Esta propuesta busca actualizar el debate sobre los "modelos de intervención social", en línea con la evolución pública del "desarrollo social". Nuestro objetivo es explorar –en una puesta en perspectiva comparativa– las implicancias de las estrategias neoliberales en términos de regulación de las desigualdades y de "gubernamentalidad managerial". Así, considerando los "referenciales" subyacentes a las dinámicas de "gestión multinivel" y las nociones de "contractualización" y contrapartida de la ayuda social; o ponderando su impacto en la práctica de los trabajadores sociales, al frente de las estrategias focalizadas de tratamiento de la cuestión social –responsables de los dispositivos de asistencia y monitoreo de los beneficiarios y de la transformación de sus métodos de gestión institucional.

Freelancers'power over Time in the Perspective of Sociology of Time

With the development of information technology and platforms in modern society, flexible employment methods and freelance workers have gradually expanded, giving rise to the "Gig economy". The loosening of the organisational system, the impact of capital markets and the innovation of digital technology have forced many people who "sell literature for a living" to move from inside to outside the organisation (Liu, 2022), with freelancers as the representative "digital spiritual workers" growing rapidly in various countries around the world, including China. While freelancers aspire to the flexibility and autonomy that this work offers, they are also increasingly experiencing the instability associated with it, particularly the long online hours and uncontrolled time power. Therefore, it is not possible to generalise as to whether this is 'freedom-giving' or 'freedom-depriving' (Wang, 2020).

Based on this, the study has now conducted in-depth interviews with 27 freelancers and 10 editors to explore whether the freedom of freelancers really holds true in the context of their daily work and life experiences. What social power lies beneath the surface of how they organise their time? How do these factors shape the ideology of freelancers? On the basis of the data developed from the interviews, I am analysing them using the research methods of rooted theory. The findings so far suggest that the 'freedom' of freelancers is not the freedom that economists have made it out to be, but a relative freedom in three stages, and this freedom is related to the length of time spent in the profession, the social capital accumulated, platform traffic mechanism, gender and the family roles assumed, which together hold the power of the freelancers' time.

Immobility within Mobility: Migrant Long-Term Care Workers and COVID-19 in China

Even before the COVID-19 pandemic there were already a growing discussion within sociology and migration studies communities on the issue of mobility-immobility dynamics. The pandemic has, however, massively spurred

and magnified this conversation as the COVID restrictions and lockdowns disrupted the taken-for-granted notion of international migration and placed immobility at the center of policy and research debate.

In China, the market-oriented reforms that began in 1979 has transformed this hitherto largely immobile society into a hypermobile one, as today, nearly 385 million internal (rural to urban) migrant people are on the go. The COVID-19, however, has completely disrupted this taken-for-granted mobility as China's pandemic governance put an immediate clamp on people's mobility. Situated within the nexus of government-imposed immobility and the mobility embodied by migrants, this paper examines the impacts of the COVID-19 lockdown on migrant direct-care workers working in Chinese nursing homes, a group of workers whose mobility was particularly affected by the lockdown process. In an effort to contain the spread of the virus, the Chinese government issued COVID guidelines directed lockdown measures on nursing homes and long-term care facilities. Most nursing homes in Chinese cities closed their doors to families and visitors, effectively sealing the residents inside. Somewhat less visible to public eyes was that the nursing home lockdowns did not only involve the residents; along with the residents the direct-care workers, most of them migrant women from rural regions, were also locked in the wards and sealed off from both other parts of the institution and the outside world. For these migrant direct-care workers, the COVID-19 lockdown therefore meant more than simple mobility restrictions and entry barriers to the workplace; rather, it was a total lock-in with their care recipients 24/7—a state of total instituted immobility.

The COVID-19 Its Impacts on Working Parents with Small Children: Korea-Canada Comparison

The COVID-19 pandemic has made the importance of care abundantly clear and highlighted the pervasive gender inequalities that are delineated by paid and unpaid carework. Across the globe, women continue to take on much of unpaid carework within the family, in communities, and in the labour market. In some cases, the pandemic has not only exposed this deep-seated gender inequality but further exacerbated it. Recent studies of the pandemic's impacts on families in North America and Europe show that pandemic lockdowns and/or school closures have resulted in increased unpaid childcare hours that have intensified parents' childcare-related stresses and disproportionately affected mothers more than fathers.

We conducted national surveys of working parents with small children in South Korea and Canada in the summer and fall of 2022, shortly after the governments began lift COVID restrictions. Our surveys, using harmonized questionnaires, focused on distributions of unpaid childcare between parents within the household and parents' experience of childcare during the COVID restrictions. I point out some of the similarities and differences between the results of the Korean and the Canadian surveys, and discuss implications of our findings for care, carework, and gender equality.

The Effect of Parent-Child Discrepancies in Educational Expectation on Adolescents' Mental Health in Taiwan

This study assessed the effect of the discrepancies in parent-child educational expectations on adolescents' mental health problems in Taiwan. Parents in Taiwan often use the proverb, "wealth and beauty can be gained through diligent study," to encourage their children to be high-achieving students. Most parents also believe their children can do better if they work harder. The high educational expectation is a primary factor contributing to the prevalence of shadow education in Taiwan. Researchers have argued that expectations result from rational calculations, self-conditions, and adjusting to new situations. In the case of educational expectations, both parents and their children need to evaluate and adapt to each other's conditions over time. Many studies have found the importance of parental and children's educational expectations and their discrepancies in adolescents' academic performance and achievement. However, there is little research on how consistency or discrepancies in parent-child educational expectations can affect teenagers' mental health. This study used the data collected by the Taiwan Education Panel Survey (TEPS) data in 2001 and 2003 to analyze the effect of discrepancies in parental-child educational expectations over time on junior-high students' mental health. The students surveyed were born between 1987 and 1988. This study used the discrepancies surveyed in 2001 to predict the mental condition surveyed in 2003 to avoid the selection bias problem. Further, since cram schooling is usually applied to fulfill the educational expectations of parents and children, this article will eliminate those who reported attending cram schooling in 2001 to keep the casual mechanism clear. The preliminary finding indicates that the discrepancies in parental-child educational expectations would negatively affect students' mental health, especially for parents with higher expectations than their children.

Inequalities in Lifelong Learning throughout the Life Course – Results from a Qualitative Study from Four European Countries

In this presentation, we examine the role of lifelong learning from an international comparative as well as from a life course perspective. Raising levels of lifelong learning is viewed as central to promoting employability among older workers (Walker, 1997; Hyde and Phillipson, 2015). The extended working lives agenda requires integral support of lifelong learning throughout the life course, however opportunities and take up are often unequally distributed.

Beginning with a brief overview of the European perspective of lifelong learning, findings from a comparative report of macro social and political-economic change within Germany, Poland, Sweden, and the UK inform case studies of these four countries, presenting lifelong learning within the national policies and political-economic background of each to prove both good and poor practice.

Moving to a person-centred perspective, original findings based on data from 100 interviews with older workers in Germany, Poland, Sweden, and the UK provide insight into how lifelong learning influences the prevention and/or management of exclusion risk – e.g., through improving chances on the labour market in late working life or avoiding boredom. The link between lifelong learning and the biosocial, macro, and operational life/work courses is explored to evaluate how lifelong learning influences the potential of extended working lives.

By analysing the factors that helped or hindered the interviewees in participating in lifelong learning – e.g., getting financial and organisational support from the employer, being forced to do the training in the spare time or creating a 'training fatigue' – it is possible to contribute to the development of measures to reduce inequalities related to lifelong learning.

Finally, these two perspectives are then brought together to evaluate the potential of lifelong learning for the broader extended working lives agenda in the near- and longer-term future.

Parental Schooling, Educational Attainment, Skills and Earnings: A Trend Analysis across 15 Countries

Using data on 15 countries based on the harmonisation of IALS and PIAC data, we provide a cross-national analysis of the evolution of the role of educational attainment and cognitive skills as mediators of intergenerational inequalities in earnings between 1994 and 2015. We find that the association between parents' education and children's earnings is large and highly stable over time in most countries, except for Scandinavian countries, where we detect a downward trend. Conversely, the US stands out as the country displaying the largest earnings differentials by parents' education and as the only country where these differentials increased over time. We demonstrate that educational attainment and skills contributed in different ways to the persistence of these intergenerational inequalities. The correlation between parents' and respondents' schooling weakened significantly in most countries, yet contrary to conventional wisdom, this educational equalisation did not carry over into an equalisation of earnings prospects as students of high-educated families managed to preserve a largely unchanged skill advantage. We also found that educational attainment yields higher earnings returns over time in most countries, whilst skills returns have remained largely stable, which challenges skill-biased-technological-change based explanations of earning inequality. On the one hand, educational equalisation was compensated in several countries by increasing earnings returns to education. On the other, the association between parents' education and cognitive skills as well as earnings stayed largely unchanged across these two decades. Educational attainment and skills thus continued to mediate largely unchanged intergenerational inequalities.

Colectivos y Tecnologías De La Información y Comunicación: Un Análisis De Colectivos Culturales En São Paulo

La comunicación tiene como objetivo analizar las asociaciones entre los colectivos culturales y las tecnologías de la información y comunicación en la acción colectiva contemporánea, a través del estudio de dos colectivos culturales de la ciudad de São Paulo (Brasil). El año 2015 estuvo marcado por la ocupación de escuelas por estudiantes en el estado de São Paulo en reacción a la propuesta de reorganización escolar del gobierno. Esta, fue impuesta sin ningún proceso de consulta ni participación ciudadana, y afectaría a por lo menos un millón de personas en todo el estado, cerrando 94 escuelas (MONTEIRO, 2015). A través de prácticas de organización horizontal y descentralizada, los estudiantes realizaron centenas de ocupaciones escolares, logrando revertir la decisión de cerrar las escuelas. A través de prácticas de autoorganización, los colectivos desarrollaron actividades de formación política y cultural y tareas de mantenimiento de las ocupaciones. Además de revertir la reestructuración escolar, las ocupaciones también trajeron grandes aprendizajes a estos jóvenes sobre movilización popular, gestión autónoma y organización política y cultural que tienen en las tecnologías digitales importantes herramientas de organización, articulación y disputa de narrativas (TORI, et al., 2020; TORI, 2021). A partir de colectivos culturales estructurados por jóvenes que participaron de las ocupaciones, este estudio presenta un análisis de la relación (usos, apropiaciones y modulaciones) de estas formas de acción colectiva contemporánea con las tecnologías digitales, a partir de entrevistas y seguimiento de actividades con dos colectivos culturales. Los datos indican que la relación con las tecnologías digitales es estructurante y relevante para sus actividades, produciendo oportunidades, así como agencias sobre los colectivos, que se preocupan por su actuación en las redes y recurren a esta.

Building Local Participatory Democracies through Social Infrastructure: The Case of Civic Management Facilities in Barcelona

In a context of increasing disaffection with democracy and a resurgence of authoritarian political parties, it is worth studying experiences that aim to create bridging social capital and act as schools of democracy. Civic management is a local policy in Barcelona that aims to create new participatory structures, improve social cohesion in the city and promote citizen participation through the management of public common goods. The local civic management policy consists of transferring municipally owned facilities to non-profit organisations so that they can administer and develop projects that are open to the public, with financial support from the city council.

According to Klinenberg (2018), social infrastructure (libraries, communitarian facilities, cultural and sports centres) is key for creating bridging social capital (ties among people with different social backgrounds) and for exercising the basic skills and values for democracy. Despite the prevailing consensus on the crucial role of social infrastructure in promoting ties for democracy and the governance of communities, there is a lack of empirical research on the mechanisms that enable the creation of bridging social capital in societies that have a tendency of social fragmentation and social segregation.

Based on the analysis of a survey conducted among 51 of the 56 existing civically managed facilities in Barcelona in 2019, as well as 34 in-depth interviews with representatives of different facilities, this research highlights some difficulties in making civic management facilities spaces of encounter among socially diverse citizens. Moreover, the analysis identifies some strategies to encourage the participation of groups that are less represented in the use of civic management facilities. The research findings emphasise the need to consider social inequalities in participation in order to achieve socially diverse participation and to make civic management facilities a space where bridging social capital can be enabled.

PERA, Marina* (Universitat Autonoma de Barcelona, Spain)
SALAZAR, Yunailis (Universitat Autonoma de Barcelona, Spain)

The Embeddedness of the Citizen Assets Programme in Barcelona: Reminding the Role of Trust

In this research we focus on the embeddedness of participatory structures within social and political contexts through the analysis of the "Citizen Assets Programme (CAP)" in Barcelona, which is a policy seeking to establish institutional support for the urban commons – those spaces and facilities rooted in the community that are susceptible to be transferred to citizens' collectives to manage them democratically (Ajuntament de Barcelona, 2017). For doing so, we define embeddedness as the setting of policies in their social and political environment with a "productive relation to the other institutions of the democratic system" (Bussu et al. 2022a, p.3). Embeddedness is considered crucial to the fruitful implementation and sustainability of innovative participatory structures.

The CAP aims to recognise, protect and promote 'public-common institutions' considering them an opportunity for democratic innovation (Bianchi, 2022; Russell, 2019). Such institutions intend to overcome traditional formal spaces of participation to create embedded and enduring participatory governance structures in which decision-making power is formally shared between active citizens, social movements and public actors, thus combining the principles of representative democracy with those of direct democracy (Blanco and Gomà, 2019).

Based on qualitative discourse analysis of official documents and 17 interviews conducted with politicians, civil servants, academics, and activists between 2015-2021, this research analyses the challenges raised in the

implementation of the policy and that contribute to understand the partial implementation of the CAP. We underline the crucial role of promoting civil society and administrative actors' trust in new democratic institutions as one of the main elements that enables innovative structures' embeddedness and thus their fruitful implementation. Trust had already been identified as an important element in the study of citizen participation in governance networks (Ansell and Galsh, 2007; Brugué, 2010) and we underline that trust remains important as well in the embeddeding of participative politics.

Pay Disparities between Male and Female Tertiary-Education Graduates in Australia: Where Is the Gap Greatest?

The gender pay gap remains a glaring reminder of Australia's failure to make meaningful progress towards gender equality. Despite the decrease in the female-to-male earnings gap in the last decade, men still earn markedly more than women. Furthermore, a significant gender pay gap has also been observed among tertiary-educated individuals, which both discredits traditional explanations focused on human-capital differentials and undermines the rise in female tertiary-education attainment in recent decades. International studies suggest that field-of-study differences in tertiary education between men and women are a plausible factor underpinning the graduate gender pay gap. Australian evidence, however, remains scarce. This study uses unique linked-administrative data to examine the gender pay gap among Australian university graduates. We provide uniquely robust evidence of the overall gap, and also identify variation across fields of study and how this variation relates to the gender-typing of fields-of-study and occupations. Our analyses are based on data from a customised Multi-Agency Data Integration Project (MADIP) dataset that includes, among others, Higher Education Information Management System records and Australian Taxation Office data. These data contain annual information from full cohorts of individuals graduating from Australian universities between 2005 and 2011 and observed one to ten years post-graduation over the 2011−2016 period (*n*=549,893 individuals; 2,790,809 observations). Using these data, we fit a series of random-effect regression models of graduates' labour income (i.e., income from personal exertion). We find evidence of a significant gender pay gap among recent Australian graduates that varies markedly across fields-of-study. Furthermore, field-of-study feminisation exerts a negative and statistically significant influence on the labour incomes of male and female graduates. The paper also discusses policy implications of these findings.

PERDOMO, Jhoner* (Central University of Venezuela. Institute of Economic and Social Research, Venezuela)

Sustainable Wellbeing Index for Monitoring the Capabilities, Freedoms, and Opportunities of Individuals Against the Rise of Global Authoritarianism.

Sustainable Wellbeing is an alternative perspective of development that has been absent so far in other approaches to measuring wellbeing; to mention a few examples: The Better Life Index of the OECD, Prosperity Index of the Legatum Foundation, as well as the recommendations of the Eurostat to measure the Quality of Life in Europe. As wellbeing is what individuals crave according to their own values, it is essential to expand freedoms, opportunities, and empowerment of capabilities to achieve what each individual value. Thus, forging a fundamental pillar against authoritarian intentions.

Wellbeing lies in reaching a full life according to what the individual values and the conditions that allow it. The conditions are all those that allow the opportunities and freedoms for 'Human Flourishing', where individuals can take advantage of their capabilities. At this point, the central capabilities approach proposed by Martha Nussbaum offers an important theoretical contribution. It expresses that the innate and internal capabilities of individuals, together with external conditions, are what enable combined capabilities to be obtained. In the end, these external conditions are what determine what the individual can freely 'to be' and 'to do'", so it is essential to consider them.

One way to capture it in a measurement is through the combination of the conditions associated with the capabilities, opportunities, and freedoms of individuals in time and space. For the operationalization the research identifies, defines, and justifies 12 dimensions of Sustainable Wellbeing, based on the philosophical approach of the 10 central capabilities proposed by Nussbaum. For the moment we concentrate the analysis on the political dimension, selecting 10 indicators, through a empirical analysis (MCA) for 19 countries of Latin America. Where political models are contrasted together with development models and their progress in the wellbeing of people.

TG03-813.2

PERDOMO, Jhoner* (Central University of Venezuela. Institute of Economic and Social Research, Venezuela)

The Sustainable Wellbeing Approach and the Right of Future Generations to Counteract the Global Risk of Ecological Authoritarianism.

The world is in a transition from models associated with economic development to alternative models "of" development. Beyond a conception of the economic dimension as a determining axis of development, to accept a multidimensionality and relationships between them in a balanced way, such as the case of sustainable development. However, the latent climate crisis is leaving room for a possible scenario of ecological authoritarianism, as a potential form of authoritarianism, where alternative models "to" development, including biocentrism, impose the environment as the axis of the rest of the dimensions, which that generates the risk of using undemocratic mechanisms, including the loss of freedoms, to promote the conservation of the planet as the absolute goal of development.

However, such a more radical perspective is not only risky for itself and its own end, but it also leaves aside the conception of development in freedom and the promotion of people's capacities. To achieve sustainability as well defined by the UN (The future we want, 2012) the individual must be the center, means and end of sustainable development. In this sense, to achieve that they are "means", their capacities must be enhanced, so that sustainability is in accordance with Amartya Sen: the promotion of the capacities of the present without compromising the capacities of future generations (The ends and means of sustainability, 2013). For this, the approach of Sustainable Wellbeing and the Rights of Future Generations based on capabilities (Amartya Sen & Martha Nussbaum) serve as a guide to counteract the risks of ecological authoritarianism. A contrast is made between the various development models, and it will be determined how to detect and minimize said risk, to conclude that to the extent that we have more empowered subjects, we will have greater sustainability, well-being and, in turn, less risk of ecological authoritarianism.

PEREIRA, Anabela* (CIES-ISCTE, IUL, Lisboa, Portugal)

Bridging the Divide between the Body and Environment: The Emotionally Embedded Cognition Hypothesis

To think of emotions in the scope of a situated mind-body interaction is to consider if and how a person's emotional processing embeds that context/environment. This question has gained relevance within the COVID-19 pandemic with the strong development of digital interactions, both in private and public sectors of economic activity, as well as in people's homes and daily life (work, leisure, relationships), accelerating the transition to the new digital economy-based societies. However, how exactly is the emotional embedded response (to a specific environment) capable of constraining cognition and behaviour, and what factors can be related to it (e.g., age, gender, personality, features/objects from the environment)?

To test our Emotionally Embedded Cognition Hypothesis, we conducted a study in 2021 with students attending university to investigate their digital embedded experiences, namely, how neuropsychological states, cognitive performance, and environment engagement correlate.

Methods included: an assessment (N=16) of biometrics associated with cognitive control and emotional response (heart rate [bpm] and heart rate variability/captured through PPG signals); the Stroop Test (measuring cognitive interference and accuracy in the task); neuropsychological scales (the Maslach Burnout Inventory Students Survey/MBI-SS); the Profile of Mood States/POMS), and a questionnaire on environment characteristics perceptions (light, sounds, objects), to which participants responded after attending digital classes (vs presential).

We concluded that the MBI-SS scale did not correlate with the other variables (results showed that none of the participants had a burnout state of mind). Regarding moods, depression/melancholy could predict the Stroop results, and confusion/disorientation could predict heart rate variability during the task. Besides, environmental engagement could predict the Stroop effect (cognitive interference) and the heart rate variability during the study.

These results suggest that environment-related-bodily-activity is essential to understanding mind-body interaction and emotional embedding in the digital world and its new societal challenges—a starting point for the sociological comprehension of emotions.

Assessing the Efficiency and Redistributive Impact of a Musical Intervention Program in French Pre-Elementary Schools. Lessons from a Quasi-Experiment.

This paper explores the impact of a music education program on the development of cognitive abilities of young students aged 4-7 years. This program, implemented in a set of 40 pre-elementary schools located in

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

disadvantaged areas of the Paris region, relies on regular violin training during standard school hours, offered to these children for 4 years. The main rationale for the program is based on the widespread belief — though unequally backed by the scientific literature — that learning a musical instrument improves general cognitive skills. Based on a quasi-experimental research design that combines propensity score matching and diff-in-diff regression, our communication focuses on two results already emerging midway into the program. First, the program has a substantial impact on some specific skills related to fine motricity and reading ; while displaying no significant impact on other cognitive outcomes. Second, the magnitude of this impact varies according to students' social background: maximum for students from high SES backgrounds, and minimal for students from low SES backgrounds. These results confirm the possibility of near-transfer, as fine motricity and reading are practised in the program through bow manipulation and simplified score reading. On the other hand, we find no support for the far-transfer hypothesis. These results also question the redistributive effect of a program that addresses educational inequalities but whose effectiveness appears to be inversely correlated with the social status of families. This may result from some cultural selection process that would discard the most socially and culturally distant children from the program's reference universe (western classical music). More prosaically, it can also signal the limitations of such a program when prerequisites such as sufficient communication proficiency and/or decent material conditions of living are not met.

Co-Creation As Innovative Way to Include Older Persons in Age-Friendly Environment

Taking into account the context of social innovations, there is a need to test new methods and tools for researching and designing such interventions that take into account social changes that they cause in real life situations (i.e. Via living lab, Dekker et al., 2019). For sociologists to offer a unique research context to see social innovations in area of ageing which assign a distinct role to citizens as co-creators of innovative solutions and then end-users is an opportunity in evaluation process. The living labs are built to respond to meet and solve societal needs and take advantage of these opportunities for transformative action in order to modify social practices and social structures. Nonetheless, such structures raise both theoretical and empirical challenges. Based on evaluation of more than 240 innovative projects, only 9 were excatly linked to ageing population/old age. The analysis of these innovations will allow to show in what way co-creation was in practice implemented and introduced in pilot phase of testing innovation and how it could be treated as a good practice from the perspective of users - older persons. The social context will be addressed with seeing if empowerment and capability building, since they constitute a requirement to create win-win contexts for collective action and genuine social innovations towards the social transformation to a sustainable society. Additionally, the results of this analysis will be linked to the new European project aiming to develop eco-systems (with living labs) of social innovations focused on ageing in age-friendly environment.

Extending Working Life in Poland: Supportive and (Un)Supportive Solutions Implemented By Employers Towards Older Workers

Poland has been demonstrating for many years a lack of willingness and ability to manage the older workforce at the macro and meso levels. Despite a positive shift in the area, the existing solutions appear to be rather scattered and inadequate to extend working life, especially at employers' level. While extending working life is considered one of desired response to ageing of population and shrinkage of the workforce in the country there are no clear mechanisms supporting extending working life on the country level.

This paper draws on two projects conducted in the Polish context: quantitative survey of more than 1,000 employers (2020-2021) and a qualitative part (25 interviews of persons 55-75 years old) of a larger mix-methods international study Exclusion and Inequality in Late Working Life (EIWO) funded by the Swedish Research Council for Health, Working Life and Welfare (FORTE).

Findings highlight low (although rising) awareness of the HR management, scarcity of resources for developed age-management strategies and the considerable prevalence of ageism. Polish companies increasingly use

separate age management tools, but their variety is largely limited. This further increases the scope of inequalities experienced by older workers as policies on extending working life are determined on the level of individual employers. Findings show also that there is a clear difference in prevalence of factors that older worker consider (un)supportive in extending working life via different sectors. Older workers working in public sector feel less satisfied with financial aspects of employment and so being less motivated for extending work at the employer, and more often describe practices of pushing older workers out of the labour market. These findings highlight that the workplace context should be taken into account for inclusion older workers at labour market.

RC08-133.6

PEREYRA, Diego* (Gino Germani Research Institute / Universidad Nacional de Lanús, Argentina)

Society in Numbers. Forms of Legitimation of Empirical Sociology in Argentina from Academic Journals and the Press (1940-1975).

This paper wants to offer a reflection on the history of the construction of quantitative information applied to the dynamics of Argentine society. This includes, on the one hand, a historical review of the establishment and consolidation of a powerful statistical regime in the national state, aimed to guide planning and public policies. This structure evolved slowly from the end of the 19th century, accelerated during Peronism (1944-1955) and matured with the creation of the INDEC (1968). On the other hand, the realization of a project to quantify social reality implies a process of institutionalization of the teaching of sociology and the development of sociological research. In Argentina, this step was given by different university institutions in Buenos Aires, Córdoba and Tucumán since 1940. But these had to submit their data to a game of political and social interpretations, in which academic journals and the press played a central role in disseminating, discussing and imposing a quantitative model of interpretation of the problems of Argentine society. In this way, this paper wants to understand the process of quantifying social issues and problems through the analysis of the production of quantitative data and the social interpretations of these figures that appear in three academic journals: 1. Bulletin of the Institute of Sociology (1942- 1954), 2. Sociology Studies (1961-1965), 3. Latin American Journal of Sociology (1965-1975). Added to this is the analysis of a set of cultural magazines and weekly newspapers (Primera Plana, Panorama, among others) that present and discuss empirical sociology as a useful tool for understanding the social dynamics and political problems of the country. This work can thus help to understand the historical dynamics of a sociological reflection on the Argentine reality based on quantified data and indicators.

PEREZ AHUMADA, Pablo* (Universidad de Chile / COES, Chile)

PINTO, Rosario (Universidad Alberto Hurtado, Chile)

Why Do Union Members Are More Willing to Strike and Protest Than Non-Union Members? Evidence from Argentina and Chile

Quantitative research has provided abundant evidence that union membership has significant effects on workers' involvement in collective actions. This research has contributed to the understanding of the political effect of unions by showing that union members are significantly more likely to protest and strike than non-unionized workers (Turner et al 2020; Kerrisey & Schofer, 2018; Cebolla-Boado 2014). However, despite this contribution, most of this research has focused on industrialized countries. Furthermore, the empirical evidence on the mechanisms through which unions produce these political effects is still scarce. As a result, we know little about *why* union members are more willing to mobilize than non-union members.

In this article we address this question by focusing on the cases of Argentina and Chile. While Argentina represents a neo-corporatist industrial relations (IR) system rooted in centralized bargaining, quasi-monopoly of union representation, and strong trade unions, Chile is usually referred to as an extreme case of a neoliberal IR system based on decentralized bargaining, fragmented unions, and a weak labor movement (Drake 1996; Cook, 2007; Etchemendy 2019). Using data from the World Value Survey (waves 5 to 7), we study the association between union membership and participation in disruptive actions such as strikes and protests. Then, using the KHB method of mediation analysis (Kohler, Karlson & Holm, 2011), we assess how much of the relationship between union membership and collective action participation is due to other variables theorized to mediate the "union effect". We analyze three theorized mechanisms—namely, unions facilitate collective action because they reinforce *working-class identity*, *left-wing political orientations*, and *pro-democratic attitudes*. Our results suggest that in Chile left-wing orientations is the mechanism that best explains the association between union membership and collective action, while in Argentina the mechanism that best explains this association is pro-democratic attitudes.

Digital Exclusion and Educational Inequality in Indigenous University Students

In Mexico, the interruption of in-person classes due to the pandemic, between 2020 and 2021, affected around 37.58 million students across the country, of which 11.8% were in higher education.

The main strategy of institutions was to continue the activities through distance classes. To do so, they relied on the use of technological devices, videoconferencing platforms, and the Internet. However, the aforementioned brought with them different consequences, especially in the teaching-learning processes and the professional development of university students. This was especially evident in indigenous students, who had to return to their communities during the confinement period, most of which does not have appropriate infrastructure.

In this paper, we present the results of a research carried out with indigenous students from two publican Mexican universities. This was a qualitative study, and we did in-depth interviews with a group of persons who were registered in different higher education programs.

The students pointed out different barriers during the online classes, such as the lack of updated equipment, problems with the Internet, either because their communities did not have the service or because the signal was poor, the lack of technological skills, in them and in their teachers, the use of conventional teaching strategies and activities that were not suitable for online classes, limitations for teamwork, and the loss of spaces for feedback and interaction between them, their classmates, and teachers.

We conclude that, in general, online classes were an effective alternative to deal with the pandemic, however, at the same time, they widened the educational gap between more and less advantaged students. Especially, in those from indigenous communities, located in rural areas, where only 50.4% of the population is an Internet user and more than 90% use the cell phone to have a connection since they do not have a computer.

Education for Sustainability in Higher Education Students

Sustainable development is a notion that has permeated institutional discourses and actions since the mid-twentieth century. Initially linked to the issue of caring for the environment, today this concept refers to the balance between societies and nature, including the protection of cultural, social, economic, and biological diversity, so that we can satisfy human needs and promote national development, without threatening life on the planet. This has become a fundamental issue for higher education institutions and for professional training in general, facing the many problems we are experiencing worldwide, from pollution and the extinction of some species to the pandemic and social inequality. In this paper, we present the results of an exploratory study, carried out with undergraduate students. A scale questionnaire was designed and applied to 38 students from a university in southeastern Mexico. The results show us a high consensus in individual actions and perceptions, especially about the threat that garbage and waste generate to the environment (89% totally agreed), the importance of depositing garbage in its place (82%), as well as care and respect for others as a way of caring for and respecting ourselves (87%). In institutional actions and perceptions, a greater variability was observed in the responses. The proposals that had the greatest consensus were Actions on self-care and on others are promoted and the others (37% totally agreed), There is a culture of respect among students, teachers, and administrators (26%) and There is a concern and measures are taken to care for the environment (24%). We conclude that it is necessary for universities to commit to this issue, through the development of training programs and specific strategies that become part of the culture and institutional values.

MOON, Katie* (University of New South Wales, Australia)

The Real Nature of Conviviality Is Onto-Epistemological

The nature of conviviality expressed in our individual realities are reflective of the onto-epistemological assumptions we make. The inherently 'social' interactions that define conviviality are representative of the structures and actors with which we engage, and which engage with us. As such, symmetries and asymmetries exist in the way in which conviviality is expressed by, and through, each of us. To understand the relative characteristics of conviviality, then, methods are needed to reveal 1) how connections and separations are made, 2) the nature of those relationships, 3) and how they influence interactions taking place. We present onto-epistemologically based tools of investigating language to show the ways in which individuals, institutions, cultures and societies frame and express their perception of the world and thus the relative nature of its conviviality. For example, when relational onto-epistemologies (e.g. Indigenous Ways of Knowing) are engaged, interactions are assumed to be connective and inherently reciprocal (i.e. kinship). The language used to describe such interactions will be reflective of their inter-and-intra connectivity. Meanwhile, when realist onto-epistemologies are engaged, assumptions and language will highlight separations and objective independence. Under these assumptions, interactions are characterized as directional or competitive (i.e. individualization). The analytical tools we present aid in revealing how language, categorizations, descriptions and assumptions characterize interactions and can operate to include, or to exclude and marginalise. Unpacking symmetries and in-commensurabilities in those assumptions will be important to outline, especially if dialogical processes are being sought to produce pluralistic societies or transdisciplinary knowledge exchanges. Identifying the implicit assumptions that are expressed through language can be useful to help define and characterize the nature of conviviality by the interactions taking place.

Cultivating Cannabis in a Paraguayan Nature Reserve: Incentives and Moral Justification for Breaking the Law

Paraguay has become the main cannabis producer in South America and one of the largest exporters in the world. Some investigations about the cultivation of marijuana in the country portray a cruel environment in which peasants are exploited in "almost feudal" conditions by intermediaries who buy their crops at unreasonably low prices. However, a group of peasants who use the Mbaracayú Forest Nature Reserve as their labour area have created a safe and profitable ecosystem for developing their business. Based on interviews with key informants and visits to the area, the article describes the constraints and incentives that lead those peasants to engage in criminal activities, the strategies they have used to establish protective barriers, and the moral justifications that emerge as a result of their success in doing business. Although there are violent practices and extortion, we claim that the decision-making process to get involved in illegal markets is a free action influenced by alternative moral understandings that provide reasons and justifications for breaking the law. The moral map of these cannabis growers goes far beyond the mere economic justification of generating material resources and is related to economic, institutional, and social premises linked to a generalized aspiration of dignity and a life worth living. The functioning of informal institutions learned through previous interactions with state and non-state actors who regulate and protect the market, the perceived social approval/legitimation of the activity by referent groups, and the awareness of the capacity and skills necessary to successfully conduct the business have a crucial importance in the moral reformulation.

Social Science Research Ethics

My book, *Assessing Social Science Research Ethics and Integrity,* describes the history of social science research ethics as it emerged from the shadow of medical bioethics, examines the power of Institutional Review Boards (IRBs) and consists of detailed analyses of six controversial and ethically questionable studies: the US Public Health Tuskegee Syphilis Study, the Wichita Jury Study, Milgram's Obedience to Authority, Humphreys's *Tearoom Trade,* Zimbardo's Stanford Prison Experiment, and the *Darkness in El Dorado*: Yanomami Controversy.

I will provide advice on finding and working with a professional editor to ensure the book and chapters are well organized and each case study adequately presents the historical background, methods, findings and ethical issues. The editor also checked for grammar and punctuation errors.

The Religious Among Nonreligious Young Quebecers: Age or Generation Effect?

For cultural and historical reasons, language (French) and religion (Catholicism) have been in Quebec the central features of a minority national identity in America. Despite a rapid secularization in the 1960s and an extremely low church attendance since the late 1970s, a strong majority of Quebecers (74% in 2011) claimed to belong to Catholicism until recently. However, the

dominant religiosity regime that was 'cultural Catholicism' has tended for a little over 10 years to give way to a pluralist regime marked by an increase in the number of young people who claim to have no religious affiliation (Meunier & Wilkins-Laflamme, 2011).

Thus, one could say that today's young Quebecers (18-30 years old) stand out as the first true 'non-religious generation' in Québec. In the context of a research project named *The Religious among Nonreligious Young Quebecers,* we have been interested in this novelty by attempting to describe the configuration and dynamics of their imaginary (beliefs, values, norms, visions of life and death) and the interactions between these different components.

When asked about the permanence of their religious non-affiliation, most of the respondents did not envision changing their position during their lifetime. How can this be explained? Does it reflect an age effect, with the challenges of youth crystallizing their religious non-affiliation as an identity component? Is it rather a generation and socialization effect in which case it would herald a new and relatively stable form of religiosity and spirituality, at a distance from denominational affiliation? While we cannot predict the future, we propose to analyse the conditions, the reasons and the explanations hidden behind these young people's non-affiliation as formulated by our respondents, and from there, to risk a prospective by submitting some hypotheses for discussion.

Caregivers' Practical, Social, and Ethical Competence When Using Robotic Animals.

Robot animals are increasingly discussed as a solution to challenges connected to the aging population and limited resources in care. Robot animals that play social, assistive, or therapeutic roles can have a positive impact on care both in terms of replacing expensive workforce in elderly care and related to patients' well-being, by facilitating communication and helping persons with dementia to remember their life story. While much of previous research focus on the robots' effect on the patients' well-being, there is a general lack of knowledge regarding the hands-on experience of caregivers' use of robots. Therefore, the aim of the paper is to explore the competences that caregivers draw upon when facilitating interaction between residents and robot animals. The study is conducted through qualitative interviews and ethnographic observations with caregivers at six dementia care homes in Sweden. The notion of competence is understood as something that is developed through human actions in the encounter with work tools, other people, and in relation to the institutional framework in which the work is performed and given meaning. The findings show that the caregivers use of robot animals in care settings rests on several competencies, involving 1) practical competence in inviting residents to interact with robots in different ways, 2) social competence in treating robots in ways that are sensitive to residents' understandings of robots, and 3) ethical competence in managing the dilemmas related to residents' stances towards robots and questions of transparency and lies.

Robot Animals and the Emotional Labor of Caregivers

Robot animals have become a topical issue as researchers and policy makers are discussing how to meet challenges connected to the aging population and limited resources in elderly care. In relation to groups that face difficulties building and maintaining social relationships, such as people with dementia, some researchers argue that robot animals can facilitate communication and promote well-being. However, such optimistic reports do not account for everyone's experience of robot animals. Some researchers also point out that the functions and benefits of the robot animal rely on caregivers' productive use of it in interaction with patients. Caregivers' roles are still quite invisible in research into the use of robots in care settings. This paper therefore contributes an understanding of the caregiver's role in the use of robot animals, focusing on how caregivers express and manage emotion when using robot animals in relation to persons with dementia.

Based on qualitative data (interviews and video-recorded observations) from an ethnographical study in dementia care homes in Sweden, we study the management of emotional expressions that is conducted in the professional role of being a skilled caregiver. Professional ideals, related to providing care (such as, Altruism, autonomy, and dignity), do not necessarily resonate with the increased requirements on technological competences. So far, there has been no attempt to examine caregivers' emotional endeavors in relation to the use of robots, despite previous findings of caregivers' resistance towards technology with the caring occupations. Our approach allows for an investigation into caregivers who do not attune their use of the robots to the institutional ideals that permeates the caring culture and professional standards. From our analysis, robot animals can actualize and provoke traditional care ideals and emotional regimes, which may be re-negotiated, or at least discussed and re-established in relation to the use of robots.

PERTEK, Sandra* (University of Birmingham, United Kingdom)

Adapted Religious Coping: Strategies and Effects in Experiences of Gender-Based Violence and Forced Displacement

While the relationship between faith and resilience in migration experience is acknowledged, minimal evidence exists concerning displaced survivors of gender-based violence (GBV). Examining the influences of religion on migrant women's resilience and coping, I argue that religious coping emerged as a primary coping mechanism and survivors fortified their resilience by drawing upon their religious identities. In so doing, I explore the role of religious resources (ideas, practices and experiences) in enabling coping behaviours and introduce the concept of adapted religious coping to contribute to theory of religion, migration and resilience.

Adopting a social constructionist and socio-ecological perspective, I draw upon data collected in my PhD research in Turkey and Tunisia with 27 Muslim and 11 Christian displaced SGBV women survivors: 21 Syrian, two Iraqi, five Nigerians, three Congolese, two Ivorians, and one each from Eritrea, Ghana, Guinea, Sierra Leone and Sudan. Mixed methods primarily involved in-depth interviews, followed by questionnaires with religious coping, psychological distress and post-traumatic growth scales.

Engaging in fairly high levels of religious coping, women summoned strength and combined it with personal strength-based coping. For most respondents, religion was a meaningful and agential resource for everyday coping. Although women reported losses in communal religious resources, they conserved personal religious resources, often the only accessible resources, generated from their religious identities. They mobilised cognitive, behavioural, and spiritual and emotional adapted religious coping strategies with positive and negative impacts. These coping strategies drew on their religious beliefs, practices and experiences, integrating their mind, body, and spirit. Despite reporting the buffering effects of religious coping on their mental health, survivors exhibited high levels of psychological distress.

Implications for future research and practice are considered. Service providers should recognise the diverse resilience expressions and healing patterns, including religious coping among displaced populations, to support positive and mitigate negative religious coping methods.

PERTEK, Sandra* (University of Birmingham, United Kingdom)

Religion, Forced Migration and Gender-Based Violence: An Intersectional and Ecological Analysis

Research suggests intersecting identities shape survivors' experiences of gender-based violence (GBV), including religious identity. Little is known, however, about how religion shapes GBV experiences across migration. This presentation responds to the research question: "what are the influences of religion on GBV experiences in displacement" based on an intersectional and ecological analysis.

Using a social constructionist perspective and mixed methods, I draw upon in-depth interviews and questionnaires with 15 service providers and 27 Muslim and 11 Christian displaced GBV women survivors in Turkey and Tunisia: 21 Syrian, two Iraqi, five Nigerians, three Congolese, two Ivorians, and one each from Eritrea, Ghana, Guinea, Sierra Leone and Sudan.

Religion was identified as part of the GBV experience, under-theorised in research. It operated as an enabler of resilience and an intersecting risk factor across the socio-ecological levels. On the one hand, religion arose as spatially and temporally fluid intersectional vulnerability factors, which shaped the gender-culture-religion nexus underpinning family violence, and the experiences of religious persecution alongside religious and migrant discrimination. On the other hand, religion manifested as a powerful resilience resource with survivors adapting fairly high levels of religious coping, which enabled them to draw strength, meaning and relief from their faith. Displaced women conserved their religious beliefs, practices, and experiences, integrating mind, body, and spirit leading to cognitive, behavioural, and emotional/spiritual coping strategies. Spiritual struggles increased psychological distress for some respondents, but service providers marginalised their spiritual needs.

The integrated intersectional and ecological analysis proved useful for capturing both vulnerability and resilience factors in GBV experiences from macro, meso and micro perspectives across borders. The study highlights the need to integrate intersectional and ecological approaches into GBV analysis and interventions to mitigate risk factors and effectively harness survivors' strengths in recovery processes.

Injecting Drug Use Among Legal Minors and the Best Interests of the Child

The protection of children from drugs is a dedicated article in the UN Convention on the Rights of the Child (Article 33). However, protecting children from drugs is often equated with zero-use goals, when there are many young people for whom this does not reflect their life worlds. Approximately 11.3 million people inject drugs globally, with many associated serious health risks. However, injecting drug use among under 18s (legally children) is a blind spot in research, policy and practice. Harm reduction services for people who inject drugs, such as needle exchange programmes, tend to cater for adult participants. Issues of consent, identity and (im)maturity may challenge the assumptions and premises upon which 'low threshold' services are delivered. Existing question marks over the autonomy of drug users are compounded by childhood as a legal and social category. The Committee on the Rights of the Child recommends 'youth-friendly' drug services that in turn must respect the 'best interests of the child', but it remains unclear what this means, or how young people who inject consider their own best interests in the context of their histories, social circles and daily lives. A central dilemma is the concept of best interests itself, which can function as a principle for contextual assessment, but can also be connected to the concept of 'the child' as an abstract ideal affecting top-down policy decisions, and into which somebody under the age of 18 injecting drugs does not neatly fit. This paper present findings from a comparative, mixed method study in three countries – Sweden, Switzerland and Wales. Combining critical child rights with harm reduction theory, and based on interviews with young injectors, focus groups with drugs workers, and policy mapping, and it locates child rights standards in the legal and policy 'setting' in which early injecting takes place.

"for the Good of Gugu Badhun People": Indigenous Economic Development, Sharing and Sovereignty

As part of an ongoing process of Indigenous Nation-Building (INB), Gugu Badhun Nation are engaged in developing an economy according to Gugu Badhun values. This is an act of sovereignty, important to Gugu Badhun to reduce their reliance on government or private funding and grow their capacity for genuine self-determination. However, rather than simply mimicking capitalism, the practice of visioning this economy begins with considering the cultural principles that must be upheld. This paper discusses the transformative potential of this practice, and of the Gugu Badhun economy more broadly. For Gugu Badhun, sharing is central, as is the responsibility to look after one another, country, the plants and animals they share country with, and neighbouring Nations. Practical questions about economic strategies then emerge from this, for example how the Nation might manage common natural resources used for business purposes, or how to balance ensuring a basic standard of living is available to everyone with a shared understanding of what is *enough*. While this work is currently internal within Gugu Badhun, and Gugu Badhun do not seek to impose their economy or their worldview on others, it nonetheless has the potential for growth. As First Nations people doing this work discuss the process with others, the concept of sovereign, self-determining, and value-led economic structures expands. Moreover, the existence of this alternative economy undermines the monolith of neoliberal capitalism by prefiguring alternatives.

Changing Landscapes of Food Consumption? Consumers' Perceptions Towards Short Food Supply Chains in Greece

The agro-industrial food system generates detachment and mistrust among consumers, particularly by the lack of transparency, adverse environmental effects, and food safety issues. Alternative Food Networks (AFN) such as Short Food Supply Chains (SFSCs) have drawn scholarly attention for their innovative features, such as the emergence of new associational forms, proximal relations and new quality conventions for sustainable and just food futures. This presentation analyses the role of SFSC and its contribution to the restoration of consumers' trust in Greece. Two focus groups were conducted on consumer attitudes, values, expectations, and preferences concerning SFSCs in Greece, along with a follow-up consumer survey (N = 456 respondents) that built upon the qualitative research findings and extended them. The study results suggest that consumers' trust in SFSC is tied to the concept of local food at the regional or national level. Also, consumers' preference for SFSC products appeared to depend on the product type, purchase context, and consumer segment, although it was felt that making supply more accessible would increase demand. There was a greater willingness to pay more for organic/pesticide-free products for health reasons. Consumers also value supporting the local community through purchasing SFSC products. The above key insights to consumer perceptions and interest towards SFSC provide important knowledge that can be applied to engage consumers in creating a sustainable and just food value chain across the country and add to the existing knowledge on consumer attitudes, preferences and acceptance of SFSC as an alternative to the conventional food system.

Women in between. the Careers and Biographical Adaptation of Italian Professional Women in the Pandemic

Having as background the answers to the questionnaire Stress, Dealing with Stress, and Experiencing Changes in Social Life during the Covid-19 Pandemic, carried out by the IPHS - Bulgaria and already presented at the 4th ISA Forum of Sociology, we present here the conclusions of a two-stage in-depth analysis of the long-term effects on the work experience of some female occupational groups: journalists, social workers, entertainment workers and teachers. A first round of in-depth interviews was administered in the last three months of 2020 and the results were disseminated at the ESA 2021 conference. Focusing on the study of the role of information and the compulsory use of media technologies, we analysed the effects of the Pandemic in terms of: relevance and effectiveness of media information; the role of the media in regulating the relationship between citizens and institutions; smartworking media and the development/diminution of entrepreneurship; domestication of work or bureaucratisation of the domestic dimension.

Starting in September 2022, we began a second round of in-depth interviews with the same group of people, willing to frame the long-term effects of the Pandemic on biographies and professional careers. We are now exploring five main dimensions whose results we intend to present at the ISA 2023 Conference:

-new skills acquired through the professional adaptations required by isolation and other health restrictions;

- expendability of newly acquired skills in a world that returns to face-to-face work,

- in career terms: changes from work achievements during the pandemic

- in biographical terms: redefinition/revision of one's relationship with the profession and with the weight it has in the definition of one's identity

- in professional terms: redefinition due to the experiences of 2020 and part of 2021. What happened, what should (better) have happened

Bourdieu Meets Disaster Robots. the Introduction of Innovative Technologies in the Field of Emergency Response

Emergency organizations such as fire brigades operate in a hazardous and volatile environment. Decision-making and task performance in emergency and disaster operations is characterized by urgency and uncertainty. Thus, the physical and mental burden put on emergency personnel is tremendous. For this reason, a bulk of research, e.g., disaster robotics, develops innovative technologies that assist or support first responders and emergency personnel with their task performance. To give some examples, UAVs or UGVs, PPE, or augmented reality increase available information, the range and scope of action, or operational safety for first responders and decision-makers. Despite these promising advantages, such innovative solutions rarely enfold their *full* potential. Often, they are only partly used, and some may even fail during the implementation stage. Practitioners may be reluctant to apply or even reject new systems. Social researchers have shed light on this paradox and challenged a too narrow perspective on technology acceptance that is strongly biased on technical functionality. Rather, a bundle of further variables is pivotal to the actual use of an innovation, such as consistency with previous technologies, cultural beliefs, social impact, etc. However, broader theoretical frameworks that enfold a deep understanding of the introduction of an innovative technology in the practical field are rare. This paper suggests applying a Bourdieusian framework providing a nuanced understanding of the field-internal dynamics induced by innovative technologies. It suggests taking such innovations as field-external dynamics, that are scattered by the field-specific logic and, thus, may (not) put serious pressure on the field-specific structures. Hence, mental structures, power structures, field-external relations, etc. come to the fore. Further, it demonstrates the frameworks' empirical relevance by providing evidence from an interdisciplinary project on an assistive system for the cooperative use of UAVs and UGVs in firefighting.

PFISTER, Sandra* (Disaster Competence Network Austria, Austria)

Reproducing the Gender Order in the Wake of Disasters

While disasters are considered a rupture of the established gender order, they rarely result in its profound change. This paper contributes to a proper understanding of its per- petuation. It suggests to take a disaster as a framework for action that is symbolically shaped by gender expectations. Within this framework the gender order is reproduced through practices that affirm and reinforce these expectations and, thus, impede the gender-neutralising potential of a practical deviation from these expectations. This is illustrated by revisiting 20 guided interviews from a previous case study on a mudslide disaster in Europe.

Helping from Home: Domestic and Family Violence Worker Wellbeing during the 'Shadow Pandemic'.

The COVID-19 pandemic has shone a spotlight on care work of all kinds and the emotional toll of this work. Working with traumatised clients, such as individuals who have or are experiencing domestic and family violence (DFV), often unavoidably affects professional and personal functioning. The onset of the novel coronavirus triggered the closure of workplaces, schools and childcare facilities and a global transition to working from home. For most DFV workers, this meant that home became the primary setting for providing care to individuals affected by DFV as well as unpaid domestic work, childcare and schooling. This paper will explore how COVID-19 and the transition to remote work is impacting the mental health and emotional wellbeing of DFV workers. This presentation will share insights from an Australian case study of DFV practitioners working during the COVID-19 lockdowns in 2020. The case study is based on a mixed method research project that draws on a multi-wave online survey and focus groups with over 100 practitioners who supported women experiencing domestic violence during COVID-19 in Victoria, Australia.

Drawing on the Australian case study, the presentation will begin by presenting finding on the psychological costs of providing care for trauma-survivors during the COVID-19 crisis. It will then go on to examine how working remotely from home during the lockdowns undid workers' self-care strategies. Finally, implications for emergency response plans in future crises will be discussed including the role that organisations can play in managing and mitigating the potential harmful effects of DFV work.

Alcohol, Addiction, and Subjugated Knowledge: Reimagining Alcohol Experiences and Subjectivity in Viet Nam through Ma Men

Despite its significance in the global governance of alcohol, the concept of addiction remains a topic of contest. Different disciplines of scientific research as well as policy initiatives constantly compete and argue for the best way to understand and pin down the concept in order to detect, manage, and cure the addicted subjects. In other words, governing alcohol with addiction in most of the prominent models requires the stabilisation of the concept in both academic and policy debates. This process has been widely criticised to be reductive of complex empirical alcohol experiences and rely on rigidly constituted governable subjects for the sake of control. Drawing from a poststructuralist analysis of expert interview data on alcohol control in Viet Nam, I consider how the fluid notion of *ma men* (loosely, 'the ghost/spirit of intoxication') offers new ways to think about alcohol-related practices and individuals as multiple and flux instead of reductive and static. With roots in the everyday language and local pop culture repertoire of describing a wide range of alcohol experiences including and especially intoxication/loss of control, *ma men* is mobilised by Vietnamese experts in variable ways to problematise drinking and addiction. At the same time, such understandings remain subjugated through knowledge practices in Vietnamese policy, which reproduces the hegemony of Western alcohol control frameworks and paradigms.

Climate Change and Poverty in India: Reinforcement of Marginalization

Climate change is one of the challenge facing the world today. It is not only an environment problem but social problem too especially in developing countries like India, where vulnerable group already facing many other types of inequalities and social division. The change in climatic condition gives major shocks to vulnerable people especially and force them into the vicious circle of poverty. Climate change also has severe ecological, social and economic impacts that pose a threat to the survival of the poor and vulnerable people. This paper highlights how climate change impacts lives and livelihood of the poor, secondly how climate change reinforces marginalization of marginalized communities in Indian context. The paper also focuses on the efforts of Indian Government and other organizations to combat the climate change and poverty. Explanatory research method is used in this paper to identify the extent and the nature of cause and effect relationships between climate change and poverty.

Pedagogical Techniques for Racial Dialogue at a Predominately White Institution

Teaching about diversity is critically important given demographic shifts and an increasingly interconnected global economy. However, many students feel ill-equipped to engage in conversations, particularly around potentially divisive topics such as diversity, equity, and inclusion. For nearly twenty years, I have taught about race & ethnicity at a predominately white institution, and I have taught about sexuality studies (especially LGBTQIA+) at a private Catholic institution. This presentation will explore common challenges faced when discussing potentially divisive topics from an intersectional perspective. For example, the instructor's (perceived) identity likely influences how students react to course material, and what students feel comfortable sharing. Practical strategies to build trust and deeper engagement will be shared including clarifying classroom guidelines (such as debate vs. discussion vs. dialogue), think-pair-share activities, and journal writing assignments. Strategies will also be provided for how to effectively solicit student feedback, and what to do when a class activity bombs.

RC53-JS-17.1

PICCIRILLO, Debora* (Center for the Study of Violence - University of Sao Paulo (NEV-USP), Brazil)

Gender Perceptions and Expectations Among Brazilian Adolescents

Being a social construct, gender patterns, expectations and displays are always subject to change. The literature has a long tradition of mapping those changes, highlighting transitions, permanence, and ruptures. Youth scholars underline how important this period of life is for identity development, showing how family and peers play an important role, as youth navigates in different settings and deal with different expectations and demands while building their personal identity.

To understand how this generation of adolescents is dealing with matters of gender in their daily life, we contacted adolescents in the city of São Paulo, Brazil, through an online questionnaire with open-ended questions (n=26). Later, we conducted in-depth interviews with nine adolescents from different social backgrounds, racial identities, and religions. Adolescents were on average 16 years old. All participants identify as cis-gender.

When asked about gendered characteristics among their peers, adolescents said there is no such thing, once the barriers between genders are blurred nowadays, and people are now freer to behave and feel regardless of traditional gender patterns.

Despite this narrative, female participants highlighted how some activities or behaviors are still seen as "masculine", such as enjoying sports and speaking in a more confident way. They affirm other people have gendered attitudes about them, expecting a more "gentle" kind of behavior because they are girls. Male participants were more likely to reaffirm gendered expectations, like agreeing to pay the bill on a date and feeling protective of women. When questioned if they feel pressured to act in this way, male adolescents said that it is easier to just abide by social expectations.

This generation of adolescents has more access to discussions about gender equality and is more aware of non-binary ways of gender performance. However, at the macro level, they still feel pressured to abide by gendered expectations.

'a "Gender Politics" to Rule Them All': Antifeminist Political Sentimentality and the International Connections of the Spanish Far Right

Since 2019, the Spanish far right (Vox) is once again represented in the national parliament. After more than 30 years of 'relative' absence of the far right (it has always been present within the Popular Party or in post-Falangist groups), Vox has become the third political force in Spain. Apart from a renewed political discourse, one of the most important differences between Vox and the nostalgic Falangist groups of the past is its international openness and its relationship with international far-right networks.

As several feminist scholars have shown (i.e. Kováts & Põim, 2015; Grzebalska & Pető, 2018; Schmincke, 2020), gender, sexuality, and the fight against the feminist movement function as elements of international far-right

unity. Through a common 'gender politics,' although contextualized to each of the territories, the international far right creates ties of cooperation at the ideological, economic and formative levels. These political ties configure a specific political sentimentality. Different affects intertwined to foster an antifeminist hatred at the international level and an ethnonationalist love at the local level.

This paper aims to explore how gender works within Vox's international connections and the configuration of an antifeminist and ethnonationalist political sentimentality. To do this, we first identified Vox's international connections and its relationship to gender politics in three geographic regions: the United States, Europe and Latin America. Then, we focused on specific moments of cooperation (meetings, jointly planned activities, events, demonstrations, etc.). This allows us to affectively analyze the political alliances of Vox, the party's role as a political node between Western far right and Spanish-speaking Latin American far right, and the centrality of gender in this new 'far-right International'.

Realities, Reactions and Results about Youth-Led Environmental Activism on Climate Change

Young people around the world have been involved in environmental activism on an increased scale in recent years. Greta Thunberg's first school strike in Sweden (August 2018) that became the Fridays For Future (FFF) movement, quickly followed by the launch of Extinction Rebellion (XR) in Britain (October 2018) along with many other networks and groups have led to a vibrant environmental movement mobilising young people all over the globe. Much has been written about the causes of this youth activism, as well as young environmental activists' repertoire of contention and demands. Less has been written about the consequences – the topic of this session.

In this paper, I discuss realities about, reactions to and results of young people's contemporary environmental activism, especially in Britain. The paper concentrates on external outcomes regarding public opinion and institutional politics. First, I evaluate the impact of youth environmental activism on public opinion about climate change, and on young environmental activists themselves and their political actions. Second, I document the impact of this activism on promises and pledges made by political parties, e.g., declarations, manifestos, legislation and implementation.

This paper draws on various sources to enable a discussion on the outcomes of young people's environmental activism in contemporary Britain. In so doing, it contributes to understanding the status of young people as political agents and their efficacy against the backdrop of evolving political participation of this young generation.

Remote Teaching-Learning of University Mathematics in Mexico. An Educational Model That Accentuated Existing Social Inequalities

In Mexico, between the beginning of 2019 and mid-2022, the public and private university face-to-face education system collapsed due to the forced confinement at home caused by the pandemic of the deadly Sars-Cov-2 virus (COVID 19). This emergency educational model that forced the students and professors at the Autonomous Metropolitan University - Xochimilco (UAM-X) to carry out teaching and learning activities at home, showed during its application a considerable increase in the already existing social and economic inequality. Let us remember that inequality implies a lack - of education - that prevents fulfillment (Sen, 2010) or the exclusion of opportunities - of education - that can arise in life (Therborn, 2013). This express transformation between a face-to-face educational model towards a remote educational model was observed to be more serious in those areas of knowledge that require a laboratory or greater abstraction, such as mathematics for their learning. Among some variables that made it possible to measure these inequalities are those associated with information and communication technologies such as: access to a fixed telephone line, high-speed Internet - 4G or 5G networks -, a computer with a webcam and microphone, and a printer. A physical area at home that would emulate a college classroom; the support of the members of the family

to accept the alternative of remote education and the economic resources necessary to carry out the transformation and be able to continue studying for more than two years. This work shows the case of a first measurement of these inequalities observed during this educational process in the area of mathematics applied to social sciences (psychology, economics, administration, social communication, sociology and politics and social management) of the university.

Explaining Labor Movements Today: Workers' Economic and Political Strikes

Since the Great Recession and the protests that followed it, labor movements have resurged in Europe. Their characteristics are, however, substantially different from labor movements in the past: strikes are part of a wider repertoire of actions; blue collars protest next to other workers and non-working categories; claims on working conditions are integrated by those against political reforms; trade unions coordinate protests in combination with social movement organizations; the state is often the target of protests. Theories explaining labor movements under industrial societies are therefore not likely to be sufficiently accounting for such changes. How can we explain labor movements today?

To approach this question we join scholarship on industrial relations with the literature of contentious politics and combine business cycle and union model explanations of the former with the political process model of the latter.

Empirically, our analysis uses data on workers' protests, mostly strikes, occurred in Italy between 2008 and 2018 drawn from a protest event analysis (PEA). Data derives from a selection of articles from one of the major Italian newspapers La Repubblica (N= 9,935 collective actions).

Preliminary results show a wave of contention peaking between 2011 and 2014. Strikes are the dominant, albeit not only, form of action. While trade union federations organize most actions, a high share of protests is organized by independent trade unions or is simply un-organized. Economic strikes prevail among workers, they mobilize different occupational categories, and most have a local scale action. In turn, political strikes are characterized by the presence, in addition to workers, of non-working categories like students; claims regard political reforms like labor market policies, and most protests are national scale actions. Economic and political cycles are closely interconnected as both the business cycle theory and the political process model account for both economic and political strikes.

Denied Motherhood: The Struggle of Guarani-Kaiowá Mothers for Future Generations of the Guarani-Kaiowá

In recent years, the increase of evangelical religious fundamentalism, the neoliberal entrepreneurial vision, and the wide setbacks in social rights marked the Brazilian political conjecture. This political context reflects neoliberal governance allied to neoconservatism, where the reorganization of families and their control become central (Cooper, 2017). Through modification in social programs, those neoliberal politics have been intervening in families, especially the poor and racialized ones. These programs mainly impact women-mothers who continue to fundamentally carry out care and reproductive work in the patriarchal society in which we continue to live. In Brazil, one of the programs that reveal this change is the "*Famílias Fortes*" program. The program aims to provide a solution to several indigenous children and young people who are removed from their communities and find it difficult to reintegrate into other families (indigenous and non-indigenous). The program defends specific family values that inflict specific effect control on indigenous families and communities. Hence, it threatens the exercise of indigenous motherhood and, in turn, the existence of future generations of these communities. Given this, the present article proposes to analyze how the "*Família Fortes*" Program impacts indigenous mothers and their social reproduction through neoliberalism-neoconservatism aspects. The analysis focuses mainly on its impact on the exercise of motherhood of Guarani-Kaiowá indigenous mothers and its historical relationship with indigenous policies of integration in "Brazilian civilization" and territorial enclosure (Federici, 2017). In conclusion, the program intervenes in the social reproduction of this community and negatively influences cultural rights and land conflicts in Brazil.

Taking and Avoiding Risks: Perceptions and Strategies in the Circulation of Cocaine through the Port of Santos, Brazil

The concept of risk, its forms of management and calculation have been gaining space as a relevant theme in the social sciences. There are different thematic areas and empirical approaches that use this analytical tool, such as studies on surveillance, security and policing. In these studies, risk usually refers to the opportunity for criminal events to occur against the expectations and efforts of public and private actors who seek to maintain the legal order. However, rather than viewing risk through this lens, this analytical tool also allows us to understand the views of individuals, groups, and organizations perceived as "criminal" and who, from their point of view, face risks in undertaking illicit activities. In this article, we seek to understand the perceptions of risk and the strategies adopted by actors involved in cocaine hydrochloride export through the largest port complex in South America, the port of Santos in Brazil. The criminal actors not only create strategies to circulate cocaine in the present, but also anticipate their actions, which are guided by imaginations (collective and individual) about the future. They need to mobilize specific knowledge, such as having information about ship routes, as well as knowledge about technologies and surveillance systems to navigate daily, to minimize the uncertainties and risks of being arrested and the drugs seized. We seek to investigate what actors perceive as risk and what strategies they adopt to avoid and minimize risk? To explore these questions, the article draws on interviews, court documents, and news reports about the international cocaine traffic in the port of Santos.

Revaluating Leisure and Its Role in Combating COVID-19

The unpredictability and uncertainty of the COVID-19 epidemic; the accompanying lockdowns, physical distancing, and other containment strategies; and the consequent economic collapse elevated the likelihood of mental health issues and worsened health disparities. People's lifestyles have changed and different patterns of behaviour emerged across various domains including leisure. Amid this pandemic, several questions have been raised about its impact on leisure, which is identified with freedom of choice and intrinsic satisfaction and offers opportunities for relaxation, diversion, and self-reflection. With the practice of "social distancing", the need for connectedness has been compromised which has inturn aggravated feelings of loneliness and isolation through the contraints put on excersing versatile leisure activities. The proposed change indicated a deep understanding of the need to connect despite the physical barrier. In order to combat with the negativity and the psychological distress even the leisure activities have been revisited and reinvigorated with a focus on what is available and how it can be utilized. A shift is seen going back to old school practices of leisure which were disregarded or lost due to the packed lifestyle, connections have been made and further grown with the assistance of social media, enabling families to gather online, individuals to share their ideas and skills, and even to operate their companies online, and instructors to continue their work by delivering online lessons. While social media play an enabling and facilitating role, social gatherings and acts of togetherness have shown themselves in a variety of forms, such as neighbours speaking "over the fence" or across the street, and individuals singing holiday songs on their balconies. This study thus investigates a shift in leisure activities, the role of digital media in accomplishing this transition, and how these changes have buffered the loss of cognitive, physical, and emotional resources.

Neo Zionist Right-Wing Populist Discourse and Activism in the Israel Education System Background and Conceptual Framework

The rise of right-wing populism is a central theme in social sciences today. Interestingly, the majority of studies on populism focus on its effects on the political system, the media and civil society, whilst its expression in education has remained unexplored. This paper examines the impact of right-wing populism in Israel on education policies and institutions. In the past decade, educational policy and practices in Israel have become another arena where the boundaries of legitimacy and loyalty are redrawn. Since 2009, most Ministers of Education have been actively pushing a neo-Zionist agenda by reshaping the curriculum, amending the State Education Act, and attempting to intervene in the content of teaching in academia. This paper uses three cases to explore the impact of right-wing Israeli populist campaigns on education. In each of these cases, reports in the media and posts or opinion columns of key figures or organizations were systematically collected. The data was then analyzed discursively using Atals.ti. The first case focuses on the campaign to

ban the activist groups 'Breaking the Silence' from entering schools and how securitization discourse was employed to position them as a 'threat to the state'. The Second example - 'Im Tirtzu' ('If You Will') - a right-wing organization that lead an ongoing campaign against left-wing influences in academia. This is an example of how a dichotomy between the 'will of the people' and the 'academic elite' is constructed, positioning the latter as the 'objective enemy'. The third example focuses on public debates over the changes to the official high-schools civic curriculum. Here, I focus on the role of the several key-players, in reshaping the curriculum using the practice of the 'will of the people' vs. the 'elite' to justify an ethno-republican majoritarian model of citizenship.

Supportive, Resistant... or in-between? a Typology of Attitudes Towards Gender Equality Among University Leaders

Since at least the 1970s, research has been conducted to map the factors conducive to gender equality policy success in Higher Education, yet, there is also a growing need to understand resistances to better evaluate the strategies implemented (Bergqvist, et al, 2013; Poggio, 2018). In order to grasp power struggles and dynamics between proponents and opponents, we need to focus on the strategies that actors use and the opportunity structures in which they are embedded (Bergqvist et al, 2013; Diogo et al., 2021; Flood et al., 2021; Husu, 2013; O'Connor, 2019; Sağlamer et al., 2016; Verloo, 2018). This presentation addresses this challenge.

Drawing from a case-study research (that included secondary data, interviews and focus groups of four HEIs) and 25 interviews conducted with university leaders of public HEIs in Portugal, collected through the *Gender Equality in Higher Education Institutions* Project (EEA Grants), we developed a typology of leadership profiles that allow us to capture different perceptions and willingness to promote and implement equality measures and plans. Portugal started late to implement these policies and has only recently massified its higher education system.

To examine positions of *resistance*, *support* or *ambivalence* regarding gender equality in academia, enables us to discuss how leaders differ in terms of knowledge about, interest in, and availability to promote gender equality, while also taking into account the different disciplinary areas of decision-makers training and the "gender cultures" of their organizations. This provides important insights into new policies that support gender equality in Higher Education Institutions.

Dynamics of Contention within Polish Urban Movements

Recent academic discussions claim urban movements to be the type of social movements rooted in "collectivities with a communal base and/or with the local state as their target of action" (S. Fainstein, F. Fainstein 1985: 189). However, some researchers point to the fact that local authorities are not necessarily the target of action; the target may include private agents or action may be directed towards self-help initiatives (cf. Passotti 2013). Passotti summarizes the development of the research on urban movements: "much analysis on urban movements sets them in the context of macroeconomic shifts. In the latter part of the 20th century, capital reacted to deindustrialization by investing its surplus in cities with a strategy of «accumulation by dispossession» (Harvey 2008), in which poor residents in high-value areas were displaced to make place for profitable urban redevelopment" (Passotti 2013).Cooperation between tenants' movements and squatting activists and its positioning against the right-to-the-city movements as an example of radical flank effects. In this case the radicalization of the tenants' movement by the squatters situate them at the radical flank, whereas urban movements' involvement into local politics as well as their role as independent experts locate them among the 'moderates'. This paper aims at bridging the concept of 'players and arenas' (Jasper 2009) with radical flank effects (Haines 1984, 2013; Gupta 2002) in order to provide insight into the dynamics within movements contesting the neoliberal changes in Polish cities.

The empirical basis for the analysis comes from long-time research on the aforementioned movements in Poznań and Warsaw, mostly in-depth interviews, This data is enriched by a Speculative Discourse Analysis of the materials – publications, recordings, discussions and posts on social media – produced by both factions of the broadly understood urban movement.

Pink, Glitter, Antifascism - Intersections of Contemporary Antifascist Movement in Poland.

The context of illiberal democracy has re-designed the scene of Polish social movements already in late 2015. Since then Poland witnessed a political backslide. This has created a number of reactions, using either new or established forms of political resistance. One of such examples is the antifascist movement that recently had to face new challenges – in particular the institutionalisation of xenophobic rhetoric and the growth of the far-right sector. The presentation presents the internal radical/moderate dynamics, in particular, it explores the role of changes in political opportunity structures for the reinvigoration of the antifascist movement in Poland, radicalisation in some of its sectors, and change in its priorities.

The conceptualization of radicalism by the actors (radicals and moderates), the use of it as a bargaining tool in coalition-making, and the backfiring of radicalism against the movement that jeopardized the coalitions and provoked repressions are the main questions in this analysis. The concept of radicalism observed here has been used by social movements beyond the usual conceptualization of it as a choice of radical repertoire of action or radical political claims. In the studied movements, radicalism is also visible in approaches to organizational models or in the broadening range of claims caused by increasing intersectionality of the movement.

In this context, Haines' (1995, 2013) concept of "radical flank effect" offers an explanation of differing views on relevant objectives, action frames, and tactics of mobilization. My goal is to provide evidence for these theoretical reflections, as well to assess which scenarios of de-radicalisation take place within the Polish antifascist movement and under what - structural (political and discursive) condition.

Empirically, this presentation is based on a long qualitative research on the Polish antifascist movement as well as on results of a protest survey conducted at the WarsawAntifascist Streetparty in 2021.

