, and fraternity are three important generative mechanisms. But we also acknowledge that an institution of and for violence is structurally restricted in the ways that it can make sense of the causal mechanisms of violence.

Wada's Global Education Strategy: Work As Imagined Versus Work As Done – Reflections from Oceania and the 2022 Wada Global Education Conference.

The World Anti-Doping Agency's (WADA) 'one size fits all' approach to anti-doping education is an example of a regulatory and education framework that imagines a perfect, unitary world but fails to account for global cultural differences. In this paper we discuss the mismatch between how education and regulatory compliance is imagined by the governing bodies versus how it is enacted (or not) in Oceania. The objective was to dissect these different views and the challenge they present to the legitimacy of the anti-doping system. The data we draw on is from a WADA funded research project into the perceptions of legitimacy of anti-doping regulation in Oceania. Data were collected using semi-structured in-depth interviews (33) with athletes, support personnel, and administrators in Olympic and professional sports across Oceania. Grounded theory and indicative thematic analysis were used to identify themes. We then used the research team's experiences of the 2022 WADA Global Education Conference as a counterpoint to explore how WADA perceives education and regulation versus the enacted experiences of our participants from Oceania. We found that stakeholders in Oceania wanted to comply but had difficulty doing so due to a combination of time and resource poverty, technological barriers, lack of expertise and a belief that doping was not a threat in Oceania. Conversely, we noted that WADA's education strategy is underpinned by assumptions that resources are readily available, that education necessarily means improved compliance and that athletes tended to be seen as passive receptacles to be educated. Further, the notion of 'values' acted as a talisman to ward off doping – yet there was little interrogation of what these were nor how they relate to diverse cultural contexts. This profound gap in expectation versus reality creates a risk for athletes of inadvertent doping and challenges the legitimacy of the system.

Homelessness in Italy. Housing Led Policies between Rhetoric and Welfare Reformation

Homelessness has become a subject of renewed attention in the past decade in Italy because it on the rise in all large and medium-sized Italian cities and it is more and more the subject of political interest. In 2015 the Italian government has approved a *Guidelines for tackling severe adult marginality* and recently, both in the National plan against Poverty 21/23 and in the Recovery and Resilience Plan, several interventions are financed to fight homelessness. Many of the services planned and financed are oriented by housing led policies and question the effective right to a house for poor people in Italy. As a matter of fact, housing is not a pillar of the Italian welfare system but rather a private and familiar resource and after the economic crises and the pandemic, housing severe deprivation and distress are taking the characteristics of a real emergency. The Italian Federation of Organizations working with the Homeless people (www.fiopds.org/en) has played a strategic role in experimenting new approaches to homelessness as the Housing First model in different regions and also support the rethinking of the public dimension of homelessness in Italy. Are the services financed through the new plans supporting an effective change in the Italian welfare system on housing and homelessness? Through monitoring the implementation of Housing First and housing led policies in Italy the paper firstly depicts the situation of homelessness and housing in Italy and finally question if the services described effectively produce a reformation of the Italian welfare system.

The Role of University in Prison: A Study on Italian Institutions

Many Italian Public universities are committed in granting to jailed persons their access to university studies. In Italy this process has actually involved 42 public universities gathered in a national network and concerns more than 1000 inmates. Notwithstanding the national framework of the penitentiary system in Italy, the relation between University and prison witnesses and still produces different realities. The differences can be defined as the result of the

local institutions and specifically of prison's directors attitude, of the different access to social policies inside the prisons, to spaces and opportunities provided to Universities and their inmate students. How this process has been developed in Italy and what effects can be shared and analysed is part of the presentation. Furthermore, a specific focus on the sicilian prisons and the relations with one of the public Universities of the region would be exposed. The final aim of the presentation is to analyse how this process is supporting social inclusion in poor territory and which relation can be structured between these two different institutions and realities: university and prison.

Intellectual Figures in the New World: Practices and Representations of Professors of Sociology in Brazil (1930-1945)

The aim is to investigate, in comparative terms, the trajectories, practices, and representations of the French professors linked to the chairs of sociology at the University of São Paulo - Paul Arbousse Bastide, Claude Lévi-Strauss, and Roger Bastide. We intend to show that each one embodied a specific intellectual figure during the period of the French missions, considering the polarization between the figure of the "researcher" and that of the "ambassador", and that such differentiations are associated with the training and teaching and research practices established in the intellectual field of origin and in Brazil. These three professors occupy a specific position in the French intellectual field and are distinguished by their training from North American professors, who also circulate in the country. In addition, the aim is to show the role of Durkheimian sociology in the interwar period in the rivalry relations established between France and the United States for intellectual domination in Brazil, as well as the circulation of competing theories in the transnational space.

CONSTANTOPOULOU, Christiana* (Panteion University, Greece)

Les Frontières De l'Europe : « Reportant » La Guerre d'Ukraine

Le conflit ukrainien est un conflit géopolitique reflétant le « politique » et le « cadre communicationnel » actuels. Comment se présente la crise ukrainienne dans les médias « occidentaux » ? Les grands thèmes du reportage autour de cette guerre sont relatifs à *la crise humanitaire*, à *la crise énergétique*, à *la réflexion « identitaire »* et enfin, aux *analyses géopolitiques centrées sur un conflit-héritier de la guerre froide*. Toutefois, cette façon de « narrer » la réalité semble dissimuler une partie des transformations en train de se faire ; si à l'époque des deux blocs, le pouvoir s'exerçait au nom d'un danger frontal clairement identifiable, au temps « des citadelles » une grande menace qui frappe, semble souvent être cet « autre » (ex. le migrant qui essaie de fuir le désastre et entrer au champ de la sécurité). Bien que les « divisions de blocs » pèsent sur les représentations sociales relatives à la réalité qui nous entoure, les étiquettes des « actants » ne correspondent plus à leurs actes (ex. affinités extrêmes droites européennes avec le gouvernement Poutine, extrêmes richesses des oligarques russes etc.).
　Nouveaux concepts pour désigner de phénomènes pas si nouveaux?
　Vieux concepts pour cadrer les nouvelles réalités ?
　Aussi bien l'Occident et la Russie se sont appuyés dans leurs discours, sur les tropes rhétoriques et émotionnels de l'époque de la guerre froide. Toutefois, des nouvelles inégalités sont en train de se former et dans ces réalités la frontière instaure une coupure et engage plusieurs niveaux d'exclusion constituant « de nouvelles peurs et violences potentielles » (en augmentant l'exclusion et en dressant de nouvelles frontières). Malgré ces changements en train de se faire les médias (de masse ou médias sociaux) ne sont pas prêts à se rendre compte de ces mutations majeures en cours.

CONSTANTOPOULOU, Christiana* (Panteion University, Greece)

Relations of Non-Commitment: Analyzing the Contemporary Sociality

The media discourses "communicate" the ongoing reality in almost the same stories in all countries rendering current myths about *remote existence* (work, education, entertainment) the substructure of the current culture. All the kinds of narration of the contemporary "politics" coexist with the frame discourse of everyday lifestyle issues and personal happiness in close relation with consumer goods.

The *public sphere has become saturated with the exposure of private life and the private life is very much "developed" on-screen and online.* By his process relationships become less important, as they often evaporate and are easily dissolved. Sociology has to explore how this virtualization, makes social bonds collapse very quickly (in contrast for instance with the dreamed "love forever" of love stories): sexual issues are one of the contexts in which hyper reality (key concept in Baudrillard's theory) has intensely penetrated, as well.

Illouz (2021) has remarked the role that capitalism plays in practices of non-choice where "unloving" is particularly striking; the unmaking of social bonds, is connected to contemporary capitalism characterized by practices of *non-commitment*, practices that enable the quick withdrawal from a transaction and

the quick realignment of prices or the breaking of loyalties; in this frame, it is not strange why female sexuality remains the main "show" (ex. revenge porn, videos and violations of privacy).

Already since the mass culture process, many social manifestations (such as affinities and relations) became more and more virtual. A good part of "experience" has thus been transferred to the imaginary (a tendency accentuated by social media practices): solidarities and links are thus recreated erasing little by little the engagement. Our analysis is based on case studies of the implication of "contemporary actors" in the frame of internet platforms either on political or personal issues, where the "presentation of self" prevails.

CONTESSA, Denise* (University of Pisa, Italy)

Filtered Identities and Its Contradictions in the Tourist City. Evidences from Bologna, Italy

A growing number of cities toil to shape a comprehensive narrative of themselves that is profitable in the global tourist market. The competitive nature of *city break* tourism highlights the municipality's urgency for a recognizable urban identity in order to successfully attract tourist flows. Nevertheless, cities are known for being cradles of hybrid and multiple identities. Hence, the journey embarked upon by city administrators to create an exhaustive portrayal of urban identity is one riddled with inconsistencies. Whilst a vast literature is present on the tourist city subject, most studies are concerned with the social and economical aftermath of touristification. Yet, the complex of ideas and representations produced by city policy-makers about the city itself (i.e. its identity), has often been under-studied. This paper argues for the need to investigate the decision-making processes that shape identity-based tourism development policies. The importance of this approach lies in the assumption that such processes underlie a broader question of who has the right to claim the city and its identity. The purpose of this research is to investigate the contradictions that arise from the clash between multiple representations of the (tourist) city. Using the city of Bologna (Italy) as a case study, this research provides a compared analysis of representations of the urban identity in City Branding initiatives, participatory laboratories and local press. Using a mixed-methods approach consisting of document analysis (qualitative) and content analysis (quantitative), official policies proceedings, reports and newspaper articles are examined. Results highlight how competing urban identities are filtered within inhabitants' consultation processes, held by the administration. Moreover, highly contradictory narratives regarding specific urban areas are found, conveying paradoxes in the identity representation processes. The research reveals that, although being given a voice, inhabitants' perception of the city is only marginally taken into account when promoting city branding campaigns

Between Fear and Resentment. Flâner between Urban Emotions for a Political Walk.

In the metropolis, Simmel wrote, subjects faced a plurality of emotional shocks from which they must defend themselves by *sterilizing* their mind and becoming *blasé*. But in that same metropolis, in the nineteenth century, the *flâneur* (the stroller) appears, a new figure that moves invisible among the crowd in search of those same emotions and of the traits of modernity and of the city in which it takes shape.

Strolling through the city is a practice that has found its relevance in the practice of the *critical citizen* able to make the urban crossing an instrument of political analysis of social processes. The stroller's gaze can reveal the details, and his sociological imagination, that allows him to connect them to the wider phenomena and processes, can reveal the city.

Among the objects of his observation there are emotions, understood as indicators of the characteristics and quality of urban living. Two of the most classic of these are fear and resentment.

Fear is able to redefine the geography of the city, tracing invisible but effective borders, especially denying to certain categories of citizens such as women, elderly and children, whole portions of the city making it limited for them both on the spatial and temporal level. Also resentment acts as a border that makes people feel *distant* from the city. They find themselves not only excluded from the spaces and the opportunities offered by the city, but also in the condition of not being able to vocalize the protest for their urban and symbolic "peripherality".

Returning to walk in the city, crossing it with the reflexive competence of the stroller, is a necessary tool to experience the city and to analyze the social processes that take shape in that, and the inevitable starting point of every project of change.

The "New Right" in Liberal Canada: Intersectional Gendered Dimensions and Implications

Despite its international reputation as a bastion of liberalism and pro-feminist politics, Canada, like other liberal democracies, has also seen the emergence of a "new right" with authoritarian and masculinist tendencies. Campus-based men's rights and anti-abortion groups organize under the banner of free speech and academic freedom in order to wage campaigns against gains made in university contexts around a range of social justice concerns, many of them associated/aligned with intersectional feminisms. In 2022, a right-wing trucker convoy occupied the capital and shut down border crossings, demanding the government resign, while harassing sexual, gender and racialized minorities. Especially since Donald Trump's US Presidential campaign in 2015, there has been a marked growth in right-wing extremist organizing on and offline, as well as a "mainstreaming" of social conservative and right-wing populist agendas, targeting political parties, electoral politics and policy reforms.

This talk will consider these developments in Canada in relation to the transnational anti-feminist gender politics of the resurgent right.

Constructing Masculinities and Femininities through the Basketball Free Throw

This paper addresses bodies in time and space, namely, in describing the processes of constructing masculinities, femininities through the bodily aesthetics and performativity of the basketball free throw in the National Basketball Association. From the advent of the sport of basketball in the late 1890's through event the 1970's the basketball free throw as performed as an underhanded shot was seen to be in the realm of acceptable cultural masculinity, with some of the best performers of the free throw at the professional level being the most expert. Over time, the underhanded free throw, or "granny shot" began to be perceived within the male sporting preserve as an expression of femininity, and at that an older femininity, with the ascribed term "granny free throw" coming to be associated with it. To the present, the underhanded free throw has all but disappeared from the professional and collegiate ranks, with even All-Star retired NBA player, Shaquille O'Neal, a less than competent free throw shooter once proclaiming to the last of the NBA All-Star players, and amongst the most proficient in history employing the underhanded free throw, Rick Barry, "Even if I shoot 0% from the free throw line, I will never shoot the granny shot!"

What explains the construction of this form of masculinity insisting on the overhand free throw as its only expression, while also diminishing its form despite clear empirical evidence that it is indeed one of the most effective and efficient forms of the free throw? How has the cultural construction of masculinity and femininity been at the center of the competing forms of the free throw? Are there emergent possibilities of masculinity? How was the body shaped by this cultural ideology of the masculine body through this performativity? How did local and global culture shape these processes?

Neoliberal Responsibilization and the Family: State Regulation of Families of Those Subject to Criminal Justice in the UK

In the United Kingdom, the family has long been the subject of policy concern. Often connected to wider issues of welfare, education and health, the family unit has previously been situated as a governable space to regulate boundaries of, and conformity to, acceptable conduct as law-abiding citizens (Simon, 2007). Within the context of crime and justice, efforts to responsibilize non-State actors have led to the dispersal of responsibility for crime control and prevention. The family has not been exempt from this trend. In this paper we address the question: *Through what method(s) does the State seek to regulate families of those subjected to criminal justice and, so, control crime in the UK?* Our analysis identifies several strategies through which the State seeks to regulate

the responsibilities expected of families, served by a host of civil orders and criminal sanctions as well as stigmas attached to the failure to police their relatives' transgressions. These strategies reinforce *precarious citizenship*: a state of *quasi*-criminality by which the State seeks to regulate families who have 'failed' to prevent relatives from offending, and 'failed' to rehabilitate, re-integrate, and reform members to become 'good' citizens. We argue that, if the State is to ask families to take responsibility for matters of prevention and rehabilitation, then this must be placed within the context of aggressive retrenchment of welfare and which, more broadly, speak to an inequality of arms (by gender, race, class) in an individual's capacity to fulfil responsibilities (King et al., 2021).

Contextualising Age-Friendly Communities: Moving Beyond the World Health Organization

Urbanisation and population ageing are two international trends creating social transformation. While Australia is smaller in size than most developed countries and is sparsely populated, most people in Australia reside in urban areas with 79% of total population growth occurring in capital cities during 2017-2018 (Australian Bureau of Statistics 2019). Such urbanisation results in urban sprawl and land clearing, which places pressure on the quantity and quality of natural and semi-natural environments. This is accompanied with demographic shifts, with approximately 15% of the total Australian population (3.8 million people) aged 65 years of age or over in 2017; a significant increase from 9% in 1977 (Australian Institute of Health and Welfare 2018). Age-friendly communities are viewed as a mechanism to accommodate this growing proportion of older adults within urban environments. Age-friendly communities are empowering and supportive urban environments that foster inclusion, social participation, and ageing-in-place. To assist with the task of creating and supporting age-friendly communities, the World Health Organization (2007) has developed eight domains that encapsulate the features of an age-friendly community, as well as toolkits and checklists to assist communities to plan, identify, and assess their age-friendliness. However, in this presentation, I will explore how relying on these domains, checklists and toolkits is too simplistic when considering context, including the dynamic and evolving nature of our communities. By drawing on my community-based research in the City of Clarence (a local government area in Tasmania, Australia), I will demonstrate the myriad of social and geographical factors that influence age-friendliness and the importance of, and how to develop, context-specific age friendly models. This will demonstrate the importance of working in and with community members, and with awareness of the urban environment when recommending, designing, and implementing age-friendly initiatives and agendas.

DUBBELD, Bernard (Stellenbosch University, South Africa)

Gigs, Hustles and Hope: Mixed Livelihoods for Global Youth Beyond the Wage

The twenty-first century has shattered the idea that countries across the world are moving towards livelihoods secured by salaried work, something which the Covid-19 pandemic has aggravated. How then, do young people in South Africa experience this precarious economic situation? How do they navigate a dearth of permanent work, and how does this shape their economic and social lives?

Like the situation globally, South Africa has a small number of secure well-paid jobs that some young people, influenced by race and class, access and an informal sector centred in peri-urban townships where the poor majority hustle and eke out a living. The country therefore serves as a microcosm for global divisions and inequalities.

We begin by describing recent changes to global capitalism, showing how these shape livelihoods for young people, framing this discussion through two key concepts: precarity and capital. Precarity is understood as taking on diverse forms across time and space. Capital, refers to both the production of value through capitalism and how social and cultural capital is leveraged through status, sets of resources and networked relationships.

A set of ethnographies illuminate "what young people are already doing", helping to unpack precarity and capital. The case studies traverse the post-apartheid generation, exploring privileged "gamers" and the children of the white working-classes that were employed in state enterprises. On the other side of the racial divide, township hustlers make a living through a carwash and others look for wage labour but experience rampant discrimination. The case studies illuminate relations between the post-apartheid, millennial generation, whose circumstances are shaped by shared social, historical and political conditions. Rather than a lack of skills, employability and experience, their productive livelihood generating practices point to possibilities for fulfilling work and challenges linked to how local and global capitalism enable social status, forging social stratification.

COOPER, Adam* (Human Sciences Research Council; Stellenbosch University, South Africa)

"Morphing between the Margins": How Youth Make a Living across Multiple Spaces in South Africa, the Global South and Beyond

In this theoretical paper I develop a conceptual framework to map youth livelihoods in the global south, with South Africa as exemplary. In such places young people regularly morph between different income generating spaces, where the state has varying degrees of control. Spaces contain different rules and rewards, calling for concepts that integrate broad structures with young people's struggles to hustle and improvise, as they make a living largely beyond the formal labour market.

Bourdieu's concept of multiple capitals initially helps to theorise young people's innovative practices to accumulate resources across space. Capitals that hold weight in the informal economy that dominates slums, townships and favelas differ to influential capitals that have power in the formal labour market. However, Bourdieu's "field" is not entirely applicable to the global south, where fields are particularly uncoordinated, state power is partial and markets are fragmented.

South African and global south youth livelihoods are forged across mainstream and peripheral translocal sub-fields, operating between physical places, including urban, rural and peri-urban areas. This approach concentrates on the global south, making particular reference to South Africa, but has increasing importance for youth everywhere, as flexibilised capitalism exacerbates precarity and wage labour becomes ever more insecure worldwide.

COOPER, Jai* (University of Newcastle, Australia)

'a Jump into Cold Water' - Hysteresis in Youth Environmental Workfare

Youth work and climate action are on a collision course. In recognising the urgency of responding to the climate crisis, youth work practice will inevitably lead to young people engaging with environmental science and scientists. In the Global North, proposed radical responses to the climate crisis are emerging. These include the appropriation of the means of production, calls for the widespread mobilisation of labour and even conscription of young people to address climate disasters. Questions emerge of what happens when youth work is done by those invested in environmental science, and when young people find themselves coerced into environmental action.

Authoritarian responses to environmental problems are not new. Over three decades, Australia has produced several national 'youth environmental workfare' programs. The most recent incarnation, 'Green Army', was based on an Australian Government intention to establish a 'standing' environmental workforce. In pseudo-military programs of both name and structure, delivered by the not-for-profit conservation sector, a mismatch occurred: environmental scientists found themselves supervising young people and young people found themselves supervised by 'accidental' youth workers. Interviewed in the wake of Green Army, the experiences of both the team supervisors and their young team members revealed a reorientation of the ideals and investments of all involved. While this mismatch of Bourdieu's 'Don Quixote effect - hysteresis' led to individuals adjusting strategically, their precarious employment conditions and an increased awareness of the climate crisis only heightened their ontological insecurity.

Understanding hysteresis will strengthen sociology's capacity to support young people and youth workers through the increased frequency and intensity of quixotic and authoritarian projects which will, inevitably, be conceived to address the climate crisis. The satirical reflexivity to be found in Cervantes' 'Don Quixote' will find application by researchers who encounter the contemporary struggles of politicians, scientists, youth workers, young people, and us all.

COOPER, Jai* (University of Newcastle, Australia)

'How Did Us Cutting Down Trees Fight Climate Change?' - Environmental Workfare and Disillusion

Authoritarian calls have recently increased from academics, activists and politicians in the Global North seeking an emergency response to the climate crisis. An emerging pseudo-military narrative poses significant consequences for workers and the marginalised. Proposals have included the appropriation of the means of production and even the return of conscription. Implementing Green New Deals will rearrange the relationship between capitalism, labour and the environment. Policies to develop Green Jobs are intended to simultaneously address environmental problems while offering security for workers. Such proposals often expand upon an established history of workfare programs. Hence, sociological examination of 'environmental workfare' programs can assist with critical understanding of the mobilisation of workers to fight climate change.

In Australia, three decades of national environmental youth 'workfare' programs have been undertaken with pseudo-military titles such as 'Green Army' and 'Green Corps'. Such environmental work has engaged a diverse range of actors: from university-qualified environmental scientists to unemployed urban and rural youth. Programs have been erratically initiated and ceased subject to political favour. While government promotion conflated these programs with action against climate change, works focussed upon biodiversity restoration. This paper critically examines the experience of the Australian 'Green Army' program which was proposed to establish a 'standing' environmental workforce. It explores the political conditions and rhetoric of its inception, its effectiveness in addressing the climate crisis, and the factors contributing to both its cessation and the absence of any similar programs since. Based on interviews and focus groups conducted during 2018, the reflections of former participants, both the young team members and their supervisors, demonstrate the precarious positioning of environmental workers and their potential for disillusion.

COPE, Nicholas* (RMIT University Vietnam, Vietnam)

Sarva Mangalam! an Exemplar of Practice-Based Research in the Academy

Electroacoustic composer Professor Tim Howle and film-maker Dr. Nick Cope have been collaborating on a series of visual music films since 2002; cross-disciplinary and inter-departmental in nature, the video 'Sarva Mangalam!' evidences practice led research contexts explored in the academy, and may be of relevance to explore in fields where the dominance of traditional or conventional formats for knowledge production and dissemination remains the norm. In this session the work will be screened and its research contexts discussed.

The work seeks to explore notions of what it means to compose with sound and moving image in works where the sonic and visual are treated as commensurate, and can be seen to extend notions of what constitutes visual music – practices which look to musical modes of composition in their realisation. Sarva Mangalam! begins to engage with wider notions of 'the soundscape' (Schaefer 1993), sound walks, sound-ecologies and field recording which have become widespread in musical academic circles in recent years, and to bring these into the realm of visual music composition. Taking Viola's analogous view of the video camera as a form of microphone, then visual music composition can be extended to explore video recordings within frameworks opened up by notions of soundscape, acoustic ecology, and the ambient.

In locating the wider research contexts for his practice, Cope (2012) has noted his work to explore notions of an affective, expanded cinema of attraction and sensation, citing Birtwistle's observation (2010) that 'a number of filmmakers, yet surprisingly few theorists, have concerned themselves with the ways in which the senses of sight and sound combine, mix and sometimes blur in cinematic experience'; Kennedy's analysis (drawing on Deleuze) of film working ultimately through sensation, and Beugnet's *Cinema and Sensation* being essential touchstones in locating the sensory explorations this practice explores.

CORCHETE, Charlotte* (Sciences Po (CRIS), France)

The Role of Human Skills in Multicultural Tensions at Work: The Case of France

Studies have shown that certain ethno-racialised groups are perceived as having less "human skills" by employers (Kirschenman & Neckerman, 1991; Midtbøen, 2014; Moss & Tilly, 2001; Shih, 2002). Employers' perceptions vary according to ethnicity as well as gender and religion of the candidate (Di Stasio, 2019; Weichsebaumer, 2020).

To address this issue, this paper will first present a qualitative pre-survey carried out in France with recruiters in order to understand the place of human skills, also known as 'soft skills', as well as the place of combined criteria such as gender, ethnicity and religion in the categorisation present in the discourses of recruiters concerning French candidates of Maghrebi or African origin.

In a second step, the paper will present quantitative data concerning the results of an experiment conducted with a large sample of recruiters. In the framework of this experiment, respondents had to analyse a CV, a job offer and a letter of recommendation from a former employer before answering a questionnaire asking them to evaluate the candidate, notably in terms of human and relational skills. The results of this experiment are intended to measure whether the mention of human skills in a letter of recommendation can alleviate employers' fears concerning French candidates of Maghrebi origin and thus increase the chances of the latter being positively perceived by employers. The originality of this study lies in the fact that it measures the impact of reported statements by a former employer and not self-reported statements by a candidate as has been done in previous studies (Agerstrom et al., 2012).

The aim of this study is to gain a better understanding of recruiters' apprehensions about people from other cultural backgrounds in order to be able to provide job candidates targeted by these fears with recommendations regarding the promotion of their human skills.

CORDEIRO DE FARIAS, Alberto* (Universidade do Estado do Rio de Janeiro (UERJ), Brazil)

Simmel's Sociology of Imagination.

The present communication presents the partial results of a research program on imagination as an aesthetic operator and as an object of sociological knowledge in Simmel. Imagination was evoked as an object at the same time relevant and challenging for sociological analysis, being implicit in many classical and contemporary models. Sometimes considered as irreducibly subjective (Freud and Sartre, for example), sometimes as an irremediably holistic phenomenon (Castoriadis, for example), the social processes that condition the imagination, as well as those constituted by it, were relatively obliterated from a sociological perspective. In this context, the main difficulty encountered in the transition from a philosophical approach to a sociological approach to imagination, from which many problems arise, was the link between the description of its operating mechanisms and the broader social and cultural dynamics constituted by it. In other words, the question of how one passes from the properties of imagination as a faculty to its social properties and vice versa. In this work, I suggest that it is possible to extract from Simmel elements for a "sociology of the imagination", understood as a description and an explanation of the dynamics of that faculty from the point of view of individual subjectivity vis a vis the constitution of the social, the constitution of society and its conditions in the modern era. The argument is that the analytical fecundity of the Simmelian understanding of sociological theory gives us elements to think about the constitutive operation of imagination as a medial term between what is most subjective in human beings and what is most objective in a supra-individual sense, thus overcoming those difficulties implicit in traditional approaches to the imagination by social theory and by theories of society.

RC08-134.2

CORDEIRO DE FARIAS, Alberto* (Universidade do Estado do Rio de Janeiro (UERJ), Brazil)

What Is a "Systematic History" of Sociology? Presentation of the Problem and Some Hypotheses.

The present communication intends to expose the general contours of an exploratory line of research: that of a "systematic history" of sociology. I would first like to present the idea of a "systematic history" of sociology as an effort to unite two frequently dissociated perspectives in the consideration of sociological theory, relating deductive chains of theories to elements of a diachronic order. I intend to show its origins in late 19th century models and approaches to neo-Kantianism, particularly those of W. Windelband and E. Cassirer, but also, more contemporaneously, in Klaus Lichtblau. A "systematic history" of sociology is doubly concerned with questions concerning events that concern the historical, institutional and social identity of the discipline, as well as with the internal aspects of the systematic development of some classical social-theoretical formulations. The systematic perspective taken alongside the historical perspective leads us to conceive another general framework for understanding the history of social theory and theories of society other than the current one, that is, the one that is mainly concerned with periodizations and that divides this history into disciplinary and pre-disciplinary. Its advantage lies both in the undoing of a progressive vision of the history of sociological knowledge, insofar as it relativizes scientific evolution in the passage from a pre-disciplinary to another disciplinary thinking, but also because the systematic questions allow us to insert attention in the history of the discipline to epistemic aspects, which are not considered as much as the conceptual ones, around which studies on the genesis of sociology revolve - such as the progressive development of modern notions of "State", "Economy" or "society". Finally, I would like to demonstrate the exercise of a "systematic history" of sociology, considering the genesis of this discipline from aesthetics within the scope of theoretical philosophy.

The Relevance of Neighbourhood of Residence in Shaping the School Choice in a Quasi-Market Educational System. the Case of Milan

Quasi-market educational settings that promote freedom of choice, emphasizing the agency of households as an instrument to counteract inequalities in accessing educational opportunities, have only softened the link between housing and school, favouring a limited part of the population. Several studies have in fact proven how school segregation is still present in these systems. Moreover, research shows that this freedom of choice has favoured more affluent and educated families over the more disadvantages, inhibiting then the goal of reducing inequalities.

This article aims at disentangling the link between residence and school choice in quasi-market educational urban contexts, by analysing the case of Milan as a paradigmatic example.

A survey, disseminated from June to October 2021, addressed to families with children to be enrolled in primary school, have permitted to collect data on 1300 families about the criteria guiding the choice. The questionnaire also focused on potential constraints and opportunity provided by the place of residence. The sample represents the heterogeneity of the population in terms of nationality, level of education and professional status.

In the analysis, neighbourhoods of residence have been clustered according to their socio-economic profile in order to understand whether and to what extent they affects families' chance of opting out from the local school, including public or private options. We hypothesis that parents' choices depend on a complex mix of reasons driven by both own socio-economic status and profiles of neighbourhoods of residence. Proximity as a criteria varies of relevance accordingly to households' and territorial profiles.

Shading some lights on these relationships would raise policy implications also related to the supply side, since the school offer is strictly connected to territory, and to wider reflections about the role of housing market in narrowing or expanding educational opportunities.

Trayectorias Escolares y Pandemia En La Educación Secundaria Desde Un Abordaje Regional En Argentina

En la presente ponencia se presentarán los resultados preliminares del Proyecto de Investigación Científica y Tecnológica 2019-03906 *"Abandono escolar: Un estudio sobre los entramados de eventos y experiencias, en los procesos de interrupciones escolares con jóvenes de escuela secundaria",* aprobado y financiado por el Fondo para la Investigación Científica y Tecnológica; y da continuidad a una línea de trabajo que se desarrolla en el Programa de Investigaciones de Juventud de la FLACSO desde 1998 abocada a los estudios longitudinales sobre trayectorias juveniles. La estrategia metodológica adoptada en esta instancia del proceso investigativo -el cual se enmarca en la técnica de follow up- es de diseño transversal y de tipo cuantitativo a través de la aplicación de un cuestionario autoadministrado entre agosto y septiembre de 2022 a estudiantes del 4to. año de educación secundaria de las jurisdicciones mencionadas, contemplando diversidades geográficas, de género y de modalidad, orientación y tipo de gestión educativa.

La investigación indaga en las características educativas, pre-pandemia, pandemia y postpandemia, así como en los aspectos familiares y laborales de las juventudes encuestadas. Específicamente los datos relevados pretenden aportar al conocimiento sobre la vinculación, distanciamiento y desvinculación en la escuela secundaria de las juventudes, enfatizando en la experiencia de los años recientes. En particular se indagará en los procesos de interrupción/reingreso escolar de jóvenes de entre 15 y 17 años que asisten a la escuela secundaria del Gran Buenos Aires, Río Cuarto (Córdoba) y Salta en el periodo 2019-2022.

Con los resultados del estudio se espera contribuir al debate teórico sobre el abandono escolar, la educación secundaria y la condición juvenil, así como brindar herramientas para el desarrollo de estrategias metodológicas de corte transversal y longitudinal en la materia a fin de elaborar conocimientos válidos para la transferencia hacia programas y políticas estatales, educativas y del sector social.

Women's Bodies As Open Access Flesh. Reproduction, Technology, and Global Inequalities

The human body has long been the object of trade, exchange and traffic, but today the astonishing advancements of biotechnology allow for fragmentation, conservation, and exportation of cells, fluids, and tissues. These are sold and purchased in a globalized, transnational bio-market, generating unprecedented commodification.

The market of female body parts is a profitable business. Reproductive technology, fertility tourism and global legal services thrive, as body components are often purchased by residents of the Global North from women in the Global South. Key drivers of emerging markets for female biocapital are women's lower status, income and protection. Women put a lot more labor in the extraction of their biocapital than men. However, in reproductive marketing, women are stimulated to be donors in a rhetoric of love.

Fluidity, recombination and trading of body parts increase what I call "women's open access flesh", i.e., body parts are made widely and readily available to society. The presentation will start with an introduction to the original concept of women's "open access flesh", a soft resource which is made of disposable units and subject to relentless exploitation. The presentation will continue with two empirical examples of inequalities in global reproduction: human milk trading and the surrogacy market. In both, women living in low-income countries sell fluids and services (often for a fragment of their final value), mostly to affluent, international individuals or couples. The presentation will conclude with remarks on alternative schemes of thought for feminism. While artificial reproductive techniques open to completely different possibilities and experiences, commodification is disturbing not only on ethical grounds, but because it transforms women into objects of property holding, rather than active subjects.

CORREA, Maiara* (PhD student at University of Sao Paulo, Brazil)

Derechos Humanos y Garantías: ¿Cómo Llega La Remisión De Penas Al Sur?

En un movimiento para ampliar el acceso a la justicia y garantizar los derechos humanos en América Latina, a pesar de un creciente y significativo movimiento conservador en boga, algunas políticas han cobrado fuerza en las últimas décadas, como las referidas al sistema de justicia y penitenciario brasileño. La oferta de educación y acceso a la literatura en los espacios de pena y privación de libertad en América Latina y especialmente en Brasil, tomó la forma de acceso a derechos no perdidos por la remisión de la pena. Una política que en sus orígenes nació en la dictadura franquista española y estuvo dirigida a opositores políticos encarcelados por el régimen, en el contexto del sur global donde el racismo, la desigualdad y el analfabetismo funcional configuran el perfil de esta población, significa sin embargo una manera de ofrecer justicia y ciudadanía, apropiándose y adaptándose a las necesidades locales, a partir de la demanda de acceso a la educación y apoyo cultural. En las últimas décadas, algunos proyectos de ley fueron formulados en un intento de instituir legalmente la remisión de la pena a través de la lectura, sin embargo, solo fueron reconocidos oficialmente a través de regulaciones recientes - Resolución 391/2021 y por Nota Técnica Conjunta 72/2021 del DEPEN/CNJ. Las políticas de acceso y promoción de los derechos humanos en las cárceles resultan una interesante clave de investigación desde perspectivas epistemológicas del Sur ya que, en su mayoría, son modelos y discursos importados de países del norte global. Esta propuesta pretende presentar y discutir los fundamentos sobre los que se basan las políticas de remisión de la pena por la educación y la lectura en Brasil, tratando de perseguir sus justificaciones, límites y transformaciones, pudiendo así comprender cómo las políticas y sus justificaciones viajan y son instituidas bajo nuevos sesgos.

Strengthening Networks in the Cities' Outskirts: Young Black Women during the Pandemic and Post-Pandemic Crisis

The pandemic has further deepened the distances between young people according to their social class, gender, color/race and place of residence. Although the serious losses for the entire youth population are recognized, including the creation of the expression "lockdown generation" by the International Labor Organization, its effects have not reached all youths equally. The study presents the results of a quantitative and qualitative research conducted with 208 young people living in the outskirts of São Paulo, during and after the social distancing imposed by the pandemic covid-19, focusing on situations of education and work.

Based on an intersectional approach, the results show how young and black women were most affected by loss of income and work, in addition to increasing difficulties in the combination of work, remote education, and household chores.

At the same time, these women sought to create possibilities for insertion and strengthen solidarity networks in the absence of adequate public policies.

Youth Entrepreneurship in the Cities´s Outskirts of Brazil: Meanings and Disputes

The promotion of entrepreneurship has been presented as the main occupational policy to face the difficulties of youth insertion in the labour market in different countries, with the encouragement of international organizations. It has also become part of curricula in schools and universities. In addition to an alternative to face unemployment, in the context of the "new spirit of capitalism", being an entrepreneur becomes an attitude valued and encouraged: to have initiative, to go after, to be propositional in the search for the improvement of one's own living conditions. Several studies have shown how the idea of creating their own business can have a strong appeal among young people from different social strata, considering the higher unemployment rates they face, the quality of occupations that are destined to them, the search for greater flexibility and autonomy. Would we be facing the triumph of the "neoliberal subject"? In the context of the pandemic and pos pandemic crisis, we present the results of an action research conducted with young residents of Brazilian citie´s outskirts who work on their own or as entrepreneurs in different areas: culture, communication, fashion, aesthetics and food. In a country where the need to "turn around" to earn a living has always been very present, we intend to analyse the new contours and meanings of this type of work in the face of the strong stimulus to entrepreneurship,

either by public bodies or by private entities, especially in the peripheries of large metropoles. The disposition (or not) for entrepreneurship has multiple origins and the meanings attributed to it are diverse, even among young people who share a similar position in the social structure.

Quantity over Quality? Rating Dynamics in Online Markets

A fundamental challenge for online markets is to build up trust between suppliers and customers without physical interaction. For this purpose, platforms introduced reputation systems where customers indicate their satisfaction with a product or service. These systems promise to create transparency of service quality, potential customers can base their decisions on, leading to the drop-out or improvements of low-quality service providers to stay competitive. Indeed, many online markets have extremely high average rating scores and long-tail distributions for the number of ratings per company. However, it is not entirely clear what the underlying mechanisms are. Does the system work as intended and increases the average quality over time, is simply a rating inflation observed, or is a self-reinforcing effect of established companies generating more traffic responsible for driving out newcomers?

In this paper, we try to disentangle the impact of the quantity of ratings from the average rating scores on receiving future ratings, and thus being able to stay in the market. We compare the theoretical mechanisms sketched above using simulation models to assess to which extend the quantity of ratings on top of the quality of ratings accounts for the observed rating distributions. We evaluate these models by analysing dynamics in empirical data. We collected ratings from an online gig platform, retrieving complete longitudinal data of 29,694 reviews for 2276 companies, covering 12 years.

Our preliminary findings suggest positive effects of higher average scores on weekly orders but a negative effect of the quantity of ratings with a positive interaction effect between both. Determining the role of quality and quantity of ratings will be useful to re-evaluate the functionality of reputation systems in online markets and possibly adjust the ranking algorithm to facilitate access for new entrants.

Public Policies and the COVID-19 Pandemic: Brazilian Government Responses, What Explains Them and the Effect of Policies

The main objective is to understand the actions promoted by Brazilian government to face the health and socioeconomic crisis triggered by Covid-19, focusing on the causes that can explain the responses and on the effects of these action on society and health. Although it analyses the case of Brazil, it aims to contribute to the development of an empirical and analytical approach that can be used in future comparative studies on the public policies of the pandemics encompassing BRICS countries. It assumes that a pandemic is a focusing and critical event to be understood with the theoretical tools of the sociology of disasters. The intention is to describe government actions and policies – health, social and economic – and identify the explanatory factors for the governmental responses and describe the effects of these actions and policies on the course of the pandemic. The analysis is based on secondary sources, such as bibliography, documents and public databases. I argue that government actions to combat Covid-19 occur within an institutional framework that includes socioeconomic conditions, the characteristics of social protection system and the health system, but they are strongly related to factors such as the ideological profile of the head of the national executive power and his government, in addition to society's attitudes. The course of the pandemic and its impact on society are primarily related to government actions, including the way of managing the crisis triggered by the pandemic, even if constrained by previous socioeconomic and institutional factors and by society's attitudes.

El Ciclo De Movilización y El Rechazo a La Nueva Constitución En Chile

Las recientes movilizaciones chilenas enmarcadas en el Estallido Social de octubre de 2019, mostraron una inusual sincronía entre ciclo de protestas y ciclos político-electorales. El estallido social tuvo una alta capacidad de impactar en resultados electorales a corto plazo, dando inicio a un proceso constituyente con elevada presencia de activistas y movimientos sociales y allanando el camino al gobierno de Gabriel Boric, un exdirigente estudiantil que protagonizó el ciclo de movilizaciones del 2011. Sin embargo, la capacidad modeladora del estallido se fue paulatinamente debilitando, tanto por factores externos (pandemia y crisis económica) como por la emergencia de un contra-

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

movimiento que revindica orden. De este modo, la nueva Carta Magna fue contundentemente rechazada en septiembre de 2022, a pesar de proponer una redacción de vanguardia en materia de derechos sociales, feminismo, ambientalismo y reconocimiento de los pueblos indígenas. ¿Qué explica esta derrota? Esta comunicación problematiza algunas de las principales tesis que han circulado para dar cuenta del resultado: 1) el proceso constituyente es un desvío del Estallido Social, 2) existe una brecha insalvable entre la agenda identitaria de los movimientos sociales y las demandas materiales de la sociedad y 3) la sociedad chilena no quiere cambios, sino orden. El proceso constituyente, aunque intentó superar la crisis política de representación que gatilló el cambio constitucional terminó por profundizarla y, a pesar de que la Nueva Constitución se hacía cargo de las demandas sociales del Estallido, no logró articular un relato común que mostrara la necesidad del cambio para la construcción de un orden justo en sintonía con el sentido común. El caso chileno reafirma la dificultad de pasar de un imaginario instituyente de justicia social a uno que logra instituirse de modo estable.

New Stories for Food Futures. a Latin American Experience of Action Research

The objective of the paper is to contribute to the debate on the potential of colloboration for local development, focusing on the role of different actors for the development of the territory. It aims to provide a brief overview of the main and innovative theoretical references and to contribute to the scientific debate through the case study of the *University Program of Social Incubation* (PUIS), incubated at the National University of Quilmes, Argentina, with the Territorial Market project (*Mercado Territorial*).

The PUIS experience is situated in the scientific debate on models of territorial development and social inclusion, or as defined by other scholars on open innovation places (MARRA, 2022). In fact, new forms of ethical and sustainable enterprises are developing in different international contexts (COHEN 2006), with the contribution of civic participation of producers and consumers, identified in the *Civic Food Networks* (RENTING et al., 2012), capable of generating innovative social processes and triggering *socioeconomic circuits* (PASTORE, 2020) and thus practices of solidarity and popular economy (PASTORE, 2015) with the contribution of different actors of the territory, institutional and non-institutional.

The hypothesis of this work is that it may be the ability to coordinate the network of interrelationships created among different actors in a territory that can determine the emergence of ethical forms of business and trade for sustainable local development.

This paper illustrates the preliminary findings of a larger international research project between Europe and Latin America (essentialsproject. eu) related to the emerging field of research on *Sustainable Entrepreneurial Ecosystems* (VOLKMANN et al., 2019). The experience investigated seems to demonstrate how it is possible to create a virtuous circle among researchers, activists, policy actors, and other practitioners, using action-research methodology, to build alternative practices for a sustainable food future.

Climate Crisis, Anthropocentrism and the Renewal of Sociology

The critique of sociology's inherent anthropocentrism is certainly one of the greatest challenges for contemporary sociologists. This critique had already been elaborated for some decades within sociology itself, especially in the field of environmental sociology, which warned about sociology's inattention to the finitude of natural resources and the agency of non-human living beings. More recently, in the context of the worsening climate crisis and the call for a planetary ethics, the critique of anthropocentrism has become even more emphatic. The critique addresses the very humanist and Enlightenment idea of human autonomy and agency, which are at the core of the sociological concept of (modern) subject. In the paper I show how studies linked to research on conviviality from different disciplinary fields, by emphasizing the deep bonds of interdependence among different living beings, can contribute to the construction of a post-anthropocentric sociology

The Symbolic-Temporal Dimension of the City in Contemporary South American Cinema

The objective of this work is to present and problematize the concept of ruins built within the narrative structure of the films A Terra e a Sombra (2015) and De Longe Te Observo (2016). While the first film, which takes place in the interior of Colombia, represents family disaffections due to memories brought to the present, the second film creates the city of Caracas (Venezuela) within the fragmented relationships in the urban space. The ruins are configured as social landscapes that show imaginary realities in which characters are involved in disappearing relationships, structured by destabilized affections. These films are part of a recent South American cinematography that has elaborated cities in the temporal and symbolic dimension, locating the place from a pragmatic

point of view, expressing dilemmas of memory spaces and of centers and regions populated by marginalized people, evidence of the resonances of the historical marks of colonization. To understand these phenomena, the methodology is anchored in the interpretation of filmic discourses and in the filmic analysis of images, deconstructing allegorical signs, symbols of intimacy and codes about ruins and memories. The analysis of the temporal and symbolic construction of the filmic South American city can demonstrate how the destabilized affects, one of the central concepts of the research, can modify the way in which urban spaces and the social relations existing in them. From this reflection, the ruins reveal temporal and symbolic structures of the social constitution of affective encounters and disagreements. Our theoretical foundation is anchored in a philosophical socio-anthropology, based on authors such as Gaston Bachelard (1988), Armando Silva (2014), Gilles Deleuze (2005) and Gilbert Durand (1997). We corroborate the hypothesis that South American films diffuse resonances of the social imaginary built in narratives linked to affections, ruins and memories in social spaces and times.

Witnessing One's Mother's Surrogacy. Experience of Canadian Youth.

Surrogacy is a mode of third-party reproduction that has generated a substantial body of research. Until now, research on surrogacy has focused mainly on the experience of surrogate mothers, their motivations and their physical and psychological well-being, on the fertility pathways of intended parents, their motivations for having children in this way and the relationships they have with their children, on the relationships between surrogates and intended parents, and on the development of children born in this way. Research conducted directly with children affected by surrogacy is rarer in comparison. This is particularly the case for the children of surrogates, who have the particularity of witnessing the pregnancy of their mother and the handing over of the child to the parents after the birth. This communication reports on the results of qualitative research conducted with 62 children of surrogates aged 5 to 24 years in Canada. The results show that surrogacy is not a one-dimensional experience for these children, and while most are proud of the fact that their mothers have helped people start families, others are more circumspect. Among the elements that generated negative affects were the upheavals in their daily lives during the pregnancy, the medical complications experienced by their mother during the pregnancy or a separation with the baby that was not well prepared.

New Modes of Collaboration during COVID-19: Reflections on the Conditions of Emergence and Sustainability for Long-Term Improvement of the Health System

The pandemic has put significant pressure on the health and social services systems of many countries, affecting not only the supply of services, but also how they are delivered. Quebec (Canada) has not been spared from this situation; many actors at the micro, meso and macro levels of the health system have been mobilized in the search for innovative solutions to address this crisis. The need to quickly respond to the needs related to COVID-19, while maintaining general services to the population, led to the emergence of new modes of interprofessional and intersectoral collaboration. Within this context of responding rapidly and effectively, we have witnessed a redefinition of certain professional roles, whether formally through negotiations with the professional licensing bodies or more informally through a rearrangement of roles within work teams. Intersectoral collaboration involving a more sustained partnership between primary care organizations and various social actors (e.g., police, schools, community-based organizations, cities) has also emerged as a preferred means of reaching certain vulnerable populations, which were even more difficult to reach during the pandemic. Based on four qualitative research projects conducted in different sectors of the Quebec health system (Family Medicine Group, primary care organizations), we will present findings related to the conditions of emergence and sustainability of these new modes of interprofessional and intersectoral collaborations. The presentation will address the following questions: How has collaborative work been redefined? Under what conditions? What lessons can be learned for the longer-term improvement of the primary care sector?

Neo-Emotions As Cultural Practices: What Can the Sociology of Emotion Learn from Compersion, Doom-Scrolling, and Black Joy?

The sociology of emotion has historically focused on universal and fixed taxonomies of discrete emotions. In Stets and Turner's foundational *Sociology of Emotion Handbook* the first question posed is "how many emotions are there?" (2006, p. 1); a simple (and simplifying) question. Yet, as Stets and others more recently argue, much can be gained from examining "the rich array of emotions" (Stets 2010, p. 265) and cases in which discrete emotions overlap, blur, or become ambiguous (Bericat, 2016). I argue that a sociology of emotion and the body is incomplete without attending to the emergence of situated, emotion-specific neologisms (neo-emotions) aimed at capturing a novel sensation of alignment or misalignment with one's dynamic environment. Neo-emotions, when situated within macro-level processes and salient cultural events, can illuminate the constrained yet creative practices that social actors use to address the disconnect between one's emotional vocabulary, embodied sensations, and situations. In other words, they represent emotional capital in flux and the generative potential of habitus. As such, neo-emotions are analytically rich cultural practices with diverse origins, types, and catalysts (digitalization, disasters/crises, and social movements). I develop a sociology of neo-emotions and discuss the emergence of several neo-emotions: compersion, doom-scrolling, flightshame, and Black joy. I embed these neo-emotions within broader, macro-level trends in digitization, social movements (including queer, feminist, anti-racist, and climate activist movements), and resurgent disasters and crises (including the COVID-19 pandemic). I highlight key questions for a sociology of neo-emotions, including what effect the use and spread of neo-emotions has for collective change.

Tackling Grand Challenges in Multi-Stakeholder Meta-Organizations: An Institutional Work Perspective

Tackling grand challenges has sometimes been associated with the need to reform the institutions that support our current societal system. Scholars have pointed out that this institutional change would be better served by the collaboration of organizations from different fields (public, private and civil society), despite the risk that such heterogeneous actors' interests and visions may differ and generate conflictual relationships. Meta-organizations, i.e. associations whose members are organizations, have been identified as organizational devices able to neutralize conflict among members, change institutionalized practices and address grand challenges. Unfortunately, little is known about the micro-mechanisms unraveling within meta-organizations to achieve these successes. That is why we ask *how meta-organizations, from a micro perspective, affect the institutional reform their members intend to shape in response to grand challenges*.

Through an in-depth case study of a multi-stakeholder meta-organization, I explore how its public and private members – despite different worldviews and interests – seek to address the grand challenge of sustainable urban mobility. Applying insights from the institutional work approach, I analyze interviews complemented by secondary data to identify sets of purposive actions (theorizing, negotiating and routinizing), which – combined – allow members to develop a common vision for resolving urban mobility issues. While member-organizations face collaborative tensions hampering their work, they are supported by the meta-organization staff to create a common ground. Testing their plans in a real context allows members to revise their shared vision and provide evidence of their collaboration's relevance, encouraging members to maintain their work and emulate it in other territories.

The study contributes to meta-organization and institutional work literature by expanding micro-level understandings of the effects of meta-organizations on efforts to instill institutional change intents performed by heterogeneous actors.

Utilizing Citizen Participation to Manage Pluvial Flooding

In literature, nuisance flooding is defined as a 3-10cm (~1-4 inches) flood with a velocity of up to 3m/s, causes no significant damage, and is cumulative. Unlike extreme infrequent events, nuisance flooding is not large enough to cause substantial property damage or significantly threaten public safety. However, it is large enough to cause public inconveniences, economic loss, infrastructure stress, real estate devaluation, and heightened public health risk. Potential sources are precipitation, extreme high tides, high river stage, and these natural processes interacting with civil infrastructure. Although nuisance flooding can have many potential sources, rainfall-driven or pluvial is the least discussed. Pluvial flooding is thought to be a problem of engineering and storm-water drainage and is often left out of flood research. Nuisance flooding can be a pre-determinant of areas likely to flood during extreme events. The lack of research and available data presents a roadblock for understanding nuisance flooding and its impacts. There is also a lack of quantitative records on occurrence and magnitude and site-specific or local flood and flood loss data for pluvial flooding.

Flood risk management is traditionally an expert-driven space. Studies have shown that the citizen-generated data can be effective to flood modeling and flood hazard mapping process. The involvement of citizens in data collection for environmental monitoring and scientific research has been broadly referred to citizen science, crowdsourcing, volunteer geographic information, or participatory GIS. Local knowledge is a valuable resource when conventional data it not available or out-of-date. Ignoring local knowledge permits environmental and human injustices. The goal of this research is to study how and in what ways local spatial knowledge can be used to produce pluvial flood maps.

Technological Changes during Pandemics: Opportunities for Growth and Organizational Challenges for Argentinean Torts and Labor Lawyers.

The emergence of a complete digital working experience propelled by the ultimate adoption of digital files by the judiciary during the pandemics has allowed Argentinean lawyers to keep practicing despite the absolute absence of in-person public activity for almost two years. At the same time, this very platforms have provided professionals with a unique opportunity to expand their practice to geographical areas distant from their traditional offices, as demand for physical presence in front of the courts has notably dwindled and as clients have got used to virtual contact themselves.

Nevertheless, the opportunities for professional growth created by this technology appear to be at risk of being outpaced by a growing amount of pressure on lawyers by stakeholders and clients, who can now easily access information on the course of their files and therefore demand immediate efficient responses without compromising quality value. Thus, organizational challenges are posed on the legal profession while lawyers themselves struggle to adapt to a new context. A combination of strategies for organized professionalism and a deeper degree of horizontal collaboration and coordination between similar professionals once competitors seem to arise as a solution to urgent needs, yet too early to judge if an effective and sustainable one as well.

Our analysis focuses on small law firms practicing torts and labor law in Buenos Aires City and its outskirts (the so-called Buenos Aires metropolitan area) covering an area of 3,833 sq km that accounts for almost 35% of the country's population. Organizational, horizontal coordination, and interdependence issues seem to have grown steadily among them since digitalization took place.

God Is the Ultimate Scientist: Lds Conceptualizations of Science

Religions and religious individuals think about science in many ways. In this presentation, we focus on members of one religion – The Church of Jesus Christ of Latter-day Saints. Drawing upon twenty semi-structured interviews with members of the LDS Church, we examine how they think about and conceptualize science, generally. For many of our interviewees, they perceive no conflict between religion and science. They explain that the reason there is no conflict is because their god is akin to a scientist; their god works through natural laws that scientists are attempting to understand. In other words, as science advances, many of our interviewees see this as science moving closer towards understanding the natural laws that their god already understands and utilizes in order to achieve his/her/their aim. One notable finding is that this perspective is particularly common among interviewees who lack familiarity with science and scientists. We draw on several theoretical perspectives to understand how Mormons conceptualize science and their god.

Religiosity Is Declining but Giving Is Increasing: Can the Nonreligious Really be Less Generous?

We examine whether there are differences in giving to secular charitable organizations and religious organizations between the religious and nonreligious. We present two studies to examine this question. First, we correlate the percentage of the US adult population that is nonreligious with inflation-adjusted charitable giving over time, finding a positive correlation. Our second study utilizes the 2019 wave of the Panel Study of Income Dynamics to examine if there are significant differences in giving between the religious and nonreligious to religions as well as to eight types of secular charitable organizations. The nonreligious, net of controls, are significantly less likely to give money to religions. However, contrary to prior studies, we find that the nonreligious are not less likely to give to secular charitable organizations compared to the religious.

CRAMER, Meta* (University of Freiburg, Germany, Germany)

Epistemic Sovereignty in the West Indies: The New World Group in the 1960s

This paper conducts a case study of the ‚New World Group', an intellectual movement of West Indian social scientists in the 1960s and early 1970s who developed a precursor of decolonial theory in dialogue with Latin American dependency theorists at the time and established the anglophone Caribbean as a space of knowledge production. Involved in the decolonisation process of the West Indian territories in the 1960s, the New World Group focussed on the notion of 'epistemic sovereignty and the understanding of the postcolonial West Indian societies in the context of their colonial history of the plantation economy.

Building on contributions on the Centres and peripheries of knowledge production and global circulation of knowledge, I will argue that the 'New World Group' objected to the postcolonial order of knowledge production in the West Indies on an institutional and epistemic dimension and represents a fruitful example of how small-scale contextualised empirical studies of Southern knowledge production further enrich the debate on how scholars in the South actively challenge colonial legacies and engaged with each other's work. The Caribbean, relatively recently achieving formal decolonisation, is often overlooked as a small region. However, it is confronted with the language-based challenge of participating in the strong asymmetric anglophone discourse. It represents a vivid case study to shed light on peripherialised social sciences traditions. In my presentation, I want to analyse the core ideas of the New World Group and their contexts as well as exemplary trajectories of its members to illustrate their mobility and engagement across the South and the North.

CRAMER, Meta* (University of Freiburg, Germany, Germany)

Institutionalizing and Decolonizing Anglophone Caribbean Social Sciences 1950-1990: Four Generations of Transnational Knowledge Production

In my contribution, I want to present a historical case study of the transnational institutionalization and decolonizing efforts of Caribbean social scientists in the West Indies between 1950 to 1990. Transnationality played a crucial role for these scholars on three levels: institutionally building a regional university, politically achieving formal independence through a regional federation and epistemically in developing a regionally-focussed research agenda.

The argument I want to put forward is that Caribbean social sciences and scientists represent an illuminating example of transnational knowledge production in which colonial and postcolonial power asymmetries were challenged and negotiated. By developing a periodization of four generations of social scientists, colonial and Caribbean institutional and intellectual history, I attempt to demonstrate how academic dependencies were differently addressed and engaged with in the West Indies during the post-war period.

Firstly, the 'generation zero,' diasporic Caribbean intellectuals in the 1930s and 1940s were engaged in anti-colonial thought and activism in London and laid the groundwork for the 'New World Group,' the second generation of scholars in the 1960s who shaped the post-independence era. The first generation of the 1950s was characterized by Euro- American-oriented research and the fourth generation by a neoliberalisation and theoretical crisis during a simultaneous success of Gender studies. All of these scholars deployed different strategies of activist, literary and scholarly work and actively shaped institutions by e.g. funding own journals and changing curricula.

The periodization will make visible how the transnational social sciences community in the West Indies was engaged in developing critical, anti-colonial

thought, thereby effectively challenging the British control of the higher education system until the 1960s and its legacy afterwards. From this meso-level perspective, macro-historical arguments of centre-periphery structures on the global level can be further refined and the role of transnationality for anticolonial knowledge production can be analysed.

Intimate Partner Violence in the Spanish Digital Press

About 122 news items on Intimate Partner Violence (IPV) are published every day in Spain. The main objective of this research is to analyse what has been published in the Spanish digital media about IPV between 1 June and 31 July 2022.

News from local, regional, and national digital media have been collected through the *Mynews* newspaper library. A Boolean search was carried out using terms such as partner violence or gender-based violence. To make the sample more manageable, only articles with more than 40% of relevance have been chosen. Relevance is calculated based on the frequency or the location of the terms within the news item.

Only 248 of the 836 digital media returned results. Information on 7,467 news items has been analysed. The media that have published the most about IPV are "La Vanguardia", "ABC", and "El Faro de Vigo". Thirty per cent of the news items were published in national newspapers and 60% in free newspapers.

After eliminating duplicate news items, the content of 1341 articles was analysed. More than 10 categories have been established according to the information contained in the articles. Events about arrests or trials are the most common topic. What political parties transmit to the media, what proposals they suggest, or what criticism they have received is analysed in another category. A particularly relevant theme is the one related to services, both existing and those requested by several organisations. Many articles share information on official reports or statistics about partner violence.

Almost all news items refer to men's intimate partner violence against women. Information on partner assaults by women can also be found only if the case is very serious. Information on same-sex partner violence is almost non-existent. To sum up, IPV is a rich and nuanced topic in the Spanish digital press.

CRIVELLARI, Paolo* (IUT, University Of Toulouse III, France)

Industrial Risk Prevention between (a lot of) Technocracy and (little) Democracy

The definition of risk is particularly important, since risk entails uncertain and disputed knowledge (Beck 1992). This is particularly true in risk policymaking, which cannot be considered as the result of inherent properties of substances and activities and is the outcome of a construction process (Borraz 2008) that involves risk definition, framing and sensemaking. More specifically, the activity of defining risk in prevention (that involves naming, selecting and categorizing) has important consequences in the inclusion and exclusion of actors, in acknowledging some types of expertise and not others, in allocating resources, leading to procedures that can have more or less efficacy and legitimacy, thus resulting in various degrees of technocracy or democracy.

Our proposal is based on empirical sociological research in industrial risk prevention. The SIMAGE (acronym in Italian for Integrated System for Environmental Monitoring and Emergency Management) in the industrial area of Porto Marghera (Venice, Italy) has been studied (qualitative fieldwork in 2009, 2013 and 2018). Empirical evidence shows that: 1) the private and the public sector have collaborated in the design and development of SIMAGE (at the same time an innovative device and a new service for the population), defining risk in scientific and technical terms to the detriment of alternative definitions; 2) experts from both sectors have worked together in confined spaces with low social noise (Gilbert and Henry 2012), creating a technocratic duopoly of knowledge; 3) citizens, who had their own concurrent definition of risk, have been excluded from the whole process and were considered just as the passive receiver of a unilateral communication emitted by the institutions about risk. The conclusion will focus on: industrial risk definition and policy framing; democratization and depoliticization in risk prevention; efficacy and legitimacy in risk prevention governance.

RC39-581.3

CRIVELLARI, Paolo* (IUT, University Of Toulouse III, France)

Technology in Disaster Prevention and Management: Innovation, Governance and (concealed) Knowledge

Public policy preventing and managing man-made or natural disasters must confront the urgency of the measures to be taken, the vast scale of the negative effects on individuals and the environment, and the seriousness of the material damages. Institutions at multiple level are urged to anticipate, manage and rebuild, and to include citizens in participatory procedures in order to replace top-down crisis 'government' with less hierarchical and more inclusive crisis 'governance'. Technological devices and systems are funded, designed, tested, and implemented, leading often to innovations, collaboration

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

between institutions and private companies that blur boundaries between the public and the private sector, and the production of knowledge or, in some cases, agnotology.

Our proposal is based on empirical sociological research in industrial risk prevention and crisis management. SIMAGE (acronym in Italian for Integrated System for Environmental Monitoring and Emergency Management) in the industrial area of Porto Marghera (Venice, Italy) has been studied (qualitative fieldwork in 2009, 2013 and 2018). SIMAGE is at the same time an innovative technological device and a new service for the population that has no equivalent in Europe, designed in 2001, implemented in 2007 and still operational. Empirical evidence shows that: 1) experts from the public and the private sector have collaborated and produced knowledge on technology for disaster prevention and management, and for crisis communication; 2) the production of knowledge has been coupled with the production of ignorance, namely concealing expertise and policymaking processes from the citizens and the media to avoid public scrutiny. The conclusion will focus on: technological innovations for industrial major accidents prevention and management; public-private partnerships in crisis governance; the production (and the concealment) of knowledge in disaster management.

Promising Practices and Barriers to Help-Seeking in Severe Cases of Domestic Violence: Findings from the Canadian Domestic Homicide Prevention Initiative with Vulnerable Populations

In this presentation we describe themes that emerged from interviews (conducted as part of the Canadian Domestic Homicide Prevention Initiative) with friends and family members of women killed in the context of domestic homicide and survivors who had directly experienced severe forms of domestic violence. The interviews concentrated on victim-survivor efforts to find support and safety, with our findings discovering the most prominent experiences were related to accessing support from shelters. We tease out the characteristics of shelters that make them most significant to those interviewed, such as the range of services and unconditional nature of the support provided. Additionally, our analysis explores characteristics related to a preference for accessing informal supports over more formal support systems. Interviews also revealed frequent narratives about barriers to support and safety. We focus on how the very nature of domestic violence constitutes a major barrier, with isolation and control tactics commonly identified within the interviews. We conclude with suggestions for how shelters and informal support networks may amplify the characteristics that make them most salient and overcome some of the barriers associated with isolation and control.

Dynamics of an Extended Working Lives Policy Agenda and Life Course Focussed Policies: A Four-Country Comparison of Macro-Social and Political Economic Change on Late Working Life Exclusion and Inequality

The ageing population is a global phenomenon that brings with it changing dynamics within the work force and work course. Within Europe, the Extended Working Lives agenda goes some way towards addressing these challenges. The European year of Active Ageing and Solidarity Between Generations and subsequent healthy and active ageing rhetoric demonstrates a collective focus, however at the national level policy changes and more importantly, demonstrable, effective policy changes have been inconsistent and with mixed effect.

Beginning with an overview of the profile of older workers within Europe and the history of the extended working lives agenda, findings from a comparative report of the extended working lives policy and practice context in Germany, Poland, Sweden, and the UK are examined. The influence of macro-social and political economic change on late working life employment exclusion and inequality is explored, with a particular focus on the influence of different regimes and policy area combinations in contributing to or alleviating different forms and levels of inequality in the four countries.

Shifting to a forward-facing outlook, the need for a life course focussed approach to extended working lives policy design is justified. Good practice examples and areas for policy learning are explored, followed by a discussion of the future dynamics of the extended working lives policy agenda.

The Relationship between the Rejection of the covid19 Vaccine and the Perception of the War in Ukraine with Religiosity in Hungary in 2022

In August 2022, we conducted 250 interviews and a nationwide online representative survey in Hungary with the participation of 1,200 people. The research focused on the rejection of the covid19 vaccine and the perception of the Russian invasion of Ukraine. The research is a continuation of the 2020 and 2021 research. We reported on the results of the 2020 research at the 2021 annual general meeting of ESA and ASA (Csanády and Mikó 2021). The results of our 2020 research clearly revealed that higher age, higher education, residence in the capital, religious background, and general trust in the government clearly increased the willingness to comply with the epidemic measures. On the other hand, his susceptibility to esoteric teachings and his willingness not to vaccinate infants had the opposite effect. I presented the results of the 2021 research at the ISORECEA and ESA-RN34 conferences (Csanády 2022). Our 2021 research results show that higher age, higher education, trust in institutions, information from traditional printed and electronic media, and the practitioner's traditional religious background clearly increased willingness to vaccinate. On the other hand, the use of closed social media platforms and susceptibility to esoteric and new age religious teachings increased the likelihood of vaccine refusal. In our latest 2022 research, on the one hand, we examine the connection between anti-vaccination views and the extreme pro-Russian political position. On the other hand, we are interested in the relationship between different types of religiosity and the perception of war. During the presentation, I will present the results of the research. Literature background of the research: (Whitehead and Perry 2020) (Meltzer, M. 2021) (Michael A. Peters 2022) Baker, S. A. (2022) Sorell, T. and Butler, J. (2022).

Ukrainian and Moldovan Transnational Families' Registers of Co-Presence in Relation to Work

Within the CASTLE EU-funded Romanian-Ukrainian-Moldovan action research project, we have investigated Ukrainian and Moldovan the practices of togetherness, coping, communication of Ukrainian and Moldovan transnational families of labour migrants to the EU, with a special concern for children's rights.

Empirical data was collected through 102 semi-structured interviews and 10 focus groups with adult and child transnational family members and caregivers, and 24 interviews with experts from relevant organizations.

Transnational families make sacrifices and adapt through new family practices to the separation and communicative strain caused by work-related migration of family members. In this context, new "registers of presence" (Greschke 2021) are established that define the dynamics of family togetherness from a distance; these registers of presence are obviously implicitly work-related, given the work-related motivation, timing and responsibility of migration, and they are shared, insofar as all family members do their part in maintaining them while only some of them migrate.

On the other hand, decisions concerning work-related migration are not shared with children and younger family members, and the degree of informality of working arrangements of the migrants, with little enforcement of labor protection laws, may pose increasing difficulties for the regularity and synchronicity of contacts with family members back home.

Moreover, external support and protection is seen as intrusive, even dangerous and family functionality (including with regard to work) is displayed emphatically towards the public.

Such an interface makes family wellbeing and resilience vulnerable and unequal especially through the non-inclusion of non-working family members in the official migration scheme; families with internal issues (related to the couple, singleness, illness or other) have difficulties relating from a distance due to practical and economic reasons and ones related to social capital.

We propose a series of civil, policy and legal measures to alleviate these challenges for families involved in labour migration.

Reflections on the Resilience of Diary Methods in Times of Crisis or How Did I Cope with the Methodological Challenges of Exploring Romanian People's Attitudes Towards Celebrating Easter during the First National Covid-19 Lockdown

Diary methods are undoubtedly less popular in social sciences than other qualitative data collection techniques (such as in-depth interviews or observation), despite the advantages they offer researchers, including facilitating access to knowledge of phenomena, processes, or groups difficult

to investigate. The Covid-19 pandemic has triggered a revival of diary research, due to another important feature of it, namely that of being undertaken remotely, thus highlighting the value of both spontaneous and solicited diaries as a crisis-resilient research tool. Based on one of my recent qualitative research projects on exploring Romanian people's attitudes towards celebrating Easter 2020 during the first national Covid-19 lockdown through solicited diaries, this presentation aims to point out the advantages of using diary methods in turbulent times, but also the methodological challenges I faced at each stage in applying this method during the pandemic. I will also pay special attention to the issues related to emotional management in the researcher-participant relationship, considering that the research took place in a time governed by strong emotions on both sides, when faith and tradition interfered with fear, anxiety, and lockdown rules. The study I will refer to was conducted on a purposive sample of 73 participants aged 16-80 years, from various areas of Romania. The participants kept a diary, either electronic, or handwritten, covering the most important three days of the Orthodox Easter period: Good Friday (17 April 2020), Holy Saturday (18 April 2020) and Easter Sunday (19 April 2020), taking daily records of their activities, thoughts, and feelings, regardless whether or not they were related to Easter celebrations, including personal self-reflections during that period marked by the pandemic.

La Articulación Entre Los Principios Éticos y Las Prácticas Comunitarias Resilientes

La profunda transformación social de los últimos años, marcados por la pandemia de la COVID-19, pero también por los movimientos migratorios y los avances tecnocientíficos suponen un reto para las profesiones del ámbito social. El trabajo con comunidades a nivel local resulta imprescindible para que: a) las personas puedan hacer frente colectivamente a los desafíos de la vida; y b) generar cambios en las estructuras que reproducen desigualdades, incrementando el bienestar en la sociedad. Así queda recogido en la Definición internacional de trabajo social.

Seleccionar una u otra forma de intervención, entre las varias posibles, siempre va a estar mediada por concepciones éticas que pueden oscilar entre el mantenimiento de las estructuras que generan exclusión, hasta la identificación y potenciación de capacidades colectivas que posibiliten una vida digna para toda la ciudadanía. Los fines perseguidos y las metodologías que ponen en marcha para alcanzarlos, por tanto, deben ser revisadas constantemente desde una perspectiva ética.

Partiendo de esta suposición, la propuesta sintetiza los resultados de una investigación empírica sobre la necesidad de un marco ético en el trabajo con comunidades. Consiste en la especificación de cuatro principios éticos que promueven respuestas resilientes frente a situaciones de crisis y adversidad: 1) el respeto a la dignidad y la autonomía de las comunidades, facilitando aquellos procesos que incrementan el grado de ambas; 2) el compromiso con la comunidad, actuando de forma responsable y prudente; 3) el empoderamiento social, que aumenta las capacidades colectivas; y 4) la justicia social, que mediante la redistribución y el reconocimiento humanizan y reconstruyen las relaciones entre las personas que componen la comunidad.

The Struggles for Recognition and Distribution: A Theoretical Approach to Rural Teaching Recruitment

Attracting teachers to rural schools continues to be a problem in Australian education. Debates on how to remedy staff shortages are based on a better distribution of financial and material resources. This emphasis on distribution has sidelined the role of recognition theory in understanding the challenges of rural staffing. I draw on the social justice frameworks of Nancy Fraser and Axel Honneth to argue that rural staffing challenges are anchored not just on matters of distribution but on issues that lead to the cultural misrecognition and disrespect of teaching and learning in rural places. Using data from a qualitative research project with pre-service teachers from a metropolitan university who undertook a six-week placement in a rural school, I explore how Fraser's and Honneth's frameworks contribute to illuminate that a resignification of the cultural value of rural education is critical to understand the root of the problem of rural school staffing.

Anti-Civil Rights Enforcement Networks: A Cascading Comparative Field-Based Approach to Understanding Racialized Control Systems

Adopting a comparative historical approach to the study of racialized control systems in the U.S., this paper examines the modes of control activated during times of challenge or perceived threat to the racial status quo. The approach here recognizes the breadth of such control efforts, emphasizing the involvement of both state and civil actors comprising *networks of enforcement*. Crucially, this conception of "network" does not center only on direct collaboration, but also adopts a field-theoretic orientation emphasizing how common awareness among actors within the field in question—sometimes, but not always, formalized through direct contact—enables joint action to emerge. This approach recognizes and highlights the diverse local instantiations of such networks, and seeks here to demonstrate the conditions, forms, and impacts of enforcement campaigns associated with resistance to civil rights gains across the long 20th century.

The analysis introduces and draws upon a *cascading comparison* approach, which allows comparison of enforcement networks operating at multiple scales both within and across spatial and temporal settings. Focusing first on multiple localities within Mississippi—the state frequently viewed as the harshest bastion of segregationist resistance—to uncover patterns and variation within a single state regime, the analysis extends to a parallel set of cases in North Carolina (enabling intra-regional comparison with a "progressive" state regime within the U.S. South), and then to inter-regional and transnational comparisons with cases in New York State and South Africa. Elucidating the manner in which a broad spectrum of institutions has contributed to racial enforcement, this framework offers a means through which to understand the continuities of racialized control within discontinuous settings. Findings additionally highlight the manner in which local contexts shape the forging of enforcement networks, yielding overlap and divergence across cases typically viewed as distinct based on their spatial and temporal locations.

MADDOX, Christian (Washington University in St Louis, USA)

Institutionalizing Violence: Trajectories of Memory and Redress in Three Cities

How do features of reparative justice processes shape the contours of memory? To engage this broad question, we adopt a comparative approach focused on initiatives mobilized in the wake of three widely-known instances of historical violence within the U.S.:

- the Philadelphia (PA) Special Investigation Commission's efforts to address the 1985 siege and bombing of the MOVE headquarters

- the Greensboro (NC) Truth and Reconciliation Commission's proceedings to seek redress and accountability around the 1979 KKK-perpetrated killings commonly referred to as the "Greensboro Massacre"

- the Equal Justice Initiative's construction of the National Memorial for Peace and Justice in Montgomery, Alabama, to recognize the long history of lynching in the US

Drawing on a range of archival and observational data, we seek analytic leverage from the multiple points of variance within this set of cases—including their rootedness in state vs. civic memorialization processes, their orientation to histories of violence occurring in different periods and operating at distinct scales, and the diverse modes of redress sought within each.