The Idea of Conviviality and Its Methodological Implications

This presentation addresses the following question: does empirical research on conviviality necessarily imply the use of convivial methods? Although it is quite obvious, the answer will depend on how conviviality is conceptualized. But this gives rise to a set of theoretical and methodological discussions that I intend to analyze. The introduction of the term 'conviviality' in the social sciences and humanities is often attributed to the book Tools of conviviality, by Ivan Illich (1973). Since then, the term has undergone a classic process of semantic change, which has given rise to various definitions, connotations and methodological implications. The Mecila Center for Advanced Studies, which focuses mainly on the analysis of conviviality and inequality as intertwined phenomena, defines the term as "everyday interactions in contexts characterized by inequality and diversity" (Mecila, 2017). This broad definition, with implications for research at micro, meso and macro social levels, enables a wide range of methods and techniques for empirical research, convivial and non-convivial, both quantitative and qualitative: ethnographies, surveys, case studies; comparative, documentary and biographical analyses, etc. However, Illich's original definition of conviviality, "autonomous and creative intercourse among persons, and the intercourse of persons with their environment; and this in contrast with the conditioned response of persons to the demands made upon them by others, and by a man-made environment" could be considered more akin to methodological perspectives based on the epistemology of the known subject, as opposed to those of the knowing subject (Vasilachis), which refer to the co-construction of knowledge in convivial situations and without establishing fixed hierarchies between types of knowledges and between researchers and "subjects/objetcs" of inquiry.

Managing Health Care through Foreign Nurse Recruitment: Bilateral Labour Agreements As Tools of Governance in Times of Crisis

The combined crisis of Brexit and COVID have resulted in a serious shortage of healthcare workers in the UK, especially nurses. To ameliorate this situation, new bilateral agreements have been signed between the UK and migrant-origin countries. Among those is the new agreement signed with Nepal, a classic migrant-sending country which is also struggling to meet its own shortages falling way behind the nurse:patient ratio as recommended by the WHO. This situation throws up a number of pertinent questions in relation to institutional actors, potentially competing political priorities and standards.

This paper takes a global social policy perspective as its starting point for an analysis of bilateral labour agreements aimed at the recruitment and deployment of nurses signed during and after COVID-19 in relation to potential and actual conflicts as regards the various global policy goals and frameworks set out by the SDGs, GCM, ILO standards and WHO and PSI guidelines. Our exploration of the recruitment and deployment of foreign nurses as per the UK-Nepal BLA will be based on interviews with key institutional actors at global and national level.

In this paper, we engage with the re-invigorated social reproduction literature which situates foreign nurse recruitment within the broader – and highly variegated - context of national welfare systems and capitalist labour relations. We argue for an urgent recontextualization of foreign nurse recruitment as a direct subsidy from global south to global north healthcare systems in the wake of neoliberal globalisation and related pandemic-related workforce crises while also analysing the home country labour market conditions for these nurses which affects their aspiration to migrate in the first place.

Degenerative Phase of Capitalism. Terminal Capitalism?

The recurrent structural crises of capitalism, its profound reasons, will be dealt with here, in order to be able to specify and explain its current systemic quagmire, tendentially terminal, without "terminal" necessarily meaning "imminent". To situate ourselves in this tendency, it is necessary to show that the conditions of degeneration are sharpening and that the development of the productive forces is increasingly giving way to destructive forces – an important moment of the academic and political contribution of István Mészáros – with the consequent decline of the whole of capitalist civilization. Dilution of value, social and environmental destruction, collapse of societies... In this contribution I propose to expose some of the processes that explain all this, as well as the conclusions or implications that are attached to them, to synthesize some of the most relevant processes and factors for the analysis of the current phase of capitalism, in dialogue with Mészáros.

More Playgrounds, Police Officers or Other Kids to Play with? Children's Reflections on How to Improve Their Leisure in a Suburb of Curitiba, Brazil

"If you had the power to change anything, what would you do to make your neighborhood and your city cooler for kids?" This was one among the questions I asked fifty children who live in low-income neighborhoods in the city of Curitiba. For my interlocutors the city is neither a "model for Latin America", nor the "ecological capital", nor the "smartest and most connected city in Brazil". Their proposals for improving the city are, however, divergent. Children belonging to the more stable fractions of the popular classes tend to defend that structural changes - such as investment in security, improvements in traffic and solving problems related to drug dealing and public cleaning - would make their childhoods more pleasant. On the other hand, children in more vulnerable situations tend to propose changes that directly affect their daily lives, proposing a greater diversity of spaces and leisure activities, sports, and culture. Besides the social properties of individuals, the length of time the family has lived in the neighborhood and its practices more circumscribed to the living space have structuring effects on their representations and daily practices (Authier, 2007, p. 213). Even though they live in the same neighborhood and study at the same school, these children do not live the same world (Lahire, 2019). The differences in terms of parenting strategies, contribute to children educated under the natural grouwth view (Lareau, 2003) having a more accurate view of what the state could do to improve the urban experiences of this social group (Qvortrup, 1995).

Combined Effects of Students´ Gender and Ethnicity on Teachers´ Stereotype-Based Expectations: A Systematic Review

Whilst student populations become increasingly heterogeneous, (inter) national large-scale studies report educational inequalities based on shared characteristics of different groups of students. Although differences in educational pathways may be related to interindividual differences in ability and achievement, these inequalities may also be affected by teachers´ beliefs and expectations. Research has demonstrated that teachers´ beliefs and expectations vary as a function of specific student characteristics, whereby teachers have lower expectations for the academic achievement of ethnic minority students (for a review, see Wang et al., 2018). In addition, teachers may have different expectations for boys and girls, especially in regard to domain specific achievement (i.e., mathematical and language proficiency; e.g., de Boer et al., 2010; Holder & Kessels, 2017) and classroom behavior (Arbuckle & Little, 2004; Glock, 2016).

Although students present themselves with more characteristics that can activate stereotypical beliefs, most research has focused on a single characteristic and little is known about the effect of the intersection of characteristics. To this extent, one could argue for a cumulative effect of ethnicity and gender, whereby stereotype-based expectations concerning ethnic minority students are amplified by the students´ gender (Ghavami & Peplau, 2012), an interaction effect, whereby different characteristics interact (Purdie-Vaughns & Eibach, 2008) or an inhibition effect, whereby one salient characteristic dominates over the other (Pratto et al., 2006). To investigate these differential effects, we conducted a systematic review on the combined effect of student gender and ethnicity on teacher expectations.

Results provide support for an interplay of gender and ethnicity, rather than a cumulative or dominance effect, on teacher expectation of student academic proficiency and behavior. That is, certain combinations of gender and ethnicity create (dis)advantages for subgroups of students. These results will be discussed in terms of theory and future research as well as their implications.

The Longitudinal Impact of Student Characteristics, School Composition and Track Placement on Mathematics Performance: Inter- and Cross Level Intersectionality

In recent decades, much sociological inquiry has focused on whether and to what extent education systems are capable of compensating for and equalizing social inequalities. While earlier studies have mainly focused on educational inequalities and their relationship with individual students' characteristics (e.g., Boudon, 1974; Bourdieu, 1984); or school-level factors, particularly school composition and segregation (e.g., Jencks, 1974), few studies have been concerned with the intersectionality of individual and school-level factors and their impact on the performance of students within and across levels of education (Gross et al., 2016).

The present study aims to investigate the intersectional impact of students´ academic and socio-demographic characteristics, school composition and school tracks on students' mathematics performance in Luxembourg. It draws on data collected as part of the Luxembourg school monitoring programme "Épreuves Standardisées" (ÉpStan; Fischbach et al., 2014) and included *all* students enrolled in public education Grade 3 (November 2013) matched with data from the same students in Grade 9 (November 2017-2021) including those repeating once or twice (N≈3600).

Results of multilevel mixed effects regression analysis show that math achievement in Grade 9 is affected by student gender, SES, migration background and prior achievement, as well as by the school track and school composition (i.e., percentage of Low SES families in school). In addition, a robust cross-level gender x school track interaction effect was found. Results show that after controlling for prior performance and other individual characteristics, the institutional placement of students into different school tracks and school composition in Grade 3 influence test results in Grade 9. The cross-level interaction effect indicates that the boy-girl achievement gap is even more pronounced in the higher (academic) than in the middle (more technical) track. Results support earlier findings that both individual and school composition variables, and especially their intersectionality, contribute to differences in educational outcomes.

PITLUCK, Aaron* (Illinois State University, United States)

Conflicts of Interest

Conflict of interest policies, regulations, and legislation can be found across diverse private sector industries, particularly those with high concentrations of professionals. It is also frequently used to normatively describe how elected officials and those with public appointments should avoid "corruption" by reducing conflicts of interest between one's private interests and one's public duties. Despite the concept's ubiquity, it remains undertheorized in sociology and is therefore rarely used as a primary causal explanation in sociological research. When sociologists use the term as a causal explanation, we tend to conflate conflicts of interest with pedestrian conflicting interests found throughout the economy, thereby sapping the concept of analytic rigor, or we narrowly apply it to the interface of the public and private sector. This paper argues that we need to create a dialogue to theorize what constitutes a conflict of interest so that we can better alleviate the problems associated with them.

Building on a number of social theorists—particularly the business ethicist, Neil R. Luebke, and the sociologists Susan P. Shapiro and Richard Swedberg—I argue that a "conflict of interest" is a claim that a social relationship is a particular kind of agency relationship ("an acting for" relationship) in which the agent is obliged to act in the best interests of a principal (a fiduciary-like relationship) and in which this obligation conflicts with the agent's other interests. The paper then draws on Merton's theory of entrepreneurial deviance and the concept of monopoly power to argue that many conflicts of interest are market niches earning supernormal profits because they are natural monopolies created by ethical ambiguity. A conflict of interest is therefore a structural social situation, often created to gain supernormal profits, and typically occupied by individuals comfortable with social stigma and violating social norms.

Gamers and Far Right's Values in Australia

Whilst *gamers* have been object of moral panic campaigns that presented them as solely white inept anti-social teen-agers (Deshbandhu, 2016; Kirkpatrick, 2016; Kowert et al., 2014), researchers demystified such misconception and highlighted the complexity of video games cultures (Shaw, 2010). Studies show how *gamers* dislike the *casualisation* of video games (Peyron, 2019). Since the Casual Revolution (Juul, 2010) started, video games for mobile and some consoles such as Nintendo Wii targeted new markets or reached people who had abandoned video gaming. *Gamers* are lured to fight against this process in a conflict framed as a political struggle (Milner, 2013).

Hard-core gamers represent a hegemonic group in the history of gaming communities. Advertising and gaming industry cultivated a special relationship with this sector of consumers taking control of the most important gaming reviews and websites (Pearce, 2008). In particular, such industries are believed to have forged the stereotype of the *gamer* ignoring female video games players (Shaw, 2012; Chees, 2017; Vanderhoef, 2013; Salter & Blodgett, 2012). The acknowledge of identities that were previously ignored even by sectorial media engendered online confrontations in gaming communities, in particular in relation to the #Gamergate (Kidd & Turner, 2016; Burgess & Matamoros-Fernández, 2016). The links between #Gamergate and Alt-right have been studied (Bezio, 2018; Khan, 2019). YouTube represents an important social media to connect Alt-right *gamers* with a wider audience (Bryant, 2020).

This study strives to investigate how *gamers* are engaged in the Alt-right online activism, analysing the data arising from semi-structured interviews conducted in Australia. In those interviews, 20 youngsters between 18 and 30 years old discuss their point of view about the #Gamergate and their online activism. They also express their opinions in relation to the Casual Revolution. The data collected will be studied via computer assisted analysis.

The Gaming Capital. a Study of Gaming Communities through Bourdieusian Theories

Scholars debated the nature of gaming communities adopting different perspectives and definitions. Gaming has hence been studied prevalently as a subculture (Krzywinska & King, 2005; Boellstorff, 2006; Williams et al., 2006; Crawford & Rutter, 2006; Downing, 2011; Ruffino & Carbone, 2014) or postmodern subculture (Hodkinson, 2002; Meikle, 2013;), and less often as a *lifestyle* (Dutra, 2021), a *youth scene* (Adamus, 2012), as a *tribe* (Maffesoli, 2008; Caizapanta, 2011), or as neo-tribe (Bennett, 1999; Bennett, 2005; Law, 2016; Hardy et al., 2018; Marechal et al, 2019), whilst the original definition of "virtua-culture" (Crowe and Bradford, 2007) seemed to not be common in academic literature. Other scholars overcome the limitations of such categories adjusting Bourdieu's *cultural capital* to this context. The gaming capital (Consalvo 2007; Consalvo 2009b; Walsh & Apperley, 2009) represents a powerful instrument to study gaming communities, whilst other elements of the bourdieusian theory may complete the toolbox for sociological analysis (Malaby, 2006; Toft-Nielsen & Krogager, 2015; Vossen, 2018; Keogh, 2021; Jaćević, 2022). Nevertheless, a complete theory of the gaming capital has not been structured yet.

This study strives to understand how different kinds of video games players access and gain gaming capital: in particular, the present study will investigate the difference between *hard-core gamers* (Poels et al., 2011; Braegger & Moeller, 2021) and *casual gamers* (Juul, 2010). The research is informed by semi-structured interviews to young people aged between 18 and 30 years old who are part of the Australian gaming community. The data are transcribed and coded via computer assisted analysis (Mortelmans, 2019).

Practices and Cultures of Boredom: Young People's Experiences of Doing Nothing in Covid Time

In its broadest meaning, "boredom" describes a state of having nothing to do and of being disengaged from one's surroundings which develops when external circumstances distance individuals from the life they hope for (Bourdieu 2000). Emerging from a situation in which individual desires, intentions, ambitions become temporarily impossible to achieve, the experience of boredom highlights a discrepancy between societal and subjective time when the individual perceive oneself as "blocked" while the surrounding world keeps moving (Frederiksen 2017). During the Covid-19 pandemic, boredom, doing nothing, and disengagement have become a daily experience for most young people. Being harshly deprived of all opportunities for face-to-face socialisation and interaction due to the preventive measures, young people have found themselves dealing with a feeling that our accelerated society has for long neglected and stigmatised (Rosa 2013). Drawing on a qualitative study conducted with Italian university students (18 – 27), the paper proposes an in-depth analysis of young individuals' experiences of boredom during the pandemic asking: a) how have young people – individually and collectively - navigated boredom? b) how are they making sense of the discrepancy between societal and individual time? c) how is their overall experience of boredom mediated by social background? Through these questions, the contribution aims at shedding lights on practices and cultures of boredom emerging amongst young people in this unprecedented time.

"Where Are You from?" the Affective and Emotional Dimensions of Being Confronted with an Othering Question

It has been argued in the literature that, for immigrants and their descendants, the question of where they are ("really") from may be an othering experience. Drawing on 66 semi-structured, qualitative interviews with three "groups" of 1.75- and second-generation immigrants (German Poles, Black Germans and German Turks) this paper explores the different ways in which people of migrant background make sense of the question of where they are ("really") from in the German context. In so doing, the paper explicitly focuses on the role of affects and emotions for both respondents' interpretation of the question and the response they give to that question. First, three ways of sense-making across all three groups are outlined. The question may be understood as (1) normal, (2) an instance of everyday racism, stigmatization, discrimination, or unfair treatment, or (3) as an ambiguous incident for which one lacks a concrete "scheme of interpretation" but which causes feelings of unease. Second, it is argued that it through affects that people "know" how to make sense of that question. Third, my data shows that understanding the question in a particular way--(1), (2), or (3)--comes with specific emotions, which need to be managed and have varying action potential. Fourth, and in addition to pointing out the role of affects and emotions for coping with the question where one is ("really") from, the paper highlights different macro-, meso-, and micro-level factors influencing, first, how the question is made sense of, and, second, how interviewees respond to it. Important factors are: one's perception of symbolic boundaries between society-at-large and "one's

group", one's understanding of the specificities of the situation and the setting in which the question is asked (power hierarchies, etc.), and personal "policies" and "rules" regarding what one regards as discriminatory, or unfair.

Climbing, Stalling, Falling: How People Experiencing Housing Instability Anticipate Their Futures

Anticipation is a key regime of self-governance in contemporary Western societies. Anticipatory regimes presume that while individuals cannot know with certainty what they will face, they must prepare for futures that present them with risks. The normative of being prepared for risks and making knowledge and material resources available for oneself to mitigate them combines future orientation with self-responsibility. However, in the context of housing instability coincide considerable uncertainty with a lack of access to resources such as affordable housing supply, disposable income, and social capital. How is the future imagined in these conditions, and how does one prepare for the potentially catastrophic consequences when risks eventuate? We explore these questions through the conceptual lens of anticipation drawing on narrative interviews with 40 participants complemented by photographs they produced for the study. The experiences of housing instability among participants included rough sleeping, crisis accommodation, marginal housing, and permanent supportive housing in an urban centre in Queensland, Australia. We tease out nuances across participants in different housing contexts, yet, found also remarkable similarities across the sample. Our narrative analysis combined structural, visual, thematic, and dialogic strategies and revealed emplotments aligned with the socio-cultural imagery of the staircase model of housing. These emplotments were depicted as participants' capacities to move upwards, or else move downwards or stagnate. *Climbing* represented a morally viable and desirable anticipatory regime even among participants who saw themselves as *stalling* or indeed at risk of *falling* down the housing ladder. We explore how such stories were inflected by the limited access to resources that constrained opportunities to act on the present to achieve desired outcomes for their futures. While we found that this narrative was highly individualised, we also identified counter-narratives of collective responsibility and systemic failure in which futures were imagined as non-linear, requiring more-than-individual anticipatory action.

PLAKHOTNIK, Olga* (University of Greifswald temporary, Ukraine)

Racial Politics and Necropolitics of the War

More than 20 000 international students, predominantly people of color, studied in eastern cities of Ukraine in February 2022. While the full-scale Russian invasion of Ukraine on February 24, 2022, changed millions of lives dramatically, the challenges were harder for non-white non-citizens. The war has replaced the routine of "ordinary racism" (Demyanenko 2014) towards foreign students with acute necropolitics performed by institutions and citizens. Drawing on the wide range of media materials and private testimonies, I study the discursive shift in public debates on race and racism evoked by the war. Using a "reading sideways" method (Somerville 2005; Puar 2007), in the first part of my presentation, I examine together two cases: the "differentiated handling" of non-white war refugees (foreign students as well as Roma communities) during evacuation and border-crossing and the racist tropes of the hate speech used by Ukrainian population towards Russian occupants. In so doing, I seek to unpack the discursive mechanisms of race construction with respect to Ukrainian citizens in times of war: how their presumed "whiteness" is substantiated and legitimized. In the second part, I consider examples of anti-racist critique in Ukrainian civil activism and arts to study how the domination of the "whitewashing" discourse can be publicly challenged. Through radical "No borders!" critique of nations-borders regimes and racist underpinning assumptions of anti-immigration politics, the counter-narratives oppose the "claim to whiteness" (Krivonos 2017) and offer a decolonial and intersectional perspective on the race issue in the Ukrainian context.

PLANCARTE, Rafael* (Universidad de Guanajuato, Mexico)

Game Theory and Internalist Perspective on Rational Choice: Possibilities for a Coherent Connection

Are game theory and internalist perspective on rational choice compatible? Game theory assumes the principle of the actor guided by a selfish outcome-oriented rationality (according to J. Eslter, 2007). Moreover, it posits that individuals evaluate the behavior of other players before choosing their strategy. On the other hand, the presuppositions (Alexander, 1987) of rational choice have been dismissed by a wide variety of theories and authors.

Internalist perspective on rational choice has taken these criticisms into account (Elster, 1983; Elster, 1989; Elster, 2007). However, little has been said about the links between game theory and internalist perspective on rational choice. The aim of this paper is to contribute to the understanding of these links. In it, some avenues for a coherent articulation are proposed. The main argument is that including an extended rationality perspective can improve the explanatory power of game theory. It is argued that the inclusion of a diversity of motivations (rational and non-rational) is fundamental to understanding actors' strategies and game outcomes. Thus, the explanation of preferences and strategies includes not only outcome-oriented selfish rationality but also other mechanisms such as emotions, social norms, ideologies and magical thinking. The link can be made in two ways: through an analysis of preferences or through an analysis of strategies. In the first case, motivations are seen as mechanisms that define the way in which preferences are ordered. Therefore, the logical ordering of preferences would not only be typical of individuals guided by a selfish outcome-oriented rationality. In the second case, it is shown how transitory motivations (emotions and social norms) influence directly the strategies, not the preferences. To show the usefulness of this theoretical proposal, the phenomenon of drug trafficking in Mexico is analyzed.

A Reflective Analysis of Grassrootfamily-a Mgazato (Crowdfunding) Initiative

Growing up my father used to call me 'Mother Teresa', and this was because I liked helping people. I genuinely wanted to make a difference in another person's life. In 2020, Covid-19 made me yearn to make a difference, because most people in the world were affected and still are affected by the pandemic (Naidu, 2020; October, 2021; Ollamparambil, 2021). When I was young, I thought for me to help people I had to be old and wealthy, however the pandemic made me realise that anything can happen. I then started this initiative called GrassRootFamily (GRF) to assist those who are less fortunate. This initiative was funded through *Mgazato (*Crowdfunding) initiatives, through the assistance of my acquaintances, family, friends and strangers. GRF is in the process of being registered as an NPO. This reflective paper will explore the projects I have embarked on through GRF to show the extent in which myself as an emerging sociologist took in the agenda of eradicating poverty through community empowerment and social support.

Judicial Review and Prosecution Accountability, England and Wales

Public prosecutors exercise considerable power within criminal justice systems, especially on decisions to prosecute. There is also considerable tension between assertions of prosecution independence when making decisions and ideas of public accountability. In England and Wales, judicial review is an established mechanism through which citizens can question the lawfulness of decisions made by public bodies. As such, judicial review is often itself the subject of criticism. This presentation provides an analysis of a unique major dataset of 60 victim-initiated applications lodged between 1990 to 2022 for judicial review of Crown Prosecution Service (CPS) decisions not to prosecute an allegation of a criminal offence. Most originating allegations involved unlawful death followed by sexual offences and involved a single direct victim. A majority of applications were preceded by internal CPS review of some kind including, from 2013, the Victims Right of Review (VRR) Scheme. Just under a third of applications were 'successful'. We assess the continuing usefulness of judicial review as a public accountability mechanism.

PLEYERS, Geoffrey* (Université catholique de Louvain, Belgium)

A Global Sociology of Social Movements after the Decolonial Turn

The rising influence of actors and worldviews from the Global South in contemporary movements calls for renewed approach, method and epistemology in social movement studies. It raises practical, theoretical, methodological and epistemological challenges. How to study global movements without ceding to the pitfalls of methodological globalism and epistemic extractivism? How to conciliate the diversity of struggles with the global dimensions of a movement? This reflexive paper draws on the author's previous research on global movements since 1999 to discuss these challenges and propose an approach built on four pillars: multi-site research, transnational analytical tools, dialogues with local actors and researchers, and an ethic oriented towards intercultural dialogues. Under these premises, global

sociology becomes a collective project that combines researchers' and actors' reflexivities in a common quest for a better understanding of our world and the actors who seek to transform it.

Religion, Social Movements and Politics in Brazil: From Liberation Theology to Bolsonaro

The move from a progressive Brazil to a country led by a far-right President in just a few years is also the outcome of another, two-fold major shift which occurred in the 1980s: the conservative turn in the Catholic Church and its attacks on liberation theology and practices, and the concomitant rise of conservative neo-Pentecostal churches. The impact of this shift was little visible in the Brazilian political arena in the following decades, as activists trained in the groups close to Liberation Theology kept their progressive commitments in lay organizations, parties and movements. On the long run however, its impact has been devastating. Liberation Christianity, and in particular its base ecclesial communities, have acted as popular and political education groups from which a new militant culture and thousands of activists have emerged, contributing to the deep transformation political, social and cultural of Brazil between 1980 and 2016. Simultaneously, it left a vacuum, soon filled by the conservative Neo-Pentecostal churches, who have acted as major incubator of militants and voters for Jair Bolsonaro.

PLIUSHCH, Valentyna* (Institute of Sociology, the National Academy of Sciences of Ukraine, Ukraine)

Migration Policies for Asylum Seekers from Ukraine in Israel

Since the beginning of Russian invasion of Ukraine in February 2022 there are two types of asylum seekers from Ukraine in Israel: asylum seekers with Jewish roots and non-Jewish refugees without Jewish roots. The Population and Immigration Authority of Israel defines two migration policies for these 2 categories of refugees.

The migration policy for asylum seekers with Jewish roots is based on the Law of Return, according to which immigrants with Jewish roots from all over the world, including asylum seekers, are granted with the state support to relocate to Israel [Law of Return, 1950].

The migration policy for asylum seekers without Jewish roots is based on 2 state initiatives. The first one is the Law for Prevention, according to which any person who enters the territory of Israel without visa, including refugee, is defined as an "illegal immigrant" [Law for Prevention, 1954]. The second one is the state decision regarding the extension of visas for all Ukrainians who, on the day the war began were legally in Israel with tourist visas, and all Ukrainians who entered Israel after 02/24/2022 with tourist visas. The policy does not grant employment rights to this category of asylum seekers, nor includes the issue of family reunification [Population and Immigration Authority, 2022].

In August 2022, 24,000 Ukrainian asylum seekers without Jewish roots received asylum in Israel, including 20,000 newly arrived non-Jewish Ukrainian refugees who have relatives or friends in Israel, being able to support them, and 4,000 non-Jewish Ukrainians who stayed in Israel on the day of Russian invasion of Ukraine [Brodskiy M., 2022].

To conclude, Israel as a member of the Executive Committee of the United Nations High Commissioner for Refugees, stays first of all Jewish state, keeping different migration policies for asylum seekers from Ukraine in Israel depending on their Jewish roots.

Criticizing and Putting Criticism into Practice: The Case of Digital Designers

In recent years, a critique of digital technology by its own practitioners has developed, particularly among interface and experience designers (Monteiro 2019). Professional communities have been organized to develop this critique (Björklund et al. 2020), among them one that emerged in 2016, initially to bring debates around persuasive design to France. Our study aims to understand the constituent elements of the designers' communities gathering under the label "ethical designers" (Gray and Chivukula 2019), as well as the roles these communities play within designers' own careers. Based on a survey of a hundred French designers and interviews with twenty of them, we show under what conditions they deploy critique of their digital design activity.

Our results show that criticism of digital design is primarily the manifestation of disillusions regarding the utopia of digital technologies (Turner 2006). The discontent prompts designers to create or connect with communities. We observe that this sense of unease and non-criticism does not come from a lack of will, but from a difficulty in operationalizing the critique. The designers we met consider themselves more as practitioners than as intellectuals.

Furthermore, while protest against certain practices –like persuasive design– may be collective, implementation is often individual. Finally, designers are limited in their practice by the dilemma of user-centered design; should they meet their users' desires (w.r.t. empowerment) or shall they adopt an incentive or even manipulative posture to trace paths contributing to societal changes and values (Williamson and Kowalewski 2018)? We find that these quandaries are at the heart of digital designers' practice; They stand in an expectant posture –crossroads between exit (in favor of a job as a designer in a public administration), voice (entrism), loyalty (counterbalanced by political engagement outside design), and neglect (expressing doubts about the utility of design) (Hirschman 1970).

POIROUX, Jeremie* (Centre Marc Bloch, Computational Social Science Team, Germany)

Making Symbolism and Connectionism Coexist: The Case of Two Risk Prediction Tools in Public Administration

Digital information systems, including decision support algorithms based on predictive techniques, have been studied for their automation objectives (Parasuraman, 2000; Moray, 2000) and their possible replacement of human decision makers.

Our proposal aims at reporting on the genealogy (Gillespie, 2016) and design of decision support tools based on a machine learning technique. To do so, we rely on two fields from a PhD thesis. The first one focuses on the design of a targeting tool whose objective is to plan future administrative safety inspections of professional ships. This fieldwork consists of twelve interviews conducted with agents of the French Maritime Affairs. The second fieldwork will serve as a comparison. It consists of five interviews with criminal investigation officers in three German *Länder* responsible for the design and/or monitoring of a "predictive policing" tool (Mohler, 2011). Both decision support tools have in common being deployed in public administrations and not targeting people.

Our results are threefold. First, we show that actors are confronted with an opening of the space of possibilities (Mackenzie, 2015; Beck, 1992). There is greater uncertainty and unlike what is commonly feared, the targeting tool is not a threat to actors. On the contrary, it allows them to provide indicators (Davis, 2012) to diversify their portfolio of information sources. Our second result underlines that the change does not make expertise obsolete (Evans, 2008; Dreyfus, 2005; Klein, 2008), but that it puts an actional paradigm and a scientific paradigm in competition (Andler, 1992; Boelaert, 2018). Our third part discuss the lack of evaluation of the tool. Its purpose and relevance –which starts with the evaluation of the need for targeting (Kleinberg, 2015)– seems to have been neither questioned nor modeled. We hope to contribute to the beginnings of a sociology of evaluation of decision support tools.

Counter-Urbanization and Centrifugal Migration in the Age of Social Turbulence

Crisis phenomena (COVID-19 and the military conflict in Eastern Europe in 2022) have transformed and reshaped in new ways the role of non-urban territories, previously in a state of deep economic depression. Ecologically clean and sparsely populated areas have become attractive to city dwellers as places of safety and mental recuperation. In recent years, the flow of centrifugal migration has increased. Working remotely online allows migrants to keep their profession and income. The paper highlights the theoretical aspects of centrifugal migration and the future of megacities ("life beyond the city") and analyzes data from applied sociological research.

Orchestrating Modern and Alternative Medicine: Challenges for the Practioners of CAM in Turkey

This paper explores the question of whether the practitioners of both modern and complementary and alternative medicine (CAM) in Turkey merge or diverge their different knowledge, skills, dispositions, and practices pertaining to these supposedly two separate domains. Through a Bourdiuesian concept of habitus, it explores if there might be multiple habitus(es) and if so how they orchestrate these realms. The paper is based on interviews conducted with medical doctors and pharmacists that have training in both modern medicine and particular CAM practices, spesifically homeopathy, acupuncture, and cupping and leech therapies. It addresses the challenges the practioners of CAM receive from both the modern state and the orthodox medical community. Although the Turkish

state has been actively supporting the CAM in line with the WHO policies, it also strictly controls and seeks to standardize especially more traditional forms of CAM. Pharmacists are not allowed to sell homeopathic remedies, for instance, while also those performing leeching beyond modern clinics/hospitals are strictly criticized, if not subject to legal enforcement. The paper contextualizes the question of the state power and authoritarianism in medicine through providing a brief history of the legislation and institutionalization of CAM in Turkey. It also, through the narratives told by the health professionals during the in-depth interviews, seeks to understand why and how they started to learn and practice CAM and what challenges, objections, rejections they received from their colleagues. The interviewees emphasize factors such as their personal illnesses, dissatisfaction with the modern medicine, limitations of modern health practices to cure certain diseases or reduce pain, and the authoritarian demands and powers of the modern health industry to eliminate alternative medicine. The paper discloses how, if they do, they try to overcome certain authoritarian barriers, and underlines ironies and dilemmas embedded in their narratives.

The Domestication of Medicine: The Experiences of Contact-Tracing Teams in Turkey

This presentation is based on a research project completed in Istanbul, Turkey, about the experience of the contact tracing teams mobilized by the Ministry of Health since early March 2020. It investigates the ways in which the state organized contact-tracing teams, how contact tracing was carried out, and the kind(s) of experiences medical doctors, nurses, and other health workers deployed in these teams had. As part of the research in-depth interviews with 21 contact-tracing team members have been carried out and other official and non-official sources have been analyzed. On the one hand how the state organized and regulated contact-tracing as a process, and how it centralized and limited the capacities of health professionals serving in these teams are examined. On the other hand, the paper focuses on the agency of contact-tracing members, i.e. the ways in which medical doctors, nurses, and their local administrators bypassed certain governmental demands, and the strategies and measures through which they tried to overcome the kinds of challenges and difficulties encountered through the contact-tracing. The paper asserts that contact-tracing in Turkey can be characterized as domestication of medicine: the medicalization of home, that is the carrying out of contact-tracing face-to-face at the home/domestic domains of the COVID-19 patients and their contacts; second, the domestication of the health professions as they were required to leave their active duties at clinics, hospitals, and pay visit to the COVID-19 cases and their contact at homes. The paper delves into the physical, emotional, and practical workload of health workers in this process as well as the ways they felt proud or burn-out particularly regarding their professional identities and vocation. The paper voices the ethical and personal dilemmas they faced and the practical ideas and solutions they offer for pandemic governance.

School-to-Work Program during Pandemic: First Evidence from Italy.

According to Caroleo at al., (2017), adolescents tend to display difficulties in the transition from high school to tertiary education or the labour market. Moreover, the COVID-19 pandemic has exacerbated current problems, threatening students' ability to successfully progress into postsecondary education and/or into the labour market (Cahill et al., 2020).

During the lockdown, the closure of the physical school and the lack of in-person contact had an impact on students' motivations to engage in learning activities and employment opportunities (Di Pietro et. Al, 2020). Further, the pandemic has had an enormous repercussion on vocational education and training, with work-based learning most gravely affected, due to their focus on practical training and direct links to the workplace (Cedefop, 2020; Stewart et al., 2021).

In Italy, the alternation between the activities at school and those at work has been introduced by the "77/2005" law[1], as a part of the high-school curriculum. School-to-Work Programs (SWPs) are mandatory for all students from Grade 11 to Grade 13, in order to improve students' ability and their job opportunities (Tino & Grion, 2018).

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The aim of this study is to investigate the SWPs during the pandemic, with the final goal to depict the developmental trajectories of students' occupational strategies and employment aspirations. Our sample involves nearly 4.000 students enrolled in 2021 at Grade 11 in 78 Italian high schools selected through a quota sampling method.

First findings show that 60% of SWPs do not avail themselves of external collaborations suggesting that constraints imposed by the Government may have affected the integration between schools and training providers (i.e., companies or employers). Nevertheless, more than 60% of SWPs are carried out in person and only 15% of SWPs are provided with online learning courses.

Further implications of social and educational inequalities will be discussed..
[1] And subsequent amendments.

Schools Self-Evaluation through Video Making: A Case Study

The Regulation of the National Evaluation System (Presidential Decree 80/2013) requires Italian schools to activate self-evaluation and improvement processes, therefore creating the need to build an evaluative culture among school staff. According to the strategic elements highlighted in the literature (OECD, 2013; Schildkamp et al., 2016), the *Valu.E for Schools* project, promoted by INVALSI (National Institute for the Evaluation of the Education and Training System) and financed by the ESF (European Social Fund), has allowed the activation of three training paths – one for each macro-region of the country – with the double aim of strengthening the evaluation and improvement design skills in the teachers and school principals and of offering guidance to policy makers on networking, training and support models in the field of school self-evaluation (Gomez Paloma et al., 2020). In one of these training courses, as a concluding e-tivity (Salmon, 2002), the participants used video-making to present their school and the self-evaluation activity carried out in the light of what they had learnt (Panciroli et al., 2017).

The production of audio-visual artefacts – which use a highly formalised language and a complex communication code, and which therefore presuppose an in-depth and stratified preparatory process – aimed at encouraging a participatory and articulated reflection on one's own school identity: students, school staff, community, role, practices. In a video-reflexive research key (Decataldo, Russo, 2022), using a hermeneutic-semiotic interpretative approach to the 12 narrative videos produced by the schools, this contribution intends to study how these self-represent themselves (Cavallaro, 2015; Mattioli, 2015; Faccioli, Losacco, 2016). Through a semi-structured observation by several independent observers, the thematic and rhetorical-stylistic choices (script, direction, setting, semantics, sound, etc.) are investigated as elements of denotation and connotation (Barthes, 1985) of the represented meanings about the idea of school and self-evaluation.

No Way Home: The Erasmus's Experiences of "Leaving" through Socio-Phenomenological Lenses

In the essay of social psychology The Stranger (1945), Alfred Schütz declares that he does not aspire to a study on the process of social integration, but rather on the analysis of the "situation of first-contact" with new models of interpretation and action which pertain to the in-group, living an experiential shock with the consequent disclosure of the "relatively" of her/his natural reality". As Muzzetto (2011) points out, the essay, together with its specular work The Homecomer (1946), explicates the affective background that underlies Schutz's thought.

Such a perspective seems to offer a theoretical framework and a conceptual toolbox useful for experiences of "first contact situation" and of micro fractures of one's taken for granted.

The following presentation aims to question the possibility of mobilizing some of Schütz's concepts (especially the notions of taken for granted, experiential shock, type, relevance, familiarity) and those pertaining to the phenomenological tradition (lived experience, sedimentation, institution, retention-protention) in order to cast it within the analysis of the experience of youth mobility, privileging two specific moments: that of arrival and that of return which represent two experiences of self-reflection. The main literature on Erasmus usually focuses on its taking place during the months of exchange, it may be interesting to consider also the moments preceding and succeeding the journey. Therefore the journey implies not only a spatial distance from

one's "home" but a sort of rupture in one's biographical path. This presentation aims to put into light the emotional intensity of the mentioned moments through the analysis of a corpus of interviews with students experiencing Erasmus between Paris and Perugia.

POLILLO, Simone* (University of Virginia, USA)

Planning and Econometric Models in Post-World-War-II Italy: A Sociology of Performative Regimes

Why did econometric modeling flourish in 1960s Italy, serving as a crucial source of legitimacy for the Central Bank that developed those models, whereas economic planning remained a matter of political debate, and failed to produce concrete methods that would shape the making of the Italian economy? To understand why certain representations of the economy entangle with technical devices and become performative, while other representations fail to connect with technique and get embroiled in political controversy, I develop the concept of the performative regime: the organizational conditions that allow experts to produce technical devices that get taken up by adjacent organizations without controversy. A key element is the concentration of cognitive authority within an organization that gives experts the resources to assemble the devices, then promotes their diffusion across a broader organizational field while the experts retain some control over their future development. The Bank of Italy's capacity to shape econometrics shored up the performativity regime of its models; by contrast, the absence of a centralized organization capable of coordinating the competing efforts of planners doomed planning to failure.

Del Discurso De #Fronterasseguras e #Invasióninmigratoria Al #Nohablesenminombre y #Laviolencianotienesexo: El Papel De La Raza y Del Género En La Derecha Radical Española.

El papel ascendente de la derecha radical (Rydgren, 2017; Mudde, 2007) en España con la formación política Vox hace necesario el estudio de su discurso debido a la capacidad performativa del lenguaje y a su papel en la configuración de marcos excluyentes. Un número significativo de investigaciones académicas han tenido como objetivo determinar su naturaleza ideológica (Acha, 2021; Ferreira, 2019), así como analizar la hegemonía del componente nacionalista frente al populista, configurado como una expresión contingente (Ortiz y Ramos-González, 2021). El discurso político ha sido abordado desde diversas disciplinas, tales como la Glotopolítica (Labrador y Gaupp, 2019), la Sociopragmática y el Análisis Crítico del Discurso, centrándose, este último, en la representación que hace el partido de lxs migrantes en sus cuentas principales. Sin embargo, se observa la falta de investigaciones centradas en la intersección entre la raza y el género en las cuentas de Vox Oficial (@vox_es) y Vox Jóvenes (@voxjovenes) en Twitter. Se pretende mostrar el papel que juega esta intersección y el dispositivo de masculinidad en la construcción del marco nativista patriarcal. Para ello, se analizan los tuits publicados durante el periodo comprendido entre 2020 y 2022 a través de la triangulación metodológica centrada en la Lingüística del corpus, el Análisis Crítico del Discurso y el análisis cualitativo desde la Sociología de Género. Los resultados muestran el uso de estrategias como el victimismo y el derecho agraviado (Kimmel, 2017), la racialización del sexismo (Farris, 2021; Mann y Selva, 1979), así como la representación de la masculinidad tradicional con la que se refuerza el nativismo patriarcal, justificando las políticas antiinmigración, la postura antifeminista y la aparente defensa de las mujeres de la formación política española.

Gender-Based Needs Assessment of Ground Zero Meranao IDPs in Iligan City: Implications for Sustainable Intervention Programs

Conflict of severe magnitude does not spare the innocent civilians from experiencing collateral damages. The May 23, 2017 Marawi siege in Southern Philippines was adjudged as the longest and the most intense armed encounter that took place between the non-state actors (the Moro Islamic Liberation Front in alliance with ISIS affiliates) and the military in the history of Mindanao conflict. Within the context of disenfranchised internally displaced Meranao Muslim civilians, evacuation to a nearest city was the most viable option. Unfortunately, there were 144 IDPs who settled in Iligan City living in evacuation centers not recognized by the government agency taking care of conflict survivors. They are not the priority in terms of assistance distribution as they live in abandoned Islamic dormitory and mosques considered as private domains. They felt being extremely victimized and left out by the government. The IDPs registered their grievances, destitution, emotional pains due to the breakdown of their communities and lost livelihood opportunities while clamoring to go back to their original life in Marawi City. Men's family position was challenged as they have become generally unemployed, and their families are starving. The Meranao women also lost their business activities when their

houses were razed to the ground and intense fighting drove them out of their foothold. Both men and women generally need shelter, livelihood assistance, food and health care in order for them to bounce back. Although they were able to receive occasional relief goods and assistance in the first six months after the siege, but this nature of support was never sustained. Until now, they are still groping in the dark.

New Deal or Green Extractivism: The Ups and Downs of the Petro and Boric Governments Regarding the Model.

The energy transition has been strongly implemented in the Global North, with a particular focus on Western European countries. By energy transition we mean the transformation of an energy economy based on oil, coal, gas and nuclear energy into one based on renewable energies. At the same time, in the Global South, an extractivist model dominates as a form of development, in which the extraction of raw materials is the core of the economy. This is how these countries have become dependent on commodities over the years. However, in recent years this model, which attempts to transform itself into a green extractivism, has been oriented towards new raw materials, as is the case of lithium, without generating a major transformation in the model. This research seeks to analyze the cases of Colombia and Chile, in order to understand the efforts of the Petro and Boric governments to achieve a change in the extractive model. Using a qualitative methodology, through interviews, we seek to analyze key actors within environmental organizations as well as those who are part of the government and think thanks, seeking to understand the ups and downs of the debate within these governments.

Gender Roles in Television Commercials in ASIA: A Comparison of Japan, China, Korea, Taiwan, Thailand, and Singapore

Television advertisements are a rich source of data for social scientists to investigate as they can be seen as a reflection of prevailing cultural values. Gender value is also one of the critical factors in developing marketing strategies via advertising messages. Although research of gender roles in advertisements is plentiful in the United States, our understanding of sex-role portrayal in an international context is limited because there are so few studies.

This study's objective is to examine the similarities and differences of gender roles in Japanese, Chinese, Korean, Taiwan, Thai, and Singaporean television commercials. The research methodology focuses on content analysis, and around 2,000 advertisements in 2022 were collected, coded, and analyzed.

As a result, most of the findings of this research are like previous results in the literature. However, the analysis refutes the conclusion that the roles of males and females in advertising correspond accurately to the construction of gender roles. Conversely, the advertisements analyzed seem to reflect an ideal image of gender roles in society. Moreover, the results of Singaporean commercial show equality in gender roles, and this supports the concept of a decrease of gender stereotyping in advertisements.

Additionally, from the research findings, the characteristics of advertising in term of gender roles in each country can be classified into four groups as outlined below. 1) *Non-stereotypical gender roles*. 2) *Stereotypical gender roles, but equality in working and non-working roles*. 3) *Stereotypical gender roles, but equality in working roles*. 4) *Stereotypical gender roles, but equality in non-working roles.*

Furthermore, one of the reasons for the decrease in gender stereotyping in advertising in Asian countries may be the change in consumer media usage. People show their opinions toward social phenomena immediately. Therefore, advertisers must be more sensitive to controversial gender issues, accounting for decrease in gender stereotypes.

POPOV, Andrei* (Vologda Research Center of the Russian Academy of Sciences (VolRC RAS), Russian Federation)

The Meanings of Precarity in the World of Work: Generational Approach

The consequences of employment precarization are the subject of extensive discussion in the scientific literature. Despite the novelty of the topic, over the past decade a large number of works have been published reviling the negative impact of this process on the working and daily life of workers. However, age specificity has not been widely reflected in studies: the authors usually focus on the population as a whole or special categories of individuals. In this regard, the purpose of this paper is to analyze and summarize the existing experience in studying the impact of employment precarization on generational groups. To do this, we examined the situation of young, middle and older workers involved in precarious work. The research was based on the domestic and foreign empirically-oriented sources, as well as original data obtained during the survey of the Russian population. The results showed that the impact of employment precarization on generational groups has a serious specificity.

For young people, the instability of work mainly affects the planning of their own future, forcing them to postpone the issues of creating a family and having children, leaving the parental home, etc. Protracted transit to stable employment is damaging to mental health. This is most notable in adulthood, when instability becomes a part of everyday life. Getting out of the precarity trap can be difficult, as low wages and social insecurity limit the ability to change the current situation. The implications of employment precarization for older people are mixed. Taking into account all the disadvantages of precarious work, having any job is often a necessity to maintain the usual way of life.

Teaching Sociology of Climate across the Curriculum: The Case of the Master of Disaster Risk and Resilience (MDRR) in Ateneo De Manila University, Philippines

Prior to the 2015 Paris Climate Agreement, the teaching of climate in Ateneo de Manila University (ADMU), has been initiated mainly by the Departments of Environmental Science, Physics or Earth sciences in the School of Science and Engineering (SOSE) and by the Departments of Sociology and Anthropology and Political Science in the School of Social Sciences (SOSS). But with the 2015 Sendai Framework and the many climate disasters that have hit the Philippines such as Ketsana in 2009, Haiyan in 2013, and Glenda in 2014, to mention a few, the ADMU faculties of Physics, Environmental Science and Sociology and Anthropology banded together to offer an inter-/transdisciplinary masters degree program, Masters in Disaster Risk and Resilience. In crafting the degree, the Department of Sociology and Anthropology spearheaded the teaching of climate and disasters through the following course offerings: 1) DRR 203,Risk and Resilience: Focus on Climate Disasters and Humanitarian Action, 2) SoAn 123, Cities and Society: Anthropogenic Climate Change and Disasters and Humanitarian Action, 3) DRR 204, Climate Governance, 4) DRR 206, Statistical Methods for Climate Risk and Resilience, and DRR 207, Quantitative and Qualitative Methods for Risk and Resilience.

This paper argues that the teaching of sociology of climate in the new normal takes on an inter-/transdisciplinary trajectories of conceptualization and action in order to reimagine the development futures in the Age of the Anthropocene and the Climate Crisis. The twin crises of our time, climate and social inequality, exacerbated by the Covid-19 Pandemic demands a radical shift towards inter-transdisciplinary teaching of the sociology of climate.

In the Shadow of the Pandemic: A Canadian Feminist Analysis

During the pandemic, Canadians, like everyone else, were subject to restrictions – lockdowns, quarantines, mask mandates etc. While most people recognised the necessity of such restrictions, some did not. Heavily influenced (and financed) by right wing USA groups, a group of truckers and their supporters drove from across Canada and occupied a part of central Ottawa. These trucks were "weaponised" both by their sheer size and by the constant use of air horns and other noise devices. Women living in and working in the area were intimidated and sometimes verbally threatened by the truckers. The truckers blocked off an area around the Houses of Parliament until they were eventually dispersed. This paper analyses the gendered dimensions and implications of the truckers' occupation, including both the physical and psychological impacts on women in Ottawa and beyond.

Infancia y Relaciones De Amistad Sostenible En Un Mundo Empantallado

El consumo de los contenidos de ficción muestra una tendencia al alza a lo largo de los últimos años. Si analizamos estas cifras, se observa que un gran porcentaje de ese público heterogéneo de las estadísticas se localiza en jóvenes, adolescentes y niños y niñas de edades muy tempranas. El protagonismo de los contenidos audiovisuales, especialmente desde las plataformas digitales, se ha convertido en una tendencia muy habitual en la mayoría de los hogares españoles. A partir del análisis de contenido de las producciones más vistas en 2021 y 2022 se estudian unas 150 categorías de los personajes más significativos y la representación de la amistad en esas historias. Series como "La que se

avecina", "ACI", "Estoy vivo" o películas como "Shazam", "Mula" o "Luca" por citar algunos ejemplos de lo más visto, muestran diferentes retratos de la amistad entre los personajes. El objetivo de este estudio es reforzar una comunicación responsable desde la ficción. Una comunicación que sea capaz de inculcar la necesidad de cultivar la amistad, valor clave en el desarrollo y educación de una persona desde los primeros años. Para ello, será necesario promover historias y relaciones verosímiles, con las que los públicos se identifiquen fácilmente, contar argumentos que motiven a construir esos vínculos afectivos de manera sostenible y equilibrada. Resulta interesante analizar algunos de los personajes de ficción más vistos en los últimos años, para identificar algunas tendencias sociales en torno a la amistad y sus implicaciones en nuestros días.

PORYES, Malki* (Ben-Gurion University, Israel)

God Is My Buddy: Haredi Youth Online and the Formation of the Haredi Generation Z (Referring to the Ultra-orthodox Jewish society in Israel)

Studies have shown that rates of internet use in Haredi society are steadily rising. The rabbinical and communal Haredi leadership sees this as breaking through its enclaved culture and cracking in its ideology of separation. They firmly denounce any internet use that is not essential and any use by children and youth. Given its inherent lack of oversight and control over the content, cyberspace is a source of potential exposure to different cultures and worldviews, interactions between the sexes, and more.

This study explores the formation of the Haredi Generation Z by examining how Haredi young people use the internet, how they understand and explain their "illegal" usage, and how they negotiate with and challenge socio-religious bans on the internet. How do they perceive the tensions and contradictions between virtual space and the communal realities they live?

In the online space, those young people examine their world and express their desires and wishes without risking their communal belonging. They criticize the concentration of power in the hands of the religious and God mediators who prohibit the social ban with the same force as the Jewish law prohibition. From the findings, it appears that they perceive God as someone who can be confronted, argued with, and come to a compromise regarding religious prohibitions. Critiquing the absolute authority of the leadership opens the possibility of perceiving God as detached from Jewish law strictness and the blind law, treating God as a buddy more than as an omniscient ruler.

POSPECH, Pavel* (Masaryk university, Czech Republic)

Rurality, Anti-Urbanism and "Real Life"

This paper focuses on the rural-urban divide, or in broader terms, on the divide between the centre and the periphery. Using various kinds of empirical data from the Czech Republic, it studies how a relatively unimportant social boundary between large cities and rural peripheries becomes a highly salient symbolic boundary in the political discourse. The paper argues that the key to answering this question lies in the social representation of "real life" and of what is perceived as "real". This underlying political conflict can be pronounced in various ways. Some people say, for instance: "urban people don't know what real life is". Others will say that "people on the periphery believe in nostalgic images which are not real anymore". In all these discourses, as in many others, there is an underlying perception of the real opposed to various kinds of artificiality: artificiality caused by wealth, by alienation, by ignorance or by moral failure. This paper will develop these concepts and theorize them with references to the Strong program in cultural sociology (Alexander & Smith) and to the theory of symbolic boundaries (Lamont & Molnar). In terms of its methods, the paper will employ survey data to introduce the case, and it will follow with data from content analysis of media coverage and exempts from interviews carried out in peripheral locations of the Czech Republic.

Nothing to Declare...Apart from Holy Water: Material Religion and Border Control in Fiji

This paper uses the case study of Fiji as an exploration of the cross border circulation of spiritual things. In this case, the borders of Fiji have been sacralised to securitize Holy Water. This article first introduces Holy Water as a spiritual thing by considering the prominent role it plays in spiritual practices across the globe, and secondly situates this circulation of Holy Water within the vibrant religious and political landscape of Fiji. In the last sections, it explores specifically the border restrictions on Holy Water in Fiji, and exportation of the miracle/healing water from Fiji over the last few years to New Zealand. It shows that while Fiji is sacralising its borders to securitise Holy Water, New Zealand remains highly secularised. This article is a call for the further theorising of the relationship between the circulation of spiritual things and their crossing of international borders.

POTHISIRI, Wiraporn* (College of Population Studies, Chulalongkorn University, Thailand)

Childlessness and the Unmet Need for Long-Term Care: Insights from a Mixed-Methods Approach

In Thailand, as in many developing Asian countries, children are the primary potential source of informal care and support for parents in old age. As such, childlessness is often believed to underlie the old-age support deficit. Evidence, however, shows that childless older adults tend to have wider social support networks, most of which serve to provide emergency assistance or short-term care. Nonetheless, little is known about the patterns of caregiving for childless older adults who need long-term care (LTC). Using a mixed-methods approach, this study aims to provide empirical evidence to better understand how the absence of offspring is associated with met and unmet needs for long-term care among older adults. Through an analysis of the 2021 Survey of Older Persons in Thailand, a nationally representative survey of persons aged 50 and above, we examine whether childless older Thais are more vulnerable to self-care disability (defined here as having functional limitations or ADL and IADL difficulties) or at higher risk of having an unmet need for LTC (defined here as stating a need for care or assistance but not receiving it) as compared to older adults with children. We further seek to determine whether the extent of the unmet need for old-age LTC differs by type of childlessness, such as never-married childlessness or effective childlessness. The quantitative investigation is followed by an analysis of qualitative interviews with 30 childless older adults and older adults who have children in which we seek to elaborate on and explain the quantitative findings. The results of this study will assist policy makers in understanding the health and care needs of childless older adults.

"Black Gold" Vs Green Energy: Drivers Towards Energy Transition in Poland

Economists argue that the economic structure of a state, as well as the economic (and consequently, political) weight of the fossil fuel industry are the main determinants of countries' climate policies (Gould 2008). However, other studies suggest that the relations and orientations of the actors who shape these policies, play an important role (Gronow 2019).

Poland, is obliged to implement ambitious European Union climate policies. On the other hand, due to country's heavy reliance on coal (75% of electricity comes from burning coal), Polish energy transformation is particularly hard both economically and socially. Currently Poland, as many countries, is facing instability in the energy market caused by the war that Russia unleashed in Ukraine. This can lead to a shift towards low-carbon energy sources or, conversely, strengthen the forces that consider coal to be a stable energy source.

This research aims at examining drivers of inter-organizational collaboration in terms of shaping energy transition policy in Poland. Using Advocacy Coalition Framework (Sabatier and Weible 2007) to explain policy (dis)integration three categories of factors were analyzed (Milhorance et al 2021): 1) level of conflict (belief homophily) between coalitions, 2) attributes of actors and coalitions 3) the functioning of an institutionalized forum where coalition partners can interact.

The data is collected via online questionnaire and semi-structured interviews with representatives of the key actors in the network. The Social Network Analysis is applied to learn about the structure and relationships between various institutions (eg. national, NGO's, business) in shaping energy transition policy. Research examines the coalitions of the network, a role of key actors, and communication between coalitions.

Initial research shows that there are several coalitions in Poland with a high level of conflict. Fossil fuel industry coalition plays crucial role and slows down the transformation towards decarbonization, especially in the electricity sector.

Protein Transition: Bridging Theoretical Models to Enhance Connection of Scientific Nutrition and Public Policies

The protein transition corresponds to the switchover of plant proteins to animal proteins.Emphasized by theoreticians of the nutritional transition, it has long been thought of as a consequence of economic development. However, the choice of sources of protein is determined by socio-cultural factors, such as religious taboos relating to consumption of certain animals, promotion or not of vegetarianism or even more largely the symbolic hierarchies specific to each culture that organize the "order of the edible". This communication proposes to study the theoretical issues involved in the study of the protein transition on which biological, economic and ethnocultural variables interact. Among the theories of social change, the transition holds a special place. It has been applied to subjects such as demography, epidemiology, food, nutrition, etc. But, beyond the common label of transition label there are quite different

theoretical frameworks.Tracking food in the theories of transition allowed to identify 3 perspectives. The first considers the move from one stable state to another and focus on the interactions between cultural and biological variables during the transition, in a vision close to the "lag theory". The second perspective conceives change as a series of stages and analyze the structural transformation of the organization at each stage. This brings us closer to the theory of stages. Finally, the third perspective combines stages and transitions.

Less "worrying" than conflictualist conceptions, the transition theories maintain explicit relations with evolutionary and progressive conceptions, which posit change as inevitable. The political uses does not escape these implicit influences. By unraveling these threads, this communication aims to contribute to the clarification of epistemological frameworks and ideological uses of the concept of transition.

Protein transition is a privileged empirical field for establishing bridges between these frameworks and to allow inter-science dialogue.

"but the Feelings Were like an Explosion Would Have Happened in the Office, and in a Sense It Had" - Analysing the Virtual Communication Efforts of European Doctoral Researchers in the Pandemic Era

In Europe, the COVID-19 pandemic "began" in the early spring of 2020, leading to closures, curfews and quarantines in European societies. For European universities the novel situation meant restrictions and reorganisation of their operations, which caused unprecedented challenges to work of all academics. The general focus of this research is on both the immediate and more prolonged pandemic-related experiences concerning work of PhD students, that is doctoral researchers, in business and organisation studies from several European universities. More precisely, in this qualitative study I describe and analyse views of thirty-eight European doctoral researchers on four varieties, and changes due to the COVID-19 pandemic, of their work communication: i) formal corporeal face-to-face communication, ii) informal corporeal face-to-face communication, iii) formal virtual face-to-face communication, and iv) informal virtual face-to-face communication. The 38 doctoral researchers came from many European universities, and they participated in two online seminars on qualitative research methods for PhD students in business research and organisation studies in May 2020 and May 2021 organised by the author. Digital platforms and tools mainly enabled the doctoral researchers to continue their studies in virtual remote mode, but many problems and shortcomings in both formal and informal virtual face-to-face work communication were reported. In more detail, the analysis elaborates some forms of suffering but also adapting and thriving of the doctoral researchers in the first fourteen months of the COVID-19 pandemic era.

Labor Market Inequalities and in-Work Poverty in Four Latin American Countries

Changes in global labor markets are posing challenges to social inclusion through employment, especially after the COVID-19 pandemic. The expansion of unprotected, precarious, and low-quality forms of employment is reshaping labor inequalities. Precisely, the working poor, employed individuals living in households with incomes below the poverty line, reflect one of the limits that employment is facing to guarantee decent living conditions.

In Latin America, little attention has been paid to in-work poverty (IWP), although some related topics –such as informality and precariousness– have been widely debated. The main objective of this paper is to analyze IWP in four Latin American countries (Argentina, Brazil, Chile and Uruguay). The 'hybrid' nature of the concept of working poverty –which combines the study of labor market and poverty– led to multidimensional theoretical perspectives to explain it. Such explanations often encompass institutional factors, individual, family characteristics of the workers and job attributes. Although we recognize these multilevel factors, this article emphasizes the relationship between IWP and labor market stratification.

The four national cases represent different labor market models and welfare regimes. Therefore, the comparative analysis is aimed to provide evidences about the factors that explain IWP in different contexts. The paper relies on microdata from households' surveys carried out in 2019 by national statistics institutes of each country: the *Encuesta Permanente de Hogares* (Argentina), the *Pesquisa Nacional por Amostra de Domicílios* (Brazil), the *Encuesta Suplementaria de Ingresos* of the *Encuesta Nacional de Empleo* (Chile) and the *Encuesta Continua de Hogares* (Uruguay).

Intimate Partner Violence and Covid-19

At a time when the feminists of the world were planning to celebrate 25 years of Beijing Declaration and Platform for Action and the achievements made towards gender equality, the world was engulfed by Covid-19, a pandemic that, to a great extent, reversed the progress made on various gender equality indices.

Though the pandemic hit everyone alike, women and girls faced increased vulnerabilities- within home as well as in larger society. This comprehensive health crisis affected every aspect of our life- economic, social, psychological and others increasing overall stress. With isolation measures and lockdown in place, there was restriction on movement and people were forced to remain confined within the four walls of their homes.

Lockdown also meant that women were trapped within homes with their abusive partners with no access to support services. The period recorded an exponential rise in cases of intimate partner violence globally with increased complexity. As per an estimate, cases of domestic violence increased between 25-35 % globally during pandemic.

The present paper is an attempt to study the pandemic triggered intimate partner violence with special reference to Varanasi district, in Uttar Pradesh, India. The study uses both the primary and secondary data to draw conclusions.

The Blockchain Prophecies: Social Imaginaries of the Cryptoeconomy

The concept of imaginary has been prominent in the social sciences over the last two decades, not least in relationship to how the future of society is linked to sociotechnical change. Interestingly enough, over a slightly shorter period of time, the ascendant trajectory of blockchain technologies has been tied in the public discourse to hopes and projects of societal transformation. The present paper examines how imaginaries of a crypto future are constituted as legitimate by the actors of the cryptoeconomy. We argue that crypto imaginaries are spectacles addressing different audiences, from lay investors in crypto to blockchain developers. We also argue that imaginaries are not monolithic projections of the future: such projections are undertaken from different perspectives by different actors, depending on their position in the cryptoeconomy, but also on their relationships with other actors. However, imagining the future is not restricted to public talk or to documents: private (expert) talk plays a significant role here too: however, the projections formulated in private talk can differ from those of public talk. Imaginaries can thus contain contradictions and dissonances rather than being coherent and monolithic discourses. As they are constituted in assemblages

that concomitantly unfold in the public and private spheres, imaginaries are resilient despite such dissonances. Their legitimacy is derived from a strategy of highlighting the shortcomings of a current state of affairs, while representing themselves as a unique technological, organisational, and moral answer. We distinguish here three types of cryptoimaginaries, according to how the future is conceived: as a relentless expansion of capitalism; as a boom-and-bust cycle; as a radical rupture with the past. Our arguments are supported by an empirical analysis of documents, talk at professional conferences and lay gatherings, ethnographic observations at conferences, and interviews with the actors involved in the cryptoeconomy (engineers, venture capitalists, managers, lawyers).

Operationalising the Indigenous Data Sovereignty Principles in Australia

This paper details a framework to operationalise the five Australian Indigenous Data Sovereignty Principles. Globally, Indigenous Data Sovereignty has emerged as a prominent concept due to the promise of returning control of the data ecosystem to Indigenous peoples. In Australia, Indigenous Data Sovereignty, including the Indigenous Data Sovereignty principles, are nascent and there are increasing calls for guidance on how to operationalise these principles within organisations controlled outside of Indigenous communities and organisations. Of particular concern, are holders of administrative data collected as a product of government and non-government service provision. This paper identifies mechanisms and tools to operationalise the Indigenous Data Sovereignty principles within organisations holding Indigenous administrative data. This includes an Indigenous Data Sovereignty appraisal tool to assess the readiness and capability of administrative data holding institutions to implement Indigenous Data Sovereignty principles. Indigenous Data Sovereignty is enacted through Indigenous Data Governance; both are Indigenous led. Indigenous Data Governance includes two fundamental elements: (i) data for Governance (First Nations (re) building) and, (ii) the governance of Indigenous data (how data is governed). Building Indigenous Data Governance into the operations of administrative data systems has the potential for profoundly positive impacts with Aboriginal and Torres Strait Islander communities and organisations. Firstly, Data for Governance enhances decision making for Aboriginal and Torres Strait Islander communities and organisations regarding data about them and that are held in environments and systems outside of their access and control. Secondly, Data for Governance facilitates nation (re)building through Aboriginal and Torres Strait Islander communities and organisations setting priorities and mapping administrative data to these priorities, for monitoring and evaluation purposes. Further, access of these data requires governance structures, procedures, and processes developed by Indigenous peoples (Governance of data) if Indigenous Data Sovereignty is to be achieved.

The Limits of Project Work: Cultural Labour in the Midst of the Pandemic

The paper analyses the field of culture from the perspective of work and employment conditions of cultural producers in the South-eastern Europe, notably Croatia. Focusing on the cultural-political framework, structure of employment and characteristics of work in the sector, the paper points to the consequences of increasingly strong projectification of cultural and audio-visual production: growing insecurity and underpayment of a large number of artists and cultural workers. Promise of flexible and self-fulfilling work has various negative consequences on working and living conditions in the field where underpaid and self-exploiting practices are common. This is also visible within artists' and worker rights: the regulation of cultural work has been neglected for decades, unionisation scarcely exist, and the professional associations serve as a gate to workers' rights demands. Furthermore, project approach to cultural labour also impacts the content of work of artists and organizations in the cultural and audio-visual field, where a number of organisations shift the focus of their work from their specialised fields towards the ones that are being funded (social inclusion, digital conversion). These issues have been highlighted during the pandemic, or, to use the words of one of the research interviewees 'stripped to the bone'. Pandemic has shown not only in Croatia and South-eastern Europe but also globally, of the unsustainability of the project-type of work in the cultural and audio-visual field. It broadened up international networking of cultural workers and opened up new spaces for solidarities. The paper discusses demands for developmental public policies that will enable paid work and better working conditions in the field of culture, as well as the wider preservation of culture as a public good. Paper is based on qualitative data from the 'The social resilience of Croatian society in the midst and aftermath of the COVID-19 pandemic' project executed in 2021.

Covid-19 As an Imperative of a New Childhood

At present, childhood is recognized not only as a stage of human maturation, but also as a special development zone, associated with a number of risks. Note that since the end of the 20th century, researchers have focused on the risks of childhood, mainly associated with the influence of the social environment on the social and physical well-being of the child. In the context of a pandemic of coronavirus infection and prolonged self-isolation, childhood, with its special temporality, receives a new imperative of development under conditions of restrictions. First of all, most of the children living in urban conditions were forced to be limited by their place of residence - which negatively affected the organization and regime of the day, diet, the level of physical and social activity of the child, his communication practices, and self-discipline. In addition, against the background of these restrictions, an increase in online activity is observed in children - this is due to distance learning at school, as well as the involvement of minors in entertaining Internet content (films, games, network communication) and addiction to digital gadgets as elements of communication and organization life. This forms in children a narrowing of the perception of the external world to limited digital channels, which in the future can negatively affect social activity, the assimilation of role models of relationships, the adaptive characteristics of minors. In addition, both adults and children showed the formation of a complex of "risks of self-isolation for health" - weight gain, decreased visual acuity, general weakness.

Thus, the obvious risks to the health of children due to possible infection with COVID-19 are accompanied by a complex of social risks - which, obviously, will have a decisive influence on the future of childhood - "encapsulated" childhood with gadgets.

The Impact of Covid-19 Pandemic on Home Care Workers: A Study of New Delhi

The Neoliberal reforms in India have led to a growing market of for-profit companies in senior care of different sizes with large multinational firms investing in the same. The emerging senior home care industry depends on the services of the caregivers who are at the lowest rung of the labor hierarchy in health and social care. Care work in India is a form of precarious work which is characterised by lack of job security, low wages and absence of social welfare benefits. During the covid 19 pandemic these companies managed to create an even more flexible workforce which further added to the vulnerability of care workers. Drawing on qualitative data from care workers and managers and other stakeholders, this article highlights the strategies and mechanisms used by the home care companies to organise work as per market principles aided by one of the current government programs " Skill India Mission"which ensured uninterrupted supply of migrant labor force to intensify "care extraction" at a time when a vast majority of the informal workers in India were left to fend for themselves. This paper uses the concept of "care extractivism" to explore the undervaluation of care work through an intersectional lens. The study contributes to the understanding that these organisations in the name of achieving higher professionalism relied on informal social institutions of caste, class and migrant statues of workers in its pursuit of aggressive care extraction during the pandemic. The workers (mostly migrants) struggled to survive at the place of destination by hanging on to their job even when their services were intensified and they were exposed to greater isolation, risk of catching infection, lower wages and various forms of abuse.

PROO, Eleane* (National Autonomous University of Mexico, Mexico)

Las Experiencias De Las Mujeres Gestantes Mexicanas En La Industria De La Subrogación: Significados De La Práctica y El Cuerpo. Análisis Sociológico Con Enfoque Feminista.

La *gestación subrogada* es una industria que se ha acentuado durante los últimos años en el contexto internacional y que de manera paulatina cobra mayor fuerza en México, donde es legal en los estados de Tabasco y Sinaloa. Este procedimiento sucede cuando "[...] una mujer se presta a gestar un niño para, una vez nacido, entregárselo a la persona o personas que se lo han encargado y que van a asumir su paternidad/maternidad" (Comité de Bioética Español, 2017).

Sobre las ganancias que genera a nivel global, el *Surrogacy Market Share Report 2025* estimó que durante el 2018 la facturación del mercado de la subrogación fue de 6 mil millones de dólares y proyectó que sus ganancias incrementarán hasta 27.5 mil millones para el año 2025, con un crecimiento anual del 24.5%. La práctica ha involucrado extensos debates sobre su regulación o prohibición desde distintas disciplinas y discursos sociales. Una

de las aristas constantes versa sobre el uso de los cuerpos de las mujeres gestantes y su capacidad de *decidir* con *autonomía* dentro de estos acuerdos, por lo cual se evidencia la necesidad de un abordaje sociológico feminista que tome en cuenta sus experiencias, sus condiciones sociales y objetivas de vida, así como la problematización de conceptos como *autonomía* y *libre elección*.

Además de realizar un breve recorrido sociohistórico para situar al mercado de la subrogación a nivel global y local, en este trabajo se expondrán algunos resultados preliminares de la investigación doctoral que aborda tal planteamiento. Desde una metodología cualitativa, a través de entrevistas en profundidad y un acercamiento etnográfico digital con mujeres gestantes mexicanas, se mostrarán algunos significados que construyen en torno a sus cuerpos y la práctica, en virtud de sus experiencias subjetivas.

Who(se) Decolonisation and Decolonial Theory: A Reflection from India with Special Reference to Northeast India

In this paper, I aim to present the limits of sociological discourse and engagement with decolonial theory and theory from the Global South with a particular reference to India. Sociological discourse and the practice of Sociology in India are founded on a critique that challenges the Eurocentric representations and theorizations of Indian Society. While such efforts are laudable, they fall short in terms of acknowledging the internal dominance and hegemony around caste, gender, region, religion, and in the case of this paper, tribal/indigenous communities. Acknowledging that a decolonial theory reflects a *position*, this paper takes an indigenous standpoint to unpack how the practice of doing sociology remains one that is embedded in the social hierarchy and dominance of a narrow section of Indian Society. In other words, the paper points out that the attempt of decolonization and decolonial theory as a mere challenge to Eurocentric dominance is not enough, particularly when dominant communities in the Global South perpetuate colonial forms of injustice, violence, and dispossession against indigenous people. The paper takes the case of indigenous people in India, with a special focus on northeast India, to reflect upon this.

It Takes Three to Tango: Bargaining Power in Online Freelancing Platform Work in Europe

Freelancers are considered independent contractors who set prices in the market. In recent years, freelancers providing their services through platforms, i.e. online labor marketplaces (OLM), have increasingly engaged in conflict with platforms and/or clients to set prices. Based on 63 narrative interviews with freelancers working on platforms within the experience of the European economic regulation for services market, we explain how freelancers exercise bargaining power also through cooperation, i.e. by developing their portfolios and building relationships with clients. We develop four types of bargaining power, i.e., *subordinated cooperation, autonomous cooperation, subordinated exploitation, autonomous exploitation*. We explain variations across these types by examining how platforms matching clients with freelancers in the market they organize and where they compete, and the wider service market where freelancers compete for clients, and platforms intermediate services, affect the opportunities and interests of freelancers to establish stable relationships with clients while setting prices on platforms.

Corporate Hiring and Talent Signalling in an Elite Professional Labour Market in India: A Social Construction

The relationship between education and work can be linked to wider structures of social inequalities and elite reproduction as the labour market in India witnesses the emergence of new age jobs. As a result, hiring outstanding talent has become a strategic priority for business leaders in the professional labour market. The management education sector in India has grown exponentially and become aggressively competitive, market-driven and segmented with a handful of institutes at the top while majority of them falling under the rubric of second rung institutes. The close alignment between top ranked institutes and most sought-after private firms has resulted in limited prospects for students graduating from non-elite institutes. These graduates also lack the resources to compete and may not be able to convey particular signals that employers seek. Therefore, the challenge for them has been to find ways to be able to deploy strategies and build profiles that employers find attractive. The elite private firms play a gate-keeping role in hiring by restricting their talent search mostly to top tier management institutes and hiring 'not so talented' from non-elite institutes for back-end work. Therefore, it is argued that the hiring practices of private firms are stratified to fit the hierarchy of management institutes. Moreover, research has shown that the recruitment strategies of corporate employers are framed more by socio-cultural signals

and less by cognition. In this paper, we investigate the hiring practices of 10 leading corporate employers. To allow for diverse viewpoints, the paper also attempts triangulation through in-depth interviews of management graduates' on corporate hiring practices and how they decode talent signalling by employers. We argue that there is a tight link between elite education and professional job market mediated by non-meritocratic factors and talent is a social construction embedded in wider social and economic contexts.

On "the People" and Their "Others": Reflections on Populism through an Intersectional Lens

The conversations on populism have typically centered on "the people" and *their* narrative about the injustices caused by economic or social elites. In this presentation I will draw upon an intersectional lens—one shaped by conversations on decoloniality and transnationalism—to highlight a wider range of targets and victims of "the people." The very act of creating discourses of "the people's" victimization and identification of enemies, central to the contemporary processes of harnessing the power of the people with a sense of grievance, certainly challenges some of the power of groups that delineated to greater or lesser extent, existing social circumstances. However, "the people" who are newly energized, seek a differently-ordered world, which rests, crucially, on a sense of others who with less power, positioned lower in the social hierarchy, who can be confined there. Consequently, those who were historically marginalized continue to be victimized, often with a degree of impunity, as a palpable reminder of "the people's" power.

Drawing on the scholarly conversations on the weaponization of language, on the brutalization of colonialists (as they committed atrocities against the colonized), and the expanding discussions on all forms of violence, I reflect on power alignments that are key to understanding populism and their overt and de facto others. Using the case of two democracies, India and the US, I will reflect on processes through which individuals and groups are drawn into the ambit of "the people," wholly or partially, to enable populists to foster realignments of power that affect those who are already marginalized negatively, and enable populists to weaken institutional arrangements that might act as checks to their quest for power realignment The discussion will position the two democracies within a transnational context to discuss intersecting structures, levers of power, and the construction of contemporary injustices.

PURKAYASTHA, Bandana* (University of Connecticut, United States)

"so Much Data, Such Few Socially-Just Solutions": Some Thoughts on Raewyn Connell's Research on Universities and Where We Continue to be Positioned Today.

Raewyn Connell's outstanding body of work on education has identified many of the structures and processes that have transformed universities from professing their contribution to the public good, to unabashedly positioning themselves as political economic growth machines. I build on her body of work, as well as other scholarly conversations on historic and contemporary colonial knowledge constructions, hierarchies of the Global North vs South as sites of powerful universities., publication nodes, and systems of exploitation.

In this presentation, I will draw upon my earlier work on intersectionality in a transnational world, to focus on two related issues: universities at the crossroads of profitable enterprises promising "neutral" data to assist in "transparent" decision making processes, of security and discursive regimes that profit from surveillance of individuals and from selling user-profile data (along with other processes that seek to control knowledge production processes). I will reflect on the experiences of individuals (especially faculty) positioned within these systems that shrink or co-opt their space-time for building socially-just structures for knowledge production and sharing.

Training of Doctors amidst Covid-19 Pandemic: A Regulatory Analysis of Indonesia's Health Workforce

In light of COVID-19, Indonesia's health workforce remains even more under pressure. In 2017, the WHO data showed that Indonesia had 4 doctors per 10,000 people (Allard and Widianto, 2020). In rural areas, accessibility to health services by doctors is even more restrained with the lack of doctors willing to practise in these areas. Such fact compromises the idea of equity in access to health services. This paper asks what kind of regulatory changes have to date been undertaken in terms of health workforce training amidst the COVID-19

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

pandemic. Methodologically, this paper uses a regulatory impact assessment, documentary research and a historical-sociological approach in its analysis. Empirical data will be derived from regulatory data, documentary data, and data from the Indonesian Medical Council. There is an explicit contribution this work intends to make to the theme of equity and justice in Indonesia's health workforce training from a regulatory point of view. There is a tendency in neo-liberal societies, especially in continental Europe, to resort to self-regulation within the profession. Higher autonomy and ensuring uniform standards within the profession may be the rationale for this inclination towards self-regulation. The challenge of regulating health professions in the Global South has been met in some countries by providing additional training. The Global South faces challenges in limited infrastructure and rural and health inequity of health services access. Indonesia is no exception to this. As it happens, there are rapid technological changes in Indonesia: telehealth, virtual care, and care across jurisdictional boundaries are part and parcel of changes.

PUSHKAR, Piyush* (University of Manchester, United Kingdom)

The Role of Shame in Forensic Psychiatric Assessment and Treatment

Feelings of guilt and shame play an important role in the assessment of mentally unwell offenders. Doctors, psychologists and nurses ask about patients' feelings of guilt, shame and remorse in relation to their offence(s), and other traumatic experiences in their lives, while patients may also be consumed by such feelings caused by other issues, such as the stigma of mental illness itself. Clinicians use the answers to these questions to form clinical judgements regarding diagnosis, personality, biopsychosocial formulation and risk. Clinicians then make decisions based on these assessments, not just for treatment plans but also for medicolegal reports that influence court processes that can have a profound influence on the lives of offenders.

There is extensive literature within psychiatry and psychology on the role of guilt and shame in psychopathology, personality and risk assessment. For example, the ICD-10 diagnostic criteria for dissocial personality disorder include an "incapacity to experience guilt". Proneness to experiencing guilt is considered a protective factor with respect to future recidivism, whereas shame is a risk factor. Such findings push towards particular treatment recommendations, such as psychological interventions that foster feelings of guilt (in relation to a past offence) without incurring shame.

Shame has also been explored by sociologists and philosophers. These scholars have drawn links not just with trauma, adverse childhood experiences and offences, but also with class, gender and ethnicity. Few have attempted to draw links between these different streams of scholarship to learn lessons that can be applied to clinical practice. Moreover, how clinicians perceive, ask about and understand the shame felt by their patients is much less studied. This paper maps out the possibilities for linking the clinical literature with that of the social sciences, with a particular focus on the political implications and consequences for clinical practice in relation to risk.

PUSHKAR, Piyush* (University of Manchester, United Kingdom)

Universal, Free and Comprehensive: NHS Values and Class Consciousness

Writing speculatively, I argue that contemporary movements to "save the NHS" hold the potential for an emergent class consciousness based on a universal understanding of who is entitled to healthcare. This paper outlines the empirical basis for my hopeful speculations.

I spent 13 months doing participant-observation with people campaigning against cuts and privatization in the UK's National Health Service (NHS). I also interviewed managers and politicians who were administering the reforms to which activists objected. The activists apprehended changes to the structure of the NHS using moral frameworks built on their memories of how the state used to be structured. They contested changes on the basis that reforms may lead to cuts or privatisation, which would be wrong insofar as they would cause the state to forego its obligation to provide welfare services for all people in the country. Their moral analysis followed from their interpretation of the values of the NHS: universal, free and comprehensive. Activists saw themselves as in alliance with the whole population and considered those advocating reforms as their opponents – the moral antagonist. The paper follows the development of such coalitions and cleavages.

I point to the community of interests implied by the universality of the NHS, to the moral community suggested by activists' imagination of socialism, to the collective memories of struggle to protect the NHS *as they imagined it*, to the inter-group coalitions built on that basis. However, I also point to the problems with a class analysis. The NHS values I have outlined are slippery. The particular value of universality highlights the gap between the NHS as imagined by activists and the NHS that actually exists in the hostile environment of the contemporary UK after 12 years of austerity. The putative class consciousness I describe is fragile, its potential is undetermined.

An Intergenerational Perspective on Transitions-to-Adulthood in a Polycrisis Era

Polycrisis is a fitting descriptor of the overlapping risks faced by young adults living in Poland today. The structural risks-including the recession, precarity on the labor and housing markets, democratic erosion and climate change challenges - have been exacerbated by the events of the COVID-19 pandemic and the war in Ukraine. In this context, it is crucial to ask how the historical moment of the intersecting polycrises translates to the experiences at the individual and family levels, including in particular the intergenerational definitions of adulthood in relation to both the 'objective' markers and 'subjective' qualifiers of adulthood. The data stems from a Qualitative Longitudinal Study conducted within the ULTRAGEN project (*Becoming an adult in times of ultra-uncertainty: intergenerational theory of 'shaky' transitions*). The empirical material comprised two waves of multiperspective interviews and one asynchronous exchange, with data collection ongoing through 2021 and 2022. Young adults (aged 18-35) and one parent of each (n=70) took part in the study. The analysis specifically focused on the pertinent effects of social crises within the intergenerationally framed processes of transitions-to-adulthood. In the findings, the first aspect concerns tracking similarities and differences in the perspectives on transitions-to-adulthood expressed by young adults and their parents. Thus, the paper offers an intergenerational look at how the ideas about the sense of adulthood are shaped by crises. In the case of parents-who largely transitioned during the 1990s' democratic transformation-the data comparatively showcases their experiences vis-à-vis the perceptions of their children's transitions-to-adulthood today. The second main finding zooms in on the dyadic relations, specifically looking at the impact of different crises on the intergenerational transfers and forms of support that parents offer to their transitioning children. The analysis contributes to a sociological understanding of the impact of the emerging and ongoing crises on intergenerational relations during transitions-to-adulthood.

An Integrative Review on the Theory-Practice Gap of Capitation Payment Model in the Indonesian National Health Insurance

This paper aims to identify the theory-practice gaps of the capitation payment model in Indonesia and how it affects private health facilities, including doctors' roles. Implementing capitation is a considerable breakthrough for Indonesia's health system as similar initiative had not been implemented prior to the Indonesian National Health Insurance (*Jaminan Kesehatan Nasional*-JKN). However, there is limited evidence on whether the Indonesian capitation payment model is consistent with the theoretical concept of capitation. Whittemore and Knafl's integrative review method guided the framework for the integrative review and analysis. Multiple types of academic literature were included in this integrative review which covers all studies and regulations related to capitation payment in JKN from 2014 until 2022. This integrative review finds that several practices of capitation payment in JKN are different from the basic theoretical concept of capitation. Reflecting on theory, the Indonesian capitation payment model does not provide any incentive for PHC facilities to create a competitive environment to attract members. *BPJS Kesehatan,* as the national health insurance administrator, uses the same list of capitated healthcare services for all of PHC facilities across Indonesia, resulting in health infrastructure disparities between remote and non-remote regions. Our integrative review highlights that at least there are four essential characteristics of capitation payment, i.e., lock-in requirements membership, the pre-defined scope of covered services, risk-adjusted calculation of capitation payments, and availability of risk management plan. As it happens, the capitation rate in JKN is calculated based on the availability of doctors and dentists but with a stark absence of regulation and plan as to how to diminish this resource gap. Hence, these two professions play a key role in terms of designating the capitation rate.

Csos' Participation in Creating Indonesia's Gender Responsive Criminal Justice System

In this article, I will present evidence of Indonesia's civil society organisations as significant actors in criminal justice reform. It's general knowledge that the Indonesian Criminal Code (KUHP) and Criminal Procedural Law (KUHAP) are products of past eras, both laws have complex problems and do not meet modern standards for fair and just criminal justice, especially when it comes to women victims' rights. Starting right after the 1998 national reform until now, Indonesian CSOs have relentlessly driven changes in the criminal justice system. These organisations play a significant role in raising the views, perspectives and awareness of law enforcement and policymakers about criminal justice and its relation to women's rights protection. The CSOs have contributed to many reform initiatives, such as developing women's service providers at the national and local levels, establishing the special police unit for women and children, and passing various laws, including the domestic violence law in 2004 and the anti-sexual violence law in 2022. I will use qualitative research methods, collecting empirical data through interviews with CSO activists, policymakers, law enforcement, and donor program representative, and combining the data from previous research, documentation, and annual reports. I hope this article will contribute to Indonesia's sociology of law, criminology, and civil society scholarships. I will conclude by arguing that CSOs have the social power to contribute to Indonesia's criminal justice reform in various ways.

Local Politics As Perpetuator of Colonisation

Local Politics as a Perpetuator of Colonisation
The main aim of the paper is to critically consider municipalities as a local form of representative parliamentary multiparty democracy in the Sámi Homeland area in Finland from the point of view of post-colonial and decoloniality theories. The state and settlers have exploited and continue to exploit the natural resources of the area; the lands and waters have been mainly dispossessed. Municipalities can be regarded as an institutional setting, which prevents articulation and protection of Sámi interests, if they are different from the interests of the majority population: the Finns. Given most land and water is owned by the state, the municipal decision-making power is severely restricted despite the supposed autonomy. Combined with the inability to get backing for Sámi interests at the national level, the political system perpetuates the colonising system. The paper is based on empirical research: interviews of Sámi local politicians, documents of municipalities, and theoretical literature.

Analysing the Intersection of Formal and Informal Water Actors As a Socio-Material Practices

The role of informal water vendors in the advancement of the supply of water to urban dwellers especially poor dwellers have been largely regarded in contemporary urban studies and planning literature. However, the discourse does not take into account policies, programs as well as institutional reforms that have been considered useful in the deliberation of issues concerning water delivery by the formal sector. To propel a comprehensive argument in the discourses of water, this study examines the roles of the informal sector in the delivery of water. Discussions in this study also unveils the systems (water policies, programs and institutions) facilitated by the formal sectors in cities in Ghana by using the concept `hybrid urbanism` as the analytical framework. By using the ´building and dwelling perspectives´ to unpack issues of water from both residents and experts respectively, the study unveiled that water programs, policies and institutions have the tendency to perpetuate inequality and social injustice in secondary cities. The results also suggest that existence of informal water vendors in the supply chain of water in urban areas is as result of complex multi-faceted developmental issues that are deeply hidden in economic, legal and institutional glitches that exist in society. The study therefore recommends that in order to achieve Sustainable Development Goal 6, there is the need for water policies and programs to be strategically geared towards the needs of the urban poor without neglecting the abilities of the wealthy and middle-class. Also, educating, regulating and or managing informal water vendor forms a crucial part in ensuring the delivery of clean and safe water to all especially the urban poor in cities in the Global South.

New Democracy and Public Opinion Research: A Study of Survey of Nepali People, 2022

Almost all the governments in the world today rely on surveys to talk about the economic and social development of any society, and public opinion research works like a mirror not only to understand one's real image but also to introduce effective public policy in order correct the character of any kind of government. However, often the society doesn't easily accept the findings of such public opinion survey and the trend is stronger in newly emerged democracies like Nepal.

There was an attempt to capture various aspects of the people in Nepal based on their lived experiences in the previous years, and their aspirations and expectations for the days to come since 2017 in the name of Survey of Nepali People (SNP). This paper describes how Nepali people described their feelings on the unprecedented socio-political changes they see in recent years, and argue that the survey results are eye openers for 763 governments working at three different levels. It also brings the issue of how the governments are selective in taking ownership of the findings of Survey of Nepali People. Highlights of the strategies the survey team has been developing to overcome challenges coming from various corners of state are other components of the paper.

Tracking COVID-19 People's Recovery Fund in the Global South Countries

There is a strong believe that a crisis response should be based on a human rights-based and sustainable development orientated recovery pathway which ensures that an adequate level of funding is made available both domestically and internationally, and that these funds are spent equitably, effectively and transparently primarily towards those who are the most impacted by the crisis – namely women, minorities and marginalised groups. However, countries have found to be suffered a severe blow during the Covid-19 crisis in terms of funds hidden in offshore tax havens to combat Illicit Flows and tax abuses, while companies operating in such tax havens should be barred from engaging in public procurement contracts mainly due to lack of transparency and accountability. This 'hidden stimulus' to corporate actors also needs to be measured, often enabled by tax exemption, tax waivers and secrecy of company operations during COVID-19 when transparency requirements in some areas were waived for rapid crisis procurement and contracting.

Adequacy is hard to establish, but official announcements by the UN secretary general establish a line of 10% of GDP as adequate. Only Chile, in 21 countries we study, reaches this level. In other words, governments in Global South countries often with their hands tied by international financial institutions are putting big corporations ahead of the people, despite the cost-of-living crisis they face. About 38% of the recovery funds went to corporates, while an equal 38% went to social protection, MSMEs got 20% and the informal sector 4%.

The study proposes a People's Recovery that primarily benefits larger corporates or the wealthy in society by looking first at the composition of COVID-19 recovery funding between four categories-social spending in social protection, funds benefiting large corporates, funds targeted towards Micro, Small and Medium-Sized Enterprises, and finally funds destined towards the informal sector.

Sociology-Making Against Its Conventions: Drawing on Concepts from Peripheral Formations

The question of concept-formation and concept-refinement in sociology is relatively neglected. Concepts, however, are elements from which theories are constituted. It is possible, therefore, to understand and reshape sociological theory by elaborating, refining and developing concepts. Conceptual innovation is at the root of invigorating theory by enhancing explanatory capacity and methodological sophistication in dealing with social and cultural phenomenon, relationships, and characteristics. It is argued in this presentation that the incorporation of select non-Western concepts into mainstream theory not only leads to a transformation, revitalization, and augmentation of the theory in question, but also enhances its sophistication. This approach goes beyond current concerns with Eurocentrism or Northern theory dominance by concretely generating alternate orientations contributing to theory development and achieving a global sociological theory.

Whole-of-Nation Innovation, Labor Market, and Industrial Transformation in China

The National Innovation System (NIS) had a significant impact on the labor market in China, by improving firm-level competitiveness via engaging with the global market and supporting technological diffusion. These dynamics between NIS and the Chinese labor market were similar to those of East Asian economies. However, since the 2010s, China initiated the whole-of-nation approach to overhaul its innovation system to improve its position in the Global Value Chain. In 2015, a major document "Made in China 2025" was released highlighting indigenous innovation as a national strategy. Further, after the outbreak of the US-China trade war in 2018, the government, universities, and firms have been mobilized to support indigenous innovation to address the adverse geopolitical shock. The whole-of-nation approach is government-led and mission-oriented. In the meantime, market-based incentives are used to leverage non-state resources in the preferred areas. Under the whole-of-national approach, the state has played a critical role in industrial transformation by coordinating the supply chain and promoting indigenous innovation. In this context, two research questions are raised in the present study. First, what are the roles of China's NIS in labor market outcomes? Second, what are the implications of the whole-of-nation approach for the structural changes in the Chinese labor market? Using city-level data between 2003 and 2020, this paper finds that before 2015, government's support for innovation facilitated labor mobility and promoted employment particularly in the private sector. After 2015, the rise of the whole-of-nation approach has reversed the previous trends and the structure of the labor market therefore changed. To be more specific, after 2015, the share of public sector employment increased with the government spending on science and technology. Also, the ratio between fixed asset investment and employment increased significantly with government spending on science and technology.

Two Years Later: The Early-2020 COVID-19 Outbreak in China and Subsequent Flourishing

Two years have passed since the early-2020 COVID-19 outbreak in China. Exploiting the geographic concentration of China's COVID-19 cases in Hubei (the initial epicenter), we compare Hubei and non-Hubei residents to examine the medium-term effect of exposure to the COVID-19 outbreak on mental well-being. We examine flourishing—a more comprehensive assessment of well-being that is not merely the absence of mental illness—and investigate a broad set of psychosocial and economic mediators that may link initial outbreak exposure to subsequent flourishing. We use OLS regression models to analyze national longitudinal data collected in early 2020 and late 2021 (N = 3,169). Results show that flourishing scores remain lower for Hubei than non-Hubei residents two years following the early-2020 COVID-19 outbreak. Mediation analysis reveals that Hubei residents' lower incidences of job promotion and lower sense of control are the two most important mediators accounting for their lower flourishing relative to non-Hubei residents. Combined, this study provides the first evidence of the medium-term psychological vulnerability borne by individuals who lived in the initial epicenter of the COVID-19 pandemic. Findings on the intervening mechanisms shed light on the policy initiatives needed for post-pandemic mental well-being recovery in China and other countries.

Educational Hypogamy and Wives' Earnings Advantage? Husbands' and Wives' Earnings Divergence after Marriage

Hypogamous marriages, in which the wife has more education than the husband, have become more prevalent thanks to recent improvement in educational attainment, especially women's. Does educational hypogamy indicate wives' earnings advantage at time of marriage? How do earnings change after marriage among husbands and wives of various educational pairings? Using data from the *National Longitudinal Study of Youth 1979,* we compare wives' and husbands' earnings up to ten years after first marriage. College-educated women in hypogamous marriage have lower earnings and lag behind their husbands in earnings less than college-educated women in homogamous marriage. The fixed effects analyses reveal that having children penalizes earnings to a lesser extent for college-educated women in hypogamous marriage than for college-educated women in homogamous marriage and gains earnings less for the husbands in hypogamous marriage than those in homogamous marriage. As a result, marriage premium for men and marriage penalty for women appear to operate differently among hypogamous couples.

Adaptive Cultural Solidarity: Understanding the Livelihood of Older Adults in Rural China —a Case Study of Lee Village

The older adults in rural China are witnessing major socio-structural changes as well as a major cultural transformation due to urbanization and population aging. The main objective of this study is to understand how older adults in rural China aged 60 plus obtain their sources of livelihood after their adult children have left rural homes to work in cities.This research utilized qualitative research method to analyse data from the case study of Lee village in Si County of Anhui province. Researchers selected 38 older adults aged 60s and 70s for in-depth interviews to understand their sources of livelihood. Qualitative data was collected and analysed. This research found that the livelihood of older adults in rural areas are sustained in four major ways: working on farm lands, taking odd jobs for an income; earning an income by adapting to the changing socio-cultural norms, and receiving a minimum basic pension from the government.

The significance of this research lies in its contribution to a renewed understanding of the cultural adaptation of older adults in rural China. Despite the lack of sufficient institutional support of retirement pension and reduced family support, older adults are shown to have a proactive attitude to face many challenges created by social changes. Their support for their children have changed from unlimited giving to limited assistance as they began to focus on their own later life.The older adults in rural China are responding to socio-cultural changes in a proactive way. This research deviates from the prevalent perception of older adults as a group of miserable older victims in Chinese society; instead, we argue that older adults in rural China are proactive agents adapting to social and cultural transformations.

Gender and Family Practices: Living Apart Together Relationships in China

This paper primarily examines how gender and heterosexuality structure the lived experiences of people in living apart together (LAT) relationships in contemporary Chinese society. Despite China's sweeping socio-economic transformations over the past few decades, the growing diversity in family forms and structures has not changed the dominance of culturally prescribed understandings of co-residential heterosexual partnerships. Marriage remains an almost universal practice in contemporary China and married couples living with their dependent children (if any) to establish their nuclear family have been deeply embedded in people's perception of being a couple. Drawing on in-depth interview data with people engaging in a non-conventional partnership, the author explores how the family is constructed and experienced in the geographical split household. In the social context where modern individualised values regarding marriage and family and the persistent influence of Confucian familism are implicated with each other, I ask how women at different life stages negotiate their gender roles and make sense of their everyday family lives. Through looking at LAT women's practices of emotion, caring, and conjugal intimacy when living apart, it argues that practices of family and intimacy have closely implicated with gender, and gendered family lives and heterosexuality are reconstructed, rather than deconstructed, in order to reclaim conventional forms of family and gender norms in Chinese social, historical and cultural contexts.

QIU, Shuang* (Keele University, United Kingdom)

Gendered Lives in LAT Relationships:Exploring Agency from a Relational Perspective

This paper is primarily concerned with the complex intersections among gender, class, and life stage through relational practices of living apart together (LAT) relationships in China. In-depth interviews with 35 LAT women in areas with contrasting socio-economic profiles were conducted to explore why they ended up living apart from their partner, perceived challenges or benefits, and the implications of this living arrangement on their understandings of their intimate relationships and family lives. This qualitative study takes a relational approach to understand the interplay between structure and agency and the analysis shows that the willingness and capacity to construct a 'conventional' family life is class related and subject to gender status. In the split households that are a result of structural constraints, family life is essentially shaped and constructed surrounding the gendered family roles and maintained through gender inequalities. Although there is evidence of the growth of individual reflexivity especially among young generation in making individual choices, the interaction and contradiction between the western notion of individualism and the Confucian familism traditions have significantly shaped the ways people negotiate and make sense of their personal lives. This empirical-based study provides an important insight of how agency is relational and potentially fluid as people's life stages change under different circumstances and contexts, through which the complex interplay of social circumstances, individualism, and relational bonds with others are captured.

A Critical Study of the Organization of Embodied Labour on Onlyfans during the State Administered Lockdowns in South Africa.

Two core arguments were found from a narrative literature review that informs ongoing doctoral research on digital sexual spaces. Firstly, it is widely held digital sex workers earn more than their public space counterparts and the ICTs mediated space is safer than the public spaces commonly associated with sex work -such as the streets or alcohol serving venues. Whereas online sex workers have reasonably less chances of being physically assaulted by men during work, many are susceptible to immeasurable psychological harm caused by capping (the download or secondary capture of performances and subsequent republication of material to other websites and social media applications without the consent and due remuneration to the performer), doxing (the investigation of the sex worker's biographical information such as real name and addresses, subsequent stalking and sharing of such information with other audience members, oftentimes to troll the sex worker) and trolling (a form of harassment, mostly through words or texts, intended to intimidate the sex worker). Therefore, the ICT mediated space may reflect offline inequalities rather than overcome them, producing algorithms of oppression that structurally silence women and expose them to other forms of violence.

Against this conceptual backdrop, developed outside of Africa, this research seeks to explore the experiences of South African black bodies on a type of ICTs mediated digital sex space, called OnlyFans, during "hard lockdown" (March 2020 to June 2020). It will do so by interviewing 20 to 30 black women, who joined OnlyFans at the start of the COVID 19 pandemic, through the method of topical ethnographic life histories between September 2022 to December 2022.

Doctoral Research Question : How can the migration of sex workers to audio visual content subscription sites during the early stages of the COVID 19 pandemic be understood?

QUANDT, Markus* (GESIS Leibniz Institute for the Social Sciences, Germany)

Using Comparative Survey Data to Describe the Religious Heterogeneity of Societies - a Test Application

Measures of cultural heterogeneity figure prominently in analyses not only of the economic performance of societies (Alesina et al. 2003), but are also hypothesized to affect solidarity, social capital, and conflict etc. (e.g. Putnam 2007). Such measures are usually variants of the Herfindahl concentration index, computed from the proportions of certain groups within each population. However, the provenance of the source information of such indices often is partially unclear and likely of mixed quality. For example, Alesina and co-authors partly had to draw on sources with largely untractable data collection methods or even only on expert estimates.

Recent attempts to improve on the limitations of existing international indices of ethnic or religious heterogeneity exist, but continue to rely on data sources of mixed types (e.g. Drazanova, 2020). Given the growing wealth of data from comparative surveys across the world, it therefore seems tempting to use the information that such surveys collect on the ethnicity or religious belonging of their respondents. The assumption is that most of these surveys follow a systematic approach towards achieving comparability, which should

ameliorate problems stemming from the inconsistent nature of mixed-source data compilations. But again, there are limitations. Besides the obvious one, - sample sizes might be too small for reliably estimating ethnic or religious minority shares -, there still is methodological variation. This includes differences in target populations, in data collection practice, and in the actual instruments.

To better understand the problems and opportunities of a survey-based approach to estimating heterogeneity indices, I will present analyses with religious group shares estimated from different comparative survey programs covering European countries. I will then proceed to explore the sensitivity of index estimates to selected properties of the base surveys and to the precision of the estimated shares.

Border Optimisation. Issues and Genesis of the Social Construction of Tax Optimisation Practices at the Franco-Swiss Border By Professionals

Un questionnaire relatif aux pratiques fiscales des contribuables transfrontaliers montre que 56% recourent à un intermédiaire fiscal. 70% d'entre eux utilisent des cabinets de conseil, déclarant en avoir « *besoin pour baisser les impôts* ». Comment expliquer ce lien *naturalisé* entre pratique d'intermédiation fiscale et optimisation ? Cette pratique est classiquement analysée comme relai de classes dominées (Bourdieu, 1979) devant l'Etat (Dubois, Burgy, Ramadier, 2017), ou l'instrument d'un rapport relativiste des dominants aux normes (Spire, 2012). Quid des travailleurs frontaliers en Suisse aux diplômes et salaires contrastés ? Il s'agit d'interroger la construction sociale de cette optimisation via 3 questionnements.

Quelles sont les conditions socio-historiques de l'émergence de cette optimisation ? La loi française a construit depuis 19735 un continuum des statuts différents selon les lieu de travail, résidence et profession des contribuables transfrontaliers. Capitalisant sur cette « pensée d'état » (Bourdieu, 2012) imparfaite, plusieurs organismes se spécialisent dans le « conseil aux frontaliers ». Ces professionnels travaillent à la (re)nomination (Bourdieu, 1993) des vides juridiques nationaux et interprètent des normes en faveur des contribuables frontaliers.

Quid des professionnels ? Les professionnels rencontrés ont des trajectoires d'ascension sociale qui contrastent avec les professionnels qui exercent dans les cabinets d'audit du Big4 (Liger-Belair, 2016).

Comment ces trajectoires influent-elles sur la qualification et construction des pratiques d'optimisation ? Nés dans la zone frontalière, certains professionnels réhabilitent l'optimisation frontalière, *raisonnement utilitariste issu d'une socialisation par la frontière qui pousse à tirer parti des côtés de la frontière et qui hiérarchise et distingue* les pratiques, ici de l'impôt, à l'aune de l'espace juridique.

Cette enquête par entretiens semi-directifs avec des acteurs différents (associations frontalières, cabinets d'aide administrative, gestionnaires de fortune) analyse l'émergence et la multiplication de ces professionnels de *l'optimisation frontalière qui* participent à naturaliser un rapport dé-moralisé à l'impôt dans le contexte frontalier.

Race or Immigrant Status? a Meta-Analysis of Field Experiments of Discrimination Against Foreign-Born and Native-Born Minorities in 13 Countries

We investigate the role of a foreign place of birth as a source of discrimination in hiring. To do this, we combine results from more than 125 field experiments of racial discrimination in hiring from 13 countries. We model rates of discrimination as a function of the applicant's place of birth, place highest degree was received, citizenship status, race or ethnicity, and controls. We examine the results of both a between-studies analysis, contrasting discrimination against native and foreign-born minorities, and a within-studies analysis, contrasting native and foreign-born minority discrimination rates in studies that include both groups. We find that place of birth has no statistically significant effect on callback rates net of other predictors. Highest degree from a foreign institution and foreign citizenship, on the other hand, significantly reduce callbacks. Race and ethnicity are also significant sources of discrimination. Foreign place of birth does not significantly affect callback rates as long as the last educational degree is from the country of residence and the immigrant is a citizen. Results of between-study and within-study analysis are mostly consistent. We discuss implications for theories of immigrant incorporation into host societies.

Decolonizing Data: Unsettling Conversations about Social Research Methods

In this book, I outline Canada's colonial history and how it has had a devastating impact on Indigenous peoples. I explore and trace how ongoing structures of colonialization negatively impact the well-being of Indigenous peoples and communities across Canada, resulting in persistent socio-economic and health inequalities. The findings in book are important because they provide empirical support that Indigenous Cultural practices, ceremony, land-based living, traditions are medicine and run counter to ongoing structures of colonization and systemic oppression which is deeply engrained in society and proliferated in our institutions. The conversation focuses on how ongoing structures of colonialization negatively impact the well-being of Indigenous peoples and communities across Canada, resulting in persistent health and socio-economic, and political inequalities. Data is critical to addressing inequalities and data governance is a critical precursor to data sovereignty and in this book the approach to decolonizing data provides a deeper understanding of the social dimensions of health as applied to Indigenous peoples, who have been historically underfunded in and excluded from health services, programs, and quality of care; this inequality has most recently been seen during the pandemic. Drawing on both western and Indigenous methodologies, this unique scholarly contribution takes both a sociological perspective and the "two-eyed seeing" perspective advanced by Elder Albert Marshall to research methods and data outcomes. This book provides an opening for researchers and practitioners to think deeply about the extent to which the theories, tools and process they have been taught and also teach within various academic disciples that are applying contribute to ongoing forms of colonial harm. The conversation draws attention to how research design practices need to be culturally responsive, which means that researchers need to consider the ethical ways in which they work in partnership with Indigenous peoples, as they move forward with their research programs.

The Postgraduate Program of Interdisciplinary Childhood, Adolescence and Youth Studies at the Federal University of Rio De Janeiro: Challenges for the Development of an Area Studies

This paper presents the background – motivational, institutional and theoretical – for the establishment of the Postgraduate Program of Interdisciplinary Childhood, Adolescence and Youth Studies of the Federal University of Rio de Janeiro, Brazil; it also presents the challenges facing the creation and the development of such an area studies that has been so far understood and formalized as distinct and separate disciplinary areas. The Program is the result of a five-year long investment which gathered scholars of the Federal University and other public universities of Rio de Janeiro whose expertise focuses on childhood, adolescence and/or youth issues. It encompasses at the moment 23 scholars from different areas of scholarship, such as education, psychology, architecture, social work, medicine, psychiatry, occupational therapy, political science and others. The problems of providing a real *interdisciplinary* training rather than one based on an aggregate of different disciplines as well as inscribing such a training in the social demands of peripheric societies like Brazil are aspects to be here discussed. Also, another relevant aspect concerns the development of the Program in view of the increasing demands of academic internationalization and the contribution that this Program can offer to Brazilian and Latin American societies on childhood, adolescence and youth issues.

Researching with Refugee-Background Participants in Non-Crisis Contexts: Ethical and Methodological Considerations

Refugee-background communities are often considered vulnerable research participants (Block, Riggs & Haslam 2013). However, vulnerability is not an inherent trait of these communities; rather, vulnerability is produced and reproduced in relationships of power and exploitation. If done ethically, participating in research has the potential to be a meaningful process as it provides a platform for refugee voices to influence policies and practices and to challenge and change public debates which are often defined by deficit, fear, demonisation, and exclusion. For this presentation, we draw on two recent research projects with members of the Hazara Afghan community in urban and regional Australia (Radford et al. 2021, 2022) to explore key ethical and methodological approaches that sought to address the complexities of power, trust, sensitivity, consent, and reciprocal benefit. The two projects used ethnographic and interview-based methodologies to understand the settlement experiences and contributions of the Hazara Afghan communities who had settled in Adelaide, South Australia, and Leeton, NSW, after arriving in Australia as refugees and asylum seekers. We discuss the strategies we used in our engagement with the Hazara Afghan communities not as mere objects of research but as collaborators in the research process.

Paying the Ultimate Price: The Death of Whistleblower Protection

Whistleblowers have been credited as playing a crucial role in exposing South Africa's state of capture. It was because of their revelations that the country was able to make headway in re-democratising the state, and alerting its citizens to the large-scale ensnarement of the country's key structures. For the South African whistleblower, however, it was a case of being a Batman not a Superman. Superman is praised and adored by the structures and citizens of Metropolis. Contrarily, Batman is reviled by the authorities of Gotham and labelled a vigilante. Both heroes wear a cape. So where lies the problem of the Batman-ness of the South African whistleblower? It is in the death of legislated whistleblower protection.

South Africa's law intended to protect whistleblowers, the Protected Disclosures Act (PDA) and its amendment (PDAA), exists but has faced long-standing criticism due to its inadequacy. Primarily, the PDAA fails to meet international standards for whistleblower protection with its provisions being

limiting and narrow. In interviews conducted with South African state capture whistleblowers, and others who interceded to support them, notions regarding inadequate protection are overwhelming. It has, however, recently been reported that the state will review the legislative framework for whistleblower protection. Even once the law is amended, we should hope that the legislative revisions are effective ones which can eventually offer adequate whistleblower protection.

This qualitative research paper scrutinises the current legislative provisions by analysing the existing South African legal framework for whistleblower protection, and by examining the experiences of South Africa's state capture whistleblowers when enduring inadequate legislative protection. This paper also provides recommendations that should be considered when revising the legislative framework intended to protect South African whistleblowers.

'Whatever Happens, Have the Courage and Honor to Act Decent...' the Limits of Hospitality in the Polish Reception of People Fleeing the War in Ukraine

Contemporary Europe faces challenges of multiculturalism and coexistence of different ethnic groups (Ahmed 2000) that are harder to tackle in the absence of community values such as solidarity and hospitality (Picozza 2021). We analyze how hospitality is a condition for welcoming (cf. Farahani 2021) Ukrainian migrants in Poland. In this paper, we answer the research question on the understanding of hospitality, as narrated by Polish people in response to the Russian invasion in Ukraine. We are interested in tracking their experience concerning the actual conditions of willingness and openness to be hospitable (Derrida 2000, Środa 2020) over time. As such, we explore the limits to hospitality in the temporal context of the refugee influx to Poland.

In terms of data and methods, we use results from two qualitative studies conducted in Poland. First, immediate reactions to the beginning of the war were tracked in the asynchronous exchange within a broader Qualitative Longitudinal Research (*ULTRAGEN: Becoming an adult in times of ultra-uncertainty: intergenerational theory of 'shaky' transitions* - 42 respondents, March 2022). Then attitudes to refugees from Ukraine after three months of the war were probed in six focus group interviews (*Uncertain times: Poles' views on the war in Ukraine* - May/June 2022).

We embed our findings in recent research on acculturation, supporting the importance of analyzing how members of the host society - in this case Polish interviewees - perceive the Ukrainian minority. We reflect on the similarity between the Ukrainian and Polish cultures as it emerged as an essential factor affecting hospitality in the data. The study participants expected Ukrainians to adopt some aspects of Polish culture, conditioning their hospitality. In summary, the analyses aim to map the understanding of hospitality, its risks and limitations, as well as the principles of guest-host relationships.

Working for "Another" Representation of Gender-Based Violence: The Politics of Feminist Movements and Anti-Violence Centres in Contemporary Italy

The social representation of gender-based violence is influenced by stereotypes and prejudices according to which women are weak subjects with fewer rights than men. This stereotyped representation depends on the unfair relationship between men and women on which society continues to be structured. As shown by recent studies, the consequence of this is a process of further victimisation of women who are victim of violence and are often blamed by the media or even by a justice system that tends to justify violent men.

Gender violence began to exist as a social fact when the cognitive tools and the political conditions were created so that this phenomenon, that until that moment was considered normal, gained the status of reality. In Italy a leading role was played by the feminist movements of the 1970s that framed gender violence as a political issue, and by the anti-violence centres that, since the 1980s, have generated a new culture on gender violence that highlights the aspect of the relationship of power between men and women and frames gender as a space for the exercise of power.

This contribution analyses the representation of gender-based violence produced by feminist movements and contemporary anti-violence centres in Italy, focusing on their methodology and the innovative actions inspired by tangible and practical approach. The aim is to retrace their work of deconstructing the stereotyped social representation of gender-based violence and to identify good practices in the fight against violence and in the transformation of the pre-existing relations in terms of gender issues. This analysis will use qualitative data collected through focus groups and in-depth interviews to feminist movement's activists and workers of anti-violence centres in Italy.

The Moral Investor : Equity Markets, Speculation and Retail Investing Boom in India

Between 2020-2021, as India battled the Covid pandemic, the equity markets in the country were bouyant with the emergence of a retail investor boom. From holding just 1 percent of the freely traded equity share , the individual small scale retail investor, held upto 10 percent by the end by 2021. These retail invetsors are largely middle class professionals in the large cities of the country such as Delhi and Mumbai. This paper will investigate the dynamics of this retail investor boom and challenge the functionalist explanations given by economists in India. The popular argument is that the investor was drawn to equity markets when other avenues of invetsment and savings such as fixed deposits in banks and debt mutual funds showed poor returns. Or else, the investor was simply better informed about the equity markets, having had time during the months long covid lockdown to read and study. However, neither explanation sufficies to show what prompted the retail invetsment boom during the pandemic, or to explain why it didnt occur previously. Using ethnographic data from a year long study of retail investors in Delhi and Mumbai this paper traces a shift in the moral conception of the equity markets. From being understood as gambling and as a market meant for criminal elements, the stock market was reframed as a site of legitimate welath creation. Over the course of two decades from 2000 to 2020, policy measures by the equity markets regulator SEBI, the growth of financial journalism in the country and the emergence of 'fin-cluencer' (financial influencers) on Youtube and Instagram transformed the equity markets from being framed as an uncontrolled volatile space to one of measured risk. Further, the Indian middle class, this paper shows, is moving away from being 'risk averse' towards 'prudent risk taking'.

Gender Based Violence (GBV) and Women's Empowerment in 21st Century: A Critical Analysis in Bangladesh

This study attempts to examine in what manner Gender Based Violence (GBV) is seen in recent Bangladesh and tries to explore how these types of GBV become the major barriers to women's empowerment in Bangladesh in the 21st century. Bangladesh is a developing country where women are being empowered gradually with the advancement of society. But GBV is also recorded as a regular incident in society that sometimes becomes a barrier to women's empowerment. Against this backdrop, this study is significant to find out the overall scenarios of gender-based violence and its effect on women's empowerment. It is a mixed method study that covers both quantitative data as well as qualitative data to make the study representable. In the quantitative method, this study analyzed secondary numeric data from the Bangladesh Peace Observatory (BPO), a large data platform in Bangladesh. On the contrary, in the qualitative method, this study conducted five Focus Group Discussions (FGD) and 10 Key Informant Interviews (KII) to cover the in-depth stories about the factors, impact on women's empowerment, and the way forwards of GBV. The population of the FGD is the students of the University of Dhaka, Bangladesh, and the experts, gender specialists, civil society people, academics and researchers are the respondents of KII. This study identified the several types, motives, and factors of GBV which are the major barriers to women's empowerment in Bangladesh. This study would help the readers, policymakers, and researchers to realize how GBV is the barrier to women's empowerment in Bangladesh.

Public Sphere and Islamization

The Face of Muslim Youth after Islamization (Post New Order Era): Projecting The Future of Public Sphere in Indonesia
Islamization is the most visible thing after the New Order in Indonesia, especially the dramatic rise of Islam in public life. Following Ariel Heryanto's arguments in "Identity and Pleasure: The Politics of Indonesian Screen Culture" (2018), the revival of Islam in the contestation of moral piety based on religion and the power of religion commodification. Commercialization of Islamic symbols become frequently appears in media. The intertwined relationship between Islamic politics and popular culture become a huge social phenomenon. This study examines the knowledge system that controls youth social life and their projection of the future social and political sphere should be. Islamization works through the reproduction of knowledge. This is important to understand because it determines whether social and political spheres will be produced. Especially last five years there are a lot of academic discussion about the contemporary social issue held by Islamic organizations and institutions. The dialogue political religion provides the recognition of

locality based on ethnicity. It is important to know what discourse they want to construct. Youth for the next decades will become the civil society that is sovereign and the balancing power. Using fieldwork with the qualitative method, this research examines youth activism in an urban area. The data was collected from university student. The paper describes the aspects driving the social life of youth, political views in an educational sphere, and also whether screen culture still has the power to shape youth identity after more than a decade of Islamic Commodification Post New Oder Era. Islamic politics has been controlling the youth's knowledge system and political view through religious organizations and figures.

Keywords : Islamization, Public Sphere, Youth's Knowledge System

RAHMANI, Fereydoon* (ASSOCIATE PROFESSOR, Canada)

Marginalized Communities' Quality of Life: Kurdish and Non-Kurdish People 1999-2019

Diverse approaches are used to estimate the people's quality of life or some domains of community's living conditions. Classical economists have used GDP or economic growth as indicators for community's living standards, while health scientists are using physical indicators to examine the health-related quality of life. It nearly took four decades for the quality-of-life analysis to establish itself as a polygonal discipline of social sciences. Since the quality-of-life studies is rooted deeply in the social indicators' movements, creating global agencies such as Club of Rome, UNDP, and IIASA also were certainly effective in further expansion or development of the discipline. Quality-of-life analysis finds its real meaning when "the predicament of mankind" is fairly incorporated into academic investigation.

Conducting a series of field analysis (both Top-Down-Model and Bottom-Up-Model) between 1999 and 2019, the author is showcasing the subjective quality-of-life gap within the Kurdish, and non-Kurdish, as well as Muslim, and non-Muslim populations in the Middle East. In this paper, some major findings of the discussed empirical fieldworks are put together to shed some light on the well-being and general quality-of-life of these communities for the first time.

The results show how the subjective quality-of-life, as well as life satisfaction has deteriorated within the period of the research, and how religion, gender, ethnicity, nationality, and the level of marginalization have played a role in this comparison. Software programs like SPSS and LISREL are used to analyze which indicators best explain these populations' well-being. The research results show that the overall and universal quality-of-life within the Kurdish citizens has been extremely lower than the non-Kurdish citizens living in agglomerations like Tehran, and within the Kurdish Iraqi regions the disparity has become extreme, while measurements for the underprivileged Kurdish Yezidis is indicating the worst level of satisfaction.

Explaining Māori Atheism in Aotearoa New Zealand

Indigenous experiences represent one of the most neglected yet critically productive sites for exploration within the fast-emerging field of atheism and nonreligion. Recent cross-cultural research demonstrates that atheism — like the broader nonreligion construct — incorporates a wide range of self-understandings, views, and commitments. Inclusion of Indigenous perspectives extends our understanding of this diversity, adding essential insights for the development of a rich and comprehensive understanding of atheism.

Between 2006 and 2018, the percentage of Māori (Indigenous New Zealanders) identifying with "no religion" on the national census increased from 36.5% to 53.5%. This change coincided with a substantial decline in Māori affiliating with Christianity and traditional Māori religion. Despite these dramatic shifts, we know little about Māori atheism, or indeed the individual, sociocultural, and historical processes contributing to Māori deconversion.

This paper addresses this gap and aims for a causal explanation of why and how some Māori became or remain atheists. We identify key causal factors of atheism at the individual and societal levels based on in-depth interviews with Māori a/theist. Given the complicated post-colonial and bicultural context of Aotearoa New Zealand, our analysis will also pay a close attention to the intersectionality between the history of colonisation, Christianisation, and the impact of Māori cultural revitalisation policies on the emergence of Māori atheism.

Algorithmic Decision Support Systems in Discourse: From a Tool to an Organizational Algorithm

Our paper presentation addresses the topic of the increasing use of algorithmic decision support systems in organizations in the course of various digitalization processes. This includes social administrations, a particularly controversial field of implementation of algorithms (e.g. O'Neil 2016; Eubanks 2018, Egbert 2018, Egbert and Leese 2020), where we observe efforts to gain public legitimacy for the use of such systems. In this context, our paper presentation examines the implementation of the so-called "AMS algorithm" in the Austrian Public Employment Service (AMS) by using discourse analysis (see e.g. Lopez 2019). The paper shows that organizations undergoing digital transformation are involved in discourses about the use of digital technologies and as such are at the center of attention; they help shape discourses around algorithms and thus contribute to their perception in society. Using the sociology of knowledge approach to discourse analysis (SKAD) (Keller 2011), we identify three discourse strategies that shape the course of AMS discourse: (1) the strategy of placing the algorithm in the discursive field of social administration of aid and efficiency, (2) the strategy of referential mobility of the algorithm, and (3) the strategy of incorporation of the algorithm by the AMS organization. Through our discourse analysis approach, we show, firstly, that the social situatedness of digital technologies contradicts the notion of technology as a neutral tool. Secondly, it shows that the AMS occupies an important and supportive position in the discourse. Following this, it shows that public discourses around implementing algorithmic decision support systems are a central point, embodying the dynamic relationship of algorithms and social structures in today's society.

Impacts of the Pandemic and Housing Conditions: A Sociological Study with Residents of the North and South Area of Natal-Brazil

This article aims to analyze the impact of the Pandemic - Covid-19 (SANTOS, 2020) on the lives of residents of the North and South zones of the city of Natal-Brazil. As a research question for this theoretical-empirical study, we ask: to what extent has the pandemic impacted on the lives of the residents of these two different neighborhoods in the capital potiguar? From a methodological point of view, this is an empirical study, which we talked with residents of both neighborhoods, trying to find out to what extente the pandemic (Covid-19) had an impact on their lives. Data collection was carried out with ten residents of each neighborhood and the data analysis technique was anchored in Amado (2013). Theoretically, we start by thinking about the "city", from Simmel (2005), one of the first classical theorists to reflect on it, through the Chicago School, with Robert Park being the first to study urban space from a sociological point of view, Howard Becker; the anthropologist Marc Augé also discusses the city as a socio-anthropological space, and finally, Brazilian theorists such as Otávio Velho, Frúgoli Jr., Licia Valadares, Mario Eufrásio, Vera Telles, Bianca Freire-Medeiros, and others. In addition to Marc Augé's discussion of the periphery, we will also dialogue with Feltran, Alexandre Magalhães and Victor Lage who study the urban periphery. From the appropriation of the most different concepts of urban space, including the neighborhood and the periphery, based on the discussion of these theorists, we hope to present, in a problematical way, a debate that relates the city, the neighborhood and the periphery. From the analysis of the data collected from the residents, we cannot yet show conclusive results, since at the moment we are relating such data to the theoretical framework, in order to prove our hypothesis or not.

RAJ, Aditya* (Indian Institute of Technology Patna, India)

Network Analysis and Computational Modeling in Sociology

Today we make meaning of our lived experiences in the digital world where different dimensions of social networks inundate and inform us. They guide also for better or worse outcomes. Our concurrent research shows that "stars" in the social networks today influence choice of lifestyle, consumption patterns, and even policy discourses. It is important, therefore, to situate the growing significance of network analysis in sociological comprehension. We need to draw from computational modeling also to surmount the curse of dimensionality and situate domain specific information. Data mining with ethical sensibilities and critical interpretative theoretical insights will further reduce the gap from empiricism and recognize theorizing. Human behavior is complex but simple and, yet, sharp computational modeling in sociology is needed to help theorize the social world in the digital world.

Promises of India's New Education Policy 2020

The union cabinet of India approved National Education Policy (NEP) in July 2020. It aims to fulfill the unfinished agenda of previous education policy in India and seeks to make education in India holistic, flexible, interdisciplinary, inclusive, equitable, and in line with future need. Some salient points are formative years of children, emphasis on learning to learn, flexibility of courses, cultivation of critical thinking, teacher training, revamping educational institutions, use of educational technology, evoking indigenous knowledge, glocal knowledge partnership, and it's like. NEP 2020 is a very important knowledge document with great promise. This paper is from a research that looks at the crucial aspect of delivery and implementation of NEP 2020 using discourse analysis and emergent trends. The focus is on how the global skill requirement is expected to be meet and, yet, India's national aspiration and indigenous knowledge is realized. How India's diversity and multicultural ethos are threatened or strengthened is a current theme of analysis in this paper. A comparison with other nations educational policy is also looked into to situate India's NEP 2020 globally.

Assessing COVID-19 Challenges to Public Health in India

Coronavirus 19 cataclysm has inflicted social turmoil, debilitating infirmities and killed people apart from crippling key sectors such as healthcare, economy and employment from which India hasn't recovered fully yet. Largely because with more than half a million Covid deaths India holds the ignominious position of being the country with second highest deaths in the world. More alarming is the fact that the deaths haven't stopped despite discovery of vaccines.

Since March 2020 India's populist authoritarian democracy has compromised Covid India's medical preparedness, economy, people's livelihoods , not only because of deficient public policies/ strategies in managing it but also because responding to pandemic needs a 'compassionate state' which is missing. India's public healthcare institutions historically have remained neglected/ under-invested. Even Government statistics concede that India's public expenditure on health is *only 1.28% of its GDP* and is *even lower than countries that are classified as the "poorest" in the world* . Lack of governmental subvention, lopsided reliance on lockdown, non-implementation of *3T's* (Tracking, Testing & Treatment) *approach* comprehensively created the worst humanitarian health crisis within 2 years as the pandemic tested India's health infrastructure, shortcomings in medicinal and hospice care alarmingly.

India had the strictest lockdown enforcement in the world imposed with brute force but with least State support/ subsidy package scarcely helped in 'containment' of the virus. A -7.3 negative GDP growth rate in 2020 induced crises which immisserized and impacted livelihoods of people negatively. State's efforts have been perfunctory and humane policy interventions, general policy initiatives and timely economic strategies to save both lives and livelihoods have been missing despite the ameliorative potential that such measures contain. Perspicaciously , it is alternative policies of State welfarism, food subsidies, cash transfers, free health intervention that can revive economy,livelihoods/ earnings as also public health upliftment which hasn't happened till date.

Increasing Hunger & Poverty UNDER COVID 19 Progression in India

India's record in mitigating hunger, poverty amidst its population has never been very edifying although there were marginal percentage decreases due to indirect fallout of limited development over 75 years of independence. However, since March 2020, Covid19 has impacted the vulnerable population severely. The first two 'waves' of this cataclysm posited healthcare crisis and aggravated the existing poverty and hunger crises of India's lower classes.

CMIE data indicates that in the second 'wave' (in May 2021) rural unemployment reached 14.34% and urban unemployment touched 14.74%. India's has a vast unorganised economy of agricultural workers of 260 million workers. Covid halted almost all economic activities and affected all types of workers including salaried workforce, of which the unorganised workers, informal economy was the worst hit. 'Of these, the lockdown has put an estimated 136 million at risk as many of these people are selfemployed or work as casual labourers'. Agriculture, the mainstay of rural people suffered (despite the fact that Agriculture was the only sector to register higher production in 2020-21 when all sectors were showing downward trend) largely because frequent lockdowns disrupted supply chains and market access.

Pandemic's impact of scuttling rural / urban employment has unavoidably worsened access to food. Hunger crisis has aggravated resultantly. National Family Health survey in its first phase report noted worryingly that there has been an increase in the number of malnutritioned and wasted children up to the age of 5 in 16 states during 2019-20 . This was on top of the notoriety that India is ranked 94th in the Global Hunger Index. India's populist authoritarian democracy hardly bothers about correcting such opprobrium as it is not a political priority but a social one. Thus, the vicious circle of hunger and poverty has become impossible to break in the era of pandemic.

RAJA, Anand* (Prof. Rajendra Singh (Rajju Bhaiya) University, India)

The Meeting of Hindu Nationalism and Vikas: A Power Ploy

The Meeting of Hindu Nationalism and Vikas: A Power Ploy
Narendra Damodardas Modi, the Prime Minister, is India's most powerful and popular leader; one of the many populist and authoritarian leaders in today's world. Populism takes different shapes in different nations and time zones. The core of populism involves the 'Us vs Them' thematic in various guises and the leader playing to the gallery. Modi uses both these tactics.

Modi has called himself a 'Hindu-Nationalist'. This ideology is a variant of the Hindu religion and the idea of geographical nationalism. The Rashtriya Swayamsevak Sangh (RSS) and its political wing, the Bhartiya Janta Party, are centred around this ideology. Modi also used the dreams and longings for fast economic growth or *Vikas* to appeal to the electorate, most of whom live in precarity.

Hindu-Nationalism serves to distinguish the people who are Hindu and patriotic against non-Hindus and Anti-Nationals. The former, who have the combined forces of state and non-governmental organisations behind them, are pitted against the latter, who are not as well organised. The battle between the two is being played politically, socially and culturally.

This paper proposes that Modi and his BJP are politically successful because they mirror Hindu-Nationalism and ambition for *Vikas*. Both are Durkheimian collective representations; 'beliefs and sentiments common to an average citizen of a society'. When people see both reflected in Modi and the institutions, people gain psychological legitimacy and upliftment. This is paid back by Modi and his hegemonic apparatus.

Such 'mirroring' can explain the scale of Modi's victories in National Elections and his ever-growing political power. The unification of an individual in a collective existence is in line with the philosophy of Ekatm Manavvad, which is the guiding philosophy of the RSS. There is increasing authoritarian power because of comprehensive mirroring.

RAJAMANI, Nithin* (Tata Institute of Social Sciences, India)

Livelihoods in Peril: A Sociological Analysis of Impact of Extreme Events on Wetland Based Livelihoods in Kerala, India.

This paper brings a sociological analysis of the impact of extreme events on livelihood among three different livelihood groups depended on a wetland based social – ecological system. The paper argues that the impact of extreme events on livelihood is multidimensional, and there is a need for deeper analysis of impact of extreme events on social interfaces and socio-cultural and ritualistic practices associated with livelihood systems.

The paper analyses the impact of increasing – both in terms of frequencies as well as threshold – extreme weather events on the ecosystem based livelihood communities in the Kole wetlands in Kerala, India. Kole wetland is a Ramsar site and a social-ecological system of huge significance. The paper analyses in detail how does the extreme events impacted the livelihood systems, calendar and assets- especially social assets/ capital for consecutive years since 2018. The impact of extreme events on the cultural and ritualistic practices of agricultural, fishing and duck rearing livelihood groups depended on the Kole wetlands, and the impact of extreme events on the nature of social interface among the communities are analysed in detail.

Following a qualitative paradigm, the paper gathered data using multiple methods, including situational analysis, participatory research techniques, interviews, oral histories, and archival and secondary data. The collected data were managed and analysed manually. Thematic analysis of the data had done. The paper is structured on grounded theory approach.

The paper advocates that the assessment of impact of extreme events on livelihoods should consider the broader spectrum of livelihood and move beyond the conventional notion of only economic estimation of impacts. The impact of extreme events on livelihoods demands a deeper sociological analysis and it can initiate changes in policies and programmes on disaster management and livelihood adaptation and resource governance.

People Centric Governance : A Comparative Analysis of Tqm in Kerala and Batho Pele in South Africa

The 'people first' approach is deep routed in a philosophy which values people and their strength. This concept owes its origin to the self advocacy movement began in Sweden in 1968. The people-centric approach is now a days increasingly recognized in various fields such as organisation management,

governance, development, etc. There are anecdotes on governance approach that places people as the focal point. Two noticeable cases with respect to governance are found in South Africa and in Kerala, India.

The shift towards democratic system of governance in South Africa since 1994 and subsequent white paper on *Batho Pele* (People First) in 1997 led the way for people-centric governance. Kerala stepped into people-centric governance with the enactment of Kerala Panchayat Raj Act and Kerala Municipality Act in 1994 and launched People's Plan Campaign (PPC) in 1996. However, PPC in Kerala has given over emphasis to planning, which is one of the aspects of whole spectrum of management. But with the introduction of Total Quality Management (TQM) since 2013, the scope of people first concept in local governments has been widened from planning to management. There are similarities between the principles of TQM applied in the local governments in Kerala and the principles behind *Batho Pele* in South Africa. In this context, the present paper attempts to juxtapose the experience of South Africa and Kerala on people-centric approach in governance; so as to draw lessons from former. This would further enrich Kerala on its democratic decentralization.

What Do We Know about Australian and New Zealand Sociology PhDs in the Latest Decade (2010-19)?

PhD students today will become the professors of tomorrow. What do we know about this cohort of young academics and researchers that will be the future teaching and research workforce of sociology in this part of the world? Has the effort to publish during sociology PhD enrolment become the new normal? Other unknowns about the emerging cohort of sociologists include what discipline changes in PhDs are apparent? How many publications are achieved during PhD candidacy? Do students undertake Thesis by Publication (TBP)? In light of the concept of cumulative career advantage, are men and women similar in their research productivity while completing their PhDs? Reflection on this new information includes asking about changes this implies about doctoral supervision practices, and whether the highest academic qualification is no longer a PhD, but a PhD with publications? This paper present selected highlights of PhD characteristics and publishing activity within the Australian-New Zealand academic environment that is different from both North American and the European settings.

RAJORA, Suresh* (University of Kota, India)

Climate Change, Growth and Net Zero: Tough Choices to Indian Policy Makers

There is no issue more important than temperature rise causing global climate crisis. Nonetheless the existential issue for the developing countries cannot be ignored. Therefore, should growth remain the central goal of policy or should net zero emissions and its subset of goals takes priority?

The developed countries, account for just 12 per cent of the global population but are responsible for 50 per cent of all the planet warming greenhouse gases released from fossil fuels and industry over the past 170 years. The challenges facing the humanity and the inadequacy of efforts and commitment to "common but differential responsibilities" to tackle the threats were reminded in COP 26- Glasgow too.

In fact India is a rapidly growing economy with a low level of per capita energy consumption. Indian experts criticized the developed nations for once again failing to deliver the promised- USD 100 billion a year- climate finance.

The first ever mention of fossil fuel "phase down" in an international climate agreement is an important indication of the energy transformation underway. The Glasgow climate agreement binds nations to do more for climate change. But the energy transition is likely to be gradual and expensive. However **India has been making efforts to retain policy space to avoid any disruption to its economic rise.** Fuel of the future- green hydrogen- is the cleanest fuel and companies can bring renewable energy from anywhere to produce green hydrogen, henceforth India can be one of the largest producers of green hydrogen in the world. With this backdrop Indian declaration in Glasgow COP26 highlights that 50 per cent needs of the energy shall be fulfilled by renewable energy sources by 2030 and Net Zero emission of carbon would be achieved by 2070.

RAJPUT, Shivani* (Miranda House, University of Delhi, India)
THOUNAOJAM, Beauty* (Jawaharlal Nehru University, India)

Sociological Study of Cross-Cultural Consumption: A Case Study of Ngari

A Meitei household and its cuisine is incomplete without Ngari and its distinctive smell which can become an element of fascination or repugnant to the unfamiliar ones; equivalently, the smell is aromatic and appetizing for the ethnic communities of Manipur. The fermentation of Ngari, a labor intensive process, involves techniques of food preservation that is particularly unique to the cultural system of Manipur. Within the last decade the consumption

and distribution of Ngari has taken place outside its geographical and cultural location. Its olfaction has bargained and continues to negotiate with the dominant food culture of the metropolis. How do we interpret this cultural interaction outside its ethnic domain?

The paper aims to study shifts in post-liberalized India's global consumer landscape by examining new forms of consumption of Ngari, in and outside of Manipur. Consequently it will explore Ngari's changing relation with its ethnic communities. A sociological enquiry of its commodification — from an immutable cultural entity to an ephemeral one — will be the focus of the study. Since consumption of Ngari is intertwined with a Manipuri identity, what constitutes this 'new being' in the global time marked by cross-cultural consumption?

*Meitei is an ethnic community of Manipur, a North Eastern state of India. The food culture of the community, determined by its geography and ecology, is starkly different from the mainland. Ngari, a non-salted fermentation of fish, is used as a flavor enhancer in most Manipuri dishes and its homology is reflected in the food system of the neighboring regions, extending to the South-East Asian societies.

RC33-501.3

RAKOVICS, Zsofia* (Eötvös Loránd University, Faculty of Social Sciences, Research Center for Computational Social Science, Hungary)

Investigating Dynamic Social Networks of Politicians Constructed By the Similarity of Their Speeches

This work was motivated by social network analysis and applied the network concept in a social research focusing on natural language processing. The aim of the analysis was to provide a dynamic network of politicians (PMs) based on the linguistic characteristics of their speeches and explore the language- and political polarization patterns observed in their communication.

This research analyzed 20 years of Hungarian parliamentary speeches based on the Word Mover's Embedding (Wu et al. 2018) document embedding method. This method embeds the speeches in an abstract vector space in which the relationships between speeches, politicians, or parties can be mapped, and networks can be constructed.

Examining the transitivity of the graph (Wasserman & Faust 1994) generated by the similarity of speeches by parliamentary term and party, an increase over time could be observed, suggesting the homogenization of the speeches within a given party. This tendency was also indicated by the classification of the document vectors by party. For the examined 20-year-long period, we trained gradient boosting models yearly that classified the speeches into the corresponding party based on the document vectors. By comparing the performance of the models, we obtained an improving trend, indicating an increasing separation between parties.

The patterns of intra-party homogenization and inter-party polarization evident in the speeches were in line with the characteristics of neopopulism-theory (Csigó 2016); a speculative mediatized political space emerges in which politicians observe the strategies employed by other politicians to appear popular and distinguish themselves from others by creating self-referential communication bubbles.

RC33-501.5

RAKOVICS, Zsofia* (Eötvös Loránd University, Faculty of Social Sciences, Research Center for Computational Social Science, Hungary)

Investigating Language- and Political Polarization through Two Decades of Parliamentary Speeches

Computational methods of social science are becoming increasingly important because of the growing amount of naturally generated data available for research purposes. This work applied Natural Language Processing, Machine- and Deep Learning techniques on all transcripts of the parliamentary speeches held by politicians of the Hungarian Parliament from 1998 to 2022, roughly 500.000 unique texts. Political communication has undergone significant change over the last two decades. The aim of the research was to provide a picture of the language- and political polarization through speeches in the parliament.

Firstly, we used keyness analysis to identify keywords that distinguish particular – pre-given – groups of speakers (e.g. parliamentary factions and parties). Secondly, by measuring similarities of these keywords, we mapped the patterns of change in speeches, revealing the political communication strategy of each party. Thirdly, based on the keywords as features we built state-of-the-art (XGBoost and BERT) classification models to predict the party of the speakers. Evaluating these models for each parliamentary term (or year) enabled us to examine the amplitude and characteristics of language- and political polarization over time.

Based on the results of the analysis, the patterns of change in political communication strategies were mapped both for the governing- and the opposition parties. Moreover, according to the results of the classification models, increasing language- and political polarization was observed between the governing parties and all other parties of the Hungarian Parliament.

RALPH, Brittany* (Monash University, Australia)

The Complex Role of Alcohol and Autonomy in Men's Lives

Alcohol is a deeply embedded, yet often harmful aspect of Australian social life - and nowhere is this complicated dynamic more evident than in lives of men who drink heavily. When Australian men drink, they are more likely to be violent and take life-threatening risks. Our recent study of men's risky drinking practices in Victoria highlights how the masculine imperative to be autonomous and in control can prevent them from enacting care for their friends on a night out or intervening in unsafe consumption practices (Roberts et al. 2019). Yet, in other projects we document how alcohol can break down barriers to men's expression of homosocial intimacy and promote emotional self-disclosure - even among middle-aged and older groups of men who are often assumed to be more firmly invested in 'traditional' masculine identities. In this presentation, we bring together findings from three in-depth, qualitative studies with over 150 Australian men to discuss the complex role of alcohol in men's lives, and consider how these findings could be leveraged to improve health outcomes. In particular, we illustrate how public health initiatives aimed at reducing alcohol-related harm, promoting healthier masculinities and improving men's mental health could benefit from a focus on challenging the persistent cultural discourse of manly self-reliance.

RAMA, Sharmla* (University of KwaZulu-Natal, South Africa)
HOSKINS, Ruth (University of KwaZulu-Natal, South Africa)

Reflecting on the Teaching and Learning Experiences and Lived Realities of the Students in the Bachelor of Social Science Extended Curriculum Degree at the University of Kwazulu-Natal, South Africa during the COVID-19 Pandemic

The COVID-19 pandemic created challenges and opportunities for students, and academics in higher education, particularly the shift from contact face-to-face to a flexible blended mode of delivery for teaching, learning, and assessment. The University of KwaZulu-Natal (UKZN) responded by developing key plans to support and guide remote, online teaching, learning and assessment during this period in South Africa. This paper examines, through the adoption of an exploratory, qualitative research design and purposive non-probability sampling strategy, the teaching, learning, assessment, and feedback experiences and lived realities of the first-year students in the Bachelor of Social Science Extended Curriculum Degree (BSS4) during the pandemic. The College of Humanities offers the BSS4, and this programme is embedded in UKZN's commitment to national imperatives prioritising transformation in higher education, including the equity of access, equity of outcomes, inclusivity, representativity, and social justice. Additionally, in the University's Strategic Plan under Goal 1 – Excellence in Teaching and Learning – one of the key intentions is to achieve a diverse socio-economic student body by increasing the number of first-year students from quintile 1-3 schools. These are schools with no school fees, they have poor or inadequate infrastructure and resources, and are in historically under-resourced, and disadvantaged communities. BSS4 is offered at the Howard College and the Pietermaritzburg Campuses and enrolls about 1300 first-year students. It is a four-year programme that provides students with a planned and formal foundation, augmented modules, and psycho-social support services. The humanising, empowerment and engaged pedagogic philosophies underpin the teaching practice, delivery, assessment, feedback, and student support in this programme. To what extent did the shift to a flexible blended delivery impact the pedagogic practice? This paper will, therefore, also reflect on the lessons and good practices that can be adopted to further enhance quality inclusive teaching and learning in the future.