Our analysis focuses on how the dialogic procedures associated with the Philadelphia and Greensboro commissions, along with the EJI's material and discursive efforts in Montgomery, have been institutionalized in different ways, and how those efforts have been received by various public audiences. Findings attend to the manner in which such efforts orient to the victims of violence and the culpability of state and civil perpetrators, and how associated narratives are shaped in part by the claims to legitimacy offered by key actors. By addressing the multivocal narratives embedded within the products of these memorialization efforts as well as the reactions they have engendered, we examine how the mode and process of redress bears upon the mnemonic trajectory associated with the acts of violence motivating each initiative.

Errekaleor Barrio Libre: ¿De La Resistencia a La Construcción ó La Resistencia Como Construcción?

Esta investigación analiza la experiencia del barrio okupado de Errekaleor desde la perspectiva de la resistencia comunitaria y la construcción de alternativas, tomando en cuenta los ejes de la apropiación del territorio y de la creación del sujeto comunitario transformador. Los movimientos sociales urbanos y las comunidades organizadas proponen otro tipo de ciudad alternativa donde construyen otras formas de habitar el mundo. Analizamos los aportes que hace Errekaleor desde el desarrollo del poder popular para la construcción de los diferentes modelos de democracia comunal, donde

los aspectos de resistencia, apoyo mutuo y construcción se unen finamente. Para ello se ha utilizado una metodología cualitativa basada en entrevistas en profundidad, observación participante y grupos de debate. Comenzamos analizando la construcción del territorio como proceso social en pugna y la importancia de los agentes sociales para la transformación del mismo. Después se analiza la comunalización del territorio que se ha desarrollado en Errekaleor poniéndolo en relación con la utilización comunitaria y la construcción del poder barrial. Luego se analiza la construcción del sujeto comunitario desde las nuevas formas de vida basadas en la comunidad autogestionada, a través de los mecanismos de participación, dinámicas colectivas, formas organizativas y creación de redes. Transversalmente se analizan la el antagonismo, la resistencia y el conflicto como elementos internos y motrices entre el camino desde la dominación a la emancipación. Finalmente, se concluye poniendo de relieve las aportaciones que se hace desde estas experiencias comunitarias para la construcción de nuevos modelos sociales.

CUZZOCREA, Valentina* (Universita di Cagliari, Italy)

The Collective Dimension of Mobility and Its Post Pandemic Promises for Youth

The limits that the COVID-19 pandemic has brought in the mobility paradigm have understandably raised concerns, on one hand on the level of individual's aspirations resulting as contained, restricted and at times denied. Obviously, such changes are to be framed in a more general reconfiguration of aspirations (as for in the so-called 'Great Resignation'). On the other hand, criticalities also pertain the policy level; here, the mobility discourse meant to see mobility as to significantly develop young people's abilities, at times even more than formal education.

Mobility however does not suffice itself on the individual level. And yet, less attention has been posed on the consequences of the restrictions of mobility on a more collective dimension. Mobility might 'transform' young people giving them a chance to discover themselves and the world also because it is an experience that is lived intensely with peers. In this interstice in one biography, mobility comes with intense connotations, whether it takes the form of an organised exchange or a gap year. A lot needs to be unpacked about how these forms of mobility -seen as generationally salient experiences - are changing in the aftermath of the pandemic, and how, in turn, this transformation affects the possibility for youth to engage in activities that are crucial for them, albeit maybe only for a very restricted period in their youth and under specific, often privileged, circumstances.

Building on work on the international bubble (Cuzzocrea et al 2021) and expanding further its conceptual underpinnings, this presentation seeks to thematise a (sub)cultural sensibility on collective dimensions of mobility and bring in the discussion of viable mobilities an attention to mobility as a collective, generational significant experience.

La Signification Politique De La Critique Littéraire Dans LES Œuvres D'astrojildo Pereira ET D'alvaro Lins

Dans la formation d'un large débat sur l'engagement des intellectuels au Brésil au cours du XXème siècle, la littérature a occupé un espace et une fonction importants dans la construction d'une interprétation politique de la société brésilienne. Cependant, plus qu'un simple complément aux œuvres littéraires, la critique littéraire a toujours eu un rôle fondamental, non seulement pour présenter de nouveaux auteurs et leurs œuvres respectives, mais aussi pour formuler une "interprétation" du Brésil et de ses processus de modernisation. C'est-à-dire qu'un certain type de critique littéraire produit au Brésil entre 1930 et 1970 avait pour point de départ la construction d'une critique sociale beaucoup plus forte et sophistiquée que les analyses théoriques énoncées dans les moyens scientifiques destinés à cet effet. À ce propos, les œuvres d'Astrojildo Pereira (1890-1965) et d'Alvaro Lins (1912-1970), surtout celles qui se réfèrent à la critique littéraire, sont des exemples d'un type d'analyse de la société brésilienne qui a dans l'élaboration de la critique littéraire un modèle de critique sociale. Dans cette communication nous montrerons comment la forme littéraire a contribué à la formation d'un contenu politique en analysant certains aspects de ces deux auteurs.

Inequalities in Life and Job Satisfaction? a Parallel Longitudinal Analysis of China, 2010-2018

The objective of our paper is to analyze job and life satisfaction in China, from 2010 to 2018. A parallel process of growth mixture modelling was implemented to analyze classes of growth of job satisfaction and life satisfaction over time. Based on the China Family Panel Studies, we found that three distinct

groups of individual trajectory classes are emerging as far as both job and life satisfactions are concerned. Our findings showed heterogeneity over time. However, a satisfaction is built on life rather than on job satisfaction. Moreover, the third group in which there are the most vulnerable persons has different development over the time, confirming the growing inequalities in Chinese society.

On Wellbeing and Happiness of Mayan Speaking Families in Campeche, Mexico.

In Mexico, there are up to 59 linguistic groups. The present study on wellbeing and happiness of the Mayan-speaking persons in Campeche allows knowing with greater scope how satisfaction is built in this Mayan community. The findings will help characterize the demand for family care, life satisfaction, and its interactions with social determinants. The study will be carried in municipality of Kanki, in the state of Campeche in Mexico. The selection of this entity was made based on the knowledge available regarding its situation of economic and social underdevelopment, high inequality, high levels of poverty, and a considerable number of the population speaking the Mayan language.

The methodology includes a mixed research approach, which will allow the objectives set to be met. The quantitative approach will allow the analysis of the surveys carried out and will offer the analysis of the determinants of satisfaction; while the qualitative approach will complement and delve into the effects already defined, but not detected by the quantitative study. The fundamental findings would define new dimensions of wellbeing among the Mayan population in southern Mexico.

D'ANDREA, Fabio* (University of Perugia, Italy)

Better Get Ready. a Long-Term Perspective on Beck's Metamorphosis

In this paper I will contend that Beck's idea of metamorphosis as more than change fits within a complex model of human evolution and aptly describes what is happening to Western culture. I will suggest that what is currently crumbling is what I call the *Ur-Paradigma*, the primordial paradigm – a set of generative cultural traits whence issues most of the form and trajectory of a given culture – that has influenced and (mis)directed the course of history so far. This leaves us with no tools or theoretical frameworks up to the task of understanding the sense and direction of global events. The «withering of the *Weltbild*» (Beck) brings to light a few of the items of the paradigm and the bias they lent to some crucial representations on which we built the world we live in: the "birth of Athena" representation of Man as a creature that appeared perfect and immutable out of the blue, instead of being the fruit of an age-long evolution; the idea of knowledge as an unchangeable given, universal and objective. Only within such a perspective must side effects be conceived of as necessarily negative, as they represent a mistake in the otherwise flawless human planning. They should instead be thought of as the other side of the reductive process that leads to knowledge, leaving an essential gap between what we know and «the meaningless infinity of events in the world» (Weber). They might then be clues to those parts of reality outside our scope and perception – in Beck's words «what we don't know that we don't know» – and show new possibilities and solutions to today's all-encompassing crisis.

D'ANDREA, Fabio* (University of Perugia, Italy)

Environment As a Short Circuit in the Knowledge Production System

In the mainstream discourse about environment, the idea of ecology as an inclusive way of acting and thinking is getting more and more popular and the existence of a climate crisis is no longer denied by the majority of both scholars and laymen. Very little is being done about it, yet, which appears logically and rationally incomprehensible. In this paper I will put forward the idea that environment is not what we think it is and manifests its otherness by short circuiting our knowledge system and the categories and dogmas on which it has been built. One of the main traits of our deep cultural paradigm is the privilege we have granted to the logical operation of disjunction (Morin), which leads to the proliferation of dichotomies and the division of reality into smaller and smaller fractions. It is an apparently harmless practice that nonetheless has shaped and bent our *Weltanschauung* and the world we think we live in. Environment is the perfect place for this delusion to crash, as it can only be understood in terms of interconnectedness and interdependence, words which we may use, but do not make true sense of. We may even believe in them, but we do not act accordingly. To try and bridge this gap I'd like to criticize the current imaginal representation of environment as just an object amongst other objects, which can be categorized and hierarchized like all others. By denying its unicity as something indescribable by our categories - thus requiring a brand-new conceptual framework - we get to handle it only through misunderstanding and mistreatment, which risks to prove fatal for our species. We need to renounce our self-appointed role as rulers of the world and learn to be a humbler part of the global becoming.

Exploring an Italian Online Community of Incel. a Netnographic Study.

The term Incel indicates a person (usually a man) who regards himself or herself as being involuntarily celibate and typically expresses extreme resentment and hostility toward those who are sexually active (*Merriam-Webster, 2022*). An Incel can be also defined as a member of an online subculture with a violent and misogynistic worldview. According to a recent European Commission report (2021), Italy is the fourth largest country in Europe in terms of the number of Incel users. Our work is motivated both by the lack of work in the Italian literature aimed at the in-depth study of this phenomenon as well as by the strict need to address the new harmful phenomena arising in the digital context. To ensure a non-intrusive observation of the study of selected communities, we decided to use a netnographic approach (Kozinets, 2002, 2010). Through an exploratory-descriptive analysis of the phenomenon, the dynamics and themes emerging in the main Italian online communities will be explored.

Co-Working with a Dolly Trolley: A Case of Human-Robot Interaction in Indian Restaurants

This paper reports a multi-city and multi-site qualitative study involving observation, photodocumentation and in-depth and photoelicitation interviews, exploring the impact of robot waiters on front-of-house work organization in Indian full-service, dine-in, family restaurants. Contrary to widespread claims that automation increases efficiency and productivity, the findings show that while the robots, as dollies, improved the restaurants' business through increased customer footfalls and customer delight, they complicated front-of-house work organization. With the robots capable of operating essentially as trollies which could only deliver food to customers' tables, captains' and waiters' work was complicated due to the robots' limited or regulated functionality, slow speed, restricted movement pathway and need for protection. Nonetheless, the robots aided human staff's continued employment, albeit of a non-standard nature, while adding to the latter's task repertoire and self-esteem.

Catharsis and Politics. Art and Cultural Movements Responding to Climate Crisis

Since March 2021, a numerous group of artists gathered somehow spontaneously and started organising and demonstrating against natures' exploitation.

In the middle of pandemic times, there were several discussions around its environmental origins, related to the modes of production of food.

Moreover, Argentina was suffering from ongoing fires and woods burning, especially in the Patagonian south.

In such a context, an unprecedented event was organised in a few days: more than a hundred artists from various contexts got together to manifest against the intentional fires, around a performance called "Sounding Woods".

From then on, the group has been growing continuously, and has continued to organise different manifestations against a wide range of environmental event and key moments of policy making.

Why in that particular moment? How the lockdown affected and triggered, in a certain sense, the need to manifest and get together? How was the emotional work developed and also discovered in the streets? How is it being redefined once the pandemic was (kind of) over and daily life got "normal" again?

The present paper looks into the various emotional dynamics in this group, as an example of a narrative dealing and acting in the climate crisis context. The analysis focuses on how the group builds the problem, coming from different backgrounds, generally identifying as middle class, not specifically linked to a particular environmental problem, and specifically expressing the need to occupy the streets from and with artistic expressions. The methodological approach is qualitative, through interviews to the long term participants, and participant observation as a part of the collective since its creation.-

Haciendo Cuerpo La Naturaleza. Percepción Del Cuerpo, Sensibilidad y Crisis Ambiental En Grupos De Prácticas De Meditación En Buenos Aires.

En la actualidad, las prácticas espirituales ligadas a la meditación y el yoga en sus múltiples formas, han tomado un lugar central en la dinámica de sectores medios urbanos. La proliferación y crecimiento de la oferta es innegable.

Asimismo, a partir de la pandemia, este fenómeno se comenzó a relacionar y entrecruzar más explícitamente con la situación de crisis climática. Es asi como diversos grupos comenzaron a relacionar ambas esferas, organizando encuentros y prácticas relativas tanto a su auto transformación y auto conocimiento, como pieza clave para la conexión con el entorno y en algún sentido, la posible "respuesta" a la crisis ambiental actual.

En el presente trabajo se busca primero relevar preliminarmente experiencias que ponen en relación la práctica espiritual (así definida por quienes la llevan adelante) con la forma de vida moderna y su impacto en el entorno a nivel global. En segundo lugar, observar críticamente qué entendimiento plantean acerca del cuerpo, la sensibilidad y corporalidad en dicho contexto.

Las preguntas que organizan el escrito versan en torno a qué sensibilidades se construyen sobre la propia corporalidad, específicamente de las mujeres en tanto ligadas a la "madre" naturaleza; qué vínculos se establecen con el plano referido como espiritual; qué relación se entabla con el "macro cosmos" -tal como la filosofía ligada a prácticas hindúes en general refieren a la naturaleza. Finalmente, en qué medida estas sensibilidades contemporáneas dialogan con la primera expansión de prácticas "orientales" hacia los años 1970s, en medio de prácticas contraculturales.-

Leisure As Political Discourse: Leisure and the National Development of Contemporary China

In contemporary China, the policies on weekends and holidays regulated the time use of people and spawned the rise of leisure demand. The term "*xiuxian*" (leisure in Chinese) has become a political discourse and integrated into the national policies. Shaped by leisure political discourse, leisure greatly influences the national development of contemporary China. This study explores the contents and impacts of leisure political discourse in contemporary China based on corpus-based discourse analysis. A corpus is built, consisting of official documents and news reports containing "*xiuxian*". Based on the establishment of the corpus, AntConc 3.5.9 is adopted to facilitate qualitative analysis. This study reveals that leisure discourse has had an extensive and multifaceted impact on the national development of China. In terms of economic development, "*xiuxian*" has become a new growth point for China's economy. In recent years, China has entered the era of "*xiuxianlvyou*"(leisure tourism). The concept of "*xiuxian*" has gradually taken root, enriching vacation and leisure tourism products and bringing huge economic benefits. The development of fitness and leisure sports has been incorporated into the national development plan, enhancing people's physical and mental health and realizing substantial commercial value. The scale of "*xiuxiannongye*"(leisure agriculture) and "*xiangcunlvyou*"(rural tourism) industries have been steadily growing, promoting the strategy of rural revitalization and facilitating the development of a new socialist countryside. As a city brand, "*xiuxianzhidu*"(capital of leisure) functions to shape the imagery and enhance the habitability of the city, which makes cities more livable and enhances the quality of life of residents. In addition, inheriting the Chinese tradition ideal of "harmony", "*shengtaixiuxian*"(ecological leisure) can promote environmental protection, green lifestyles and the harmonious development of human beings and nature. Overall, the accelerated national development and China's endeavor to make life better for the people are embodied in the leisure political discourse.

DA COSTA, Isabel* (CNRS, IDHES, ENS Paris-Saclay, France)

Platform Workers in the US and the EU: Independent Contractors or Employees?

In the technologically advanced societies of the 21st century new and often precarious forms of work are increasingly replacing traditional employment relations, posing organizational, social, and legal challenges. Platform work has become one of the most important new form, often associated with the gig economy, or work on demand.

Platform work covers a number of work situations across various sectors of the economy. Their common denominator is that work tasks are organized through an online platform which generally controls their pace and price through algorithm management. Yet most platform workers are considered to be self-employed "independent contractors" not "employees", which makes it difficult for them to join labor unions and organize collective actions to improve their situation. Furthermore, the business model of the most visible platform companies is based on non-permanent employment relations with no fringe benefits and labor protections. Platform workers in several countries have begun to organize to improve their situation but, not all platform workers are underpaid drivers, or food delivery riders and, in most countries, clear rules and regulations for this new type of work are still unavailable.

My communication proposes to compare the legal status battles of platform workers in the United States and the European Union, from the enactment in California of the AB5 Bill in September 2019, to the current proposal for a EU Directive on improving working conditions in platform work. I will focus this international comparison on the legal definition of "employee" and the challenges it poses for participation, collective representation, and attached rights and protections, such as job benefits and pay guarantees. I will also outline how trade unions adjust to the new composition and varied status of the labor force, and which strategies platform workers have when they organize. I will conclude with an analysis of the diverges observed.

DA COSTA, Isabel* (CNRS, France)

Theoretical Reflections on Power, Authority, and Democratic Participation in Employment Relations

When Sidney and Beatrice Webb published "Industrial Democracy" in 1897, the book was widely discussed within the British and international labor movements and the term was introduced in the social sciences, particularly in what would later become the multidisciplinary industrial relations field. It would indeed be difficult to find a modern equivalent to its impact. For the Webbs, democracy in industry was related to trade unions and their "common rules" but for the less skilled, lacking bargaining power, legal minimum standards, such as a "living wage" (another concept they introduced), would be required. On the other side of the Atlantic, for John Commons, the founding

father of labor studies in the United States, the working rules of going concerns were perceived as one of the pillars of "reasonable" value and a way to "save capitalism". His thought and practice in drafting labor and social protection legislation, together with his Wisconsin students, had a significant impact on the New Deal policies. After WWII trade unions grew in numbers and economic and political power and mainstream industrial relations focused on their collective bargaining practices and resulting wage increases, until austerity and neoliberal policies brought about recession and growing inequality. Meanwhile mainstream industrial and labor relations academics had become employment relations experts losing sight of the political concerns of the earlier theories, with the exception of the political economy scholars. No new theory has yet emerged in the 21st century able to capture the complexities of the current situation of resurgent authoritarianism in politics, economies and labor relations around the globe. My communication will focus on the notions of Authority, Power, and Democratic Participation in order to revisit these and other theoretical approaches to employment relations, identify theoretical gaps, and propose some reflections for debate and for future research.

Perspectivas Docentes Sobre Vínculos Sociales y Pedagógicos Con Sus Estudiantes Durante La Pandemia. Variaciones, Desigualdades y Cambios En El Pasaje De La Educación Remota a La Bimodalidad.

Este trabajo examina las representaciones de docentes de nivel secundario sobre sus estudiantes cuando se cerraron físicamente las escuelas en marzo de 2020, y cuando a principios del 2021 autoridades, docentes y estudiantes empezaron a volver físicamente a las aulas con distintas modalidades y formatos de escolarización. En primer lugar, mapeamos las necesidades y dificultades de los/as estudiantes durante las fases de educación remota e híbrida identificadas por los/as docentes. Seguidamente prestamos atención a las prioridades del trabajo pedagógico en cada momento para poder reconocer los diversos "escenarios de escolarización".

La comparación entre períodos permite identificar continuidades y discontinuidades en las representaciones de los/as docentes respecto de los/as jóvenes y nos ayuda a entender algunos de los eafectos de la pandemia en el trabajo docente y en los esfuerzos de escolarización llevados adelante por asociaciones de actantes humanos y no humanos.

La agudización de las desigualdades socioeducativas constatada por estudios locales e internacionales, nos ha impulsado a analizar cómo estas miradas docentes sobre sus estudiantes varían de acuerdo a los atributos de docentes -como el género y su formación-, las características de la oferta -como el sector de gestión y el tipo de formación ofrecida- y del perfil institucional -como el uso de TIC antes de la pandemia y los niveles socioeconómicos y variabilidad-similaridad social del alumnado. Para ello utilizaremos métodos de análisis multivariado para establecer la incidencia relativa de estos condicionantes de las dificultades estudiantiles durante la pandemia.

Los datos analizados provienen de una encuesta a docentes aplicada en diferentes regiones geograficas de Argentina que llevamos adelante colegas de distintas provincias y universidades pertenecientes a la red ENCRESPA. Como parte del diseño metodológico mixto, aplicamos la encuesta a 2.544 docentes de nivel secundario en todo el país en octubre/noviembre de 2021.

Food Self-Sufficiency As Contested Socio-Technical Imaginaries

One of the major contributions of the sociology of agriculture and food is the historical materialist analysis of the incumbent power of neoliberal capitalism in transforming global agrifood systems. However, recent 'turbulent transformations' brought by the COVID-19 pandemic, the unprecedented climate and ecological crises, and the crisis of neoliberal economic globalization gave way to new agrarian and food politics that articulated the role of the state and civic engagement in reimagining and co-producing alternative food futures. This paper attempts to illustrate this contradiction by looking at the different narratives around the concept of food self-sufficiency in the case of the Philippines particularly with the policy stance of its new president Ferdinand Marcos Jr.

DAGLI, Winifredo* (University of the Philippines Los Baños, Philippines)

'Central' and 'Peripheral' Adaptation Pathways of Entangled Agrifood Systems Transformations

In the agrifood systems of developing countries, local adaptation actions and pathways often interact with other climate and development responses, creating new trade-offs, uncertainties, and potentially maladaptive outcomes. While knowledge on the interacting pathways of adaptation is expanding, previous studies have focused on complex systems dynamics, and studies that address the human, social, and political forces that drive the cascading of risks between different coupled social-ecological systems are few. This paper aims to examine climate adaptation trade-offs, uncertainties, and maladaptation through an interdisciplinary analysis of two interacting pathways of transformational adaptation in the Philippines: the post 2004 disaster rural transformations in the coconut-producing municipality of Infanta and a state-led urban water resilience strategy for the capital region of Metro Manila. Data were collected from January 2021 to March 2022 through ethnographic field visits, participant observation, focus group discussions, semi-structured interviews, geospatial analysis, multicriteria mapping sessions, and review of planning documents and secondary data sources. Key findings suggest that the pathways of transformation and their entanglement are rooted in historical processes of change and that maladaptation is contingent on the political relations between the 'central' and 'peripheral' pathways. Overall, the paper offers a significant contribution to adaptation research in the agrifood systems of developing countries as it calls for a deeper kind of collective reflexivity and action that can transform narrow notions and practices of resilience and sustainable development.

Social Discourses and Creative Collective Actions of the Fridays for Future Movement in Italy

In recent years, a significant rise in climate protest has been triggered by the birth and spread of several environmental movements, such as Extinction Rebellion, Sunrise Movement and *Fridays For Future*, which involved a large number of activists (Hayes, O'Neill, 2021).

The *Fridays For Future (FFF)* movement is now a world-class movement involving young activists who protest against political leaders in squares around the world with the principal aim of achieving efficient changes in political and economic approaches to the environment; however, at the same time, they invite people to change their mindset and assume responsibilities through concrete and effective actions, in order to re-establish the balance between humans and the environment (Colmegna, Favazzo, 2021; Morandini 2020).

The paper aims to give an insight into the different strategies through which FFF impacts the public scenario and creates social discourses in order to achieve their principal goals. The analysis will be twofold and will explore the following: a) data coming from a two-step campaign of narrative interviews with the activists of the *FFF* network in Italy, and b) how the movement uses creativity to express their dissent and impress public opinion through shared meaningful images and symbols (visual analysis), useful to spread the principles on which such dissent is based.

Welfare-Work Trajectories Among Social Assistance Recipients in a Local Perspective

Background and aim: Comparisons of national welfare regimes have a long tradition in welfare,- and social policy research. Far less attention has been paid to variations in local welfare systems and how these frame welfare-work trajectories. This is unfortunate since increasingly a varied menu of services is provided locally and welfare-work trajectories unfold in a local context. In many countries organizational reforms, on the national and the local level, have been introduced to facilitate pathways to work. This paper aims to contribute to this debate by examining the welfare-work trajectories among young social assistance recipients in Norwegian municipalities and how they are related to the organization of local labour and welfare offices. *Theory:* The concept of Local Welfare System is applied. This denotes the interaction between individual characteristics, relevant municipal characteristics, and organizational features of the local labour and welfare agencies. *Data and methods:* National registers provide longitudinal information on all young social assistance recipients (N=4700) in 2012. Information on municipalities (N=430) and the local labour and welfare offices is collected from official government sources. Welfare-work trajectories covering eight years are created by sequence analysis forming eight clusters. The relationship between organizational features of the labour and

welfare office and trajectory cluster is tested by means of multinomial logistic regression after controlling for variables on the individual and the municipal level. *Results:* Preliminary analyses show: a) among the individual variables, those reflecting poor health consistently predict trajectories characterized by benefit receipt and loose attachment to the labour market; b) variables related to the municipal level are of limited importance, and c) variables pertaining to the organization of the labour and welfare offices play a minor role. *Conclusion:* Once individual and municipal factors are accounted for, characteristics of the local labour and welfare office are of marginal significance.

Formulating Problems and Solutions: The Case of Hackathon Events and Data-Based Innovation in Digital Societies.

A common way to present and justify innovations, especially technical and data-based innovations, is to claim that they solve problems. Pitches and advertisement copy are testament to the wide variety of formulations of problems that innovative technologies solve. However, finding and formulating these problems is not trivial. Especially in the case of data-based innovation, familiarity with the subject matter is not always seen as a necessary requirement for producing insights and solutions. Meanwhile, sociology has a long history of working with and about social problems, a history that can be a resource in understanding the work of innovative actors.

The talk explores how social problems are formulated and reformulated as data problems in the innovation work of competitors in a Hackathon event. It argues that Hackathons can be understood as innovative social worlds, in which the different parties (organisers, competitors, and jury) collaborate to position and solve social problems with data and technology. As such, they are case studies of how datafied societies produce and solve their problems. The talk reports from a PhD-project that accompanied a Hackathon with ethnographic interviews, observations, and analysis of documents. Reconstructing the trajectory of one problem through competition rules, project pitches, jury sessions, and final presentations, the talk points out tasks and challenges that arise in this formulation work. For instance, how competitors recruit categories of users and invoke categories of data when making a case for their projects. These challenges are tied to the specific innovative actor constellation of the Hackathon and its genre conventions for presenting, but they also link to wider concerns of how data shapes innovation. Some potentials and limitations of Hackathons as case studies for data-based innovation in digital societies are discussed and implications for a sociological perspective outlined.

Multi-Sited Institutional Ethnography: Comparing Public Ombuds Institutions' Practices in Promoting Access to Justice in the Digital Era

In this contribution I will discuss the design of my comparative study on public ombuds institutions which is based on multi-sited institutional ethnography. As the central control body of public administration and guardian of citizens' rights, the public ombuds is an ideal observation post for citizens' problems with digitalized public services and the challenges of ensuring access to administrative justice. Citizens can contact the ombuds for extrajudicial support free of charge if they experience problems with the public administration and feel unfairly treated. The research focuses on the challenges that come along with the digital transformation of public services and public ombuds' role in promoting access to justice for all, in particular how the risk of social groups being excluded from these services (digital inequality) and, as a result, restricted access to justice - a fundamental right that is also a prerequisite to exercising other rights - is encountered. The study is based on a multi-local case study in countries of both the Global North and the Global South, including conversations with ombuds staff, shadowing, participant observation, website and document analysis. Theoretically, the project builds on findings from the sociology of law and administration as well as the sociology of organizations and institutions, with a focus on the interaction between citizens and the state. I will investigate the practices and strategies of ombuds institutions, e.g., what measures they take to ensure equal access to justice for all. The country comparison will also be used to study the role that specific social contexts, such as the overall degree of digitization, the legal culture and institutional framework conditions, in particular the legitimacy of public ombuds, play in explaining institutional design and its effects on promoting equal access to justice.

Violence Against Men and Women: The Impact of Different Indicators on Perceptions of Gender (In)Equality

The public discourse on violence has intensified in recent years. In particular, violence in personal relationships and violence against women have moved into the focus. Victimization surveys have become part of the standard repertoire of social science research in many countries and victimization rates are routinely published and discussed. But do these standard indicators really capture the extent of violence? In fact, the mere counting of victims neglects the fact that the same person can be attacked several times and suffer several incidents of violence (e.g. if perpetrator and victim know each other)[1]. Therefore, alternative approaches based on a count of victims AND of events have long been implemented in Anglophone countries. Proponents point out that the extent and profiles of violence vary depending on whether the victim or the event is the unit of measurement[2]. We examine these two types of indicators using the example of the Luxembourg Victimization survey. We find that, overall, standard victimization rates suggest that men and women are more or less equally affected by violence. However, when using novel incidents-based measures, a different picture emerges. We find that women more often experience repeated violence. As a consequence, we argue that standard victimization rates underestimate the extent of violence against women.

We conclude by discussing the implications of particular types of data-based reporting for public perceptions of differences between genders. Finally, the results suggest implications for national and international reporting and related policymaking: Future surveys should be designed to collect information on both victims and incidents to improve policies that are meant to protect and help victims of violence.

Cross Border Migration between India and Nepal: A Study on Integration of Indian Immigrants

International migration has increased recently for all countries throughout the world. The majority of the beneficiaries of migration are developing nations; nonetheless, when discussing international migration, neighbouring country migration issues are frequently overlooked, particularly when migration occurs from a more developing to a less developed country. This study's objective is to explore the phenomenon of international migration from India to Nepal, about the integration of Indian migrants in Nepal, and the reason behind migration. Secondary data from the Nepal population and housing census was used in this study (NPHC). This study found that the working age group (15 to 59 years) people having 74 percent for male and 83 percent for female respectively. Kathmandu Kaski and Lalitpur districts receives the highest immigrants from India. Three fourth of the male immigrants in Nepal come to seek employment & trade. While 85 percent female immigrants proceed to Nepal for marriage and family reunion purposes. On one hand the cultural similarity between Indian migrants and Indian-origin Nepali citizens plays a vital role in immigration pattern. But on the other hand the cultural dissimilairy in forms of language, and economic dominance of Indian people in Nepal restricts the societal integration of Indian immigrants. Closure of land entrance during the COVID-19, comes out with the scenario that despite having friendly border Indian immigrants were not allowed to cross the border. Further, accommodation of Indian community in Nepal is very challenging, as there is an anti-Indian feeling exists among the population of Nepal. So, the target of safe, orderly, and regular migration as directed in GCM (Global Compact for Migration), needs policy concentration for Indian immigrants in Nepal.

DAMASEVICIUTE, Goda* (Vilnius university, Lithuania)

Childhood in Post-Soviet Lithuania: Precarious Places and Sour Encounters

Childhood in Lithuania after the break of the Soviet Union was formed between two poles - socialism and capitalism. These interacting poles changed the entire social, cultural, and economic environment, as well as everyday practices, one of those was children's understanding, and activity in their childhood spaces. Despite the fact that transformative societal processes are broadly analyzed themes, they are usually looked at from the perspectives of elites, institutions, or political establishments. Nevertheless, the life experiences of children and childhood spaces are not thoroughly researched. The main focus of this paper is how children understood their yard spaces, and what experiences they associated it, with focusing on the Transformation period in Lithuania that took place between 1980 and 2010. The main research method is biographical interview analysis. Theoretical approach is taken from Children's Geography studies and Karl Mannheim's generational theory. The aim is to

show the perception, activity, mobility and experiences of children in the yard spaces. Data from biographical interviews with people born in the period 1980-2000 reveal an essential childhood space - the yard, which includes different meanings, practices, rules, accessibility, emotions. Stories of the yard appear as a formative factor for the biographical identity or in relation to socio-cultural changes of the Transformation. The yard is a significant symbolic and material space and was perceived, accessed and used on the basis of different factors. Territory, children's mobility, control exerted by parents or other adults, and experiences of long-term relocation were significant factors that reflected in their biographies. The 1980-2000 generation put a clear emphasis on feelings of fear and insecurity determining, accessing and using their yard spaces. Even though childhood and its spaces in the 90's are often romanticised in popular culture, the interview data show that it involved far more unpleasant and negative experiences.

Living Alone in a Children-Oriented Space: The Well-Being of Vietnamese Elderly

Like many developing countries, over the last two decades in Vietnam, the trend of living alone or/and living with spouses of Vietnamese old people has found increasingly obvious. The situation becomes more noticeable when Vietnam is one of the fastest-aging countries in the world, while basic social services remain low coverage. Such practices pose a huge challenge to the well-being of Vietnamese elderly, especially when they "get old before get rich".

This paper presents findings of two qualitative studies on old people in Vietnam in 1999-2000 and 2021-2022 in the same locations and using the same sampling procedures ans research design. It describes how old people over the past two decades maintain their own well-being while living with limited family ties. From a life course perspective, the paper argues that Vietnamese old people have a static set of significant others over their life nospan. Research results show that after more than twenty years, old people still generally arrange their activity space to primary relationships surrounding their children and grandchildren. Living close to children is seen as a way to secure the elderly's welfare. At the same time, it also limits their activities and concerns and thus put their old-age well-being in a dependent status. Expanding their social ties to secondary groups, actively participating in social activities could be suggestions to maintain a healthy and active aging of Vietnamese elderly.

Endangered Language and the Afterlife of Language Development in Hamap Language, Alor, East Nusa Tenggara, Indonesia

This paper examines the endangered problem of Hamap Language spoken by Hamap people located in Alor, East Nusa, a small island in Indonesia that has a significant variation of languages in one regency. Hamap language is predicted to disappear in the near future and needs to be revitalized. The endangered language discourse emerged by standardization authority from international institutional actors concerned with promoting language diversity as a basis and tools for governmental policy in language development. Its tools also influenced the significant actors in Indonesia who declare and preserve the languages in extinction both government and non-government institutions. In the report of Badan Bahasa 2020, the Indonesian government provides 180 billion rupiah as proof to seriously deal with this matter. The other problem comes when they generate methodology as a tool to save the language in different people and cultures who speak different languages. There is a gap between the language and the speakers when we are not looking at cultural practices as a central aspect for societies. This ethnographic paper shows the complexity of the afterlife of a language development program called "language revitalization" at the community level by looking at the practice of Hamap language. The declaration of endangered status at the national level triggers them redefining or reforming their culture. At first, they resist and reject that status because Hamap language exists in daily conversation, whereas they take the national language status thoughtfully by arranging multiple rites meetings to discuss their language problem. It takes performative resistance, internal conflict, and transmission intergenerational. In this analysis, semiotic ideology and Actor Network-Theory perspective are important to expose the doer and the unexpected association of the social constellation towards endangered language. I also see language revitalization as a material that has its agency on the mediating connection in social problems.

Children's Suffrage Rights: Southern Perspective on Decolonizing Children's Rights and Childhood

In the field of childhood studies and children's suffrage studies, there is now a growing body of literature on the need to extend the right to vote to children. Much of this literature however, emerges from the Global North contexts. Discussions on children's rights in the Global South contexts are largely concerned with the rights of marginalized children to schooling and protection from harm. I opine that until children are also extended the right to vote in global South regions such as India, conceptions around children's advancement, equality, and improved futures, remain bleak. Instead of drawing on the United Nations Convention on the Rights of the Child (UNCRC), 1989, as the referential point for equality for children, I extend the arguments on universal suffrage proposed by Bhimrao Ramji Ambedkar, the chairperson of the drafting committee of the Constitution of India, to argue that, by extending the right to vote to children, both contemporary democracies. children's rights, and childhoods can be decolonized. That is, if children are also enfranchised, and are recognized as minorities with constitutional safeguards, they can negotiate equations of power, and claim their associated rights for protection, education, and their futures. And in this way, this paper offers a southern perspective on children's rights today.

Collective Action on Gender Equality and Sexuality: The Weight of Religious Affiliations in Europe Today

In the field of cultural liberalism, developed countries are characterized by contradictory evolutions. On the one hand, new legislations are introduced that seeks to advance gender equality – in marriage in particular. On the other hand, we observe in some countries a questioning of old laws, for example on abortion.

However, religions feel concerned by gender relations to a high degree. These legislative and regulatory changes have therefore prompted mobilizations, sometimes supported by religious institutions.

This communication will seek to identify the degree of support of the members of different denominations and religions for these mobilizations. It will use data from the European Values Survey 2017-2020. This survey includes many questions relating to religion and beliefs. Secondly, it measures participation in different methods of collective action (petition, boycott, demonstration, etc.). And it questions above all about opinions on gender and sexuality: on abortion, homosexuality, gender equality in the family and at work, etc.

The survey will make it possible to differentiate the positions of Catholics, Protestants, Evangelicals, Orthodox and Muslims in Europe, according to their level of religious integration, their gender, their generation but also their systems of beliefs in the area of spirituality. It will therefore be possible to know, denomination by denomination, whether religious affiliation really guides gender and sexuality norms, and to what degree. And whether or not the participants in the mobilizations reflect the majority opinions of the denomination to which they belong.