HOSKINS, Ruth (University of KwaZulu-Natal, South Africa)

Teaching the Sociology Honours Research Module then and Now: Reflecting on Innovative Curriculum (Re)Design and Optimizing the Use of Technology to Enhance Student Engagement and Success

Transformation in higher education institutions (HEI) in South Africa is about redressing the historical inequalities of apartheid and colonialism and foregrounding equity of access, equity of outcomes, inclusivity, representativity, and social justice. The COVID-19 pandemic propelled curriculum and digital transformation efforts. The University of KwaZulu-Natal (UKZN) responded by developing key plans to support and guide remote, online and a flexible blended mode of delivery of teaching, learning and assessment. This included online workshops and e-resources to build the digital competency of academic staff and support the adoption of a digital pedagogy to enhance excellence in teaching and learning. Pre-COVID 19 the Sociology Honours Research module's mode of delivery was a three-hour weekly face-to-face contact seminar. The Learning Management System (LMS), that is Moodle, was used as a repository for the module resources rather than a tool to encourage student engagement. Students taking this module usually struggle to navigate the technical nature of

the content. The COVID-19 related restrictions to contact teaching, therefore, necessitated a rethinking, reimaging, redesign and re-development of the curricula, teaching practice, mode of delivery, assessment, feedback, and support in this module in a remote online virtual space. This paper is a critical reflection on the ongoing innovative curriculum (re)design and the optimising of the use of technology to enhance student engagement and success in the Sociology Honours Research Module. The paper presents two intersecting reflections, that is, one from the module coordinator and lecturer of this module, and the other contextualising the institutional and College of Humanities curriculum and digital transformation agenda pre-COVID, during COVID-19 and for the post-pandemic era. This papers also prompts a discussion on how we weave together humanising, empowerment and engaged pedagogic philosophies with a digital pedagogy to enhance student engagement, student success and quality inclusive teaching and learning.

Trade Unions Under Attack: Labor Reforms and the Dismantling of Social Rights in Brazil

Affected by the sophistication of work flexibility and control mechanisms and the economic insecurity resulting from the coronavirus pandemic, unions face perhaps the greatest challenge in their history as they see their collective power once again in check. Campaigns and actions to restrict their practices and deconstruction of national labor protection laws became recurrent, as in the case of Brazil. But, in addition, the union institution has suffered from a reduction of its structural capacity of representation due to the continuous changes in production processes, the adoption of new technologies by companies, and the formation of an increasingly fragmented labor market (in terms of gender, race, age, among others).

The proposal of this text is to bring arguments to the debate on this "crisis of trade unionism", from an analytical perspective that values efforts to resignify practices of resistance, collectivism and solidarity, at the national and international level.

The empirical reference will be the metallurgical trade union experience of a Brazilian industrial sector that has as characteristics the predominance of transnational companies in the automotive sector, the production concentrated in a regionally consolidated territory – the ABC of São Paulo, and a history of intense organized public participation, forged in situations of labor confrontation and negotiation common to the countries of Western Europe and, therefore, with a social democratic profile.

The intention here is to verify how the questions to the various levels of power consolidated over the last six decades by the Metalworkers´ Trade union of the ABC are answered by their leaders in the period of the health crisis, as manifested in regional and national bodies in which their institutional power has lost strength, and how they react to the dismantling of Brazilian labor legislation with the 2017 Labour Reform.

RAMEL, Frederic* (SciencesPo, France)

Beyond Bellephonic Sound: Musical Diplomacies in the Ukraine War

British Secretary of State for Digital, Culture, Media and Sport Nadine Dories proclaimed culture and sport the "third front in the Ukrainian war". Russia, Ukraine but also national institutions in Western countries recognize this strong dimension in their own strategic conducts. Music is clearly part of this War whether on the side of belligerents or of third party States, cultural actors and artists even though they try to escape he dilemmas they cause. What does mean listening music in such figuration? Does it entail a "bellephonic sound" dissemination that could not be transcended or are there some experiments of musical diplomacies that tend to have another representation of otherness even in a context of war? By focusing on several musical programs and institutions in Europe since the beginning of Ukraine War, this paper aims at sheding light on the role of music as a source of recognition in strategic context from public diplomacy to people-to-people diplomacy.

Race and Indigeneity: Accounting for Kinship in Racial Boundaries

The analysis of processes of racial boundary formation, especially in everyday practices, allows for researchers to understand how racialized distinctions are made, remade, and understood. For Native Nations, membership is heavily influenced by place-based Indigenous kinship practices. Kinship systems reinforce laws that maintain place-based forms of social organization; however, Indigenous kinship practices are not always accounted for in discussions of

　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

American Indian racial boundary formation. The overlooking Indigenous kinship practices has provided space for misidentification, especially when misidentification is grounded in anti-Indian and anti-Black racism helping to future settler colonial occupation and silence racial violence in the United States. Overlooking Indigenous kinship systems also leaves room for Native identity and trauma to be appropriated, namely by white American settlers. In this presentation, I define race and indigeneity as intersecting yet distinct processes that influence how American Indians are classified and identify themselves. I argue that instances of racialized "boundary crossing" that are not based on one's lived and historical relationship to a people and place indicate a form of racial violence and a sociological process deserving of critical attention.

Centennials Consumption Culture. a Comparative Analysis of Peru and Spain.

El presente trabajo busca conocer las percepciones y realidades acerca del consumo responsable en los 'centennials' para ello se analizan sus conocimientos, deseos y prácticas referidas al consumo. Se recoge información de datos primarios sobre pensamientos y prácticas de consumo a través de una encuesta entre jóvenes universitarios en Perú y España. Entre los resultados es de destacar que se observa un consumo especialmente sensible al cuidado medioambiental. Los 'centennials' se muestran responsables y respetuosos con el medio ambiente (conciencia del pago justo a proveedores, respeto por los derechos humanos de colaboradores, la ética de la gestión empresarial). El análisis sugiere una tendencia hacia una mayor concienciación medioambiental en las prácticas de consumo que es un rasgo común entre la generación de los 'centennials' y que puede ser un interesante indicador de cambio social hacia una sociedad más sostenible y respetuosa.

Challenges and Opportunities of Virtual Education for Business Training for Entrepreneurs in the Latin American Context

Retos y oportunidades de la educación virtual para la formación en negocios para micro empresarios en el contexto Latinoamericano

La pandemia ha significado un gran desafío para el sector de las micro empresas en Latinoamérica. La enseñanza y capacitación en negocios ha significado un aporte necesario para la reactivación económica. De esta manera una Escuela de Negocios mediante un programa de responsabilidad social basado en un voluntariado docente ha logrado capacitar de manera virtual a miles de micro empresarios mediante el uso de nuevas tecnólogias como el google classroom y el redes sociales como el Facebook desde donde han podido conectarse a clases en vivo e interactivas dictadas por docentes de una escuela de negocios. Este caso peruano implica todo un aprendizaje desde el ámbito de la gestión de la responsabilidad social universitaria pero también desde la comprensión de las diversas oportunidades que ofrece la virtualización que ha permitido llegar a más microempresarios, de todo el país. El estudio surge de la experiencia práctica desarrollada con el programa Mejorando mi bodega, que nace de una alianza entre Centrum Pucp y las empresas ISM y mi banco. Para mayor detalle: www.mejorandomibodega.com

Esta experiencia peruana nos demuestra que es posible contribuir directamente en la formación de conocimientos y competencias en micro empresarios, personas que en algunos casos no han recibido formación universitaria pero que sin embargo necesitan complementar sus experiencias en negocios con herramientas y competencias que les permita mejorar sus negocios y crecer como personas; lo cual les trae como beneficio mejorar su calidad de vida, todo ello además contribuye directamente en la reactivación económica del país, más aún en tiempos de pandemia.

"Thank You for Asking Us and for Listening to Us": Experiences of Loneliness and Emotional Health Among Older Adults Living in Long-Term Care Facilities

Background. Loneliness increases the risk of having worse physical and mental health, and affects individual well-being and community life. Loneliness is made up of multiple aspects and each person experiences it differently. Yet,

we have a limited understanding of the meaning that older adults give to the feeling of loneliness and how they cope with those issues. The scarce research about this topic from a sociological perspective is centered on community-dwelling older people, and there is almost nothing about older adults living in long-term care facilities.

Objective. The objective of this communication is to analyze the experiences of loneliness of older adults living in long-term care facilities, how they cope with these issues, and the relationship between loneliness and intensity of family links in a (post)pandemic context.

Methods. We conducted a cross-sectional research that included 390 semi-structured in-person interviews with people living in 25 long-term care homes in Andalusia (Spain) selected by type of management (public, private) and the number of residents (<50, 50-100, 100+).

Preliminary results. Social and emotional loneliness is prevalent in the institutionalized elderly population of Andalusia, as well as the risk of family and social isolation. Among the needs of people who are in a situation of loneliness or isolation, we identified a need to reactivate meaningful relationships, individualized attention, a feeling of belonging and the assumption of an active role within the institution. The current residential model, both public and private, is deficient in addressing the emotional well-being and psychological health of residents, covering primarily material needs and physical care (with notable deficiencies) but not of a psychological or sociological nature. *Work in progress. More detailed results would be presented at the conference.*

RAMIS MOYANO, Rodrigo* (Instituto de Estudios Sociales Avanzados (IESA-CSIC), Spain)

Does Ideology Matters? a Systematic Review of Participatory Institutions Implementation By Political Parties

Does party ideology matter when it comes to implementing participatory institutions? Even if the question has appeared in a considerable amount of research, the attention devoted to it is mostly partial or secondary in empirical work and has offered no systematic and cumulative evidence. This becomes relevant for the democratic process itself: different partisan strategies regarding citizen participation might imply different democratic impacts depending on the ideological orientation of the government.

To tackle this question, we use a knowledge-gathering strategy: systematized review. Our study universe is all papers that consider party ideology as a variable affecting the implementation of (any kind of) participatory institutions, published in English between 1990 and 2021 and indexed in WoS or Scopus, bibliographic databases in which the works have been systematically searched. This strategy, complemented by studies cited by the collected works themselves, has generated a sample of around forty works.

The review of this literature shows us the diversity of approaches that exist to this object of study, as well as the diversity of their results. The relatively few studies based on a larger n show mixed results. But when we also include work that focuses on a few cases, the result seems to lean towards the non-influence of partisan ideology. The study of different types of participatory institutions or in different regions could be behind these disparities. However, the scarcity of comparative studies and the lack of dialogue between these studies make it difficult to generalize their conclusions. This raises the need to think of ways to include ideological orientation of their initiators in the main databases on participatory institutions.

Zero Violence Braves Club, Preventing Violence in Educational Centres

Bullying among peers in schools is a growing problem with devastating consequences for children and adolescents from an early age on, worldwide. Children and youth who are victims of this deeply damaging scourge will have effects on their emotional development as well as their academic achievement, and its impact affects the whole school community extending into the mid and long run. To face this challenge, relevant research findings are showing how the *Zero Violence Brave Club* is being implemented in many schools within the larger framework of the Dialogic Model of Violence Prevention with very positive results. The latter is a successful educational action analysed in the INCLUD-ED project [Strategies for inclusion and social cohesion in Europe from Education], funded by the 6th Framework Program of Research of the European Commission. The *Zero Violence Brave Club* has proven to decrease peer bullying occurring in schools of diverse contexts cultivating a deeper feeling of solidarity among peers through defining and keeping a culture of zero tolerance to any form of violence in educational centres from very diverse types of contexts as refers to socio-economic and cultural backgrounds. This paper will present some of the results of a larger research line analysing the social impact of this evidence-based intervention. Particularly, data from 7 schools in Spain which are very different among them -in terms of public or private ownership, religious or lay background, and population served (including also cultural minorities and students with special needs- will be presented, challenging the misconception that the impact of educational interventions depends on

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the context. The results shed light on how the particular functioning of this intervention contributes to prevent and put an end to bullying in schools, increasing solidarity among peers in the school and beyong, with benefits for overall wellbeing.

RAMNUND-MANSINGH, Aradhana* (MANCOSA, South Africa)

South African Lone Mothers Challenges: Graduation in Adversity

46% of all South African children live in lone mother households, with 75% of lone mother households living below the poverty datum line. Children face structural and systemic inequalities and adversities. Limited knowledge of universities' application and funding processes and associated demands primarily because they are first-generation university graduates.

The study explored the experiences of twenty-five black women graduates raised by a lone mother. Respondents included alumni and senior students from the University of KwaZulu Natal and Stellenbosch University. NVivo was used to identify critical themes for analysis. Purposive snowball sampling facilitated access to participants. Compliance with ethical protocol remained consistent.

Crenshaw's (1991) intersectionality and Bell Hook's (2003) multiple forms of oppression provide a framework for data analyses. Findings included entrenched patriarchal lived challenges in lone mother households. Socially constructed roles of care for siblings and elders, domestic chores, and confined dwellings impacted their academic time. Absent running water, electricity and food insecurity intensified challenges to graduating successfully.

The focus is on the adversity and challenges in lone mother families for black women's successful university graduation. Respondents' fortitude, mental agility, support and role models are significant success indicators. A clinical intervention offers mechanisms for risk mitigation and increased successful graduation.

The Queen Bees and Imposters Are Responsible! Women in Academia – the Unspoken Challenges

The boys' network in academia has controlled the patriarchal narrative for centuries with their policies, processes and demeanour towards women in academia. The current inclusionary and equity legislation in South Africa gives women in academia opportunities to rise into leadership portfolios. These women progress slowly due to excessive workloads, stress and burnout. Recent Department of Higher Education (2020) statistics revealed that these factors significantly impact research outputs and funding apportionment. Women in academia are obstructed by two enemies, both inclined to disempower them. The research analysed lived experiences of women academics at the University of KwaZulu Natal. Twenty female academics at various levels in their career were interviewed from five UKZN campuses. The findings confirmed that the boys' network was pervasive in their career development. However, the barriers to their growth and success were themselves. The approach of sabotage occurred in two ways. On an upward trajectory, the queen bees aligned themselves with the boys' network to ensure that no women rise with her. Secondly, the academics suffering from imposter syndrome were victims of academic bullying, resulting in anxiety and a further loss of self-esteem and self-worth. The details of the narratives analysed into themes give insight into the experiences of women academics and their daily challenges—the self-doubt on the one hand and the refusal to support and mentor on the other, thereby continuing the cycle of disempowering women in academia. The theoretical frameworks of the social construction of reality underpinned the findings and the queen bee syndrome.

Age(ism), Adultcentrism or Generational Ordering? Linking Childhood and Ageing Research

Age serves as a significant social marker of differentiation in societies. This in turn calls for procedures such as protection, welfare, and control, as age means assignment of social status (age of consent), definition of social roles (voting age), and specification of social demands (school enrollment, age of retirement). Although age is a fundamental component of subjective experience and personal identity, it is rarely understood as a social variable, unlike gender or ethnicity, for example. Yet, both childhood and aging research show that age defines social positioning: Children *do not yet belong*, old people *do not belong anymore*. Focusing on theory, this paper asks about the implications of age for these two life stages, thus linking two separate fields of research. How is age constructed with reference to children and the elderly? How are children and old people generationally situated in their everyday lives in relation to time and space? Does the prevailing (ostensibly ageless) adultcentrism result in a twofold, 'age-legitimized' marginalization? Or, on the contrary, can potentials

also be derived? To answer these questions, the concepts of 'generational order' and 'ageism' will be intertwined in order to initiate a promising dialogue between childhood and aging research.

The Implementation of the National Socio-Educational Assistance System (SINASE) to Assist Young Brazilian Offenders

This research was funded by the United Nations Development Program (UNDP)and the main questions are: a) How is the implementation of the National Socio-educational Assistance System (SINASE) in assisting young offenders in the twenty six Brazilian states and in the Federal District?; b) are there similarities or differences in the implementation of SINASE in Brazilian states ?; c) which factors affect (positively or negatively) the implementation of the system? The research was conducted in two stages. The first stage was an online survey with actors representing the local level (socio-educational care units) and the federative level (the state administrations). The second stage sought to deepen the investigation of Stage one through online focus groups, with actors from the three levels of analysis: local, federative, and national. We found two major results in Stage 1: low adherence by actors linked to the System of Guarantees and Rights. Secondly, the absence of a well-defined standardization in the distribution of attributions and competences among the members of the System of Guarantees and Rights. Thus, we concluded that there is no homogeneously structured system in the country, which makes a detailed investigation of these different realities necessary. We observed in stage two a heterogeneity in the practices by the various professionals and institutions that work in SINASE. This heterogeneity, and even inequality, reflects the differences in the realities of the various Brazilian states and municipalities, but also reveals the absence of national cohesion, especially in regard to the construction of a dialogue between the various institutions that operate at the national level.

RAMOS TORRES, Rogelio* (Centro de Investigaciones y Estudios Superiores en Antropologia Social, Mexico)

September 2017 Eartquake Insights: From Criminal Species Extermination to Criminality As a New Element in the Relationship between Fishermen and Domestic Sea. the Case of Paredon Bay in Chiapas, Mexico

The lecture is aimed to show the results from a three year fieldwork research in the mexican southpacific coast during the recovery process after the 7th september earthquake that struck the states of Chiapas and Oaxaca. Some of the biggest damages registered in seabord fisheries such as Paredon Bay in the Chiapa's isthmus, were closely related with the socioecological relationship between population and water, and the evolution this relationship has performed in the last forty years. At the beginning of this period, different economic powers extracted local sea products without limitations, in which inhabitants were often involved.

The initial economic success, particularly impressive in the case of shrimp fishing, boosted the material transformation of the village, increasing as well the use of water and electricity. Paredon was settled on a wetland, and the growing use and waste of water created severed problems in the undersoil, such as the eartquake showed. The lack of a drainage system has affected the sea too, as the final receptor of waste waters. Together, inmoderate explotation, unruled urban growht and ecological damage, have driven to a permanent state of crisis and landscape deterioration.

The extermination of a big number of local species initiated around twenty years ago, forced fishermen to sail much far away from seashore searching for their catch. Since this became more and more common, fishermen eventually came across the drug traffic routes coming from central America. As time went by, those contacts got stronger by mixing criminal and fishing activities. The last twenty years the organized crime has had an increasing influence in the region. That influence grows during times of acute crisis such as the one triggered by the earthquake, in which this kind of powers find an opportunity to capitalize.

CORTES MORALES, Alexis (Universidad Alberto Hurtado, Chile)

Pensamiento Crítico y Sociología. El Caso De Chile

¿Qué caracteriza hoy al pensamiento crítico en Chile, en su vertiente que fluye desde las ciencias sociales, en especial desde la sociología?¿Qué diferencias tiene con respecto al pasado y con respecto a la situación en otros países de América Latina? Asumiendo el concepto de relato crítico (científico social) como narrativas que, apoyadas en evidencias, hacen diagnósticos cuestionadores de determinadas realidades o de la sociedad en general con miras a su transformación, esta comunicación aborda estas preguntas. Para ello se apoya, por un lado, en la revisión sistemática de las Antologías del Pensamiento Crítico Contemporáneo en América Latina organizadas por CLACSO y el contraste con la Antología Chilena en la misma colección y, por otro, en la revisión de las principales obras críticas de las ciencias sociales producidas en Chile en las últimas dos décadas. De este modo, se muestran los principales reacomodos y emergencias en el pensamiento crítico: renovación de tópicos, enfoques teóricos y formas de producción, surgimiento de centros productores de diferente cuño y, junto a ello, una decisiva interacción con los movimientos sociales -estudiantil, mapuche, ambientalista, de género, etc. Paralelamente, ha tomado forma una mayor versatilidad en los espacios académicos para la actividad crítica y han entrado a funcionar medios de restricción o constreñimiento de la labor crítica que operan no ideológicamente, sino que indirectamente por vía del mecanismo de las indexaciones. De tal modo, se ha reconfigurado un campo intelectual crítico diferente al de décadas anteriores y que presenta una marcada articulación con el ciclo de movilización social experimentado por el país desde la década del 2000.

Exploring Pre-Existing Vulnerabilities of Domestic Violence Among Women in the Post COVID-19 Era: A Study across 3 Northern States of India

The COVID-19 pandemic is a human, economic and social crisis. The imposition of the lockdown to control the further spread of the infection resulted in increased levels of stress, anxiety, insecurity and financial instability among masses.[1,2] Existing literature has already established that the heightened emotional responses lead to increased vulnerability for the occurrence of incidences of domestic violence. The National Family Health Survey (NHFS)[3], 2016 and 2019 have reported the pre-existing vulnerabilities of domestic violence (DV) among women especially in India where the prevalence of DV was reportedly high. Being married, low level of education, substance abuse, poor socio-economic status of women, unemployment were established risk factors[4]. In addition, own family as a most common source of support (61%) and reluctance to report the issue to police (only 3% sought help from police) are also existent. However, while data has indicated that domestic violence rates have increased in India, we explore what factors have contributed to the increased vulnerability for domestic violence and the existing gaps in policy to adequately address these in the post covid times. Since, non-profit organisations (NGOs) have been the forerunners for many welfare schemes, we collected data through interviews with non-profit sector professionals across the three northern States namely Rajasthan (26.3), Delhi (25.8) and Haryana (20.6%) which have the highest reported rate of DV as per NFHS 2019,. Our findings indicate that a number of factors have played an important role but the changed living situation has added onto the existing factors and that there is a lack of policies to address these situation in crisis situations such as the pandemic. More studies, including other stakeholders are needed to develop a better understanding of the impact of crisis on the pre-existing vulnerabilities. Such an understanding is required in order to establish more sustained systems.

Perception of Women of Reproductive Autonomy: A Cross-Sectional Exploratory Study in Punjab

Around 45,000 mothers die due to causes related to childbirth every year in India and nearly five women die every hour in India from complications developed during childbirth, with heavy blood loss caused by haemorrhage being a major factor, as per the World Health Organisation report[1]. However, Right to Reproductive Autonomy has been traditionally compromised in the Indian patriarchal society, wherein child bearing is a compulsion attached to the institution of marriage. Findings suggest that husband's subsequent reaction, on being refused sexual relations, include reprimanding women (67.5%), refusing her financial support (59.1%) or forcing sex on her (67.2%), in the "Land of five rivers", i.e. Punjab, a North-Indian State being the forerunner of the Green Revolution.. The present study has tried to explore factors including women's informed consent for conceiving, individual decision regarding the spacing between children, the choice regarding the number of children (including the influence of gender preference) and the socio-economic and mental preparedness while family planning. A self-structured interview guide was prepared to explore the ground reality by analyzing the perception of women aged 25 to 49 years across different strata in the state of Punjab. The findings indicate that numerous cultural factors affect the women's right to reproductive autonomy and status of education and employment are not found to be significantly related with the exercise of rights of reproductive autonomy. A change in social mindset coupled with implementation of progressive laws is the need of the hour. More studies on marital disputes, domestic violence and mental well-being of women concerning reproductive autonomy can be conducted to come up with the better understanding of the phenomena and devise effective mechanisms to ensure autonomy among women for their own health and identity.

Girl Child Trafficking in Central India during COVID-19 Pandemic: A Sociological Analysis

Historically evident that the global pandemic crisis not only impacts society economically and socially but also exacerbates significant risk factors for the most exploited group of persons. Social isolation and economic distress intensify the possibility of unemployment, interpersonal violence, and homelessness. This lead to pose a threat to the marginalized and precarious group of being victimized and trafficked. Although in the absence of critical analyses of the impact of COVID-19 on human trafficking, especially girl trafficking, it is impossible to assess the actual condition. Therefore, the study aims to focus on revealing the prevalence and potential consequences of COVID-19 on girl child trafficking in central India. Particularly, the study investigates major determinants of girl child trafficking in Madhya Pradesh state in central India based on primary and secondary data. Further, it discusses the case studies with the help of non-government organizations (NGOs), which have been actively participating in mitigation programs of girl child trafficking in Madhya Pradesh for a long. The findings of this study point toward the intersectionality in human trafficking in terms of increment in the number of trafficked girls child. Most of these girls are from tribal communities, marginalized communities, and poor and broken families. This indicates the presence of a structural vulnerability in Madhya Pradesh, which creates a risky environment for the girl child. Additionally, this study provides a social framework to guide policymakers in developing an effective mechanism to deal with human trafficking during the global crisis.

Reflections of Psycho-Sociological Impacts of OTT Platforms: A Study from Central India

The journey of television entertainment in India started in 1959 with the emergence of "Doordarshan". The "Doordarshan" ruled the television industry for more than four decades with a variety of shows, including drama, mythology, fiction, etc. But, in recent years, India has witnessed rapid growth in viewership on different entertainment media, specifically Over the Top (OTT) platforms. Due to the increment in the number of mobile users and accessibility to the high-speed 4G internet, people are inclining toward the OTT platforms for daily entertainment. These platforms adopt the "Artificial Intelligence" techniques to acquire customers by suggesting the shows as per their search history and interests. In this direction, this study investigates the phenomenon of change in the interest in viewership from television to OTT platforms. Particularly, this

study analyzes the available contents on OTT to reveal its impacts on society. To this end, we adopted qualitative methods with unstructured interviews and group discussions to collect data. Forty-eight respondents aged between 16-40 years were selected by purposive sampling based on their daily access to the OTT. The results show that the viewers have more freedom to invest their time at their convenience due to the availability of content round the clock, unlike the television. On the other hand, the results indicate that the contents on OTT platforms promote the use of abusive language, violence, and obscenity due to the absence of a proper censorship body and the lack of awareness among the viewers about censorship. This is because youth is hammered psychologically to the condition of "Hero Syndrome" and prefer objectionable content, which leads to the number of seasons of a particular show.

Perceptions of Immigrants As a Threat to Economy, Culture and Security in Australia

Despite the importance of immigration to Australia, limited research exists on whether the causes of support among Australians for restricted policies for migrants are driven by perceptions that migrants are a threat to the economy, culture, and crime in the country. The sociological literature on group threat theory and immigration predicts that when the size of an outgroup increases, a sense of threat among non-immigrants increases, which leads them to be increasingly opposed to immigration.

Using waves of the Australia Election Study (AES), this paper advances our understanding of Australian public attitudes to immigration levels and support for policies curtailing the rights of migrants, in light of the established international literature. This analysis is aimed at examining the heterogeneity of such attitudes across varying interpersonal and social factors against key demographic variables on survey data between 1996-2019. By examining how such views differ across such population segments and by individual differences, and how the magnitude/direction of such associates have shifted over time, we discuss the implications of our findings from both theoretical and a policy perspectives.

An Assessment of Impacts of AI Revolution on Agriculture in India

AI is cultivated as significant tool in present time to allocate the activities of human beings in day-to-day life. AI performs the activities of forecasting, thinking, analyzing, assessing, interpreting and responding like human beings with more accuracy and less time. Recently it has attracted the attention of IT organizations to use AI as major technological tool after mobile and cloud platforms. AI is boosting the energy of individuals and markets. India is a developing country with more than six villages and agriculture is major source of livelihood. John McCarthy, an American commuter scientist first introduced the word "Artificial Intelligence" at Dartmouth conference in 1955. Agriculture is one of the oldest activities of human being. India with vast diversity is the world's largest producer of milk, pulses and jute, and ranks as the second largest producer of rice, wheat, sugarcane, groundnut, vegetables, fruit and cotton. India has varied climate from humid and dry tropical of south to temperate alpine in the northern reaches. It has diversity in ecosystem. In India majority of rural population is dependent on agriculture. In India agricultural productivity, competitiveness, and rural growth are major areas that needs concentration for growth. Majority of farmers are using traditional technology. AI has emerged as an effective tool for farmers to get the opportunity for better output. Present paper discusses the scope and constraints of Artificial Intelligence in rural areas in India.

Impact of Digitalization on Rural Empowerment

Digitalization improves the opportunities to have multiple options to utilize man, machine and material in an effective way. Digitalization helps in addressing challenges and enhance the ease of business and life. Digitalization has reduced the barrier between producer and customer, government and public, teacher and students, job providers etc. It has helped the rural economies to strengthen themselves. Digitalization is supporting rural people to take their decision in effective way. It has helped them get knowledge of government schemes, share their views with other people to solve their social and administrative problems in an effective way, pay their bills and receive their grants, get updated information about weather conditions and cultivation technologies. Digitalization is helpful in saving money and time. In India two third of population is residing in rural areas. Rural India has varied culture,

diversified area, multiple languages, low income and poor infrastructure. Despite of urbanization still rural has a major share in consumption of products and services. Presently the government has taken several steps to upgrade digitalization in governance to support rural population. The share of internet users is increasing at faster pace. Information technology is also emerging as major tool for agriculture. Technology has made the agriculture cycle more modern starting from growing the crops to marketing it to customers. Present paper discusses the impact of digitalization in rural areas of India.

(Gendered) Gatekeeping in the Recruitment and Support of (female) Early-Stage Researchers in a Mathematical Cluster of Excellence

Up to now, the equality of women and men in the academic profession in general and in the academic field of mathematics in particular has not been nearly achieved. The proportion of women in mathematics is still continuously decreasing with each academic career level. Our sociological qualitative study investigates possible causes and mechanisms of the reproduction of these gender disparities in a mathematical cluster of excellence, with focus on the role of gatekeeping. We assume that gatekeepers, due to their field-specific power positions, have the ability to influence women's advancement in the science system, e.g. by selection in recruitment or by providing career-relevant information in support.

In our presentation, we will share findings from 44 qualitative, semi-structured interviews with scientists in leadership positions in the cluster. In particular, we will focus on their recruitment and support activities as elements of gatekeeping, as well as their (gendered) attributions about their profession in connection with their recruitment and support. Our presentation addresses the following questions:

How are gender disparities (re)produced in the recruitment and support of (female) early-stage researchers?

What role do (gendered) perceptions on the profession itself, understandings of excellence or implicit (unreflective) criteria in the selection of the eligible play in the (re)production of gender disparities in (mathematical) academia?

What are the implications for addressing gender disparities in mathematics?

RC23-343.4

RANSIEK, Anna* (Department of Mathematics and Computer Science, FU Berlin, Germany)
MISCHAU, Anina (Department of Mathematics and Computer Science, FU Berlin, Germany)

Being a Woman or Being a Mathematician? (Self-)Perceptions of Female Early-Stage Researchers in an Excellent Mathematical Research Environment.

Gender equality in the academic field of mathematics is far from being achieved. The proportion of women in mathematics is still continuously decreasing with each academic career level. Our project analyses possible causes and mechanisms of the reproduction of these gender disparities in a mathematical cluster of excellence in which equality is formulated as a goal and implemented in various measures. Against the background of sociology of knowledge (Berger & Luckmann) and field theory (Bourdieu), the mathematical subject culture and the development of a "mathematical identity" as well as gatekeeping, and scientific practices of recognition and support are part of the analysis. In addition, the inequality-reducing potential of career-supporting measures in the area of equality within the cluster are being examined.

The results we like to present are based on qualitative semi-structured interviews with female early-stage researchers. The focus of our presentation is on the self-perception of these women as (female) mathematicians as well as the (gendered) attributions they have to deal with against the background of scientific practice in general and the specific mathematical subject culture in the cluster. We will highlight the tensions these women see in being addressed as women but wanting to be mathematicians. We will also outline the (sometimes) dismissive attitudes of these women toward equality policies and identify the resulting implications for equality (and diversity) policies in mathematics. Based on our results we will also propose initial ideas for a debate on intersectionality in the field of equality policy.

The following questions will be addressed:

How do female early-stage researchers constitute themselves as (female) mathematicians between self-perception and external attribution?

What are the perspectives of these women on equality policies?

To what extent do our findings affect the discussion on equality and diversity policies in mathematics as well as the general debate on intersectionality?

Food Security amidst Disasters in a Post-Growth World: Opportunities and Tensions

There are a growing number of disasters globally, and the destabilizing impacts are only anticipated to increase. From the social science research, it has been established that disasters disproportionately impact vulnerable populations, increasing food insecurity and making it more difficult for those populations to recover from disaster. Simultaneously, we have a growing number of scholars calling for degrowth, post-growth, and/or post-development world in agri-food systems (see McGreevy et al. 2022). Yet, there has been little consideration for how our existing understanding of food insecurity amidst disasters could inform calls for a post-growth world. Similarly, calls for a post-growth world recognize the need to change dominant forms of agri-food systems, but may not fully appreciate the challenges of ensuring food security during a period of increasing disasters. This works seeks to explore the opportunities and tensions that exists between these two sets of literature.

Emerging Anti-Racism Activism and Discourses of Racism in Times of Political Polarization in Bolivia

Advocating for the rights of Indigenous peoples has been central to the activism of social movements in Bolivia for decades. In a country where a large part of the population belongs to one of the thirty-six recognized Indigenous groups (Afro-Bolivians being one of them), the land rights, autonomy and self-determination of Indigenous peoples have been at the center of the politics of social movements. Furthermore, for the past 15 years or so, Indigenous issues, plurinationalism, and decoloniality have played a significant role in state discourses and policies, although not without disputes and contradictions. As in many parts of the world, the debate about race and racism has intensified significantly in recent years in Bolivia, but instead of anti-racism activists leading it, it appears to have become a fierce battlefield between the governing regime and the political opposition. This paper examines the emerging anti-racism activism in times of political polarization, when political elites have become active in the discursive deployment of the notions race and racism for a variety of purposes. Using fieldwork observations and interview data, it analyzes Indigenous activists' complex navigation amidst challenging political scenarios, as well as their perceptions and experiences concerning racism and anti-racism. The aim of the paper is to enhance an in-depth and contextualized understanding of how and why issues of indigeneity, race and racism have become increasingly visible in the contested national politics over the last few years. Importantly, the paper suggests that in times of political polarization, discourses of racism intersect with concerns over democracy and authoritarianism. Furthermore, it underlines the importance for the autonomy of Indigenous and anti-racism activists, and warns of the attempts by political parties to instrumentalize anti-racism struggles.

Reforming and Resisting Development: The History and the Present of Development Alternatives

This paper examines the history and the present of development alternatives. Drawing on a historically grounded analysis, it suggests that there is a constant and contested interplay between critical discourses of alternatives and the continuous practices of development aid apparatus that aim at integrating and, thus, taming radical, alternative proposals to its agendas. Consequently, development alternatives may bring new concepts, ideas, and methodologies to development discussion, reforming its practices. Alternatively, they may resist development altogether, imagining civilizational shift beyond capitalism and colonialities. This paper will identify three main historical times during which new utopian ideas – democratic, ecological, and inclusive – have been proliferating in terms of how to rethink, renovate and transform the concept and practices of development; namely, 1960s-1970s, 1990s, and contemporary times. Through a historical analysis of development alternatives, it will discuss what kinds of similarities and differences exist between the radical ideas and alternatives of each era. Furthermore, it discusses how changes in the global political economy have lead into the proliferation of utopian thinking and pluriverse proposals during certain eras, and not during others. Through a detailed analysis of alternative development approaches, post-development and contemporary transition alternatives, such as Buen Vivir/Vivir Bien, the paper aims at enhancing a historically grounded, nuanced and in-depth understanding of the complexities and situatedness of utopian thinking and pluriverse proposals.

Barriers for Older Users of Digital Technologies

As European and world populations are aging, more attention is given to social inclusion of older people, in particular in relation to digital technology use. The level of ICT use among older adults in Lithuania is significantly lower than in Western and Northern European countries. 53 percent of population aged 65-74 years never use the Internet, while in most Northern and Western European countries this share varies between 2 and 15 percent. The situation does not improve significantly despite many practical initiatives, and has intensified during the COVID-19 pandemic, as older people had to practice physical distancing, consequently becoming even more excluded from social life. The aim of this study is to explore the barriers of ICT use based on qualitative semi-structured interviews with older ICT users (N=36) and their facilitators (N=9). The difficulties revealed by the study can be divided into three groups: 1) adjustment to the digital technologies as a unique system (its specific principles of functioning, English and technical language), 2) psychological relationship with an unknown and complex subject (a spectrum of fears, insecurity, shame of not knowing, experience of one's limitations, lack of patience), and 3) changes that informants relate to old age like deminishing motivation to engage with innovations, experienced learning difficulties, and bodily changes (sensivity of fingers, weakening sight and memory). The limit separating things which learning would require too much efforts, even if wished (e.g., electronic banking), might sometimes be covered by the lack of need. Some findings different from previous studies are discussed. To overcome the barriers, access to mentoring would be beneficial. Research project is financially supported by the Research Council of Lithuania (LMTLT), agreement No S-MIP-21-58.

RAPOLIENE, Grazina* (Lithuanian Centre for Social Sciences, Lithuania)

GEDVILAITE-KORDUSIENE, Margarita (Lithuanian Centre for Social Sciences, Lithuania)

Distrust and Fear - Obstacles for Digital Inclusion of the Older People in Lithuania?

Trust is at the core of human interaction and an integral part of different types of sociality as belonging, integration, inclusion, participation, cohesion or solidarity (Endress 2014; Carpiano 2006). Trust is seen as one of the components of social capital, together with social networks and norms of reciprocity (Putnam 2000; Delhey and Newton 2003). However, Eastern and Central European countries are characterized by low levels of trust. In 1999, the average percentage of trust in the parliament in this region was only 26, compared to 41 percent in Western European countries (Inglehart et al. 2014; a similar gap was estimated by Papaioannou, 2013). Lower levels of digital literacy also characterize Eastern and Central European countries. Fifty-three percent of population aged 65-74 years in Lithuania never use the Internet, while in most Northern and Western European countries, this share varies between 2 and 15 percent. Are (dis-)trust and digital exclusion interconnected?

Based on qualitative semi-structured interviews with older ICT users (N=36) and their facilitators (N=9), this study discusses lack of trust, insecurity and fear as obstacles to use digital technologies for older people. Lack of trust manifests as fear and hesitation in gaining new digital skills. The narratives include arguments about unclear, insufficient or potentially insecure messages, pop-ads, stream of false, unreliable information, and unclear functioning. Feelings of insecurity range from a general lack of trust in electronic communication to specific moments of communication in social space because of discrepancies in earlier experiences and attitudes to communication. The strategies to overcome the distrust are discussed. Among others, the role of intergenerational networks in overcoming digital exclusion and lowering the dis-trust play a significant role.

Exposure to Online Fake News on Covid-19 and Consumption Preferences. a Comparison of the United States and Finland

Since the beginning of current Covid-19 pandemic, various speculations have been presented about the long-term consequences of the pandemic to consumer citizens. While it is still too early to say how much daily activities

of citizens will actually change after of the pandemic. Some existing studies indicate decrease in the use of public transportation, travelling, and avoiding social gatherings. At the same time, online shopping, buying take-out food and the use of online communication tools have increased. However, some citizens have changed their behaviours more than others. This paper aims at offering possible explanations why such behavioural disparities have taken place. We examine how does exposure to online fake news on coronavirus connect with changes in daily consumer activities. Our theoretical motivation comes from social embeddedness theory and recent notions of media 'infodemics'. The data come from comparable and nationally representative survey samples of Americans and Finns, aged 16 to 75 (N=3,108). The surveys were collected in November 2020. We examine self-reported measures on such activities as stopping the use of public transportation, stocking up food at home, and avoiding public places. We expect to find both socio-demographic and national differences in the changing behaviours. Especially, we expect to find that changes are more visible in the United States compared with Finland. In conclusion, the increased significance of social media as the source for relevant information retrieval is discussed.

Integration into Australian Labor Market: The Case of Transnationally-Married Muslim Bangladeshi-Australian Women.

This paper explores the Australian labor-market integration of transnationally-married Muslim Bangladeshi-Australian women. Muslim women such as Bangladeshi-Australian women who enter transnational arranged marriages are homogenized as cultural victims by dominant Australian (and European) policy, public and media discourses. Muslim transnational brides, in particular, are assumed to lack cultural capital (educational qualification, language proficiency) with consequences for their socio-economic integration to the host nation (e.g. Australia). Such homogenization masks the heterogeneity of transitionally-married Muslim women as well as the complexities of the integration process. Using a postcolonial-intersectionality approach to analyze quantitative and qualitative data obtained from a national survey (n:122) and 16 semi-structured interviews with Bangladeshi-Australian women, this paper presents ways in which these women's experiences of labor market integration have been shaped by discourses and power relations regarding race, gender, class, culture, migration, as well as material conditions in Australia. This has manifested in gendered expectations concerning child rearing and home duties, misrecognition and/or racialization of institutionalized (overseas academic credentials and work experience), and embodied (hijab and attire) cultural capital, lack of social capital, racism, gender discrimination, and lack of Australian government assistance [HECS/HELP] particularly for temporary residents. This study shows that these factors, in multifarious ways, limit the participants' (most of them are employed and hold tertiary educational qualifications) opportunities to access jobs relevant to their level of education, to upskill and/or re-skill.

Living Experience of Transgender Community in a Permanent Settlement: A Study on the Manab Palli, Bangladesh.

An individual who is born with a gender identity different from the male and female sex is considered as transgender. In Bangladesh, these transgender people are commonly known as *Hijra,* who are socially excluded due to a lack of social recognition and fundamental human rights. In mainstream society, hijra people are tabooed and excluded because of the stigma about them which creates gender discrimination. They cannot get a formal education, employment and medical attention. In 2013, the Bangladeshi cabinet recommended a policy allowing hijra as a third gender on all government forms, such as passports and national identification cards. The total number of hijra in Bangladesh is 12,629 (BBS, 2022). Sustainable Development Goal 5 advocates for **Gender equality**, to achieve this goal Bangladesh's government took the initiative for providing housing to the transgender community of Dinajpur in 2011 which is known as "*Manab Palli,*" and this settlement is considered as the study area for this research. This study examined the experiences of transgender people in the settlement. Both trans-feminism and social exclusion have been used as theoretical lenses. Guided by Qualitative methodology, intensive fieldwork has been initiated. To record the voices of the respondent, in-depth interviews in the form of testimonio were used. After thematic analysis, it was observed that their economic situation, the social perspective of community people towards them, and other amenities all improved with the establishment of Manab Palli. One of our respondents named Bokul declares, "even if I die, I will never leave

this place", which indicates that they feel comfortable here and are leading a more routine existence than they had before. Gender inequality can be minimized if accommodations are made for all transgender people. Therefore, the outcome of this study will facilitate the policymakers to adopt adequate policies to ensure a settlement for all.

Rising Inequalities in the Wake of the Covid-19 Pandemic: A Study of Foreign Born's Labour Market Situation 2019-2022

Based on earlier crises, the effects of the COVID-19 pandemic might aggravate the already-wide employment gap between foreign (out-side Europe)- and native-born people, creating a long-term employment crisis. The aim of this paper is therefore to investigate how the pandemic has affected the labor market situation for foreign-born individuals in Sweden during 2019–2022. In the paper, we combine sociology and economics with an intersectional approach, which enables the identification of mechanisms and trends affecting the labor market for the foreign-born. We use a labor force survey (Labour Force Studies, LFS, collected by Statistics Sweden) to analyze the effects of the pandemic on the labor market situation for foreign borns. The preliminary results show that during the investigated period, the employment rate fell more for the foreign-born (out-side Europe) compared with the native-born. Furthermore, we found that within the foreign-born group, the employment rate fell more for foreign-born women than for native-born women. The results indicate that the labor market situation has worsened more for women than men and for the foreign-born than the native-born and that foreign-born women are most affected. By identifying the underlying discriminatory structures and the groups that are particularly vulnerable, the results can provide a basis for policy actions aimed at preventing a further weakening of the labor market situation for foreign-born individuals and creating essential settings for increased resilience in future crises.

RASMUSSEN, Mary Lou* (The Australian National University, Australia)

Australian Young People, Reproduction, Inequality and Climate

The International Planned Parenthood Federation (IPPF) (2021) recently put out a position paper entitled *The climate crisis and sexual and reproductive health and rights*. In the paper they warn against a perceived shift towards the promotion of forms of personal responsibility as a means to address "unsustainable patterns of consumption and production, particularly in high-income countries". They argue specifically against the use of contraception as a strategy for climate change mitigation because the focus of "such narratives – explicitly or implied – is women and girls in lower income countries, where rates of fertility are comparatively high...It is a deeply unjust and harmful distraction from countries' responsibilities to address the structural drivers of the climate crisis." (2021:10). The IPPF is rightly concerned with the ways in which concerns about climate crisis are potentially impacting women and girls in lower income countries. These associations are also having an impact on young people in the Australian context where rates of fertility are already comparatively low.

For some young Australians relationships to reproduction are increasingly mediated by questions of climate, population and inequality. Here we trace the ways in which thinking and feeling about inequality have become entangled with young Australian's decision making about reproduction and climate. This paper is based on interviews conducted by ANU research interns with young people aged 24-35. Four specific groups of young people were recruited for this pilot study (young people committed to environmental causes; young men; LGBTQA+ young people; and young people from lower socio-economic backgrounds).

Pregnant Women's Experiences of Seeking Shelter and Health Care in the 2019-20 Bushfires in the ACT and NSW South Coast: Implications for Practice

Introduction and Research Questions

During the 2019-20 bushfires, pregnant women were asked to evacuate and seek shelter from smoke and fires. What actions did they take when asked to seek refuge? How did health and government authorities respond to their need for shelter and care? What are the implications for public health practice and disaster management?

We interviewed 23 mothers living in Canberra or the NSW South Coast about their experiences of being pregnant, giving birth and/or parenting a new-born baby. All participants had to seek refuge from smoke. Some were directed to evacuate because of the threat of bushfire. We asked participants to describe the steps they took to seek refuge from fire and about the effects of this on their capacity to care for themselves and their foetus/new-born baby.

Methods

Interviews were conducted face-to-face or via Zoom and were approved by the ACT Health and ANU Ethics Committees. Interviews were audio-recorded, transcribed verbatim and coded by team members.

Results

Participants reported various strategies used to seek refuge and health care after being told to evacuate from their homes/places of residence. Participants made divergent decisions about avoiding smoke/fire: some stayed where they were, some went to shelters, some went to shelters and subsequently left and sought refuge elsewhere. Women also talked about challenges associated with seeking health care related to their pregnancy/birth during the bushfires.

Conclusions

Our study provides empirical evidence about the complex ways pregnant women respond to orders to evacuate and the health-related actions they take during bushfire events. We demonstrate that women want place-specific and time-sensitive advice. They also want places of refuge and health care that can cater to pregnant women/women with newborns in the event of having to evacuate from their homes and their communities.

A Study on the Impact of Digital Marketing on Export Growth Afghanistan – India

The main purpose of marketing is to help companies increase their performance while putting their goods and services across from customers. Today's businesses compete intensely with each other in the order to expand and guarantee their long-term existence in the market. According to Ayyagari, Beck, and Demirgüç-(2007) Kunt's study, the expansion of enterprises is crucial for every nation's economy as a whole, hence additional motivational factors must be taken into account to help firms expand. Clients' recruitment and retention are essential for many Afghan businesses that export goods to India because they are at this stage of their life cycles. As a result, to attract clients throughout India, including rural areas, businesses must have a clear marketing purpose and strategy in place. Afghan traders have always relied on word-of-mouth marketing to spread the word about their products and services. The paradigm of marketing has changed away from the provision of connectivity and toward the sale of commodities as digital marketing has gained prominence. Technological improvements, new marketing channels, and the ongoing change in the media environment have all contributed to this transformation (Bhattacharya and Bolton, 2000). The purpose of this study is to ascertain the effect of digital marketing on Afghanistan's export growth to India, we have created the simple linear regression model below to better understand how digital marketing affects export growth and sales, and Primary data for the study was acquired through a survey form made especially for it. Data on both the quantitative and qualitative levels were gathered using a semi-structured questionnaire the sample size was 60 traders.

RATH, Archana* (O.P. Jindal Global University, India)

Rethinking Child Citizenship in India: Age, Agency and Law

While formal citizenship guarantees certain rights with regard to birth, period of stay, or descent, the associated responsibilities and participation are a focus of limited research for children in India. Citizenship in a substantive sense embraces social and political interpretations which involve viewing the child as an active member, irrespective of the age of the child. The Constitution of India and the United Nations Convention on the Rights of the Child, 1989 recognise the age at which a person can be distinguished from an adult, as 18. However, national and international legislation create possibilities for children less than 18 years of age to be considered as adults due to the kind of work or crime that they engage themselves in. 16 year-olds can be tried as adults if they commit heinous offences as per as the Juvenile Justice (Care and Protection of Children) Amendment Act, 2021, while 14 year-olds can work as adults in non-hazardous enterprises in accordance with Child Labour (Prohibition and Regulation) Amendment Act, 2016. The International Labour Organisation Minimum Age Convention No. 138, 1973, seems to uphold this, with provisions for children as young as 14 to work, while recognising the age limit in national laws to be lower. The research question of the paper is, how do law and politics reimagine child citizenship in India? The methodology is a normative study based on interpretative analysis of age-related sections in specific national and international laws. The paper explores the possibility that law seems to recognise age as a construct, arguing that rethinking child citizenship in India involves reimagining agency of children being constantly created and recreated by law in practice.

Trafficking in Persons in India: Dealing with the Surprising Lack of Legal Infrastructure

India is home to 17 Percent of world population. As per the United Nations India is the top "destination for human trafficking in South Asia". Trafficking in human beings is the third largest organized crime (after drugs and weapons) violating basic human rights. There is no exact figure on human trafficking in India as only a few studies on this subject have been done so far. It is calculated that there are 36 million annual victims of human trafficking worldwide. Experts estimate millions of women and children are victims of sex trafficking in India. Despite being a victim country, India lacks legal infrastructure to deal with the very notion of Human Trafficking. Prostitution in India is legal although the law is vague. It is illegal on the ground. But there are strange peculiarity involves with the profession. The Immoral Trafficking Prevention Act, 1956 ("ITPA"), the main statute dealing with sex work in India, does not criminalize prostitution or prostitutes per se. As long as it is done individually and voluntarily, a woman can use her body in exchange for material benefit. But the IPTA punishes acts by third parties facilitating prostitution like 1) living off earnings, 2) brothel keeping, and 3) procuring. Since India is a densely populated country with lots of strain on resources, the unprecedented measures undertaken by the government to deal with Covid19 pandemic disrupted economic activities and made poverty-stricken women more vulnerable to trafficking. This paper argues immediate amendment in the definition of trafficking in Section 370 of the Indian Penal Code is essential to undertake vigorous investigations, prosecutions and convictions of traffickers.

RATHA, Sre* (Manipal Centre for Humanities, India)

Being a Mother in STEM Academia in India: Examining Academic Cultures, Institutional Support and Individual Strategies to Maintain Work-Life Balance

One of the defining constructs of "womanhood", motherhood, has undergone changes as women entered the workforce. While motherhood is seen as integral to the life-cycle of a woman, in the workforce it is often an impediment to women's career ascension. This causes a dilemma in women's lives while trying to balance their responsibilities at work and familial/childcare duties. In large part, these narratives are propounded and constructed by workplaces' (lack of) understanding of motherhood, its challenges and its sociality outside the workplace. This is evident by the dearth of institutional and infrastructural support for working mothers in most workplaces.This can directly have a negative affect on women's ability to perform at work and their career trajectories. This is particularly noteworthy in Science, Technology, Engineering and Mathematics (STEM) workplaces as evidenced by the steadily diminishing number of women as one ascends the academic/corporate rungs, a phenomenon known as the "leaky pipeline" effect. The historically male-dominated nature of these fields also has direct consequences on the workplace cultures leading to women's issues being insufficiently discussed at best or outrightly dismissed at worst. While working mothers in STEM have received significant academic attention in the West, Indian scholarship has paid lesser attention to the intersections between STEM academia and motherhood. Using a qualitative approach, this study, through narrative interviews administered among mothers in STEM academic careers in India, attempts to highlight the lack of support mothers receive in Indian academia. These narratives further provide a backdrop to probe into the questions regarding construction of motherhood in workplaces. The paper will also touch upon mothers' individual strategies to cope and negotiate with the same and thus attempt to present a critical look at workplace cultures in the traditionally male dominated STEM fields and the structural challenges they pose for women's career advancement in India.

Going Full Circle? the Potential Role of Prosumerism in a Circular Society

Current efforts in the European Union to foster a circular economy include an emphasis on promoting circular consumption. However, the scope and nature of circular consumption practices remain under-explored, calling for

contributions from environmental sociology. In particular, an over-emphasis on economic aspects of circularity has hitherto eclipsed social, cultural and material aspects of circular consumption. These include (infra)structural and cultural conditions that foster people's engagement in resource-intensive routine everyday practices and potential pathways for shifting these practices towards greater circularity. Conceptually, linkages between the production of less resource-intensive goods and services that facilitate circularity, and their consumption in households deserve further attention, facilitating a new appreciation of the potential role of prosumerism.

This paper presents conceptual insights and good practice examples from CircEUlar, a Horizon-funded European project that explores potential circular pathways for an EU low-carbon transition. Particular attention is paid to forms of prosumerism that focus on the provision and use of services in the context of housing and domestic resource use. Efforts towards product lifetime extension such as repair, maintenance, reuse and repurposing as well as commoning practices intended to reduce consumption and increase sufficiency will receive particular attention. The paper concludes with some policy recommendations to enhance circularity across the European Union.

RAUB, Amy* (WORLD Policy Analysis Center, University of California Los Angeles, USA)

Mapping Barriers and Supports for Caring Fatherhood: An Analysis of Laws in 193 Countries

Men's desire to be engaged, caring fathers in fundamentally shaped by both cultural norms and laws and policies that either support or create barriers to more equal involvement in caregiving. Drawing on data from the WORLD Policy Analysis Center, this session will examine three main ways that laws and policies impact men's opportunities to care. First, when laws explicitly reinforce gendered norms around caregiving that exclude fathers. For example, as of 2021, 11 countries prohibit discrimination at work against women with family responsibilities, but not men. Second, laws can support men's engagement in care, by enabling working fathers' the opportunity to engage in caregiving while maintaining their job and still receiving income. While much of the literature has focused on approaches to men's engagement in infant caregiving in high-income settings, the proportion of low-income countries guaranteeing paid leave specifically for fathers has quadrupled since 1995 and increased more than six-fold for middle-income countries. Third, gender-neutral laws can support men's engagement in caregiving by making it feasible for all caregivers to share in care responsibilities during routine childhood illnesses, long-term disability-related or other serious health needs for children, care for an adult family member's serious illnesses or accidents, and end of life care. However, in the majority of countries leave is either unavailable or unaffordable for many families. This session will also highlight how data can support civil society organizations already working to create change at scale that matters to engaged fathers, drawing on an example from South Africa of Sonke Gender Justice's successful campaign to expand paid parental leave to reach more families and caregivers, including fathers, adoptive parents, and parents who had a child by surrogacy.

RC32-JS-150.1

RAUB, Amy* (WORLD Policy Analysis Center, University of California Los Angeles, USA)

Understanding How Laws and Policies Contribute to the Economic Gender Gap in 193 Countries

Despite international agreement on the importance of closing the economic gender gap for individual women, their families, and national economies, progress in many countries has stagnated. While economic, social, and cultural factors contribute to gender disparities, these gaps are also fundamentally shaped by the legal environment that determines economic opportunities. Drawing on data from *Equality within our Lifetimes: How Laws and Policies can Close – or Widen – Gender Gaps in Economies Worldwide* (UCPress, early 2023), this session will give an overview of three main types of laws and policies that matter to economic gender inequality using data from 193 countries. First, it will examine laws directly targeted at ending all forms of gender discrimination at work. For example, despite #metoo, 50 countries globally have not even taken the very first step of legally prohibiting sexual harassment at work, and in many more, legal gaps undermine protections from all forms of sexual harassment. Second, laws that promote gender equality at work will only be effective if all women have pathways to access justice. However, in 55 countries gender discrimination is prohibited at work, but women have no protection from being fired for reporting that discrimination. Third, it will be impossible to achieve gender equality in the economy without addressing gender inequality in unpaid care. Yet, in 66 countries working women have paid time available to care for a newborn infant, but not men, and in more than 100 countries there are no provisions in place to help workers balance work and their older children's everyday health needs. This session will also highlight how this type of legal data has been used by policymakers and civil society as part of successful efforts to change the legal environment that limits women's economic opportunities, drawing on examples from countries around the world.

Change and Challenges of Educated Rural Youth in Context of the COVID-19 Pandemic

The Covid-19 is the global pandemic which is affecting all over the world and every part of society. Rural youth constitute a vast group that often faces both the challenges of age-specific vulnerabilities and those of total areas.

This paper presents evidence of the experience of the youth covid-19 pandemic and lockdown in their rural areas. We did a study about 600 rural youth from Gujarat after the second wave of the corona. The main objectives of the study are to know the socio-economic profile of the respondents. To know the impact of covid-19 on their live hood, mental health, education, economy, migration, and psychological aspects.

The questionnaire is used for data collection 500 rural educated youth are selected as respondents.

The study explores various concepts and sociological theories i.e. corona education, stress labour forces, mindset, hygiene, etc. power and control, subaltern perspective, conflict, and interaction theories are included in this study.

The study discusses the impact of covid-19 on rural youth in their various aspects of life and focused on the impact of the second wave in rural Gujarat. The issues of health services emerging in this stage and rural youth faced some problems and challenges as well

The role of government and NGOs played their role but some myths and mindsets of rural people and patriarchal structure caste and culture lack of infrastructure and communication have affected rural areas. The paper shows the change, opportunities and challenges of rural youth. The paper concludes with some important remarks and suggestions.

The Universal Periodic Review : Supporting the Ban on Intersex Genital Mutilation?

The Universal Periodic Review (UPR) assesses the human rights records of all 193 United Nations Member States at regular intervals of four and a half years. In 2022, the UN Human Rights Council closes the third UPR cycle. All countries will be reviewed three times since 2008, against the benchmark of The Universal Declaration of Human Rights (1948) and its core human rights treaties. The UPR has resulted in more than 93,000 recommendations received by States under Review (SuR) from their peers. Less than 1% emphasises the rights of a particular group of individuals: intersex children and adults. Intersexuality is identified against the framework of a binary understanding of sexuality, whereas intersex persons are considered somewhere in between the two categories of women and men, imposing a linear layer to the binary outline. Although human rights are universal, intersex persons experience one of the worst forms of human rights violations: Intersex Genital Mutilation (IGM). This is a medical intervention imposed on individuals with perfectly healthy bodies, with only one goal: conforming to the prevailing medical and socio-cultural norms. While significant research is conducted on the rights of persons of diverse sexual orientation and gender identity in relation to the UPR, the rights of intersex persons have scarcely been discussed. This article broadens the scope and integrates the ban on IGM into the discussion of UPR recommendations. The findings of the discourse analysis of 750 UPR recommendations reflect that only a few address IGM. This article argues that to support this plea and to build an *opinio juris* for the ban on IGM, compromises should be made by prioritising the right to free, prior and informed consent and the right to physical autonomy, over the ban of IGM.

RAY, Manashi* (West Virginia State University, United States)

Social Mobility in Transnational Spaces: Subjective Perceptions of Indian Women Entrepreneurs

The reproduction and negotiation of spatial and social inequality across national borders is especially complex in transnational spaces because migrants simultaneously occupy social locations/positions in origin and destination countries, which often leads to status inconsistencies (Faist et al. 2021; Nowicka 2013; Weiss 2005). The framing of social position in transnational spaces is thus bifocal, assessed through the lens of experience and perceptions of social position in home and destination countries.

Using Bourdieu's theory of capital and a feminist intersectional perspective, my paper focuses on the life stories of 15 Indian women transnational entrepreneurs (TEs) engaged in cross-border business in infotech and manufacturing primarily between India and the US. I examine the interplay of institutional structures, cultural practices, and social arrangements that particularly condition these women's agency and their social actions in both

enabling and constraining ways: first, I analyze the transference and conversion of their capital and skill sets in host societies, and second, the profitability of cross-border businesses in transnational spaces.

By studying women TEs' *habitus*—their transnational way of life, resources deployed for business performance, and networks—I look closely at changes in their social position and ensuing empowerment in the process of migration over time and between sites. While I examine different types of capital embedded in transnational spaces, I emphasize geographical/regional locations in India and western countries as crucial for the appreciation and conversion of varying forms of capital for women entrepreneurs, which impacts their identity. Ultimately, I show how women TEs subjectively assess their own economic capital (class), status, and social mobility across multiple scales (individual, local, national, familial, social networks), which in no way ignores the working of nation-state borders. Women TEs' individual perceptions of their social positions expand our understanding of social mobility beyond objective or "official" definitions of upward or downward mobility.

To Flee or Not to Flee? Im/Mobility Among Ukrainian Glass Artists and Entrepreneurs

Since February 24, 2002, the war in Ukraine has been the most important story of our time. Some 7.4 million Ukrainians have been recorded as refugees across Europe; another 4.13 million have applied for temporary residence in another country (UNHCR, Sept. 22, 2022). Poland has welcomed the highest number of refugees while Moldova has the largest concentration of refugees by population. Ukrainians have also moved on to other countries, especially those who crossed into Poland, Hungary, and Slovakia, which have open borders with other EU states. But many more have not fled Ukraine—which had a 44 million prewar population—particularly men between the ages of 18 to 60 years, who were barred from leaving the country for war efforts. Further, it is estimated more than one-third of those who had left may have returned to their home country (UNHCR cited in NBC, June 30, 2022).

To investigate divergent forms and determinants of im/mobility among Ukrainians during the ongoing war, this paper adopts the *aspiration-capability* framework (de Hass 2021; Schewel 2019) to explain the process that leads to both mobility and immobility outcomes. It focuses on how *capability* to migrate or not to migrate as a refugee is dependent on capital accumulation and the portability and convertibility of resources in the destination country and physical location in Ukraine.

Based on data collected through virtual interviews with 12 glass artists located in Kiev and Sumi, Ukraine, who were able to sustain their global businesses despite the war, this paper conceptualizes im/mobility as a continuum experienced by these artists. Interviews addressed whether or not participants fled during the war; who in the family migrated and who preferred to stay and why; and which country was their choice of refuge. My findings highlight how im/mobility is negotiated within families under a prolonged stressful situation.

RAY, Rajorshi* (IIT Kanpur, India)

Financial Actors in Context: An Ethnographic Study on Financial Intermediation and Its Role in Platform Dependent Entrepreneurship in India

Digital platforms are said to be reshaping and restructuring markets across the globe. Embedded within the market is the idea of the growing dependence of individuals on credit and debt. The literature in sociology of finance discusses the role of intermediation done by networks and individuals for seeking credit. However, the extant literature has not examined the point at which certain networks and individuals are invoked in the life-cycle of a debt. The literature on platforms characterises platforms as self-contained systems and has demonstrated that sometimes platforms themselves act as creditors. We bring the two literatures (sociology of finance and sociology of platform) into conversation, we propose our provocation: When and why in the life-cycle of a debt are certain financial actors invoked by platform dependent entrepreneurs (PDE hereafter)?

For this paper, we draw on ethnographic fieldwork conducted in the city of Kolkata from October, 2020 to January, 2022. We studied platform dependent entrepreneurs (*n=51*) engaged with ride-hailing platforms (OLA and Uber) through semi-structured interviews (both in-person and telephonic) and participant observation. In addition, we also interviewed individuals (*n=18*) who acted as moneylenders, brokers, bank employees and employees from non-banking financial corporations. Our findings indicate that the platform infrastructure pushes the PDE to seek multiple types of loans from multiple sources. By following a debt from loan-seeking to its repayment, we found that PDE`s need to invoke multiple specialised actors at various points in the life-cycle of a debt. This is because at various points in the debt life-cycle, only particular actors are able to assist the PDE`s due to their expertise. Finally, we observed that, platforms act as providers of creditworthiness to platform dependent entrepreneurs for seeking loans from non-platform sources.

RAYAMMARAKKAR FASAL, Fathima* (PhD Scholar, India)

Ethno-Religious Migrant Communities and Their Role in Co-Production of Urban Spaces: A Study of Migrant Businesses and Local Marketplaces in Bangalore

Space and spatiality are key theoretical constructs increasingly brought to the sociological study of socio-political processes in cities. Massey (1999) conceptualises space 'as constituted through interactions, from the immensity of the global to the intimately tiny'. Research on Markets as social and public spaces reveals its potential as a site of various vibrant social encounters (Watson, 2009). Yang's study of 'Bazaars' explores the role of markets in linking indigenous communities to larger networks of commerce, culture and political power. This study using grounded theory approach explores how ethnic-migrant communities co-produce places significant for local businesses in Bangalore, A South Indian city transformed into an I.T hub of Asia. Local markets in Bangalore sustained by Muslims are the sites of the study, to understand how ethnoreligious migrant traders and associated actors build political spaces, trans-local networks and strategies in the urban co-production of places.

Studies on Muslims in India reveals gaps in the literature that have avoided this heterogeneous community's everyday life, aspirations, and agential potentials. Therefore, the nuances of intra-community relations, gendered and spatialised experiences have scope for empirical exploration and theorisation. Moreover, scholarship on the intersecting themes of ethnicity, economies and spatialities offers insight for future research — especially as communities negotiate, make claims, and create places and economies within urban terrains where tenures and property ownership are constantly in a 'state of flux' (Rajagopalan, 2011; Benjamin and Raman, 2001). My research thus explores: How are local economies in Bangalore, where poor groups, Muslims and migrants have relative socio-spatial and economic clout, affected by urban land transformation politics in the city? What entanglements of relations with state and society do the traders of markets manoeuvre in the making/remaking of marketplaces? What has been the role of migrant women and their gendered experiences in place-making with respect to the marketplaces?

The Social and Institutional Bases of the Solidarity Economy

This paper examines the bases for the emergence and growth of solidarity in the economy. The economy is the realm of instrumental rationality. Yet, there are many economic activities—such as cooperatives of all kinds, mutual aid organizations, or associations of producers or consumers—that operate on a logic of solidarity. Our goal is to investigate the social and institutional bases that can support the development of solidarity in the economic realm. We do so by analyzing three very different experiences of solidarity economic organization— the Argentine recuperated enterprises, the Mondragon cooperatives, and the experience of self-management in the former Yugoslavia—and extrapolating from them what forms of social embeddedness and what kind of institutions can sustain solidarity. We identify three elements that can contribute to the emergence and expansion of the solidarity economy. First, institutions that generate interests in cooperation. Second, a collaborative relation with the state that can help the solidarity economy growth while allowing for its autonomy. Third, the presence of social movements that make their goal to build and expand the solidarity economy.

Critical Agency and Creative Imagination: Snapshots of the Future in Youth Movements

Kairos is the fragile catching-up with the right moment; today when it happens into the high complexity in which we are living, it let us glimpse what a sustainable future could be. This effort is crucial for contemporary youth movements that – especially with the economic 'great recession', the pandemic, and the emergency of climate change – tackled with uncertainty, individualization and crisis of representative politics. The aim of this presentation is to analyse this systemic issue with the help of a research fieldwork in Italy, based on the analysis of a network of experiences of youth mobilizations as reinvention of politics, characterized by the encounter of personal meaningful activities and innovative forms cooperation in different fields, from worker rights to environment protection. These creative experimentations of emancipative activism, rooted in everyday troubles, in the local dimension, in horizontal relations, in the mutual recognition of fragility, represent a form of critical agency, but also a strategy characteristic of a time where the future can be glimpsed mainly from local and concrete experiences, rather than based on abstract long-term visions.

Goodness Groceries! Can a Mobile Sustainable Food Shopping App Foster Food Literacy and Ethical Choices? Entailments for Suppliers, Citizens and Researchers

Within currently rising concerns around sustainability of food systems, in the related economic areas of regenerative production modes, responsible supply chains and informed consumption, there often remains a *practice gap* between what citizens know they should do and what they actually do. This is preceded by a *knowledge gap*: the knowledge of what a sustainable product specifically is tends not to be entirely consensual, blurred with potentially contradicting injunctions between different claims of sustainability. Instead of trying to solve this puzzle with metrics, we propose an App that makes various components of sustainability transparent, thus *qualifying sustainability complexity*. Our aim is not to hierarchically determine 'the best' sustainable choice, but rather to relationally empower citizens to choose the product with the sustainability criteria that most fit their values and priorities.

Goodness Groceries! is a University of Luxembourg consumer study piloting a mobile sustainable food shopping App in partnership with a supermarket chain. The App acts as a virtual shopping companion providing eco-responsible and ethical product information of selected daily food products, each time for up to four types: local organic, local conventional, imported organic and imported conventional. The information provided is based on self-assessments made by product suppliers. Each food item is granted criteria in the four main themes of Environment, Social Well-being, Economic Well-being and Good Governance, subdivided into relevant indicators (SAFA guidelines, FAO 2014)–marked with easy-to-recognise icons. The user-friendly App is designed to scan alternatives of the same product via a QR code whilst shopping, to analyse if this helps consumers make an informed choice – or not, and why.

Starting in Autumn 2022, entailments of the (ongoing) study and App in terms of structural obstacles for researchers, necessary supply chain adaptations for suppliers and analysis of citizens' shopping habits and App usage feedback will be discussed.

Values-Based Territorial Food Networks (VTFN): Qualifying Sustainable and Ethical Transitions of Alternative Food Networks (AFN)

Localized food growing and livestock rearing initiatives with more direct transformation and commercialization structures, often at comparably small scales, gained ground worldwide. They represent various types of 'alternatives' to industrialised agri-food processes and to standard producers/consumers divides characterizing the global food system. While these alternatives are not always new, they have sparked growing scholarly interest.

Over time, the literature has addressed them via four main conceptual denominations: Local Food Systems (LFS), Short Food Supply Chains (SFSCs), Civic Food Networks (CFS), Alternative Food Networks (AFN). These concepts have distinct foci, partial overlaps, and they seek to capture an immense heterogeneity of empirical phenomena. Yet this conceptual plurality risks to conceal that these empirical initiatives, despite their differences, have structural commonalities at food system level, relevant for understanding pathways to a sustainable food system transformation.

Therefore, I argue for an overarching concept subsuming the existing ones. *Values-based Territorial Food Networks (VTFN)* would take into account the diverse perspectives from the four main concepts in this field, classify their specificities and address their shortcomings. The social critique at their core, leading to transitions, is constructed around values of 'doing things differently', at the level of specific territories. The more robust and authentic these sustainability values in VTFN are – in terms of environmental integrity, social well-being, economic resilience and ethical governance – the more likely they are to be incorporated into practices, to become more and more legitimate and gain a voice at negotiation tables, in order to help reorient the current corporate agrifood regime.

Dialogic Leadership for Social Justice

This paper presents the transformative dimension of dialogic leadership as a shared practice for social justice that improves schools and neighborhoods. Through close collaboration, participation and dialogue between teachers, students, families and community members, educational agents demonstrate to generate leadership in classrooms and beyond the schools.

Leadership embraces approaches that consider possibilities beyond administrative and managerial activities and the sociocultural perspective, and dialogical learning shows the possibilities to transform the sociocultural context and to improve the learning processes with impact beyond the school. In this vein, the inclusion of dialogic leadership in challenging contexts demonstrates to enhance processes and dynamics of change, influencing the implementation of actions to improve social justice, particularly in deprived areas.

Research on dialogic leadership has demonstrated that leaders in different positions can contribute to advancing social justice. Furthermore, there is evidence of the relevance of empowering the diversity of communities existing in schools to create, develop and sustain leadership practices within and beyond the schools. It is necessary to advance knowledge about the synergies between educational agents to identify those dialogic leadership practices that increase participation, creating leaders in very diverse contexts.

This research is based on qualitative techniques using the communicative approach to study how educational leaders and other members in schools enhance the participation of the community through dialogic leadership, enabling the community to lead activities for social change.

The results provide insights on how to improve education by developing dialogic leadership that promotes community participation. This process of change allows the overcoming of stereotypes, facilitates the social inclusion of diverse populations in schools and brings us the opportunity to create leaders for social justice.

REHAL, Satwinder* (The University of the Philippines Open University, Philippines)

No Longer Elusive: Discourses over the Philippines' First Olympic Gold Medal

The 2020 Tokyo Olympics shall go down in the annals of Philippine sports history when the country won its first ever gold medal following Hidilyn Diaz's victory in the women's 55kg weightlifting event. The victory in effect ended the country's 97 year wait for the elusive gold. The victory however brought to fore various discourses in the public captured in both mainstream and social media content. The argument holds that socially constructed normative discourses abound in a society and reflected in media narratives. The central research question follows: What different narratives appear to inform the Olympic gold medal win by Hidilyn Diaz, and how can these be explained in relation to existing and pre-existing discourses around gender, economics, nationalism, and politics in the Philippines? The data is drawn from content derived from purposively sampled mainstream and social media content in the Philippines and thematically analysed guided by Fairclough's three-dimension model of discourse analysis which focuses on the use of language that is analysed as text, discursive practice, and social practice. The analysis of media text over Diaz's gold medal victory reveals the reinforcement of and challenges against pre-existing discourses around entanglements of gender, culture, nationalism, economics, and politics which tend to play out in everyday Filipino society. The paper contributes to nascent research in sport communication in the Philippines on the sociological dimension between media and social practices where dominant pre-existing discourses are played out in media narratives about sports performers.

FIEDLER, Anna Julia (The University of Hong Kong, Hong Kong)

Sympathetic but Inactive? – Explaining Youth Non-Participation in Social Movements

Its vivid civil society made Hong Kong one of the cities with the most protests worldwide. Youth activists also gained prominence over the past two decades and were among the most active groups throughout the anti-extradition bill protest movement in 2019. However, some youth who were sympathetic to the movement's causes did not participate in the movement, and others who were initially active dropped out subsequently. In this research, we examined why some youth dropped out ("erosion") and why others who sympathized with the movement never got involved ("non-conversion") using a mixed-methods design. On the one hand, structured questionnaires were completed by 536 undergraduate students in Hong Kong. These students were either of Hong Kong (local), mainland China (mainland), or of other origins (overseas). On the other hand, semi-structured interviews were conducted with 13 purposely selected students who had completed the questionnaire. The analysis revealed that non-local students were less likely to resonate with mobilization efforts as they lacked information due to language barriers and did not feel addressed by protest communication. Mainland students felt particularly excluded by hostile anti-mainland sentiments. However, ineffective (esp. ineffective violent) protest tactics, conflicts between different facets of students' identities, and specific barriers (e.g., residency status) appeared to be more critical factors that discouraged students from joining protests. The findings indicate that non-participation results from careful negotiations and decision-making processes. Due to conflicting identities, individuals may perceive their ability to contribute in a meaningful way as limited, or they may not feel that they belong. This situation particularly affects minority groups in culturally diverse societies and may be further amplified in post-colonial societies, such as Hong

Kong. Therefore, non-participation is not merely the opposite of participation. It should be viewed as a measure of societal (dis-)connectedness, (in-)accessibility, and (non-)resonance to movement communication.

Understanding the Catholic Community in Australia: History, Methods, and Applications

When it comes to religious demographics, Australians are fortunate in that the 5-yearly Australian Census includes a question about religion. In fact, the optional question has been asked in all Australian Censuses since the first one held in 1911. According to the most recent Census, held in 2021, Catholics made up one-fifth of the Australian population. At the same time, a national count of attendance revealed a continued rate of decline amongst Mass attenders, exacerbated by COVID-19 but not entirely as a consequence of.

This paper will describe how the Catholic Church utilises Australian Census data to assist with understanding the changing face of Catholicism, and religion more broadly, in contemporary Australian society. It will outline the nature of the data acquired by the Church from the Australian Bureau of Statistics since the 1991 Census, what the data tells us about Australia's Catholics, and how the data is used for mission and ministry planning at parish, diocesan and national level.

Characteristics of Research on Ultra-Deepwater Oil and Gas Platforms

Brazilian pre-salt oil and gas operations are carried out 200 km from the shore. To access these exploration and production platforms located in ultra-deepwater regions, a one-hour helicopter flight is required. During the period on board - usually two weeks -, people work and reside in the same place. Thus, communications and family life are restricted, characterising an isolation condition.

These platforms remotely positioned in the ocean and subject to severe meteorological phenomena configure hostile workplace environments. Front-line workers handle heavy and oversized equipment; operate noisy machines; and are exposed to chemicals or toxic products. In addition, there are hazards related to processes, such as blowout and explosions, which could affect the integrity of the entire place.

The opportunity to interview workers on board allows researchers to have access to the point-of-view, challenges or difficulties experienced by workers in a more accurate way. The field observation and participation help in the perception of the interaction and the support network among workers, which would be more challenging to identify only through onshore interviews.

The aim of this presentation is to discuss the characteristics of research on platforms and show how the researchers dealt with all limitations of this field in a project in Brazil. In order to be able to embark and investigate strategies that offshore workers use to deal with the peculiarities of their work, researchers had to take basic safety courses, complying with the Brazilian Navy, to respond in case there is an emergency.

On two one-week long offshore experiences, in 2017 and 2018, the researchers got involved with the workers' routine and conducted biographical interviews. Every experience which took into account the proximity with workers and their limitations added more richness to the results comparing to the online data collection which took place during the Covid-19 pandemic.

Political Economy Analysis of Energy Transition in Colombia: The Window of Opportunity of a New Goverment

El extractivismo como método de producción de energía se pueden entender como un legado de dinámicas coloniales, tanto las derivadas de procesos de conquista como del establecimiento de un sistema-mundo posguerra. Por ello, pensar en la transición energética se convierte en una oportunidad para romper con imposiciones transnacionales, dándole importancia a procesos de desarrollo tecnológico, social, económico y cultural en la esfera local. Y para ello, la reciente elección presidencial en Colombia plantea para los autores la existencia de una ventana de oportunidad para acelerar la transición energética con cambios institucionales que contribuyan en temas ambientales, puntualmente, de cambio climático. La ponencia pretende realizar un análisis de economía política de los esfuerzos de transición energética colombianos referidos tanto a la implementación de energías alternativas y limpias como

tanto en el sentido de la restricción de uso y explotación de combustibles fósiles. Posteriormente analiza el programa de gobierno y el plan nacional de desarrollo del país en mención para identificar las propuestas de cambio institucional y de política energética. Esto implicará reconocer la ambición tanto de un nuevo carácter de la transición energética guiado por la sostenibilidad fuerte como un nuevo papel geoeconómico del país en relación a los energéticos. Finalmente, se enuncian algunas consideraciones normativas en relación con la actual crisis climática y de energía.

Stitching Governance for Labour Rights: Towards Transnational Industrial Democracy?

The 2013 Rana Plaza disaster demonstrated that the prevailing model of private labour regulation through social auditing had failed to protect its alleged beneficiaries – workers at the end of corporate supply chains. The problem is that these private governance institutions show little concern with the democratic representation of those affected: workers and their representatives are often neither involved in a meaningful way, nor have been empowered by it. By its very nature, global supply chains undermine institutions of democratic labour regulation: democratic oversight and binding state regulation as well as workplace level democratic participation. Thus, the objective is to explore whether meaningful private transnational labour governance can emerge in a way that that is underpinned by the democratic representation of those affected – the workers. Thus, empirically, the question is what kind of institutions might promote more deliberative, representative and inclusive decision-making processes within private transnational, governance arrangements?

We argue that a model of "transnational industrial democracy" emerged based on both traditional principles of industrial democracy and more market oriented reliance on MNCs to act in a state like capacity. In this way, worker interests were represented not just through Bangladeshi unions and Global Union Federations but also through NGOs. In addition, the key leverage utilised was not one of threatening production but exerting pressure on MNC brand image. That said, while the Accord did prove a meaningful initiative in transnational labour governance problems did emerge for example in terms of the exclusion of important national actors in Bangladesh, including the government and the employers' association. Ultimately, the argument presented is that what is needed is a new paradigm of global labour rights, rooted in principles of transnational industrial democracy.

Change and Continuity in the Perceptions of Poverty, Inequality, and Role of the State Among Brazilian Elites

The paper compares opinions and perceptions of Brazilian business, political, and bureaucratic elites about three issues: poverty, inequality, and the role of the State in redistribution. For this purpose, we revisit survey data collected in 1990 and 2013. The first section proceeds to dialogue with the literature to circumscribe our concept of elite, and to present key issues in the academic debate on national elites, such as their internal homogeneity, the relative weight of long-term socialisation and of short-term interests. The second section details the sample selection and data exploration methodology. In section three, we describe and analyse the major results of the survey. Based on the survey results, section four discusses key arguments in the literature. We address also how to interpret the differences between elite sectors, particularly with regards to the leeway for adopting wealth redistribution policies. Moreover, we highlight the importance of considering the long-term stability of values and perceptions, as well as of identifying where opportunities for change lie. We conclude pointing to the role of politics for reverting high levels of income and wealth inequality.

Pubertal Maturation and Gender Gaps in Educational Achievement in Norway and the United States

Across the developed world, girls are outperforming boys in academic achievement. Girls attain higher reading scores and receive higher marks than boys in most school subjects. Emerging research investigates whether this pattern can be explained by gender gaps in developmental maturity – that girls on average mature at an earlier age than boys, and therefore are better able to live up to expectations in school at a given point in time.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Extant studies on pubertal development and school performance show mixed results depending on types of developmental measures, but earlier peak hight velocity, which is a measure of adolescent growth spurts, seem to be consistently associated with better school performance on average. But because there is considerable variation within gender as well as between, it is not clear whether this association helps explain the gender gaps in academic achievement.

The association between maturity, gender and school performance may also be influenced by socioeconomic background, as well as the school context. The timing of school selection, tracking and final exams vary across national contexts, which may have consequences for how the relationship between social background, maturity and gender is played out. In Norway there are high stakes exams at age 15-16, which has consequences for further school selection and vocational tracking, whereas in the United States most adolescents transfer to their designated high schools from local feeder schools, without high stakes exams or final grading at this age.

The paper investigates the relationship between timing of pubertal development and the gender gaps in school performance in the United States and Norway, using linked survey and register data. Preliminary findings indicate that pubertal development is more strongly associated with school performance among adolescents in Norway than in the United States, but it still explains relatively little of the gender gap in performance.

REJI, Neha* (Ph.D. Sociology-Indian Institute of Technology, Kanpur, India)

Church, Crisis, Women: A Study of the Ongoing Conflict between Jacobite and Orthodox Churches of Kerala Syrian Christians

What does a church conflict site with an "unusual" presence of women defending church's ownership imply? And thus ask the questions of how a contested atmosphere changes normative ideals of "being" and spaces. What roles are gendered bodies supposed to play (or not) differently/similar/outside their gender-defined boundaries? What does all this do (or not) to state and judiciary who come as clarifiers? These questions make me ponder the centrality of women in Kerala's Jacobite Syrian Christian churches and their contestations which has complex dynamics of fragmentation, until the final split into Jacobite and Orthodox factions in 1912. This church is again under tension with 2017 Supreme Court verdict, wherein state is supposed to hand over Jacobite parishes to Orthodox. The state enactment of court ruling faced disagreement from Jacobites. The contestation between these two groups, their claims, and articulations at socio-political levels serve the paper's plot and will employ gender as an analytical category in understanding everydayness of church, services, organization, and meetings, during its disputed times. I am interested in capturing extension of crisis in church's activities, accommodation, confrontation, mobilization, and disengagement and thereby look at (re) framing of gender, family, and church.

Why is gender an analytical tool? What difference does that bring compared to men and women taken in isolation? Understanding conflict through gender would not only concentrate on "what" Jacobites are doing but also look at "why and how" they are doing what they are doing; this historicizing will highlight genderization of bodies. The 'acceptance' provided within religious contours of sacrificial-valorized narratives on women excites this research to look into how and why women are visibilised. Clearly, it is not invisibility of women in these institutions that is of interest here, but contexts where their visibility and adaptations find themselves at junctures inviting exemptions from norms.

Making Standards for Cocoa Excellence: The Cocoaqualitystandards.Org

Cocoa is a commodity produced in the South, mainly by small producers, and mostly traded to the North in a buyer driven value chain. The world of cocoa quality assessment is undergoing changes in the last years. Cocoa is generally divided between bulk cocoa and excellence cocoa (finest flavor). Yet, no international standard exists to define what is cocoa of excellence. The Codex Alimentarius has norms for cocoa and chocolate, in paste and powder, without differentiation by quality.

A multistakeholder initiative, the Cocoaqualitystandards.org is trying to set on a definition and a common international standard for the cocoa of excellence. Cocoa Excellence, driven by the Alliance of Biodiversity and the Center for Tropical Agriculture (CIAT), organizes competition of finest flavor's cocoa in the world, using metrics criteria of quality.

Behind all technical norms exist interests and social actors who legitimize them. The paper aims to determine which values underpin the making of that standard, which values are hidden or not taken into account.

REPA, Marcus* (Sao Paulo University, Brazil)

Androids and Humans: Representations of Artificial Intelligences

The article aims to discuss the representations and social imaginary present in fictional films that present social aspects concerning human relationships with artificial intelligence, especially androids. Thus, it is considered that audiovisual production with this theme is permeated by relationships between appearance and reality (BADIOU, 2015). In this sense, representation in cinema is thought by conventions and chaining of sounds and images (SORLIN, 1985), being these combined with the way in which films can be perceived by the public and critics, producing new realities (MERLEAU-PONTY, 1983). Thus, audiovisual productions potentiate discourses as an exchange of signs (FOUCAULT, 2014), in which the real and the imaginary (ZIZEK, 2018) allow meanings and metaphors (MARTIN, 1990) to satisfy our desires and imagination (NICHOLS, 2005) in movies sequences. Thus, through the reading of images (JULLIER ; MARIE, 2012) combined with theories of industrial robotics and estrangement (MORI, 1981; 2012) and the boundaries between science fiction and reality (HARAWAY, 2009), it is aimed to discuss the films Ex-Machina (2015) and The Trouble with Being Born (2020). In both productions, we seek to understand the ways in which the film conceptions highlight the human experience mediated by intelligent agents (RUSSEL; NORVIG, 2013) and, likewise, how these films question the modified social behavior in the face of communication and interaction with these systems.

Community Development in the City: A Clinical Sociology Approach

Community development is a major issue in a world in great transformation, with a neo-liberal ideology dominating the economy and politics, in many countries, valuing exclusively individual performance and success in the work situation as well as in many spheres of life. That is combined with a decline of reliance on regulating social institutions, conducing to a fragmented social actions and individualism, far from a more democratic and collective ones. We will first refer to some inspiring recent theoretical views in that respect, specially the works of Harmut Rosa, François Dubet and Danilo Martucelli. The second part will be to present some experiences of community groups in Montreal, a Canadian city, involving vulnerable populations, people living in precarious conditions and marginalized from the mainstream society. We present more particularly three community organizations offering possibilities of social re-integration for homeless or marginalized youth and drugs consumers adults. Fort the youth, one is about transitional community housing, another one, offers a work training situation and for the adult population, it is a street journal organisation. These action-research studies have been using a qualitative and clinical sociology methodology, based on individual and collective life stories. We discuss the possibilities and limitations of such methods from a clinical sociology perpective to address community development issues.

The Development of Clinical Sociology in Canada, France, Latin America.

Looking at the development of different initiatives based on a Clinical Sociology perspective in some countries, I will try to focus on the similarities and differences present in the theoretical and methodological views related to the specific social and national contexts. That is based on the different writings of many authors who are members of groups or organizations in France, Brazil, Uruguay, Argentina, Chile, Columbia, and Quebec Province. It constitutes more informally a real network of members sharing their experiences, confronting and debating their epistemological as well as their methodological choices. The political and economical national situations will also be evoked, as well as the academic ones, and the relationship between the researchers in the academic status and the practitioners in the field. A brief comparison will also be included regarding the development of Clinical Sociology in USA.

Authoritarian Innovation in the United States: The Role of Judicial and Subnational Labor Governance

I apply Curato and Fossati's (2020) concept of "authoritarian innovations" to analyze the historical foundations of rising authoritarianism in the United States, showing how incremental changes, often framed as in defense of individual rights, have undermined core democratic institutions, limited space for popular participation, and dis-empowered the ability of actors to resist authoritarianism.

I focus on two areas of labor market and workplace governance as critical but understudied sites for these processes in the American context. First is the "return of judicial repression" of workers' rights (Rhomberg 2012). For decades, decisions by the federal courts have reduced the scope of union power and workers' collective action, in effect reverting to a pre-New Deal regime based on conservative constructions of freedom of contract and rights of due process and free speech. Second, I argue that under American federalism the U.S. has had not one unified, national labor regime since the 1930s but *two* competing, sub-national regimes: the New Deal order in the North and West Coast regions and an "anti-New Deal" regime, based in the former Confederate Southern states. Historically associated with anti-democratic, one-party control of state government, the Southern regime features more restrictive labor laws and a weaker welfare state. Together, judicial repression and dual regime rivalry have reduced the scope of democratic governance and contributed to the decline of an organized working class actor able to resist the rise of authoritarianism.

The analysis draws on historical evidence from studies in American political development, labor history, and welfare state research. It sets a foundation for a subsequent, quantitative analysis of the dual regime hypothesis that I am pursuing with Todd Vachon and Laura Bucci, using cross-sectional time series data for the 50 states from the 1980s to the 2010s (Bucci and Jansa 2021; Vachon and Wallace 2018).

RIBADEAU DUMAS, Hugo* (Ecole des Hautes Etudes en Sciences Sociales (EHESS), France)

"Dosti Kranti Hai": Friendship As a Revolution? the (dis)Empowering Potentials of Extra-Household Socialisation in Urban India

The study explores the role of friendship in challenging and consolidating gender inequality in India. A survey (n=1,000) was conducted along with a series of in-depth interviews (n=30) in Purnea, Bihar, and Margao, Goa. The findings offer insight into how individuals understand, experience, and leverage socialisation beyond the household. Friendship patterns reveal social fractures and disparities embedded in the fabric of the two cities. For instance, as compared to Margao, Purnea's women face a larger number of barriers in building and sustaining friendships, while men thrive with greater social capital.

Urbanisation happens to be a game-changer: certain urban resources make it easier for friendship to flourish, including for women. From that perspective, in a context grounded in kinship traditions, friendship can be perceived as disruptive and even as '*revolutionary*', as a respondent put it. The study suggests that the weight friendship carries in the life of people is correlated with self-confidence and open-mindedness on societal issues.

Yet, the empowering potential of friendship is not straightforward. Friendship is undoubtedly complex. There is significant variation in the understanding of what friendship encompasses and how it should be practiced. Gendered patterns overlap with class, caste, and generational differences. Certain friendships can be disempowering, both from an emotional and social perspective. Far from destabilising traditional norms, friendship can also at times contributes to rigidify social expectations in terms of manhood and womanhood. In this context, a significant number of people, especially women, remain ambivalent, and at times fearful, of friendship.

Put together, this study provides empirical evidence and theoretical reflections regarding the link between the practice of friendship and the process of empowerment. In conclusion, it brings to the fore the social role of (mis)trust in the interplay between these two concepts.

RIBADEAU DUMAS, Hugo* (Ecole des Hautes Etudes en Sciences Sociales (EHESS), France)

"Rahul, What Is Friendship?" - (Re)Defining Emotional Bonds Outside Kinship in Urbanising India

In the 1998 Hindi blockbuster *Kuch Kuch Hota Hai,* a professor asks Rahul – a student, and the main protagonist of the movie – "*Rahul, what is love?*". His answer – "*Love? Love is friendship*" – has become one of the most legendary lines of Indian cinema. Fair enough, Rahul, but what is friendship? This article investigates how friendship is understood, practiced and performed in urbanising India.

In India, kinship has traditionally represented a central space of socialisation. Yet, a wide range of urban factors have now significantly increased the likeliness of emotional bonds to bloom outside one's own family and community. In this context, the present study examines the extent to which friendship – in the way it is understood and practiced in contemporary India – can potentially challenge pre-existing social norms, particularly in relation to gender and caste.

The article offers methodological reflections on the challenges related to observing and measuring friendship, a concept which is ontologically fluid, highly contextual and largely intangible. The article champions a use of mix-methods to grasp the different dimensions of friendly love.

The study is based on doctoral fieldwork undertaken in two small cities of India, Purnea (Bihar) and Margao (Goa). First, the study mobilises a quantitative survey (n=1,000) to map how men and women engage with friends, both in terms of volume and nature of their relationships. Second, the research leverages in-depth interviews (n=40) to understand how urban dwellers perceive friendship, and how this varies across gender, class and caste. Finally, the article relies on ethnographic observations to explain how individuals perform friendship, in private and in public.

The study provides novel insights on popular conceptualisation of friendship, beyond Western theory, and attempts to answer a critical question: can love among friends foster social change?

New Entanglements of Religions, Politics, Economies and Cultures: The Peculiarities of the Theatre As Public Sphere

What are the manifestations in arts showing the new balances between Religion, Politics and Culture in contemporary globalized society?

Contemporary globalized and digital society is less and less definable in terms of a group of members, and more recognizable in an exchange of relations based on an economic logic. Contrary to the artistic process in modernity until its denouement, or in contemporaneity, collective action has been retracted in favour of individualized mass action; the steady disappearance of the collective phenomenon, initially in favour of a private reality, has gradually been transformed and transferred to the mass media, even appending the reduction of experience to the lack of a shared reality. The sociology of Arts offer us insights into significant irregularities in terms of understanding society and its complex development dynamics inquiring artistic collective actions, but also re-introducing participation, shared experience and recapturing public spaces. This paper will go through some art manifestations as they become places for the reconstruction of sociability and civic sense, of belonging and collective celebration. Theatre, music, performances, installations, but also museums recapturing with their presence places and spaces, reshaping or elaborating collective emotions, or being the evidence of a clear social awareness into social problems and needs, as well as solidarity and ethics, beyond social engagement.

Singularity and Social Resistance in the Interplay of Imaginaries, Politics and Religion

In post-traditional societies like today's, social change and the very dynamics of the intertwining of phenomena are essentially set in train by the technical factor.

With the privatization of society by neoliberal capitalism, the values of a shared social sphere are progressively eroded in favor of an immoderate individuality. And the idea of the public, understood as the reality of all, shared, common good, no longer exists in the imagination of this era, and clearly indicates how the collective imagination is also triggered and conditioned by emotional, irrational and hardly justifiable charges, which, however, change the balance of a society and its values. In this sense, the function of the imaginary comes forward as a possible way out, also through art forms such as performance, theatre for example, or installations that are the expression of a socially engaged action, in the sense of an art whose widespread practices undeniably transform the way of perceiving the social fabric, identity, differences and social inequalities sanctioned by neoliberal social structures, placing reflection on the individual as a synthesis of a much broader reality of which it is part.

But a society mainly dependent on technical factor, is also a society with an image-driven imaginary, which is again mainly driven by preordered images. In this paper, the aim will be to consider how a visual society, such as today's, can comprehend and leave room for free-thinking, for an experienced-based imaginary, which is a necessary assumption for critical thinking and potential singular perspectives. Together with the capacity of individuals to build their images connected to their level of experience.

How can this pre-logic area, a realm of creativity, be preserved from atrophy in a society invaded by images as types of pre-formed thinking and connect, instead, the experience to sense-making?

The Neighborhood-School Structure: A Unifying Framework for Studying Social Contexts within Segregated Systems

Robust literatures separately estimate school effects and neighborhood effects on children's educational, economic, health, and other well-being outcomes. Scholars increasingly acknowledge that both contexts matter and consider neighborhood and school effects jointly. Depending on the study design as well as the timing, outcome, and measures of school and neighborhood conditions, these studies have produced varying conclusions. This variation does not indicate lack of knowledge—one would not expect a unifying consensus that neighborhoods or schools universally "matter" more. However, research is often constrained to studies that add to the evidence on one or the other context's dominance, and scholars continue to consider neighborhoods and schools as independent contexts, without attention to how they affect one another from a systemic perspective that considers families' selection processes and policies that connect neighborhoods and schools.

We argue for a richer project of jointly studying neighborhoods and schools that engages scholarship on neighborhood and school selection and segregation processes. We introduce a broader framework—the neighborhood-school structure (NSS)—that describes how neighborhood and school contexts reciprocally shape and reshape one another through the actions of families and policymakers. Schools do not merely reflect neighborhoods or serve as a mechanism through which neighborhoods could affect children; they also influence the composition and characteristics of neighborhoods via cyclical sorting processes that unfold over time. This interdependence is a structural feature of spatial stratification that influences how families navigate housing and school choice markets. The NSS—the relationships between neighborhoods and schools—should be modeled, both conceptually and empirically, when considering how neighborhoods and schools affect individuals and how families navigate residential and school choice. We conclude with recommendations for bringing the NSS to bear on both outcomes-oriented studies of neighborhood and school effects as well as studies of contextual selection and segregation.

Models of Mental Health Problems: A Quasi-Systematic Review of Theoretical Approaches

Mental health and mental illness have been contested concepts for decades, with a wide variety of models being proposed. To date, there has been no exhaustive review that provides an overview of existing models. This presentation reports on a quasi-systematic review of theoretical models of mental health problems.

We searched academic databases, reference lists, and an electronic bookshop for literature that proposed, endorsed, reviewed, or critiqued such models. Papers, book chapters, and books were included with material by researchers, clinicians, non-medical professions, and service users writing between 2000 to June 2020 being considered.

Based on 110 publications, we identified 34 different models which were grouped into five broader categories (biology, psychology, social models, consumer models and cultural models). Many models bridged two or more categories. Biological and psychological approaches had the largest number of models while social, consumer and cultural models were less diversified. Due to the non-empirical nature of the publications, several limitations apply in terms of search and quality appraisal.

We conclude that the uncertainties around what constitutes a mental health problem have become more pronounced in recent decades. We were unable to detect any approaches which might act as a basis for consensus within the academic field, amongst clinical professions, or between stakeholders. Key areas of contestation are: (1) the characterization of mental health phenomena as a disease (or not), (2) the etiology of such phenomena, (3) the boundary between mental phenomena and mental health problems, (4) whether to take a first or third-person perspective. Debate remains as to whether acknowledge that some models are commensurable with others, or whether a meta-theory can be developed.

RICHTER, Dirk* (Bern University of Applied Sciences, Switzerland)

Variation Is the Norm: A Multidimensional Account of Neurocognitive Diversity

Recent psychosocial and medical research has revealed that the traditional understanding of mental illness as described in conventional classification systems such as ICD/DSM is no longer valid. New research and service user/survivor activism suggest that the neurodiversity model may be a promising account that could aid both support services and user/survivor identity. This presentation explores the pros and cons of the diversity account and proposes a fundamental change of how to view mental health problems, namely a multilayered and multidimensional model of neurocognitive diversity. In particular, the follwing dimensions will be explored: (1) mental phenomena (e.g. mood, hearing voices); (2) psychosocial consequences of phenomena (e.g. social exclusion, interpersonal conflicts); (3) appraisal of phenomena (e.g. identfying as being divergent or disabled); (4) aetiology (e.g. trauma, biological or psychosocial vulnerability); (5) perspectives (first person or third person); (6) ethical/legal implications (e.g. autonomy, human rights); (7) support preferences (e.g. therapy, supported employment); (8) sociocultural aspects (e.g. stigma of mental health problems, treatment willingness). Consequences of the neurocognitive diversity model for support services will be analysed.

Integrating Immigrant Students and Increasing Local Students' Acceptance in Europe through the Buddy System and the Dialogic Learning

The European Union establishes that the social integration of immigrants is a two-way process that involves both the host society and the immigrants (European Commission, 2003a: 8-9; European Commission, 2003b: 17-18). Focusing just on one side does not provide social cohesion. Just actions that contemplate both parts in their planning achieve it. We present an innovative action within the H2020 project Key Development Strategies for Long-Life Learning, consisting of designing teaching materials and learning methodologies based on the buddy system (Baloche & Brody, 2017) and dialogic learning (Flecha & Soler, 2013). According to the literature, we hypothesise that some expected results are double-side acknowledgement and acceptance, which produces social cohesion in the classroom and school. As a result, we get immigrants and refugees integrating into the school and host society, and the local students get used to accepting and understanding the foreign and immigrant students. And thus, obtaining more integrated and cohesive societies. The innovative actions involve students working on learning content related to the eight competencies of lifelong learning through theoretical understanding, applied content or methodologies, and interactive co-creation activities. Since an essential part of the project is implementing the buddy system online, another of the outputs will be testing how the online environment works and to what extent it achieves higher or lower inclusion than the offline's, or just different and complementary kinds of inclusion and integration. The pilot phase will occur between October 2022 and April 2023 in schools and educational centres in seven countries, such as Italy, Greece, Turkey, Israel, Germany, Norway and Spain. So by June 2023, we will be able to present data and evidence to confirm or nuance the hypothesis.

RIDGEWAY, Cecilia* (Stanford University, United States)

Status: Why Is It Everywhere? Why Does It Matter?

Status is a form of inequality based on esteem, respect, and honor. It is ancient and universal yet nevertheless pervades modern institutions, organizations and everyday life. Although we see it all around us in the workplace, the classroom, the neighborhoods we live in, the groups we socialize in, we barely understand status as a social process, what it is and why it matters both to individuals and for inequality in society. Status is often dismissed as a vanity at the individual level and, at the societal level, as a simple gloss on the better understood inequality processes of wealth and power. This is a major mistake that underestimates both the power of status as an individual motive and its central role in perpetuating durable patterns of inequality based on social differences such as gender, race, and class. I argue that status hierarchies are best understood as a cultural invention to organize and manage social relations in a fundamental human condition: cooperative interdependence to achieve valued goals that cannot be achieved alone but that create nested competitive interdependence to maximize individual outcomes from the shared effort. This invention is a two-fold cultural schema, consisting of a deeply learned basic norm of status allocation and changing common knowledge status beliefs that people draw on to coordinate judgements about who or what is more deserving of status. Because status beliefs become attached to social

differences such as gender, race, and class, status perpetuates inequalities based those differences as people spread status everywhere through their cooperative endeavors. Thus status is inherently a two-edged sword, part useful social technology for organizing cooperative achievements and part agent of injustice based on social difference.

RIEMANN, Me-Linh* (Catholic University of Leuven, Germany)

The Case of James: A Migrant's Path into the Gig Economy

James' career trajectory was marked by several major setbacks and disappointments, which could be retraced both to his personal upbringing and the structural conditions he was faced with. His early biographical project of becoming an IT specialist was obstructed by his father's insistence on a more traditional university degree (petroleum engineering), which he experienced as invasive and alienating. James portrayed the belief that working in the oil industry would bring about job security as a collective myth in Nigeria, resulting in an oversupply of petroleum engineers, who struggle to compete for very few positions available.

James tried to maintain ties to his earlier biographical interest in computer science by following free online courses. His training seemed, however quite fragmented and ill-directed. Given his lack of formal credentials and the meagre job opportunities in Nigeria, James became interested in online labour platforms. He soon witnessed how the fierce competition drove freelancers into a downward spiral of undercutting each other's prices.

As an action scheme of taking control, James decided to go abroad and pursue a master degree in the Netherlands. The institution turned out to be fraudulent, targeting international students for financial gain. Highly indebted and with little-recognized credentials, James found himself in a difficult situation after graduation. He feared returning to Nigeria, not only due to the lack of opportunities but also because of the violence and crime rates. His chances of getting a work permit in the Netherlands, however, appeared very slim. James turned to an online platform to remain economically active in the meantime. His work experiences were marked by the rating system, the blurring of temporal boundaries, incidences of discrimination and difficulties of combining his informal training with the pressure of being available 24/7.

Religion-Based Movements and Right-Wing Alliances Against Abortion and Lgbtqi+ Rights. the Case of the Italian 2022 Elections on Twitter.

This paper analyses messages over morality issues to unravel the relationships between religious movements and right-wing politics, focusing on the case of LGBTQI+ and abortion rights debate during the 2022 Italian election campaign.

Over the last decade, right-wing leaders have increasingly supported traditional Christian values becoming political references to religion-based reactionary movements striving for illiberal shifts regarding LGBTQI+ and reproductive rights.

The Italian context has proven an interesting laboratory to study religion-politics relationships, and the 2022 elections are particularly interesting. They were won by Fratelli d'Italia, a far-right party that has voiced pro-life and traditional-family values for years, and signed accords with religion-based movements to oppose LGBTQI+ rights and abortion.

Given that moral issues are a privileged perspective on contemporary religion-politics relationships and the strategic role of social media communication for social and political movements, this paper focuses on social media discussions about LGBTQI+ rights and abortion to unravel the relationships between religion-based movements and right-wing politics, addressing the following questions:

- What religious networks and actors discussed the topics of abortion and LGBTQI+ rights during the elections, and what are their relationships with the right-wing actors and networks?

- What were the religious and secular frames used in the debate? How, and how much, were they used and integrated?

These questions are answered using computational methods, including network analysis and topic modeling, to advance the understanding on the religion-politics relationships in the contemporary society.

Communion and Generative Social Change: A Study of Intra-Organizational Processes Enabling Individual and Collective Agentry

Social change happens through various means and targeting different issues such as poverty, environmental protection, and social justice and equality. Organizations can be either sites for social change, or agents in creating social change, or social change organizations themselves. In this theory-building paper, we focus on generative social change that creates possibility for further action, opens dialogues, amplifies individual and collective efforts, and generates and mobilize resources. Through three in-depth case studies of two Indigenous community-based enterprises in Mexico and Chile and one social enterprise in Egypt, we look critically and expansively at varieties of explanatory organizational mechanisms used by these organization in affecting dynamics and outcomes of social change and explore the role of agentry in the social change process. We show how everyday practices, community-based governance, and shared cognition are important parts of the change agentry repertoire of social and community-based enterprises and constitute important mechanisms for implementing social change at the individual and organizational level. In our analysis, we pay focus on rituals, Indigenous community habits and customs ("usos y costumbres"), and cosmology as factor that contribute to building of organizational communion, a factor that we see as essential for enabling individual and collective agentry leading to generative social change. Our work contributes to the conversation that generates new points of leverage and insight for studying, theorizing, and influencing social change, including (i) augmenting current views of social change that often focus on reducing the negative, (ii) drawing attention to processes and states important in explaining social change but which are often treated as insignificant, and (iii) pointing that no process, especially in the context of social change, is inherently positive across different contexts and time.

RIMAC, Tomislav* (ESCI, Pompeu Fabra University, Spain)

Innovation As a Deviant Behavior: A Comparative Study of Introduction of New Agricultural Practices, Forms of Organizing, and Modes of Collaboration

This paper investigates the dynamics of innovation processes that deviate from institutionalized norms of acting and that are directed at social change. Through comparison of three in-depth case studies; (i) introduction of biodynamic practices in cotton cultivation in Egypt, (ii) creation of a new form of regional collaboration in the agriculture sector in Catalonia, and (iii) establishment of food hubs as a new organizational form in the agriculture sector in the United States, we contribute to theory building about the innovation processes. Building on Merton's work on deviance, we conceptualize innovation as a deviant behavior of entrepreneurs who, unable to act on their opportunities within the given institutional context, choose to pursue their goals through illegitimate means of acting. The specific historical contexts provide reference points for our research and allow us for the examination of the interplay of cultural, regulatory, and normative institutions and their impact on the innovation process. We portray entrepreneurs as rational actors who make choices and decisions based on structural, as well as psychological and cultural arguments resulting in deviant behavior that can be simultaneously perceived either as a liability or as an asset. We show, that in order to legitimize their deviant innovative practices, entrepreneurs need to be able to keep multiple evaluative principles in play and to manage and exploit the resulting friction of their interplay. Finally, the paper shows that opportunities are opened for those who can understand and make the most of the local institutional regime and are able to create distinctive business models which can shape the institutional environment and facilitate entrepreneurial activities.

Frozen in Time – a Comparative Analysis of Emerging Temporalities Among Social Egg Freezing Users in Germany and Israel

Assistive reproductive technologies are increasingly used to control the biology of fertility and its temporality. Cryopreservation is a key technology for this practice. Cryo-technologies make it possible to stop and start biology with its bounded temporality or clocks, to halt, suspend and initialize metabolic or biological activity. They can therefore be perceived as challenging and as redefining the boundaries between life and death and between youthfulness and aging. This paper aims at expanding our understanding of the way temporality emerges and is negotiated in the contemporary practice of cryopreservation of reproductive materials, by focusing on the practice of 'social egg freezing' (SEF). SEF is a particularly interesting case as it aims to enable women to disconnect their reproductive potential from their biological rhythms. Based on 39 qualitative semi-structured interviews with Israeli and German SEF users, we will present socio-empirical findings illustrating different reproductive temporalities and their connection to the social acceptance of and expectations towards the practice of SEF. The cross-cultural comparative findings reveal three types of attitudes: postponing motherhood/reproductive decisions (German interviewees); singlehood and "waiting" for a partner (Israeli and German interviews); and the hope for multiple children (Israeli interviewees). These findings will be comparatively discussed in the context of relevant cultural scripts such as Israeli pro-natalism and social expectations from German mothers. The analysis uncovers temporality formations embedded in gender and reproductive moral values; including the 'extended present', 'waiting', and 'reproductive futurism'. We conclude by discussing the contribution of our comparative findings, highlighting the gendered and cultural imaginaries (re)constructing medical technological innovations and related temporalities, for advancing the theoretical framework of 'cryopolitics'.

RINALDI, Débora* (Universidade Pontifícia Católica do Rio Grande do Sul, Brazil)

Public Policy Analysis Via Qualitative and Biographical Research: Possibilities, Limitations, and Contributions

In Brazil, as in the rest of the world, broad-scope studies that assess the effects and impacts of public policies tend to do so via quantitative research methodologies. Even the qualitative studies tend to similarly work with a large amount of interviews that, for the most part, follow pre-determined scripts, seeking their explanations based on the frequency of repetition of certain phenomena within and between cases, thereby prioritizing "representation" over depth. Under this light, and based on the result of a recent biographical study about one of the main conditional cash transfer programs in Brazil, Bolsa Família or Family Allowance, the current presentation promotes a discussion on the possibilities, limitations, and contributions of researches that analyze the effects of public policies from the perspective of qualitative methods, i.e. methods open to data production which allow us to work with a small interview sample, albeit rich and dense in content, that can be analyzed in depth. Some of the study's specificities will be presented, as well as its results and contributions to debates about conditional cash transfer programs in relation to personal skill development. Finally, there will be a discussion on the possibilities, limitations, and contributions of open, biographical research for public policy analysis and improvement.

Huronia's Double Bind: How Institutionalization Bears out on the Body

Frequently missing from histories of forced institutionalization are close readings of the enduring impact on survivors' corporeality. In this presentation the author analyzes interview data featuring people who survived the Huronia Regional Centre: a total institution designed to warehouse people with intellectual disabilities that operated in Ontario Canada from 1876 to 2009. These interviews reveal the impact of institutional technologies on the bodies of the institutionalized, and how institutional survivors resisted those technologies. Institutional rituals meant to organize and cleanse residents, resulted in the reification of institutional subjects as inescapably contaminated. Drawing from Mary Douglas's theory of dirt and Julia Kristeva's interpretation of dirt as abjection, the author engages with interview data on daily institutional care routines, particularly dressing, eating, showering, and the administration of medication, to show how these rituals produced for the institutionalized subject meanings around gender and disability as markers of defilement. The author argues that the kinds of deeply oppressive and often violent rituals central to lived experiences of institutionalization are grounded in the assumption that disabled gendered bodies are already-abject, hence the institutional demand for the institutionalized to be brought under control.

WG08-795.1

RINALDI, Jen* (Ontario Tech University, Canada)

What Survivors See: Creative Condemnations of Total Institutionalization

This paper presents a 2013-2016 research project that documented the history of the Huronia Regional Centre from the perspectives of survivors. Located in Ontario Canada, Huronia housed children with intellectual disabilities from 1876 until its closure in 2009, and is notorious for its deeply violent history. The author of this paper is a member of a research collective, called Recounting Huronia, which formed in an effort to support the institution's survivor community and to center their stories. Survivors are co-researchers and equal partners in this collective.

Together the collective visited Huronia in 2014 so co-researchers could take pictures of the buildings and grounds. In monthly workshops following this site visit, the collective used collage techniques to transform selected photographs. This adapted version of photovoice (a methodology developed by Caroline Wang and Mary Ann Burris) enabled co-researchers to focus on what in the photographic image they deemed important and impactful--essentially making the work of critical consciousness-raising accessible to intellectually disabled institutional survivors.

This paper showcases co-researchers' manipulated photographic images of the Huronia Regional Centre, to illustrate the emotional resonances of total institutional space. Total institutionalization is a sociological concept first coined by Irving Goffman referring to the bureaucratic management of a population sub-set. Total institutional models continue to exist in myriad forms, especially prevalent as a tool for managing disabled populations. The images this arts-informed project produced lay bare the affective impacts of total institutional spaces, to show how models of total institutionalization are designed to produce violence against the institutionalized.

Forming One's Own Family in Times of Labour Market Uncertainty and Dependency from the Parents: A Comparison between French and Italian Young Adults

In France and Italy, structural and ideological transformations affect young adults' independent living arrangements. Atypical employment contracts and partial reforms in the Bismarckian welfare state generate uncertainty and dependency on family resources, undermining the departure from the parental home. Besides institutional changes, secularisation and the individualisation process are ongoing in both countries - despite at different speeds. The declining share of married people combines with the increasing share of cohabiting or solo living. However, gender roles and socio-economic inequalities diversified the ways men and women live independently, further selected by the effect of the family of origin's structure and financial situation, especially in Italy.

Therefore, the main research question is whether and how occupational position, social class and family of origin characteristics affect the selection process underlying alternative, independent living arrangements from a gender perspective in two most-similar national contexts.

The analyses are based on 2011 EU SILC cross-sectional data. Multinomial models with Heckman selection are performed to analyse whether the unobservable that decrease the living in a married couple and solo-living (*vs* unmarried couple) occur with unobservable that reduce the chance of living out the parental home.

The male-bread winner hypothesis shows men's occupational position is more crucial to living in a partnership. The Malthusian hypothesis about the economic costs of marriage makes men's standard contract positively associated with being in a married couple in Italy but not France. The secularisation hypothesis found French women more likely to live alone, while family dependency affects Italian women's propensity to live out of the parental home.

From a comparative and gender perspective, this contribution provides new evidence on the influence of economic position and socio-origin on how young adults set up their independent living arrangements. Few studies account for the selection mechanisms in the leaving home phase

At What Cost? the Corporeal Dimensions of Convenience

Digital technologies are accelerating the speed at which consumers and tourists access goods and services. Businesses and customers alike rely upon ideologies of convenience (Huberman 2021) to conceal the labour behind products and services like on-demand food delivery. However, the convenience of the platform economy for customers comes at a cost as exemplified by the recent deaths of workers. We sought to understand the impacts of food delivery on the lives and bodies of migrant workers in Brisbane, Australia. To answer this question, we conducted a 12-month ethnography with delivery workers (n27) and key stakeholders (n10). This included semi-structured interviews, participant-observation, and an innovative method of shadowing workers by bicycle. This approach introduced data from interlocutors (about the body in motion) alongside auto ethnographic insights (from the body as a data collection tool). Based on this data, this paper argues that migrant food delivery workers are highly skilled and employ a range of strategies and tactics to cope with mental and physical challenges of their hard (and underpaid) labour. Further, while workers use their bodies as a resource, so too do consumers, restaurants, platforms and governments who are dependent on the bodies of migrants to maintain their ideologies of convenience. These results diverge from much of the literature which focus on the benefits of digital technologies and obfuscate the costs to (migrant) workers. This research cuts through the hype of the "sharing" or "gig" economies to further expose the power imbalances and inequities which are often absent from discussions of the "future of work" in industries such as tourism and hospitality.

Social Representations of Human Dignity in Colombia

In this paper we examine the Colombian society in order to assess how transitional justice measures are actually responding to people's experiences and understandings of dignity. The purpose of this paper is to better circumscribe the notion of dignity to the Colombian context (thanks to the analysis of social representations); and to better understand the social expectations in terms of dignity restoration.

The impact of the idea of human dignity has moved beyond the legal sphere of human rights and has become a crucial component of the political culture in many countries. Furthermore, its use in everyday language has also influenced how people see themselves and their own struggles, including perceiving acts of social and political mobilization as a way of reclaiming their dignity. The notion of dignity has been critical to mass mobilization and has become a powerful motivation for protest participation in places such as Colombia, Chile, Ukraine and Tunisia.

Following the debates on human dignity in philosophy and legal scholarship, we understand that there is no unique or universal definition of human dignity that can be applied to every social context. It is necessary to examine how the idea of human dignity is represented in a specific context. Our analysis is based on the findings of a survey conducted in Colombia in 2020. In this survey we asked to 300 respondents key questions regarding the idea of dignity, loss of dignity, and restoration of dignity and questions related to the conflict in Colombia, particularly regarding issues on victimhood and responsibility.

Of Borders, Trumpian Walls and Security Discourses: Performing National Security at the Southern Border

Borders are interesting spaces where definitions of nations, nationhood and national security are constructed, and national security discourses are performed. Since 2016 the US-Mexico border particularly along the Rio Grande Valley (RGV) has emerged as the performative site where notions of national security policy in its various facets were defined. The RGV border community has received both national and international attention as the space for both Trumpian nationalistic Public Policy initiatives as well as social movements of resistance. In this paper we attempt to interrogate the discourses and Public Policy initiatives around border security structures in the US, especially the symbolism of "The Wall " and assess if they were indeed responses to evolving material challenges along the US-Mexico border. This is especially crucial given that since 2016 "The Wall " along the Southern border between US-Mexico border occupied a central space in the discourse even though border structures have a longer history. We will look at US Congressional Records to locate these national security responses in the continuum of material challenges and developments along the U.S. Southern border. This is a preliminary effort to explore the discourses around the Trumpian Border "Wall" and locate them in the broader literature on performing national security around Borderlands. We hope the paper will add to the literature that humanizes forced migration and interrogates efforts to securitize borders.

Migrant Insurgencies in the Post-Pandemic Border Regime: Undocumented Activism in Canada

The Covid-19 pandemic has significantly transformed both the border regime and the migrant justice activisms (MJAs) in the Canadian context. As new bordering tactics have been deployed from above and undocumented migrants' precarities have further expanded in the post-pandemic era, Canadian migrant justice activists have crafted innovative, hybrid and unruly repertoires of contention that contest the challenges imposed by the post-pandemic border regime while practicing everyday forms of mutual aid committed the expansion of human welfare and freedom of movement within and across biopolitical borders. Using a political process approach to the study of social movements, this paper will analyze 1) the ways in which the post-pandemic border regime has affected undocumented migrants and the MJAs in the Canadian context, 2) the ways in which undocumented migrant and MJAs have responded to those challenges through new and expanded repertoires of contention, and 3) how such repertoires have had an impact on both the Canadian border regime and the lives of the undocumented population.

This paper will deliver results of a multi-sited ethnographic project that the author has been conducted in 4 Canadian provinces since the beginning of the COVID-19 crisis until today.

Food Environmental and Inequalities. Determinants in Adolescent Food Consumption in Spain

Introduction. The physical and social environment is very relevant to understand food consumption in the adolescent population.

Objective: To study the factors that determine the inequality in food consumption in adolescents in Spain.

Method. We made a selection of three areas of different socioeconomic level in two Spanish cities, Madrid and Bilbao. We classified both cities' neighborhoods according to socioeconomic level. We built an index through which we stratified Madrid and Bilbao neighborhoods into three tertiles: high, medium and low. **After building the classification according to the above criteria we selected the first neighborhoods of each tertil.**

In each area of different socioeconomic level, we selected two neighborhoods and, in each neighborhood, two schools.

We conducted 12 semi-structured to key informants, 12 to adolescents and 12 to parents and mothers of adolescents, and 6 focus groups to adolescents, 6 focus groups to parents and mothers of adolescents and 12 to teachers.

Results. Across all socioeconomic levels, there was a tendency for adolescents to purchase and consume high-fat food. Female concerned about their diet more for the physical aspect than for health, in male it also happened but mediated by the making of physical activity. In all the studied schools the quality of food was considered at lunch. However, in the schools of the low socioeconomic level neighborhoods this effort to watch food during lunchtime was not effective because the food that was brought by adolescents from home was unhealthy.

Conclusions. Food policies in educational centers in the cities studied emphasized healthy food in schools and in neighborhoods of all socioeconomic levels. However, the daily practices, in relation to food, in each of the families and the greater or lesser consideration of physical activity means that the desired results are not achieved, especially in areas of low socioeconomic level.

Elder People and Access to Data. a Case Study about the Postpandemic Challenges for the Digital Appropriation Gap.

The presentation deals with the processes of appropriation of ICT by older people through which they can get out of digital exclusion in a context of progressive digitization of society and of services (Abad, 2014; Llorente et alt, 2015; Lüders et alt, 2017) taking to account the specific characteristics of digital divide in this sector (Sourbati and Carlo, 2015; Hunsaker and Hargittai, 2018)

The study was conducted in Uruguay, which has significant digital development, digital inclusion policies for the elderly and data protection privacy laws. (Rivoir, Morales and Casamayou 2019; Rivoir, Escuder & Liesegang, 2020)

The presentation is based on research that aims to analyze the personal data literacies processes (Pangrazio & Selwyn, 2019) that allow identifying the needs of older people in the use of data and to characterize their knowledge about the implications of sharing personal data through digital platforms. Due to the Covid19 pandemic and the increasing use of platforms, these issues became more important. Through an innovative methodology, a cumulative digital literacy process was carried out in three workshops during three months in 2021 achieving the development of digital skills and understanding of the needs for the use of data. It was supported on a theoretical intentional sampling of 16 older people was carried out. The qualitative technique was carried out through the Zoom platform and the discussion forums through WhatsApp.

Protecting Personal Data in the Digital Society in Latin America

Platformized activities rely on network effects, and use strategies of constant user engagement, to gather and leverage the personal data of platform members so that they can govern the rules of interaction within a particular business space. This means that personal data is highly valued by platform businesses, and they experience a strong drive to gather and leverage this data to extract profits or advance their competitive advantage in the marketplace. This private drive to use personal data has exposed consumers to a series of risks, such as privacy violations, anti-competitive practices, profiling, and disinformation. This has caused governments around the world to regulate business practices that use personal data.

This presentation focuses on identifying citizens' perceptions and meanings about the private sector's use of their personal data, co-constructing citizen audit tools that reflect the values of local communities, and disseminating its results with policymakers to reflect the resulting divisions. of the research from the perspective of the participants. The particularity and richness of the project lies in the approach it adopts that transcends the conceptions of the branch of law and seeks to rescue the meanings, from an interpretivist episteme, in 5 particular cases of study of various kinds: in Chile with a migrant population, in Colombia with rapiteneros, in Paraguay and Peru with young women and in Uruguay with older people. 12 new citizen audit tools were developed and they provide some findings about process of appropriation of data from appropriation of technologies and value giving and meaning the uses.

Determinants of Happiness and Life Satisfaction in the Maldives: Findings from the World Values Survey Wave 7

A country that uses one language, adheres to one religion, and has relatively no poverty could be hypothesized to have a happy and satisfied populace. There is no comprehensive study that has investigated these factors of the Maldivian society, which is a high middle income small island developing state. The literature on happiness and life satisfaction shows two approaches: a more focused approach limited to psychological determinants, or a social determinants approach where several predictors are taken into consideration. This paper uses the latter to examine the happiness and life satisfaction indicators of Maldivians using the data from the wave seven of the World Values Survey (WVS). A total of 1039 residents (41% urban, 59% rural; 47% males, 53% females) from an age and gender stratified random sample participated in the quantitative survey which contained a section on measures of happiness and wellbeing. To determine the predictors of happiness and life satisfaction, two regression models were drawn on self-reported level of happiness (measured on a scale of very happy, rather happy, not happy, not at all happy) and level of life satisfaction (on a 1 to 10 scale). These were measured against economic status, social status (importance given to family and friends), subjective health status, level of religiosity, gender, age, marital status, and locality as determinants. Good health ($p<.001$), importance given to family ($p<.001$) and being married ($p=.002$), were found to be the significant predictors of happiness. Being married ($p.<001$), good health ($p<.001$), urban living ($p=.033$) and increased income ($p<.001$) were found to be the significant predictors of life satisfaction. Gender and age were not found to be predictors of happiness or life satisfaction. The implications of these findings are discussed from an equity perspective and its implications for social and development policies.

RIZZO, Emanuela* (Military Academy (MILAC) At ETH Zurich, Switzerland)

Swiss Military Families: Facticity, Challenges and Implications for Employee Retention.

The military and the family are greedy institutions (Segal, 1986), as both demand a considerable amount of time, energy and loyalty. As a result, important tensions arise between the two. Over the last decades, important changes in societal trends have taken place and shaken the traditional understanding of the family, which have led to intensified friction between the two institutions.

The study conducted at the Military Academy (MILAC) at ETH Zurich is the first in Switzerland to explore the relationship between the country's military and the family. Its aim is to identify the facticity, composition and hurdles of Swiss military families. Furthermore, the collected data will provide a better understanding of the improvement strategies that are most helpful for employee retention. Based on 17 qualitative interviews with selected professional officers, their partners and experts, first data was collected and coded using the six-phase approach (Braun & Clarke, 2006).

Initial results show that the reconciliation between work and family strongly depends on the rank and the role of the enlisted personnel, with the reconciliation being the hardest at the beginning of the military career. The low predictability of inland deployments as well as the high flexibility that the military spouse has to muster are among the most mentioned strains for the family.

Signs and Posters, Images and Icons: Governing Contagion through Instruction, Information and Emotion Regulation

The COVID-19 pandemic during 2020 and beyond made visible many taken for granted aspects of social and emotional life typically shrouded by the busyness of daily interactions and relationships. Using various powers, including those made available by emergency management legislation, governments restricted individual mobility with bans on international travel and movement across state borders, slowed interaction by limiting where people can go, the spaces they can occupy, where they can stand or sit, requiring the wearing of face masks and prohibiting a range of activities and amenities. Central to the amalgam of new norms is communication of information and instructions in the form of simple images and icons in posters and signs widespread across public (and private) settings. Such posters are a visible part of the inventory of 'governing through contagion', often relying on legal and medical-scientific authority, as well as appeals to collective wellbeing, and sometimes individual self interest which also anticipate emotions and their management. This regulation invoked emotion in several ways: fear of contagion, distrust, anxiety, frustration, feelings of commitment and satisfaction in doing the right thing, and advancing community wellbeing. Two sociological concerns animate this paper: the emotional dimensions of social control and visual research. It relies on photographs of posters/signs in public locations across Adelaide (South Australia) and Melbourne (Victoria) to investigate the recalibration of social interaction by the requirements to wear face masks during the pandemic. The signs and posters anticipate that individuals will (be able to) interpret instructions correctly and then have the motivation and capacity to modify their behaviour and shape their emotions in the same ways to maintain the interaction without disruption.

The Challenges of Emotion and Judging

Judicial officers must regulate their own feelings to maintain a detached, emotionless demeanour, to be (and appear to be) impartial. Nonetheless, recognition of emotion in judicial work remains unsettling for judicial professionals and for courts as institutions: First, judicial wellbeing can be compromised when judicial officers suppress their feelings or engage in deep or surface acting to maintain an appropriately 'judicial' demeanour. Second, a display of emotion that departs from the enduring script of judicial dispassion can lead to complaints, a perceived need for more professional education, even discipline of individual judicial officers. Both concerns arising from the intersection of judging and emotion that characterises emotion as an individual, easily recognisable quality that must remain incidental, minimised, and disavowed. Yet, achieving and communicating impartiality necessarily entails emotion work shaped by feeling rules and situational demands. Emotions are

denotes a presenting author. Abstracts are organized by first presenting author's last name.

practices which enable judicial officers to do their work, but the repertoire of emotions, felt and displayed, is limited by the practical context and the ideals of the judicial role.

Young people's social media use in the context of imagined employment futures

Young people's social media use is highly scrutinised and surveilled by peers, family, and even imagined future-employers. A common refrain in advice to young people is 'don't post anything you wouldn't want your grandma or future boss to see', and indeed employers increasingly use social media to vet job applicants and surveil employees (Carrillat et al. 2014; Nikolaou 2014). Duffy and Chan (2018) assert that young people are increasingly subject to a 'hidden curriculum of surveillance' when it comes to their social media use, learning to internalise the risk of using social media and the threat social media visibility might pose to imagined employment futures. In what ways does this limit and shape social media practices? And how does this constrain their capacities to engage in youthful experimentation, identity-work, and connect to experiences of belonging?

In this paper we examine how young people in Australia navigate this tension between the pressure to and pleasures of being visible and active on social media, with moral panics around young people's social media use and the threat of employment doom or even 'cancellation' associated with this visibility. We draw on focus groups with 72 young people (16 to 35) in Australia where we discussed social media use in the context of employment, to explore processes of identity-work, impression management, and audience segregation. We report on findings that point to complex privacy and content management strategies on social media, anxieties about the future, and the internalisation of discourses that frame young people as productive only as future employees, with blurred boundaries between 'personal' and 'professional' lives.

RC30-443.3

ROBERT, Peter* (TARKI, Inc, Hungary)

Excluded from Work, Excluded from Politics? Young People's Integration at Work and Engagement in Political Participation

The paper deals with the influence of employment relations on various forms of political participation, such as voting at national parliamentary elections, participating in lawful public demonstrations, or signing petitions. These activities are seen as signs of democratic engagement and the extent of this involvement is an indicator of the quality of democracy. Previous studies on the relationship between labour force participation and political participation revealed that unemployment (with its social and economic consequences) has a negative effect on voting, as well as on political activity. Precarious features of employment (temporary contract, employee vs. self-employed status, low degree of job autonomy) also affect political participation negatively. Unemployment risk and non-standard employment is particularly prevalent among young people, which makes this analysis even more appropriate for them. In addition to information on employment, the study controls for the regular correlates of participation in political science literature like being interested in politics, being satisfied with the government or democracy, trust in political institutions as well as for socio-demographic measures like gender, age, education, urban-rural difference, financial situation.

The paper employs European Social Survey data with a focus on respondents, being not in education, aged between 18 and 29. ESS rounds 1-9 between 2002 and 2018 are worth using to perform the analysis on a larger sample (N=40 000) of the cohort. The data allow to investigate and compare a wide range of European countries that differ in terms of employment relations, political culture and traditions; nations from Northern, Western and Southern Europe, as well as post-socialist societies. The paper intends to contribute to the literature in two respects: a) the difference how employment influences the forms of political participation; b) the difference between the countries (country groups) in the above association.

ROBERT, Peter* (TARKI Social Research Institute, Hungary)

How Do Unhappiness and Marginalisation at School Undermine Academic Performance?

Literature in sociology of work shows that happier and more satisfied workers perform better at the workplace. Analogously, literature in sociology of education claims that subjective well-being of high-achieving students is generally higher compared to low achieving students. The analysis of this association is combined with an intersectionality approach, where children's lack of subjective well-being is interpreted as a form of marginalisation. Types of this deficit are dissatisfaction with life as a student, with things learned at school, or with other children in the class. More concrete forms of marginalisation include feeling unsafe at school, being hit by other children at school, being called unkind names by classmates, or being regularly left out by other children at school. The paper assumes and explores a negative relationship between forms of deficit in subjective well-being, marginalisation at school and lower levels of academic performance.

Data come from the Hungarian investigation of The International Survey of Children's Well-Being (ISCWEB), conducted in 2019 in schools among pupils aged 10 and 12 years old, with paper-pen method (N=2000). The child questionnaire, which covered a wide range of subjective well-being items at school was supplemented by a teacher questionnaire, this is the source of the students' grades, the dependent variable in the analysis. As for the independent variables, items on subjective well-being and marginalisation at school, a parental questionnaire serves as a further addition and allows to control for parental education and financial conditions. Demographic controls are also considered, such as gender, regional variation, and ethnicity. A multivariate model of the negative relationship between lack of satisfaction and marginalisation at school and academic achievement demonstrates that deficits in subjective well-being at school can be seen as an extension of the analysis of marginalisation, intersectionality and educational inequalities.

Occupational Polarization, Threat Perception, and Mass Preferences for Restrictive Immigration Policy: A Conditional Process Model

Over the last two decades, the rise of anti-immigrant attitudes has motivated extensive comparative research on the micro- and macro-level determinants of mass attitudes toward immigrants. A prominent explanation from this literature is economic insecurity and anxiety fuels the social psychological perception that immigration is a threat to the economic, cultural, and social conditions of society. However, despite decades of empirical research, it is unclear whether this process is driving the recent shift in mass preferences for restrictive immigration policy, particularly outside the United States and Europe. Drawing on data from the most recent wave of the World Value Survey (2017-2021), we examine whether threat perception mediates the effects of occupational insecurity on preferences for restrictive immigration policy and whether these mediated effects are moderated by the macroeconomic conditions of countries. Empirically, we estimate a series of multilevel process models using an international sample of 33,590 adults from 42 developed and developing countries. We find the routine task intensity (RTI) and offshorability (OFF) of occupations are not directly or indirectly associated with preferences for restrictive immigration policy because of substantial cross-national heterogeneity in these effects. We account for this heterogeneity by examining whether these effects are conditioned by country-level market income inequality, unemployment, and economic development using multilevel conditional process models. We find market income inequality and the rate of unemployment moderates the direct and indirect effects of RTI and OFF on preferences for restrictive policy where low levels of inequality and unemployment nullify these effects and moderate to high levels amplify the positive effects of RTI and OFF. Overall, these findings show the growing tension surrounding immigration and recent populist movements to restrict immigration may be partially attributable to the increasing precarity of work within an increasingly unequal and competitive economic environment.

ROBERTS, Anthony* (Colorado State University, United States)

The Covid-19 Pandemic and Contemporary & Future Income Inequality in the United States: A Machine Learning Approach

The economic fallout from the Covid-19 pandemic has renewed concerns about income inequality in the United States. However, despite evidence of the uneven impact of the pandemic across industries, geographies, and households, studies are still unclear about the extent to which the pandemic affected the trajectory of income inequality in the United States. The paucity of monthly estimates of labor income limits our capacity to examine these effects because the timing and duration of health-related restrictions varied substantially between March 2020 and September 2021. Accordingly, this study estimates monthly personal income between January 2000 and May 2022 using multiple imputation for combined surveys with the monthly Current Population Survey (CPS) and the Annual Social and Economic Supplement of the CPS. Drawing on repeated cross-sectional data on a representative sample of 40 million U.S. workers between January 2000 to May 2022, we construct, validate, and train models of income and working hours using random forest regression to identify the most salient predictors of income and working hours with supervised ensemble machine learning. Additionally, we estimate distributional models with unconditional quantile regression to observe the effects of geographic, socio-demographic, industrial, and occupational determinants across the observed distributions of income and working hours in the U.S. Model estimates show the incomes and working hours of minorities, service workers, and urban residents were most affected by the pandemic and these effects were strongest among workers at the median and lower

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

percentiles of the income and working hours. And despite a recovery in income and working hours since late 2021, this economic loss exacerbated market income inequality in the United States by 16 percent from January 2019 and January 2022. More importantly, these models predict the disproportionate impact of the pandemic is likely to accelerate the growth of income inequality over the next decade.

Education-to-Work Transitions in Post-2004 European Union Member States after 30-PLUS YEARS of Transformation

After 30-plus years of political, economic and social transformation, young people in some of the European Union's post-2004 member states still face working lives in which they can expect to earn less than a half of their counterparts in 'the West'. Why are some young people dropping-out of university knowing that even if they obtain 'graduate jobs' they will be able to earn more as migrant farm labourers? The single European market was supposed to eliminate these inequalities. What is wrong with the theory? This paper examines differences between the 27 current EU member states in higher education participation rates, youth unemployment rates and average monthly earnings. It shows that the extent to which youth in new member states have 'caught up' varies with the geographical location of their countries, and exactly when and how their countries' transformations began after which the states and their economies became locked into 'path dependence'.

Time Use, Work and Leisure in the UK before, during, between and Following the COVID-19 Lockdowns

This paper presents findings from time use surveys in the UK which were conducted prior to, during and following the Covid-19 lockdowns in 2020 and 2021. These findings are set against the background of evidence from similar surveys in the UK, and globally, from the 1920s onwards. Movements into and out of successive lockdowns during 2020 and 2021disrupted former temporal routines with consequences that were enduring in 2022. There had been no return to the old normal, or even towards that normal. The new normal was a population with more leisure time than pre-pandemic but which was also spending more time doing paid work. There were differences by sex, age and income, but overall time had been released for other uses by people doing less travelling, less studying and less unpaid child care. Extra leisure time was being filled mainly by the media.

Exploring the Drivers and Impacts of Men's Participation in Front Line, 'low Level', Paid Care Work: Insights from Australia

Australia's Health Care and Social Assistance (HCSA) sector is facing significant attraction and retention challenges, especially in jobs in personal care work and nursing – challenges that have been amplified by the COVID-19 pandemic, which has further increased the demand for such workers. Given the HCSA workforce is currently comprised of just 20 percent men, (and only 13 percent in areas such as aged care), one potential solution to this crisis lies in addressing men's underrepresentation in paid care work. Against the grain of the much research that highlights that care work is antithetical to valued forms of masculinity, we argue for the value of research into this issue that proceeds from the perspective of aiming to learn from the experiences of men who are employed in front line, low paid care roles. In this talk, we present initial findings from an Australian Research Council funded project that qualitatively explores the drivers to participation in, and attitudes towards, care work amongst men currently employed as 'Personal Carers and Assistants' and 'Aged/Disabled Carers'. Drawing on the concept of 'caring masculinities' (Elliott 2016), we are concerned to unpack and analyse what we call men's 'care trajectories', which include, for example, caring responsibilities as a young person, experiences of fatherhood, or even limited opportunities for better paid work. We consider whether and how these biographical experiences come to produce a habitus that is commensurate with and indeed stimulating of men's journeys towards paid care work. Lastly, we attend to whether these men's biographies produce not just an embrace of values of care, but also the second crucial part of Elliott's formulation: that is, a rejection of domination and its associated traits.

Sort of in Everything, Everywhere All at Once: Reflections on Australia's Contemporary Class Inequalities, from the Macro to the Micro

The strong discursive commitment to a culturally idealised narrative that Australia is an egalitarian and just land of a 'fair go' betrays the reality: the country is deeply unequal, with access to education, housing, employment and wealth and so on cut by numerous intersecting and compounding dimensions of social difference, including but not limited to Indigenous status, 'race', gender, disability, sexuality, gender identity, and social class. In this talk, I reflect on several co-conducted research projects that illuminate different aspects of marco and micro level class-based inequities. Consideration is given to troubling class-based wage penalties, even as working-class people experience upward social mobility; the way class is implicated in access to and knowledge about vital Australian public services; and the 'othering' present in public and even academic discourses that render working class people as 'less good' in essentialist fashions. These insights contribute to the growing volume of sociologically informed research evidence about the deeply ingrained and pervasive nature of contemporary class-based inequalities.

While marked by its own particular form, class inequality in Australia, in keeping with Lynnette Finch (1993), is argued to be a product of and still informed by what was imported via the colonisation process – a quasi-Victorian socio economic-cum-moral hierarchy that rests on an understanding of the urban poor and racialised 'others' as being dangerous, degenerate, decadent and deserving of what they (don't) get in material terms. In closing, I suggest that sociological analysis must remain attentive to the rigidity of class relations even amidst the shifting substance of changing forms, mechanisms and processes of inequality that occur in new times. We can then more readily remind ourselves that rather than land of the fair go, Australia remains, to riff off Raewyn Connell, a thousand miles from fair.

Doing Care: The Role of Social Networks in Promoting International Students Migration

Social scientists have noted the role of 'global care chain' in facilitating transnational processes such as maintaining and sustaining migration, families and labour processes. However, its application to international student migration – one of the fastest growing categories of migrants in many western societies –has been undertheorized. This has created a gap in understanding the role of social networks and transnational processes in determining how international students negotiate information flows and arrive at their decisions about where to study. Drawing on the narratives of 30 IS at a Canadian university, this paper investigates how IS arrive at their decisions to study overseas. It found that care and nurturing was one of the key motivators for international students' migration. In particular, it reveals that family, friends, ethnocultural and religious communities, and professional networks in both origin and settlement countries were intimately involved in doing care work for international students. These include providing accurate migration information to ease psychological stress of migration, and tangible supports such as housing, orientation to the new environments, financial resources, friendships, companionship, counseling and pastoral work. The paper discusses these carework in the context of the wider social capital and global care economy, with special consideration of how the post-pandemic world will either reinforce, undermine or sustain these networks. We recommend broadening existing theories to better accommodate students' fluctuating transnational social networks and account for how care is performed in these networks in the context of social change.

Reconceptualizing Open Pedagogy in the Post-Pandemic Classroom to Meet Transformative Goals

The post-pandemic higher education environment has transformed in ways that make learning easier and more convenient. For example, online and asynchronous practices are increasingly being normalized, making learning more accessible and engaging. However, these practices increase workload of both students and educators, require learning and adopting to new technologies. At the same time, the implications for engaging in certain pedagogies such as advocacy and activism might be more challenging. In particular, instructors committed to decolonizing, social justice and transformative work must be intentional about how to continue to meet these objectives in these newer settings. In this presentation, we discuss reconceptualize the practice of open pedagogy and position it as a practice that can be employed in course designs and lesson plan to meet these objectives. While contested, open pedagogy is primarily seen as a framework for producing free educational resources, and is based on principles of such as reuse, retain, redistribute, revise and remix. However, we seek to broaden this definition to elucidate how it can

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

become a standard classroom practice. In so doing, we reconceptualize open pedagogy as a framework for redesigning courses and lesson plans to foster: (a) connections in the classroom rather than isolation; (b) creative expression rather than limited or narrowly defined tasks, readings and assignments; (c) the use of a wider spectrum of (formal and informal) resources and ways of knowings; (d) students as sources of knowledge and decentering the 'teacher'; and (e) the development of strategies to tackle social injustice. We supplement this theorizing with survey results from three Sociology courses at a higher education institution (n=290) to elucidate the advantages of these strategies. Hence, we recommend the expansion of the definition of open pedagogy to account for accessible practices for instructors and students to engage in transformative work.