DARWISH, Housamedden* (Leipzig University, Germany)

(Political) Islam in a (Political) Secular Environment

This paper aims to discuss two main assumptions/theses regarding political Islam: (1) one that sees political Islam as the inevitable fate of the Muslim-majority societies; and (2) another one that sees political Islam as a definite and imminent danger that must be confronted, and that the reasons for its presence, and the negative consequences of that presence, must be eradicated. The two theses are put to the test in the post-Arab Spring era. The paper argues that despite the conflict between these two theses or assumptions, and the diversity and even the contradiction of the reasons for their adoption, it is not rare for them to be adopted together in various culturalist visions. These visions see, in various ways, the nature of Islam to include indissoluble links to politics and that those links prevent Islam and Muslims from interacting positively with any secular environment. Although the post-Arab Spring era witnessed a rise in political Islam movements -- which achieved historic victories in the elections held, for example, in Tunisia, Morocco and Egypt -- these movements, at their heights, did not enjoy an absolute majority, even in cases where they scored major electoral victories. The paper argues that the experiences of (Political) Islam in the (political) secular environment of the post-Arab Spring era shows the implausibility and the inaccuracy of both of the above assumptions and of their culturalist and essentialist bases. To this end, many qualitative research techniques or tools will be used: conceptual analysis, textual and hermeneutical interpretation, and historical description, as well as an analysis of some of the main events related to the Arab Spring uprisings.

DARWISH, Housamedden* (Leipzig University, Germany)

Authoritarianism in the Contemporary Arab Secular/Religious Debates on the Question of the State: Missed Issue

The paper explains how secularists and Islamists who debate the classification of a state as secular or Islamic/religious do not adequately consider question of authoritarianism or democracy. Although brutalizing authoritarianism is prevalent in most Arab countries, many important debates in contemporary Arab thought about the nature of the existing or desired state focus mainly on the relationship of politics with religion, specifically Islam, while often ignoring the issue of authoritarianism or the democracy of the state and its political system. Wael Hallaq focuses on the contradiction between modern (Western) state and what he calls paradigm of Islamic governance, arguing that Islamic state is realistically impossible, and theoretically self-contradictory. Others, as Muhammad Mukhtar al-Shanqiti, go as far as adopting an anti-thesis, according to which, it is the secular state that is impossible, not the Islamic state. The presence of the authoritarian or democratic issue appears weak and limited. In order to overcome this often dead-end debate between secularists and Islamists, many Arab thinkers, as Tariq Ramadan and Rachid Ghannouchi, have called for the establishment of a democratic civil state that can overcome this harmful epistemological and normative division – a secular state versus a religious or Islamic state, so the focus is on the question of the state's democracy or (non-) authoritarianism rather than on its religious/Islamic or secular characteristics. The paper seeks to analyse the concept of "the civil (state)" and explore its cognitive and normative capabilities to deconstruct and overcome the dichotomy of "secular (state) versus religious/Islamic (state)". It discusses the contemporary Arab debate on three basic concepts: the (impossible) Islamic state, the (impossible) secular state, and the (possible) civil state, arguing that the often absence of the question of/the consideration of authoritarianism or democracy is partially a result of and supported by the brutalizing authoritarian ruling regimes.

Extractive Development and Everyday Resistance: Solidarity and Peoples Movement in the Global South.

In the global south, we are witnessing a drastic shift in terms of the developmental policy of the nation states where the agenda of economic growth and development have taken the centre stage. This agenda of the state is leading to a rift between the state and marginalised section of the society due to the implementation of various extractive developmental projects. It has been alleged by the activists and academics that the nexus between the global capitalist forces and states of the global south is gradually increasing and which have resulted in more investments in the extractive developmental projects of the global south. On the other hand this has produced resistance from the citizens and inhabitants of the regions where the extractive projects are being implemented. To counter the grand narrative of extractive development propagated by the global north, the indigenous population of the global south constantly resisting this propaganda through resistance movements. People not only consider these areas as their home, they are also part of the cosmological whole, and the ecology is part and parcel of their everyday life. Their socio-economic-religious world revolves around their surroundings. By contextualising various environmental movements in the global south, this paper analyses two on-going environmental movements in Niyamgiri and Dhinkia in Odisha, India. And further explores the solidarity and everyday resistance by local inhabitants against the giant mining MNCs.

DAS, Amiya* (Centre for Public Policy and Governance, India)

Seeing like a Citizen: Welfare Provisions and Negotiations of Poor in Everyday Life

The aftermath of COVID 19 has created difficult conditions for the disadvantageous population in the global south. Including India many developing countries are struggling to cope up with the losses. The unprecedented lock down during pandemic became a double burden on the poor and migrant labourers who largely depend on the welfare provisions of the state. These sections of the population suffered most.

In this backdrop, the paper underscores the dynamics of governance in a multi-ethnic society like India. Different local specificities are heavily controlled and conditioned by different stages of governance. The daily functioning of the state depends on both formal and informal governance. Poor individuals have access to a variety of informal channels for dealing with the state. Both the state and the community engage in on-going negotiations with one another's interests to forge new experiences of plurality in governance. This paper looks at the welfare provisions where poor people struggle to get necessary goods and services and often try to take help of a broker. By looking at few important welfare provisions such as maternity benefit and housing scheme as case studies, this paper argues that it is important to look at the governance and policy framework from the perspective of the poor citizens to make the policy and its implementation more robust and effective in the global south.

Hate Speech and Social Media: Understanding the Changing Nature of Far-Right Extremism in Canada

Social media has proven to be a significant medium that encourages far-right activism, the spread of misinformation, the circulation of online hate, and the organizing of far-right activist networks. In the last ten years, Canada has witnessed an insurgence of far-right extremist (FRE) groups motivated by white nationalism. Through the spread of misinformation, FRE promote a version of nationalism that is rooted in xenophobia and "white power," and is predicated on excluding perceived threats posed by groups such as non-Whites, immigrants, 2SLGBTQ+ communities, and feminists. Informed by critical race theories, semiotic theories, and a mixed-method qualitative approach, my project asks: How do FRE use social media to garner support? And, can law balance the need to regulate online FRE and hate speech, and the protection of free expression in Canada? Often, online posts by known Canadian FRE constructs themselves as the "victim," and they normalize hate and difference by bringing in false, unsubstantiated claims that appeal to individuals wanting to find answers to their problems. In serious cases, online hate can lead to racial violence offline, as far-right extremist organizations spread their philosophies, expand their influence, and attract supporters across Canada. The ultimate goal of this project is to learn more about the dangers and consequences of online hate, as well as the challenges and possibilities for the legal regulation of online far-right extremism and hate speech in Canada.

Ambedkarite Buddhism and Its Role in Socio-Cultural Transformation of Dalits

Abstract:
Dalits are those, who were referred as the Chandals, Atishudras, Avarna, Panchama in the Hindu scriptures and Protestant Hindus to Dr. B.R.Amebedkar and Harizans to Mahatma Gandhi. To the Britisher, they were the untouchables and depressed classes. They are referred as the Scheduled Caste in the Constitution of India. Today, the term *Dalit* as adopted by the above mentioned communities ,symbolizes assertiveness, consciousness and aggressiveness toward their rights. Social reformers like Swami Vivekananda, Swami Dayananda Saraswti and M.K.Gandhi condemned the practice of untouchability, but uphold the caste system as integral part of Hindu Society, which is root cause of their miseries. Great social reformers Jyotibrao Phule and Dr. Ambedkar who worked for the upliftment of depressed communities fought against the tyranny of caste system and religious orthodoxy in all possible ways. Finally, Dr. Ambedkar became Buddhist after denouncing Hinduism and following his footstep his followers embraced Buddhism and later aquired the identity of *Ambedkarite Buddhists*. According to Ambedkar, Buddhism as a religion is realistic and advocate equality among human beings, and negate birth based discrimination, advocated equality among human beings, and negate *avtarwad* and orthodoxy. In Haryana, a state of India bordering with he national capital New Delhi, where we can see socio-cultural transformation among *Dalits* with the awakening about their rights inspired by the literatures of Dr. Ambedkar and Mahatma Jyotibrao Phule. This study is based on primary data collected from 40 families. They were interviewed extensively. It has been found that the head of family decides the issue of conversion. Although, some family member express dissent. All have ideological reason for leaving Hinduism. For them, this is the way to liberate themselves from the age old socio-cultural disrespect suffered by these communities while being in lowest strata within Hinduism.
Key words- Ambedkarite, socio cultural disrespect, Buddhist identity

Dr B.R.Ambedkar and His Concept of Democracy

Dr B.R.Ambedkar and his Concept of Democracy
Dr Binoyjyoti Das, Academic Director ,International Institute of Cosmic Sciences New Delhi
"Democracy is not a form of government, but a form of social organisation." Dr B.R. Ambedkar.
Abstract:
Dr B.R.Ambedkar who is known as the 'Father of Indian Constitution" was a scholar per excellence, an eminent Jurist, a well-known politician, a social reformer , a polymath and above all, an competent son of motherland *Bharat* (India). His philosophy for "Just society" inspired millions transcending beyond state boundaries multiplying its relevance in contemporary world. Democracy is the most popular form of government that empowers its citizens to participate in the process of decision-making relating to her/him in a nation-state. Ambedkar's concept of democracy builds on the pillars of liberty, equality and fraternity. He preferred Representative form of democracy over Presidential form of democracy considering the diversities and plurality present in a society. His concept of democracy consists of three dimensions, political, social and economic. Political democracy cannot succeed where there is no social and economic democracy. Social and economic democracies are the tissues and

fibre of political democracy. According to Ambedkar, "government intervention and initiatives can bring revolutionary changes in the economic and social life of the people without bloodshed". Dr. Ambedkar opined political democracy as the rule of people, social democracy as associated living and economic democracy as state socialism with room for private enterprises.Amid gloomy picture presented by political scientist Shawn Rosenberg about the future of democracy in the rise of populist form of government worldwide, there is a need to revisit Ambedkar's views on democracy and bring into practice. This paper is based on content analysis of the various writings and speeches delivered by Dr B.R.Ambedkar.

Is Human Trafficking a Serious Problem in India: Who, Where, and How?

Globally, India is displayed as a "Tier II Watch List" country in the Trafficking in Persons Report (TIP). The objective of the study is to examine the scenario of trafficking of human beings, with special reference to female victims. Therefore, the present study aims to contextualize a gendered perspective on the recent trend and regional patterns of human trafficking in India. The study used annual data provided by states/UTs from Anti-Human Trafficking Units under the Ministry of Home Affairs, Govt. of India. Descriptive statistics are used to accomplish the study objectives. Findings show that since 2006, there has been a steady increase in trafficked victims; in 2014, there was a sharp increase, and the highest trafficking happened in 2016. Low trafficking cases reported in 2020 may be due to COVID-19 lockdown restrictions or inadequate reporting. A persistent gender gap is observed, with more women being trafficked than men. It was found that trafficking of people under the age of 18 predominated during 2014–2017; however, in more recent years, victims of trafficking were older than 18 years. Sexual exploitation was the key purpose of trafficking during 2018–2019, whereas forced labor was the sole purpose of trafficking during 2016–2017. Over the years, the prevalence of domestic servitude has increased. The forced marriages related to trafficking have diminished. The Eastern and Southern regions of India have experienced the most victims of trafficking, the reason may be the declining number of anti-trafficking units in these states in comparison to the Northern states of Uttar Pradesh, Madhya Pradesh, and Bihar. There is a need for enforcement of anti-trafficking laws and training in India, especially in states with high human trafficking hotspots.

Life in the Camp: A Study about Women's Health in Conflict Affected Area of Btad, Assam, India

The study tries to bring out the effect of conflict on health of the people, who had to stay in the camp. It specifically focuses on women's health and tries to see the aspects of accessibility of health services. In the absence of proper medical care what options becomes available to them is also under the purview of the study. The study was conducted in the conflict affected village of BTAD, Assam, India. The tool used for collecting data was mainly semi structured interview schedule. The non availability of services was equally troublesome for men and women but for women, who had special biological requirements they had to suffer the most along with that if any of the family member fall sick in the camp, it was the women's responsibility to take care of the patient. The overcrowded camps along with lack of rest and non availability of proper food created a situation where people's health got affected and those who had pre existing medical conditions were aggravated. The aspects of accessibility of services which became visible in the study are- physical accessibility, affordability of services, availability of services. Another point which came up while addressing the accessibility of services is that, in the absence of any formal medical services people resorted to the services of a cadre of health care provider who became prominent during that time of conflict. This cadre comprises of paramedical professionals, quacks (kabiraj) and bonesetters. However there availability of services was always there during the normal times but its the non accessibility of the formal services providers during the conflict that acts as a boon for them.

Strengthening Disaster Preparedness from the Ground up - Study of Community Groups in New Zealand

New Zealand is exposed to a range of natural hazards and has witnessed devastating disasters in the past. Community groups across New Zealand are currently engaging with emergency management practitioners and are taking steps to enhance disaster preparedness of their communities before a hazard strikes. Emergency management agencies are also increasingly relying on these community groups to develop preparedness; investing resources and efforts to work with them as partners. However, relatively little is known on how this process is unfolding on ground - who are these community groups, how do they engage in disaster preparedness, what are their outcomes and what facilitates or challenges the process? Our paper aims at addressing this knowledge gap. Using a case study approach, a series of interviews were held with emergency management practitioners and community group leaders and representatives across four regions in New Zealand – Bay of Plenty, Hawke's Bay, Wellington and Southland. The findings suggest that a wide range of community groups are supporting emergency management agencies in preparing communities, starting from informal resident's groups to formal registered entities. Their engagement with disaster preparedness can either happen organically as the groups expand their range of activities or through processes pushed and supported by emergency management. Most groups act as liaison between emergency management agencies and communities and engage in prescriptive tasks like establishing community emergency hubs, developing community emergency plans or forming emergency response teams. However, some take on advocacy functions as well. The community groups also play a role in strengthening intangible community assets like community networks, efficacy beliefs and sense of responsibility all of which contribute towards social capital within the community. The facilitators and barriers vary based on the social demographics of the regions, however, lack of engagement of transient residents and youth emerged as key concerns.

Technoscience, Risk Society and Democratic Accountability: Field Notes on the Adoption of GM Crops in India and Community Seed Banks

Historically, developmental states have unequivocally adopted what can be referred to as 'agricultural technoscience' in order to attain rapid growth in a brief time period. India is no exception to this. In doing so, the state for its developmental interventions derives legitimacy from seemingly postcolonial narratives such as food security, national sovereignty and economic growth. In this discourse, these imperatives in turn form the bases for a strong nation–state and consequently agricultural technoscience becomes an instrumental tool of/for the state. These technoscience based development interventions, be it in the form of a technological artefact (GMOs) or legal instrument (IPR) as a value-laden body of knowledge, are rarely questioned and hence subjected to reification. The interests, norms and values therewith in the 'agri-biotech model' of large-scale commercial farming of GM crops in India requires the rearticulating of conflicting perspectives, mandates and practices of various stakeholders, viz. the State, market and farming communities. In doing so, the study analyses the making and unmaking of India's regulatory biosafety regime – the local (PILs, farmers' rights act) and global pressures (WTO-regulated IPR regime). In this context, the study examines the role of scientific bodies as independent and disinterested agents in providing science-based policy guidance to the state. The study finally takes up the case of community seed banks in India in analysing the ways in which community participation, farmers' and breeders' rights are mangled – dialectic of resistance and accommodation – in the context of the ever-increasing influence of the agribiotech corporates on domestic agriculture policies.

Contribution of Interactions between Start-Ups and Academia in Digital Innovation: An Empirical Study in Technology Development

Quadruple Helix Model of Innovation is a perspective in innovation studies that highlight the role of entrepreneurs participating in technology development and innovation through their interactions with Government, Industry, and Academia. This perspective is used to study the role of entrepreneurs who establish their start-ups/ business ventures and participate in innovation and technology development. It is argued that the locus of innovation in modern societies happens through the combination and recombination of technologies and interaction with allied actors of the innovation ecosystem. The study recognizes academia as a paramount actor in the innovation ecosystem as it gives stimulus to young entrepreneurs to innovate, interact and participate in technology development in society.

Through the paper, I bring forth successful start-up and academia interactions fostering innovation with the following objectives:
1. Exploring the contribution of interactions between start-ups and academia for digital innovation,
2. Highlighting the process of combination & recombination of resources like, technologies, finance, skilled manpower, and strategic management of incubated start-ups through academia (that are moving from technology development to commercialization stage).

The findings are based on the empirical study of 214 Information and Communication Technologies (ICT) start-up founders out of which 74 start-ups are academically incubated in New Delhi (NCT), India. It has been found that with the growing prominence of the innovation and entrepreneurial ecosystem, strategic academic interaction, continuous experimentation, and channelization of resources towards technology development entrepreneurs are no longer passive recipients of technology but are taking an active part in innovation themselves. Interactions and the best channelization of technical resources are leading to i) stable inflow of revenue, ii) more industrial projects and strengthened technology linkages, and iii) diversity of funding sources for the start-up founders. Thus, development in the innovation ecosystem is aiding diversity in technology development and participation of actors.

How Can We "Neither Agree Nor Disagree?": A Content Analysis of Reasons for Intermediate Responses to Questions with Respect to Gender Role Attitudes in Japan

International comparative studies have revealed that the tendency of Japanese survey respondents to answer a question with the "middle answer" is extremely high. In this respect, social survey research has also been conducted domestically and internationally on the meaning of intermediate responses such as "neither agree nor disagree." Previous research has often employed a statistical analysis of the characteristics of those who respond "in the middle" to interpret the meaning of intermediate responses. However, there has been little attempt to directly understand why respondents give intermediate answers by asking respondents to explain their answers themselves. The purpose of this presentation is to clarify respondents' own logic concerning the reasons for their intermediate answers. To meet this purpose, an online survey was conducted in 2022. Married men and women aged 30–49 living in the Tokyo metropolitan area were surveyed. Respondents were asked whether they agreed or disagreed with the idea that "A husband's job is to earn money; a wife's job is to look after the home and family" using a five-point scale (+ don't know). In addition, respondents were required to describe the reason why they chose their response choice. Initially, logistic regression analysis was conducted to grasp the general characteristics of those who chose the middle answer. Then, content analysis was conducted to see how respondents explain "neither agree nor disagree." According to the content analysis, respondents' reasons could be classified as follows: (a) don't know or have no reason, (b) distrust concerning the wording of the questionnaire, (c) dilemma between an ideal life and real life, (d) depending on the situation, and (e) referring to alternatives to conservative gender roles. Finally, how we should understand the diversity of explanations for intermediate responses when we deal with measuring the scale of gender equality is discussed.

Similarities and Differences in Patriarchal Value and Filial Piety in Asian Societies: Results from the Cafs Project

Relying on questionnaire surveys employing a common format, the Comparative Asian Family Survey (CAFS) Project has constructed a database covering the five societies of Thailand (Bangkok), Vietnam (Hanoi and Cantho), Malaysia (Kuala Lumpur and Selangor), India (Delhi, Chennai, and Rohtak), and Turkey (Ankara). This presentation will provide an overview summary of several key findings regarding the similarities and differences among Asian families, based on the forthcoming book by the CAFS team. The book covers the following themes: i) Attitudes with reference to marriage, cohabitation, and divorce; ii) Marriage history; iii) Gender preference for children; iv) Gender role ideologies; v) Patriarchal values; vi) Behaviour of couples; and vii) Attitudes and behaviour with regard to intergenerational support. The effects of gender, age group, and education level are examined in every country.

The analyses reveal both inter- and intra-societal differences, as well as certain commonalities among Asian families. Some of the main results are as follows: (a) Patriarchal values can be manifested in two dimensions -- attitudes towards paternal authority, and attitudes towards the division of gender roles. Thailand and Vietnam show a unique combination of strong support for the division of gender roles, and weak support for paternal authority. Higher levels of education do not necessarily imply lowered patriarchal values. (b) There is a strong sense of filial duty towards both parents and parents-in-law in India,

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.*

Malaysia, Thailand, and Turkey, but Vietnamese men in Hanoi have little sense of responsibility for their parents-in-law while women in the city feel little sense of duty towards their own parents. Expressions of filial piety in Hanoi are confined to the patriline. Across the survey region, the results suggest the influence of multilayered factors, such as the type of family and kinship system, differences in the pace of modernization, religious differences, and other socio-cultural factors.

Migrants and Religious Identity in Canada: A Critical Examination of the Canadian Hindu Diaspora's Media

This paper examines how the ideology of *Hindutva* (Hinduness) influences the media texts (such as festival literature, newsletters, pamphlets and annual souvenir magazines), produced by five Toronto based Hindu religious organizations, which target the Hindu Canadian diaspora. The elements of *Hindutva*, which uses the term 'Bharat' for India as an imaginary for a Hindu 'Holy land' and asserts Hindu *Dharma* as the eternal truth (*Sanatana Dharma*), are embedded in the media discourses of these organizations. The ideological premise of these organizations calling for 'the Hindu unity' is based on the purity and superiority of Hinduism. Although these organizations' official position supports liberal multiculturalism, a critical reading of their media texts reveals a strategic infiltration of Canadian multiculturalism by *Hindutva* as the exclusive identity of Canadians of Hindu origin. In a hypermobile globalized world, these Hindu religious organizations connect India's eminence as an emerging economy in a post-Soviet era international relations landscape with the country's cultural superiority drawing on its Hindu heritage. Based on a close reading of these organizations' media texts, the paper will explore two important questions: (a) how the erstwhile notion of religion as a spiritual solace rendering belongingness to migrants to cope with everyday marginalization in the adopted country has been replaced by a muscular political Hinduism, which undermines secular civic freedom; and (b) how life under a neoliberal order in the host country propels the growth of ethno-nationalist ideologies among the migrants, who cannot turn to cosmopolitan and secular organizations to build solidarity and fight inequity, since these latter kind of organizations have been dismantled by the onslaught neoliberal transformation.

Understanding Families of Choice and Practices of Kinning through Adoptive Families in India

Adoption of an unrelated child legally via a government agency and transnational adoption from India are recent in comparison to the age-old practice of adopting from a near or distant kin in India. One needs to take note of the patrilineal-patriarchal context in India, along with practice of son preference, as well as belief in caste purity, and attribution of higher status to marriage and parenthood. When it comes to India, there is a gap in adoption literature and this paper tries to address one aspect of it by sociologically looking at adoption as a way of making families of choice, and by looking at kinning within adoptive families.

Keeping in mind this non-western and specifically Indian context, I explore how parents establish bonds with their adoptive children, in other words, how they attempt to make the child their 'own'. I analyze various phases within the adoption process such as pre-adoption, homecoming, and disclosure narratives. This paper is based on ethnographic research conducted in urban cities of India where I talk to parents—heterosexual couples, single parents, as well as parents who already have a genetically related child. I discuss what makes the parents choose to adopt and the idea of intentionality along with the larger family dynamics in Indian families. I look at these families of choice and their kinning practices through the lens of relatedness and mutuality of being which goes beyond the biogenetic model. I aim to understand kinning practices without discounting the adoption trauma and to look at making families in the face of trauma. Thereby, expanding the idea of kinship and to think and rethink what does kinning mean as a process especially in case of adoption at its many different junctures by looking at adoptive families in India.

DAVIDSSON, Tobias* (Department of Social Work, University of Gothenburg, Sweden)
ERIKSSON, Erik* (School of Social Work, Lund University, Sweden)

Young and Overindebted. Time out of Rhythm

In an on-going project, 18 over-indebted Swedish young adults are followed over time through repeated in-depth interviews and observations. Our analysis shows how different stages of the social life of indebtedness entails distinct temporal rhythms.

In the phase *preceding* indebtedness, the respondents tend to be preoccupied with a sense of not 'keeping up' financially. This could either relate to an inadequacy to settle basal expenses or a sense of falling behind in a consumer-oriented formation of identity.

The stage where the young adults are *becoming* indebted is marked by a fervent hyper-speed where actions tend to spiral out of control. Credits are rapidly granted through digital platforms, making the time gap between financially desperate and having money on the account extremely short. This is often described as a rush, albeit only temporary. Soon a lot of time is spent on seeking out new creditors to pay old loans.

The social life *as* over-indebted, registered at the Swedish Enforcement Authority, constitutes a sharp contrast in temporality. Time is perceived as being set on pause, in the sense of not being able to move forward through the course of life: the credit spiral has ended and only a strenuous time of repayment and economic restraint remain. All the while, time goes on unremittingly: bills and other expenses must be regularly paid, subjecting many to work overtime and not daring to call in sick. Continuously, the respondents subjective time rhythm can be interpreted as out of time in relation to the perceived normative life rhythm of their peers.

With regards to the *future*, the young adults tend to express a bleak vision. Their dreams and hopes of a future life tend to be articulated in a negative fashion; they dream solely of being free from debt somewhere in an unforeseeable future.

DAVIS, Jenny* (The Australian National University, Australia)

Failing Fast: Start-up Culture and the Silicon Valley Creep

Global technology start-ups have followed closely in Silicon Valley's image—adopting and adapting its norms, values, and practices across oceans and continental divides. As a nascent, geographically distant, and tightly regulated market, Australia holds the potential to develop into something different. This is particularly the case given Australia's late emergence, maturing at a time of waning adulation for Silicon Valley and increased public scrutiny of the Valley's culture and societal effects. Based on three years of ethnographic research in Australia's technology start-up sector (2019-2022) I show how, despite these conditions, prevailing cultural standards infuse and drive the Australian start-up domain. I anchor this analysis in a particular value-set, *the failure-speed duo*, representing a fundamental ethos. Drawing on interviews and fieldnotes, I delineate and illustrate the failure-speed duo, trace its origins through migration and institutional enculturation, and examine how the demands and costs of failure and speed distribute unevenly between actors within the start-up ecosystem. Findings have implications for the nature of innovation work in a globalized society, the context of technological development, and the sociological processes by which culture spreads.

DAVIS, Kathy* (VU University, Netherlands)

Dreaming in Conditions of Precarity

The focus of this session is a biographical interview with a Nigerian boy whose dream is to become a web-designer. It is this dream which enables him to narrate his life story as an up-the-hill battle of an agent who is convinced that by taking a series of steps and being as good as he can possibly be he will ultimately achieve his goal. In the interview, this dream serves not only to explain the challenges (obstacles and difficult circumstances) he faces, but is also recycled in order to justify his own (in)actions and to obfuscate how they may have contributed to the downward trajectory of his life. In my presentation, I will talk about the ambiguous or two-sided role of aspirations in biographical narratives and their importance in negotiating precarious lives. I will also discuss what dilemmas they might present for us as sociologists and how we might use these dilemmas to re-think our own notions of agency and biography.

Creating Participatory Space: Sustaining Collective and Intergenerational Youth Participation through YPAR

In recent years there has been a growing focus within youth research and policy on methodologies and processes which could heighten youth voice and promote youth co-production and inclusion during the research process. However, such processes are often poorly enacted or fail to adequately address the barriers that limit young people's meaningful participation and therefore rarely result in authentic inclusion or sustained change in issues which matter to young people. In this paper we critically review an 18-month-long Youth Participatory Action Research [YPAR] project which operated through an existing youthwork programme in Wellington New Zealand, focusing on youth mental wellbeing. Data were collected through autoethnography, artefact analysis and participant interviews and reflections with youth participants. In contrast to similar projects where researchers try to distance themselves

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

from taking the lead, this study found that both youth and adult contributions helped enable young people's sustained participation within the project. The research identified that peer-to-peer as well as adult-to-peer relationships helped to sustain involvement and were a by-product of strong participatory processes. While traditional models of youth participation have conveyed individualistic and linear notions of youth agency and power, the study found there were dynamic flows of power between youth participants and adults, where at times youth stepped into leadership roles and other times adult leaders managed the pace and progress. Theorising this through critical and post-structural theorists, we propose the idea of holding open a dynamic 'participatory space' for youth participation which both enables, and is enabled by, intergenerational and collective relationships.

Regulating Vulnerability: Analysing Australia's Policy Approaches for Preventing and Responding to Violence Against People with Disability

Current approaches to preventing and responding to violence against people with disability often adopt a deficits-based perspective, focusing on the vulnerabilities of people with disability themselves rather than on the environmental factors that exacerbate and create vulnerability to harm. In this paper we apply vulnerability theory to explore how people with disability are constructed as certain kinds of policy subjects within the policy frameworks designed to prevent violence and abuse, in the context of Australia's new market-based system of disability support. Through analysis of the situational and pathogenic forms of vulnerability that are produced by disabling service environments, segregation, and social isolation, we explore the need to think beyond the concepts of vulnerability, risk and protection that have traditionally structured – and narrowed – approaches to safeguarding groups categorised as "inherently" vulnerable.

Vulnerability theory has been developed through the work of Judith Butler and Martha Nussbaum, among others, and argues for understanding vulnerability, dependency and precarity as essential features of what it means to be human. We begin this paper by outlining the findings of a project that reviewed and analysed current national approaches to protecting people with intellectual disability from harm in service provisions contexts and responding to their experiences of violence, abuse, neglect and exploitation. We discuss how institutional responses to vulnerability must incorporate autonomy and empowerment as core principles to achieve their aims and avoid becoming sources of pathogenic vulnerability themselves. We conclude by outlining some ways these policy frameworks could do this better by building capacity and connection and providing accessible pathways for complaints and redress.

Does Political Distrust Threaten Democratic Stability? a Cross-National Empirical Investigation of Trust in Partisan and Non-Partisan Institutions

Is political distrust harmful for democracy? While the literature has been divided on this issue, a widely cited theoretical perspective suggests that some distrust is healthy for democracies, while widespread distrust is detrimental. That is, well-functioning democracies contain and channel distrust into the more partisan political institutions designed to manage conflict (i.e., political parties, the government and parliament) to keep distrust from generalizing to the entire political system. This provides a certain level of insulation for those less partisan institutions responsible for providing public goods—such as the civil service, the police and the judiciary—which are predicted to have comparatively high levels of trust. Accordingly, in healthy democracies, one would expect political trust to be substantially higher in less partisan political institutions. In this paper, we test this proposition and compare the extent of political trust in both partisan and "non-partisan" institutions within democracies and across regime types. We draw upon data from the World Values Survey, the European Values Study and several other sources to undertake multi-level analyses of the connection between political distrust and democracy using a cross-national panel dataset for the period 1989-2020. The findings suggest that, within democracies, trust in partisan political institutions is somewhat lower than trust in non-partisan institutions. However, contrary to expectations, trust in both partisan and non-partisan institutions are comparatively low in democracies. The findings suggest that political distrust in democracies is not limited to partisan institutions, and therefore may be a threat to democratic stability.

DAWSON, Hannah* (Southern Centre for Inequality Studies, South Africa)

Redistributive Politics and the Possibilities of Crisis: The Case of Social Protection in South Africa during Covid-19

Is a crisis useful for enabling radical political change? Or are the possibilities opened up by crisis ephemeral, passing as soon as a crisis passes? This paper asks these questions with a focus on the opportunities afforded by the Covid-19 pandemic to rethink social policy and welfare provisions along more universalist lines in South Africa. South Africa is a country with an already existing extensive cash transfer system, a history of political debates around basic income, and endemically high rates of inequality and unemployment. It examines the unfolding political possibilities and support for more direct and universal forms of social protection during and after the pandemic, both from above and from below. To do so, it draws on original data from a survey of low-income inner-city residents in Johannesburg, interviews with government actors and civil society activists, and a close reading of political, media and policy discourse around social protection between 2020 and 2022. It argues that while the crisis context authorised and expedited the expansion of more universal approaches to social protection, the very fact that new policies have been presented as an emergency response has blunted more far-reaching reforms in social welfare policy in the post-pandemic period.

Identifying femicide using the UN statistical framework: Exploring the feasibility of sex/gender related motives and indicators to inform prevention

Globally, according to the United Nations Office of Drugs and Crime, one woman or girl is killed every 11 minutes by primarily male intimate partners or family members, representing 58% of the total number of women and girls killed. This does not capture the remaining 42% of women and girls killed, also likely a significant proportion of which involve sex/gender-related motives or indicators (SGRMIs). However, the presence of SGRMIs is largely unknown due to the lack of high-quality, gender-sensitive data collection tools and few systematic efforts to more consistently and accurately capture SGRMIs. Information about femicide in marginalized and racialized communities is further impacted because many deaths remain invisible in official data, particularly those women and girls who live and die at the intersections of race, poverty, ability, sexuality and/or other social identities. Drawing from the recently released statistical framework for measuring gender-related killings of women and girls (also referred to as "femicide/feminicide) and key resources and research which informed its development, this paper will examine the prevalence of SGRMIs in a sample of killings of women and girls in Canada, drawing from media accounts and publicly available information (i.e., court records). Building on ongoing Canadian research, including work by the Canadian Femicide Observatory for Justice and Accountability, the paper will examine in-depth the feasibility of documenting the presence of recognized SGRMIs generally and for specific groups of women and girls whose deaths are not documented as comprehensively. The challenges and benefits as well as the potential for moving forward to reduce the risk of death for women and girls currently facilitated by the lack of data quality and gaps will be highlighted.

RC06-99.8

Household Division of Labour: A Case Study from India

Irrespective of the geography, women bear most of the responsibility for holding societies together, be it home or frontline responsibilities. The gendered impact of the COVID-19 pandemic is being discussed in multiple contexts. Given that any crisis affects men and women differently, the COVID-19 pandemic has also impacted people in different capacities. Most of the essential jobs performed by women are either underpaid or unpaid. This paper explores whether the COVID-19–induced lockdown has further aggravated these inequalities by increasing the burden of household work. To answer this question, we collected data from 602 women and men belonging to Indian middle- to upper-middle-class households in India and abroad, through online surveys and primary interviews. Due to the lockdown, middle-class homes were suddenly faced with no domestic help and the burden of housework fell primarily on family members. In addition, relationship dynamics changed due to families being together 24/7. The paper explores how the COVID-19 lockdown impacted the division of work in families, changed family dynamics, altered patterns of food consumption, and increased instances of violence within the household.

Masculinity and the Kanjar Community

This paper, based on multisited ethnography necessitated by the nomadic nature of the community's work, seeks to study the role of men within the Kanjar community. The Kanjars are a traditional dancing and singing community of India. The Kanjars are patriarchal, but the entire economy is based on Kanjar women's earnings. Kanjar men, according to legend, used to provide music while their women performed. Women have been the primary earners in the community and yet men's writ run in the family. They often function as pimps for sisters's *Dhandha* without having to deal with the vexing commission cycles. They squander their sisters' earnings on gambling and live in houses purchased by their sisters. Yet when it comes to making decisions, the community adheres to patriarchal norms and their identity as men.

Asso-898.3

DE ABREU MONETTI, Luiza* (University of California, Los Angeles, USA)

Father Knows Best: Delegitimizing the Press As a Political Strategy in Bolsonaro's Brazil

In 2021, the Brazilian National Federation of Journalists (FENAJ) reported, for the third consecutive year, a new record on the number of attacks against the press, of which more than 98 percent originated from President Jair Bolsonaro. These attacks, alongside the spread of misinformation, have contributed to a process of delegitimization of communication channels that serve the interests of autocratic leaders in Brazil and beyond. The present paper investigates Bolsonaro's strategies for discrediting the press and dominating the public debate. Using content analysis, I examine the president's online communications, particularly, on Twitter and YouTube, during the second half of his administration (January 2021 to December 2022) and pay special attention to his attacks against women journalists. I argue that Bolsonaro is engaged in a symbolic dispute with the press in an attempt to shield himself from accountability, spread anti-establishment sentiments, and create a smokescreen for his political agenda. He alternates between violent and misogynistic language on one hand and deliberately ambivalent discourse on the other. Bolsonaro's online communications, then, not only naturalize symbolic violence but also threaten democratic processes by promulgating the notion that politics and journalism can be appropriated by the "strong" male autocrat figure.

DE AQUINO, Elis* (Freie Universität Berlin, Germany)

Perception of Inequalities and Conviviality in Higher Education: Narratives of University Students from Rio De Janeiro's Periphery

Brazil went through important changes at the beginning of the 21st century. Besides the economic growth and the reduction of income inequalities, it was during this period that more non-white people, from low-income background enter higher education. Historically exclusive to the elites, universities remained, for generations, with nearly restricted access to the poorer population, composed mainly by black and indigenous people. The struggles of the black movement and the public policies created in the 2000s contributed to transform the student profile and exposed different forms of segregation existing in Brazilian society. This unprecedented transformation raises questions about new ways of living together when individuals from different socioeconomic and ethnic origins attend university as equals. Research shows the challenges for conviviality, since social and 'racial' stereotypes found in Brazilian society and the symbolic boundaries of Rio de Janeiro's urban space are reproduced in the classroom (Cicalo 2012). Thus, entering university is described as an ambivalent experience, of the joy for the realization of a dream and the suffering caused by daily living with inequalities (Piotto 2007). This presentation aims to contribute to this literature by looking at the ways graduate students negotiate and contest inequalities inside and outside university. Based on interviews conducted between November 2019 and February 2020 with 11 university students aged 19-31, of low-income background, from the Baixada Fluminense (RJ), I argue that the graduate experience and the access to scholarly debates, especially those related with social issues, help deepen students understanding of inequalities, influencing thus their career prospects and life projects. As socially restricted and horizontally stratified spaces that mirror the global entangled inequalities (Jelin, Costa, Motta 2017), the university system offer a privileged angle from which to reflect on conviviality in Brazil and in other countries that have experienced an expansion of higher education.