ROBINSON, Richard* (The University of Queensland, Australia)

The (Tourism Worker) Clash: 'Should I Stay or Should I Go…'

COVID-19 had a deep and prolonged impact on tourism employment (Baum et al., 2020). Across most developed nations a combination of tight labour markets and a seeming reluctance for tourism and hospitality workers to return are manifest in critical labour and skills shortages - compounded by a lack of mobility for various 'stop-gap' labour markets; backpackers, working holiday makers, migrants and international students. An Australian study set out to understand a) why workers left the industry and b) what would bring them back. It mobilised paradox theory (e.g., Lewis & Smith, 2014), which has explained tourism employment phenomena like "tourism businesses declaim that their employees are their greatest asset, and yet, in countries such as the UK, tourism and hospitality represent the lowest paid sector within the economy" (Baum et al., 2019, p.252). A diverse demographic and sectoral sample of key informants, who left tourism employment during COVID-19 and hadn't returned, was recruited (*n*=16). The sample included migrants and Indigenous, the young and old, who had worked in restaurants and accommodation (front and back of house), bars, retail, tours, attractions, administration, and airline, across contingent, line level, managerial and executive levels. Nine informants further volunteered for an innovative dyadic technique whereby they nominated a significant other (a personal or professional contact) who proffered their perspective on the key informant's experiences. Finally, the significant others' recollections, and the author's iterative analysis, was member checked in a third interview with the key informant. In all 34 interviews, ranging in length from 135 to 25 minutes, were conducted and interpreted mobilising paradox theory as an analytic frame. These worker narratives concomitantly bring to life 'the clash' between the paradoxical affordances (e.g., passion, travel, sociability), untenability (indecency, insecurity, inflexibility, unviable progression) and COVID-inducements (disconnection, distrust, survivor syndrome) of tourism employment.

They Who Can't Stay and Yet Who Can't Move: Examining Disaster Displacement of Those Affected By the 2020 South Japan Flooding

The frequent occurrence of extreme weather events and natural hazards brought forth disasters that underscored people's long-standing insecurities across various dimensions of their lives. More so, these disasters contributed to creating unique narratives of vulnerabilities and resilience building. Among the critical challenges of disasters is displacement, where the affected population is driven to move away from their habitual place of residence to escape from disasters and ensure their safety. Groups and communities with various vulnerabilities to multiple and often compounded insecurities are at the core of these displacements. And thus, addressing people's forced move requires a human security perspective that situates those displaced at the center of protection instruments and empowerment initiatives against the critical and pervasive threats to their safety and well-being. This paper will examine the case of the displaced residents of Kuma Village in Kumamoto, Japan, from the 2020 South Japan Flooding from a human security lens. As an individual-based security approach, it attempts to answer the questions: 'security of whom,' 'security from what, and 'security by what means.' This paper illustrates how protecting people from the disaster and empowering them to move forward and recover is enmeshed with complex issues, including the COVID-19 pandemic, challenging rural conditions, and the aging population. By using the temporary housing as a spatial reference to people's displacement, the paper presents how the displaced residents staying in the temporary housing found immediate protection; and yet struggled to move to a permanent home beyond the existing structural concerns. The paper presents the universality of disaster displacement as a human security concern that indiscriminately affects people regardless of their level of development. The basis for this paper is the fieldwork conducted in Kuma Village in the last quarter of 2021.

ROCHA, Zarine* (University of Auckland, New Zealand)

Applied and Clinical Sociology in Aotearoa New Zealand

This session will present the findings of our recent edited volume, *Applied and Clinical Sociology in the Aotearoa New Zealand*. This book is the first to explore the concept of Clinical Sociology in this unique context, looking at how sociology is applied outside of North America and Europe, and what makes sociology "clinical" across different national and cultural positionings. We explore the development and potential of clinical and applied sociology in Aotearoa New Zealand, looking at the intersections around public and applied sociology, and expanding the field to include new grounded theorizations, applications and case studies. Aotearoa New Zealand has a unique position in the social sciences and in the global community: as a small country, it has a vibrant social scientific community, a significant diversity of scholars and practitioners, and frequently innovative and unusual approaches to addressing social problems. New Zealand, as a multicultural nation, is structured around a bicultural national framework based on *Te Tiriti o Waitangi*, and much research in the country emphasizes the importance of Māori approaches to the theory and practice of sociology. Case studies from Aotearoa New Zealand bring much that is new to the clinical sociology literature, including indigenous- and migrant-centered sociological applications and practice. As an interdisciplinary project, we find that it is the interconnections and overlaps, the *whanaungatanga* [close connections/relationships] within the social sciences, that make the clinical practice of sociology so valuable in addressing the complexities of everyday life.

Saving Whose Face?: Masculinity Construction in One Philippine Private University

Numerous gender initiatives exist in the Philippines. Yet the focus remains on women and more recently LGBTQ+ concerns, overlooking issues of masculinity that contribute to a patriarchal society. Philippine universities experienced various issues of gender-based violence, from sexual harassment cases to fraternity-related violence, despite these institutions' gender policies and the country's existing gender laws. Universities serve as a product of the country's complicated colonial history (Spain from 1565 to 1898; the United States of America from 1898 to 1946) and contributed to both colonial interests and the interests of the local indigenous elite. Currently, the local Filipino elite are known to send their children to private and religious universities, as part of the "tradition" of their family, highlighting the links between gender issues and the country's historic and cultural gender context. I then ask, how can we utilise feminist research methodology to understand the construction and perpetuation of harmful masculinities in a post-colonial context such as the Philippines?

This presentation serves as a critical reflection on utilizing feminist methodologies in understanding the relationship between feminism and research on masculinities, specifically masculinities in the Global South. Utilising a feminist case study and online feminist interviews, I explored the interplay between institutional mechanisms and institutional gender culture in one private and religious Philippine university. Through a critical feminist lens, the study unearthed what the participants call a "saving face" culture, which prevented the institution's gender policy from being enacted. Applying an indigenous Filipino framework, Sikolohiyang Filipino, I connect this "saving face" culture to Raewyn Connell's conception of "hegemonic masculinity" which ties to the colonial and religious nature of higher education and extends to the country's greater gender order. Utilising this feminist methodology, we explore embodiments of power and privilege through a colonial and class lens which inform systems of gender construction.

Post-Conflict and Post-Dictatorship Latin American Migration to Australia: Doing Difficult Memory-Work through Desire-Centred Research

Latin American migration to Australia nospans over five decades. Despite a growing and celebrated Latin American diaspora in Australia, little is known in public imaginaries about the difficult histories, desires and struggles that have shaped those who fled their countries due to conflict and dictatorships. This presentation draws from fifteen in-depth interviews with Spanish-speaking mestizo migrants from post-conflict and dictatorial Latin America living in Australia. Drawing from decolonial interventions and scholarship in Latin American memory studies the article argues for desire-centred research praxis in which trauma, damage and deficit narratives are decentred. The stories narrated reveal how migrant's intergenerational, everyday and place memories are part of difficult memory work that is unsettling normative understandings of Latin American migration in Australia. Thus, this article discusses the entanglements, possibilities, and limitations of desire-centred difficult memory work.

Intersectionality on the Perception of Health

This paper is presented in the framework of the project PID2021-127113OB-I00. Intersectionality is a powerful theoretical concept for understanding the multiple oppressions and discriminations that certain social groups suffer. Social positions that exist on a hierarchy of social power are not independent (Crenshaw, 1991); on the contrary, they shape human experience jointly. Gendered health inequalities may be addressed from the intersectionality-based approach. This article offers quantitative data analysis of the multiple interactions of Sex, Citizenship, Civil Status and Scale of Income as sources of inequality, discrimination, oppression and subordination, which impact on the Perception of Health. Using World Values Survey data base (Wave 7, 2017-2021), *Binary Logistic Regression* (SPSS) has proved to be a strong tool to analyze these complex interactions. Results suggest that Sex and Citizenship, and the interactions of these two variables, have the strongest impact on the Perception of Health.

RODRIGUEZ MARTINEZ, Pilar* (University of Almeria, Spain)

Social Networks, Extremism and Pro-Violence Attitudes

In this paper we present the results of a survey of adolescents (N=1170) in secondary schools in the province of Almeria, Spain (UAL2020-SEJ-C1947). The survey was conducted in class groups by cell phone in May 2022. In this research, attitudes about extremism, and pro-violence and illegal acts were studied and measured with the scales proposed by Ozer u Bertelsen (2018). The results of the study indicate that the lower the level of education of the adolescents' mother, the more right-wing they are, and the more they attend religious services, the higher they score on the violent extremism scale and on the pro-violence and illegal acts scale. Having a foreign parent makes them score higher on extremism, but it is not a significant variable in explaining the use of violence and illegal acts. And the more social networks they use daily, the higher they score on the index of use of violence and illegal acts, but the more social networks used daily is not a significant variable in explaining extremism. In the discussion we will put forward some hypotheses about the difference between extremist attitudes and pro-violence attitudes and illegal acts to advance a sociological analysis of violent extremism in the digital world.

City Invaders: 8-Bit Video Games for the Right to the City

Video games moved away from the shared screen of the living room to the almost intimate and personal interfaces of the mobile phone. Almost seven decades since Higinbotham's earliest game, they also invaded the cities in a form of a collective urban action.

Mobile enhanced urban spaces have stirred the city culture and generated extensive academic research. Yet, the fascination for the cosmopolitan beat has been inherent to modernity and to some romanticised belief in the catharsis of breathing shared humanness: from the flâneur to flash mobs, from Metropolis to urban-caching, the question about the transformation of the urban space and place matters.

The discussion on the field is upgraded here by bringing together three conceptual strands of social science: the considerations of the city as a communicative space; the research on geomedia and the city as a social interface; and the strategies for a communicative city as a locus for encountered discrepant interests: between city branding and the right to the city.

This paper revisits the ramified work initiated by the French urban artist Invader and their 8-bit tiled pixelated video game alien characters materialising city invasions. The study uses the mobile data collected during auto-ethnographic itineraries in Paris in May 2022. The analysis is then further combined with a review of the extended network of devices-locations-archives-rewards that build the creation of the artist and its inspirational offspring: from the nostalgic video game culture at the heart of the artworks to the mobility-related initiatives that reproduce them for strategic, political or commercial purposes.

This paper barely scratches the surface for further outer-space exploration; but the emerging multi-layered map and networks highlight how video gaming cultures transcended the living room, and the bedroom, to become powerful tools to invade the city and give it back to their playful citizens.

ROESCHERT, Franca* (University of Greenwich, United Kingdom)
VACCHELLI, Elena* (University of Greenwich, United Kingdom)

Participation and Contested Forms of Citizenship in the City of Sanctuary

The UK-based network 'City of Sanctuary' aims to create more welcoming conditions for those who had to flee their homes. This is done through activities designed to highlight the contributions of refugees to society and create opportunities for communities and refugees to meet in order to build a positive vision of cities as proud agents able to welcome people seeking asylum (Darling et al., 2010).

City of Sanctuary's mission is in strong contradiction to a set of government policies around immigration widely described as the 'hostile environment'. As part of the hostile environment, migrants are criminalised and required to prove their immigration status in a variety of contexts (see Humphris, 2020), among other strategies to expose potentially illegalised migrants to the Home Office's draconian measures such as imprisonment and deportation. Despite the well documented efforts to integrate refugees and asylum seekers at a local level, City of Sanctuary practices have been criticised by scholars as re-enacting government prescribed passivity and exclusion of refugees and asylum seekers. This is usually done through forms of protection and control leading to hindering their everyday agency (Mosselson, 2021), in this way reinforcing legal distinctions of citizen and non-citizen, rather than encouraging participation and sharing of power.

This paper examines the practices of City of Sanctuary groups in London and how participation of those seeking sanctuary is discussed and enacted by those involved in City of Sanctuary groups. By doing so, the paper assesses whether the City of Sanctuary effectively enforces a top-down understanding of citizenship or allows for participation and bottom-up claiming of citizenship rights by those seeking sanctuary. This exploration provides insight into practices of in- and exclusion in urban contexts and in how far refugees and asylum seekers in the City of Sanctuary can claim meaningful power within the movement.

Hiding Technical Complexity or Erasing Social and Ecological Difference? Abstraction in the Design of a Data Infrastructure for Digital Agriculture.

This paper juxtaposes the theorization of abstraction in critical agri-food studies and computer science to understand how abstraction is understood and used in the early development of a networking infrastructure for data transfer in agriculture. Network scientists create and use abstractions to hide technical details and expand data interoperability, while social scientists have produced critical scholarship on the industrialization and simplification of agriculture, highlighting the potential risks of overriding social and ecological variability. We focus on the development of a data infrastructure that supports an open-ended set of digital agriculture applications. As envisioned, this infrastructure will enable data capture, integration, and actuation across all types of farms and all nodes of value-chains. Drawing from the theorization of abstraction in critical agri-food studies and computer science, we explore the network scientists' understandings, ontologies, and use of abstraction for agricultural innovation, and how abstraction sits with ongoing processes of agricultural industrialization. We build on the scholarship on agri-food industrialization, digital infrastructure studies, and networking research to examine our interviews with the network scientists and to provide an ethnographic account of their research practices and meetings. Our findings indicate that the scientists engage critically with issues such as vendor lock-in and the right to repair. Nevertheless, the distinct contexts in which the data infrastructure will be used and the different needs of human and nonhuman elements of agri-food systems need to be considered in order to prevent the exacerbation of social inequality and ecological degradation. Through the symmetrical treatment of abstraction in computer science and critical agri-food studies, this article presents the results of a long-term collaboration between computer and social scientists.

ROGERS, Peter* (Macquarie University, Australia)

New Concepts of Liberty

Since World War II there has been a continuous movement to reject centralised state authority and distribute power more broadly. Since the 1970s this has manifest in the relentless expansion of free-market liberalism, advancing into the anthropocentric neoliberalism of the 21st century. This paper will discuss the emergence of these 'new concepts of liberty' by extending and adapting Isaiah Berlins seminal 'Two Concepts of Liberty'. Using a genealogical analysis I will adapt Berlins intellectual history to propose a new encounter with the hypocrisy of market-led freedom. I propose that a deep critique and problematisation of 'financial fundamentalism' is required to address the fictional automatic balance of Hayek's new economic authority. Instead of liberating the individual through the freedom of self-interest a new self-serving authoritarianism of efficiency has taken root; obsessed with cost reduction, economic growth, quality and risk-management, supply chains, efficiency and the measurement of deliverables. These obsessive compulsions towards market-efficiency are inherently limited by the a priori assumption that automatically balancing markets deliver freedom better than centralised governments. The new authoritarianism of amoral markets will be questioned by reworking the faulty assumptions underpinning modern freedom and authority, proposing potential solutions to the continued imbalance of capitalism and democracy as we search for more meaningful and 'new' concepts of liberty.

ROGOWSKI, Lukasz* (Adam Mickiewicz University in Poznań, Poland)

Visual Representations of Rural Development. Challenges of Using Visual Research Methods in Studying Rural Areas.

Visual methods have gained a relatively established tradition in social sciences. With their development, new challenges arise regarding their appropriate application to research problems. One such challenge is the lack of in-depth reflection on the differences in the application of visual methods depending on the type of research terrain. Most visual projects deal with the urban environment, and the principles developed within them are transferred to other areas.

The purpose of the proposed presentation is to reflect on the use of visual methods in rural research. This will be done using the example of the RurAction project, which was funded by the European Union in the Horizon 2020 Marie-Sklodowska-Curie actions Innovative Training Network. The project aimed to study social entrepreneurship in rural areas and the social innovations implemented there. One of the project's components was a comparative visual study carried out in rural regions of three countries: Greece, Ireland, and Portugal. Among the topics covered were those related to regional development, in particular:

- (1) Networking of local farmers

- (2) New uses of farmers' traditional ways of working

- (3) Creation of local community centers

An interdisciplinary research team of sociologists and photographers created a documentary film on these issues and photographic documentation that later made up the visual-textual narrative in the form of a virtual photo exhibition.

The presentation will discuss topics such as:

- (a) Ways of working with the local rural community on visual documentation, including their ethical challenges

- (b) Ways to produce relationships between visual and verbal narratives about local development

- (c) Ways of reconciling knowledge in the collaboration of sociologists, photographers, and the local community

- (d) The role of the natural environment in visual research on rural development

The presentation will be illustrated with selected excerpts from the documentary film and photographic exhibition.

Femicide in Sub-Saharan Africa

Femicide is one of the leading causes of premature death in sub-Saharan Africa, but scholarly work on this topic remains limited. A systematic search of bibliographic databases, such as Scopus, Google scholar, Web of science, and grey literature resulted in the inclusion of 21 scholarly articles on femicide. The studies were conducted in Ghana, Nigeria, South Africa, Botswana, Mozambique, Namibia, Rwanda, and Zambia. Results indicate femicide, particularly intimate partner femicide (IPF), is common in sub-Saharan Africa. We found suspicion of infidelity, jealousy, and sexual rejection were major factors leading to the majority of IPF incidences. Guns played a significant role as well. Meanwhile, the media framed femicide as isolated events and not a systematic problem. Cultural norms and beliefs associated with masculinity were important correlates of femicide Additionally, witchcraft femicide was common. Accusations of witchcraft were a handy pretext for the ruthless treatment of impoverished and marginalised elderly women. It is important to increase investment in violence prevention, enhance risk assessments at various points of care, assist women facing intimate partner violence, and place restrictions on gun ownership for those with a history of violence. Improvements in data collection and management are critical defence resources as well.

Structural Barriers to Help-Seeking Among Female Victims of Intimate Partner Violence in Ghana

Purpose The literature shows that the majority of Ghanaian women who experience IPV do not seek help, but there is limited understanding of the barriers to their help-seeking behaviours from either an individual or an institutional perspective.

Methods This study used qualitative data from 30 women in three of Ghana's 16 administrative regions (Ashanti, Upper East, and Greater Accra) to explore IPV victims' experiences of help-seeking. Fifteen staff at the Domestic Violence and Victim Support Unit (DOVVSU) in the three selected regions were also interviewed to examine barriers to help-seeking from an institutional perspective.

Results Results of the thematic analysis showed lack of trust in formal support channels, lack of knowledge about DOVVSU, and fear of partner arrest were common barriers identified by victims. From an institutional perspective, barriers ranged from inadequate resources, including administrative and logistical support, to inadequately trained personnel, visibility and distance to DOVVSU offices, lack of privacy at DOVVSU offices, and financial constraints.

Conclusion The findings suggest the need for future interventions to take into account both individual and institutional factors associated with victims' help-seeking decisions. The development of a multifaceted solution responsive to the needs of IPV victims should involve addressing the various barriers identified in this study.

ROHR-GARZTECKI, Marek* (Collegium Civitas, Poland)

Easternisation of the Atlantic Alliance

The Eastward enlargement of NATO in years 1999-2004 in parallel to a similar process undertaken by the EU, was generally portrayed as an exercise in which the former Warsaw Pact countries and some Soviet Union successor states were "socialized" in intrinsically Western norms and values (Schimmelfenning 2003, 2005).

We argue that this process was far from one-sided. Over the past twenty or so years, by the virtue of being inside the "European family", the new NATO members from Central and Eastern Europe were able to gradually affect the strategic priorities and the perception of threats facing the Alliance. The current war in the Ukraine only made this process visible.

We distinguish three phases in NATO's view of those states: the first one, during the Cold War, when they were seen primarily as an enemy and the second, when they were treated as its secondary members, needing assistance and tutoring. We posit that that the third, current phase started with the first Russian invasion of Ukraine in February 2014, that elevates those countries into a pivotal role in the Alliance.

The paper is based on data collected by the author as a part of a longitudinal study tracing the reform of the armed forces of the Czech Republic, Hungary and Poland as NATO members. It reviews the four post-Cold War NATO Strategic Concepts, results of the opinion polls, as well as literature of the subject including newspaper and magazine articles. The original data consists of face-to-face interviews conducted by the author in four intervals since 1997 with key informants such as generals, ministers and parliamentarians in Brussels, Budapest, Prague and Warsaw.

ROJAS, Hugo* (Alberto Hurtado University and Millennium Research Institute on Violence and Democracy, Chile)

Towards Comprehensive Reparation for Victims of Police Violence during the Chilean Social Uprising in 2019: Lessons and Proposals from the Theory and Practice of Transitional Justice

This paper presents the main lessons of transitional justice in public international law and comparative experiences in the field of reparation for victims of state repression. The objective is to contribute to the formulation of public policies for the comprehensive reparation of victims of police violence during the social outbreak that occurred in Chile between 18 October 2019 and 17 March 2020. The Subcommittee on Historical Truth of the Human Rights Commission of the Constitutional Convention (2020-21) held public hearings during August 2021 to hear victims' views and needs. The recently elected government of President Gabriel Boric created the "Roundtable on Integral Reparation for Victims of Human Rights Violations in the Social Outbreak", whose members are currently touring the country to interview victims in order to generate concrete proposals. This research aims to systematise the demands and spaces for participation of the victims of state repression during the 2019 social outbreak, on the one hand, and to evaluate the capacity shown by public administration institutions to provide material and symbolic reparations to those who have reported having suffered abuses by the police, on the other.

BERGQUIST, Magnus (University of Halmstad, Sweden)

Automated Decision Making and Professional Work in Healthcare.

Technologies of automation and algorithmic data processing are becoming an integrated part of decision-making in healthcare, increasingly transforming professionals' work practices. Researchers have emphasised how this type of Automated Decision-Making (ADM) foster challenges associated with labour-saving automation. Still, we lack empirical studies examining institutional conditions shaping such technological solutions. To recognise the impact of institutional conditions, this study investigates how the introduction of ADM in healthcare involves human expertise.

We approach ADM as a technology that changes the way we conceptualize automation from being a matter of executing work routines, to becoming an integral part of clinical and managerial decision making. The analysis engages in the fact that ADM, reconfigures the relationship between professionals and technologies in healthcare, as well as the distribution of responsibilities and competence demands. ADM thereby also fosters expectations on new forms of professionalism in healthcare. By professionalism, we here refer to the performance of good work, informed by knowledge and skills recognized as necessary to the conduct of professional services (Friedson, 2001). The study draws on a purposive sampling strategy comprising two cases (Bryman, 2012); one large university hospital and another regional hospital in Sweden. The analysis comprises 25 semi-structured interviews with specialisations located at various parts of the healthcare organisation. We interviewed radiologists working with lesion segmentation, clinicians from neurosurgery, oncology, and pathology. We also interviewed nurses specialised in mobile unit emergency care and psychologists using ADM for prediction of mental illness.

Leading Schools from the Rainbow: The Challenges and Complexities of Being an LGBT Primary School Leader in Australia

School leaders face many challenges in leading schools. Identifying as lesbian, gay, bisexual, or transgender (LGBT) and being a school leader places additional layers of complexity on the person. Research suggest LGBT-identifying persons experience marginalisation, oppression, silencing, inauthenticity, and disenfranchisement. This paper seeks to explore the challenges and complexities they face, the impact this has on their ability to effectively lead, and ways these challenges and complexities can be ameliorated.

A major theory underpinning the research field is identity management. This refers to the hypervigilant analysis that LGBT school leaders make in any of their surroundings, and all the subconscious adjustments they make to protect the integrity of their identity.

Drawing on grounded theory and identity management, the proposed paper will examine the experiences of LGBT primary school leaders in Australia from public, Catholic, and independent school sectors. Using grounded theory, and drawing on semi-structured interviews with Australian LGBT school leaders, their responses will be used to create a framework that highlights the challenges and complexities they face. Suggestions for ways to ameliorate their complexities will be extracted from their responses.

The proposed paper will contribute new insights to this under-researched area within the primary school Australian context. Currently, most research available is limited to American high schools and universities with Caucasian participants. It is hoped that these findings can be used to create positive change for Australian LGBT primary school leaders, and that the paper can be replicated globally and provide positive change.

Cuerpos y Fronteras: El Derecho a La Ciudad En Situación De Movilidad

La comunicación presenta resultados de la investigación: *'Migraciones y frontera: el caso de ciudades limítrofes de Uruguay y Brasil'* . La investigación produjo conocimiento acerca de las vivencias, imaginarios, historia de vida y corredores geográficos por los que transitan las personas en situación de movilidad. Se exploraron los sentidos de las categorías: Frontera; Territorio; Cuerpo; Cuidados; Desplazamientos forzados entre otras. Las relaciones entre el cuerpo y el territorio constituyen un campo de problemas de larga duración, desde las ciencias sociales y la esfera política la correspondencia entre el mapa y la realidad se construyó históricamente como un espacio de disputa. En términos contemporáneos la propagación de la pandemia COVID XIX produjo una transformación radical de las relaciones que las sociedades mantienen con su entorno. Como nunca antes *el afuera* se introyectó en la vida cotidiana, es así que desde la intimidad hasta las esferas del trabajo y la salud se produjo un nuevo espacio material para la construcción de relaciones sociales. Para Achille Mbembé la pandemia modificó las formas en las que nos relacionamos con nuestros cuerpos, tanto es así que: "Nuestro cuerpo se ha convertido en una amenaza para nosotros mismos" (Bercito, 2020). La afirmación de Mbembé hace referencia a la *amenaza*, junto a su planteo, podemos agregar -en el marco de una política de gobierno global- que la amenaza forma parte de un conjunto más amplio de emociones que tiene centralidad en las políticas del miedo donde éste funciona como un dispositivo de gobierno de las sociedades transparentes. La presentación de la comunicación será oportuna para intercambiar acerca de las nuevas territorialidades, del miedo a los/as otros/as, al futuro, a las enfermedades, a la inseguridad, a las pérdidas, al desempleo, a la soledad en tanto denominadores comunes de las prácticas de gobierno y de producción de socialidades.

ROMANOVICH, Nelly* (The Russian Presidential Academy of National Economy and Public Administration (RANEPA), Russian Federation)

Survival Skills of Russian Entrepreneurs Against the Backdrop of a Crisis

Two years of the pandemic have put small and medium-sized businesses in an unprecedented struggle for survival. This crisis had a negative impact on many entrepreneurs who lost not only their income, but also the business itself. However, those entrepreneurs who managed to keep their business and sometimes even increase their income are ready to share their experience and talk about the skills that helped them to survive. The all-Russian study of entrepreneurs' opinion which was conducted at the end of 2021 made it possible to study the invaluable experience of the small and medium-sized businesses survival in a crisis situation and analyze the lessons learned by businessmen. As a result, the passed test can be considered not only as a negative factor, but also as a powerful stimulus for the development of Russian enterprises by acquiring the skills which can help them to overcome the current crisis.

The need for a safety cushion and the rapid development of online technologies, the awareness of the constant demand for new knowledge and constant development as a way to survive - these and other lessons helped Russian business survive. They told about this to researchers from the Association of Regional Research Centers, who held 23 CEP sessions with entrepreneurs from 23 regions from Vladivostok to Kaliningrad at the end of 2021. CEP sessions are focus group discussions with competent expert entrepreneurs, who are essentially "survivors of the crisis", which means they can share survival recipes. Some kind of declarations of intent were made that will determine the fate of Russian small business in the short term. Lessons such as "responsiveness", "business diversification and business optimization", "business flexibility and customer focus", "training", "refusal of loans" and the right attitude towards government support will set the direction for entrepreneurs in the coming years.

Masculinities and Anti-Immigration Politics in the US

This paper draws on Raewyn Connell's conceptualization of the gender order to examine masculine and feminine constructions that framed anti-immigration discourse and policies in the US during the Trump administration and the years following his loss for a second term. White, upper middle-class, women in the administration used traditional gender roles in supporting the anti-immigrant policies implemented in the Trump administration. Following his term, white male Republicans constructed anti-immigration sentiment and used their positions as governors to limit asylum seekers in bordering states. Strong-arm tactics demonstrated their stance against immigration in opposition to governors in states characterized as sanctuary spaces for migrants and refugees. Masculine and feminine constructions are also examined in relation to the different refugee populations during this period and the wider US population

'Justice Orthopedics': Meanings and Sensibilities and Penal Change in Colombia

Since 2016, Colombia has been implementing one of the most challenging peace agreements. Not only for its complex design but also the political opposition, the implementation has been sluggish and has encountered numberless barriers. A central component of the agreement was to address the needs of victims of human rights violations. The Special Jurisdiction for Peace (JEP, in Spanish), a new institution in charge of the judicial component, has been working for more than four years, from a macrocriminal perspective. Despite the incipient advance of the processes, the participation of victims in the dialogic judicial procedure, and the intervention of other parties and actors in the system, have shown a lively transformation of the perception and expectations of the process. A set of new practices and discourses has been critical for accomplishing the functions of a bewildering model of justice, even for the judges and legal advisors, in a country that is still in the middle of conflict and fearing the truth that may be revealed. In this paper, I want to show how judges, legal advisors, lawyers, and perpetrators contribute to transforming the perception of this institution, and at the same time benefit from the role they are meant to play. For this reason, I want to discuss the concept of "justice orthopedics" as a set of mechanisms in which mindsets and sensibilities towards justice and punishment are transformed, as an informal process of penal change. In doing so, I connect scholarship on the sociology of punishment and cultural sociology. This paper aims to contribute to the debate about the conditions in which changes in mindsets and sensibilities of justice and punishment take place.

Parental Leave's Use By Latin-American Fathers in Spain

Studies that focus on how the migrant population knows and uses family policies are scarce and are only present in Central European and Nordic countries. Studies in the Nordic countries analyse how migrants are influenced by the pioneering design of family policies in these countries of the involvement of men in childcare. Both the investigations of the Polish population in Norway (Zadkowska et al., 2020), and the population of other European countries in Europe (Kvande and Brandth, 2017), show how migrants change both the forms of care, how the discourse regulations of care influenced by the design of family policies, especially the parental leave agenda.

The heterogeneity of the immigrant population is diverse both from their place of origin, culture and social class. We focus on the Latin American migrant population with children and with employment in Spain. The lack of knowledge of the recognized rights in terms of parental is expected to occur more frequently among the migrant population. Among these social groups, it is also to be expected that prejudices against using long leaves and dividing them up over time so that parents can "take care of their children alone" while their partners return to work.

This work is based on an online survey of parents with at least one child under 7 years of age (QUIDAN Survey), which is representative of young families residing in Spain. In total, 3,100 parents were interviewed.

We carry out multivariate model using logistic regression for fathers of children from 0 to 6 years old, where the dependent variables are the use of different parental leave, and the independent variable is the country of birth. We use several control variables as a level of education, age, age of the children, working conditions and ideals about gender and care.

Engaging Communities and Stakeholders to Achieve Energy Equity: Lessons and Best Practices

Although the restructuring of energy infrastructure requires community and stakeholder engagement, such engagement can result in opposition and rejection. Examples include public opposition to nuclear energy, wind energy, and siting of bioenergy infrastructures, due to concerns about security, privacy, noise, and potential health and socioeconomic impacts. To target this challenge, scholars and practitioners have examined the significance of engagement, public perceptions of and responses to new energy technologies.

However, fewer efforts attempt to understand, describe, and explain the links between community engagement and equity in transitions such as those associated with bioenergy. This paper is a collaborative effort combining a systematic literature review with a meta-analysis to addresses the gap. Meta-analysis is often applied to find commonalities within a variety of research papers and methods. It involves the pooling of data that quantitatively examine whether relations and patterns described in individual papers hold across a broader body of scholarship. While meta-analysis is frequently combined with systematic literature reviews to synthesize the results of previous research, in our approach, we combine both to systematically investigate patterns on the framing of community engagement and equity, with an emphasis on the siting of energy infrastructure. Utilizing a community-center approach to stakeholder engagement, the paper will detail:

- General methods and guidelines for bottom-up justice and equity approaches to community engagement in the development of bioenergy and other energy transition infrastructures;

- Specific examples that reveal how these methods and guidelines must be adapted to the local context and histories of each case study, as well as how we can learn from the lived experiences shared by community members; and

- A series of lessons learned and best practices in community engagement that can inform transition policies development in bioenergy and beyond.

Towards Equity and Justice in Energy Transitions in Los Angeles

The transition to zero-carbon and equitable energy futures is now as inhibited by social, cultural, and institutional factors as by technological factors. While many historical transitions revolved around technologies and investments, the current energy transition will additionally need to create enabling political and sociocultural conditions via programs and policies. Therefore, programs that target sociocultural and institutional factors will be as crucial as those targeting techno-infrastructural factors. The goal of this presentation is to highlight results from LA100 Equity Strategies, a two year-project undertaking a community-informed analysis of policy strategies for Los Angeles. This project aims to ensure the city's transition to 100 percent clean energy and improved energy benefits for underrepresented populations. By creating new community engagement mechanisms, the project is creating options for community-tailored innovations – such as community solar, cooling center, and electric mobility solutions – that address structural energy injustices. We will present results and lessons learned from listening sessions and policy analysis aimed to examine barriers to energy equity that community members and community-based organizations highlighted. These barriers may contribute to the inequitable distribution of program benefits identified in the National Renewable Energy Laboratory's statistical analysis of Los Angeles Department of Water and Power (LADWP) programs. We will then consider these barriers to determine community identified opportunities for modifying the existing program design to be more equitable. Finally, our analysis will inform the future design of strategies that address those identified barriers in accessing the benefits of existing LADWP programs and services.

Proyecto a-Guajira: Promoviendo La Salud En La Alta Guajira

El Proyecto A-Guajira surge en el marco de la Línea de Comunidades Rurales Saludables de la Fundación Keralty y promueve la recuperación del valor del cuidado comunitario, así como la creación y mantenimiento de la salud en territorios aislados o dispersos, respetando y recuperando la cultura y las tradiciones de las comunidades allí presentes. Esta, es una iniciativa innovadora de promoción de la salud basada en un enfoque comunitario y en una teoría enfocada en los recursos, talentos y conocimientos con los que cuentan las comunidades para cuidar y mantener su salud en las dimensiones física, emocional, social, espiritual y ambiental llamada salutogénesis.

En este sentido, el modelo trabaja desde la identificación y réplica de los activos en salud de los territorios rurales, que se entienden como una herramienta material o inmaterial que hace que un individuo o una comunidad puedan mejorar su bienestar. Así, trabajamos de la mano de las comunidades de Yorijarú y Kulesiamana en la elaboración de herramientas como el catálogo de etnobotánica con plantas medicinales, en donde se reúnen conocimientos de medicina tradicional wayuu y medicina occidental. La implementación de esta y otros activos de salud reconocidos por la comunidad, se han reflejado no solo en el fortalecimiento de las costumbres del pueblo indígena wayuu sino que se ha registrado una disminución de casi el 40% en prevalencias de indicadores de salud priorizados como: las Infecciones Respiratorias Agudas y las Enfermedades Diarreicas Agudas.

Desde el modelo, buscamos dejar capacidad instalada en las familias e instituciones que habitan el territorio, permitiendo la recuperación del valor del cuidado comunitario, así como la confianza, capacidades, visión y protagonismo de las personas para impulsar cambios positivos en su bienestar y condiciones de salud de una manera integral, respetuosa y sostenible.

Enduring Midlife Love: Temporal Qualities and Possibilities

Enduring midlife love: temporal qualities and possibilities

This paper proposes temporality as an analytical lens to study love, focusing on the temporal qualities and possibilities of *enduring love at midlife*. Keeping midlife love alive means negotiating some of the main late modern societal challenges: work pressures, parenting expectations, multiple care responsibilities, fear of commitment, and fear of missing out. Feminist scholars have observed that love entails contextual, qualitative, and repetitive care that is potentially at odds with results-oriented activities in other domains of modern life. The everyday acts (kissing, hugging, listening) that are important for enduring love could either conflict or resonate with, for instance, work, parenting, or leisure temporalities. How do middle-aged people succeed in maintaining an enduring love, especially when society values individualism, speed, and youthfulness? Simultaneously, the gendered, ageist, classed, and racialised exclusionary mechanisms of beauty norms attest to the importance of social positioning for people's experiences of ageing. Moreover, people of colour and working-class men and women are excluded from linear notions of progress/resignation, and concerns related to 'career stagnation' or an 'empty nest' may not resonate with less privileged groups in society. Rather than assuming midlife as a universal phase, this paper suggest to instead ask how midlife love generates different experiences of temporality. Insight into these differences will not only provide a more inclusive picture of the predominantly white, middle-class based understanding of midlife love crisis, but may also help diversify underlying notions of the good life beyond late-modern imperatives of improvement and progress.

Micro and Macrocosms: Ayurveda and the Microbiome

"One thing to remember, as the Ayurveda says, '*Yatha Pinde Tatha Bradmande*': As is the microcosm, so is the macrocosm. As is the body so, is the universe." This paper explores how the microbiomization of the self and society within the Postgenomic Era impacts understandings of traditional medicines and in particular Ayurveda. Ayurveda is a medical system originating in South Asia and commonly translated as the 'science of life'. Ayurvedic researchers are now utilizing scientific research on the gut microbiome as a frame in which to view Ayurvedic practices that focus on diet and digestion. For instance, researchers have suggested that one's *Prakriti* (one's constitution, similar to phenotype) can potentially be used as a stratifier of the gut microbiome and may produce evidence for a conceptual framework for personalized medicine in Ayurveda (Jnana et al., 2020). Here, Ayurvedic researchers place themselves within a scientific framework which helps to transcribe Ayurvedic ideas and practices into biomedical and microbiological terms. This paper uses ethnographic data and interviews to explore how Ayurvedic practitioners use the microbiome to help (or hinder) their understandings of the body, society, and universe.

Masculinities, Citizenship and Right-Wing Populism in Australia

This paper reports findings from an Australian online survey with 335 male respondents and 50 follow-up interviews. The data was collected for a research project titled *Far Right in Australia: Intellectuals, Masculinity and Citizenship*. We were guided by earlier findings in the field which show right-wing populism is primarily supported by white men. Scholars have found an affinity between disenfranchised working-class men and right-wing extremism. The men in our survey sample were primarily from occupations that match contemporary definitions of 'working class'. In the survey data and interviews, we found much evidence for the discourse of white male victimhood. The men's responses expressed anxiety and resentment about the life and career circumstances in which they found themselves, but tended to locate the blame away from changed socio-economic structures, towards so-called 'woke' thinking and the push for cultural change to achieve greater equity and diversity. Anti-government rhetoric was intense. Right-wing populist ideas seemed to be influential and were tied to active misogyny.

Modes of Gathering: Methodological Contributions for Studying Landless and Rural Collective Action Dynamics

Studing collective actors as the effect of the association of heterogeneous elements (Law, 2004, Rodríguez-Giralt et al, 2018) has opened innovative ways for understanding the constitutive heterogeneity and instability of social movements. In our work, we are interested in the continuous composition and recomposition of rural movements in Brazil and South Africa (Rosa et al, 2022). While attentive to instability, we also identify recurrent patterns of association of heterogeneous elements that are produced by collective actors while trying to engage in political debates and to modify norms and behaviors. For instance: Contag, a Brazilian trade union organization, gathered family farming, participatory institutions and policy claims and literally transported those elements from national to international arenas, using them to open new venues for its political agenda. In this paper, we draw from cases of rural activism to further develop the notion of "modes of gathering" (Law, 2004) suggesting these modes often enable the production of new connections, but also modify the assemblages they are connected to, producing new gatherings (agencements), which can potentially affect the composition of the collective actors themselves and produce unexpected effects. Post-structuralist inspired approaches still pose important methodological challenges. We expect to contribute to this research agenda by developing analytical tools that help researchers to grasping the continuous formation of heterogeneous actors.

ROSA, Marcelo Carvalho* (UFRRJ, Brazil)

Ontoformativity: Southern Challenges to Peripheral Sociologies and Social Theories

The aim is to present a concrete conceptual advancement in the contemporary debates of social theory, including the areas of southern, post-colonial and decolonial studies. The paper invites readers to come to terms with the ambiguous legacies of the hegemonic ontology of social theories and its consequences on social research. It addresses a gap in the dominant literature by suggesting that the critical sociological attempts to democratize the discipline should be committed with the possibility of amplifying its ontological foundation and not only to the inclusion of unexplored realities into the hegemonic narratives on the peripheries as the victims and reaction to the centre. It is a plea for the development an intellectual attitude where every empirical research becomes an open ground for the manufacturing of new subjects heavily dependent on theoretical and methodological innovations. Drawing on the efforts and limits of the current literature, the paper develops the notion of an **ontoformative ethics** as a theoretical-methodological programme to amplify the canonical scope of the discipline. By **ontoformativity** I mean specifically the continuous combination of research and theory in order to produce new relevant analytical ontologies, expanding our possibilities to deal with multiple, unequal or incommensurable worlds. The proposed amplification is anchored in already existing research subjects that cannot be circumscribed to the current theory due to geopolitical limitations of the hegemonic principles and by its ontological circumscription to the scope of the capitalist modernity imagination.

The Consolidation Paradox. Why SES Disparities By Race Cannot Explain the Racial and SES Segregation in US High School Friendship Networks and What Does.

Already Coleman's (1966) landmark study found that peers are crucial to students' school achievement. More recent studies highlight the importance of cross-SES friendships, which provide lower-SES students access to the human, cultural, and social capital of higher-SES students and positively impact their school achievement and later socioeconomic attainment (Chetty et al. 2022a). Given the importance of cross-SES friendships, it is, therefore, key to understand their formation.

In a much-discussed study, Chetty et al. (2022b) describe the spatial distribution of cross-SES friendships in the US, revealing a lack of cross-SES friendships and that the socioeconomic disconnection is largest in racially segregated areas. Due to data limitations, however, Chetty and colleagues are unable to examine the association between race and SES segregation at the network level.

Prior research in sociology highlights two reasons for why same-race and same-SES friendships should coincide in friendship networks. First, due to the consolidation of race and SES (i.e., SES disparities by race). If race and SES are correlated, racial segregation reduces the opportunities for cross-SES friendships and racial homophily reduces the realization of them. Second, due to differences in social closure by race. If SES homophily differs by race, racial segregation will also affect the prevalence of cross-SES friendship. Moreover, differences in SES homophily by race also determine which groups will be most affected by socioeconomic disconnection.

Accordingly, this paper disentangles the degree to which the race and SES segregation in US highschool friendship networks is the result of (i) schools' distribution of race and SES, (ii) schools' consolidation of race and SES, and (iii) race-specific SES homophily.

The results show that same-race and same-SES friendships coincide at the network level but—paradoxically—not due to the consolidation of race and SES. Instead, we reveal that race-specific SES homophily explains the coincidence of same-race and same-SES ties.

Hybrid Arrangements in the Formalisation of Pueblos Jovenes in Arequipa, Peru

This paper deals with the hybrid practices of the state and residents in the development of pueblos jovenes in the Peruvian Secondary City of Arequipa. These urbanisaciones are often founded in processes of informal land invasion by neighbourhood associations established for this purpose. This contribution builds on the findings of ethnographic field research in three different neighbourhoods and analyses these processes and the subsequent long road to formalisation of the land by the state. It shows how the inhabitants struggle for the provision of infrastructures and what means they use to help themselves in times of need. In addition, the importance of these infrastructures for the process of formalising neighbourhoods and transferring property rights to the residents is analysed. The complex interplay of formal practices of state actors and informal practices of residents and the resulting forms of hybrid urban development are examined. Finally, the article describes the partly conflictual relations between two groups of actors within the pueblos jovenes. On the one hand, actors with high resources, who regard the land as an investment, often push for formalisation in political offices in order to later resell the land at a high price. On the other hand, poorer actors, who move to these parts of the city out of great need and lack of resources and try to push development there in order to improve the poor living conditions and to enable a higher standard of living for themselves and their families.

(EN)Countering Raceless Narratives: Migrant Mothers and Children with 'NO Recourse to Public Funds'

In the UK, the 'no recourse to public funds' (NRPF) condition borders social support for undocumented migrants and those with time-limited leave to remain. Previous research has highlighted NRPF's detrimental impacts, particularly on single-parent families headed by mothers from former British colonies, who are racialised as 'Other' and already economically marginalised. The only potential state support available is for 'children in need' under the *Children Act 1989*. In practice, this support is minimal and difficult to access as Street Level Bureaucrats (SLB) in cash-strapped local authorities interpret 'need' through, often racialised, frameworks of deservingness.

Drawing on an ethnographic study with mothers with NRPF and their children, we consider the ways that 'race' and racism appeared in our interlocutors' narratives. We demonstrate that suffering was articulated most profoundly, and made sense of, largely through 'de-raced' interpersonal encounters. Where 'race' did appear explicitly, it referred to micro-level aggressions including by intimate others, usually other people of colour, or in abstract terms of 'good' Whiteness. What's more, in much of the scant scholarship on NRPF, we find a striking absence of 'race', with systemic racism rarely granted explanatory purchase for SLB's decision making.

Speaking against such erasures, we argue for the importance of listening to silences to address the ways that racism pervades Britain's internal and external borders. In asking what we can learn from its presence *and* absence, we offer three tentative ways of making sense of the spectre of 'race'/racism: (1) The overdetermined Whiteness of the research encounter. (2) A context where post-racial fantasies dominate state discourses and individualised neoliberal subjectivities prevail. (3) The often faceless and fleeting nature of encounters between families with NRPF and SLBs, which mean that systemic racism is obscured by hyper-violent interpersonal acts and the daily challenges of sustaining life under duress.

ROSENFELDT, Adrian* (La Trobe University, Australia)

Bringing Religion and Science Back Down to Earth in the New Millennium

This paper examines the post-9/11 God debate in the 'global north' while focusing on the most prominent and influential English God debaters. Through a close study of God debaters, Richard Dawkins, Karen Armstrong, Christopher Hitchens and Terry Eagleton, I argue that New Atheist and religious apologist ideas and arguments about God, science, and identity are driven by mythic autobiographical narratives and Protestant and Catholic cultural heritage. This approach is informed by criticism of the New Atheist polemic as being positivistic and the religious apologists as propagating 'sophisticated theology.' In both cases, the God debaters are perceived as disassociating themselves from human lived experience.

Ostensibly, the post-9/11 God debate is about ideas and conceptions of God, religion and science. However, I argue that the English 'Protestant' New Atheists, Dawkins and Hitchens, share a particular individualistic scientistic cultural heritage that is deeply offended by the coordinated and flagrantly religious nature of 9/11, and the movement by religious fundamentalists to have Creationism taught as a science subject in American schools. I also demonstrate how the recognisably 'Catholic' literary theorist Terry Eagleton, and former nun and religious historian Karen Armstrong, find the reductive New Atheist propositional view of religion distinctly unsophisticated and alien.

In this post-9/11 God debate identity-making is recognisable in the way these English atheist and religious identities are performed, cultivated and recreated in the public arena. Identity-making is a dark performance art where many unacknowledged elements remain hidden so that the illusion of a one-dimensional identity can be maintained: whether it is the identity of the rational atheist scientist or the religious spiritual being. It is through reconnecting the God debaters' intellectual ideas to their Protestant or Catholic cultural heritage that the God debate can be grounded in a recognisable human reality that eludes reductive distinctions and disembodied abstractions.

RC47-JS-28.1

ROSENFELDT, Adrian* (La Trobe University, Australia)

The English Post-9/11 God Debate between Religious Apologists and New Atheist Agitators

This paper explores the post-9/11 New Atheist movement in the West and the religious apologists' response to this cultural phenomenon. In 2006, Richard Dawkins' atheist manifesto *The God Delusion* became a lightning rod for discussion and debate, and the term, the 'New Atheists,' was first used by journalist Gary Wolfe in an article for British magazine, *Wired*. In this study I have deliberately concentrated on the two English 'Protestant' New Atheists, Dawkins and Hitchens, while also emphasising the fact that they felt compelled to write their atheist texts in reaction to 9/11 and the movement by religious fundamentalists to have Creationism taught as a science subject in American schools. I explore just why these particular events in America galvanised these two English Oxford intellectual elites into publicly denouncing all religious belief.

On the religious apologists' side of this new millennial debate, 'Catholic' literary theorist Terry Eagleton, and former nun and religious historian Karen Armstrong, have publicly challenged New Atheist beliefs. Eagleton's highly critical review of *The God Delusion* in the *London Review of Books* has become a sensation in its own right, and, as I will show, is largely governed by his Catholic Dominican distaste for what he recognises as Dawkins' Protestant positivistic scientistic worldview. I also demonstrate how the Thomistic 'ineffable God' espoused by Armstrong in her encounter with Dawkins in *The Wall Street Journal*, is distinctly offensive to his Protestant sensibilities. I maintain that it is no coincidence that all four of these English God debaters are recognised as leading intellectuals in Britain and that this is salient to their habitus and identity-making, that I contend cannot be detached from their intellectual

denotes a presenting author. Abstracts are organized by first presenting author's last name.

ideas. In this study I emphatically reconnect these God debaters' seemingly disembodied intellectual ideas and arguments about God to their cultural and social background.

Patient's Participation in Medical Consultation

Cancer patients' agency in challenging their 'sick' role, the social stigma put on them, and in collaborating with medical and health professionals in their own care process is increasingly important, especially in times when healthcare systems intend to realise a patient-centered approach. Differently from a doctor-centered approach, which traditionally enhance institutional, asymmetrical, and monological interactions, a patient-centered approach is improved by medical dialogue and considers patients not merely roles, rather individuals with personal needs and fears, able to express their own ideas, to tell their stories, to ask questions, and to suggest options when interacting with practicioners. By presenting some research data, this contribution focuses on patients' involvement during medical consultations in the oncology field. Research was conducted at a local level in five health structures that deal with oncology, surgery, and radiology care. The corpus of data includes about 80 videorecorded consultations, divided in first visits and follow up visits. Data transcription followed a simplified version of Conversation Analysis norms. The principal aim here is to examine in some example of transcribed extracts in which ways and with what effects health physicians facilitate patients' participation in three stages of the visit: history taking, diagnosis, and treatment. The theoretical framework used for data analysis combines a constructivist theory of systems of communications, with studies on dialogue, and some conceptual aspects drawn from Conversation Analysis. Objects of the analysis in this contribution are: 1) the forms of communication created in doctor-patient interactions, observing in particular their cultural presuppositions (value, positioning, expectations) and the type of actions (dialogical/monological) produced by professionals; 2) the forms of patients' participation and agency within interactions, for example questions, opinions, oppositions, emotions, concerns, narratives, etc. Preliminary results highlight a connection between certain physician's dialogical actions and specific types of patient's involvement.

Contributions of the Sociology of Cinema for Analysing Streaming TV Shows

This paper presents an approach combining research agendas on Digital Sociology and Sociology of film and cinema, considering specifically the spread of Serial TV Shows on streaming platforms such Netflix and HBO-Max. One understands that, since around 2006, with the facilitated traffic and consumption of multimedia – music; photos; videos and animation – on the internet, the presence of audiovisual contents in everyday life became even more intensified than before, with cinema and broadcast television. We believe this technological shift brings relevant changings on how societies and individuals relate to electronic mediated images and constitute symbolic and valueting references through social life. However, much of the cultural and imagetic references set in motion in present digital media were established by cinema and television currently the 20th century, being seen almost as a natural perception, although historically produced.

Insofar, one proposes to review Pierre Sorlín's (1977) sociological approach to films as constitutive parts of ideology – as historical and social shared ways of conceiving reality – as much as his methods for analyzing sets of films but considering both technical and cultural specificities of today digital societies. So, it's presented an analytical reflection that places together a connectivity culture (VAN DJICK, 2016) and a cinematic culture, in order to comprehend how today´s ideologies are part influenced by specific recurrent imagetic constructions diffused by streaming platforms, by using cinema and television languages. Since, one focus our attention to fictional series and how they can be related to contemporary individualization (BECK, 2002) processes which endorses reflexive and "do-it yourself" biographies as ways of living and coping present systemic challenges. Besides all the individualized possible ways of consuming streaming contents with different devices, its shows offer viewers higher chances of relating to evolving characters season by season, when compared to isolated films.

'Doing Family' in Western Jihadist Subculture and Its Effects on Radical Careers

Researchers often ask how family backgrounds affect radicalisation of young European jihadists. Rarely do they examine how members of the jihadist subculture handle their family lives. In our qualitative research on the jihadist careers of young men from Germany we pursued this question and focused on how young radicals are "doing family". Thereby we gained interesting insights into family related causes of jihadist radicalisation. We found that family backgrounds not only affect jihadist careers, but that radical careers also change the young men's family lives, with family conflicts retroacting on careers and reinforcing ideological convictions. Presenting case studies of young jihadists, I will elaborate on two subcultural family practices and their effects on jihadist careers.

The first practice I will focus on is the political-religious empowerment of young jihadists towards their parents. We observed that the young radicals reject their parents' authority by means of sacred subcultural norms and identity. They perceive themselves as 'true Muslims', devoted to god's authority and a community of brothers. Relying on this self-perception they repulse the role-models and expectations of their 'infidel' parents. So, the jihadist subculture especially appeals to young men in adolescent and other familial conflicts. Submission to subcultural norms grants them autonomy from parental authority and helps to create their 'own' lives.

Secondly, I will focus on the young men's attempts to preserve this independence. When the families don't break up due to the sons' radicalisation, they mostly end up in long-lasting conflicts. We found that these emotional contentions become a situation of proof for the young jihadist. They try to stay 'steadfast' and hold on to their subcultural identity. They must prove to themselves and their brothers that they don't lose their convictions due to familial sentiments. Living through these conflicts often reinforces ideological commitments and leads to radical actions.

Active or Passive Participants? How Higher Levels of Involvement By Lay Participants Impacts on Their Experience of Justice.

Jurors for the most part are passive listeners – they sit through days, sometimes weeks, listening to other people talking. Several jurisdictions encourage jurors to ask questions of witnesses, while others keep jurors focused by making evidence presentation more engaging. Previous research from Arizona suggests that giving jurors a somewhat more active role increases their satisfaction without having an impact on outcomes. Besides jurors, there are a range of other lay participants in court hearings, including witnesses, litigants and defendants. Drawing together several randomised controlled trials and evaluations carried out by the researchers over more than a decade, this paper examines how different levels of participation for these court users impacts on their judgements (such as verdicts), their assessments of the fairness, honesty and credibility of judicial officers and lawyers, and their own sense of presence and engagement. We compare how these impacts vary by type of technology used, including immersive visual evidence, distributed courtrooms (multi-channel video with screens for each remote participant) and immersive virtual court platforms.

Technological Enablers of Citizen Science – a Diagnosis of Technological Advancement of NGOs in Poland

Citizen science is a social innovation that requires adoption of proper technological solutions. According to Unified Theory of Acceptance and Use of Technology (Venkatesh et al., 2003) a perceived likelihood of adopting an innovation depends on four key constructs, including facilitating conditions – 'the degree to which an individual believes that an organization's and technical infrastructure exists to support the use of the system' (Venkatesh et al., 2003). Facilitating conditions can be understood as compatibility of an innovation with norms, values, and believes of targeted population. People are more likely to adopt a technology if it feels familiar. If an innovation is very different from what people are used to using, the adoption process might take longer or not be picked up at all.

In our research we studied technological solutions that NGOs working for the protection of the environment in Poland are using to diagnose their potential to implement citizen science projects. We have decided to study all NGOs, regardless their experience in running citizen science projects, to better understand the context in which the social innovation is supposed to take place.

We interviewed 28 board representatives, managers and initiators of social movement and conducted a desk research of 65 NGOs in Poland. Every technological solution was recorded and later categorized. Altogether, we found and coded 45 different technological solutions used for communication, education, data gathering, and data visualization.

Our study shows that although majority of NGOs see a great potential in citizen science, they are lacking proper technological solutions to implement and manage such projects. Only a few NGOs run citizen science projects in

the past for which they mostly used internationally recognized applications like Amber or GLOBE program; two used platforms developed locally. We will discuss how affordances of today's technologies influence the future of citizen science.

ROUDOMETOF, Victor* (University of Cyprus POB 20537, Cyprus)

Globalization, Glocalization and the ICT Revolution

This paper explores the relationship between globalization and the information-communication technologies (ICT) revolution. It argues that the impact of ICTs does not by and large conform to the predictions often attributed to or conventionally associated with globalization. Specifically, the empirical record is at odds with predictions of a single, all-encompassing unified digital world. In order to sufficiently reconfigure our sociological interpretations to align with the empirical evidence, it is necessary to expand the meaning conventionally ascribed to globalization. In most accounts, globalization is seen as synonymous with global integration or the construction of a singularity. Instead of accepting this misleading interpretation, it is possible to incorporate the notions of glocalization and localization into the analysis of global processes. These concepts are seen as relatively autonomous vis-à-vis globalization. Glocalization refers to the construction of local-global hybrids that use ICTs to construct a fusion between the two. Augmented reality offers a specific illustration of such glocal fusions; and this notion is explicitly incorporated into contemporary accounts of the so-called "meta-verse". In contrast to glocal hybridity, localization refers to the construction of new "places" that use ICTs to re-articulate or redefine a "sense of place" in contemporary social environments. The use of geomedia offers a specific illustration of these processes. Taken together, glocalization and localization provide a conceptual means for the interpretation of the consequences of the information-communication (ICT) revolution in techno-social relationships. Their outcomes include: the reconstruction of "places" through digital means; and the construction of newfound third spaces of glocality. In the first instance, ICTs lead to a reconstruction of local places; while in the second instance ICTs lead to multiple glocalities. Specific examples of these outcomes are used for the purposes of illustration.

ROULLEAU-BERGER, Laurence* (French National Center of Scientific Research -ENS Lyon, France)

Non-Hegemonic Theory and Post-Western Sociology from China to Europe

In social sciences the challenge that has developed over the past twenty years is a major one, revolving as it does around the question of the international recognition of non-Western knowledge. From the production of an epistemology shared with Chinese and European for 17 years (Roulleau-Berger, 2016; Xie Lizhong, Roulleau-Berger, 2017, Roulleau-Berger, Li Peilin, 2018) we have produced the post-Western sociology to enable a dialogue "à parts égales" on Chinese and European theories, to consider the continuities and discontinuities, the assemblages and disjunctions between sociological knowledge spaces situated in different societal contexts, to work on the gaps/intervals between them. Post-Western Sociology is producing an ecology of diverse knowledges from China and Europe and we can observe, on one hand, the multiplication of Chinese epistemic autonomies vis-à-vis Western hegemonies and, on another hand, theoritical assemblages between Chinese and European sociologies. This groundbreaking contribution is to co-produce a Post-western space in a cross-pollinization process where "Western" and "non-Western" knowledges do interact through cosmovisions, as well as the co-production of transnational fieldwork practices. Post-Western sociology is above all relational, dialogue-based and multi-situated (Roulleau-Berger, Li Peilin, Kim, Yazawa, 2022).

Migration Narratives: Delhi As an Imagined Space of Belonging and Citizenship

India is poised to urbanize on an unprecedented scale in the next few decades. Internal migration remains the most significant driver of urban transformation in India. Rural-urban migration offers us a window to view the varying imaginaries, potentialities, and possibilities of belonging and citizenship in the city. Drawing on migration narratives of poor migrants of Delhi, the paper examines how the individual and collective struggles for a 'better life' inform the imagination, embodied subjectivity, and aspiration of the rural poor who throng the city. I will examine how the city is imagined a) as a space of adventure, autonomy, and freedom from the disciplining grids of parental, village, and familial control, b) as a space of escaping poverty and participating in the labor market, and c) as a space of liberation from the exclusionary logics of caste and gender. In doing so, the paper will argue that the imaginaries are not static but rather ever shifting in response to the contextual predicaments of the migrants in Delhi. In analyzing the discursive realm of imagination, the paper will illuminate how the narratives of rural-urban migrants contest the idea of an inexorable process of individuation. Through various embodied representations, the poor argue that an autonomous existence in the city is not desirable, as it empties the moral contents of living and sharing in the community. The paper will also provide concluding remarks on solidarities and conflicts over belonging and citizenship in the host neighborhoods. It will demonstrate how place-based stigma, rudimentary infrastructure, and social cleavages contribute to forging imaginations of belonging and citizenship in these dense neighborhoods.

'Almost like Engineers!' Material and Symbolic Practices of Plumbers in Delhi

Most of the plumbers in India—along with a significant number in the Middle East— originate from a particular district in the eastern state of Odisha. For the past seventy to eighty years, the water and sanitation infrastructure in the cities of India has been intricately linked to a community of plumbers belonging to an intermediate caste of Odisha. This occupational monopoly has entailed the creation and maintenance of unprecedented material and symbolic practices. The plumbers have learned the skills they need not in their home state, but on site in their new places of work through informal apprenticeships. They do not only plumb the material depths of the urban landscape by installing and repairing pipes, ducts, and ditches as they cultivate technical skills, but also constantly plumb the cultural and symbolic depths of their caste, village, and kinship networks as they aspire to upward mobility. While the solidity of caste networks among the members of this intermediate caste has entrenched their occupational monopoly, these networks foreclose the entry of the members of other oppressed castes into the occupation. At the same time, the material practices of plumbing entail the handling of 'polluting' substances which often threaten the symbolic boundaries of otherwise closed caste relations. Drawing on ethnographic fieldwork over twelve months, in depth interviews, and oral histories, this paper examines how these communities guard their *pollution secrecy* while reinforcing their occupational calling in novel ways.

Endless Exile – Alain Resnais's the War Is over

The aim of this text is to analyze the film "The War Is Over" (La guèrre est finie / La guerra ha terminado - France / Sweden, 1966, directed by Alain Resnais and screenplay by Jorge Semprún). The idea is to point out a possible sociological discussion on the topic of exile, mobilizing the notion of the imaginary. The methodological approach is an internal analysis of the film, to allow the elaboration of sociological considerations along with the expressive elements of the filmic construction, such as the use of shots, camera movements, music, flash-forward, among others. To do so, we shall focus on the "leaps" within the film's narrative order, in which a main character (Diego) anticipates an imaginary series of sequences and events that might or might not have occurred. The main theoretical reference will be Cornelius Castoriadis' book "The imaginary institution of Society" (L'institution immaginaire de la Société). This presentation examines some aspects already explored in other sociology

and cinema meetings held in Brazil or in previous ISA (International Sociological Association) forums and congresses. Originally, the research was sponsored by Fapesp (São Paulo Research Foundation - Brazil).

Sport, Diplomacy, Gender and Region: Positioning the FIFA Women's World Cup Australia and New Zealand 2023

Sport mega events, including multi-sport events like the Olympics, are historically male dominated. Recently, however, this gender power imbalance has shifted, with women's sport becoming increasingly prominent in the global sport field. The FIFA Women's World Cup is the largest and most conspicuous women's sport event, attracting teams from around the world performing before substantial co-present crowds and massive media audiences. In taking place at specific locations, sport events are necessarily enmeshed in the histories, politics, and socio-cultural relations of host regions, nations and cities. As a result of its popularity and capacity to facilitate interactions in both state and civil society domains, sport has strategically asserted its role in public diplomacy – an obvious unmasking of its oft-claimed apoliticality. However, like the institution of sport itself, sport diplomacy has mostly been focused on and practised by men from affluent societies in replicating prevailing asymmetries of power. In being held for the first time in Oceania and shared by the settler colonial nations Australia and Aotearoa New Zealand, the FIFA Women's World Cup 2023 constitutes a 'new entanglement' ripe for sociological analysis. This presentation focuses predominantly on the significance of the tournament regarding sport diplomacy's engagement with a range of tensions and conflicts, including regional geo-political rivalry with China, the threat of inundation of Pacific Islands as a result of climate change, the assertion of Indigenous rights following colonial invasion and dispossession, and the persistent disadvantage of women in sport and society. It analyses these 'pressure points' in relation to the struggles within and between the sport, media and political fields (following Bourdieu), exploring the implications for sport diplomacy and its material-symbolic outcomes of holding a woman-focused mega sport event in a region that has quite suddenly emerged as a highly sensitive geopolitical zone of superpower conflict.

A Tale of Two Bonds: The Technoscientific Features of Experimental Finance in Social Services and Public Health

Financialisation poses a challenge for conventional welfare and public health metrics. The prerogatives of finance potentially disrupt norms of national and international statistical expertise and introduce new priorities within health and welfare policy making. In this tale of two bonds, I focus on the techno-scientific dimensions of social impact bonds and pandemic bonds. The paper's double aim is to explore the instrumentalization of data, infrastructures and actors, and to consider the ways in which these techno-scientific arrangements may enable, reproduce or co-produce financial logics within social policy and public health knowledge-making. One way the paper does this is by tracing the World Bank's pandemic bonds from their initial design during the Ebola outbreak in West Africa, to the COVID-19 pandemic and subsequent closure of the bond. While pandemic bonds marshalled conventional data sources, consequential roles for third-party analytics firms emerged to determine whether conditions for payments to investors and/or developing countries had been met. This application of measurement and calculation strategies presents a challenge to alternative rationales of distribution and efforts to address structural drivers of inequality. One of the most vociferous criticisms of pandemic bonds has been their lagging release of funds to poor countries (Jonas 2019, Erikson 2020). Given this, if better predictive data and algorithmic observation are seen to enable faster financing, perhaps what we are witnessing is just the beginning.

RC34-JS-71.5

ROWLEY, Harriet* (Manchester Metropolitan University, United Kingdom)

Exploring the Potential and Limitations of Co-Produced Research Using Film; A Comparison of Two Participatory Projects in Manchester with Young People.

Although methodologies that seek to co-create knowledge have grown in popularity, the initial heady excitement needs to give way to more critical and sober reflections on the limits of coproduced research (Rowley et al., 2022). Similarly, the use of film in participatory research has been celebrated as a method which can support empowerment, self-advocacy and has become a favourite in satisfying the 'impact agenda' (Braden, 1999; Kindon et al., 2012). However, as Shaw (2015) argues there is no inherent 'magic' in the use of film which guarantees these results whilst much less attention is given to the potential harm and ethical issues that can result.

This paper compares two different projects undertaken by the author which used film. The first was coproduced with young people and documented their experiences of homeless on the streets of Manchester, UK and the second young people's experiences of 'lockdowns' during COVID-19 who were

members of a youth representation forum. The former was a case study in the 'PARTISPACE' (H2020) research into the spaces and styles of young people's participation across eight EU cities, and the latter, an Erasmus+ project called 'Partibridges' involving universities and youth associations in four cities, three of which were in 'PARTISPACE'.

The paper will explore why different deliberative ethical decisions were made in how young people coproduced these projects, collaborated in the process of making the films and how they were involved in the dissemination. It will argue that using film in coproduced research is fraught with ethical issues in relation to processes of empowerment for young people especially when balancing the potential of symbolic violence with that of self-conscientisation. It will reaffirm the importance of forms of solidarity, witnessing and hope, familiar in community development, as important processes which can work against the inevitable limitations of coproduced research.

ROY, Bijoya* (CENTRE FOR WOMEN'S DEVELOPMENT STUDIES, India)

Making Reproductive Health Safe: Stratified Reproduction and Reproductive Justice in India

During the second decade of the twenty-first century in India, obstetric violence and broader issues of reproductive violence (contraception and abortion) unfolded the terrain of stratified reproduction and reproductive injustice. It seeks to bring into conversation the three theoretical frameworks i.e. stratified reproduction, reproductive violence and reproductive justice. Drawing from the narratives of the *Dalit Adivasi Bahujan* (DAB) and religious minority women, this paper interrogates how the reproductive oppression, population control and eugenic dimensions of the population policy have shaped their reproductive lives.

DAB and religious minority women have a higher risk of dying at childbirth, interference with their reproductive lives and experience much reproductive injustice. It illuminates how social welfare policies punish their right to have a child. Overall, in different ways, their reproductive health becomes more precarious. With an emphasis on reproductive injustice in India and at a time when casteist practices and their consequences are being critically engaged with, the paper documents the struggles for reproductive justice that will enable to explicate challenges and possibilities for DAB and religious minority women and their communities. In India, the women's movement has generally confined these issues within the reproductive rights framework. It now needs to expand its framework and integrate the intersectionality of caste, poverty, religion and ethnicity as they shift the idea of increasing reproductive choice to reproductive health care access. These three frameworks will help to understand the tensions within the landscape of reproduction of women from marginalised communities who are '*medically underserved and over surveilled*' that can strengthen and influence the policy.

ROY, Rianka* (University of Connecticut, United States)

'Online Is Just a Backup': Shortcomings of Virtual Protests for Tech Workers' Unions in India

This paper examines the ambivalence of online protests for tech workers' unions in India. Tech unions and their target groups constitute high-skilled tech workers. Union organizers are proficient in using digital tools and have access to ample digital resources—two key ingredients of successful online mobilization (Schradie 2019). But contrary to expectation, why is online organizing not their top preference?

To answer the question, I rely on in-depth semi-structured interviews, conducted since 2020 with ten representatives of two unions in India—the Forum of IT/ITES Employees (FITE) and UNITE. Additionally, I participated in five virtual campaigns that these unions organized since 2020. FITE was formed in 2015, based on a Facebook group 'We are against TCS layoffs.' In 2017, FITE was first registered as a trade union, the same time as UNITE's registration. I also analyze 1419 Facebook posts of FITE, KITU and NDLF-IT from 2020, the first COVID year, when in-person gatherings were suspended.

I find that tech unions now increasingly turn to hybrid methods of organizing, strategically combining virtual and non-virtual campaigns. Online activities make these unions visible to their potential members *within* the tech community. But non-virtual activities are better aligned with their current agenda on solidarity with non-tech labor groups, plans for political outreach and aim to strengthen connections with current and future members.

Besides, organizers identify three major limitations in online campaigns—a. slacktivism, or the discrepancy between online commitment and in-person participation; b. internal disputes about the control over online resources; c. surveillance. The three conditions affect FITE and UNITE in varying proportions. But both unions agree, especially in view of the pandemic-time experience, that online platforms are not designed to support labor organizing but to serve corporate interest.