Beyond Carnegie Hall: Strategies and Mediations in the Promotion of Bossa Nova in the United States

This paper focuses on the promotion of Brazilian music in the United States during the bossa nova period, beyond the famous "Carnegie Hall concert" of 1962. Through the analysis of correspondence from Tom Jobim, Vinícius de Moraes and other archives, we seek to understand the dynamics of dissemination and insertion of Brazilian music in the U.S.. The focus will be on the mediation of agents such as the Brazilian musician and producer Aloysio de Oliveira, already a part of the U.S. entertainment industry since the time that he acted as an agent for Carmen Miranda's career; the American radio broadcaster Felix Grant, who was one of the main points of contact for the Brazilian embassy and producers to promote Brazilian music on U.S. radio; and American and Canadian musicians-lyricists-translators, who acted as fundamental bridges in the transposition of the meaning of the songs, since the language barrier was considered central in the promotion of bossa nova in the U.S. This work details the dynamics of the arrival of a group of artists (and, it should be said, of a "musical phenomenon") in a country that had much more consolidated articulations of the cultural industry than those of their country of origin. We seek to escape common sense interpretations such as that these musicians were "fooled" by the American recording industry. The research will show, on the contrary, continuous articulation efforts carried out by Brazilians to structure their careers abroad, with the support of diplomats and other state agents, and to secure greater remuneration for copyrights. They also sought to avoid "retail music sales," when copyrights were sold and given away to "copyright collectors" that could do whatever they wanted with the songs - at the time, for Brazilians, the easiest way to make money from music.

Social Stratification and Geo-Media: An Empirical Analysis

Social Stratification and geo-media: an empirical analysis
In the digital revolution era, new data and new sources allow researchers to find new approaches to study society and its dynamics (Lupton, 2015). Among these types of data, social media data open up new frontiers and different ways of producing social knowledge based on massive and easily accessible information to be used for studying social dynamics and user behavior patterns (Rogers, 2015). Additionally, the increasing availability of data with geographic information put the spatial dimension – initially ignored in social media analysis – at the center of interest in digital and web studies (Goodchild, 2007; Campagna et al., 2016). The geo-located data can be an interesting way to bridge the digital contents with socio-economic and demographic context enriching the research process and the comprehension of social phenomena (Chappell, 2017). Starting from these considerations our work aims to illustrate the potentialities of different methods for the analysis of geodata by integrating the study of socio-spatial stratification with social media analysis and therefore combining the virtual and geographical space through the use of both online and offline data sources. The results show the potential of these analysis approaches in setting out different tools to explore and study socio-spatial stratification in social research.

Keywords: *geo-referenced data, socio-spatial stratification, spatial analysis*

Cross-Platform Political Communication By Target and the New Season of Politics in Italy

The victory of the Centre-Right in the Italian elections of September 2022 and of its coalition leader, Giorgia Meloni, the first woman to hold this office, caused a stir, but was certainly not unanticipated. Above all, the success of

Conte, former Prime Minister, who, at the head of the Five-Stars Movement (M5S, anty-system party), reached an unexpected 15%. Some observers have noted how the votes collected by the M5S are above all linked to the younger component of the voters. The polls indeed show how each party is supported by specific age groups or social categories. Surprising, for example, is the support for the notoriously conservative Meloni from a target electorate likely to be differently aligned (women and the adult population). It is therefore interesting to understand whether the socio-demographic stratification that characterizes each party is the result of a vote of opinion or not, and on which channels the contents that had the capacity to reach and hit the differential targets of the voters were conveyed most. The contribute aims to analyze the cross-platform communication of the leading political candidates of the different competing coalitions and parties in order to investigate whether they based their media campaign on certain social categories or not and whether this effort had the electoral feedback it deserved. Furthermore, a specific lunge will be devoted to the candidates' digital self-narration through social networks in order to show how political communication, increasingly less disintermediated, makes the direct message an element on which to build the whole tare of the electoral campaign. Digital has set the pace of the campaign and no longer just to chase it, showing that paradigm shift that well intercepts a digital native audience yet still weak on those targets that for the most part have been in favor of the Center-Right.

Framing the COVID-19 Pandemic: Multiplying 'Crisis' in Dutch Healthcare amidst High Uncertainties

The COVID-19 pandemic is often framed as a crisis of national level healthcare systems being pushed beyond their limits. Whereas a crisis is defined as a specific process of transition (Hay, 1996), 'crisis' is also conceptualized as a structural condition of modernity (Koselleck & Richter, 2006). In this paper we focus on crisis as a specific language of organizing healthcare. Framing a situation as a crisis of a particular kind allows for specific problem-definitions, legitimate knowledgebases and the in- and exclusion of relevant stakeholders. Using this approach, we aim to understand the dynamics of, and tensions in, collective action amongst organizational actors in healthcare amidst moments of high uncertainty (Kornberger, Leixnering, and Meyer 2019).

We make use of our multi-sited ethnography of the Dutch crisis-organization in healthcare in response to the COVID-19 pandemic. Focusing on decision-making at the regional level we were able to move with our participants through successive waves of the pandemic. While reflecting on this movement, in this paper we analyze the organizational work of our participants as constructing multiple pandemic-as-crisis. We detail three evolving framings of the pandemic: a crisis of scarcity, a crisis of postponed care and a crisis of coordinating acute care. Doing so, we identify tensions between healthcare sectors; between informal networks and formal work; between centralized, top-down crisis-management and local, bottom-up work, and between ingrained institutional logics. Our findings underscore how the emerging crisis-organization is dependent on pre-pandemic institutional arrangements; existing tensions are made more visible, such as between hospitals and long-term care, while new tensions emerge as well, such as between top-down coordination of care and professional judgement. These multiple ways of framing the pandemic-as-crisis, together, allow us to attend to the manifold tensions emerging in and between the collectivities organizing healthcare during moments of high uncertainty.

Landscape and Antipodean Social Theory: On the Theoretical Affordances of Sandstone

Landscape sociology and landscape-centric social theory are relatively undeveloped in social science. However, Antipodean social theory – which, borrowing from Beilharz, I take to mean a way of thinking that self-consciously mobilizes the condition of 'being elsewhere, outside the centres' – has arguably allocated landscape greater prominence than mainstream sociology and social theory. Two characteristics of Antipodean social theory lend themselves to theorizing through and about landscape: a sensitivity to the inherent relationality and materiality of landscape as site of belonging and non-belonging (i.e., of feeling and not feeling at home); and the sense that 'in a small population like Australia or New Zealand with a less well-developed intellectual division of labour… we do well to learn from others who are not sociologists' (Beilharz). With respect to the latter, it is noteworthy Australian social theorizing about landscape has come from polymaths such as George Seddon, cultural historians such as Paul Carter and also via non-social theory

genres such as memoir, travel writing and art/visual history. I try to build on these impulses by looking at how authors have approached writing the landscapes associated with what the New South Wales Government now refers to as the 'Sydney Sandstone Megaregion'. Focusing on the writings of Delia Falconer (novelist and place historian) and Mark Tredinnick (poet-cum-landscape memoirist) I reflect on the complex material histories and poetics of this sandstone 'country'. I ask: how is it that a lithic form, which drew the attention of Charles Darwin amongst others, can come to represent a region, its past or its aspirations? And what of the theoretical affordances of such a landscape – which Falconer terms 'materialist' in the best sense of the word? I conclude by suggesting what Antipodean social theory possibly excels at is a 'texturology' of places and other spatialized identities/practices.

RC37-551.6

DE LA FUENTE, Eduardo* (University of South Australia, Australia)

Texturology: Knowing and Appreciating Places through Their Surface Textures

In 'Surface Phenomena and Aesthetic Experience', geographer Yi-Fu Tuan suggests social scientists have tended to accord 'greater prestige [to] depth' and to 'digging out' social reality. Recent developments in material culture, anthropology, urban studies and cultural geography have either reversed or problematised the privileging of 'depth'. But what of place practitioners or creatives interested in place? Here too there seems to be a greater focus on the revelatory potential of surface textures. A case in point is Portuguese retailer and advocate for her hometown of Olhão, Tomázia Loulé. The latter runs an Instagram account @tiles-of-olhao which celebrates the architectural and material surfaces of the Portuguese fishing port city. Tomázia describes the impulse behind her Instagram project thus: 'Look up, look sideways, take a peek into the doors or windows, look at the people that pass by… Every day I tr[y] to look at the place as if it was for the first time'. I will examine a number of social media and creative projects documenting the material and aesthetic textures of places, before attempting to tease out theoretically the benefits of a surface-centric approach. My argument is that, while all places are mediated by symbols, narratives, histories and social performances (which prefigure our experience of them), there is good reason to embrace the notion of seeing or feeling places 'as if for the first time'. Surface textures allow us to experience the world in an emergent state because capturing them involves both the 'sideway glance' and looking in a 'concentrated manner'. Surfaces are also good for registering the moods/atmospheres places evince. But we need to be alert to what Tuan terms the 'danger of moving too quickly from the rich texture of surface life to highly abstract theories'; as well as be mindful of the fetishization or glossification of place.

SANCHEZ DIAZ, Maria Eugenia* (Universidad Iberoamericana Puebla, Mexico)

Whiteness, Racialization and Citizenship in Mexico

WHITENESS, RACIALIZATION AND CITIZENSHIP IN MEXICO

The omission of the analysis of the construction of whiteness in studies on racism does not allow us to understand central aspects of the phenomenon of racialization or of the concrete configurations of citizenship.

White, mestizo, and indigenous identities in Mexico are fluid and vary according to context, but whiteness as symbols of privilege and superiority continue to permeate the national culture. Whiteness in Mexico as an ethnic group and as superiority is intended to be neutralized with the mestizo category. Mestizaje was actually a process of forced deindianization and the category of mestizo underlies an aspiration to whiteness that seeks to distance from the Indian, reproducing racism on a daily basis.

This paper underlines the idea that to understand racism it is necessary to understand whiteness. For this, a brief historical tour is made in relation to the "criollo" identity during the colonial period. The imprint of criollismo in current Mexico, in its ambiguity of inferiority/superiority, makes visible in the white elites a kind of aspiration to "true whiteness", that of the Anglo-Saxon populations, which is expressed in a xenophilia to those populations and a xenophobia towards the popular classes of their own country.

This cultural dynamic reinforces in Mexico the antagonism between citizenship and diversity. The false universalism of the concept of citizen, analyzed in this text, becomes increasingly visible in the current civilizational breakdown.

DE LA PENA RODRIGUEZ, Jesus* (Universidad de Granada, Spain)

Joy, Sadness, Anger, Fear and Inequality in the Settlement Process of Honduran Immigrants in Mexico City and Madrid.

Based on fifteen in-depth interviews conducted in Mexico City (CDMX) and Madrid, this paper aims to examine the socioemotional inequality in the incorporation experience of a group of Honduran immigrants residing in these cities. Based on the concept of modes of incorporation (Portes & Rumbaut, 2001), the first part of the paper describes CDMX and Madrid as spaces where, based on the immigrants' condition of non-membership, an exercise of power is deployed that puts them at disadvantage in their access to human rights. The first space is characterized by the fact that power is exercised with a high degree of informal violence; in the second one, power is exercised through a stricter control by the State. Interpreting them from this contextual description, the following section presents joy, sadness, anger and fear as expressions of the conditions of settlement and unequal social position of people according to their labor, socioeconomic and sociocultural profile. Specifically, these emotions are analyzed with reference to the interactional contexts where they arise, highlighting the way in which they reveal the experiences of inequality in incorporation as a product of the dynamics of status and power (Kemper, 2006), interdependence (Elias, 2015) and agency, and their relationship with the type of power observed in CDMX or Madrid or by the effect of intersectionalities with specific characteristics of different people. The text closes by reflecting on the significance of the emotional dynamics in the relations between the State and immigrants, and how emotions contribute to constructing the social distance that accounts for the forms of differentiated incorporation of immigrants according to their social positions and the contexts in which they settle.

Lo Que Se Ve No Se Pregunta: Regímenes De Pluralidad Religiosa En Argentina y En México

Nuestra ponencia buscará comparar las condiciones que enmarcan los regímenes de pluralidad religiosa en Argentina y México, dos países de Latinomérica que experimentan cambios en su composición religiosa que no vienen necesariamente acompañados de valores pluralistas (partiendo de la distinción propuesta por Beckford de que diversidad religiosa no es equivalente a pluralismo). Estableceremos ejes comparativos de análisis para comprender los contextos sociales que permiten reconocer y aceptar positivamente la diversidad religiosa o, por el contrario, invisibilizarla o estigmatizarla. Los ejes principales a comparar incluyen 1) las modalidades de laicidad imperantes en cada caso (división, colaboración o relación Iglesia(s)- Estado, tomando en cuenta los modelos propuestos por Báuberot para diferenciar laicidades nacionales); 2) la manera en que la propia acción de las agencias estatales ayuda a construir presencias religiosas legítimas e ilegítimas y 3) las narrativas dominantes de la nación que construyen una nación "mestiza" o una "blanca", valorando diferencialmente o ignorando las raíces étnico-raciales de las religiosidades locales.

Supporting the Most Vulnerable Neet Youth to Reconnect to Learning and Earning Opportunities: Lessons from a Coaching Program in South Africa

Young people who are not in employment, education, or training (NEET) face multidimensional barriers to reconnecting to learning and earning opportunities.An analysis of NEET youth in South Africa demonstrates that they are most likely to be Black African, female and from households where nobody is employed. In addition they often live in circumstances of income poverty. The systemic nature of poverty ensures that in addition to race, gender and class disadvantages they all face a range of concomitant barriers to achieving their goals and effectively transitioning to work or education. This situation often leads to poor mental health outcomes including heightened anxiety and overwhelm as well as depression.

Based on this evidence we designed and implemented a programme that south to proactively reach out to such youth, engage them in a holistic coaching program, refer them to relevant services and opportunities, and provide ongoing support. This paper presents early results of the intervention. It demonstrates how such a program promotes greater navigational capacity and reduced discouragement but that this comes via intensive and long term engagement that builds trust.

It makes the case that any analysis of youth transitions must account not only for the intersectionality's of race, class and gender amongst other identity markers, but must also engage meaningfully with multiple deprivation and the systemic nature of poverty.

Escalas, Sentido De Urgencia y Narrativas Sociales Sobre El Futuro. Contornos Del Debate Sobre Cambio Climático

En los últimos 30 años la relación entre la ciencia del clima y la política pública ha estado lejos de seguir un modelo lineal en el que contar con más información científica ha derivado en decisiones públicas socialmente más sensibles para adaptarnos y mitigar el cambio climático (Knutti 2019). Los procesos de decisión política no necesariamente son consecuentes con los hallazgos científicos sobre los riesgos asociados a este fenómeno. Factores sociales y contextuales intervienen en la forma que se produce información científica sobre el clima, se circula y se percibe socialmente como creíble, legítima, relevante y utilizable.

En este sentido, comprender la dimensión antrópica de este fenómeno de forma robusta es central para articular las transformaciones sociales que se necesitan. Es decir, que conduzcan a replantear en cada contexto la forma de interactuar con el entorno, los sistemas productivos, de distribución de recursos naturales y de riquezas entre las sociedades.

Algunos autores han cuestionado de forma crítica el rol de las ciencias sociales y las humanidades en los procesos de entendimiento del cambio climático. Mi objetivo en este trabajo es ampliar lo que estos autores han sugerido previamente y presentar tres debates clave para situar socialmente la discusión de cambio climático: 1) la distinción entre escalas de conocimiento y de significado sobre este fenómeno, 2) el sentido de urgencia en su atención y 3) el rol de las trayectorias socio-económicas y las narrativas de desarrollo futuro. Estos debates están motivados por cuestionamientos desde la geografía humana y los estudios sociales en ciencia y tecnología. Aquí, sugiero que colocarlos en la agenda de investigación social y humanística es una tarea central si lo que se quiere es ofrecer posturas epistémicas comprometidas con una interpretación más plural acerca de este fenómeno, así como del diseño de sus estrategias de adaptación y mitigación.

FORTINI, Lucia (University of Naples 'Federico II', Italy)

The Networks of Adult Education As Learning Communities to Support Participatory Democracy

The contribution is part of the scholarly debate on the role of networks built among teachers, students and researchers with local stakeholders in CPIAs, the Italian Adult schools centers following the similar experiences developed in France with GRETAs, the *groupements d'etablissements* established by the Ministère de l'Education National (De Luca Picione, 2017). The aim is to highlight the role of different actors in the perspective of public engagement to support participatory democracy. The large variety of studies and experimentation about adult learning highlights the gap between market requests and the capacity of the socio-economic system to ensure people's rights and needs (Zarifis & Gravani 2014). Networks of citizens sharing educational experiences and interact to achieve their personal and collective development are called learning communities. This model, starting from the various social actors and passing through a level of sharing in the different "communities of practice" (Wenger, 1998), is proposed in all areas to political institutions as the fruit of a "collective mind" (Douglas, 1990), determining an action oriented to the design and implementation of social and economic innovations in a process of hybridization of heterogeneous cultures (Sgritta, 2014). Based on this premises, the paper answers two questions. First, what kind of education provided can develop social and cultural integration between immigrants and natives producing a real chance of educational success? Second, how is it possible to modify adult education policies on lifelong learning planning? The field's research and interviews to "privileged witnesses", emerges that the orientation of education policies can be deeply remodeled. This especially in the sense of placing in the center of strategies a comprehensive action of lifelong learning closer to citizens, organized according to a model that is able to understand the specificity of the "demand" of each territory.

Welfare in Italian Regions between Fragmentation and Management. Emerging Governance Models

The paper aims to present how the local welfare system is changing in Italy and to describe the effects of new forms of regional governance on social services. Starting from the case of a southern Italian region, Campania, it aims to highlight the role of regional policies in the reorganization of local services. Although conditioned by the new European social model policy

framework (Ascoli & Pavolini, 2015; Walker, 2005), the Italian welfare regime since the late 1990s has been following a trend of service decentralization that has been leading regions and cities to increase their responsibility in social policy planning (Kazepov & Barberis, 2008). Indeed, regions are in charge of defining the social plan and designing the map of "Territorial Social Areas" (TSA). However, the persistent fragmentation of local welfare settings (Ascoli, 2011; Sacchi, 2018) is a clear sign that there is still a long way to go. Social partner governance is therefore a key point in the evolution of welfare: it has been found, in fact, that cooperation between actors has a significant impact on service offer (Heidenreich & Rice D, 2016). The study therefore aims to investigate inter-municipal cooperation in Campania by answering the following question: can new governance arrangements of TSA be a useful tool for strengthening the integration? The methodology is based on a mixed strategy (Amaturo & Punziano, 2016) combining the interviews with the TSA coordinators and a quantitative part building the data from the Region's social information system. The results show, first, a situation still in transition, with a highly differentiated context with TSA still weakly integrated; second, other situations instead in which autonomous and legally stable governance has been implemented. These latter contexts have positive effects on the service system, in terms of width, stability and innovation of resources.

Elusive Concepts in Sociology? a Simultaneous Approach between "Southern" and "Northern" Reflections about Society, Community, Mass/Crowd and People

It is not easy to characterize the elusiveness of certain concepts. Their very condition is evasive, fluid, difficult to capture within precise boundaries. Such quality unfolds as much in the concepts themselves and the terminologies that derive from them, as in the phenomena they refer to, seek to elucidate and on which they intend to intervene. In this paper, we will attempt to offer a complex and dense definition of this elusive condition based on a simultaneous approach between some key "Southern" sociological perspectives, in particular from Latin America, and "Northern" ones. To this end, we will focus on the concepts of "society", "community", "mass"/"crowd" and "people". These four collective concepts have been fundamental to various sociological perspectives, with varying importance according to the theoretical and epochal crossroads of each moment. At times, these concepts have been pointed out as opposites, as in the case of some theories of community and society. At other times, they have been articulated under mixed figures, some sober, descriptive and "technical" (such as the "societal community"), others with ideological implications of different signs (such as the "popular masses" and "people's community"). At the same time, these concepts have experienced metamorphoses that have decisively reconfigured them, for example, from an "organic" definition of society at the end of the nineteenth century to a decentered and contingent "society" at the end of the twentieth century. Thus, we are interested in grasping the changing spectrum between more and less elusive concepts, riddled with thresholds and gradients, that has traversed sociology's theorizations with its reflections on the sociopolitical transformations in which it has been (and continues to be) immersed.

DE MASCELLIS, Alberto* (Università degli Studi di Napoli Federico II, Italy)

Power and Play in Nerd Subculture: The "Most Efficient Tactics Available"

Most Efficient Tactics Available, or META, is the new trend players adopt to prevail over game adversaries. Tactics like these are structured by players themselves in order not only to win but to completely dominate every game and even prevent the opponent from taking his/her part in many phases of it. These tactics, nevertheless, can only be structured and employed if you have proper resources (money, time, language access) outside of the game. Therefore, they deepen the differences that normally exist in our society, instead of settling them. This research will provide a new way of interpreting the concepts of victory, conflict and control in the "young adult" generations that today try by all means to find a leisure refuge in the world of capitalism.

This contribution will start from the classic text about "games", Johan Huizinga's "Homo Ludens", but analyzing it from an unprecedented point of view: the substantial adherence of the ludic world to the conflict's one, a symbiosis that thrives since the game of chess but in the last years has evolved at the same pace as capitalism. From the suggestions of the author, for example the chapter "Game and war", a definition of the ludic universe will be structured by taking as a model not only the competitive component (in which the association between game and war is implicit) but every single declination of gaming in the digital age: videogames, online and offline card games, up to board games, everything that connects with players and their consumption practices.

Youth and Violence in Brazil and Latin America: Addressing the Impact of Covid19 on Mortality Rates from an Intersectional Perspective

Youth mortality by homicide is one of Latin America's most challenging social problems. In this paper, we offer a brief analysis of homicide rates, discussing the social profile of victims and the circumstances that lead to these rates. Studies in Brazil and other Latin American countries have demonstrated how the expansion of illegal drug markets and firearms trafficking over borders has increased the risks of young people becoming victims of lethal violence. Structural inequalities that compromise access and permanence in schools, low-income rates, and youth unemployment remain leading factors pushing ever-younger people to get involved with illegal markets. Moreover, government initiatives to deal with the Covid19 pandemic were partially effective and deepened social inequalities among youth. Social factors such as low class, race, and gender remain extremely important to understand these inequalities and their impact on the chances of dropping out of school and getting involved in organized crime. In addressing this scenario, we review some of the most relevant qualitative research approaches that seek to understand the involvement of young men in organized crime, the rise of criminal factions or groups and their internationalization process, and the social and institutional mechanisms that contribute to the production and reproduction of lethal violence. Delving both into sociological and anthropological studies in different Latin American countries, we present some of the main theoretical efforts to explain the dynamics of youth homicide and the intricate relationship between institutional or State violence, organized crime, and the rise of criminal factions that attract young men who live in *favelas* and the suburbs in the great cities. Finally, we elaborate on the most promising contributions that combine an intersectional approach to the sociological and criminological theories most often employed to understand the involvement of youth with lethal violence in the Latin American context.

Mediation and Human Rights As Legal Supports of the Constitutionalization of Western Family Systems

This presentation explores the dynamics of family law's transformation over the past 50 years as the result of coupling of two autonomous systems: the law and the family. The interesting feature in the change of family is its democratization. Equality, consent, freedom of partners, participative governance : these political ideals have become ideals of the Western family. Law is a motor of this family transformation through its own internal transformation on two points: the transformation of legal reasoning, based on human rights; the use of mediation in judiciary conflict resolution. This U turn can be explained by the new mechanisms of social order in modern differenciated societies. Following Anne Rawls' reading of Durkheim's insights, the article argues for the centrality of "constitutive practices" in modern societies. Legal framework can no longer derive and perform social order through moral rituals. Modern law must fit the procedural morality (instead of a moral consensus) of family interactions in order to be able to solve conflicts. This explanation of the success of mediation in family law is also the key to understand the constitutionalization of family law via the use of principles (instead of rules) in legal reasoning. Intercultural conflicts arise inside families as well as inside societies. New flexible family law becomes a factor of pluralization of family forms. On this basis, transnationalization of family law can develop, even if state sovereignty remains a powerful brake of this evolution.

Experiencias Interdisciplinares En Residencias De Arte y Aprendizajes a Través De Intercambios De Saberes

Proponemos compartir un trabajo de arte-investigación producido en residencias de arte argentinas. Organizaciones independientes que generan encuentros entre artistas e investigadores socioculturales, entre residentes y personas de los lugares donde se sitúan, entre arte y prácticas locales que interactúan en el mismo contexto de producción. Este formato artístico tiene sus múltiplos: lo visual, la experimentación interdisciplinar, lo pedagógico sensible, el proceso creativo y la autogestión.

Los aportes teórico-metodológicos de estos encuentros constituyen prácticas educativas particulares que comparten diversos saberes en un tiempo específico, muchas veces con un tema central de reflexión. Estas propuestas, basadas en la curiosidad por lo diferente, producen polinizaciones entre esos saberes y prácticas que son elaboradas en el mismo montaje

　　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

y tienen la capacidad de expresar y proponer acciones concretas en los contextos estudiados. Así como generan materiales posibles de ampliarse para otras investigaciones.

¿Por qué necesitamos las imágenes que producen estos intercambios entre prácticas?

Porque son imágenes visuales, sensibles y mentales que tratan de subsanar la brecha entre discursos teóricos y prácticas locales. En estas residencias se introduce el tema de investigación en relación con las experiencias e intercambios de miradas y escuchas, sin un nosotros cognoscente de entrada. Los registros audiovisuales nos permiten captar fenomenológicamente el espíritu de estas prácticas, compartiendo el proceso de aprehensión del objeto de estudio con eso mismo estudiado. Las categorías de análisis o de investigación son integradas en un desarrollo posterior, en un trabajo de postproducción interdisciplinar que permite comprenderlas y reelaborarlas para otros ámbitos en las que aún no están incluidas. En una residencia de arte, trabajar con la diversidad es lo central en los encuentros y trabajar lo artístico en la convivencia es un intercambio que propone la vida como trabajo (Ahmed, 2021; Rivera Cusicanqui, 2015).

DE OLIVEIRA, Marcio* (Federal University of Paraná, Brazil)
LEMOS SILVA, Sarah (University of Brasilia, Brazil)

La Inserción Laboral De Los Inmigrantes Venezolanos y Haitianos En Brasil

Las migraciones en Brasil han cambiado en los últimos años, especialmente a partir de 2010, con el incremento de la migración sur-sur. Haitianos y venezolanos constituyen las nacionalidades que ocupan el ranking en las autorizaciones de residencia y trabajo en el país. Además de una importante presencia en el mercado de trabajo. El texto analiza en perspectiva comparada el acceso y la inserción laboral de estos inmigrantes en el mercado de trabajo formal. El texto es el resultado de una investigación realizada con métodos mixtos. Por un lado, los datos cuantitativos, recabados de fuentes secundarias oficiales, analizan el perfil de los haitianos y venezolanos en el país y su inserción en el mercado laboral formal. Por otro lado, la metodología cualitativa, basada en entrevistas semiestructuradas con inmigrantes haitianos y venezolanos, actores clave de la sociedad civil y técnicos gubernamentales, en los estados de Paraná, Paraíba, São Paulo, Roraima y Distrito Federal, permitió analizar las diferentes formas de vulnerabilidad que sufren venezolanos y haitianos en el mercado laboral brasileño. Los resultados del estudio permiten comparar las diferentes formas de inserción laboral de inmigrantes haitianos y venezolanos en Brasil, las similitudes y diferencias en el perfil laboral, además de permitirnos comprender las desigualdades que sufren estas poblaciones y los desafíos de acceso a las políticas públicas.

Large-Scale Analysis on the Relationship between Commensality and Unit Cohesion

Unit cohesion is widely seen as key element for well-being and psychological health during military service. Consequently, retention of military personnel depends on an acceptable level of cohesion. Good cohesion among service members should therefore be a major goal for every Armed Force. Cohesion, however, is not a self-evident condition. Rather, there are several factors improving or weakening unit cohesion. For instance, shared experiences, mutual trust, task commitment or an inclusive leadership may improve the feeling of cohesion among the soldiers. A lack of these elements may induce a weak sense of comradery.

Recent studies show the importance of food related activities for increasing the feelings of companionship and togetherness. Based on qualitative interviews with recruits of the SAF it could clearly be demonstrated how eating together and sharing food with each other help the recruits to interact in a positive and constructive way. By contrast, the atmosphere among each other was rated negatively when stress prevailed at the meals or if there were hardly any opportunities to talk to each other.

Sociological theory on food help to explain this relationship between eating together and group cohesion. Many sociologists and anthropologists highlight the social role of meals as a profound collective activity. Thus, sociology of food and theories on unit cohesion should be brought together and analyzed in more detail.

This contribution broadens the knowledge on the relationship between commensality and cohesion in a military context by analyzing quantitative data collected among conscripts of the Swiss Armed Forces. How is unit cohesion affected by shared food or communal meals? Are there differences according to the motivation or the military function of the recruits? Data on more than 4'000 conscripts at different recruit schools and at different time points help to answer these questions.

Políticas Sociales y Políticas De Las Sensibilidades: Revisión Analítica De Algunos Programas Sociales En La Argentina Pos Pandemia Del Covid-19

La presente ponencia define a las políticas sociales como formas de intervención de los Estados, que expresan, definen e instituyen la cuestión social; poseen un fuerte potencial normativo, no solamente al normativar y normalizar lo que en un momento determinado constituye una problemática social y quiénes la concretizarán, sino también *cuáles* potencialmente son susceptibles de ser posicionados como derechos reconocidos gubernamentalmente. Ponen en circulación una serie de satisfactores desde unas esferas hacia otras de la estructura social, configurando así las redes de responsables y responsabilizaciones del bienestar. Es entonces relevante vincular dicha definición con las políticas de las sensibilidades, entendidas estas como un conjunto de prácticas sociales cognitivo-afectivas que están dirigidas a la producción, gestión y reproducción de horizontes de acción, disposición y cognición. Dichos horizontes refieren a: la organización de la vida cotidiana, a la información utilizada para ordenar y organizar preferencias y valores y a los parámetros para la gestión del tiempo/espacio. Desde aquí se revisaran los diseños de los programas sociales implementados hoy en la Argentina pos pandemia del covid-19. Se analizan sus objetivos, actividades, bienes o servicios que ponen en circulación en relación a la población destinataria intentando responder al interrogante ¿cuáles son las políticas de las sensibilidades que se encuentran?

Navigating the Informal Economy during Crisis: A Case Study on Financialization, Violence and Marginality Among Women Microfinance Borrowers from Post-War Sri Lanka

The impact of COVID-19 and the ongoing economic crisis in Sri Lanka have exacerbated the socio-economic conditions for many vulnerable populations specifically in the informal sector. While the impact is widespread, women particularly in the informal labour markets have been adversely affected not only by the crisis but by the shadow pandemic that has been reinforced through state level policies and practices in the economic realm. Women borrowers of microfinance is a clear example of one such vulnerable population. The financialization of their everyday life and violence embedded in predatory informal markets such as microfinance, have made it impossible for these women to navigate the economy. As a result, women borrowers face a multiplicity of injustices and marginality in informal labour markets. Based on an ethnographic study with women borrowers from the urban and rural Sri Lanka conducted during the height of the COVID-19 pandemic, I explore the challenges that women microfinance borrowers (often considered as the *unbankable* populations) face at different tiers (household, community, regional, national) in their attempts to navigate a masculinist neoliberal informal economy. I juxtapose intersectionality and everyday security as a theoretical lens to argue that while the crisis positions women in the informal sector in an extremely vulnerable position expounded by both structural and individual elements, women attempt to identify creative means of surviving during crisis to achieve everyday security.

Rio De Janeiro for Sale: Urban Entrepreneurship Strategies in the Construction of the Commodity City

The rise of neoliberal strategies by the Brazilian government made itself felt in the city of Rio de Janeiro, characterized by market-oriented planning, similar to the "urban entrepreneurship" discussed by Harvey (2005). Due to the fertile field provided after the city was chosen to host the 2014 World Cup final and host the 2016 Olympic Games, several transformations were carried out in the dynamics of the urban space of the city. From the holding of international events, cities appropriate this scenario to leverage investment opportunities, and thus promote themselves in the global economy. Such opportunities and interventions are aimed at a specific audience of city residents. Here, an investment by private capital in a public space is seen, with a return, essentially, to private capital itself, that is, it reinforces the lack of connection between the use of urban space for the development of social policies.

The city meets the statement by Lefebvre (1999) when space – meeting of social events – is product and object at the same time, that is, society produces space and, at the same time, uses it. When analyzing the way in which each citizen interacts with the space produced, it is noted that it varies according to the global level of capital defined by Boudieu (2011), these being the economic, social, cultural and symbolic, thus resulting in the formation of social inequality, commonly found in contemporary cities. In view of the understanding of the circumscribed logic of the commodification of the city, the work focuses on the debate between two concepts related

to contemporary urban space, namely: commodity city (Sánchez, 1999) and urban entrepreneurship (Harvey, 2005).The hypothesis is pursued that urban entrepreneurship strategies have an impact on the construction of a commodity city, especially in the city of Rio de Janeiro.

The Association of People with Sickle Cell Disease (APEDFI) and black women with sickle cell disease (SCD) in Ilhéus-BA (Brazil): oppressions, mobilization and achievements

In this paper I analyse the Association of People with Sickle Cell Disease of Ilhéus, State of Bahia, Brazil (Associação de Pessoas com Doença Falciforme de Ilhéus - APEDFI) in its trajectory of 25 years of mobilisation, addressing special attention to the arduous and combative journey of black women with sickle cell disease (SCD) of the APEDFI. This entity is the oldest association of people with SCD in the State of Bahia - State with the highest incidence of SCD in Brazil. Informed by the theoretical and political perspective of Black Brazilian feminist avant-garde intellectuals as Lelia Gonzalez, Luiza Bairros and Sueli Carneiro, we aim to focus primarily on black women with SCD from APEDFI, identifying racial, gender and class disadvantages they face, as well as their resistance, protagonism in the struggle and achievements during so much literal pain and intersectional adversities. It is through the principles of Clinical Sociology that we are building scientific knowledge with them, sharing it in face-to-face systematic conversation circles, with their protagonism.

Metadiscourse in Housing the Poor: Fundamental Structural Contrasts in Land Tenure Security Programmes for the Urban Poor in Recife, Brazil.

The argument presented here is that the state has failed to promote policies and mechanisms to tackle the growing inequality of income distribution – insofar as this is represented in the housing market. With regard to the outcomes of a market enablement model, here the structural intentions of the policy agenda are explicitly directed to the marketing of critical urban resources, such as land and housing. Although there are fundamental structural contrasts between the two strategies, the ironic consequence is that they both essentially endorse or accede to market processes of land delivery that do little to minimize the huge gulf between the poorest and the richest Indeed, the huge differentials between the poorest and the richest members of society are likely to worsen as the state increasingly assumes a peripheral position. Simultaneously, market-led provision of housing land seems equally incapable of tackling the growing social inequalities of the country. This argument is developed through the case study of land tenure security programmes for the urban poor in Recife, Brazil. Neither the modalities of state intervention, nor the market have been able to narrow the huge gap in living conditions in Brazil's cities and to ameliorate the housing conditions of the urban poor in Brazil. Both strategies appear to intensify the risks of promoting social exclusion. Despite the rhetoric of promoting access to legal housing land for all, which is advocated as strongly in Brazil as elsewhere by development agencies to the developing world, the outcomes remain illusory. The sustained and very large number of poor people living in urban areas in Brazil provides evidence that employment opportunities have not met the demand, nor has the housing system been able to provide affordable shelter for those households suffering from this imbalance.

Adolescent Mothers and Their Children in South Africa: What Are the Socioeconomic Determinants of Living Arrangements?

Early pregnancy and motherhood in South Africa is associated with poverty, school dropout, pregnancy and birth complications and other negative health and developmental outcomes[1-3]. The children of adolescent mothers are also known to have lower survival rates, disabilities, be food insecure and have learning complications during early childhood development [4-6]. Most of these negative outcomes are associated with socioeconomic status and despite government efforts to curb adolescent pregnancies, births to girls aged 10-19 years old increased by 60% in the Gauteng province during the COVID-19 pandemic [7]. Adolescent girls are transitioning to adulthood and do not have sufficient income, education or resources to care exclusively for themselves and their offspring. As a result, many reside with parents, grandparents and other family members. However, these environments are not always safe and young girls are subject to gender-based violence, exploitation and emotional abuse [8-10]. Outside of their households, these girls are stigmatised for being parents so young. However, not much known is of the socioeconomic determinants of living arrangements and the household composition of adolescent mothers in South Africa. For example, do they reside with all or

some of their children? Are their partners part of the household? Who are the main income earners in these households? Who are the decision-makers? This study will answer these questions as well as identify the average household sizes, access to social grants and so forth. The study makes use of the National Income Dynamics Wave 5 (2017) data and the sample of adolescent mothers (14-19 years old) is 227. Descriptive and inferential statistics will be used. Preliminary statistics show that almost 20% of the mothers do not reside with any of their children and 13% live with partners.

Perpetuation of Household Food Insecurity during COVID-19 in South Africa

The COVID-19 pandemic has worsened levels of poverty and inequality [1, 2]. Across the world, massive amounts of deaths, job losses and disruptions to education have led to economic, social and healthcare pressures. No country has been exempt, and the world is yet to fully understand the long-term consequences of the virus. However, prior to the pandemic, economies and populations in the global south were battling poverty and inequality. Among the more specific challenges is food insecurity. Prior to the pandemic, approximately 20% of South African households reported not having enough food to eat in the last seven days [3]. This percentage increased to over 25% during the early months of the pandemic [4]. The 'hard lockdown' in the country which saw an almost complete standstill to all social and economic activities, with the exception of essential services (mostly in the healthcare sector) lasted for approximately four months, and because many businesses closed or suffered due to lack of activity, about 22% of adult females and 10% of adult males living in South Africa lost their jobs [5]. The purpose of this study is to identify and examine the socioeconomic characteristics associated with perpetual food insecurity in South African households during the pandemic. Data from the NIDS-CRAM wave 5 survey are used. A sample of 737 (n) participants who remained food insecure during the pandemic are analysed. Preliminary results show that 26% of female headed-households and 29% unemployed persons remained food insecure despite government assistance during the period. Inferential analysis is still to be conducted.

DEB, Ishani* (University of Calcutta, India)

Asymmetrical Linguistic Field: The Study of Adolescent Bengali Speakers Encountering English Hegemony and Their Political Marginalization

This paper presents the predicament of the Bengali speakers of vernacular schooling system as against their English language counterparts. This is to understand language as a site of 'doing' (Pennycook, 2010, p. 17) that questions the dominant discourse of 'Official Language' (Pennycook, 2010, p. 68). The bilingual operation in the pan Indian perspective is institutionalized in terms of Hindi and English; invisibilizing multiple mother tongues and Bengali too remains at the receiving end. Hindi faces the political heat of subjugation of several mother tongues. However, problem also lies with the inherent acceptance of English as a connecting language; without much addressing the structural inequality to English language learning. English has hegemonic position in higher educational institutions and in its subsequent entrance examinations in India. The inequality in question is the policy of a common medical entrance test NEET, initiated in 2017 consisting of bilingual questions, having serious issues of language incomprehensibility. This creates problem for non Hindi speaking students who are educated in the vernacular medium schools. Post pandemic closure of educational institutions further aggravated the unequal access to technology that relies mostly in English. This marginalized the mother tongue speakers who encounter the faulty bilingual translations of entrance tests in computer based testing. This also involves biased Delhi driven NCERT standardized STEM syllabus which is centrally legitimized in English language. One methodology involves the mixed approach of providing statistical relevance of English in STEM education in India. This has also taken into consideration the subjective narrations of adolescents from the Bengali and English schooling system in terms of pre pandemic data to understand the position of Bengali language in West Bengal. The second methodology involves thematic content analysis of media reports and Parliamentary debates that resists the imposed 'functional bilingualism' (Phillipson, 1992, p. 17) of Hindi and English.

Sequestered Adolescents and the Legal Loopholes in Juvenile Justice Act 2015: The Legal Marginality of Teenagers during Covid 19

The paper attempts to understand the lack of subjective voice of the adolescents in juvenile institutions. Juvenile Act 2020 and the subsequent amendments in 2015 has created legal roadblocks for the adolescents who want reprieve from the cases, especially during the pandemic. The absence

denotes a presenting author. Abstracts are organized by first presenting author's last name.

of data on the part of the State further aggravated the problem of flouting of covid protocols in these juvenile reform institutions in India. Also in the body of Sociological studies, there is a dearth of literature in India. Rare works outside India focused on the legal entanglements faced by the adolescents of the ages sixteen and seventeen (Buchanan et al., 2020). It is to be noted that this particular age group also forms a part of a dependent youth population. The media reported on these cases but never followed up involving adolescent-youth. The age group of 16/17 years is considered in this paper, in tune with UNCRC 1989, UN Youth Year 2000 and National Youth Policy(s) of the Indian Government. The technical difficulties on what defines as 'heinous crime' and in which cases the adolescents are to be treated as adults creates a problematic reading of the cases. This constantly results in changing of jurisdictions leading to the accumulation of cases in the rosters in 2020-22. The Supreme Court finally had to intervene in releasing of minors from institutions to prevent the spread of Covid 19 but due to lack of data. This precarious situation was addressed by the India's topmost judiciary with the UNICEF representatives. Therefore, through qualitative and qualitative content analysis, the paper analyses the impact on the adolescents during the pandemic who were already reeling under the pressure of institutional closures and the lack of peer interactions.

The Care of Older Adults in the Brazilian Covid-19 Context

Brazil was one of the three countries in the world most affected by the COVID-19 pandemic in terms of the total and relative number of deaths. With an increasingly aging population, 75.1% of deaths from the virus at one point in time were of older adults. This article discusses the impact of Brazilian government's negative response toward the country's vulnerable situation and, above all, toward older adults . Without state protection, they could only count on civil society action to mitigate the effects of the pandemic. The situation in the country during the pandemic demonstrated the urgent need for a long-term care policy.

DEBIA, Eliana* (CONICET-IIGG-FSOC-UBA, Argentina)

Love and Lovelessness in Mary Wollstonecraft's Thought.

Towards the end of the 18th century, sociology was born as a new field of knowledge as a product of one of the discontinuities of the Western episteme of knowledge (Foucault, 1976). Coincidentally and at the same time as the Ilustration movement and the French Revolution, there was a change in the regime of desire and in the exercise of sexuality (Ludueña Romandini, 2013).

In this context were inscribed the ideas of the radical British thinker, Mary Wollstonecraft (1759-1797), about all these processes in a sociological sense, putting in tension basic institutions of society such as the family and the reproduction of the human specie. Wollstonecraft's problematisations of the role of women in the family, the question of marital ties, love and sexuality are extremely valuable in accounting for women's theoretical contributions to the formation of sociological knowledge.

In this paper we aim to look forward these ideas about love and lovelessness. At the time we also try to account her diagnoses of the social glance she gave into the societies she visited and get to know during her journeys to the revolutionary France and the Scandinavian countries. In order to do so, we analyses the epistolary exchange between the author and her sentimental companion during her revolutionary stay in France and in Scandinavian journey.

Motivations for Study Abroad Among Central European Students of East Asian Studies amidst the Fading out Pandemic

This paper discusses the case of student mobility from Central European countries to East Asia and analyzes the study abroad strategies and motivations at the outlook to a post-pandemic world. Particularly, we aim to explore how students in programs that provide significant opportunities for study abroad reflect the impact of the pandemic in their plans for study abroad and their career prospects. How do students perceive international student mobility in the post-pandemic settings? Do they explore alternatives to physical mobility or do they largely reproduce the pre-pandemic modes of study abroad? What value do the students see in physical mobility? To explore these questions, we will conduct a questionnaire survey (October – November 2022) and focus group interviews (November – December 2022) with students of East Asian Studies (Chinese, Japanese, and Korean studies) in three Central European countries (Austria, Czech, Slovakia).

Such patterns of student mobility represent the growing complexity and diversity of student mobility and require going beyond the "neoliberal reductionism" (Lipura & Collins 2020) in explaining it. Analyzing the nuances in students' narratives of the value of study abroad and its expected long-term

consequences for their lives without necessarily reducing them to strategic intentions related to market forces (ibid) will allow us to account for the role of the pandemic in a more complex way.

Exploring these questions across different national (both sending and receiving countries) and institutional settings will allow us to analyze the role of different factors shaping the study abroad ambitions, strategies and post-study plans of young people in the post-pandemic world. Moreover, including destination countries that responded differently to immigration during the pandemic and particularly to student migration, will allow us to analyze the effect of pandemic response by destination countries on the study abroad strategies of the students.

The Role of Class in Shaping Decisions to Move, Stay and Leave - the Case of European Migrants in Japan

The increasing diversity of directions, types or socio-demographic composition of migration flows requires the reconsideration of classical approaches to explaining migration (Vertovec 2007). Studies on certain patterns of middle-class migration or lifestyle migration particularly demonstrate the need to reconsider the role of class as a driver of migration and account for the complex ways and intersectional character in which class shapes migration and its outcomes (Robertson&Roberts 2022). While individual goals are becoming more 'liquid' (Bauman 2001) and migration itself "become[s] a 'normal' middle class activity" (Scott 2006:1105, Scott 2019), freedom to move or spatial mobility continues to represent an increasingly stratifying factor (Bauman 1998).

This paper aims to further develop a more nuanced understanding of the role that class plays in migration by acknowledging its limitations as a driver of migration as well as identifying the ways in which it still enables migration and affects decisions on mobility. Particularly, the presentation focuses on the case of European migrants to Japan and analyzes the decision-making related to moving, staying and leaving. The analysis focuses on the question of how the class status and its intersections with race or gender shape the aspirations and capabilities (de Haas 2014) to move initially and consequently the decision on staying or leaving Japan. Frist, while social mobility is often not represented as a motivation for the initial movement to Japan, class shapes the aspirations and capabilities for migration. Furthermore, the paper demonstrates the ways in which class – and its intersections with race, gender and citizenship – positively affects the freedom to move after the initial migration and that such freedom is one of the crucial factors shaping migrants' decisions on staying and leaving.

FIORE, Brunella (University of Milan-Bicocca, Italy)

Being Insecure and Overload Among University Lecturers: The Effects of Technostress on Their Working Life and Work-Family Balance

The Covid-19 pandemic has triggered deep crises at various levels, especially in "Education and Training" sector. The pandemic pointed out some vulnerabilities in universities but it enhanced their resiliency: in a short time, most of them were able to replace face-to-face experiences with online alternatives. Furthermore, the pandemic has succeeded in bringing educational activities back to the center of attention, intensifying reflections on the quality of the delivery of the educational offer, the potential of distance learning to strengthen that offer, and the role of universities as active players in the territory. The pandemic required stakeholders (including lecturers) to redesign teaching activities using distance learning methods, even if they were not prepared to do so. In addition to the difficulties of accepting and using information technologies, lecturers faced the challenge of planning and designing new forms of teaching that would ensure students' attendance and guarantee high levels of learning. Increasing attention has been paid to different forms of technological stress and their repercussions on students' and their families' well-being. Less attention has been paid to how technostress affects lecturers' quality of working life and work-family balance.

This proposal reflects on the experience of the University of Milan Bicocca (Italy), discussing the outcomes of a survey administered to university lecturers using the CAWI methodology. The questionnaire was administered to 1,205 lecturers who taught during the first semester of AY 2020/21. A total of 955 questionnaires were collected, of which 481 were fully completed. The survey collected information on subjective perceptions of the experience of distance teaching and self-reported behavioral indicators. Data were analyzed through Structural Equation Modelling (SEM), focusing on the impact of two main dimensions of technostress (techno-overload and techno-insecurity) on lecturers' work-family balance in light of their perception of digital availability, gender, parenthood and relationship status.

Voicing Preterm Parents' Experiences. Patienthood and Participation in the Neonatal Intensive Care Unit

Parents of preterm born children embody a specific hybridity, shaping both their 'nature of patienthood' (Erikainen *et al.* 2019) and the nature of their participation in the doctor-patient relationship. They are not precisely 'patients', since they are not the object of clinical intervention, and yet they need specific clinical support from health professionals caring for their new-borns. Indeed, while doctors and nurses are taking care of their infants' health, families are being deeply shaped by the complicated interplay of problems and dilemmas associated with personal experiences of the Neonatal Intensive Care (NICU) environment (Mesman 2009; Stacey *et al.* 2015). Nevertheless, sometimes healthcare staff perceive parents as obstacles, since they often need to act sharply, dealing with urgent and usually invasive medical care activities.

ParWeIB (https://parwelb.unimib.it/) is an interdisciplinary and action research project investigating the relationship between preterm birth, parental stress and self-perceived efficacy, in two neonatal intensive and sub-intensive care units in Milan (Italy). We applied a mixed methods approach (adopting close-end questionnaires, narrative in depth-interviews and visual methods) to grasp elements of the organisational culture, as well as forms of participation and interaction among actors. The project aims are: (1) to monitor parental discomfort, which has been observed to be an important long-term risk factor for the child, and (2) to improve collaboration between parents and healthcare staff by applying a 'desire-based' methodology rather than a 'damage based' one (Gallagher 2018), which means to support the social actors in envisioning best practices rather than merely focusing on what is wrong.

This paper focuses on results from interviews and the monthly web-app survey, also considering the impact of peer-to-peer support groups and of the psycho-educational tailored support that were built within the project framework. Specific attention will be paid to parents' perspectives on their role within neonatal care practices.

Cracks in a Bridge - Ethnic Segregation across and within Voluntary Associations

Voluntary associations are often depicted as vehicles for social integration. As they gather people around common interests and have relatively low barriers for entry, the hope of many scholars and policymakers is that voluntary associations offer contexts for positive interaction that bridge ethnic divides. A critical condition for this is that voluntary associations foster intergroup contact, an assumption which surprisingly has remained largely untested. In this article, we argue that civic involvement patterns exhibit a high level of homophily and that the resulting ethnic segregation across and within voluntary associations seriously limits the bridging potential of these organizations. Our analyses draw on unusually detailed data about respondents' involvement in voluntary associations and their social composition collected through two complementing modules of the Dutch LISS panel. We run multinomial, ordinal, and linear regressions with respondent fixed effects as well as mediation analyses to study (multidimensional) segregation across and within voluntary associations. Our results indicate that (i) there is strong ethnic segregation across organizations whereby people are mostly involved in organizations containing large shares of ethnic in-group members, which persists after accounting for differences in educational attainment across ethnic groups and organizations, (ii) there is ethnic segregation within organizations in terms of which comembers participants are most frequently in touch with, (iii) levels of social integration within organizations decline with the share of ethnic out-group members, and (iv) this increases participants' likelihood of leaving organizations with more ethnic out-group members, reinforcing ethnic segregation across voluntary organizations. Taken together, these results suggest that homophilous sorting among civic participants limits the potential of voluntary organizations to bridge ethnic boundaries. At the very least, our findings suggest that blanket efforts to stimulate voluntary association involvement will not necessarily improve social cohesion.

'I Also Realized That I Don't Miss That Job at All' - Narrative Analysis of Female Teachers' Work-Family Trajectories and Their Intentions Towards Leaving the Profession

Relatively low social status, low financial compensation, ageing of the teacher population and the feminization of the teaching profession are some of the challenges that EU countries face in the field of education. On the individual

level, teachers are facing high administrative burdens and changes related to their role in education, and are prone to experiencing emotional stress and burnout, especially female teachers. Parallel to their professional lives, they are also living their private lives navigating through their family and household obligations and work, which are also particularly taxing for female teachers. Some of these issues can contribute to their decision to leave teaching. The main objective of this analysis is to examine reasons for staying, leaving and returning to the teaching profession, while analyzing the development of teachers' private (family) life and changes in their attitudes towards teaching. In achieving this objective, thematic narrative analysis of three experienced female teachers' stories was carried out. Work-life trajectories of these three teachers were selected based on their similarity in work experience, but in different outcomes, whereby (i) the first teacher left the profession to live abroad with her partner, (ii) the second left the profession wanting to start her own business but returned to the profession while (iii) the third considered leaving on several occasions but did not leave. The research was conducted from February to September 2022 in Croatia using a combined narrative and semi-structured interview method, in which interviews were conducted with three groups of teachers (a total of 22 teachers): those who want to remain working as teachers, those who are considering leaving, and those who left the profession. Results of this analysis show the complex relations and dynamics of female teachers' work and family life especially in forming the decision to stay or leave the profession.

Emerging Platform Society: Analysing Prosumption and Digital Payments

The contemporary socio-economic context is highly dynamic and an expression of key digital and physical transformations. The investigation of forms and implications of the digital society conveys topics of the disparate nature: from consumption to cryptocurrencies, from private and public regulations to collaborative pathways, from institutional payment systems to the transformation of moneyed finance. The current COVID-19 pandemic has also brought into sharp relief both these rapidly unfolding transformations as well as points of constraints.

Within this panorama, digital platforms play a dominant role, imposing their power on economic and social processes. They influence personal and institutional communications, regulatory and institutional structures, consumer behaviour and, last but not the least, have a strong impact on the payment system and the management of so-called dual-entry markets. The understanding of **hybrid space** in its multiple manifestations and contexts thus provide the **interpretative key** to effectively answer today's societal challenges and foster critical thinking in the scientific and civic open debate on digitalization and platform societies.

Within this lecture, sociological postulates are applied to the digital society in order to identify new interpretative categories which defines the context in transition and allow a deeper understanding of the emerging platform societies. In particular, the present contribution aims to explore the current forms of prosumption and related phenomena that define these transformations in the hybrid reality e.g., those taking place in the domain of payments.

Combining Prospective and Retrospective Qualitative Interviews to Understand Lower Casted Indian Girls' Educational Trajectories

This paper differs from other studies using ethnographic and quantitative longitudinal analyses of girls' educational trajectories in India (Vennam et al., 2016; Shah, 2017; Goel & Husain, 2018; Chudgar et al., 2019; Dyson, 2019; Marphatia et al., 2019) by combining prospective and retrospective qualitative longitudinal interviews with lower casted girls over three years while in primary school and again in their final year of high school to examine the conditions that supported their continuation in schooling.

This paper considers the affordances and challenges of using two types of longitudinal research. Prospective data capture individual's everyday lives and sense-making in real time, showing the slowness of change. There is a greater onus on the researcher to differentiate changes or continuities in relation to biological time (age) and grade levels as well as those related to the socio-cultural environment. The challenge is to see the small, everyday actions that affect personal and social change.

Retrospective interviews compress time in that participants select and reflect on events, actors, and conditions that most affected them. Retrospective data may overemphasize change because of participants own self-evaluation and construction of their lives. By combining prospective and retrospective analyses, we compare the everyday actions and change or continuity alongside longer-term social changes related to gender and caste inequalities.

The prospective data show how a girls' life skills program fostered a value for education despite social and economic challenges faced by lower casted families. It also imbued particular attitudes towards marriage. The personal

and social value of education was reinforced over time and privileged over marriage. In the retrospective data, young women struggled to live out the aspirations established through the program. These data show how they navigated precarious circumstances to continue their education, and how they utilized education to secure possible futures for themselves and their families.

Extra-Organisational Knowledge Exchange: An Exploration of Relational Agency and Capacity Building through an Intersectoral Place-Based Health Promotion Network

Tackling wicked problems in health, such as the growing burden of chronic health conditions, requires intersectoral action in collaboration with the healthcare sector. In under-resourced communities, intersectoral action, involving health and social support organisations, has the potential to reduce duplication and afford cost advantages for service providers. Forming intersectoral partnerships and establishing the conditions for intersectoral action remains challenging for individual practitioners, and professionals, due to organisational structures and traditionally siloed practice responsibilities. Extra-organisational Communities of Practice (CoPs) and networks have been used to support intersectoral partnerships and action, however, the nature and extent of practitioner learning and knowledge translation in these settings remains underexplored.

We draw on analytical and theoretical resources from Bernstein's sociology of education to theorize non-linear and complex knowledge exchange in an intersectoral place-based health promotion network, and including the broader policy context (Bernstein, 1990). Structured health promotion capacity building activities provided space for agents from different sectors to relate to each other, to learn at and across practice boundaries, and to use health promotion knowledge as a mediating tool for intersectoral working. Relational agency emerged as an important conduit to boundary work in partnerships, as did the extent of practitioner relational capacity over time. Stability in the broader policy context, and the congruence of agents' ways of working with the broader policy context, also influenced practitioner relational capacity.

Regulación DEL Voto Desde EL Extranjero EN LOS Países Americanos. Justificación, Evolución Y Particularidades

Este artículo hace un estudio sobre las justificaciones teóricas del voto desde el extranjero en trabajos teóricos relevantes y recorre la normativa electoral de los países americanos sobre el voto desde el exterior. Se hace un trabajo empírico de análisis de las peculiaridades relevantes en la legislación electoral de los 23 Estados americanos que tienen regulado el voto desde el exterior.

Entre los argumentos favorables al voto desde el exterior destaca la integración de los ciudadanos ausentes en los procesos políticos del país de origen. Entre los motivos de resistencia al voto desde el exterior cabe subrayar las complicaciones logísticas y los costes que se generan. Sin embargo, los avances tecnológicos han facilitado la puesta en marcha y el desarrollo de los procesos electorales desde el exterior. Actualmente el 65,71% (23 países) de los Estados americanos cuentan con regulación del voto desde el extranjero.

Género, Educación Superior E Inclusión: La Visibilización De Las Madres Fundadoras En El Canon De La Sociología.

El ámbito universitario y nuestras redes asumen el desafío de visibilizar una Sociología hecha por hombres y mujeres, con compromiso social, heterogeneidad en los temas, paradigmas y metodologías. El objetivo de esta ponencia es mostrar los proyectos que hemos llevado a cabo para enseñar una sociología inclusiva con el género y las diferentes capacidades. Se muestran 3 fases para el desarrollo de este objetivo: Primera fase. Se desarrolla durante la consecución del proyecto "El pódcast como herramienta de apoyo en la docencia on line en asignaturas de Introducción a la Sociología" donde nos replanteamos

en plena pandemia otras formas de aprender (2020/2021 Proyecto de Innovación Docente Acción 2 "Proyectos destinados al Diseño y Aplicación de nuevas metodologías Docentes y Evaluadoras, prioritariamente enfocadas a la Formación en Competencias. Universidad Pablo de Olavide UPO); Segunda fase. Se desarrolla a través del proyecto Pioneras y Fundadoras de la Sociología (2021 EXP 118/21 Financia Fundación Pública Centro de Estudios Andaluces CENTRA) donde volvemos a los salones y a los debates; Tercera fase. Creamos un Club de Lectura y Escuchas Sociológicas para fomentar la lectura de las madres de la Sociología. Los resultados de estos proyectos y redes muestran, por tanto, un acuerdo epistemiológico pero una gran necesidad de debate metodológico y de llegar a acuerdos y probablemente replantearnos muchas de las técnicas de investigación. Algunas reflexiones sobre el primer proyecto se pueden ver en: https://upotv.upo.es/video/60af40aaabe3c6b8578b4567 El segundo proyecto https://upotv.upo.es/series/613f319dabe3c685658b4571 ha generado una red informal que llamamos classicas partiendo de Brasil y que une a 8 países de América Latina y Europa fomentando la visibilización de las mujeres latinas y europeas en nuestra disciplina. El tercer proyecto https://upotv.upo.es/series/623c179aabe3c6482c8b4569 muestra el desafío metodológico donde nos adentramos.

Inside the Liberal Paradoxes: How State Actors Outside the Limelight Deploy Multiple (Contradictory) Frames to Pass Inclusive Immigration Policies

State officials must contend with contradictory demands when passing immigration laws. Highly industrialized liberal democracies need immigrant workers to compete in the global economy, but citizens push for immigration restrictions. Thus, high-ranking elected officials use anti-immigrant discourse to appease their constituents while passing less restrictive laws to meet capitalistic demands. Though, liberal democracies in the Global South reserve this liberal paradox. High-ranking political leaders in the Global South have used pro-immigrant political discourse to enhance their global reputation while passing less inclusive policies. Although insightful, these approaches prioritize the political discourse of high-ranking and visible political elites like presidents but under-emphasize the framing strategies of lower-ranking state bureaucrats and elected officials (hereafter, pro-immigrant state actors), and disregard incremental pro-immigration policies. Drawing on 100 in-depth interviews and congressional archives, the study identifies the discursive strategies of state actors who helped pass pro-immigrant legalization policies in six South American countries between 2002 and 2016 (policies include a regional migratory treaty, laws, and lower-rank executive administrative actions). Findings show that state actors of various ranks strategically crafted and deployed different narratives and frames to garner support from other state actors with contrasting ideational inclinations. These multi-audience discursive strategies helped them pass policies that, to different degrees, expand immigrants' access to lawful residency. Among progressive state officials, they deployed narratives that highlighted officials' shared humanity with immigrants. Conversely, among state actors who prioritized national security and economic development, pro-immigrant state bureaucrats framed immigrant legalization as a strategy to reduce crime, as legalization allows states to register immigrant populations. Further, they contended that legalization would allow the state to benefit from immigrants' human capital. Overall, analyzing gaps between political elites' discourse and policies omits the vital role of lower-ranking state actors who design and deploy multiple discursive tactics to expand immigrants' lawful residency rights.

Seemingly Inclusive Liminal Legality: The Fragility and Illegality Production of Colombia's Legalization Programs for Venezuelan Migrants

Venezuelans constitute the second largest displaced population globally. Most Venezuelans move to Colombia, where the government incorporates them through administrative legalization programs. While the international community has praised Colombia's governmental response, this article demonstrates that these programs provide Venezuelans with liminal legality. Existing liminal legality research indicates that recipients are highly aware of the fragility of their legal status because they live in hostile political contexts with complicated legalization procedures. However, the present article argues that liminal legality in inclusive political contexts such as Columbia—with straightforward application procedures, pro-immigrant political discourse, and weak immigration enforcement—hide this legal status' fragility and illegality production features. Empirically, the study draws on in-depth interviews with Venezuelan migrants in Bogotá, D.C. Findings show that most liminal legality recipients want to reside legally in Colombia and experience their legal status with a sense of state protection. Though, their sense of security inhibits their efforts to acquire legal permanent residency. Conversely, undocumented Venezuelans tend to have the fewest resources before emigrating, cannot meet the liminal legality requirements, and experience all forms of legality

　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

as unattainable. Broadly, governments who seek to legalize migrants need to include direct pathways to citizenship and lower the legal residency requirements.

Work-Family Balance in a Gender Perspective. an Analysis of the Transition to Motherhood / Fatherhood By Employment Status in a Country with Very Low and Late Fertility (Spain).

We analyse the relationship between labour participation and fertility from a gender perspective, in a country with very low and very late fertility. In particular we focus on analysing the effect of achieving labour stability on the birth of the first child. We consider different profiles according to educational level and generation of birth. We expect to find different effects of job stability on fertility according to sex, education level and birth generation.

The data source is the 2018 Spanish Fertility Survey of the National Institute of Statistics. This retrospective survey allows the application of survival models to analyse the birth of the first child over the life course. In this paper we use the Cox proportional hazards model.

The results show that for both men and women job stability favours having a first child. However, in the case of women, working without job stability reduces the probability of becoming a mother with respect to women who have never worked. Finally, job stability only has a positive effect on the most recent generations of men and women, and at higher education levels.

The Slow Violence of Mining: Children and Women Codesign Recuperative Practices

Recuperating the devastation of the Capitalocene is urgent given growing recognition of ecological challenges and climate-related risks around the globe. Women and children who are targets of slow violence through capitalism and colonialism understand the value of non-hegemonic knowledges/practices to heal ruined places. The challenge is in recognizing their unconventional ways of knowing and doing as legitimate healing alternatives to the technological "fixes" that damaged blasted landscapes.

This presentation will address how a group of young children and women in Northwest Territories, Canada and Azuay, Ecuador, are engaged in codesign recuperative practices in "blasted landscapes" in an urgent effort to address the damage of gold mining.

We draw on principles of feminist and decolonizing methodologies that work to foster dialogue between women and children, and to trouble inequitable power relations in research practice, with the aim of creating positive and regenerative environmental change in collaboration with community.

Biomedical Narratives Around Gender and Sexuality in Religious Contexts: The Case of Digital Activisms in Mexico and Spain

Within the fragmentation of spaces for the construction of meaning and the growing mobilization of religious identities in the public sphere, the COVID-19 pandemic context caused an explosion of digital activism. The creation and circulation of content in which the mixture of different fields of knowledge and symbolic universes proliferated on social media.

This poster presents the results of a research project conducted for a year to identify and examine the key scientific and religious arguments on the body related to gender and sexuality debates mobilized by religious-oriented activists on social media platforms. We identify the circulation of content between activists in Mexico and Spain linked to religious groups and the increasingly important use of scientific arguments within debates around the body and gender.

In this poster, we share a typology of social media profiles and narratives in which religious and non-religious beliefs intersect with the human body's life science and biomedical knowledge within digital activists -advocates and organizations- in the Spanish and Mexican contexts.

Methodologically, the project is based on a digital ethnography in social networks and the analysis of discourses, images, and audiovisual content produced by religious and non-religious Mexican and Spanish advocates and organizations that deploy digital activism linked to moral visions, ethical regulations, and visions on gender and sexuality.

Investigación En La Frontera: El Viaje Para Llegar Al Pueblo Manchineri En La Selva Amazónica

Esta investigación es el resultado de una expedición realizada en la Selva Amazónica en Brasil. En septiembre de 2021 se realizó un viaje al estado de Acre – uno de los estados que componen la Selva Amazónica – para la investigación biográfica y la grabación documental con el Pueblo Manchineri. El viaje se llevó a cabo desde el sur hasta el noroeste de Brasil, saliendo del estado de Río Grande do Sul al estado de Acre. La distancia entre los estados brasileños corresponde a una media de 3.000 kilómetros en avión y coche. Esta distancia se hace aún mayor por la llegada a la pueblo indígena, que recorre toda la Cabecera del Río Acre hasta llegar a la Tierra Indígena de Mamoadate, en uno de los lugares donde se encuentran, ya que también están presentes en Bolivia y Perú. Este tramo tuvo que hacerse en barco y en algunas partes fue necesario entrar en la Selva Amazónica para seguir el camino a pie.

Para llevar a cabo esta expedición fue necesario el contacto y el apoyo del cacique y de los miembros del pueblo. En el viaje participaron un profesor responsable de la investigación, otros dos investigadores además de mí. Al no ser una ruta habitual, el desplazamiento es arduo y requiere una planificación previa, con la ayuda de los que ya conocen la travesía. Es necesario establecer contactos para organizar la hora de llegada y salida de las embarcaciones que puede durar más de seis horas dependiendo del tiempo y del nivel del río. También es importante prestar atención a la cantidad de gasolina, preparar comida, bebida, ropa, repelentes, hamacas, así como equipos de investigación y grabación. Por todo ello, esta investigación se sitúa en un lugar de riesgo y de difícil acceso para la producción de investigación académica.

DELLO BUONO, Ricardo* (Manhattan College, USA)

Moving Beyond Leviathan: Mészáros on the Role of the State

The final works of István Mészáros reflected a concerted attempt to theorize the state in the context of a transition away from capital. Liberal and Weberian approaches based in pluralistic imagery and a mythology of the rule of law failed to conceptualize the state's pivotal reproductive role let alone the historic tendency to break its own laws in support of capital. Western Marxist debates concerning the "relative autonomy" of the state remained entangled in Weberian scenarios and fell short of theorizing an alternative social command structure compatible with a sustainable, post-capitalist order. Likewise, anarcho-Marxist currents failed to distinguish state repression from the necessity of social control in a dynamic new order. Mészáros disputes all of these views by intimately linking the modern state as a hierarchical command structure directly to the metabolic reproduction of capital. In this view, any definitive transcendence of capital requires the eradication of the state as we know it in favor of constructing a radically different mode of political organization and effective social control that supports a new metabolic order under conditions of substantive equality. This paper explores the polemical views of Mészáros on the state and contemplates its meaning for a critical, emancipatory sociology.

DELMAS, Corinne* (UNIVERSITE GUSTAVE EIFFEL/LATTS (UMR 8134), France)

The Porosity of Work Boundaries in the Age of Digitalisation and Teleworking: The Case of the Notary's Office in France

Since the Covid-19 pandemic, teleworking has become widespread in France, including in companies that were not previously concerned, such as those in the notary's sector. Their employees experimented with it during the first containment, where notaries partly maintained their activity at a distance. The dynamism of this sector, its liberalization, the dematerialization of activities and the profile of the workers, who are female and qualified, have facilitated its generalization under various statuses (employee, temporary worker, self-employed...); this practice has spread at the cost of an increasing porosity of the boundaries of notarial work and of diversified strategies for circumscribing time and space. In this respect, this sector concentrates several contemporary developments in many professional worlds in France, including the diversification of statuses, the apparent questioning of salaried employment, forms of confusion of times and spaces dedicated to work and private life, and a 'de-spatialization' of work that this paper aims to shed light on. On the basis of statistical, documentary, observational and interview data, I will analyze these changes, focusing on the changing environments of professional work, the organizational contexts in which notarial professionals work, the impact of these changes on the sharing of time (work, family, leisure), working conditions and the well-being of workers. Most workers indicate that they wish to work differently, which partly motivates the choice of teleworking, but also of alternative forms of employment, or even of leaving the sector.

The aim here is to understand these choices, as well as the transformations in working methods facilitated by digitalization. It will also analyze their variations according to the occupations (notary, clerk-writer, formalist, accountant, etc.), offices, status, socio-demographic profiles, trajectories, resources and living conditions of the workers concerned, in an environment marked by significant gender hierarchies. Some comparative elements with other professions of law will be used.

RC30-JS-59.2

DELMAS, Corinne* (Gustave Eiffel University, France)

Towards a Re-Evaluation of Legal Employment and Work Standards in France? the Case of the Legal World.

The pandemic has contributed to a major reassessment of employment and work standards. It has highlighted new forms of work organization such as telework and contributed to its growth, including in small enterprises that had previously made little use of it. The COVID also contributed to the debate on employment standards and work organization. At the same time, new forms of employment are changing the direct relationship between employers and employees, and new organizational modes are being reinvented. This is particularly the case in France for legal services, especially in the notary's sector, which, consisting of small local businesses hitherto little concerned with telework, are nevertheless exemplary of the generalization of telework and of new forms of work organization. Using documentary data, observations and interviews, the paper will target these changes. It will also analyse the debates that they may have given rise to in different spaces (work, trade union, political) and among different actors (employers, employees, trade unions, employer and association representatives, partners, public actors, journalists) The paper will question the complexity of points of view and the evolution of labor standards in the light of these multiple discourses. Public discourses will also be questioned. These new ways of organizing work have been the subject of legislative intervention and media debates; moreover, notary's offices are public services that had to remain open during the confinement. The paper will also show that these reassessments can be explained by a whole range of socio-demographic, professional and technological factors and are part of wider developments in this economic sector that the pandemic seems simply to have accelerated. Some elements of comparison with other companies and legal professions will be used to support the demonstration, which will aim to question the reality of this revaluation of legal employment standards and work in France.

The Heterogeneity of Authenticity Arguments in a New Craft Market Sector : The Case of Microbrewery in Belgium

The recent rise in the number of small artisanal breweries can be seen as an emblematic case of the resurgence of craft in modern economies. The microbrewery segment usually refers to the revalorization of qualities associated with the rediscovery of ancient flavours, the diversity of tastes and the search for quality in process and products. Boltanski & Esquerre (2017) have characterised this evolution by the term 'enrichment economy', emphasising the way in which certain products acquire value through narratives that emphasise their intrinsic preciousness, authenticity and difference from standard mass-produced goods.

Our contribution proposes to complete the idea supported by these authors that contemporary capitalism relies on new lodes of wealth, i.e. on new forms of valorisation differing from the standard form that has been the dominant way of making profit since the industrial revolution. Our work is thus part of research in the sociology of markets which proposes to study the processes of construction of the qualities of goods (Beckert & Musselin, 2013), and particularly of singularities (Karpik, 2007) whose valuation is based on narratives of authenticity which show the producer and the processes behind the product (Thurnell-Read, 2019).

We propose to highlight the dynamics, which have not received much attention in this literature, of articulation, friction and opposition between forms of valorisation and arguments of authenticity within a market segment characterized by its difference from a standard mass production market. We use in-depth interviews with Belgian microbrewers (n = 35) to analyze the way in which narratives of authenticity come together to form both specific production logics and lines of distinction and opposition between microbreweries that lead to a new specific structuring of Belgian brewery production.

Fight Against Domestic Violence and the 2020 COVID-19 Lockdown in the European Union

Our intervention will be based on the work of the consortium of the European research project IMPRODOVA (www.improdova.eu). That project 2018-2022 involved researchers and practitioners from research institutes and first-line responders' (FLR) organizations of 8 countries: Austria, Finland, France, Germany, Hungary, Portugal, Scotland, and Slovenia. While the overarching objective of IMPRODOVA research was an improvement of FLR communication and cooperation in cases of high-impact domestic violence, the project developed a work stream on the COVID-19 lockdown repercussions in the context of public policy networks of FLR (police, social workers, health, shelters, NGOs, etc.).

Our intervention will provide a comparative snapshot of the domestic violence developments as well as an overview of state agencies' reactions during the 2020 lockdowns. Based on reliable data (verified by a peer review process), we show that lockdown measures had effects on prevention and detection of DV. First-line responders' interventions and interagency cooperation became much more complicated. Our intervention analyses FLR dealt with the situation, and which tools were used to mitigate adverse effects of the lockdown on DV victims. We examine and compare innovations that were put in place in the 8 countries studied to prevent conditions undermining FLR capacities to provide services. Among the issues discussed, we can mention: monitoring of risks, safety plan adjustment in new conditions, the prioritization of the well-being and resilience of professionals in critical services, excessive demands placed on female workers, effectiveness and impact of awareness campaigns, the creation and utilization of various online solutions, such as helplines and chats, the creation of alternatives like contact points, e.g., through neighborhood markets, pharmacies, post offices as well as through health and legal clinics. Our intervention will outline the main points of a forthcoming collective book to be published by Springer, which has never been presented to a scientific audience.