"We Want to Get Back Our Normal Life": Social Integration and Rohingya Refugees in Bangladesh

Background: Integration and inter-ethnic relations of refugees in the context of conflict has become a subject of research and debate over the past few decades. Following ethnic-cleansing in the Rakhaine province of Myanmar in 2017, the Rohingya people fled mainly to Bangladesh, Malaysia, Indonesia, and the Philippines. However, few of the existing research studies have explored issues of integration in the context of the Rohingya refugee crisis in Bangladesh.

Methods: A multi-method qualitative study was designed to explore patterns of inter-ethnic relations and the integration of the Rohingya refugees in Bangladesh society. Both Rohingya refugee people and representatives of the host communities were recruited to the study. 12 in-depth interviews (IDIs), 6 key informant interviews (KIIs), and two focus group discussions (FGDs) were conducted. All interviews were transcribed and read to develop themes about issues of inter-ethnic relations and integration.

Findings: Findings revealed that religious sentiment and a concern for the humanitarian needs of the Rohingya people motivated local people of the host community to welcome the Rohingya people initially, but later inter-ethnic relations deteriorated between them. Participants from host communities expressed reluctance to welcome and allow the refugees to live permanently in Bangladesh, claiming disruption in their normal life. Moreover, both the host community people and refugees lived in spatially segregated areas. Local people reported facing several social problems including encroachment in their spaces, security threat, and identity crisis, scarcity of resources, unemployment, low wage and drug abuse due to the migration of Rohingya refugees. With little hope for repatriation, some refugees said that they were adopting aspects of the local cultures. Overall, findings point to increasing tension between host and refugee communities.

Conclusion: To avoid long-term conflict between the host community and refugees, all stakeholders working in the area need to foster harmony between these ethnic communities.

'Ritualized Relational Work' As Ethical Support for Corruption: How Do Banquets Promote Guanxi Exchange Among Rural Cadres in China

Although banqueting play important role in *guanxi* exchange in Chinese society, how banquets promote *guanxi* among rural cadres has received little attention.Based on an ethnographic case study of a Chinese county, this article finds that the practice of banqueting with a large number of interaction rituals provides ethical support for exchange among rural cadres. Their instrumental banqueting(*fanju)* can be understood as a process of 'relational work' to justified their exchange and strengthen their relationship, and what the rural cadres try to beautify and strengthen are mainly the relationship between friends, or between superior and subordinate, which are two of the five cardinal relationships of Confucianism (*wulun*). Unlike the concern of avoiding "commensurate the sacred with the profane" of the relational work in the West, the style of relational work in *fanju* attempt to show 'valuing righteousness over profit' of Confucian morality. During the process of banqueting , rural cadres use a large number of interaction rituals to show their 'benevolence and righteousness' , constructing and emphasizing private rather than public morality. As such, their banqueting may provide ethical support for collusion of corruption practice. The use of interaction ritual for relational work, which is found in rural China, can be regarded as a new type of relational work, 'ritualized relational work', contributing to the present literature.

Discounted Deaths: The Eruption of COVID-19 in the Geriatric System of the Community of Madrid

In this session, we will explore a new category of analysis that we have called "discounted deaths," with which we will seek to examine forms of dying occurring outside the scope of the triple meaning of the term "to count"—i.e., deaths that did not count, deaths that were not counted, and deaths for which there was no account. To do this, we will look at the empirical case of elderly people who died in Madrid's nursing homes during the first wave of the pandemic, between March and May 2020. Compared to other affected groups, theirs were deaths that were deemed tolerable. People who died in nursing homes were first excluded from the assistance mechanisms available under the health emergency and then buried in solitude, away from their loved ones, who were not made aware of their situation until they were in their final moments. These were lives abandoned to their fate, lives that were lost in a context of structural precariousness and permanent undocumented status and that, once the cloak of exception was lifted, seem to have disappeared suddenly and for good. What was posed in terms of a tragedy and seemed to have strained the geriatric system and the state's duty of protection toward vulnerable populations, today appears to have evaporated without any trace. Finally, this experience should be taken into consideration to rethink situations in which death is discounted, both in the social sciences and in the fields of medical and social intervention.

A Journey to the West? a Reflexive Public Reason for Energy Transition in China and Taiwan.

Urlich Becks' works on risk society and the reflexive modernization theory prove that the rising level of uncertainties and risks are directly connected with the previously assumed model of linear development- based on techno-scientific achievements. At the same time, technological and economic perspective dominates scientific reflection and public discourse.

Different speeds and paths across political and social contexts of implementing climate mitigation policies showed the weakness of these perspectives in shaping public trust and responding to public expectations- in other words creating reflexive public reason. One of the key elements of climate change policy and political action is energy transition.

The aim of this paper is to propose a new way of understanding energy transition paths by the **reflexive public reason mode**l, which is going to be introduced. This paper illustrates the mechanisms of the energy transition using the example of the energy transition in Taiwan and the People's Republic of China. Based on three types of sources: 14 in-depth semi-structured interviews with researchers from SSH and STEM working at universities in both regions, 300 press articles, legal documents and strategies on the energy transition, issued between 2005-2020 in the P**eoples Republic of China** and **Republic of China** (Taiwan). The choice of mainland China and Taiwan is due to the importance of both regions for the climate and energy policy on a global scale. Whereas both regions and societies have a similar cultural code, however, they exist in two different and separate political and social systems

Understanding the Material, Epistemic and Affective Dimensions of Racial Domination

The processes and practices of the settler colonial state are steeped in racial hierarchies, inherited from colonialism and racial capitalism. Taking as a starting point Aileen Moreton-Robinson's (2015) analysis of the settler colonial state as invested in patriarchal white sovereignty, we examine the efforts made by the settler state to make and uphold Australia as a white possession in the face of unceded Indigenous sovereignty. The production of 'white colonial paranoia' (Moreton-Robinson, 2015, xxiii) through the unresolved tension of settler colonial governance on unceded Indigenous land engenders, we argue, both formal and informal education practices that bolster white racial dominance. In this paper we demonstrate how pedagogies of the state are employed to benefit the settler colonial fiction of white possession and continue a project of racial injustice. We offer examples of pedagogies of the state that are delivered through material, epistemic and affective means and we argue that an understanding of racial domination in Australia must be cognisant of the multi-layered project of racial domination. We suggest projects for divesting from racial domination could benefit from a reparative justice approach that considers the material, epistemic and affective dimensions of domination.

Resisting Big Science: How the Opposition Movement Against the Thirty Meter Telescope Sustained Momentum

Big Science projects, which cost billions of dollars and revolve around expensive, large and complex instruments, are increasingly common in research. These projects are embedded in local communities through their physical infrastructure, economic contributions, and societal outreach. Yet it is not uncommon for local residents to oppose Big Science projects. In South Africa,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

for example, local communities were concerned by the land acquisition process for the Square Kilometer Array and questioned whether project expenditures would benefit them. In southern France, health and safety concerns led some local residents to oppose the construction of the International Thermonuclear Experimental Reactor. Typically, however, opposition to Big Science projects is short-lived, either because local concerns are addressed or because the opposition movement fails to sustain momentum. The story is different for the Thirty Meter Telescope (TMT), a billion-dollar astronomy project planned to be built on Mauna Kea, Hawai'i. Native Hawaiians and local residents have sustained opposition to the TMT for more than ten years. How did the local movement against the TMT manage to sustain such momentum? The present study seeks to answer this question by drawing on social movement theory and the literature on place attachment. Using data from interviews and participant observation, this study argues that five factors – elite support, persuasive frames, strong place attachment, community leadership, and resources – were decisive for movement survival.

RUELLAND, Isabelle* (University of Quebec in Montreal UQAM, Canada)

Citizen Care Workers in Public Health: Critical Reflection Based on Research on Community Outreach Practices on COVID-19 in Disadvantaged Neighbourhoods in Canada

In Canada, the strategy of the citizen community health worker had been using in specific public health programs (HIV-AIDS, breast cancer, etc.). During the pandemic, the community health practices that emerged are more the result of independent citizen initiatives or supported by local community organizations. It is an incremental mode of action created by and for citizens to quickly respond to the needs of vulnerable communities in a crisis context. Public institutions now perpetuate these practices to act on other social issues such as violence, mental health, etc. Various issues are raised by the deployment of these community health practices which are becoming institutionalized. With these practices, are we in front of real public services and a democratization of health institutions in which citizens would have a place through their practice or should we see a new form of precarious work which accentuates inequalities between workers within public health institutions? How to understand the tensions between care civic engagement and the institutionalization of citizen community health practices? The reflection on these questions will be supported by the results of research carried out with citizens, mostly migrant women, who have played a caring role in community health within their neighborhood since the start of the pandemic and that continue now paying that role. To problematize these practices, we propose the critical perceptive of the analysis of the activity of citizen work. We document the daily life of citizens community health activities, their work conditions as well as the interactions and power dynamics between actors, the place given to citizens in the organization of public services. Considering and analyzing citizen work as an activity remains a key to describing power dynamics at a micro-social level and to examining the potential for the renewal of public services organizations from below.

"Refugees, Family Well-Being and Urbanisation Trends in Africa"

Africa is a continent with diverse in its social, cultural, economic, political and environmental architecture. It is a continent constantly on the move and the migration configuration reflects this diversity and complexity. Research shows that Africa only accounts for 14 per cent of international migrants, but the focus on African migration gives more emphasis to displacement, irregular migration, and refugees. Contrary to sensationalised narratives, the majority of African migrants do not wish to leave the continent, and displaced people and refugees would prefer to return to their home countries. This paper seeks to provide an overview of how refugees and their families adjust to new environments and what are the trends in terms of family well-being, urbanisation and integration of refugees within the African context. The paper will highlight certain regions and provide a comparative in terms of refugee resettlement, endowment, and empowerment in relation to clinical sociology interventions.

Transnational Family Practices Among Zimbabwean Women Migrants in South Africa

In the early 2000s, Zimbabwean women increasingly accounted for a larger ratio of the migrant population in South Africa. Economic drawbacks such as poverty and unemployment remain core migration push factors for Zimbabwean women to South Africa. They are forced to leave their children and elderly parents behind to pursue a breadwinner role in South Africa, leading to an increasingly transnational family context. Using polymedia theory as a conceptual framework, this article examines the transnational family practices by examining two sets of research on Zimbabwean women in South Africa. The first set of research results, conducted in 2011, using in-depth interviews with ten Zimbabwean refugees mothers living in Hillbrow, looks at transnational family practices and discusses intergenerational support from adult children to elderly parents and between grandparents and grandchildren. Building on this, the second set of research results on fifteen Zimbabwean women living in South Africa, examines how Platforms such as WhatsApp, Mukuru and Malachia are key to experience a sense of intimacy and virtual care, particularly among Zimbabwean transnational families. As mobile phones increasingly evolve, there is a continuous need for up-to-date research on contemporary transnational family practices, and comparing these two data sets, over a ten year period, shows how transnational care practices evolve over time. The findings reveal several examples of care practices toward their children, siblings and elderly parents who remained in Zimbabwe, and to maintain a sense of togetherness. Findings indicate that transnational family practices are not free from challenges and issues such as internet access, connectivity and affordability remain core issues for both the migrant women in South Africa as well as the families left-behind in Zimbabwe.

RUIZ-ANGEL, Elena* (Universidad de Huelva, Spain)

Resilience Capacity of Women Victims of Gender Violence in Spain.

The communication we present is contextualized in Spain in 2019, in the midst of the worldwide tension generated by the COVID-19 pandemic.

It focuses on the analysis of the 2019 Macro-survey on Violence against Women published by the Ministry of Equality, the largest statistic on the victimization of gender-based violence in our country, conducted every four years.

The aim of the survey is focused on knowing the prevalence for each type of violence that takes place within the couple -physical, sexual, psychological and economic- and the resilience of Spanish women in the face of gender violence. The risk factors of Spanish women aged 16 years and older to suffer gender violence in the different typologies (physical, sexual, psychological and economic violence) have been analyzed according to their sociodemographic characteristics (sex, level of education and employment status).

A quantitative methodology was used for the scientific analysis of the data, using the R statistical package (R Core Team, 2022). The frequencies and statistics of the study variables were calculated. For hypothesis testing, contingency tables were performed with the chi-square test for the relationships between qualitative-nominal variables and Student's t-test for the comparison of means between groups. The significance level assumed was p < .05.22:49.

As main conclusions we found that Spanish women over 50 years of age are those who claim to suffer the greatest degree of gender violence. Those who suffer psychological control violence have a medium-higher educational level, while women with a medium-low educational level are those who suffer sexual violence. Women without a job are the most at risk of suffering gender-based violence, showing a situation of economic dependence on their partner or ex-partner.

RUIZ-ANGEL, Patricia* (Universidad Pablo de Olavide (Sevilla), Spain)

Access to Digitisation in Spain during the Period 2006-2022.

This paper analyses the evolution of the Spanish population's access to technological resources and access to the Internet, which are key resources for digital consumption. We focus on the analysis of the Survey of Cultural Habits and Practices in Spain published by the Ministry of Culture and Sports, which is carried out every three to four years. The aim of this paper is, on the one hand, to analyse the evolution of cultural practices in Spain from 2006 to 2022; and, on the other hand, to determine the profiles of the people who have more access to digital resources. It also analyses the socio-demographic and attitudinal components within a holistic model in which to test the impact and evolution of each one of them. To this end, we have used a quantitative methodology in which we have analysed the Survey of Cultural Habits and Practices (EHPC), aimed at a sample of 16,000 people aged 15 and over living in Spain. This survey is the most important in the field of analysis of the cultural habits and practices of Spaniards, and its methodology allows us to carry out a longitudinal analysis of the continuities and changes in cultural practices in Spain and Andalusia. As a preview of the results, we can state that in Spanish households the digital equipment that has evolved the most is internet access, from a consumption of 43.3% in 2011 to 80.5% in 2019. 2015 was the year in which the majority of Spanish households, around 78%, were equipped with digital devices, producing important structural effects on the population's cultural practices.

RUIZ-ESTRAMIL, Ivana* (Centre for Social Studies University of Coimbra - Institute for International Cooperation and Development Studies University of the Basque Country, Portugal)

Climate Crisis, Asylum and Refuge: Environmental Justice from International Protection

The objective of this communication is to put on the table the urgency of recognizing international protection for people who are forcibly displaced due to the impact of the climate crisis in their territories of origin. Based on a qualitative methodology and analysis of secondary sources of information, this communication proposes to contextualize forced displacement within the climate crisis, to then share two specific results. In the first place, to argue the need to adapt international protection to the new global contexts of lack of protection, as a measure that guarantees minimum rights for those people who leave their countries of origin forced by the environmental impact on their lives and means of subsistence. Second, to highlight the importance of recognizing the category of "climate refugees" in receiving countries, as a tool for making visible and responsible for the protection of those affected by this type of displacement. From these two results, the discussion opens towards the idea of "environmental justice" based on the recognition of a "climate debt" by industrialized nations with respect to those regions that today suffer the environmental consequences of an economic development that they did not form part of. By way of conclusion, it is highlighted that guaranteeing international protection to those people who go to industrialized States for climatic reasons would be a point that would complement the commitment to the "Sendai Framework for Disaster Risk Reduction 2015-2030", since it would provide security to those people who need it after being affected by the impact of the climate crisis on their livelihoods and their territory.

TG03-814.1

RUIZ-ESTRAMIL, Ivana* (Centre for Social Studies University of Coimbra - Institute for International Cooperation and Development Studies University of the Basque Country, Portugal)

International Protection in the European Union in the Face of New Scenarios of Lack of Protection

Starting from the evolution of international protection in the European Union (EU) in the last decade, this communication aims to address the new "Regulation (EU) 2021/2303 of the European Parliament and of the Council of 15 December 2021 on the European Union Agency for Asylum and appealing Regulation (EU) No. 439/2010". This analysis is based on two investigative periods, the first between 2014 and 2019, and the other currently underway since the beginning of 2022, worked from a qualitative perspective. This comunication is based on the hypothesis that this new regulation strengthens a strategy that focuses attention on the protection responsibilities of third countries, as a measure that curbs the pressure on the European asylum system. Together with this strategy, I analize the protagonism acquired by three categories of protection (subsidiary protection, humanitarian reasons and temporary protection), used as tools legitimized by the urgency of protection required by people from

certain contexts, which shows us the variety of forms that lack of protection acquires today. As a discussion, the need to update the refugee definition and the binding provisions is raised, with the aim of guaranteeing protection and preventing both the externalization of the responsibility to protect and the unequal consideration depending on the region of origin. By way of conclusion, I argue the need to create mechanisms that guarantee safety on the journey and protection in the reception of those people who arrive in the EU, emphasizing the commitment in terms of protection, against attempts to hinder the access to the EU, be it migration or forced displacement.

Invisible Violence at the Centre: Strategies of Psychological Gender-Based Intimate Partner Abuse

This paper shows some of the research results of the project Una realidad invisible: violencia psicológica de género en la pareja carried out in the Autonomous Community of Andalusia, Spain. The fieldwork was carried out from March to June 2022. During this period, both in-depth interviews (N=17) and focus groups (N=2) were carried out. The total number of participants is 27 people (21 women survivors and 6 professionals specialised in gender-based violence from different fields). Two main age groups were established in the women survivors of gender-based violence: young women aged 18-25; and adults in three age ranges: 30-40 years, 40-50 years and 50-60 years; residents in rural and urban areas of Andalusia; with and without children. Among the main conclusions we can highlight the different manifestations that psychological violence takes on in the context of the couple, many of which are very normalised in our society. This fact makes it difficult for women victims-survivors not only to detect the violence they suffer, but also to get out of it. In this sense, there are some differences between young and adult victims. The fact of having children with the aggressor makes it more difficult to break off the relationship and to denounce it. We also found differences in terms of the environment in which they live. The rural environment presents greater difficulties for victims of gender-based violence.

RUIZ-REPULLO, Carmen* (University of Jaen, Spain)

¡Cuidado Con Ellos! La Importancia De La Despatologización Del Agresor Sexual

This communication shows some of the research results of the SEXVIOL Working Group, within the framework of the project "Sexual violence in Spain: Study of its incidence through the analysis of statistical and legal sources". In it, 178 sentences associated with prosecution processes of sexual assault issued by the Provincial Court of Madrid between 2016 and 2018 have been analysed. Among the main conclusions, we can highlight the demystification of sexual aggressors, who are often seen as unknown persons, predators, monsters, non-persons, etc. In contrast, the results show that in more than 80% of sexual assaults there was previously some kind of link between victim and aggressor, with 17.4% being an intimate link (partner or ex-partner). The use of weapons only appears in 13.5% of the cases of sexual assault prosecuted. In 90% of the assaults, extreme violence is not used. 70.2% of the aggressors did not have a criminal record of any kind and only 1.7% had a record for sexual assault. These data belie the social configuration that continues to exist around sexual aggressors and which only serves to divert our gaze. The wolf is closer than we think.

Climbing up Together? Intergenerational, Gendered Negotiations of Upward Social Mobility in Migrant Families

The upward social mobility induces a change of social status and societal position. According to Pierre Bourdieu, these changes are supposed to be followed by the transformation of the habitus, comprising of alienation from the life world of respective family and its social position. This argument that is mainly concerned with the idea of reproduction of distinct, hierarchical class positions, seems to neglect the power of intergenerational family dynamics and the importance of family support networks in the context of upward social mobility processes. Taking this into consideration, I ask in my paper how upward social mobility processes are induced and intergenerationally negotiated in the context of migrant families. I am especially interested in interrogating the gendered notions and emotional underpinnings of these negotiations. In my argumentation I draw on empirical material from my ongoing research project on intergenerational negotiations of social upward mobility experiences in migrant families in Germany. The research project explores from a biographical perspective how social upward mobility experiences are individually processed and intergenerationally negotiated in migrant families. It asks how social

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

upward mobility influences intergenerational and gender relations, experiences of belonging and respective family support structures and aims at developing a theoretical model to explain the dynamics of the intergenerational and gendered negotiations of upward social mobility processes.

RUSER, Alexander* (University of Agder, Norway)

Counter-Expertise, Weaponised Common Sense and the Promises of Local Climate Knowledge

Climate change and climate change politics are driven by expert knowledge. Climate change itself is a scientific discovery, that required the collaboration of specialized researchers from a variety of scientific disciplines. Likewise, climate change politics are informed by expert advice that combines insights from natural science research with economic, medical and political expertise.

Instead of paving the way for comprehensive evidence-based decision making, the institutionalisation of scientific expertise at the international level and the inclusion of expert advice in the formulation of national policies has provoked concerted and comprehensive attempts to discredit scientific expertise. Next to the formation of a versatile countermovement, spearheaded by a coalition of think tanks, pressure groups, media outlets and conservative donors in the USA, to provide counter-evidence and to undermine the impression of scientific consensus, tactics to erode trust in scientific expertise increasingly include the weaponisation of common sense. Ever since US Senator Inhofe tossed a snowball in the Senate to disprove global warming, climate science is confronted with common-sense arguments to discredit scientific expertise and to pit the "dogmatic" advice of aloof elites against the everyday experience of ordinary people.

In my talk I will argue that this weaponisation of common-sense arguments is not only an increasingly strategy in the repertoire of professional climate change (politics) deniers but effectively prevents any traditional paths for reconciliation with scientific knowledge be it "increased scientific literacy" or improved ways of communicating scientific research. I will the outline how the a focus on local climate knowledge and the pursuit of a "narrative turn" in our understanding of climate expertise itself, can contribute to bridging the gap between scientific knowledge and personal experience. By broadening our understanding of what constitutes climate knowledge and any including "folkways" of knowing, we can "disarm"common-sense arguments, align scientific expertise with personal experience.

Roundup the Unsuspicious Suspects: The Role of Small Non-State Actors and Informal Networks to Undermine Climate Change Consensus

Non-state actors such as NGO´s, social movements, foundations or local citizens associations promise to play a key role in promoting just ecological transitions by increasing the legitimacy of policies, enhancing the transparency of their implementation and improve the accountability of decision makers. At the same time sociological research has exposed the contribution of non-state actors to erode trust in climate science and subsequentially climate politics. This – mostly US American - "counter movement" consists of relatively large, well-funded think tanks and foundations who maintain close ties to economically powerful donors, industry and influential media outlets.

In recent years, however, new, and in some ways complementary networks have emerged outside the USA. Unlike their publicly visible and well researched American counterparts these networks include small organisations, think tanks masquerading as membership associations, obscure media outlets and a plethora of weak ties to online activists or conspiracy theorists. And yet these networks of unsuspicious suspects have managed to forge connections with the above mentioned countermovement and, even more importantly, with political actors and populist parties.

Drawing on social network data from Germany the talk will outline how these networks evolve without the large-scale funding or organizational structures of their kindred spirited in the USA. It will show how after an initial phase of institutional learning *from* American climate change deniers, German climate skeptic networks developed their own unique techniques of producing, disseminating and aligning their messaging within specific political and cultural contexts. The talk will conclude with an outlook of a potential "dark side" of non-state actor involvement and point towards future research opportunities to identify how small, weakly organized and unsuspicious non-state actors can undermine climate change consensus

Dropout Intentions of Students with Disabilities

The Covid-19 pandemic has changed the conditions under which students study, work, and live. Importantly, the impact has likely varied across student groups. For instance, recent research shows that the already higher risk to drop out of higher education among students with disabilities has further increased in the wake of the pandemic. Currently it is unclear what precisely causes the higher dropout intentions of students with disabilities. Therefore, we present an in-depth analysis of the mechanisms explaining dropout amongst students with disabilities – a group which has thus far hardly been considered in the dropout literature. To do so, we integrate Tinto's model of student integration, which focuses on students' academic and social integration into higher education, with social stratification research, which highlights the importance of private resources for academic success. Specifically, we consider students' financial, home learning, and mental resources. All of these resources have been strongly negatively affected by the Covid-19 pandemic and are related to drop out of higher education. Based on data from the large-scale nationwide survey "Studying in Corona Times", we find that students with disabilities are substantially more likely to voice dropout intentions during summer semester 2020. Linear regressions and Oaxaca-Blinder decompositions show that their lower academic integration is most relevant for explaining this difference, followed by their fewer mental resources, more scarce financial resources, and lower social integration. Overall, our results highlight the importance of considering both the higher education environment and private resources for understanding student-group-specific dropout intentions – even in times after the Covid-19 pandemic.

A Transnational Trajectory between Consultancy, Academia and Care Work: The Pioneering Sociological Lens of Cynthia Hewitt De Alcántara

My presentation introduces the unknown intellectual and professional transnational trajectory of the US-American sociologist Cynthia Hewitt de Alcántara (1942) from the gender and sociology of knowledge perspectives. Based on her written production and an in-depth interview conducted in July 2022, I will focus on the author's production in Mexico between 1966-1985, reconstructing the interconnections between the contexts of knowledge production (between consultancy, academia and care of children) and her sociological contributions. Firstly, I will analyze her controversial research contesting modernization processes within the Mexican green revolution and the situation of women in peripheral rural contexts. Secondly, I will refer to the contexts of production and international reception of her pioneering book on sociology of knowledge "Imágenes del campo. La interpretación antropológica del Mexico rural" in which she analyzed the entangled paradigms and socio-political tensions (local/global) within anthropological interpretations on rural Mexico.

The Production and Circulation of Knowledges Under the Lens Conviviality-Inequality: Topics for Sociological Research and Challenges

The perspective of conviviality-inequality opens up challenges and topics for sociological research on the production and circulation of academic knowledge. To the research that has been developed around the concepts of centers, peripheries and semi-peripheries, structural heterogeneity and intellectual dependency, is added the relevance of analyzing negotiations, tensions and transformations in the difference, especially around marginalized knowledge, other epistemologies and multi-medialities. Based on an analysis of different recent investigations on medialities of conviviality in Latin America, I propose to highlight central methodological challenges and innovative topics arising when thinking about the production and circulation of academic knowledge under the lens conviviality-inequality, within the current dilemmas and articulations of the digital transformation and the decolonization. First, despite the structural inequalities in the circulation of knowledge reflected in the hegemony of Eurocentric, white and masculine canons, other knowledges and epistemologies emerges on the margins, managing to negotiate academic recognition and circulations, both at local and global levels. Secondly, to make difference visible, various medial and inter-medial strategies are used, mixing traditional genres, digital media and aesthetic representations (poetry, arts,

music, corporality).These topics and perspectives suppose greater efforts in inter/transdisciplinary and intercultural exchanges, as well as transformations in the established notions of archive and sources.

RUZZEDDU, Massimiliano* (University Niccolò Cusano, Italy)

Understanding Smart Societies: The Role of Sociological Theory

In the recent times, the word 'Smart' has denoted the massive use of ICT's and other new technologies in social spaces. More exactly, this word is referring to the recent technological progresses, which are causing unprecedented changes in the contemporary societies: new opportunities to improve social life quality, create new jobs, start communication flows etc; on the other side, these innovations require totally new social skills and long processes of adaptation.

This paper aims at demonstrating that sociological theory can provide epistemic tools for reliably describing, understanding and, where possible, managing those changes.

This will imply three levels of analysis:

– cultural reception: the outcome of innovation processes always depends on the cultural models that characterize all social contexts;

– new social needs: technological progresses might generate new expectations among social groups, such as free time, new kinds of job, higher social skills etc.

– policymaking matters: technological innovations always imply advantages and criticalities, which trigger important social changes; Policymakers are supposed to manage those changes in the most effective way.

More specifically, the theoretical tools on which I will rely, will be basing upon Elias' work about multilevel analysis; within this framework, I will show how ICTs will impact at all levels -micro, meso and macro- of social life, in terms of social production, educational needs and managements strategies; we will show how policy-makers can manage this impact through the innovation theory, especially Etzkowitz's Triple Helix model.

Trans-Asian Railway: Hopes and Threats for the Traditional Society of the Mountainous Tribal Belt of Northeast India

A decade-ongoing project Trans-Asian Railway under the Look East Policy of India, is a welcoming project for the natives, whose primary occupation is shifting cultivation, as they have been reeling under the hardship of life in the mountainous region, especially on roadway transportation. In this study, the Noney district of Manipur has been selected because it is the most affected district, where the tallest railway bridge in the world and the longest tunnel in India are under construction. Maximum substations and the intersection station lie in this district. Recently, it has witnessed an initial sign of a deadly threat, a massive landslide that swept away the chunk of the mountain, taking 61 lives near the ongoing railway construction site on the 30th of June 2022. To see the impact on indigenous livelihood and practices, we have chosen 80 respondents from the 12 worst affected villages. We used the interview method: unstructured in-depth interviews and focus group discussions (FGD) to expose the challenges and threats to the indigenous institutions, which are likely to come from the service sector, the Trans-Asian Railway, built to bolster a global economy and geopolitics. We argue for implementation and clearance from Environmental Impact Assessment (EIA) for every developmental project in such an ecologically sensitive zone. The study concluded the Trans-Asian Railway brings hope to the natives, resulting in them deviating from their traditional knowledge and posing a threat to indigenous sustainability.

The Mobility-Immobility Dynamic and the 'Fixing' of Migrants' Labour Power

Low-wage labour migration from lower to higher income economies has become a precondition for capital accumulation. As part of this, neoliberal actors (businesses and states) strive to actively produce migrants with a strong work ethic. They do this in numerous ways. In this paper we draw upon Labour Process Theory to argue that a 'mobility-immobility dynamic' is one of the main ways capital now controls working-class labour migrants. The mobility-immobility dynamic relates to low-wage workers' need to move (and often circulate) internationally but, once they have moved, a desire by businesses and states to keep them in place. The fixing of working-class migrants both across space (through transnational mobility) and in place (through immobility) underlines the importance of a multi-scalar approach to understanding the control of the transnational working-class. We draw on evidence from European horticulture – involving 36 in-depth interviews with migrant worker, employers and community stakeholders in Norway and the UK – to highlight the mobility-immobility dynamic in practice.

Secularising Marriage: A Leeway in Hindu Law

Secularising marriages can be defined as the process of eliminating the legal value of religion and customary practices in giving legal sanction to a marriage. In Indian context, the process is analysed with the reference to Special Marriage Act 1872 & 1956; mandating the registration of Hindu marriages and envisioning the implementation of Uniform Civil Code, as they give scope for a civil marriage. The present study unravels the hitherto research on a regional Hindu law culminated by the Self-Respect movement which conducted non-religious and non- ritualistic marriages to counter Brahmanisn and patriarchy. Arguably one of the foremost radical social reform movements in India was the Self-Respect movement which had a critical engagement with the women's question through its radical politics of social justice and effectively countered the national movement and Indian nationalists' quest for distinct Indian modernity through gender reforms. The movement chose to instill self-respect in human beings who have been denied dignity due to caste and religious oppression. It is in this context, the movement had propagated specific kinds of marriage reforms in the form of non-ritualistic marriage, claiming that traditional marriages was always upholding caste supremacy and subordinating women's position in marriage. The movement advocated that, without conforming to any religious practices, a man and woman should take a dissoluble contract to enter into a conjugal relationship. Such marriage practices were legislated under Hindu personal law as The Hindu Marriage Act (Madras Amendment) Act 1967. Taking this context, the paper traces the shift from movement politics of marriage reform to legislative measures that had to contend with Hindu national homogenization of law reform which insisted on the sacramental aspects of Hindu marriage over secular and contractual nature of diverse marriage practices among the Hindus as in the case of the "Self-Respect marriages".

Screen-Media Parenting Practices & Its Impact on Social-Interaction of Pre-Schoolers.

The global expansion of mass-media and increased exposure to screen-media among children have elevated significantly since COVID-19 pandemic due to the omnipresent influence of digitalization in every sphere of life. Increased screen-time and early introduction has caused concerns regarding child development.

Various global clinical case studies have found the prevalence of virtual autism, speech delay, and cortex thinning in young children caused by excessive screen-time. According to American Association of Paediatrics, exceeding recommended daily levels during early childhood is prone to development disorders linked with social, emotional and cognitive vulnerabilities.

The underlying problem of concern of this study is about early introduction to screen-media and excessive exposure to screen-time as a matter of detaching children from the social world and its prospective impact on social development. The research was conducted with a framework characterized by Exploratory Sequential Mixed Methods approach. The base of the research was qualitative where it assessed a target population of ten parents of pre-schoolers, under the age of five years for case studies and specific themes derived from the study was quantitatively tested using an online survey conducted among fifty parents within the district of Trivandrum, Kerala. Both the data was then integrated and thematically interpreted for robust outcome.

The findings of the study demonstrated screen-time of pre-schoolers exceeding the advisable daily levels and prevalence of early introduction to digital devices below the age of 1. Children spent more time on passive screen-time and had limited parental interactions during screen-time. Therefore, it is important to promote screen-media parenting practices to foster meaningful socialization of children in the modern digital world and prevent screen-time as a catalyst of alienation from social interaction, which is a potential threat associated with overall child-development.

SA VILAS BOAS, Marie helene* (Universite Cote d'Azur, France)

Establishing God's Kingdom in Brazil : Traditionalist Catholic Movements in the State of Rio De Janeiro (Brazil)

The Brazilian elections of 2022 have been characterized by a high mobilization of religion during the electoral campaign. If religious references in electoral discourse are not new in Brazil, they were placed in the heart of the far right campaign in 2022. This new situation is linked to the growing mobilisation of religious movements, in parallel with the consolidation of far right actors. This paper analyses the rôle that a tradionalist Catholic movement, the Dom Bosco Center (CDB) in Rio the Janeiro, plays in the promotion of orthodox religious conceptions within the local political field. Created in 2016, during the impeachment process of the former left president, Dilma Rousseff, the CDB is composed of lay members. The center defends national catholicism, claims for the establishment of God's Kingdom in Brazil and invests candidates for local election. It can be considered as one of the radical support's group of the far right President, Jair Bolsonaro.

Based on an ethnography of the CDB conducted during five months, the paper will question how religious thoughts are transformed into political action. Such a perspective implies to consider two questions : the first one concerns the political organisation of the CDB. It is based, internally, on the creation of a hierarchical and elitist organization, that strictly separate the producers of ideas and the followers, women and men. The paper will analyse how religious thinking is used to justify such divisions. The second concerns the traductions of religious ideas into political programme. By interpretating left ideas through orthodox religious thinking, the CDB divides the political field between the good and the evil, the first being linked with conservatism and the second with the left.

SAALFELD, Robin* (Friedrich-Schiller-University Jena, Germany)

What's Mine Is Yours!? Property Arrangements Among German Couples

Even though social research showed that couples increasingly value egalitarian ideals in their partnerships, ample evidence exists to prove that gender inequalities still persist. Gender inequalities among couples have mostly been studied by analyzing differences in income (confirming *gender wage gaps*) and by focusing on the division of paid labor work and unpaid care work (confirming *gender care gaps*). There is limited research investigating *gender property gaps*, that is couple's negotiation of property in their everyday lifes. Property exceeds income and it includes assets such as wealth, residential property, and tangible goods. Debts and liabilities also belong to property and numerous couples are faced with the negotiation of these negative forms of property. Property negotiation is also framed and promoted by property orders (judicial system, economic system, welfare state). In this paper, I typify property arrangements couples establish during the time of their partnership. The presentation is based on an interview-study with couples in Germany, where joint couple interviews were conducted and analyzed by a combination of two qualitative research methods (documentary method and in-depth hermeneutics). The sample (n=45) not only allows for systematic comparisons between West and East German couples but also between three different cohorts (joint household formation before, right after and after German Reunification).

Decolonizing Epistemology: A Sociology of Persisting Crisis in Palestine/Israel

Attempting to transcend extant vacuous depictions, the talk aims to offer a diagnostic delineation of settler colonialism and the contemporary condition, posing afterward a prognostic understanding of decolonization in Palestine/Israel. To do so, I first identify four general social processes in the contemporary one-state condition in Palestine/Israel: 1) The entrenchment of social hierarchies and classifications that organize access to rights and sustain ethno-racial divisions. 2) Predation and violence by a singular (though concatenated) settler state apparatus and by individual settler colonizers, which involves spatial encroachment, dispossession, siege, and/or ghettoization. 3) A mixture of political economic practices and outcomes, including widening stratification across historic Palestine, developmental responses to global economic forces in the West Bank, and ostensibly paradoxical Israeli governmental earmarking efforts directed to both Palestinian citizens and East Jeruselamites. 4) A shifting context for Palestinian mobilization, by which I mean various forms of resistance, refusal, and other relations of negotiation that take place every day amongst Palestinians (this includes a context of fragmentation). I then clarify how these processes coalesce in the "total social fact" of settler colonization. I further attempt to define the possible contours of decolonization. I draw on the comparison of Palestine to the case of South African decolonization to especially center the rupture between political and material decolonizations. I explain why only their concurrent enactment can engender necessary, and just, redistribution of power. Deciphering the form of the one-state reality can better enable us to envision a reparative future for Palestinians and a decolonial Jewish-Israeli existence.

Critical Arena of the Authoritarian Public Sphere? Imihigo-Induced Governance Forums in Rwanda

Rwanda's *Imihigo* performance contracts generate a less discussed platform for scrutinizing state officials. Critics generally highlight the mechanism's instrumentalization by the regime to promote its international image. This view, however, glosses over potential channels of self-criticism offered by *Imihigo*. Against the backdrop of ongoing debates on resurgent authoritarianism, this article draws on fieldwork with local government agents and non-state actors in district arenas to unpick the official logic and quotidian societal responses undergirding *Imhigo* in the public sphere. The state's reasonable support for its decentralization reform offers the requisite institutional basis to project *Imihigo* as a cultural innovation for local government service delivery. Contrary to arguments of unstrained regime overreach, this case study shows a paradoxical mix of cultural and contemporary governance norms promoted by state elites to control the local arena. The seemingly unintended – but potentially by design – societal interest in *Imihigo* frames a set of forums for official criticism, thereby revealing a societal capacity to keep authoritarian power in check.

The Paradox of Local Autonomy: An Inverse Relationship between the National State of Democracy and Space for Autonomous Decision-Making of Local Councils?

Ghana and Rwanda are two show-cases for successful decentralisation in Africa. Both countries hold multiparty elections and claim to run a democratic polity. In Rwanda, however, the executive and the ruling party strongly dominate the state and limit the space for civil society and other political actors. The government holds local administration strictly accountable for their performance with the help of formal goal achievement contracts (*imihigo*). Ghana, on the other hand, is a vivid open democracy with two effectively competing parties and freely organised and vocal civil society organisations that experienced several political turnovers after 2000. Local government faces demands from central government, but also from civil society and neo-traditional rulers. National governments and their respective ruling parties seek interference with local politics through the appointment of local chief executives (mayors) and the distribution of resources. Local councillors in Ghana tend to associate this interference with limited decision-making power of their council and seek personalized informal influence as local development brokers. Paradoxically, the strong central state in Rwanda seems to leave (more?) space for local political decision-making in the designated formal arena. Local councillors have learned to put pressure on the elected mayor and local administration using the same *imihigo* contracts as the country's political leadership. They use their limited formal influence to advance local interests. Thus, the extent of political freedom or control at the national level does not generally determine the space for the local councils' autonomy.

SABETTA, Lorenzo* (Sapienza-University of Rome, Italy)

The Infra-Ordinary as a Privilege?

A pervasive dichotomy structures our perception of social reality: a small number of highlighted and remarkable phenomena (what we heed, the socio-cognitive spotlight) stand out against an unarticulated background (what we disregard, the socio-cognitive default). The opposition, the attentional asymmetry, is further consolidated by both common sense and academic thinking, since usually the culturally salient elements get more attention, while unnoticed "negative spaces" get even less. Following cultural-cognitive sociology, it is possible to list a series of features characteristic of the nameless side of social phenomena: frequency (what is done when nothing special is being done? The majority of things, a number of things which greatly exceeds the total number of remaining things done elsewhen); usefulness (we bracket out from our streams of consciousness those objects of perception that are not pragmatically useful to the performance of our daily lives); eticness (the unmarked is not theorized from within, being emically apprehended as spontaneous, unselfconscious, colloquial). This paper insists on another dimension typical of "minimal units of meaning in social life": are these dimensions of social life theorizable only insofar as one has "time to waste", i.e. the privilege of adopting a scholastic angle? Who can afford venturing a Perecian attempt at exhausting a place, in Paris or elsewhere? What is the relationship between this inherently lettered and well-educated understanding of the unmarked and the one reluctantly produced by marginal people who cannot simply surf social life (from Garfinkel's Agnes onward)? What are the implications, for humanities and social science, of such conception of the infra-ordinary as a theoretical luxury?

Political Leaders in Pandemic and Post Pandemic Times: Inclusive Democrats and Resurgent Authoritarians.

The Covid-19 pandemic has caused a multilevel crisis that has hit national public health policies, economies and international relations. The very concept of authority has been questioned and governing skills have been stressed and exposed. In this paper we will analyze how different leadership styles have dealt with the pandemic starting from its framing and representation. We will then analyze how the crisis has highlighted and polarized different leadership power models, polarizing between inclusive democrats and new autocrats. A polarization that has continued in post-pandemic times and that has invested other domains, questioning the principle of the rule of law and of democracy itself.

Tackling Stereotypes and Prejudices. Educating to Contrast Gender Based Violence

Despite the growing attention drawn on male violence against women by institutional authorities and by civic movement (such as #Metoo and Ni una Menos), the road towards the eradication of violence has proven to be very steep. One in three women (33 %) in the EU has experienced physical and/or sexual violence since the age of 15; 75 % of women in a professional job or in top management have experienced sexual harassment; and one in ten women has experienced some sort of harassment or stalking through new technologies. For the first time in history, violence against women is recognized by the Istanbul Convention as a manifestation of historically unequal power relations between women and men, which have led to domination over, and discrimination against, women by men and to the prevention of the full advancement of women. Therefore, it is this unequal power relations that needs to be tackled in order to obtain consistent improvements, both from a structural and from a superstructural level. It is this very unbalance that makes violence not only possible but also accepted. In this paper we will analyze how the Italian press as well as the Italian courts reproduce a stereotyped culture that jeopardizes women's' rights and their rights to a fair justice. Targeting, unveiling and deconstructing stereotypes is part of the necessary cultural and educational process that contributes to the contrast of gender-based violence.

The Effects of Social Cohesion on Local Societies

Little is known about the empirical relation between community performance and social cohesion (Dirksmeier/Göb 2021; Lichterman/Eliasoph 2014; Muhuri/Basu 2018).

In a large-scale study (n=12,493) of twelve German communities (from small villages to large cities) the relationship between social cohesion (measured as a composite index of identification, trust in neighbours, collective efficacy) and community performance was analysed in a two-wave study (2021ff.). Multivariate regression demonstrates that the levels of social cohesion are lower in post-communist East Germany and even lower in disadvantaged city districts, which are characterized by a high turnover of residents.

In an accompanying qualitative case study, a subsample of the three East German municipalities was drawn to get deeper into the mechanisms of this result. News in the local newspapers regarding the social cohesion of the political elites of these municipalities (mayor, local parliament) were selected for the time nospan 2000-2022. A topic modelling (Papilloud/Hinneburg 2018) was applied. First results show that a low level of social cohesion of local populations corresponds with a low level of social cohesion of political elites. However, in East German municipalities with successful mayors (reinforced by a series of re-elections) and constructive tensions within the municipal parliament, the level of social cohesion of residents was higher. Therefore, one mechanism connecting community life to democracy seems to be the level of social cohesion of both residents and local elites. Local media are one means to mediate this effect.

Rights on the Ground: Street Level Bureaucrats' Understandings and Practices of Refugee Protection in Portugal

The granting of refugee status and the consequent provision of international protection occurs within international and national legal frameworks. However, much of what happens in the daily lives of refugee destination contexts depends on the work of professionals (such as social workers) responsible for safeguarding the rights intrinsically associated with granting asylum. The aim of this paper is to enquire into how "street-level bureaucrats" engage in the process of refugee reception and integration in Portugal, understand these rights and put them into practice. To this end, we approach professionals working in this field from two perspectives: as extension officers, reproducing and implementing the state bureaucracy of the institutionalization of refugee rights; and as change agents: complements to state services, (possible) agents of resistance, and even of state rectification, assuming responsibilities and improvising responses in situations of state dismissal. Taking into account that professionals who mediate between refugees and the state do much more than deliver policies and operationalize rights, the focus is on the dialectic between institutional bureaucratic regulations and discretion; between the formality and informality of professional practices.

Turismo De Masas y Riesgos De Bioseguridad: Evidencias De La Pandemia De Covid-19

Los retos de bioseguridad que plantea el turismo de masas son un tema de gran actualidad, todavía aún poco abordado en la investigación científica más sociológica. Tomando la pandemia de Covid-19 como referencia más inmediata y basado en una investigación empírica de carácter documental en diversas fuentes (periódicos, instituciones internacionales de carácter intergubernamental y el foro de discusión de la plataforma de viajes TripAdvisor), me propongo a analizar los riesgos de bioseguridad derivados de las actividades turísticas de masas. Al suponer la movilidad y las grandes aglomeraciones de personas de diferentes orígenes, el turismo de masas ha propiciado múltiples brotes de Covid-19 y la rápida propagación mundial de las cadenas de contagio. La pandemia ejemplificó claramente la responsabilidad del turismo en la dispersión de agentes bióticos con graves repercusiones ecológicas, económicas, sociales y de salud pública. Por lo tanto, es urgente repensar la trayectoria de crecimiento del turismo y considerar más eficazmente los riesgos de bioseguridad asociados a la movilidad en los debates sobre turismo y sostenibilidad. Al mismo tiempo, el turismo debe ser delineado en términos de los grandes objetivos de la sostenibilidad, y este propósito transversal al que contribuye debe ser considerado como condición intrínseca de su propia sostenibilidad sectorial como actividad económica.

Straying on the Limits of Equivalence. Case Study in Dilemma of International Value Comparison.

The paper will illustrate practical dilemmas researchers face while conducting comparative analysis on internationally replicated indicators. The dilemmas are implied by the ongoing debate on measurement equivalence in survey methodology, embodied primarily by rivaling views by two author duos. Alemán and Woods (2015) argue that without measurement equivalence, national aggregates can poorly represent compared concepts. They reproduced comparative analyses based on the World Value Surveys, declaring the incoherence of the results – often lacking even a configural invariance – and, thus, the invalidity of conclusions. The reviewees themselves, Welzel and Inglehart (2016), dispute those allegations, pointing to the fact that giving a strict priority to convergence patterns at the individual level is not a well-substantiated assumption. In particular, weak and variable convergence within countries is rather an empirical norm, while at the same time, it can be irrelevant for convergence patterns between countries. They point out the basic difference between dimensional and combinatory logic, that is, validity based on strict item convergence vs complementary divergence. In their view, internal configurations exist in their own right, and the premise of scalability is

often unrealistic, thus, they declare the notion of equivalence as fundamentally flawed and propose a nomological criterion instead. This debate touches upon very basic and practical issues, which I'm going to elaborate on in light of a comparative analysis of cohort data from German (SOEP) and two Polish studies that replicated questions concerning values. The analysis of the prima facie identical indicators reveals clear differences in response patterns and comparative limitations imposed by the data itself. This prompts to seek substantive explanations to the observed measurement invariance and look for a practical solution that would allow to satisfy assumptions concerning convergence and complementarity of indicators. The discussion of those dilemmas points to some implications for the equivalence debate.

Climate Change and the Water-Society Nexus in the Amazon Region

Home to the world's largest tropical forest and 20% of the earth's freshwater, the Amazon Basin is central to the climate crisis. Stopping deforestation and wildfires in the Amazon has been a focus for the international community but expanding urban populations and the social impacts of climate-related drought are also immediate concerns to Amazonian communities. This project uses a case study of the water-society nexus in the Brazilian Amazon state of Acre to 1) document the links between climate shifts and social change in the region and 2) assess the extent to which existing institutional models for addressing climate change are adequate for water-related concerns in the Amazon Basin. Synthesis of climate, demographic, and economic data show that population growth and development in Acre is occurring in areas with extreme climate and hydrologic risks. This analysis also shows that poor urban populations in the capital city of Rio Branco are some of most severely impacted by climate-related drought, but mitigation of these problems is almost non-existent. Relatedly, water management institutions are under resourced and management approaches are ill adapted for addressing the emerging issue of water scarcity in this tropical region. Finally, while hundreds of millions of dollars have flowed to Acre through the REDD+ and similar climate mitigation programs, international doners have focused on combating wildfires and deforestation, that have global importance, leaving the local climate impacts on Amazonian water resources and their social implications unaddressed. These findings illustrate not only the social importance of the water society-nexus and impact of climate change on the Amazon and its people, but they also raise questions about climate justice and the extent to which international climate priorities versus those of local people are considered within global climate mitigation programs.

Niyamgiri Movement in Odisha : A Sight for Entanglements of Indigenous Communities, Religion, Politics and Economy

Niyamgiri Movement in Odisha is considered to be one such unique movements where the entanglement of indigenous communities, religion, politics and economies are clearly marked. This is a specific resistance movement which aims towards calculation of sustainable development of Particularly Vulnerable Tribal Groups, Kondhas. The role played by the Government agencies, local people, law enforcing agents etc all are undergoing constant changes. Further there is a criss cross of these elementary pillars and sometimes the worst victims of such entanglements are innocent indigenous community's members. This paper aims to capture those constant changes and tries to locate the past , present and future of such resistance movement. The instance of green referendum and other unique elements of this movement , makes it a distinctive movement within itself. Locating the international, national and local implications of such a movement would be another primary aim of this paper. This will be a combination of empirical and secondary sources as collected from the Kalahandi and Raigada districts of Odisha from the Kondha community people itself regarding their plight with international industrial companies.

Scientific Interactions and Its Consequences on Inequality: A Mechanism-Based Perspective.

The distribution of rewards and recognition in science is particularly unequal: most scientists' work get little attention while a few pursue outstanding careers. At the same time, science is a collective enterprise. This project explores whether collaborations and inequality in science are related. More specifically it focuses on the *Learning From Peer* (LFP) mechanism: when they collaborate, scientists interact with their teammates and get a chance to learn from them. This study analyzes the consequences of LFP on inequality in scientific careers. These consequences are not immediately straightforward, because whether LFP will increase or reduce inequality largely depends on the structure of opportunity for scientific collaborations. One the one hand, if teams

are formed by matching scientists of similar productivitytogether–assortative matching–then LFP will likely strengthen already existing inequality; on the other hand, if the opportunity to collaborate with productive scientists only loosely depend on one's prior accomplishments–random matching–then LFP will broaden the diffusion of knowledge and skills in the scientific community and thereby reduce inequality.

This article aims at answering the following question: *under which conditions does the LFP mechanism contribute to strengthening the unequal the distribution of rewards and recognition in science?* For this, it firstly empirically quantify the causal effect of the LFP mechanism in science using bibliometric data and statistical modeling; secondly, it developsan Agent Based Model (ABM) formalizing the mechanisms underlying scientific collaborations and integrating the empirical estimates found in the statistical model, to derive their macroscopic effects under different team formation scenarios.

By doing so, the paper goes towards the integration of empirical (digital trace) data, advanced statistical modeling, and ABM. This specific combination of empirical material with theoretically grounded formal modeling in the spirit of analytical sociology, illustrates what credible sociology may be.

Understanding the Work of Public Actors in the Human Rights Field in Finland

According to Hagtvedt et al (2018), the Nordic countries have featured in human rights research, but the approaches have often been too normative, generic or theoretically oriented. As Stammers (2015) argues, the complexity of human rights as forms of social praxis is often overlooked.

This article will focus on public actors and human rights work in practice in Finland. The method relies on Smith's methodology and conceptual tools of Institutional Ethnography (IE). The informants are public officials, advisors, and professionals in implementing state human rights obligations, in public institutions.The article will relate information gathered from public actors, to the role of these actors as the formal implementers of the state´s legal human rights obligations. Moreover, this article makes use of practice theories and explores the *ethics as a practice* by looking at discourses and practices that aim at enhancing human rights, which in itself is an ethical practice (Clegg, Kornberger, Rhodes, 2006). The article discusses how impactful work and practices in human rights can be recognized, and visualizes the complexity, interconnections and tensions in making human rights a reality in a society.

SAGOT, Montserrat* (Universidad de Costa Rica, Costa Rica)

What Is Justice for a Victim of Femicide? Feminist Proposals to End Violence Against Women in Central America.

Central America is one of the most violent regions in the world, outside of an open war zone, with countries like El Salvador, Honduras and Guatemala, presenting some of the highest homicide rates. As a result of this deadly process, El Salvador also has the highest femicide rate in the world. Guatemala and Honduras are also among the ten countries with the highest femicide rates in the planet. As a regional tendency, female homicides are on the rise and have increased at a much higher rate than male homicides, particularly during the pandemic.

In those contexts, femicides are not social anomalies. They play a role in a climate of increasing authoritarianism and neo-conservatism and become a form of "pedagogy of cruelty" with a punitive and disciplining discourse.

The argument that I will develop in this presentation is that in contexts of instrumentalization of human existence and disposability of many female bodies, the rights and justice paradigms risk losing their legitimacy, unless we can envision new ways to integrate them within a wider framework of emancipation. Thus, justice for a victim of femicide should not be confused with criminalization and incarceration because in doing so, we only aligned ourselves with the prison mentality of the repressive states. According to some feminist in the region, the aspiration should be the construction of a new concept of justice, beyond just better criminal laws or social policies. This transformative conceptualization of justice should help to dismantle the hierarchies installed by different types of inequalities and guarantee women´s (and all people`s) access to full lives in terms of the social, economic and political means required to develop and exercise their abilities, express their experiences, and participate in the determination of their living conditions.

Populist Extremism and the Education Connection: Some "New" Sociological Perspectives

The study of both left-wing and right-wing populism has expanded considerably during the past several decades. The occurrence of populist leaders, and the increasing numbers of populist supporters, has been described by Judis as an "explosion" (2016). This has especially been the case of populist extremism. Almost all studies of the emergence of populist leaders

and followers have occurred within a political science framework and have been productive in charting both the definitions and the emergence of these phenomena. However there are other dimensions of current populism which are less well explored, and one of these is within the sociology of education paradigm.

The focus of this paper will be on the various effects that education plays on both populist leaders and populist voters. In addition to reviewing previous research which focuses on variables related to social inequality, social mobility and perceptions of social justice, case studies of populist leaders, and of populist elections, will focus on "newer" sociological and educational factors and identities which help explain the rise of both right-wing and left-wing populism (Saha, 2022). A crucial variable will be the social divisions or cleavages which characterize many societies today, and which often are said to differentiate between the "educational cosmopolitans" and the "low educational nationalists" (Robertson and Nestore 2022). Cleavage theory and the social identities of "the people" and "the other", combined with the political importance of higher education credentials, help further explain the emergence of populist extremism. Finally, the paper will consider the sociological role of education in the production of, and reduction of negative effects of populist extremism.

Household-Level Coping Strategies in Coastal Bangladesh: The Case of Cyclone Aila (2009)

This paper explores the coping strategies the Cyclone Aila-affected households in Bangladesh employed to cope with the post-Cyclone Aila situation. The paper is based on primary data collected through a mixed methods research approach from two Cyclone Aila-affected villages, one of which was subject to continuous inundation for almost 21 months and the other for almost 33 months following Cyclone Aila. The findings show that the important coping strategies households employed to cope with the post-Aila situation include reducing the number of meals per day and the amount of food intake per meal, relying on inexpensive food, arranging cooking with other families for several days, relying on various aid items including monetary aid from relatives, fishing for consumption and selling, borrowing money from relatives, migrating to other places for work, relying on emergency aid and long-term aid from the government and NGOs and participation in cash and food for work program and cash for training program. Other coping strategies that many households employed include relying on food and non-food aid items from neighbours, friends and acquaintances, consuming rice stored before Aila and using previous savings. The findings also reveal that some households sold livestock such as cows and goats and a few households sold or mortgaged farming land to cope with the post-Aila crisis. The findings demonstrate that some of the coping strategies made households more vulnerable rather than resilient. Finally, the paper argues that the affected households were unable to cope with the post-Aila crisis on their own capacity as most households in both the villages were unable to resume economic activities until the embankment was repaired and thus, the assistance from the NGOs and the government was vital for the survival and recovery of the affected households.

SAHA, Sebak* (Shahjalal University of Science and Technology, Bangladesh)

Weaknesses of NGOs' Post-Disaster Response and Recovery Operations: The Case of Cyclone Aila in Bangladesh

This paper examines the weaknesses of NGOs' post-disaster response and recovery operations following Cyclone Aila (2009) in Bangladesh. The paper is based on data collected from two Aila-affected villages through a mixed methods research approach. Although NGOs played a vital role in the response and recovery process of the Aila-affected households and in the repair and construction of the community-level infrastructure, NGOs' response and recovery operations involved some serious weaknesses that undermined the effectiveness of their response and recovery operations. The findings show that NGOs failed to start relief operations immediately after the event and could not harmonize the relief packets in terms of the quantity and quality. They provided overlapping interventions due to lack of coordination and less livelihood and housing support compared to the needs and did not provide psychological support. They preferred the interventions that had visible outcomes and implemented projects following the top-down approach that made the aid recipients passive recipients and resulted in the delivery of inappropriate aid items or the less successful implementation of the interventions. They addressed remote areas least and distributed relief items in the easily reachable places and provided more interventions to the less affected area to spend the allocated money within the project time period. Other weaknesses include favouring own CBO members and microcredit borrowers, putting pressure on microcredit borrowers to repay the instalments of loans taken before Aila when the borrowers were unable to meet their basic survival needs, the exclusion of many households from aid and non-aid support and the involvement of NGO personnel in corrupt practices in a few

cases. These findings will be helpful for the NGOs and other stakeholders in Bangladesh and other disaster-prone regions to design more effective post-disaster response and recovery operations in the future.

Bureaucratic Government in Overcoming the Covid-19 Pandemic in Yogyakarta

Bureaucratic government is often seen as a government that is slow and convoluted in overcoming crises. This study aims to answer the question of how far the bureaucratic government is able to overcome the crisis, especially in dealing with the Covid-19 pandemic in Indonesia, especially in Panggungharjo Village, Bantul Regency, Special Region of Yogyakarta. To answer this question, this study uses an exploratory qualitative method, where data is collected by means of observation, interviews and document collection. Data analysis used triangulation technique where observational data, interviews and documents were analyzed using contextual interpretive analysis techniques. The results of our study found that; (1) the bureaucratic government in Panggungharjo Village has the ability to deal with COVID-19 with various actions, including the establishment of a Covid-19 Handling Task Force consisting of various elements, including the Health Office, the Social Service and so on; (2) In overcoming Covid-19, the bureaucratic government in Panggungharjo Village carried out two strategies, namely a social inclusion strategy and a social capital institutionalization strategy. The social inclusion strategy is carried out by involving as many parties as possible affected by Covid-19 who need government assistance and assistance, while the strategy for strengthening social capital is carried out by optimizing the ability of the community to help each other for people who are experiencing economic difficulties due to Covid-19. This research recommends that bureaucratic governments can operate in overcoming the Covid-19 crisis.

Assessing the Trajectories of People's Movements in Odisha, India

Social movements and protests in contemporary Odisha are the reflection of emerging voices of dissents and rising aspirations of the people.The state has been criticized for the authoritarian and militant operations. The relationship between the state, communities and social movements in various partsof Odisha require comprehensive understanding of protests and movements through which one can assess the broader socio-political structures in various sites of Protests. It makes an attempt to review various movement studies and their theoretical standpoints and tries to articulate the dynamics of existing relationships between the state, communities, Corporate and people's protests in Odisha. On an empirical basis, the paper analyses a successful people's protest of Baliapal in Odisha popularly known as Anti-Missile movement, against the proposed National Missile Testing Range. This protest has raised several collective issues of development induced displacement. This missile testing centre project was supposed to displace 55 villages covering an area of 102 square kilometers and displace more than 1,00,000 people. The people of Baliapal, irrespective of their caste, class, gender and political affiliations could manage to put pressure on both Government of India and Government of Odisha to stop this project. As a result of the protest, the National Test Range Centre could not be established in Baliapal. It was considered to be one of the successful protests in India ingeneral and Odisha in Particular. Further, the paper also tries to analyse how this successful protest facilitated other micro movements in Odisha.

Investigating Youth's Social Imaginaries in an Elite Educational Institution

Many social scientists have studied youth education and elite schools (Bourdieu (1998), Abraham (2007), Khan (2011), Darmon (2013), Pochon (2021)). My research focuses on the construction of youth's social imaginaries within an elite educational institution. It draws on a one-year ethnographic study in a leading business school in France. The first material consists of participant observations of everyday life and activities of students (in class and extracurricular activities). In addition, I conducted about 25 semi-directive interviews. I use these materials to understand the representations, behaviors, choice strategies, aspirations of those young students, social networks that emerge, and institutional discourses. The fieldwork allows me to give voice to the students, share their academic, social, and associative experiences, and multiply the opportunities to understand the critical stages and moments they are going through. It also allows me to consider how the institution, in its very transformation, will induce transformations in the reading of possible and desirable futures. The interviews conducted provide information on the trajectories of the students and the networks that these trajectories involve.

SAITO, Asato* (Yokohama National University, Japan)

Localism and Urban Social Movement: A Case Study of Queen's Park Community Council in London

Decentralization / devolution has been a world-wide trend for the last 20-30 years. In the case of England, the decentralization discourse took a particular form of localism which highlighted the importance of local identity, economic efficiency, and good governance in a local and neighborhood scale. Localism Bill in 2011 has given "general power of competence" to the local authority and ensured a degree of local autonomy, but at the same time, made it possible for the local community to exercise more independent power against local government bureaucracy. The Local Government and Public Health Act in 2007 also allowed new parish council, the lowest tiers of local government and hence the closest to the local people, to be established in London for the first time since the 1800s.

Against this backdrop, Queen's Park Community Council (QPCC) was born in North West London in 2012 as a new parish council. This paper reviews the way in which it was planned and conceived in a particular local economic and social context and created by the mobilization of local community. QPCC was established after the long and hard work by Paddington Development Trust and Queen's Park Community Forum, a voluntary group by the local residents to improve the local environment. The paper examines the way in which community mobilization eventually led to the creation of new parish council and argues that it could be interpreted as a social movement, which contains some elements of social innovation such as blurring the boundaries between social and political and challenge the attitude of local residents. It also investigates more recent challenges such as Brexit and Covid-19 global pandemic and examines how neighborhood community cope with such enormous and disproportionate challenges.

Assisted Reproductive Technologies Prompt Male Subjectivity in Reproduction: Issues and Controversies Surrounding Elective Abortion

In the past, reproduction has always been considered a woman's issue, not only in sociological discussions but also in actual medical practice. In issues such as abortion, women have been the only parties involved, and the presence and role of men have been marginalized. However, with the development and spread of assisted reproductive technologies, medical practice has begun redefining men's role in reproduction.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Following the changes in practice, several research studies that reexamine the relationship between reproduction and men have recently been published in sociological circles. The new research interest in "reproduction and male" brought about by assisted reproductive technologies has forced reconsideration of existing discussions on reproduction. Specifically, the question that has emerged is how the existence and role of men, which have been invisible in the context of reproduction, should be positioned as an actor in reproduction.

Based on a qualitative survey of male patients who use assisted reproductive technologies and medical professionals who deal with such patients daily, this report compares the current situation in Japan with that in Australia. Moreover, it considers the issues of elective abortion in which male subjectivity has become apparent as a result of assisted reproductive technologies. Furthermore, it points out that the spread of assisted reproductive technologies has raised the question of who is the "reproductive party." Finally, the report compares the social changes in Japan and Australia and summarizes the new issues and points of contention thereof.

Women's Conflict with a Promotion in the Manufacturing Industry in Japan

This paper analyses how women engineers in the Japanese manufacturing industry establish their careers while balancing work and family life. Today, there are more women in the Japanese workforce than before. However, the gender wage gap is still larger in Japan than in other developed countries because of the low percentage of women managers in Japanese companies. The government established the Equal Employment Opportunity Act in 1985 and has shaped many systems to support female managers, but the proportion of women in managerial positions is still below 20%.

Based on qualitative research of about 50 workers in two manufacturing companies in Japan, I discuss the reasons why women tend to stay in low-level positions even though the company for which they work has encouraged them to be promoted. The manufacturing industry is one of the leading industries in Japan, and it is male-dominated. The companies where I conducted research have tried to increase the number of women workers and managers they employ, for example, by establishing a childcare leave system for every worker. Consequently, the management in these companies thinks that women are less motivated to pursue a promotion.

In the study discussed in this paper, I found that women engineers have the drive to become managers but they felt it was still difficult for them to be in positions of responsibility because managers have to work overtime. Moreover, in Japan, housework and childcare are traditionally viewed as women's work even though couples share this responsibility in their household. The women also think that middle management does not have enough power to decide when and how they work. There is a perception gap between female employees and management, and the companies need to reform their system to improve the work-family life balance of all workers, not just female employees.

A Theoretical Examination of the Concept of Familialism in Compressed Modernity: Toward Further Development of Welfare Regime Typology

The concept of "familialism" was introduced in reformulations of previous theories of welfare regimes to compare the welfare states of European countries. By using "de-familialization" as an analytical index of social policy, comparative welfare state analysis has made it possible to analyze the diversity of welfare capitalism, which could be overlooked in decommodification and stratification. This has also opened the possibility of comparative studies within European countries and comparative studies that do not assume regional proximity, such as comparisons between southern European countries and East Asian countries.

On the other hand, familialism in East Asia has been characterized by compressed modernity, which is concerned with the timing and speed of socioeconomic modernization. Therefore, for more valid cross-national comparisons of welfare states, it is necessary to refine the theoretical framework based on the impact of the relationship between the compression of the modernization process and the maintenance or transformation of familialism on social policy formation. Previous comparative social policy research based on familism has not fully developed such considerations.

In this paper, we examine the theoretical considerations of the linkage between familialism and compressed modernity and identify the variations this linkage brings about in the formation and transformation of the welfare state. This will provide a theoretical framework for not only capturing the characteristics of East Asian welfare regimes and their internal diversity, but also for properly analyzing the differences between familialisms between European countries and East Asian countries.

Challenges to Tamasha - a Folk Art : A Case Study in Satara and Sangli District of Maharashtra, India.

Leisure is a activity central to the survival of humanity. Just as work is necessary for our growth, time away from work as leisure stimulates our cognitive and emotive development, if spent well. Thus a 'good life' has leisure activities as an important source of happiness and well-being.

Modern society, with its limited working hours coupled with technology and infrastructure makes leisure activities a commonality. However, in ancient India, just like material possessions, leisure time too was not distributed fairly and equally. With the shackles of caste system, the lower Varnas and Dalits (untouchables) lived a life of 'survival' one day at a time. This hindered an emergence of social bonding over leisure activities and led to creation of 'broken men and women'. Dharma Shastras thus forwarded and enforced an ascriptive idea of leisure.

Since the natural predispositions tend to be stronger than manmade rules, Dalits in Maharashtra created a leisure activity in the form of Tamasha, a folk art. Due to the process of Universalization, Tamasha today is a part of culture of Maharashtra, practiced across castes and Varnas.

Thus, the Folk Art of Tamasha can be seen not only a cultural symbol but also as a Dalit Symbol. With globalization, new media, new forms of entertainment, Pandemic disruptions, etc Tamashaa as an art-form is facing several challenges. This research paper aims to study it in depth. Secondary data has been used for the research along with Interview and Observation Technique.

Medical Practitioners, Social Closure and the State: Variations across National Health Systems and Their Implications for Patients

This paper charts the different professional regulatory position of medical practitioners and their effect on patients across the range of modern societies from a neo-Weberian perspective. It begins with an analysis of the development of the medical profession in Britain which, from the mid-nineteenth century, has been a key example of exclusionary social closure – albeit in recent times, in light of a number of medical scandals, it has moved from independent self-regulation to regulated self-regulation predominantly under the shelter of the National Health Service. Such exclusionary arrangements in a mixed neo-liberal economy generally exhibit differences on a sliding scale from systems in Western Europe where medical practitioners, with some exceptions, have tended to be more strongly regulated by state bureaucracies. However, the key contrast is with medical practitioners in societies lying towards the extreme ends of the spectrum – such as those in the more individualized and privatized health system of the United States and in the health system of the more autocratic and state-dominated Russian regime. In the former, whilst independent medical licensing occurs across its constituent states, the income, status and power of doctors has been diminished through growing corporatization. In the latter meanwhile physicians lost their growing autonomy in face of increasing party control with the Bolshevik Revolution – and such professional independence has yet to be regained in post-Soviet times. The variations in medical practitioner regulation in different types of societies, though, also have important implications for patients and other users of health services, including in shaping patterns of access to doctors who in turn have associated differential reward structures. In consequence, the varying regulatory frameworks in place have a greater or lesser impact on inequalities in healthcare from a patient perspective.

Professionalization and the Relationship between Orthodox and Unorthodox Medicine in Britain: Sympathy for the Devil?

This paper takes a neo-Weberian theoretical framework based on seeing professionalization in terms of the self-interested drive to augment income, status and power in establishing social closure to the detriment of outsiders in a competitive marketplace. It is argued that professionalization was the device employed by biomedicine to gain ascendancy in its battle against other approaches in the pluralistic field of healthcare in the first half of the nineteenth century in Britain. Once independent self-regulation had been legally underwritten by the state through the 1858 Medical Act, the newly forged and increasingly authoritarian medical profession launched ever more adversarial ideological attacks centred on heresy and quackery against the range of therapies that now are seen to constitute complementary and alternative medicine (CAM). This resulted in CAM becoming ever more marginalized and restricted in its scope of practice by the mid-twentieth century. However, CAM revived thereafter following the 1960s/70s counter culture, on the back of which the practitioners of several such therapies then seemingly perversely – but beneficially in terms of self-enhancement – sought themselves to professionalize. Nonetheless, although the largely independent

orthodox medical profession has recently become more tightly regulated from above in the wake of a series of medical scandals, CAM professionalization has been limited in terms of rapprochement mainly as a consequence of the ongoing dominance of medical orthodoxy. The intriguing switchback in approaches to professionalization in the relationship between orthodox and unorthodox medicine in Britain is held to be represented metaphorically by the now classic Rolling Stones' track 'Sympathy for the devil'. This highlights that – while there is much perceived evil in the world and we blame the devil for many atrocities – there is good and evil in all of us and cross-overs frequently occur.