Women's and Men's Leadership during the Chilean 2010 Earthquake and Tsunami: Facing the Emergency and the Recovery

Socioenvironmental disasters are disturbing experiences which disrupt the life of the population affected. For this reason, they provide a favorable context for both men and women participation in their communities during as well as following such a disaster. Understanding how the population affected faced the disaster has significant potential to inform and influence the development of risk reduction policies that are more effective, egalitarian and resilient. The aim of this communication is to analyze the extent to which the earthquake and tsunami in Chile on February 27, 2010, contributed to fostering leadership in the communities affected in terms of gender. The information used for the analysis was gathered from four focus groups, all of them composed of people directly involved in the disaster, two of them made up of women and the other two of men.

The results revealed that male leadership during the response and recovery processes is linked to traditional gender roles, although the continuity of this differed between the two phases. Women, on the other hand, assume leading roles in the post-disaster period, being very active in the response phase in terms of managing emergency aid, a task linked to their reproductive and care roles. Women's leadership also appears in the recovery phase, in their actions a collective dimension stands out, defying to some extent these roles and highlighting their capacity to adapt to the challenges of the disaster and the strategic prominence that women can play in disaster risk management.

Digital Communication and Lifestyles in Online Social Networks: A Systematic Review of the Literature on the Impact on the Mental Health of Digital Users.

La digitalización es una realidad en auge que ha transformado nuestras vidas cotidianas, así como la forma en que nos comunicamos. A pesar de las

considerables ventajas que ofrecen las nuevas formas de comunicación digital, los riesgos que de la misma se derivan no son nada desdeñables. Los usuarios digitales consumen numerosos y muy diferentes tipos de contenidos en las redes sociales en línea, quedando modificados sus hábitos y costumbres, en ocasiones sin que aquéllos lo sepan.

En este sentido, este trabajo de investigación establecerá una revisión sistemática de la literatura existente sobre comunicación digital, profundizando en los riesgos y vulnerabilidades que se derivan de la misma. Se recopilarán y analizarán las publicaciones más relevantes sobre el impacto producido en la salud mental de los usuarios a la hora de consumir aquellos contenidos digitales que provengan de las redes sociales en línea. De tal modo, se expondrá un estado de la cuestión que presente aquella literatura más significativa. El objeto de investigación vendrá delimitado por los contenidos que circulan por las redes sociales en línea, pero dada la ingente variedad que presentan, este trabajo centrará su atención únicamente en aquellos que transmitan un estilo de vida, ya sea una tendencia, una forma concreta de pensar, de actuar... Considerando la pregunta de investigación *¿Qué impactos producen, en la salud mental de los usuarios digitales, los contenidos de las redes sociales en línea sobre estilos de vida?*, orientada a conocer la literatura existente al respecto, se empleará una metodología basada en la Declaración PRISMA para responderla.

Mobile Phone and Rural Development. Case Study in Côte D'ivoire

How do farmers use mobile phones? The question may seem trivial. However, based on the answers to this question, a new field of research has emerged since the early 2000s. Grouped under the acronym "ICT4D", this field starts with the pioneering work of R. Jensen and J. Aker. In their respective papers, conducted on fishermen in India (for the former) and on farmers in Niger (for the latter), they argued that improved functioning of rural markets was associated with the use of mobile phones. This paper is based on an ethnographic field survey conducted in 2019 among rice farmers in four villages around the city of Yamoussoukro in central Côte d'Ivoire. The purpose was to analyze how the mobile phone fits into the socio-economic activities of rice farmers. We argue that rice production in Côte d'Ivoire is informal and structured by actors who specialize in specific tasks, ranging from the provision of agricultural inputs to marketing in rural and urban markets. The study highlights actors embedded in network of social and power relations. In this regard, we analyze the existing relationships between rice farmers and middlemen. Difficulties encountered by farmers - related to lack of capital, lack of equipment, and access to land, among other things - lead them to become dependent vis-à-vis middlemen who provide production financing. We show that the use of the mobile phone, far from helping to redefine this power relationship, is part of an ongoing situation of dependence. Given the current context where digital technologies are seen as essential tools for rural development, this case study, by highlighting the interplay of social agents and a segmented agricultural market, shows that the obstacles encountered by farmers lie less in access to information than in the long-standing issue of access to both capital and productive capacity.

Philosophical Inquiry and Creative Writing with Children on Rights of the Human and the Environment

This paper explores child standpoints for human rights through philosophical inquiry and creative writing sessions. The preliminary field study consists of three stages of thinking and art activities with children; a creative drama session, a critical thinking activity through a P4C discussion, and a creative dialogue writing part in the end. At first, I start an art-based session with young people, which questions the concepts of equality and justice in their everyday lives according to a child play I have worked on as a fiction writer. Secondly, we try to understand the existing privileges in society and the world belonging to adult beings regarding the frame of our debates. We attempt to put forward the rights of other beings. Eventually, we try to answer various questions, such as; "which children have a word in their everyday lives; some humans can be more valuable than others; what kind of hierarchies exist among the humans and the species?" during our performance and discussions.

On the one hand, our discussion of whether specific child rights differ from human rights would be an attempt to research childhood activism through their points of view as the facilities of participatory fieldwork. On the other hand, I plan to start an art-based activity with young people, which questions the concepts of equality and justice in their everyday lives. In this study, I endeavour to expand the present text with the younger participants to understand the existing privileges in society and the world belonging to adult beings. Consequently, we can also practice an interactive developing process of designing a cultural product with children. This multidisciplinary study aims to reveal various standpoints against human rights, engaging the participants in a playwriting process.

"Artificial Intelligence Is like a Baby" Children's Commentaries on Technological Developments

This paper examines children's self-understanding of technological developments by pointing out their commentaries on the potentials and challenges of digital environments they have been facing. Based on critical thinking and creative drama sessions with children for a child participation project in Istanbul, Turkey, I try to reveal the reactions of a group of children against digital developments and human-machine relations. Since 2020, as one of the researchers of a child participation project at Boğaziçi University, I have encountered children from lower and low-middle classes with my colleagues and other experts in the education and drama fields. When the project expanded to include children with disabilities, migrants, and minority groups from Istanbul and other parts of Turkey in 2022, I began to mentor workshops with children ages 9 to 16, focusing on children's digital lives, from virtual experiences to their tendencies and interests in technological innovations.

In this paper, I share my preliminary observations about children's expectations of digital technologies and how they develop tactics against the pitfalls of ethical challenges deriving from advances in artificial intelligence experiences differently from previous generations. Regarding a specific session I conducted with 35 children from various neighbourhoods and cities, I intend to open a discussion on the relationship between children's digital literacy levels and their age ranges by reconsidering age for different childhood experiences in physical and digital environments. Because migration and disability background may influence each child differently, and age ranges can also vary for each individual, this study tries to focus on children's subjectivities to understand how age impact differs in each childhood experience. According to the results of this stage of the continuing project, I put forward how Turkish youth experience virtual spaces and what ideas they uncover within the inspirations of time and space travelling, artificial intelligence and human enhancement.

Church, State, and Women's Rights in Greece from World War II to the End of the Twentieth Century

Before World War II and the Axis occupation of Greece, a Greek woman's place was in the home under male authority. During the occupation, women and men joined one of the two major resistance movements: on the left or the right. The more popular leftist movement meant liberation for women. For the first time, many women stepped outside their homes to assist men who fought or to take up arms themselves. Conflict between the two movements broke out during World War II and eventually led to a civil war ending with a victory of the right and the royalist government. Government sympathizers and some on the left labeled as "whores" women who had fought in the two wars. The government imprisoned thousands of women on Greek islands to "re-educate" them as "Greek" women.

Such family practices as dowry were locally legislated until 1950 and the implementation of the Greek Civil Code of 1946, when the patriarchal family became the law of the land, not to be struck down until 1983 in response to feminists' demands. The Greek Orthodox Church is the national church of Greece, and its business intersects with that of the state. It has supported the patriarchal family including woman's second place in the family.

The paper will describe the relationship between the Greek Church and State in defining Greek nationality, including Greek woman's place from the time of World War II to the end of the twentieth century. It will point to ways in which Greek woman's experience in the resistance, the overthrow of the military junta, and Greece's entry into the European Union meant changes that were countered by the Church.

The Leisure Activities in Community "Vacant" Lots: How the Grassroots Practices Appropriate the Public Space in China

The informal and spontaneous leisure activities in vacant public spaces around residents' life circles are a significant part of urban lifestyle in China. The transition of cultural policies promoting lifestyle and cultural consumption, the growing grassroots activities led by spontaneous resident associations, as well as the stationary built environment and its dynamic appropriation by people are the intertwined factors that trigger these activities.

Studying the adaptive use and appropriation of undefined vacant lots by the local population to perform leisure activities reveals the articulation of government policies, place-making, and people's bodily experiences. It reflects the soft social engineering prompts to foster orthodox leisure practices,

empower physical activities and transform urban public spaces in a context where the promotion of sport/healthy lifestyle, the continuation of cultural traditions, and the development of digital cultural consumption coexist.

This contribution will illustrate three case studies at different scales in Chinese cities to analyze: 1) to what extent the cultural policies influence the practice of public space transformation and grassroots leisure lifestyles; 2) how the grassroots activities appropriate and redesign/reconstruct the public space, which may disrupt current cultural and urban policies.

- Shi-Jia Hutong micro garden project will demonstrate the empowerment of residents in collaboration with designers to resist the homogenized beautification of historic districts through personal creative gardening activities and the revalorization of vacant street corners.

- Zhong-Gu-Lou Cultural Square will show how residents spontaneously appropriate a renovated area and divert government-led leisure activities with folk games and socializing activities rooted in the lifestyle associated with the surrounding hutongs.

- Shenzhen Citizen Square will highlight how social media provides new meanings for an overscale public space showcasing the grand urban landscape. The online sharing of pop physical activities conducted by skateboarders and street dancers reinterprets this inactive area and breathes new atmosphere and sounds into it.

Skilled Migrants Go South: Taiwanese Professionals in Indonesia and Vietnam

According to the national statistics of Taiwanese government, around one of fifteen Taiwanese work-aged citizens were working abroad before the pandemic. Although the pandemic reduced the number of working abroad professionals but it is still attractive for many Taiwanese, particularly for the young people. Past studies on Taiwanese expatriates were mainly focused on those who going to the US and to China. This paper, however, explores the migration of Taiwanese professionals to Indonesia and Vietnam and discusses the phenomenon of a south-south mobility.

Based on ethnographic studies and in-depth interviews with Taiwanese professionals, this paper discusses how the decision for a south-south migration was made among these expatriates. Is making money or the desire to go abroad more decisive for the decision making? It explores also how they cope with the difficulties facing in their host societies. Are professional knowledge and skills fully transferable to the host country they work? And how their skills and human capital are accumulated in the mobile international career?

Democratic Regression in Brazil: How Transitional Impunity Fueled State Violence Targeting Human Rights Defenders

Violence is an intrinsic part of the Brazilian political landscape. From before its inception to now, Brazil has been a usual scene of repression of democratic initiatives. The last military dictatorship (1964 to 1985) represents an important era where State violence targeted democratic movements. Repression and human rights violations became systematic. Notwithstanding the country's democratization process, the dictatorship has left behind important authoritarian enclaves, including total impunity for the human rights violations committed by State agents. Yet, compared to its neighbors in the region, Brazil's transitional process has drawn little attention in academic circles focusing on democratization processes.

Since its democratization, violence in Brazil has skyrocketed, with State violence increasing steeply. In 2020 alone, 6,416 were killed by police officers, echoing an ever-increasing tendency that saw as many as 33,000 extrajudicial executions being recorded between 2010 and 2020. While drug-related favela massacres are highly publicized, human rights defenders (HRDs) are also important targets and victims of this violence. The most affected are those defending land and environmental rights, the rights of indigenous and Afro-descendant peoples, those working in Rio favelas and LGBTQ+ activists. As violence against women is pervasive throughout the country, women HRDs also face increased risks with the added threat of sexual violence always looming. Adding fuel to the fire, the criminal justice system exacerbates repression by criminalizing HRDs through the application of various legislations. Meanwhile, widespread impunity for human rights violations further intensifies violence against HRDs.

For the 2023 ISA Congress, we would like to shed some light on the kind of authoritarian legacies susceptible of influencing current political violence targeting HRDs. More specifically, we would like to explore how transitional impunity has fueled State violence under democracy and, in time, paradoxically been a democratization tool contributing to democratic regression in Brazil.

Changing the 'Vulnerable Foreign Bride' Image: How Ukrainian Brides Became Diaspora Representatives in Turkey?

Marriage migration, often involving women, is increasingly becoming an important way of migration in many countries, leading to the emergence of different forms of migrant female agency. Turkey is also a country where this global trend is seen. Among foreign brides in Turkey, Ukrainian women have been establishing migrant associations in recent years to bring the migrant community together, to protect the Ukrainian identity, and to develop strong relations between sending and receiving countries. Foreign bride, who have become community representatives, have been functionalized as if they are consuls, especially after the occupation of Ukraine by Russia. This situation has led foreign brides who have a strong hidden social and cultural capital to become actors of international relations area. In other words, the relative fragility of the state created an environment in which migrants need to play a greater role for empowerment. This study focuses on this unusual form of agency of foreign brides. In this context, in-depth interviews were conducted with 16 women representing the migrant associations and the social media accounts of the associations were examined. In the study, it was seen that taking part in a non-governmental organization improved the relationship of women with public space. In addition, it has been understood that they have created a strong organizational structure despite their limited economic resources through the monitoring of digitalized more advanced diasporas. Finally, it is very critical that while developing institutional structures, women instrumentalize the kinship bond established by marriage and develop multiple relations networks from local to transnational.

Navigating Racial Boundaries with Intersecting Identities: Lived Experiences of Mixed-Race Families in Turkey

Turkey is a country where mixed marriages have increased in recent decades. However, most of the migrants are white women. Unlike these, it is noteworthy that black grooms and brides have been gaining more and more visibility as migrants recently. Turkey's flexible visa policy, regulations on citizenship by investment and student and labor mobility agreements have an impact on this. This study aims to reveal how couples experience racism in their daily lives and their coping strategies. In this context, in-depth interviews were conducted with 6 mixed couples (12 people) in 5 different cities. The posts and viewer comments on the open access accounts of two couples, who are also social media celebrities, were examined. It was seen that marriages were not consistently supported from the beginning of the marriage decision until after the marriage took place. A more intense exclusion was noticed against black grooms than against brides. The discourse in cases where marriage is not supported is fed from a nationalist basis and the concern that the Turkish family structure will change with the children born from these marriages comes to the fore. In cases where marriages are supported, the perspective of ummah becomes clear if the groom is Muslim. On the contrary, some secular families support a black Christian groom rather than an Islamist Turk. Therefore, as mixed families pushing racial boundaries, their other identities are also included in the negotiation process. To manage social reactions, the couples develop strategies such as focusing on cultural similarities, creates an 'ideal' wife-husband profile and determining their residence areas and urban space uses according to social acceptance.

DENT, Mike* (Staffordshire University, United Kingdom)

The Medical-Industrial Complex: Implications for the European National Health Services

The medical-industrial complex is a radical concept that originated in the USA (Ehrenreich 2016: 206, fn. 37; Ehrenreich & Ehrenreich 1969) that derived from the earlier concept of the military-industrial complex. It has played a crucial role in perpetuating that country's expensive, fragmented, and for many, poor-quality health system (Light 2004: 2). Critics of the US health care system often contrast it unfavourably to the European NHS systems (Gaffney and Muntaner 2018: 119; Light 2003). With the encroachment of neo-liberal health policies upon these NHS systems in recent decades, however, there is a concern the efficiency, quality and accessibility of these NHS services may now be under threat (Waitzkin 2018:16; Gaffney and Muntaner 2018). This concern can be dated from as far back as the 1980s (Dent 2003), with the introduction of New Public Management (NPM) and later with policies encouraging privatization. All of which raises the question as to whether there is now a medical-industrial complex within Europe comparable to that in the US, and if so, what are the implications for its NHS systems?

In this paper I will examine the role, character, and impact of the medical-industrial complex particularly on the work of Light, who's particular use of the term is closely linked to his elaboration of 'countervailing powers' theory (Light 2004; 2010:271). This will allow me to analyse the changing relations between

the principal actors in the health systems including the state in the face of the growth of private industries' growing entanglement with these NHS health systems.

Is My Bikini Selfie Empowering or Contributing to My Objectification?: An Autonetography of Postfeminist Sensibilities on Instagram

Previous research has explored women's media presence through a focus on postfeminism. Postfeminism defines idealized femininity by themes that further perpetuate an obsession with a "sexy body" (Gill, 2007; Lucas & Hodler, 2018; Riley, Evans, Elliott, Rice, Marecek, 2017). These themes include: an emphasis on self-surveillance, monitoring, and self-discipline; and a focus on individualism, choice, and empowerment (Lucas et al., 2018). To conform to idealized femininity is seductive, especially in the world of social media where women can receive constant validation through Instagram likes and followers that lead to monetary gain. The idealized femininity, however, is all too often entrenched in westernized views of the body which reproduces racial inequalities within media spaces (Butler, 2013). In this presentation, I plan to expand the previous research by utilizing intersectional theory to further explore how forms of idealized femininity (re)produce dominant racializing and gendering expectations which are both taken up and rejected by women of colour on Instagram. As a woman of colour, with an active social media persona that encompasses many postfeminist sensibilities, I utilize a critical self-reflexive method of autonetography (Howard, 2020; Kozinets & Gambetti, 2020) to make sense of agency, empowerment and autonomy in the contemporary digital age. I focus on the body and sexual politics enacted on the social media platform of Instagram through my own social media persona. I ask, how do I, as a self-identifying woman of colour create claims and boundaries implicated within postfeminist sensibilities? In what ways do I resist and/or maintain the white, heterosexual, classist, ableist feminine ideals?

Neoliberal Meritocracy Holds Us Tight in Different Ways: Memory Work of Bipoc Women Graduate Students

Neoliberal meritocracy assumes that inequalities within the intersections of race, gender, and class are a thing of the past and we have now entered a post racial/sexist/classist society (Littler, 2017). Consequently, many intersecting systems and processes materialize into complex power dynamics within the academy. The neoliberal logic of knowledge commodification and push for commercialization (Denzin and Giardina, 2017) relies on social stratification to produce desired outcomes. Thus, neoliberalism's effect in academia requires an intersectional analysis of the workings of power within neoliberal meritocracy. For instance, a failure to address action against neoliberal capitalism, and colonial logic situates women in asymmetric power relations because the issue is not placed on what structures we legitimize but rather on women's failure to fully participate in those structures (Grande, 2018). Therefore, if we do not question how neoliberalism oppresses in different ways, we too become implicated in the ideology of a fair system chasing success through objective measurement metrics. I focus on the experiences of Black, Indigenous and People of Colour (BIPoC) women graduate students in fields such as kinesiology and health sciences. I explore how BIPoC women graduate students enact politics of refusal and resistance within the academic space and how they build strategies to maneuver through the ideological systems and processes of neoliberal meritocracy in academia. I argue that neoliberal meritocracy is a social system that requires an intersectional approach that foregrounds an analysis within the interaction of systems such as, capitalism, and processes of racialization and gendering that permeate within heteropatriarchal neoliberal universities. For this study I plan use memory work as a method to share experiences with fellow BIPOC women graduate students who are included as coresearchers in this project. Located within critical feminism, this method has explicit political value because it documents problematic processes to advocate for social change.

DERIU, Fiorenza* (Sapienza University of Rome, Italy)

The Manifold Narratives of the Russian-Ukraine War, and the Primary Components of Their Latent Structure in the Italian Public Debate

This paper analyses the narratives of the Russian-Ukraine war emerging from three prevailing sources of information: the speeches of the principal preeminent political figures, to whom the world has been looking since the beginning of the Russian invasion of Ukraine, the press news, and the social media communities.

The research question posed by this study is: how might these manifold war narratives have influenced the Italian public opinion? Is there a dominant emerging narrative which captures major consensus? Is there a recurring language characterizing the debate and the discussion about the Russian aggression to Ukraine?

To address these questions, all the public speeches of the main key players of the war were collected (V. Putin, V. Zelensky, J. Biden, M. Draghi, E. Macron, O. Scholz, U. Von der Leyen) since the beginning of the invasion. Then, articles published in the same period by three Italian national newspaper were selected – one for each political orientation. Finally, tweets published in that same time frame were extracted in order to obtain data concerning the range of opinions circulating on the net.

Applying the lexicon-textual analysis technique to the narratives from these divergent sources, the author has identified some stable structures linked to recurrent topics, such as risk and fear, that may play a twofold role. Even when the narratives tell a completely different/opposite story, we can observe an underlying common structure, upon which they are based. This latent common root structure reveals the power the narratives have to both create and destroy at the same time, as J. Gottschall states in *The story paradox*. This paper tries to reckon with the power to obstruct an effectively free debate on the war, and to offer concrete pathways to overcome it.

Gendered Violence and Urban Transformation in India and South Africa

The GendVProject (2020-2024) is an ESRC-funded research project focused on a comparative study of the multiple determinants of gendered violence against women in two urban sites in the Global South, specifically Gurgaon (in Delhi, India) and Alexandra/Sandton (in Johannesburg, South Africa). The sites are located within two countries grappling with social and political transitions – post-apartheid reconstruction and transformation in South Africa and market liberalization and Hindu nationalist populism in India. Gender relations and enactments of violence against women have multiple, interrelated drivers that vary across race, class, caste, and region. The study employs in-depth qualitative and archival research to understand the various factors (such as gender hierarchies, class and societal inequities, and familial and kinship-based contextual realities) - and the accompanying discourses and rationalizations that create the conditions for violence and insecurity. Building rich and textured data has necessitated time-consuming and painstaking research primarily during the height of the COVID-19 pandemic when lockdowns aggravated interpersonal, communal, and state violence. It is argued that understanding the dynamics of violence against women requires careful tracing of how the major societal transformations are manifested in everyday life, and why in these daily rhythms of life, violence against women becomes so prevalent. This project uses qualitative methodologies requiring immersion of the researchers in the lives of women in Gurgaon and Alexandra/Sandton, while also looking critically at how local and national state agencies and policies frame the problem of gendered violence. Besides scholarly outputs, the project will lead to documentaries, art installations, digital testimonials and engagements with community-based organizations. The paper will reflect on the long-term research of the GendV Project conducted in the two sites and the challenges and promise associated with transcending disciplinary siloes to construct substantive comparative feminist research and build an agenda oriented towards strategies to end violence against women.

DESAI, Manan* (University of Michigan, USA)

Imperial Vinyl: Race, the Cold War, and the Sound of U.S. Empire

Titled "Imperial Vinyl," this paper explores U.S. media representations of the "Third World," the global bloc of decolonizing nations in Asia and Africa, during the early Cold War. It takes as its central focus the development of the mid-century music genre known as Exotica. Emerging after the Second World War, Exotica was a hugely popular form of mostly instrumental "mood music" that featured non-western instrumentation, as well as a broader aesthetic that combined imaginaries of the primitive with the modern and technophilic. This paper argues that Exotica music (and its associated visual aesthetic) produced an ahistorical fantasy of the Third World, reanimating age-old racist colonial stereotypes precisely at the same time that saw the explosion of decolonization efforts worldwide and the beginnings of the Civil Rights movement at home. Drawing from an extensive archive of materials—including music recordings, television shows, films, newspaper reports, and advertisements—the essay uses discursive and visual studies analysis to unpack the ideological dimensions of Exotica's representations of Asia and Africa. I argue that Exotica produced a "fantasy of containment," an imaginary which effectively used the tropes of

denotes a presenting author. Abstracts are organized by first presenting author's last name.

exoticism to contain both the looming threat of the postcolonial nation and the anxiety of racial integration and citizenship in the Cold War. More specifically, the paper examines the references to the Mau Mau uprising, the Kikuyu-led anticolonial rebellion of British Kenya of the 1950s, that appeared in albums by Exotica artists like the percussionists like Martin Denny and Chaino (born Leon Johnson) as well as jazz musicians like Art Farmer and blues artist Screamin' Jay Hawkins. If Exotica signaled the sound of empire, in what ways did such performances rework 19th century colonial tropes of Africa, while also slyly drawing on contemporaneous forms of anticolonial resistance?

DESAI, Manisha* (University of Connecticut, USA)

Beyond "Secularism and Rights?" Reflections on the Changing Landscape of Hindutva and Feminisms in India

The global surge of authoritarian political forces has met with grassroots, feminist resistance in almost all countries. The landscape of these encounters, however, varies greatly. In this paper I examine the current political dynamics between the forces of Hindutva and feminisms in India. Specifically I focus on how the hijab-ban in one school in one state became a lightening-rod for mobilizing both Hindutva and feminist forces in India and analyze how both sides selectively draw upon the language of secularism and rights even as both sides question their legitimacy. Hindutva forces for nearly two decades have sought to dismantle secularism using the language of rights to make India a Hindu nation, even as it perpetuates violence against the Dalit Hindus. While feminists challenge such cynical use of the language of rights, they too have had to face internal dissent around secularism. Given this complex constellation and the current focus on decolonizing, I offer some examples from current feminist protests as possibilities for peoples in multicultural and multireligious democracies such as India.

To Wear or Not to Wear: Hijab, Feminists, and Fundamentalists

Feminists have long demonstrated how women's sartorial choices become flashpoints for fundamentalists, nationalists, and other political actors who seek to curtail women's agency and rights. In response to a Hijab ban in the state of Karnataka, India young women took to the streets claiming, "hands off my hijab." In Iran, women are burning their scarves to protest the murder of Mahsa Amini for inappropriately draping her scarf. While apparently oppositional, we show how both these protests are against fundamentalist authorities that seek to control women, challenge simple binaries between feminism and fundamentalism, and complicate struggles for women's rights in the current context of the global rise of religious right wing politics.

Assistants As Agents: Precarious Labor in Hollywood

This paper examines assistants in Hollywood at the intersection of elite organizations and precarious labor arrangements. Assistants are a ubiquitous role in Hollywood, and are tasked with a variety of administrative, creative, and personal responsibilities, very far 'behind the scenes.' As such, assistants can become enmeshed in situations outside of their professional purview, such as harassment projects. Harvey Weinstein's assistants, for example, many of whom are women, were forced to help facilitate his harassment and abuse of other women in the industry. This paper uses data from over 60 semi-structured interviews with industry professionals—assistants, writers, showrunners, development executives, and producers— to propose that work organizations in creative industries are best described through a cultural approach to principal-agent models (Reed 2020). We focus on assistants as agents, and demonstrate how employees become bound to employers and their projects.

DETEMPLE, Jonas* (Federal Institute for Vocational Education and Training (BIBB), Germany)

The Gendered Role of Mobility for Adolescents' Status Attainment in Vocational Education and Training (VET)

At the end of schooling, adolescents interested in vocational education and training (VET) are faced with a far-reaching decision about which career path to pursue. In this decision-making process, career preferences are combined with reality-based opportunities, often leading to trade-offs (Alm, 2015; Kleinert & Schels, 2020). Research on geographic mobility shows that, on average, men are willing to accept longer commutes (McQuaid & Chen, 2012) and also benefit more career-wise from commuting and moving than women (Nisic, 2009; Shauman & Noonan, 2007). Among adolescents, however, it is girls who have a higher propensity to be mobile in terms of moving (Konietzka & Tatjes,

2018). By combining the two strands of research on vocational choices and geographic mobility, we address the overarching research question: *what is the impact of mobility on boys' and girls' status attainment in VET?*

We argue that mobility, i.e. the willingness to relocate or commute, leads to a wider range of possible training places for adolescents. Therefore, we assume that mobility helps adolescents to transfer their status aspirations into more suitable training occupations. Based on gender role theory, we further assume that boys use relocation and commuting strategies in a more career-oriented way than girls.

Using data from the National Education Panel Study (NEPS), Starting Cohort 4 (Blossfeld & Roßbach, 2019), we focus on adolescents in grade 9 until they make their first vocational training decision. Preliminary results indicate that the readiness to relocate is associated with a higher status in adolescents' VET choices for both boys and girls, and that this association can be largely explained by adolescents' status aspirations. In the next steps, we will consider the mobility that actually took place in connection with differences in regional labor markets.

Emociones y Consumo En Receptores De Políticas Sociales Del Municipio De La Matanza, Buenos Aires, Argentina

Las políticas sociales vienen constituyéndose como elementos centrales del Siglo XXI. Una de las modalidades más extendidas han sido los programas de transferencias condicionadas, que de forma bancarizada, otorgan ingresos a sus receptores en diferentes modalidades de condicionalidad o contraprestación. En este marco, y luego de dos años de emergencia sanitaria a causa de la pandemia por covid 19, esta ponencia pretende conocer cómo se organizan los consumos de las personas receptoras de estos programas y las emociones que se configuran en torno a estas prácticas.

Tal como se viene desarrollando en otras investigaciones, el consumo es un elemento central en las estructuras sociales del Siglo XX, vinculado con las formas que asume la producción y acumulación, así como involucra modos de sentir. Esta práctica no se circunscribe a formas de opulencia o riqueza, sino que incluye a todos los sectores sociales, incluidos aquellos que reciben un programa de atención a la pobreza. En vista de ello, esta ponencia se interroga por los modos de organización del consumo de estos sectores así como los sentires que se traman en su concreción luego de dos años de emergencia sanitaria.

Emotions in Virtual Ethnography in Facebook Groups of Social Policies in Argentina: Notes from Our Role of Researchers

From the digitalization of the management and implementation processes to the virtual communities created by the recipients of the interventions, the Internet began to appear as a space for the deployment of social policies. From auto-ethnography, this paper aims to explore the emotions that have taken place in the realization of virtual ethnographies in Facebook groups of recipients of social policies in Argentina between 2020 and 2022. An important part of our work is the self-socioanalysis regarding the subject under study and the way to approach it, considering the theoretical load from which the phenomenon is problematized, and also the personal dispositions to carry out the task.

Virtual ethnography pretends to capture the experience of networks. It mplies the continued presence of researchers in the virtual environment. This entails knowing these environments, delimiting the possibilities of interaction they offer, a particular form of social presentation of the person, as well as a spatially and temporally dislocated way of interacting. Another element is its multimedia character: These environments allow us to analyze the written word, images, videos, emojis and different reactions. This abundance of resources and the speed of their flow, has implied the use of field logs, which have recorded our provisional analyses, but also our methodological questions and uncertainties: How to record the different types of resources that appear deployed in the social networks? How to establish contact? How do we introduce ourselves to build trust? How to sustain dialogues and interactions? In this framework, different emotions are superimposed in virtual fieldwork: uncertainty in the face of virtual response rhythms, daze in the face of the flow of exchanges, the effects produced by the images and comments posted such as displeasure, disapproval and the mistrust that we receive when starting the first virtual contact with the study subjects.

Mapping Socio-Economic Mobility and Urban Inequalities through Spatial Histories and Biographies: Trajectories of Dalit Life in a Metropolitan City, Delhi

In India, the caste system stratifies and hierarchically ranks people based on the degree of purity and pollution. The system also determines and unevenly distributes the power, entitlements, privileges and disadvantages to each caste group. According to the caste system Dalits, ex-untouchables, positioned at the bottom of the system are considered impure and assigned to perform the demeaning and disgraceful work for the "pure" upper castes. Structurally subjected to exploitative life, they are denied dignity and property ownership in rural India. The prolific leader and Dalit icon Dr. B.R Ambedkar urged Dalits to abandon the wretched and degrading village life for urban centres. Envisioning dignity and liberation for untouchables, he imagined cities as modern spaces holding the promise of emancipation from the clutches of caste-driven exploitative feudalistic relations.

This paper focuses on the urban life and spatial shift of Dalits who outmigrated from the villages to Delhi in search of livelihood and dignity. Based on an ethnographic study conducted in a resettlement colony in Delhi which is predominantly inhabited by Dalits, it uncovers the extent and limits of urban spatial geographies in realizing the envisioned promise of emancipation of Dalits in the city. In 1976, at the height of the national emergency, the first generation of the Dalit residents of the neighbourhood was relocated from their erstwhile squatter settlements spread across the city into state-planned resettlement colonies. At the intersection of tracing the familial histories of the spatial shift from informal to state-recognized and legitimized settlement, and biographies, the paper unfolds how the internal movement of the marginalized is interwoven with the urban design of the city vis a vis how urban inequalities are perpetuated and reproduced.

DEVI, Rama* (KREA University, India)

Negotiating Caste in Educational Spaces: Trials of Dalit Youths in Higher Education in Delhi

The caste system represents a complex structure of social stratification which is perceived as a cultural feature unique to India. The system founded on the ideology of hierarchy determines the order of social-ritual status of people based on the notion of purity and pollution. The people, ex-untouchables, placed at the bottom of the system are considered impure and traditionally were assigned to perform the demeaning work for the superior castes. The leader and Dalit icon, B.R Ambedkar famously and fiercely invoked Dalits to "educate, agitate, organize" in order to attain liberation from the clutches of this degrading social arrangement. In the quest of gaining emancipation and dignity, for Dalits education became an instrument holding the potential of radical transformation and claiming liberation from the humiliation wrought by the system. While access to education and affirmative policy has enabled members of the Dalit community to mark their entry into modern occupations, upward economic mobility and assert identity, caste continues to reappear in modern educational spaces making educational success a challenging endeavour for Dalits.

Drawing on the qualitative fieldwork conducted in a Dalit predominant neighbourhood in Delhi, the paper unravels the experiences of arduous negotiations of Dalit youths in higher educational institutions and how it affects their self-perception vis-à-vis self-worth. Most youths in the settlement "choose" specific disciplines to pursue higher education distance learning. Whereas a small segment is able to pursue education in regular mode in public and private universities emerging in the city. Comparing the administrative hostility and everyday social experiences in the distinct educational institutions the paper highlights how Dalit youths navigate educational space to forge friendships and accomplish aspired success. The paper also engages with how these experiences of casteism cast doubt on the promise of affirmative action and shape the contemporary discourse on the reservation.

Resurgence of Religion: A New Avatara in the Post-Pandemic World

In today's wireless world where the society and culture has got connected digitally, the great pandemic phase further accelerated this connection. The Pandemic, Covid-19 brought with it not only social distancing and isolation among the people but also fear about life & death. People totally witnessed new social life or the other face of social reality. Man once again questioned life and wanted answers for the questions that science could not answer. Despite having being connected to his fellow beings digitally, he could not continue his social life without some internal security and his only way out to this was God-Religion. And to our witness, the pandemic could stop people from social contacts but could not stop the people from finding a way out to their Religion. With social distancing, it made its believers find an alternative way to their religious world. Religion being one of the strong forces behind individual's

social life made once again a grand entry. Religion thus, became their bread and butter to their souls and minds especially during such this crisis and post crisis. And this alternative way or the middle way of 'Do or Die' resulted in *Resurgence of the Religion*. This has made it evident that, the religion as an institution has once again changed its form or *Avatara* to survive and continue in the social system. It has become a win-win situation to both individual and the institution. The present study examined the resurgence of religion with its increasing faith through its new *avatara* due to the experience of Covid-19. The tool used to verify this is survey method.

Linguistic confinement and people and societies' relationships with their languages

This paper proposes a *new paradigm* concerning the presence or the absence of normal relationships between people, societies and their own languages. Our paradigm is the outcome of two concepts: 1- the leading factors to *normal relationship* with languages and 2- the presence of what I call *linguistic confinement* (LC) which means the use only of Mother or national languages in speaking and writing. My discovery of the leading factors came well before that of the LC. Both concepts are considered to be born out of *a natural interaction* with one's languages. LC is similar to *health confinement* (hc) as far as the protection of the confined (language and health) is concerned. HC protects individuals from the spread of infection of the Corona virus and LC does also protect *individuals and people and institutions* from the spread use of foreign languages in speaking and writing. I believe this analogy might be fairly new because it is hardly expected to be imagined by the minds of most researchers in the field of language since 2019. The LC protection of languages derives from its capacity to generate *intimate relationship* with one's own language as expressed in loving, defending it and being proud of it before any other language. *LC is a tool of resistance* against French oppression in the Tunisian society in this paper. LC leads to *primary relationship* with one's language because of its intense use. As such, it is like the human primary relationship which results as well from frequent interaction between humans.

Practice and Participation of Young Women in Village Panchayat: A Study of Haryana

Demographically, youth constitute a significant segment of the population in the country. They are the most vibrant and dynamic segment of Indian society and also the most valuable human resource of the nation. Their active involvement in governance is imperative for the country to march ahead with dynamism and youthfulness. Decentralization of political power in India enabled the local governments in different parts of the country with the power and authority to function as units of self-government. The importance of an enabling environment, wherein both the local governments and the youth come together and function as "partners in development", needs no emphasis. But usually, women are considered dispensable voters in India as they have to cast their vote according to the wish of their family members. Also, they do not have any active participation in the village local government due to patriarchy. Dr. Bhimrao Ambedkar has said that a society's progress can be observed by seeing the women's status in that society. So, a study has been conducted in the villages of Haryana, a state in north India, which is an example of classic patriarchy. This study explores the knowledge and the participation level of young women in their local government. An attempt has been made to bring the problems, status, and necessity of women's participation in the local democracy, to the notice of the state for the empowerment and the development of rural society.

Regional Gender Equality Measurement in the EU (REgem): Experiences from a European Jean Monnet Project

Gender equality is a topic of increasing relevance worldwide, but its measurement is mainly limited to national levels, even in the UE. During the last 20 years, various experiences tried to exploit gender equality at a subnational (regional) level, but they were country-specific studies focused on single or a few domains (e.g.: education, health, labour market) not providing a complete overview of the territorial disparities on gender equality.

In this presentation, the main results of the ReGEM project, realised with the support of the Erasmus+ Programme of the European union, will be shared. In the project we propose a **regionalization** of the most complete gender equality indicator, the Gender Equality Index (GEI) of the European Institute on Gender Equality (EIGE). EIGE's GEI measures gender gaps and different levels of achievement of the 27 Member States of EU + UK over time and across a range of relevant 6 core domains: Power, Knowledge, Work, Money, Time, Health for a total of 14 sub-domains and 31 different variables (called indicators). To avoid proposing another brand-new indicator, in this project we developed

a regional version of the index following, as close as possible, the EIGE's GEI methodology building what we call Regional-GEI (in brief, R-GEI). However, the regionalization of EIGE's GEI is not a straightforward process and clashes with two serious issues. First, albeit most of the variables used in the GEI are based on European surveys which are representative also at the regional (NUTS 2) level, a large part is not. Secondly, some variables are meaningless if measured at the regional level (think, for example, to the number of women seating in the national Parliament).

Femicide, Offenders and Trajectories: Identification of Prevention Points Based on Biographical Narratives of Perpetrators

Femicide/feminicide has been a topic of increasing recognition and social awareness in academia and the public sphere in the last three decades. Perpetrators have been predominantly analysed from a biomedical and medicalising perspective, to the detriment of a social understanding of their actions, their narratives and life trajectories. From a biographical approach, this paper identifies the strategies developed by femicide offenders to hide and camouflage the physical violence performed to their partners before the femicide, and the narratives sustaining these strategies. A special focus was made to analyse the contact between the offenders and public institutions. This paper is part of a broader narrative project (CRIMLA: Crime in Latin America), based on sequential multi-stage interviews with prisoners in Argentina and Chile. 25 interviews with femicide perpetrators were analysed, following an open coding strategy. Six main strategies were identified: a. breaking and weakening bonds, b. strengthening bonds with male peers, c. targeting the body, d. targeting the outside world, e. blocking access to labour market, and f. blocking the access to health institutions. These strategies were sustained by narratives about masculine self, dominance and control, and changing social contexts. This paper discusses that offenders' stories about their relationships help to identify missed opportunities for intervention in both the prevention of- and responses to intimate partner violence (IPV).

SANTI, María Florencia (Consejo Nacional de Investigaciones Científicas y Técnicas, Argentina)

When Fieldwork Becomes Problematic: Ethical Dilemmas in Programs for Men Who Have Used Violence Against Women

Sociological and criminological studies on gender-based violence have encouraged methodological debates about how to conduct research with offenders. In particular, studies focused on those who exercise physical violence against women, given their relative scarcity in academia, have led to a discussion about the relevance, limitations and strategies to conduct empirical research on perpetrators. In this field, little attention has been given to the ethical issues involved in doing qualitative social research on violence in Latin America. Drawing on four experiences of qualitative fieldwork on perpetrators of gender-based violence in this region, this paper identifies the main ethical problems that arise in institutions for men who have used violence against female intimate partners. Four problematic aspects were identified: interactions with IRBs, institutional requests, coercion of participants, and the protection of the interviewees. The rationalities of the different social actors involved, and the contrasting viewpoints and interests of institutions create tensions in the research process and force us to rethink the ways of conducting ethically and methodologically sound interviews. We discuss the need to highlight and analyse the institutional and ethical challenges when studying violence in the context of programs and institutions, which have been marginal in academic literature.

DI NUNZIO, Daniele* (Fondazione Giuseppe Di Vittorio, Italy)

Intervention Research and Labour Movements: Theory, Experiences and Challenges

In the labour movement, action research has a long-term application with many different theories and approaches at global level and it plays a key role to analyse the working processes as well as to support the strengthening of the autonomous workers' point of view and their collective actions.

The paper presents some theoretical and methodological analysis on the relations between intervention research and trade union action, starting from some concrete experiences carried out by the author in the last decade in the Italian and European context, on different topics, as: precariousness, work transformation, digitalization, working conditions, health and safety, trade union renewal, workers' protests and organizing.

Main theoretical framework is based, on the one hand, on the sociology of action and sociological intervention (Touraine 1978), on the public implication

of the research (Burawoy 2004), on the participatory action research, on the other, on the relevance of an interdisciplinary approach to cope with the many questions of the world of work.

The analysis of the role of the intervention research try to outlines a three-dimensional model focused on the inter-subjective relations between researchers and activists, considering: a) objectives (scientific knowledge, collective action and individual engagement); b) meaning of action (planned intervention, explicit values); c) organizational model (co-management, collaboration, participation). These dimensions are explored through different on-field experiences to show more or less structured research paths and the specificities of different qualitative tools, as: in-depth interviews, focus-groups, workshop, case studies, participatory observation, surveys. In addition, critical points are underlined, in particular: role of autonomy and collaboration, difficulties of the fieldwork, limits of the scientific and social impacts.

Finally, the paper try to present some challenges and perspectives highlighting the relevance of an "adaptive research intervention" in the contemporary world of work characterized by high fragmentation and continuous changes.

Expectativas Estudiantiles y Políticas De Articulación Interniveles En La Educación Secundaria Bonaerense Argentina En La Pandemia

La masificación del nivel secundario y su obligatoriedad desde el año 2006 en Argentina han dado impulso a indagaciones sobre la continuidad de estudios en el nivel superior por parte de sectores sociales a los que anteriormente ese horizonte de expectativas le era ajeno. Este trabajo se propone analizar la articulación entre el nivel secundario y superior mediante una investigación comparativa en distintos establecimientos secundarios de la Provincia de Buenos Aires durante la pandemia, poniendo el foco en dos cuestiones. Por un lado, en la comparación de las expectativas de estudiantes del último año de escuelas secundarias de diferente sector de gestión y que atienden a distintos sectores sociales respecto de la continuación de estudios; por otro, en la apropiación de las políticas de articulación por parte de los establecimientos de nivel secundario y las estrategias institucionales en pos de promover la continuidad de los estudios.

En este trabajo nos concentramos en hallazgos a partir de las entrevistas a estudiantes. Dichos hallazgos mostraron que las expectativas sobre continuar los estudios en el nivel superior son generales, a la vez que fueron reconfiguradas a partir de la pandemia. También detectamos que hay una mayor precisión en la opción de carrera, facultad y/o universidad en el caso de las escuelas privadas en comparación con las estatales.

Por último, en relación con la apropiación de las políticas e iniciativas, muchas veces recae sobre la voluntad individual de un/a docente o directivo/a que los/las acercan a exposiciones/ muestras o difunden iniciativas tales como Plan NEXOS, PROGRESAR.

African Female Skilled International Migration, Brain Waste, and Precarity from an Intersectional Perspective

The phenomenon of brain waste is one of the fundamental challenges of skilled international migration. Brain waste is also known as "taxi driver syndrome" (Reitz, 2011). Because of the lack of recognition of their credentials and qualifications, skilled migrants may face several constraints in working in their field of expertise in receiving countries, thus practicing in low paid jobs to make ends meet.

The brain waste phenomenon is caused by various interrelated factors, including employers' reluctance or lack of familiarity concerning foreign credentials, constraining professional licensing procedures, racial and cultural barriers, and skilled migrants' lack of linguistic skills, non-familiarity with the host country' labor market system, and lack of social networks in the host country. It can lead to frustrations, loss of self-esteem, and downward social and professional mobility, thus hampering the wellbeing and future of skilled migrants, their development potential towards their homeland, and accentuating their vulnerability.

This paper seeks to enhance understanding of the causes of African female "brain waste". It also scrutinizes African female skilled migrants' migratory trajectories, their situations in the host country, and their experiences of the 'brain waste' problem, how they confront multiplex forms of precarity, and how does the intersectionality of gender, class, race, and skills play out in their "brain wastisation" and "precarization" in the context of female African skilled international migration to the Global North. It aims at deepening understanding of their transnational experiences in the context of precarity, their experiences of brain waste, deskilling and discriminations, social and economic vulnerabilities, and the nature and limits of their coping strategies from an intersectional perspective.

DIA, Ibrahima Amadou* (African Centre for the Study and Research on Migration - African Union Commission, Mali)

Human Trafficking in Africa: A Human Rights-Based Approach

Human trafficking constitutes one of the fundamental challenges of our world. It affects all regions and countries and is a grave infringement of human rights and dignity. The trafficking of women, children, and men has led to many suffering, atrocities, inhuman and tragic circumstances within and across borders. International agencies underscore the global nature of human trafficking. Wide-ranging forms of human trafficking prevail, ranging from sexual exploitation, forced labor, organ trafficking, forced marriage, child trafficking, child soldiers, to name but a few. There is an increasing concern about the higher trafficking risks for vulnerable social groups. Human trafficking gravely affects the mental and physical health and wellbeing of the victims.

This paper strives to provide a greater understanding of human trafficking in Africa, focusing on the root causes of trafficking and the internationally agreed-upon definitions of the human trafficking phenomenon and the different forms of trafficking as well as the variables of human rights, gender, and health, especially in the context of the COVID-19 pandemic. It also aims to comprehend the leading causes of human trafficking in Sub-Saharan Africa, including poverty, conflicts, and globalization, alongside the consequences of trafficking. It will examine the human trafficking phenomenon from a human rights-based approach to gain insights into the reasons underlying trafficking, the modus operandi of human traffickers, and the consequences of human trafficking on victims. It analyzes the gaps between national and international policy and legal instruments on anti-trafficking (namely, the Palermo Protocol and the Ouagadougou Action Plan) and the ensuing policy implications. Finally, it scrutinizes the consequences of the COVID-19 pandemics on the configurations, dynamics, and challenges of trafficking in Africa.

Youth, Facebook and Political Participation in West Africa

This contribution raises the question of citizenship and political involvement of young Africans through social networks in the face of the governance of their leaders. The idea was born out of the observation of this all-out development of collective mobilisation via Facebook, where we have witnessed, since the "Arab Spring", a strong investment of this medium by young people in the name of a common objective: speaking out against the governance of political leaders.

Indeed, unlike marches or demonstrations, which involve the staging of a show of force, Facebook has become a space of sociability giving African youth the primacy of political discussion, protest, resistance and revolt against governance, which constitutes fertile ground for any development process.

Does the development of this collective mobilisation via Facebook have an effect on the democratisation process of West African countries?

Our field of study concerns three(3) Francophone countries, namely Côte d'Ivoire, Burkina Faso and Senegal.

Following a socio-anthropological approach to communication, we will examine the modes of occupation of space and its deliberative dimensions with regard to governance; we will show how young West Africans have invested this medium to become involved, to inform themselves and to denounce what they consider to be injustices or how commitments coexist with the production and sharing of information. The data collection is based on two main methods: ethnographic online observation (video, photos, post writing and sharing) and interview survey (written and video).

TV series in the era globalized threat: Killing Eve in the eye of feminist modern discourse.

This presentation considers the growing number of films and TV series, since 9/11, that are set behind the scenes of democratic regimes facing multifaceted threats. Revealing a moral state of the world, spy series (*24, The Americans, Homeland, The Bureau, Killing Eve)* are part of a wider reflection on popular culture (Wilcox 2006; Sanders & Skoble 2008; Laugier 2012, 2019) through the representation they offer of multifaceted threats, from jihadist terrorism to health risks. Although women have already had access to important roles in this type of series, some of the most popular and critically acclaimed examples entrust the main roles to women (such as Carrie Mathison in *Homeland* or Villanelle and Eve in *Killing Eve*). Female characters are no longer confined to supporting roles but are "agents" at the center of the action. Such a change responds to the need expressed in society and by entertainment professionals to change an industry that has long relied on white male actors in leading roles. The purpose of this presentation is twofold. Firstly, it confronts the

representation of Eve and Villanelle in *Killing Eve* with contemporary feminist discourse ("post-feminist media culture" and "popular feminism") and questions new representations of female characters in long-form television. The second aspect concerns Sandra Oh, a star previously known for work in different genres. The presentation interrogates this turn in her casting and whether her role as Eve is part of a gendered casting against type or the exploitation of her media appeal ('star effect'). The presentation draws on research in stardom since Edgar Morin's *Stars* (1957), including subsequent works that highlight the role played by media coverage (Morin 1957; Dyer 1979; Borghans and Groot 1998) and celebrity (Wright-Mills 1969; Boorstin 1971) or investigations of the "unique" qualities of individual stars (Morin, 1957; Vincendeau, 2000; Menger, 2009).

DIAZ, Belen* (Freie Universitat Berlin, Germany)

"Make Neoliberalism Cool Again": Right-Wing Subject (Trans-) Formations in Brazil

In the context of the global right-wing backlash, I shed light on the micro and macro dimensions of the processes of right-wing ideology and subject formation. Therefore, I delve into the paradigmatic case of the Free Brazil Movement (MBL). This neoliberal organization led the protests for the impeachment of center-left president Dilma Rousseff in 2016. Consequently, it paved the way for the upsurge of the extreme right under Jair Bolsonaro in 2018. I develop the notion of right-wing subject "(trans-)formations" for illuminating manifold dimensions of a political movement in the making. It refers to "formation" in the sense of consolidation, but also of intellectual and activist training as in the case of the MBL Academy. "*Trans*-formations" also points to the bridging of borders between different spatial scales and networks. Since my aim is to offer a "situated history of neoliberalism" (Plehwe & Slobodian, 2022), this broad category allows me to grasp the fluidity and flexibility of concrete actors embedded in political struggles.

The MBL constructs mobilization strategies at the crossroads between social media and the streets. Hence, I examine the role of memetic warfare for ideological interpellation, that initially targeted the urban middle classes of São Paulo. I also explore how masculinity is at the core of organizational and politico-ideological configurations. Drawing on the critical geography notion of "creative destruction" (Brenner & Theodore, 2002), I contend that there are two entangled moments in this right-wing phenomenon. On the one hand, anti-leftism implies a program of dismantlement of progressive social policies. On the other hand, anti-leftism emerges as community enactment of neoliberalism in the form of a growing militancy with a cool political culture. Since I build upon in-depth interviews and participant observation, I also engage in the methodological discussion about the challenges of an ethnographic approach to the right-wing field.

¿Real... Food Influencers?: A Critical and Comparative Review

Objective. Information about food in social networks is becoming so relevant that some countries, such as Spain, are beginning to regulate some content (especially advertising) issued by the so-called food influencers. In this context, from social studies, we are trying to know the influence that these leaders are having, especially the impact on the youth and children population, however, it is not easy to objectify their influence. The aim of this paper is to make visible the questions that arise when we want to know the real impact of food influencers, in relation to the disparity of approaches and methods (and results) on this object of study. **Methods.** A comparative study has been carried out between different research on the measurement of influence and engagement of food influencers **Findings.** The results of this comparative study show a heterogeneity of techniques and processes to measure the impact of food influencers, ranging from very simple measurements to combinations of complex algorithms. They also highlight the difficulty in determining what is actually being measured. The methodological heterogeneity around data engineering and Big Data does not allow comparison of results between different studies and raises some important questions about what to measure when studying the real impact of food influencers.

La Multinationale « Auchan » Au Sénégal : Une Source d'Approvisionnement Pour Les Femmes Vendeuses d'Étalage à Mbour (Thiès)

Au Sénégal, les marchés locaux (fixes et hebdomadaires), les grossistes et les boutiques de quartiers ont toujours été les lieux d'approvisionnement en produits de consommation. Mais, les prix des produits fixés de manière libérale et/ou anarchique, obligent de plus en plus les commerçants locaux, en particulier les vendeurs d'étals, à explorer d'autres sources

d'approvisionnement. Par vendeurs d'étals, il faut entendre les commerçants locaux qui exposent les articles en vente en plein air, dans la rue ou à domicile. C'est un petit commerce généralement tenu par les femmes.

De plus en plus, à Mbour, département situé dans la région de Thiès au Sénégal, l'enseigne « Auchan » devient source d'approvisionnement pour les femmes vendeuses d'étalage. Ce faisant, en vue de diversifier leurs sources d'approvisionnement et d'innover leurs stratégies managériales et marketing, ces femmes achètent à « Auchan » certains des produits qu'elles exposent. Ces achats portent à la fois sur les produits locaux et importés.

Pour étudier ce phénomène qui semble nouveau dans cette zone, les méthodes qualitatives, couplées à une approche ethnographique des systèmes et lieux de vente ont permis de mieux saisir les logiques d'approvisionnement de ces femmes à « Auchan ». Avec ces méthodes, les pratiques managériales et marketing des femmes vendeuses d'étalages à Mbour ont pu être documentées.

Emergence of Inefficient Norms

Emergence of Inefficient Norms
In coordination games, actors can fall into the trap of "bad" equilibrium in a path-dependent manner. A well-known example is Mackie's (1996) study of foot binding in imperial China. We conduct an experiment to investigate the conditions under which suboptimal equilibrium strategies emerge in the repeated prisoner's dilemma. This involves so-called "sticky norms": norms that used to be environmentally appropriate are no longer so in a new situation, but are nevertheless retained. This kind of "cultural lag" (Ogburn) can also be seen in varying degrees in an experiment on the emergence of social norms. The experiment was conducted with 184 subjects at the University of Leipzig. Beyond decisions in repeated interactions, normative expectations and attitudes were also measured.

A Decade of Youth Activism in Spain: From the Indignados 15M Movement to the Pandemic

March 15, 2011 was a moment of implosion for mobilizations, protests and social movements. And the explosion of new forms, articulations and social movements in Spain. Young people had acquired a renewed prominence rarely seen in previous decades. New cohorts of activists were questioning the established order through subjective practices, making massive use of virtual tools without neglecting the wider physical networks of sociability (which serve as channels for the transmission of ideas), with innovative styles of *reclaiming the streets* and *occupying* public space to make their demands visible to the media. The crisis of political legitimacy towards the two-party system in Spain and the political socialization of this new generation also implied the emergence of new parties that promised to regenerate institutional politics and promote new social policies, which implied a new party system in which the youth vote had a great deal of weight, as it incorporated the *generational issue*.

We approach conventional political participation (different forms and evolution of youth voting), and we analyze more in detail contentious youth politics (protests, strikes and youth movements). In this way, we will be able to carry out a longitudinal analysis of the 15M Generation and characterize the different processes of diffusion of these strategic innovations that involve a new "canon" in youth activism, in a temporal thread that goes from 2011 to 2022. This temporal thread is fundamental because it marks the border of two economic crises (the 2009 financial crisis and the 2020 coronavirus crisis) that have strongly conditioned the youth condition, its precariousness, practices and discourses.

Forming an Alliance between Interdisciplinary Fields of Political Ecology and Critical Animal Studies for Earth Liberation

This paper aims to explore the possibility of forming a necessary theoretical and political alliance between the ever-growing, interdisciplinary fields of Political Ecology (PE) and Critical Animal Studies (CAS) in the face of planetary ecological crisis. It argues that both fields converge on many aspects including their political perspective, their primary foci on the intersectional oppression of human and nonhumans, emphasis on the capitalist foundation of extraction of "nature" and its inhabitants, incorporation of activist knowledge, distancing

of themselves from apolitical ecological/rights frameworks, qualitative and participatory methodological approach, and commitment to action, structural change, justice and sustainability for all beings. However, there are also possible tensions amongst both fields that constitute gaps in research which could be resolved through an alliance. For example, less attention is given to the oppression of animals in PE despite the impact of animal agriculture in climate change and zoonoses. Similarly, concerns of ethics and agency are still recent within PE. Alternatively, CAS could gain much from a strengthened focus on food sovereignty and ableism especially for its call for veganism alongside its criticism of green capitalism. CAS can also incorporate Marxist historical materialist thought (that have inspired PE from its introduction) in its discussions of exploitation and capitalism. Methodologically, the paper will rely on a literature review of both fields, particularly foundational and theoretical works, empirical research that reflect their aims and commitments as well as those that already represent the intersection between PE and CAS. Impactful journals (e.g. the Journal of Political Ecology and Journal for Critical Animal Studies), introductory books and diverse range of research that are exemplary of recent approaches and emerging subfields will provide the primary sources of this inquiry. An alliance between PE-CAS would provide new insight for environmental sociology whose discussions and methods have informed both fields.

Egypt 2.0: The Rise of a Digital Developmental State

This paper seeks to understand the emergence of what we are calling the "digital developmental state" in Egypt. Like the industrializing developmental states of the 1980s and 90s, this recent iteration is grounded on the premise that states in the global South are differently positioned in their ability to engage with the global economy. Their disadvantaged position necessitates that the state play a distinct role in the growth process. Nonetheless, whereas the original developmental states – Japan, South Korea, and Taiwan – sought to increase their comparative advantage through exporting complex manufactured goods, nascent digital developmental states must find other ways to engage with a profoundly transforming global economy that is being shaped by the Fourth Industrial Revolution (4IR). In this paper we ask: How is the digital developmental state different from, and similar to, previous forms of the developmental state?

Egypt is a powerful case from which to document and explain the rise of the digital developmental state. Enchanted by the promises of technologies for economic development and modernization, the Egyptian state recently embarked on a comprehensive and aggressive digital transformation quest intended to build a Digital Egypt, a society that integrates technologies, and an economy that operates digitally. Through its Digital Egypt Strategy, the state seeks to digitize governmental institutions, operations, and services; forge a techno entrepreneurial ecosystem that encourages digital innovation and creativity; and build a New Egyptian Person, a skillful, innovative, competitive, responsible, flexible, and digitally literate citizen who is passionate about technology and ready for the future. This paper examines the actors, institutions, and resources that are being marshaled to establish Egypt's digital development state.

Hungarianisation, Horrorism and a 'Funeral for Higher Education': Populist Knowledge-Making and Political Legitimacy in Pre and Post War Hungary

"Hungarianism'. People have become accustomed to "drinking *Hungarian* water [in Hungarian rooms] and reading *Hungarian* books and talking to *Hungarian* people.' Ages *Heller, 2015*.
The late Agnes Heller's words, a Hungarian activist and philosopher, expose the paradoxes that emerge within populist imaginaries and their relationship to state-making as a 'blueprint' of imperialist thought and as an energising concept of modernity. Heller's words also highlight how knowledge-makers and state-makers ignite arguments about sacred forms of legitimacy in the nation-building project. In this paper, we explore Heller's concerns about 'Hungarianisation' within Higher Education (HE), focusing on its 'inner circle' of elite knowledge-makers and HE student resistance to authoritarianism across time (1939 -1968, 1989-2022). Drawing particularly on Arendt and Mbembe, we examine the rise of populism in HE through three distinct avenues. First, drawing upon archival sources we examine the history of conservative elite knowledge-makers representations (e.g., lawyers, theologians, academics) of Hungarian citizenship in pre- and post-war HE. We focus particularly on Hungarian scholarly accounts of the relationship between race science, conservative ideology, and religion and its association with the emergence of modern post-war Hungarian HE. Second, placing oral history interviews and activist writings about state-making dating from the 1930's until the present into context, we explore how modalities of HE student resistance have sought to challenge authoritarian strains within Hungarian HE. Finally, drawing on

contemporary interview data and visual representations of student political action, we examine more recent activist resistance to the forced move of the CEU across the European frontier space to Vienna. In so doing we argue that Hungary's claim to legally sanctioned forms of authoritarianism in HE has fulfilled in part the longstanding racialised mission of Hungarian statecraft to energise a 'folktale of historical injustice' about the place of Hungary in global geopolitics and in the history of empire.

The Subversive Archive in Historical Sociology: Hannah Arendt and the Authoritarian State

Drawing upon personal letters, documentary film and academic sources from the Hannah Arendt Archives (Bard College) and the Arendt Project (Berlin Universitat), I identify political figures and modalities of knowledge shaping Hannah Arendt's conceptualisation of authoritarian state theory. I focus particularly on Arendt's mid-twentieth century interlocuters and their role in her historical and sociological understanding of authoritarian bureaucracies, race science, and 'the camp'. I do so as a way of responding to Scott's (2002) 'problem space' – a space where new questions must necessarily be asked about the 'promise of politics', coloniality and the critical intellectual in relation to rising authoritarianism globally. I begin my argument from three interrelated premises: (1) that global sociologies of knowledge-making (Bhambra, 2011; Mbembe, 2017), alongside an archival historiography of Arendt's oeuvre, provide potentially novel ideas and questions about the role of the intellectual in relation to authoritarianism, particularly as a radical historiographer and implicated activist-scholar (Rothberg, 2015); (2) this approach provides a rich intellectual, visual and historical context for better understanding how instrumental rationalities and colonial logics of reason emerge from violent foundational legacies governing the modern nation-state; and (3) instead of 'drowning in proceduralisms' (Honig, 2017) central to the modern academy that we instead agonise positively over new political idioms, new research imaginaries and 'public things' as sociologists seeking to challenge contemporary authoritarian politics. Fighting over public things in the academy and beyond - Honig (2017) asserts - provides a space for the retrieval of what can never be foreclosed - the radical promise of politics and the need for 'public things'. In so doing, I strive to generate new 'problem spaces' and conceptual grammars for contextualising and nuancing the dilemmas, paradoxes, and practices that all forms of academic labour must necessarily bring to the challenge of authoritarian violence in the 21st century.

Distress in Physiotherapy Low Back PAIN Care: A Socio-Relational Exploration

Distress is poorly understood in health care, including in physiotherapy low back pain care. As a concept, distress is often pathologised, individualised and understood in reductionist, dualistic ways. This presentation draws on relational understandings of emotion to explore distress in physiotherapy interactions with people with low back pain and challenges these taken-for-granted understandings of distress. First, I explore ways distress has been traditionally understood and discuss what this makes (im)possible. Second, I draw from my empirical work to explore the ways in which conceptualisations of distress are deployed within physiotherapy low back pain care. My analysis shows that distress is often understood to have a negative impact on clinical interactions and physiotherapists often find it difficult to recognise and respond to their own and their patient's distress. I show how distress is often conceptualised within the individual, in physiological and biochemical ways, with sociocultural, spiritual and relational ways of understanding distress often side-lined.

Overall, I offer a critical affective conceptualisation of distress in low back pain care for physiotherapy and health care contexts, drawing on Dragojlovic and Broom's (2018) application of Deleuze and Ahmed's theorisation of emotional assemblages as relational. I will also provide insight into my experience of applying this (re)conceptualisation of distress to my clinical work as a physiotherapist working with people with low back pain.

Theories from the sociology of emotions have been rarely applied to physiotherapy and other allied health professions, but have much to offer. This presentation provides a worked example of how application can help to reconceptualise current physiotherapy practices, and their limitations, provoking more relational approaches to navigating distress in low back pain

care. In short, this presentation demonstrates how the sociology of emotions can be usefully applied to see and do care differently in under-explored areas of healthcare.

Multi-Cultural Transformation through Practices of Foraging and Consuming Wild Edible Plants Among Vietnamese Immigrants

Natural foraging or the practice of collecting raw biological materials from public greenery spaces, which has been neglected in our modern industrialized food production systems, re-become attractive due to its decisive socio-cultural contributions. While collecting natural vegetables and games in the Global South is an important part of their livelihood, herbal remedies, and traditions from many generations, contemporary Global-North foragers appreciate its new identity of high-level cultural capital, such as elite restaurants serving seasonally foraged dishes on the menu. In the light of dynamic global immigration and its roles in multicultural societies, there is little understanding about the attributes and determinants guiding immigrants to select "good food" from both cost-effective and culturally appropriate aspects. The data is derived from in-depth interviews with several groups of Vietnamese migrants living in Hyogo, Osaka, and Kyoto prefectures of Japan between September 2021-September 2022 about their practices of collecting wild food. To capture material and symbolic meanings, the interview protocol focuses on what is harvested, who participates, and how they use the foraged products, besides general socio-demographic questions. The preliminary findings have affirmed the vital role of wild edible plants as a "free" food source substituted for less diverse food markets, traditional remedies for some common health problems or just a nostalgic account. At the same time, foraging activity and sharing mechanisms of the products function as the fabric of social-cultural interaction among intra- and inter- ethnicity groups. The practice will be used to revisit concepts of indigenousness, gender roles, and generational effects in the process of traditional knowledge transfer.

Theorising 'Elites' across Discursive-Material Terrain: A Poststructuralist Approach to England's 'Red Wall'

In the last year alone, anti-elite populists have consolidated power in places as far afield as Chile, Colombia, Hungary, Peru, the Philippines, and most recently Italy and Sweden. The success and ideological breadth of these movements demonstrates the many ways 'the elite' can be articulated by political actors, and that excoriating elites is sometimes a viable means of achieving elite status for oneself. Yet two decades after Higley & Pakulski noted the symbiotic connection between actually-existing elites and the subjective understanding of elites by publics, social scientists continue to theorise elites in regrettably essentialist terms. Typically as an objective sociological stratum whose existence precedes our socially constructed notions of them.

Poststructuralist Discourse Theory challenges such framings by foregrounding the role of discourse and contingency in the construction of the social. On this telling, political actors engage in a perennial 'War of Position' in which they compete to define key rhetorical categories such as 'the people' and 'elite' in terms favourable to their goals. Populists of the left, right and centre are each therefore able to profess opposition to 'the elite' while advancing entirely distinct hegemonic programmes. Elite Theory which overlooks the myriad competing articulations of 'the elite' in the public imagination – and their mutually constitutive relationship with actual elite configurations – is thus incomplete.

This paper presents theoretical reflections on a programme of semi-structured interviews with residents of England's so-called 'Red Wall' of historically Labour-supporting towns, whose apparent opposition to elites was said to be crucial to the outcome of the 2016 Brexit referendum. Findings reveal the social and political logics underlying participants' subjective understandings of 'the elite', and suggest the term is a much-contested floating signifier in British political life frequently understood differently by subjects with divergent political identities and material life conditions.

Social Networks for Renewable Energy Transition in Small Off-Grid Islands in the Philippines

Given the archipelagic character of the country, one of the keys to achieving total electrification is to establish more hybrid energy systems especially in small off-grid islands. Given the urgency of addressing climate change, this effort should include actions towards increasing the contribution of renewable energy (RE) in these hybrid systems. (Ocon & Bertheau 2019) But despite the development of RE technologies and the existence of a more enabling policy environment, the transition to clean energy electrification remains slow and sidetracked by the continued dependence on diesel and other fossil fuels.

One of the stumbling blocks to energy transition in off-grid islands relates to consumers' criteria in energy source selection. Consumers prefer using more familiar energy sources such as diesel, over the new and unfamiliar but cleaner energy sources, such as solar. On the other hand, studies on successful energy transition point out that making and sustaining the shift to renewable energy requires the existence of social networks of information that enable the social acceptability of energy transition.

This presentation describes an initial social mapping of functional RE organizations that may become networks for the sharing of information and skills related to renewable energy transition. It is proposed that a more proactive engagement with these organizations could facilitate successful energy transition in small off-grid islands in the Philippines.

Social Networks of Care in Times of COVID-19

The COVID 19 pandemic disrupted the global system and exposed its inability to respond rapidly and effectively to the needs of the most vulnerable sectors in society. In the Philippines for example, coercive lockdowns cut-off access to conventional food marketing systems. This resulted to food insecurity and hunger, especially among the poorest and most vulnerable sectors.

Against this backdrop, individuals and communities undertook the burden of providing for their welfare needs. Various civil society initiatives opened alternative access to affordable and nutritious food supplies. Thus, these care-based emergent agency are instructive of how a more just and compassionate society may be built as part of a new normal.

The International Inequalities Institute (III) at the London School of Economics (LSE) collaborated with Oxfam on a multi-country research project. The aim was to understand the many ways through which people and their communities have responded to the new challenges brought about by the COVID 19 pandemic. To contribute to this global endeavor, Oxfam Philippines worked together with the Philippine Sociological Society in documenting cases of emergent agencies in the Philippines in response to the COVID 19 pandemic.

This presentation discusses some of the findings from these case studies from the Philippines. The civil society responses from the Philippines were mainly in the form of humane aid. They were initiated by social networks that are motivated by care and operated within a framework of generalized trust. Their effectiveness may be attributed in part to the successful creation and mobilization of mini-publics of netizens. These civil society networks of care have swiftly and effectively responded to the needs of the marginalized, including those who have become invisible to official agencies and have become unable to access aid from government.

Rewriting the Social in Light of Gilles Deleuze's Molar/Molecular Dialectics: A Study on Black Women's Movement in Brazil

The concept of the social is at the heart of any sociological investigation. The first important sociologist to have pointed out its particular characteristics as a distinct phenomenon was Émile Durkheim in his pioneering analysis where he defines the social as external, general and coercive. By this characterization, Durkheim identifies the proper object of sociology as distinguished from other human sciences such as psychology or philosophy. In spite of his intellectual

breakthrough in pointing to the objective status of the social, the French sociologist's concept is commonly criticized for being overly objectivist, leaving aside an appropriate diagnosis of its relational aspect. This is one of the most important contributions of Gabriel Tarde, French sociologist and philosopher, Durkheim's contemporary. According to Tarde, the social is structured as difference, and thereby, consists basically of relations. It constitutes, nonetheless, a qualitatively new phenomenon irreducible to its components in isolation. This position puts him at odds with Durkheim's, a tension, which in a way gains a conciliatory turn in Gilles Deleuze's famous dialectics of molar/molecular. According to the French poststructuralist philosopher molar/molecular are two different forms of fluxes coordinated by two different regimes. Whereas the molar flux points to the arborification and rigidity, molecular one indicates segmentary rizhomification representing multiplicities. Despite their different character, both are present simultaneously in any social phenomena, the reason for which it can highlight certain aspects of contemporary social movements' dynamics, in this particular case, the Black Women's Movement in contemporary Brazil, and its relation to the State. This paper thus aims at unraveling the complex entanglement between molar and molecular dynamics in the analysis of the movement.

The Emergence and Regulation of the Profession of Emergency Management

Discussions regarding the status of emergency management continue. Emergency management remains a career field that affords professionals the ability to play a vital role in protecting communities from disasters and harm. Over the past few decades, emergency management has developed as an academic discipline with its own body of research, collegiate degree-granting programs, methods, theories, and techniques to systematically analyze and address disasters and crises. This paper compares both the United States and Australian emergency management contexts of academic and professional emergency management and the need for a recognized body of regulations governing emergency management. We maintain that the core functions of emergency managers are worthy of regulation as part of an organized profession. By considering the evolving role of emergency managers in two countries and the diversity of stakeholders in creating the professional landscape, we seek to bridge the gap in the understanding of the importance of the development of education, experiences, and qualifications that leads to a form of certification formally promulgated and recognized by governing authorities as a requirement to enter the profession of emergency management. The authors evaluate the social, cultural, and legal advances that currently define the role of an emergency manager and situate the need for the professionalization of this field within the broader professional first responder context and offer sociological explanations for professionalization.

Revisiting Violence Against Women from Marginalised Women Perspectives

Addressing the question of violence against women in general and Dalit-women in particular should be the prime concern of society and the democratic-structure. The existence of violence in society not only disturbs the social fabric and political economy of the region but also prevents individual development. Though over the last four decades, feminists have drawn attention towards this area, the question of violence still persists. Thus, one needs to scrutinise the theoretical perspective and address this question in the context of heterogeneous diverse realities. Since in India, a woman's status is not defined by her independent-identity; it is defined by her caste, class, region and tribal identity. As a result, the level of violence differs from woman-to-woman. But who is more affected, whose condition is more vulnerable and how the state and society can prevent this kind of violence should be the major concern. Though Dalit women's conditions are more vulnerable compared to women in general, and they share a large percentage of the population and work as daily wage labourers, their economic-dependency on perpetrators makes them face systemic structural forms-of-violence. The nature of violence is different from that encountered by Dalit-women. Consequently, Dalit-women faced mental-torture or unconventional-violence and caste-based exclusion.

The internalisation of violence bestows their isolation from society. The way society excludes them and their internalisation of self-exclusion makes them downtrodden among the downtrodden. The women started believing that there must be something wrong with her and that her exclusivity must have made her vulnerable to attack. She not only blames her caste, poor-condition, and social-status, which make her ostracised in totality. Therefore, this paper is going to examine the theoretical discourse on the nature-of-violence against women in general and Dalits in particular. Within the larger concern of violence-against-women, this paper is limited to sexual-violence against both categories.