SAKSENA, Rachna* (Institute for social action and research, India)

The Dynamics of Indian Foreign Policy in the Light of Russia – Ukraine Crisis

The unfolding of the Russia-Ukraine war in February 2022 has had implications for nation-states across the Globe. The global order is not only imbalanced but a new process of alignment and re-alignment has also begun.

After the downfall of the USSR at the beginning of the 1990s, the world was oriented toward the global integration of nation-states and the scholars of globalization assumed a single world order under the leadership of the USA. During this period, Indian Foreign policy has also shifted as a result of the adoption of the LPG policy in 1993. This major shift in economic policy from a mixed economy to a globally oriented economy has also changed the political orientation from a welfare state to a capitalist-oriented political system. However, India successfully maintained a balanced foreign policy to have cordial ties with USA and Russia. But, the recent Russia-Ukraine crisis has created an imbalance in its foreign policy.

The paper looks at Indo–Russian proximities due to the former's military requirements, crude oil, and strategic geo-economic needs but at the same time making alliances like Quad through QSD. The paper also analyses the balancing and leveraging acts through the foreign policy of the Indian Government during the Russian-Ukraine Crisis.

Queer Student Activism and Its Discontents in Turkey

Ever since feminist women's movement started addressing to queer movements and concomitantly turned out to be a gender movement in Turkey, particularly after 2000s, lgbttqi+ participation has always been construed as a problem by all kinds of authorities be they governmental or academic. Middle East Technical University, which is known with its both left-wing and liberal democratic leanings and ranked first among other state universities in Turkey, also as a reputable international university, was first to establish an interdisciplinary international Women's Studies Graduate Program in 1994, which soon after was reorganized as Gender and Women's Studies Program (GWS) and became highly active in research, knowledge production and taking leading roles in bridging State and Civil Society Organizations both at the national and international levels in fostering and disseminating gender equality. For both its GWS staff and students always kept their relationship tight with gender activism, METU students came forth in defending the human rights of lgbtqi+ people as well, though by having been confronted with constant legal obstacles parallel to the increasing authoritarianism in Turkey. In this paper , as the first and current academic advisor of Gender Studies Student Collective, through the experiences of METU students , I will attempt to show how academic freedom and independence of thought can not be enough to support Queer movements in the context of political authoritarianism and discuss whether this is a moment of backlash or a long lasting hegemonic situation in Turkish society.

SALES, Arnaud* (Université de Montréal, Canada)

Innovative Corporate Networks and Dynamic Reticular Structures

An important field of sociological research has developed around interlocking Directorships and Corporate Networks. These studies aim to describe, reveal, and explain the ownership and control system of corporations, the interconnection of elites and more generally to highlight the structure of economic power. The interfirm networks have considerable power for national and global economic structuration. However generally, their constitution is first and foremost focused on the regular operations and strategies of self-development, and interest defense of their corporations. However, it is possible to identify corporate networks which are fundamentally focused on transforming the environment in the broad sense of the word, to their long-term advantage.

In this session on *Brokering Novel Concepts into Economic Sociology*, I will suggest first to return to the interpretation of ethnologist Radcliffe-Brown who used the term 'Social Structure to denote a *network* of actually existing relations.' Escaping the conceptualization of the structure consisting of only rules and resources, I propose another view of structuration processes with the concept of Dynamic Reticular Structure. It can be defined as a powerful network, incorporating human actors and corporate actors tied by common interests that will shape, promote, defend, and diffuse their specific innovative model of accumulation and economic development, locking in the path of human action. This long-term process often involves challenging and breaking the dominant model carried by a rival network by means of different strategies. As it expands, the initial network of innovative leaders, (if it succeeds in imposing its model), ends up constituting not only a new sector of economic activity and its markets, but more broadly a Dynamic Reticular Structure, always in motion under the action of multiple organizations, social agents, millions of consumers, and followers, lastingly changing lifestyles, and more broadly parts of our material civilization.

SALLAWAY-COSTELLO, Jake* (University of Nottingham, United Kingdom)

Artistic 'Lines of Flight' for Food Security: A New Materialist Appraisal of the Birmingham Creative Class in Community Food Support

Watson (1993) theorised an urban 'new middle class', of highly educated, economically autonomous creative intellectuals, who scuppered cultural analysis using ethnographic methods, declaring these social actors 'unregistered' in cultural studies of the Birmingham School. Thirty years later, this modern creative class is a growing and vibrant part of Birmingham social life, found in diverse post-industrial geographies centred around a vibrant arts scene (Warren & Jones, 2019). This presentation concerns interactions between Birmingham's creative class and the community sector, exploring how artists contribute to new social food movements, and analytical lenses for their appraisal and valuation.

A traditional urban ethnography was undertaken with a network of food activists in Birmingham across a calendar year, in which I was a full-time volunteer of numerous community food support services such as food banks and urban agriculture projects. Although the study initially focused on climate change adaptation, ethnographic immersion connected me to a sub-community of artist-activists, including caricaturists, musicians, community arts workers and other creative practitioners, using art to support social food movements. The work of artist-activists was generally undervalued, contributing to a micropolitics of food activism concerned with arts decentring or displacing traditional forms of food support.

Using New Materialist Social Inquiry (Fox & Alldred, 2015) as an analytical framework for exploring cultural meaning in research-assemblages, I determined artist-activists promoted materialist 'lines of flight', offering novel divergent perspectives on long-established health inequalities in the city. Though often discordant with more tangible solutions promoted by traditional activists, the Birmingham creative class offered supportive visions of food for social justice and wellbeing. Examining the progressive but often poorly visible role of artists in urban food activism, I question Watson's position, asking whether an 'unregistered' creative class disrupts cultural analysis, or rather that novel post-qualitative analytical methods are required to appraise their contributions to social movements.

Disrupting Colonialities of Knowledge: Learning and Teaching Sociology through Immersion in Social Food Movements

The nutritional sciences have traditionally exerted expert authoritarianism over health: that only qualified nutrition professionals may hold and use knowledge of the diet to improve wellbeing (Millard & Kingfisher, 1998). This has resulted in widespread 'nutritionism', and the disempowerment of lay

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

peoples, knowledges, and discourses of dietary health (Cohen, 2017). This conflicts with decreasing public investment in nutrition services (Chapman & Middleton, 2019), and increasing reliance on the community and voluntary sector for food support (Loopstra et al., 2019). The cultivation of healthy, inclusive, and resilient food systems requires intersectoral learning from, and partnership with, new social food movements (Sage et al., 2021).

A compulsory module on the sociology of food and nutrition was introduced in September 2022 on the BSc Nutrition degree at the University of Nottingham, designed using a Pedagogy for Civic Engagement framework (Wingeier-Rayo, 2016). Privileging community-based learning as the primary pedagogic concept, the module required students to immerse themselves in local social food movements, to facilitate critical consciousness of the conflicts between physical wellbeing and social determinants of health, and the reductionist nature of expert interventionism. Assessing appraisal and interpretation of sociological theories of food through an ethnographic portfolio exercise, the module challenged trainee nutritionists to produce a realistic proposal marrying expert and community knowledge to support dietary health, which the student could implement through volunteering experience the following year.

At the end of the first iteration of the module, this paper uses student feedback to reflect on teaching sociology through civic engagement, learning from new social movements, and the epistemic value of disrupting colonialities of knowledge in the allied health professions. A student co-produced living document will be shared to highlight the opportunities and challenges of teaching sociology via community-based learning, and evoke ideas for use of these pedagogic concepts in other areas of sociology.

Plen-4.1

SALVATORE, Armando* (McGill University, Canada)

Reinventing Secularity As Civility? Islamic Articulations Linking Past and Present

Secularism as a constitutional doctrine and political ideology presupposes not only a political theology but also a theology of history. The paper first addresses the question of whether (and to what extent) this also applies to the more sociological notion of secularity, which has a higher analytical purchase in turning political ideology or theology into a focus on the socio-cultural 'will to differentiate' one's (or one's group's, or an entire society's) life from the normative power of however defined religion.

The approach to multiple secularities is inclusive of movements and ideas that de-absolutize this will to differentiate between religion and secularity without turning it into a symmetrically opposing will to de-differentiate them. The approach consists in building a layer of reflexivity in apprehending an increasing diversity, around the globe, of notions of secularity. It shows how this diversity consists in differentially articulating the historical, normative, and life-orientational reasons for the differentiation altogether.

In this perspective, the paper proposes to see the way contemporary social thought and social movements in the Muslim-majority world have folded the (islamically often controversial) notion of secularity (*'almaniyya* in Arabic or its equivalents in other languages) into horizons of civility. This option facilitates navigating the straits between the Scylla of a modernist-Westernist straitjacket calling for a sharp differentiation between religion and secularity and the Charybdis intimating a traditionalist tabula rasa of any differentiation. This option often requires linking the analysis of the turbulent present of Muslim-majority societies with a reflexive and nuanced (i.e., not fundamentalistically simplifying) apprehension of the Islamic heritage, where notions and practices of civility play a major role.

Complexity of Disaster Resilience Discourse: With Special Reference to Neoliberal Sri Lanka

Disaster scholarship being mainly western-oriented and western-dominated, there is a lacuna in critically exploring the term 'disaster resilience' with a special reference to 'global south' including Sri Lanka. This research paper aims to critically engage with the term 'disaster resilience' while bringing the examples from the experiences of the Sri Lankan flood affected people and interventions of the government and donors. It takes a Foucauldian approach and a critical lens to engage with the disaster resilience discourse in neoliberal Sri Lanka. The research study uses mixed method approach and employs questionnaires, in-depth interviews, focus group discussions conducted with the flood affected people in two flood prone communities and semi-structured interviews with the DRR related government and donor officials. The research paper brings David Chandler's, Jonathan Joseph's and Julian Reid's conceptualizations on resilience into the Sri Lankan neoliberal disaster context and critically engages with the term while providing examples from the narratives of the flood affected people and experiences of the Sri Lankan government and donors. The research paper interrogates the disconnects between the Sri Lankan government's and donor's perspective of 'disaster resilience' and flood affected people's narratives on disaster resilience in grassroots level. The research findings indicate how the government and donor initiatives use the term as a metric of their project success while pouring with other buzz words such as 'empowerment' and 'sustainability development'. On the contrary, flood affected people's narratives show the complexities surrounding their disaster

resilient identity mainly outlining larger root causes, structural inequalities and systemic injustices behind their failures to be resilient as government and donor's expected. The paper mainly raises the question of whose disaster resilience is decided by whom with what kind of outcomes and emphasizes the need for nuanced understandings including non-linearity and complexity surrounded by the term 'disaster resilience'.

RC39-564.1

SAMARAWEERA, H.* (Department of Sociology, University of Colombo, Sri Lanka, Sri Lanka)

Understanding the Need for Decolonizing Disaster Recovery Process in Neoliberal Sri Lanka

Within the limited social science disaster scholarship on disaster resilience and recovery in Sri Lanka, there is a serious emerging concern for decolonizing neoliberal disaster recovery process. In this research paper, the term decolonizing indicates the power imbalance and the need for potential rebalance through the voices and experiences of the local disaster affected communities. The paper aims to explore the need for decolonizing disaster recovery process in increasingly neoliberalized disaster context in Sri Lanka with special reference to two recurrent flood affected communities. The study employs mixed method approach while using questionnaires, in-depth and semi-structured interviews and focus group discussions with flood affected people located in two flood prone communities and semi-structured interviews with donor and government officials who have closely worked in the Sri Lankan DRR context. The paper indicates the gaps and limitations identified in the disaster recovery processes after the major flood disasters occurred in 2016, 2017 and emphasizes how the Sri Lankan government's and donor's monopoly and centralized power lead not to address actual needs of the local communities. Since the majority of Sri Lankan disaster studies and disaster recovery processes have been western-oriented, top-down approach-based overlooking people's voices, this paper raises the need for decolonizing disaster recovery process in neoliberal Sri Lanka while providing an opportunity to hold the power and agency by the flood affected people themselves. Those people have lived in the flood prone areas for generations while facing recurrent annual flooding and dealing with larger neoliberal root causes which produce disaster risks and vulnerabilities, systemic injustices and structural inequalities. Hence, decentralizing the government's and donor's power towards flood affected people while understanding the existing power imbalances in the disaster recovery process will lead to further explore the problematic nature of the existing western-oriented DRR policies and recovery initiatives in Sri Lanka.

SAN MARTIN, Maria Eugenia* (Universidad de Buenos Aires, Argentina)

La Profesionalización Del Mando De Las Mujeres Policías. Un Estudio De Caso Sobre La Policía Federal Argentina.

En el año 2019, cuarenta y un años después de que se habilita a las mujeres a ingresar al cuerpo de oficiales de la Policía Federal Argentina la cúpula de mando de la institución está integrada por ciento ochenta varones y once mujeres. Cinco son Comisarias Inspectoras, cinco son Comisarias Mayor y solo una Comisaria General. La feminización de las fuerzas de seguridad es un fenómeno de apertura e integración heterogénea que enfrenta un bloqueo progresivo a las jerarquías más altas del organigrama institucional que, al decir de Susana Durao (2017), las hace protagonistas de un cambio incompleto.

En este trabajo se analizan las prácticas que posibilitan la transgresión a la prohibición del mando (Pruvost, 2008) en contextos restrictivos a lo largo de las trayectorias de ascenso profesional de las mujeres que acceden a posiciones jerárquicas. En su trayectoria ascendente se identifican tres vías a través de las cuales ellas disputan el acceso al mando: la masculinización, la feminización estereotipada y la construcción del prestigio. Por último, estas trayectorias son relacionadas con sus experiencias de organización de la división sexual del trabajo doméstico y de cuidado.

Effect of out-of-School Education in Entering Higher Education: A Focus on Post-Tracking in High Schools

This study examined the effects of shadow education on the transition from secondary to higher education using data from the Japanese Life Course Panel Survey. Despite a disadvantageous track in high school, students may use shadow education to improve their grades and join a track that they originally desired. This study explored whether shadow education in high school helps women to recover from a track disadvantage and achieve attainment of higher education. The results showed that women's use of shadow education indeed promoted the attainment of their higher education. Contrarily, for men, it was effective only in overcoming the differences between junior colleges and technical schools and four-year colleges, but not between four-year colleges and branded colleges. Furthermore, the effect of shadow education by high school track was found only for a subset of men. These results suggest that

shadow education is effective in promoting educational attainment regardless of high school track, and may also help students recover from disadvantages in high school track.

Social Sustainability and Social Economy Organizations: A Way of Overcome Vulnerabilities through Intergenerational Dialogue

The main aim of this research is to analyse social sustainability through the promotion of intangible heritage of different generations living in the same community in three different countries through the role of two different social economy organizations. The term 'sustainability' does not always translate easily and is sometimes only considered in limited environmental and economic terms. Social sustainability has not been given the same attention and implementation as its counterparts, and that has held back sustainable development around the world from reaching its maximum potential. Therefore, we seeks to encourage effective practices trough social economy organizations for achieving social sustainability in communities from Spain and Cyprus. The idea is to endorse intergenerational dialogue and intangible heritage as effective practices for building coherent societies. According to "The 2030 Agenda for Sustainable Developments-UN", essential elements for achieving Social sustainability are the opportunities given to different generations to build healthy and adoptive communities. Human societies have constantly developed and adapted their intangible cultural heritage, in order to address fundamental needs and social issues across time and space. Taking into consideration the above, we will implement intergenerational dialogue through people coming from two Foundations, interviewing citizens living in the same communities enabling at the same time their civic engagement and active participation. The interviews will be framed to collect the perceptions of different generations through their life stories narratives promoting active ageing as another selected priority. In addition, citizens with fewer opportunities and diverse backgrounds will have the opportunity to get involved in interviews and have their testimonies shared among the community. We analysed the role of social economy organizations implementing the fieldwork and their perception of the three main concepts, social sustainability, intergenerational dialogue and intangible heritage, all inside the constructivism theoretical approach.

SANCHEZ, Fabio* (Universidade Federal de Sao Carlos, Brazil)

Interrogations Regarding the Reconfiguration of Social Movements – from the Grammar of Rights to the Solidarity Economy

The aim of the present work is to discuss the constitution of a solidarity economy agenda in conjunction with the Brazilian social movements in the last decades, seeking to perceive its constitution as a political subject and its relationship with the Brazilian democratic process and the social movements after the 1980s. As a general rule, the literature temporally locates the (re)emergence of the solidarity economy in Brazil starting from the re-democratization in the early 1980s. However, the hypothesis of this work is that only in the 1990s - as a response to the advance of neoliberal policies and the consequent configurations of social movements in this scenario – did the solidarity economy acquire meaning and presence in the public sphere. The central argument is that this process takes place precisely because of the more general reconfiguration of social movements throughout the 1990s, which stemmed from profound transformations in Brazilian society. These transformations led a group of social movements and several of their activists to find in the solidarity economy a new agenda that allowed them to (re)position themselves in a field of conflict in profound mutation. In order to carry out the discussion proposed above, we will address the trajectory of some activists who have participated in different social movements in recent decades and who take part in the solidarity economy today. We pursue a broader understanding of the changes in the dynamics of social movements that occurred in the 1990s, which brought about the transformation of these grammars. Considering that, we aim to discuss the reconfiguration of the mobilization processes originally organized around the grammar of rights to the solidarity economy, focusing on the semantic sense of democracy in both cases.

SANCHEZ, Phoebe Zoe Maria* (University of the Philippines Cebu, Philippines)

"Corporate Impunity in Sustained Modern-Day Coloniality of Power: The Case of the Pantaron Range, Talaingod, Davao Del Norte, Philippines"

The study looks into the problematic of Developmentalism as Global Southern states drumbeat economic prosperity via extractive capital intrusion in their poor economies – the case of the Pantaron Range, Talaingod, Davao Del Norte, Philippines.

Rather than the extraction and exploitation of the country's abundant natural resources such as minerals, timber and fuels that will lead to the development for local advancement, it resulted to the underdevelopment and the impoverishment of the deemed owners of these resources. The Global South States experience massive cases of deforestation, desertification, and the shrinking rivers depriving local communities of their traditional source of sustenance.

State enterprises are privatized and tariffs lowered as in the liberalized markets. Following WTO Policy Nos. 52-54, the Philippine Mining Act pushed for a primary commodity export strategy making industries compete with imports from transnational corporations. This commodity export strategy is being used to capture the "comparative advantages" derived from the value of natural resources in order to service foreign debts. In a way, the postneoliberal state now becomes the handmaiden of foreign investment and capitalist development, as it poses as vendor of natural resource extraction with the notion of "better deal" with global capital as well as regulating the public interest, in the hope for equity or social inclusion, and protection of the environment.

And yet comes the all-time corporate impunity expressed in "false climate solutions," or "food systems and agriculture adaptation," if not "climate financing," and "climate induced migration and displacement". Is this just a matter of "politics" as in the "political ecology of natural resource extraction," or the "international political economy" of peripheral state subordination to extractive capital? Is it still a rent seeking state, or a state agent to "extractivist imperialism"?

Democratic Institutions in Crisis-Ridden Male-Dominated Cognitive Empire: Misogynistic Attacks on Women Opposition Candidates

How should we expand the democratic space for women's political participation in developing states?

In the 1992 Philippine presidential elections, smart, articulate and intelligent Presidential Candidate Miriam Defensor-Santiago boldly ran against Philippine Army General and Presidential candidate Fidel V. Ramos, only to earn the label of being "crazy and delusional". She lost the race.

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Last May 9, 2022, bannering opposition candidate Leni Robredo, the lone female presidential candidate has been subjected to misogynistic attacks since she got elected vice in 2016 against the son of former dictator Ferdinand Marcos. These attacks often belittled Robredo's intelligence and have since been amplified to target her daughters (Rappler 2022). Misogynistic messaging appears to be largely influenced by political leaders and notorious tyrants in the country. As as result Marcos, Jr. won the elections.

Setting the stage is the regularity of killings, hyper-inflation, wage freeze, removals of public subsidies and prize controls. Four years of no-knock raids and massive EJKs, punctuated with militarized lockdowns, and massive "tiktok" saturation on "historical lies" make perfect storm for a dystopian gulag. Social consciousness is whittled on gaslighting and whitewashing of political crimes of tyrants and authoritarian rulers. Citizens are kept poor, hungry and confused. The war is engaged at two levels: the mind and the belly.

The study problematizes on the sustained tussle for women's voice to vanquish male dominance in the political playing field.

SANCHEZ BELANDO, Maria Victoria* (University of Barcelona, Spain)

Challenges and Chances of Citizen-Driven Initiatives in Encouraging More Equity Power Relations in Governing the City. Learnings from the Case of Barcelona.

During the last decade, Southern European cities has become the scene of citizen-driven initiatives aimed at the provision of welfare services, in a context of withdrawal of the role of the state and the market as providers of collective consumption. These initiatives led to the multiplication of community-based practices that set-in motion a variety of partnerships with local administration, introducing changes in urban policy production and management. The objective of this paper is to analyze the configuration process of this community-based initiatives, as well as their contribution in fostering more democratic and equity relations in urban governance. By studying the case of the city of Barcelona, we propose to answer the following questions: to what extent and how are these experiences encouraging processes of decommodification of urban collective goods and services; to what extent and how do they promote practices of democratic deepening in the urban governance and broaden the exercise of rights in urban life? We develop the analysis from a path-dependent perspective and considering local and institutional context factors, as well as multilevel ones that shape the rise and configuration of community-based experiences. From the methodological point of view, the study is based on the examination of a significant sample of community-managed initiatives with implications in sociocultural and urban regeneration policies in Barcelona. We have adopted a qualitative strategy to collect and analyze the data that includes in-deph interviews, semi-structured interviews and the analysis of local government, grassroots organizations and social movement's documentary sources.

SANCHEZ BELANDO, Maria Victoria* (University of Barcelona. Gran Via de les Corts Catalanes, 585 - 08007. Barcelona, Spain)

The Role of Community-Based Initiatives As Collective Action in Shaping Urban Governance Relations in a Southern European City: The Case of Barcelona.

The great recession has involved a reorganization of the role of urban actors in governance relations of Southern European cities. During the last decade, cities became the scene of mobilization and collective action claiming for social justice and more citizen participation in urban management and production of the city. In this context, community-based initiatives have proliferated in order to face the effects of the austerity policies by providing welfare service and revitalizing urban space. These initiatives have represented laboratories for political and socioeconomic experimentation, since they allowed to put in motion and test forms of collective organization and decision-making as well as forms of coordinated actions that have favored, since 2017, the institutional recognition of community based-practices in managing facilities and providing services in the sociocultural field. By studying the case of Barcelona, the purpose of this paper is to analyze the configuration process of this community-based initiatives in order to know their role in fostering democratization and decommodification processes in urban governance dynamics, by influencing, for example, emergent forms of codifying relations between organized citizens and the state at local level. We develop the analysis paying attention to path-dependency and local context factors, as well as multilevel-factors and other community-based initiatives in Southern Europe that are relevant references in order to explore the case. From the methodological point of view, the study is based on the examination of a significant sample of community-based initiatives in the sociocultural that are currently operating in Barcelona and in the study of the policy instruments that have emerged in the last decade in order to regulate citizen involvement in urban policy deployment. To collect and analyze the data, we have followed a qualitative strategy that is mainly sustained by semi-structured interviews and the review of documentary sources of grassroots movements and local administration.

SANCHEZ DIAZ, Maria Eugenia* (Universidad Iberoamericana Puebla, Mexico)

Los Desgarramientos Civilizatorios: Una Perspectiva

El texto *Los Desgarramientos Civilizatorios: Una perspectiva* propone la categoría de desgarramiento civilizatorio entendida como la ruptura de andamiajes estructurales de larga duración y de imaginarios sociales naturalizados durante siglos. Se trata de una propuesta teórica y epistemológica que pretende aportar elementos de comprensión a la inédita crisis civilizatoria que está viviendo la Humanidad. A partir de una articulación compleja y no lineal de capitalismo, patriarcado y colonialidad, el texto sugiere la necesidad de deconstruir las categorías analíticas tradicionales que en vez de ayudar a comprender las realidades emergentes las encubren. Se agrupan en tres ámbitos los desgarramientos civilizatorios medulares: Territorios y corporeidades resquebrajadas, Símbolos e identidades dislocados y Regulaciones institucionales desestructuradas. Territorios y corporeidades resquebrajadas hace alusión al trastocamiento de la base material de la sociedad, de sus coordenadas espacio-temporales y de la corporeidad societal. Símbolos e identidades dislocados hace referencia a las rupturas de los entramados culturales y de las subjetividades de individuos y colectividades relacionados con procesos tecnológicos, imaginarios rotos, futuros inciertos. Regulaciones institucionales desestructuradas hace referencia a la desconfiguración de los aparatos regulatorios de la sociedad que se concretizan en instituciones y normatividades. Los tres ámbitos se refieren a la base material y corpórea, a los referentes simbólicos y a las lógicas político-regulatorias que conforman las redes estructurales y los significantes sociales de una colectividad. La categoría de desgarramientos civilizatorio puede ser útil para ahondar en esas tendencias subterráneas que sugiere Sassen (2015) para profundizar en la comprensión de las lógicas sociales contemporáneas.

SANCHEZ GARCIA, Jose* (Universitat Pompeu Fabra, Spain)

Tawab (repenting) and Muslaha (reconciliation): Mediation Processes Among Youth Streets Groups in Magrib

Maslaha and tawab are processes close related with guilt. It can go two ways, (1) destructive and (2) instructive. The person involved may have developed a deep-rooted belief that they will not have to answer to anyone as they face no serious repercussions for their misdeeds. The objective of this presentation is to understand the mediation processes in the Magrib recognizing the significance of identifying pre-existing resources for dealing with conflict as well as culturally competent prescriptions for mediation processes (Irani & Funk, 1998; Majeed, 2004; Al-Ramahi, 2008). Although the institutions of the state do not always penetrate deeply into society, "private" mediation is managed through informal networks in which local political and/or religious leaders determine the outcome of feuds between gangs or conflicts between individuals. For most people, however, conflict control and reduction are handled either by state-controlled courts or by traditional means. The path to resolution thus goes through local religious figures, not through social workers. In this sense, communal religious and ethnic identities remain strong forces in social life, as do patron-client relationships and patterns of patriarchal authority. We discuss the significance of tawab (one of the 99 God names) as a key concept to start the mediation processes in everyday conflicts among youth urban groups analysing ethnographic findings coming from Sale (Morocco), Tunis (Tunisia) and Djendel (Algeria).

"Ummi" the Mediator: Resolving Conflicts Among Youth Street Groups in Moroccan "Houma"

Mothers as mediators are key figures to understanding conflict resolution among youth street groups (YSGs) in popular neighborhoods (Houma in Darija) in Morocco. In this presentation, "Hajja" and "Malika", our models of mediation and whose life narratives will be the locus of analysis, accomplish mediation outcomes in the "Houma" where authorities collapse. The presentation reposes on the findings of a qualitative research carried out in Salé where we scrutinize the central roles these adoptive "mothers" play in evading prison, aggression, violence and deaths for the youth. All in all, Mothers mobilize inter/cultural maneuvers to resolve conflict, trespassing gender, religious and kinship norms to protect the Houma space.

SÁNCHEZ-BARRÍA, Felipe* (Pontificia Universidad Católica de Chile, Chile)

Interest in Politics and Participation in Protests in Chile Today: A Longitudinal Analysis.

We often use individuals' "interest in politics" as a strong predictor of political behavior, especially when we study electoral participation or participation in protests. In this line, research usually assumes that participation in political activities results from the prior development of certain attitudes, such as interest in political issues. However, we rarely ask what factors explain variation in interest and attention in politics and how previous political behavior may subsequently modify interest levels. Investigating this question imposes a significant empirical challenge since it requires data that allows us to observe how the attitudes and behaviors of individuals vary over time. Taking advantage of a six-wave panel survey, we examine the relationship between interest in politics and protest participation in contemporary Chile. Using a series of dynamic linear panel models and cross-lagged models, our results show that protest participation is positively and strongly associated with an increase in individuals' levels of interest in politics. However, the degree of prior interest in politics is not related to subsequent participation in protests, except in the year of the "social outburst." Likewise, this last contentious event has an independent positive effect on interest in politics and is conditioned by age and gender. That is, the year of the social explosion increased interest in politics, particularly among young people and women. These results suggest that political participation can produce and reinforce certain fundamental attitudes for the proper functioning of democracy, such as interest in politics.

The Social Stratification of Hope: Lessons from Pandemic Times

Scholars of social stratification and mobility have long charted disparities in outcomes such as wealth, health, educational attainment, wages, and international elasticity within and across societies. Often these outcomes map onto 'durable inequalities' such as race, class, and gender through interconnected structural and cultural mechanisms. Members of RC28 have examined the role of attitudes in shaping inequality and subjective experiences, which can both reflect and reinforce inequality's structural roots. In this vein, this paper looks at how "*hope*"— both a subjective outcome and emotional resource— is stratified before and after the upheaval of the COVID-19 pandemic in the US. Following work on historical and biographical unsettlement, we hypothesize that hope will map on to social positions that reflect the unequal opportunity structure in the US, but how this manifests will change with the historical and biographical unsettlement of COVID, which will affect expectations of the future in disparate ways. Current inquiries into these topics remain limited by the paucity of multivalent data that combine systematic representative sampling, the qualitative nuances necessary to chart narratives of hope, and a disrupting event that effects various social strata. The recently released American Voices Project (AVP), which includes data before and during the initial wave of the COVID-19 pandemic, addresses this gap. The data also provide key variation in respondent characteristics, a validated quantitative measure of "hope," and linked qualitative data from nearly 2000 in-depth interviews. The baseline approach we will use for analysis is transposed from recent works which combine more traditional quantitative modeling with computational techniques for visualizing and linking patterns in qualitative text.

Securitizing the Road to Autocracy: Public Security Policies As Strategies of Democratic Erosion in Hungary, Poland, Turkey, India and Brazil

Amidst the current "third wave of authoritarianism", elected autocrats take advantage of particular local contexts to rise to power and gradually impair democratic institutions. In doing so, we argue, they mobilize an arsenal of common legal and extra-legal strategies and tools. Through interdisciplinary comparative analysis, this paper will present the most commonly identifiable strategies in the field of public security policies to deepen the materialization of an autocratic political project in various stages in five of the most prominent countries under autocratization processes: Brazil, Hungary, Poland, Turkey and India. Our paper will show the double-edged pattern of dismantlement and construction of policies, first in the use of surveillance technologies and the expansion of privacy violations; second, in the practice of penal populism and the incitement of moral panic, strategies that usually target, depending on the context, groups such as immigrants, women, religious minorities and

LGBTQIA+ people. By doing so, we will show how central public security policies are to autocrats in their process of advancing against democracies and shed light on the risks of reelecting these leaders.

The paper builds on the results of a broader previous research by the authors at the Center for the Analysis of Freedom and Authoritarianism (LAUT), "The path of autocracy: current strategies of democratic erosion". In light of the process of democratic decline experienced in Brazil in the last four years and the risk of a potential re-election of the right-wing president Jair Bolsonaro, the research mapped some longer-lived experiences of autocratization around the globe (in particular those of Hungary, Poland, Turkey and India) in order to identify potential effects of an autocrat's reappointment to power and analyzed the concrete changes that occurred in these countries in three areas, considered central to the consolidation of an autocratic project: education, civic space, and public security.

SANDBACH, Katrina* (Western Sydney University, Australia)

Western Sydney Reimagined

Going as far back as the 1948 *County of Cumberland Planning Scheme* that sought to coordinate planning and growth between Sydney's many councils, visual material such as maps, aerial photographs, illustrations, exhibitions explaining the scheme's proposals were used extensively to identify and visualise the region, to promote the need for the urban development of Sydney to stakeholders and potential residents and ultimately shaping the ways in which people imagined or visualised the vast area that would become Western Sydney. During the 1960s-2000s Western Sydney developed an image problem through recurring mass media narratives focusing on the region's problems that played a significant role in establishing Western Sydney's cultural identity as the "Other" Sydney. More recently, an array of maps circulated on the internet as social media memes, data visualisations or illustrations accompanying news stories have tended to reinforce our region's deficits and perceived geographic, social, and economic distance from the rest of Sydney.

This paper will discuss Creative West, a project that maps Western Sydney's cultural capital, past and present. From the inside position of designer and Westie, this paper will explore how visual representations have helped to shape and sustain Western Sydney's reputation as the "other" Sydney and proposes how it could be repositioned through harnessing the power of visual communication. In doing so, it contributes to the reconceptualisation of Western Sydney's identity during a time of unprecedented change and development.

Violencia e Izquierda Democrática En Colombia: Las Elecciones De 2022

La nueva izquierda en Colombia alcanza la victoria por primera vez en la historia en 2022 con el 50.34% de los votos. La presente ponencia busca explicar el retraso del proceso (*lagged*) de la entrada de la nueva izquierda colombiana a esta oleada que inició en la región en 1999 con la llegada de Hugo Chávez al poder presidencial en Venezuela y que culmina -en la denominada segunda ola- con la elección de AMLO en México en 2018, Pedro Castillo en Perú y Gabriel Boric en Chile en 2021 y Xiomara Castro en Honduras en 2022. Colombia es el último país de la región latinoamericana que ingresa a la ola del giro a la izquierda. Podría catalogarse como un caso *outlier* dado el desface temporal de este fenómeno frente al resto de América Latina. La respuesta a este retraso puede ser explicado por muy diversas causas, no obstante, una de las determinantes es el uso constante de la violencia en el campo político, lo que no aparece en los análisis de los casos del giro en América Latina estudiados por diversos analistas, quienes se han dedicado a señalar sus causas estructurales de índole económico, social y político, bajo condiciones de paz. Se establece que las masacres y asesinatos de líderes sociales y de derechos humanos por parte de los actores violentos entre los que se encuentran agentes de la clase política, fue un factor obstructivo que retrasó la llegada de la nueva izquierda al poder en Colombia hasta el 2022 y cuya incidencia continúa hasta el presente.

Women's Participation in Protests Against the Three Farm-Laws in India: Perspectives from the Ground

The farmers' movement in India against the three farm-laws has been considered historic in many ways. The movement built unity and solidarity between different sections of society and at the same time it created a churning in the agrarian social structure. An important feature of the movement was a large scale active participation of women at different levels. This aspect of the movement while highlighted by the mainstream media has hardly received any attention in the existing rushed academic scholarship on the movement. This paper tries to address this gap and provides descriptions and insights into the forms in which women participated in the protests and factors which

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

were working behind this participation with specific reference to the state of Haryana which was geographically at the centre of these protests. By using participant observation method and digital documentation of the protests the paper highlights how this participation impacted the character and scope of the movement and brings out the dynamics between the women protesters and the movement. The discussion draws attention towards certain possible progressive changes in the gender relations as a result of the women's participation in the movement and identifies tasks for future to sustain and strengthen these changes.

Roadmap for Proposals for Interventions with Healthcare Professionals: Knowing and Counteracting Vaccine Hesitation. First Results from Vax-Trust European Project (Project: 965280)

Counteracting vaccine hesitancy is an important issue for healthcare professionals who meet more additional challenges in constructing relationships with their patients. Healthcare professionals need abilities to encounter vaccine-hesitant individuals so that these individuals can make their decisions about health. Professionals need to be prepared to answer questions and concerns related to vaccines. VAX-TRUST Project (funded by EU Horizon 2020 Program) strives to both increase understanding of vaccine hesitancy and improve the interaction between healthcare professionals and vaccine-hesitant individuals. Our target group are doctors, general practitioners, paediatricians, gynaecologists, midwives, nurses, medical students and parents. We found it useful to conduct a systematic review of the literature using primary studies from PubMed and Scopus published between 2016 and 2021. SLR analysis topics include educational interventions, pilot studies, comprehensive studies, and guidelines that address vaccines' hesitation to healthcare professionals and medical students. Two groups of blind researchers examined the documents. The selected data from the SLR meet the objective of promoting actions for the facilitation of health communication interventions, campaigns and intervention models on vaccines and immunizations. We selected 5% (874) of the total number of articles remaining (17,000) and blinded to include or exclude studies and then checked for any conflicts which were subsequently resolved together. The results of the SLR have led to the possibility of being able to carry out an analysis to develop guidelines to facilitate health care choices through a synthesis of knowledge on vaccination hesitancy. Thanks to this background research path it was possible to identify actions to facilitate, through direct interventions, healthy communication with sustainable and replicable campaigns, innovative models of representation on vaccines and immunization policies.

How Do the ICT Affect to the Discourse on Reproductive Health Rights: A Case Study of Germany and Japan

In this presentation, the impact of ICT on access to abortion will be discussed based on recent trends mainly in Germany. In addition, through interviews with medical professionals including doctors, who confront the conflict of pregnant women, it is considered how to provide appropriate information and abortion services needed by pregnant women in the Internet age.

It is undeniable that the conflict between "pro-life" and "pro-choice" is deeply engrained in the debate over the pros and cons of abortion. In Germany, after intense debate on legal reform at the time of unification, some parts have dared to remain ambiguous. While pregnancy counseling is emphasized to support the "self-determination" of women and to provide a variety of information, the principle that "abortion is a crime" remains solid along with German constitution. if a woman chooses abortion, she must receive counseling at least three days prior to the procedure. Yet, the repealing of 3 days waiting period has been recommended by the Committee on the Elimination of Discrimination against Women(CEDAW), according to the WHO policy.

Meanwhile, Covid-19 and the recent development of the Internet have had a significant impact on the information provision of such pregnancy consultations including it regarding prenatal diagnosis, as well as on the abortion framework. The incumbent government, with a strong emphasis on digitalization and gender equality, has already amended the law to allow the doctors to provide information regarding abortion on the Internet.

In Japan, as in Germany, online medical treatment and services are also being discussed due to the influence of digitalization. The question is how should pregnant women be cared in the midst of digitalization? Based on the

interviews with healthcare professionals, we will analyze the situation in both countries and try to present the ideal of reproductive health & rights in the digital age.

SANO, Kazuko* (Osaka University of Commerce, Japan)

Japanese Mothers' Careers in Transition: Who Choose to Work and Why?

This paper aims to explore the changing aspects of Japanese ECEC（early childhood education and care）systems in relation to mothers' attitudes toward work and childcare.

Japanese welfare systems are well known as "familialism" where public commitment to education is small while families play a stronger role (Esping-Andersen 1999), and the same is true for ECEC systems. Japan spends 0.19% of its GDP on ECEC in 2018, the second lowest among 31 OECD countries, and about half of ECEC expenditure per child is funded by private sources.

However, such "family-oriented" Japanese ECEC regime has been showing a sign of transition in recent years coupled with an increasing number of working mothers and an increasing number of children under three waiting to be enrolled in ECEC institutions. For example, the number of childcare service providers increased by 40% between 2014 and 2018. In addition, a new measure was enacted in 2019 which ensures ECEC services free of charge to all children aged 3-5. These reforms can be considered as the shift of Japanese ECEC regime from "familialism" toward "defamilialization". If so, what is the implication of the institutional shift on mothers? Would it be a drive to activate mothers' labor participation?

This paper proposes a new perspective on the Japanese ECEC regime in transition by looking at mothers' attitudes toward childcare through the analysis using Japanese social survey data (JGSS) of different years between 2000 and 2021, with employment status of mothers as dependent variables; working full time, part-time, self-employed or non-working. Preliminary results of multinominal regression show that mothers with college degrees have an increased propensity to work part-time over the last two decades, and that mothers with children aged 5-10 are more likely to work either part-time or full-time to supplement educational fees for their children.

Family Solidarity Norms and the Salience of Family Relationships for Individual Social Support in a Comparative Perspective

Interpersonal relationships play a key role in providing support for individuals throughout their life course. Interpersonal relationships and the support they provide to individuals are however shaped by norms and institutional arrangements in the place and time where these lives occur. Despite certain cultural differences reported cross-nationally, little is known about the macro-structural factors explaining them. This paper examines the relationships between family solidarity norms and social support provided by familial and non-familial relationships in a comparative perspective, aiming to disentangle several dimensions of national contexts that might influence the social support provided to individuals by family or other personal relationships. It assesses notably the role of gender inequality, individualism and traditional values on family solidarity norms, and the moderating role of the latter for social support practices. We use data from 30 countries from the ISSP's 2017 Social Networks and Social Resources survey module, and meta-analysis and meta-regressions to assess cross-country variations. Results show that while some family solidarity practices are universal, others are specific to the dominant norms and values prevailing in countries. Most people turn to family relationships in case of illness, independently of contexts, while there are much more variations into who to turn to first in case of emotional and instrumental needs for help, depending on cultural and institutional factors in the countries. In countries where gender equality is higher, women turn more to the family for domestic tasks and conviviality, but less in case of depression and family problems. The traditional values also moderate the effects of family norms on family support with similar effect implicating to turn to other types of relationships in case of emotional support need. These findings suggest that solidarity practices are present in all societies, but the salience of family relationships vary according to specific needs and institutional/cultural arrangements.

SANTANDER, Luciano* (Freie Universitat Berlin, Germany)

Authoritarian Mechanisms of Neoliberalism: On the Implementation and Validity of the Hegemony of Neoliberalism in Latin America

At present, the degree of consolidation of neoliberalism in Latin America varies. However, when the neoliberal State faces anti-neoliberal social mobilizations, the response is an unrestricted defense of the model through reactionary practices and authoritarian methods.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Is there a point of convergence in the institutional reaction to defend the model in the different countries with neoliberal institutionalism? Are there devices that allow neoliberalism to maintain its institutionalism under conditions of "normality"?

My work proposes that there is a hidden generality in neoliberalism, which is its authoritarian character. In that sense I suggest that in those countries where the neoliberal project and its governance have been challenged, the response is usually the same: a series of abusive devices that together elaborate systematic mechanisms that seek to generate a desirable pattern whose objective is to protect the model. I call these "Neoliberal Authoritarian Mechanisms" (NAM), represented by devices and symbols that make it possible to defend neoliberalism. I define these mechanisms as five previous categories: i) State repression; ii) Communicational closure; iii) Technocratic authoritarian; iv) Breaking international laws; v) Legal regulations. My project seeks to define such mechanisms, study their development in the region and their consequences in Latin American societies.

To explore the above, I am carrying out a comparative study between Chile and Colombia. The comparative analysis seeks to explore and characterize both conceptually and empirically the form and nature of the authoritarian mechanisms of neoliberalism, and their role in the development of governance, both in times of stability and in situations of crisis. To accomplish this, I proceed to generate descriptive and causal inferences to describe these authoritarian mechanisms, as well as their effects, through the observed data. I seek to develop a mixed methodology work, using qualitative tools for field research and quantitative research methods employing descriptive statistics.

The Transition to Adulthood in Transnational Families: Gaps between Aspirations, Expectations and Practices in a Life Course Intersectional Perspective

The socio-economic inclusion of the children of immigrants' is a crucial challenge for equality and social cohesion in contemporary societies. However, during the transition to adulthood, disadvantages related to the migratory background persist. Yet, the experiences of youths with transnational families becoming adults are still little explored, especially in the southern Europe.

The paper investigates from an intersectional and life course perspective the trajectories of 56 families with immigration background, starting from the school experiences of the children who graduated in Italy in 2012, 11 of which were re-contacted between 2019 and 2020 during the Covid-19 pandemic crisis. Based on the analysis of 104 interviews with 56 children, 17 parents and 22 key informants (staff of schools and educational services), the article explores the gaps between aspirations, expectations and practices concerning the transition from secondary to tertiary education, the entry into the labor market and the transition to parenthood, through a longitudinal qualitative approach.

The research highlights the role of school tracks, intergenerational exchanges and the segmented labour market in shaping the children of immigrants' transition to adulthood. Migrants' previous educational paths tend to influence their post-graduation trajectories, trapping those who attended vocational institutes in secondary level qualifications. Students' expectations regarding the transitions to adulthood, their peer groups, the transnational families' economic resources and intergenerational obligations effect the children's perspectives on tertiary education, as well as their expectations and experiences in the labor market. Job insecurity and gender discriminations are associated with childlessness or postponement of the transition to parenthood. Higher education is seen as a means of overcoming these difficulties and becoming middle-class adults.

The advantages of using the transnational family as a lens through which understanding aspirations and experiences becoming adults emerged, at the intersection of gender, generation, class, citizenship.

SANTORO, Monica* (University of Milan, Italy)

The Effects of Lockdown Covid-19 on Children and Families: The Italian Case

Italy was one of the first countries hit by the Covid-19 pandemic and the central government imposed a very restrictive lockdown period. Little attention was paid to the effects of this measure on children, who were suddenly deprived of outdoor spaces and the possibility of going to school. Studies have reported sleep disturbances, increased aggressive behaviour, and difficulties in managing emotions in children (Idoiaga et al., 2020; Jiao et al., 2020). These studies agree on the effects of parents' state of mind on young children's behaviour: their anxiety about the future and their stress about remote working negatively influenced their relationship with their children (Fontanesi et al., 2020).

The aim of this paper is to investigate some of the aspects that emerged from these studies on children aged between 2-10. To this end, 20 mothers living in Lombardy, a region particularly affected by the epidemic, were interviewed. During the in-depth interviews, two dimensions were investigated: communication between parents and sons and daughters with respect to the need to remain confined within the home and the management of information about what was happening.

The interviews revealed different communication strategies depending on the age of the children and the educational level of the interviewees. Younger children received limited information while some mothers with school-age children preferred to offer realistic information. The patterns of communication varied according to the educational level: the respondents with a high level of education were inclined to rationalise events and provide realistic explanations; on the other hand, the respondents with a medium to low level of education valued the emotional impact of too direct information and therefore avoided it. Consistent with this attitude, the less educated mothers reported behaviour disorders, whereas the more educated mothers were concerned about the consequences of distance learning on their children's education.

Mass Music and the Meanings of the Feminine: Brazilian Country Music and "Popular Feminism"

Feminism has become a polysemic word that escapes the classic references of political conformation (social movements and political parties) and takes as an important reference the public world mediated mainly by consumption experiences. Music is an important index of this movement: in recent years, some Brazilian music genres (MPB, funk, and samba) have presented a female perspective on the contemporary world, impacting how values and ideas about feminism circulated and became a reference for processes of subjectivation. This presentation focuses on feminejo- a subgenre of Brazilian country music that takes shape in 2016- and one of its representatives, the singer Marília Mendonça, and intends to answer two questions: what meanings does the word feminism assume when it circulates through mass music? Can feminejo be understood as an experience of "popular feminism" (Banet-Weiser, 2018)? I take as a hypothesis that feminist subjectivities are currently constructed from globalized references and mediated by the experience of consumption so that becoming a feminist through pop culture connects people from the four corners of the world from a shared, globalized reference. The mass music produced in Brazil can be understood in connection with other productions that circulate worldwide that align with "popular feminism" (BANET-WAISER, 2018), in other words, Marília Mendonça and Beyoncé, apart from their deep differences, propose readings on women, femininity and feminism that converge, pointing to the worldwide circulation of symbols and worldviews. Therefore, the concept of performativity (Judith Butler) is used as a methodological tool to explore how mass music and the processes of subjectivation, taking feminism as a reference, can be articulated when reproducing or subverting power relations.

Intersectional Dialogues in Contested Canons: Lessons from W.E.B. Du Bois, Ida B. Wells, and Anna Julia Cooper

In recent years, we have witnessed several calls for the decolonization and diversification of the standard sociological repertoire which remains bound to Eurocentrism, methodological nationalism, and related fallacies. These new contributions often operate at the intersection of entangled histories and connected sociologies, retrieving peripheralized voices from the history of the discipline and reinscribing them into the canon, or rejecting the idea of canonized knowledge altogether. A key figure in these scientific revivals has been W.E.B. Du Bois whose scholarship is now widely and belatedly acknowledged as foundational for sociology. There is less engagement, however, with Black female thinkers such as Ida B. Wells and Anna Julia Cooper, contemporaries and interlocutors of Du Bois, who made explicitly sociological contributions in their own right: tabulated statistics and political analyses on lynching in the case of Wells, and Black feminist thought and historical readings of the Haitian Revolution in the case of Cooper. In highlighting and interconnecting their work and legacy, I make the case for "undisciplined" and intersectional dialogues as a productive way for the "peripheral turn" to think with and against the archive and the very idea of the sociological canon.

Kinship and Slave Ship: Decolonial Methods Against the Archival Grain

The conditions and (im)possibilities to form a family, stay with one's family, and trace one's family history have varied across time and space. Here, enslavement and the transatlantic trade in enslaved people play a crucial role: as centuries-long and continent-nonspanning processes of violence, subjugation, exploitation, extermination, and alienation, they have dramatically transformed social structures, including kinship ties, across the Atlantic and beyond. Combing through forgotten pieces of the sociological and abolitionist archive and engaging with new historical counter-narratives, I argue that the historical study of family and kinship requires a radical re-thinking of sociological and archival theory and methodology against prevailing Eurocentric assumptions and the silencing of inconvenient histories, that is, the active production of absences. Two interrelated decolonial strategies guide my contribution: besides conceiving of uncovering and closely reading long-

forgotten foundational sociological works as a decolonial device challenging knowledge canonized in the North, I also introduce critical fabulation and related approaches challenging the authority of archival records as decolonial methods. I thereby situate the uprooting and re-composition of families and biographies in the longue durée of enslavement and its aftermaths.

Prisons, Border Spaces and Favelas: Building Access and Trust Strategy to Biographical Research

One of the key questions in conducting research based on biographical narratives interviews is the establishment of trust with the interviewees. This process is even more critical when we consider conducting biographical interviews in field of complex access, as prisons, border spaces and *Favelas, for instance*. Based on my experiences of recent years in conducting studies in all those fields, this paper will propose a critical appraisal on the process of getting access to these fields and on the obstacles in gaining confidence from the research subjects, illustrated with examples of how these obstacles were surpassed successfully.

Making Sense of Big Text Data: An Application of Topic Modeling Techniques to Online Newspaper Articles and Social Media Text.

Improvements in computing and information technology have made it possible for researchers to access vast amounts of data to understand social phenomena. Rich textual data are now available from social media sites and traditional media such as newspapers that moved their content online. Statistical techniques used in computational sociology allow us to make sense of such unstructured and enormous data that would otherwise be difficult to do manually.

This study demonstrates the usefulness of topic modeling techniques in understanding shifts in conversations because of critical events. In particular, it aims to discover topics from Twitter and an online newspaper in the Philippines during the pandemic. The number of topics k to be generated was varied, and coherence measures were calculated to help in deciding the appropriate number. Top terms and their contributions to the topics were extracted. Overall, this study illustrates the value of using statistical methods to discover latent topics and summarize a vast amount of text data.

Genealogy As Immanent Critique of Forms of Life

The present study seeks to demonstrate that genealogy can be an instrument of immanent critique of forms of life and recast genealogy's place within critical theory. The catalyst for this proposal is Honneth's challenge of describing and justifying a standpoint from which society and its institutional practices can be meaningfully theoretically criticized.This study delves deeply into the concept of forms of life and its critique proposing that a genealogical approach realizes the goals intended by Jaeggi's proposition in her book *Critique of Forms of Life*. Martin Saar's tridimensional description of Nietzsche's genealogy is the guide towards the realization of this genealogical project. Jaeggi has a theoretical proposition developed and genealogy can be an instrument that could bridge the gap between the theoretical possibility of immanent criticism and the practice of social critique. The genealogical proposition provides a surplus in comparison with Jaeggi's position. Genealogy presents itself as an instrument of critique tailor-made to the challenges of late capitalist societies.

Worldwide AI Ethics: A Review of 200 Guidelines and Recommendations for AI Governance

In the last decade, a great number of organizations have produced documents intended to standardize, in the normative sense, and promote guidance to our recent and rapid AI development. However, the full content and divergence of ideas presented in these documents have not yet been analyzed, except for a few meta-analyses and critical reviews of the field. In this work, we seek to expand on the work done by past researchers and create a tool for better data visualization of the contents and nature of these documents. We also provide our critical analysis of the results acquired by the application of our tool into a sample size of 200 documents. The development

space of systems and applications that affect so many people is still a "black box" for most. All stakeholders should be aware of the inner working of the processes that regulate and control their surroundings. The process to change our current deregulated AI industry can only start with a push for stronger government regulation, but also with a culture change.

Burnout Syndrome: The Case of Financial Professionals

This article discusses one of the biggest diseases of the 21st century, Burnout Syndrome, focusing on the financial area, one of the most prone to suffer from the phenomenon. Thus, this article aims to analyze the role of the work-family/family-work conflict, occupational stress and Burnout syndrome in financial professionals, to study the relationship between them, as well as the influence of sociodemographic and professional characteristics in the variation of Burnout levels.

A mixed methodology was adopted, due to the complexity of the phenomenon. First, the questionnaire survey was used, and 255 questionnaires were analyzed. This included three scales, namely the Work-Family Conflict Scale (WFCS), Job Stress Scale (JSS) and the Maslach Burnout Inventory (MBI-GS). Afterwards, a qualitative research was carried out based on interviews. This proved to be a fundamental tool to complement the knowledge gained. In this logic, the data were read and transcribed, using MAXQDA.

The results show the positive correlation between the independent variables (characteristics, work-family/family-work conflict, professional stress) and the dependent variable (Burnout syndrome). There were moderate levels of work-family/family-work conflict and professional stress, however, high levels of Burnout. Positive relationships were also identified between the work-family/family-work conflict and the Burnout syndrome, as well as between professional stress and Burnout. On the contrary, professional effectiveness is negatively correlated with occupational stress, as well as with certain sociodemographic and professional characteristics.

SANTOS, Maria* (SOCIUS / Lisbon School of Economics and Management, Portugal)

Global Supply Chains and Work Practices: The Case of Inditex

The question that drives this paper is: the development of an International Framework Agreement (IFA) in a textile global value chain will lead to improvements in labor conditions? To deal with this question, we analyze the case of Inditex's production chain in Portugal. We made documental analysis to understand the content and the main characteristics of the IFA of Inditex. Also, semi-structured interviews were carried out in Portugal at various social and political actors: trade unions' representatives, supply chain managers and subcontractors of Inditex and also workers in textile workshops.

The empirical research highlights the disparity of the power relationship between a multinational and its subcontracting networks. Subcontracted textile companies retain little negotiating capacity and the prices are very low, putting at risk the economic and financial sustainability of the companies that are situated at the base of the supply pyramid. The asymmetry in Inditex's production chain in Portugal reveals the fragility of the local business sector. The recourse of subcontracting and the emerging of "mushroom companies", with weak economic sustainability are a reflection, on one hand, of their economic dependency on Inditex and, on the other hand, of the absence of companies with their own brands that can compete independently in the market. This situation has an evident impact on the working and life conditions of workers: job instability and the absence of safe working conditions. However, the IFA represents a new route for monitoring working conditions and has had a impact in correcting complaints about fundamental workers' rights.

How Decent Is Work in the Automotive Production Network? an Operational Typology of Quality of Work in a Brazilian Region

The debate on social upgrading, i.e., on the process of expanding workers' rights and the consequent improvement in the quality of employment with a focus on establishing decent working conditions in global value chains and production networks is already well established. However, despite the theoretical and empirical advances in their understanding in different sectors, little progress has been made in operationalizing work quality indicators, especially in view of the considerable difficulties when comparing the quality of work in different sectors. Accordingly, in the paper we present a proposal for a typology of work quality that operationalizes the key drivers of social upgrading presented by Barrientos, Gereffi and Rossi (2011). Such a typology is built on a survey on the profile of workers in the automotive hub of Rio de Janeiro,

　　denotes a presenting author. Abstracts are organized by first presenting author's last name.

Brazil, carried out between 2020 and 2021, which involved 408 respondents (Ramalho *et al*., 2022). Using the typology, we empirically test the social upgrading key drivers' model and, questioning and improving its indicators, present an operational model of work quality appropriate to different sectors. Also, the empirical application to the automotive hub of Rio de Janeiro showed privileged working conditions and relations, despite a growing trend towards precariousness, which deserve to be compared to other car-producing regions and countries.

Disasters As Processes: Trust, Information Seeking, and Protective Action Decision Making

While there are more than six decades of research on how people respond to risk information, less is known about information seeking in the context of competing official and non-official sources of risk information available through social media (National Academies of Sciences, Engineering, and Medicine, 2018). Moreover, there is a dearth of disaster research, more so research on risk communication in Puerto Rico. Yet, Puerto Ricans have been coping with consecutive extreme events in the last five years, including hurricanes, landslides, an earthquake sequence, and the COVID-19 pandemic, challenging more traditional event-based definitions and studies of disaster. For the last two years, our research team has been conducting research to understand how, in the context of navigating multiple disaster cycles simultaneously, emergency management-related personnel, as well as residents, make decisions about what actions they should take to protect themselves and others against the possibility of a significant earthquake in the future. Using data collected through in-depth interviews with key informants (n=51), a semi-structured survey (n=428), and focus groups (8 facilitated) in three communities, we explore how emergency responders and residents in Puerto Rico access, interpret and use available information to inform protective action decisions. This research is vital to promote situational awareness and preparedness for future earthquakes effectively.

¿Cuándo Entenderán Que Nos Mienten? a Case Study of White-Collar Corruption in Post-Disaster Puerto Rico

In the last five years, Puerto Rico, a territory of the United States of America in the Caribbean, has faced several natural hazards resulting in standing catastrophes. Disaster declarations and executive orders have been used as part of large emergency response operations, bypassing required governance processes and protocols, and creating a perceived state of exception (Atiles, 2021). Each disaster has been politicized, partly based on accusations of corruption, mismanagement, or nefarious implementation of emergency management plans by municipal, state, and federal actors; government employees, senators, corporate partners, and most recently, even a former Governor was arrested and accused of wrongdoing. In contrast, disaster scholars have long argued that social solidarity emerges in the aftermath of disasters, and people affected by disasters engage in prosocial behavior (Dynes and Quarantelli, 1968; Fischer, 1998). Nevertheless, there is a need to examine the criminological aspects of disasters, particularly white collars crimes (Aguirre and Lane, 2019). This research presents a case study of the frequency and temporality of corruption crimes and arrests in the aftermath of recent disasters in Puerto Rico. Using official documents from the U.S. Department of Justice, we 1) generate a profile of each offender, 2) characterize and classify the crime committed, 3) identify the disaster declaration to which the accusation is related, and 4) document the length of the investigation process, the arrest date, and the outcome of cases that have been decided. The delivery of emergency services is compromised when resources allocated to meet the needs of those who withstand the worst of disasters are diverted. This research seeks to move beyond the assumption of crimes as myths in the aftermath of disasters, contributing to understanding under what conditions and situations alleged criminal acts occur.

SANYAL, Paromita* (Florida State University, USA)

Life and Debt: Household Financialization & the Changing Culture of Credit

Financialized credit has been making inroads into low-income urban households in 'developing' (i.e. middle-income) countries ever since 'financial inclusion' was accepted as a normative goal and mandate in lending institutions. With this recent development, household financialization has been advancing in communities where relatives and friends, moneylenders, and informal associations were the customary sources of credit in the decades before. In tandem with this change, working class financial subjectivities are evolving to accommodate cyclical use of credit, increasing debt, and debtor relations to financial institutions. In this presentation, we delve into what kind of financialization is occurring, how it is occurring, and what kinds of financialized subjectivities are emerging. Based on an ongoing longitudinal qualitative study on working-class households in Mumbai, India, we trace how global and national commercial banks and small-finance companies are entering a space occupied by culturally embedded informal sources of credit and capital raising. We analyze household money management strategies for borrowing, saving, and raising capital; the processes and transaction experiences with financial institutions; and the moral positions and sentiments regarding financial institutions and financialized consumer credit. In the presentation, we will draw on these qualitative data to discuss the changing 'culture of credit.' As consumer credit becomes unembedded from culturally familiar informal institutions and begins to also flow through new neoliberal financial institutions, how does it shift the meaning of credit, alter household habits and practices of credit, and shape the affects and anxieties associated with credit. Alternatively, what kinds of cultural practices and preferences stymie the rapid progress of household financialization. This presentation will engage these broad questions to advance the research agenda in economic sociology and sociology of development.

Los Medios De Comunicación Ante La Transición Energética Justa. Discursos y Coaliciones En Territorios Afectados Por La Salida Del Carbón

Con cada vez más interés los medios de comunicación se vienen haciendo eco de las diferentes políticas energéticas de transición justa desplegadas tanto a nivel internacional como nacional, asumiendo un rol más o menos activo en la articulación de la opinión pública en torno a los procesos de descarbonización y la lucha contra el cambio climático. Este trabajo recoge el análisis discursivo de los medios de comunicación regionales y locales de los territorios afectados por el cierre de minas y centrales térmicas en el proceso español de eliminación gradual del carbón. Los medios se conciben como un actor relevante en el proceso de construcción de significados sociales y la conformación de opinión pública. Con el propósito de analizar su posición, sus discursos y las coaliciones discursivas en las que se integran se ha realizado un análisis discursivo argumentativo (Hajer, 1995) de un corpus mediático compuesto por 2700 noticias de 87 periódicos, tanto impresos (42) como digitales (45), de cuatro regiones españolas vinculadas al carbón: Aragón, Asturias, Castilla y León y Galicia. El análisis refleja el posicionamiento de los medios de comunicación con el territorio y su escasa y tardía implicación en la comunicación de argumentos deslegitimadores del carbón. Los medios han dado la voz a numerosos actores especialmente a aquellos que, primero, se oponían a la salida del carbón y, después, defendían los amplificados discursos retardadores de la transición. Las voces de actores visibilizando modelos de desarrollo alternativos y escenarios futuros sin carbón han sido escasos, lo que refleja la dominancia hegemónica de viejos actores, estructuras y relaciones de poder.

The Changing Role and Morphology of the ISA in Light of Its Congresses

The history of disciplines has overlooked the role of international associations in their institutionalization. Founded in 1949, the ISA played a central role in four processes: the academic institutionalization of the discipline, its professionalization, the formation of a transnational scientific field, and the circulation of sociological knowledge worldwide. The ISA set up and circulated a research agenda, teaching norms, and helped disseminate findings though its Congresses and publications. The ISA also furthered the development of the discipline in countries where it was not established. However, in the first period of its existence, the ISA was not entirely autonomous from the UNESCO political agenda, as attested by the congress themes. Starting in the 1970s,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

thanks to a change in the statutes which allowed individual membership, the ISA gained autonomy and the Research Committees multiplied. From then on, rather than orienting research for policy purposes, the association focused on the international circulation of knowledge, on the construction of transnational networks through the RCs, and on the discussion of professional matters. Individual memberships also opened the ISA to women and non-Western scholars, but this diversification was only progressively reflected in the Congress plenary sessions as in the RCs boards, with persisting (albeit variable) gender and geographic imbalances. The ISA thus contributed, especially after 1990, to the formation of a global sociological field, less nationally organized and less dominated by the West, although this globalization was not to be achieved until the third millennium. Beyond morphological changes, the presentation will focus on the congresses, their structure, themes and plenaries, and on the epistemological, methodological and thematic shifts they reflect.

RC04-69.7

School Belonging and Social (In)Justice in Mexico

In recent years, belonging has become a challenging conceptual framework for revisiting different issues in youth studies, such as identity, place attachment, subjectivity, social recognition, and even inclusion and exclusion. Belonging does not replace those concepts, but provides a new analytical angle to explore them in a changing contemporary world. This paper presents some findings of an extensive research about the process of belonging among Mexican adolescents from working classes in a particular institutional setting: the school. The analysis focuses on the daily struggles, dilemmas and contradictions involved the construction of school belonging by disadvantaged youth both in terms of self-esteem and social recognition. In these contexts, belonging take place under unfavorable conditions like social stigmatization and devaluation, material deprivation, and authoritarian relationships. Under such negative conditions, however, these young people resist and struggle to find and develop a sense of belonging. This paper explores these aspects of school belonging and discusses their effects on youth social and subjective well-being; the paper suggests belonging is a possible avenue to explore social (in)justice in educational settings. Methodologically, the paper is based on qualitative research carried out in Mexico in three different urban regions of the country: Tijuana, in the northern border with the USA, Tuxtla in the southern state of Chiapas, and the central metropolitan area of Mexico City. Fieldwork was done in 7 public middle-schools located in poor neighborhoods. In total, 73 semi-structured interviews were conducted with students and 22 with teachers and principals. All of them were recorded, transcribed, and then analyzed with the NVIVO software for qualitative research.

Science in Policy-Making: Examining the Opinion of Scientists on Innovation and Development of Solar Energy in India

Being the third largest emitter in the world, India's climate action is central to the global effort against climate change. Acting proactively, the Indian government has announced an ambitious renewable energy target to be achieved by 2030, where solar energy plays an instrumental role. Due to this push, the Indian scientists are actively engaged in the innovation and development of solar energy technologies. The current academic literature on solar development is predominantly techno-economic and has not concretely dealt with the interaction of emerging science and technology with policy. Therefore, there is uncertainty regarding how the science-policy interface will emerge and sustain to deliver committed solar targets.

In this context, we employ the theoretical framework of sociology of expectations to investigate the opinion of Indian scientists working on solar energy research about the policies related to sustainable energy transitions. In-depth interviews (n=36) were conducted with scientists, working in the solar energy space, from five autonomous branches of premier science and technology institute named Indian Institute of Technology (IITs).

Our study has three major findings. First, scientists expect a clear-cut policy framework for solar thermal energy for meeting large-scale energy requirements, which will eventually help them set a research agenda. Second, they expressed the current solar energy policies focus solely on enhancing first-generation photovoltaic technology whereas third-generation technology has already been introduced in other countries. Third, they emphasized the importance of policies promoting research on indigenous material to replace silicon, a vital source for manufacturing solar panels, and at present primarily imported from China. Deriving conclusions from the lens of sociology of expectations, we argue inclusion of scientists' perceptions and opinions in the policy-making and active cooperation from the government and other stakeholders can unlock the huge potential of the scientists related to the development and deployment of solar energy technology.

Contested Right to Connect: Controversies about Teenagers Living in Shelter to Access Social Media and Mobiles

Teenagers living in care institutions in Brazil experience exclusion and oppression throughout their lives. Their very presence in those places, which are organized in the forms of shelters or care units and homes-residences, is the result of a persistent process that led their rights to be violated (art. 101 of the Statute of the Child and of the Adolescent). The problems that triggered their placement are diverse, but most of all related to inequalities and poverty: children associated or threatened by drug cartels, children with ties with criminal activities, family violence, abuse and neglect, and streets situations. Care institutions are then an instrument of public policy designed to be the lesser evil between the danger and the removal of children from their original family and their community.

In thos institutions, I found that the right to access the digital environment (Article 4 of the Civil Framework of the Internet in Brazil) was highly contested, especially when it came to allowing access to social media. Out of the 12 institutions that were visited, 7 imposed restrictions, while the remaining were at least very wary. The reasons for such limitations were connected with the context of oppression they lived in: looming danger from drug cartels, neighbours and families.

By using qualitative research with ethnographic methods, and informed by Grounded Theory, the Actor's System (Stoecklin, 2017) and methods for social media embeddedness analysis. I found that the situation was not met unchallenged. I observed that the teenagers exercised their rights creatively to address the contestation of their connection. This called my attention that for the children and teenagers I met, the affordances (Hutchby, 2001, Pinch, 2010, boyd, 2014) of the digital environment provided grounds to mitigate or reduce the stress of family and community removal and the shock to their identity.

SARLI, Andre* (University of Geneva, Switzerland)

The Digital Cartel? Experiences of Marginalized Teenagers in Brazil with Drug Cartels through Social Media

The increased role of drug cartels in everyday life in Brazil is already a consummated fact. This is especially true for marginalized groups which live in places such as the peripheries and favelas, where often those places are circumscribed under a cartel "jurisdiction". In that context and facing a dread economical scenario, teenagers often resort to take part in the activities of a cartel or they are influenced by it through extended networks.

In my research I will discuss how a particular group of marginalized teenagers, which are living in care institutions such as shelters, are active objects or subjects of the digital irradiation of such cartels. This is the result of a qualitative research with ethnographic methods in 12 institutions in Brazil, where I found that all those institutions had at least surface contact with the cartel's power. I explore how teenagers and institutions alike use of the internet and especially social media is influenced by actions and discourses of and about cartels.

I use the framework of the Mutual Shaping of Technology (Oudshoorn and Pinch, 2005) and Mundane Technology (Nemer, 2022) and boyd's studies about the networked lives of teenagers (2014) to propose grounds to understand the narratives of interaction between the teenagers, care institutions and drug cartels, and the digital environment.

From "Being Othered" to "Promoting the Value of Otherness": Empowering Self-Narratives Among Migrant Immediate Descendants in Italy

This work analyses qualitative data collected through interviews and focus groups with migrant immediate descendants (MIDs). In particular it involves 60 MID university students raised in Italy, where MIDs are often victims of othering dynamics. Questions aimed to elicit respondents descriptions of their strengths and weaknesses in intercultural communication.

The MID university students involved show a high reflexivity on intercultural communication. Amongst strengths, a central role is played by affective empathy towards members of minorities (ethnic, but also other minorities, such as LGBTQ+ or disabled people). Respondents describe their strengths in relation to situations where they strive to improve the acceptance of cultural diversity in society.

I argue that MIDs' early experience of being labelled as different causes pain and identity struggles, that under certain conditions can be overcome by positively construing their multiple cultural belongings. Learning to praise their hybrid identities goes hand in hand with their willingness to involve in intercultural relations and to create a counterdiscourse on cultural difference. Through a process of resignification MIDs can turn their outsiderness into an

agentive position and propose themselves as active civic subjects (Arnone, 2011).

Interplay between Habitus and Reflexivity in Agential Responses to Marital Violence

Based on qualitative data from Assam in India, this paper attempts to underline agency of women facing marital violence through the structure and agency dialectic that takes an 'analytical dualist' approach (taking cue from the critical realist Morphogenetic Approach) to explain the relationship between the two components. Recognising intra-culture variations and intersections of gender and class, it will underline the nature of agential expressions by treading between the binary opposite stands of 'victimhood' and 'survivorhood'. Certain material-cultural enablers and constraints that have been observed to operate at distinct levels (individual-interactional-institutional) will be underlined. The focus of this paper is a proposal to highlight a hybridity of habitus and reflexivity in the agential trajectory of marital violence which has been mapped through a temporal diagram. This diagram also attempts to explain *how* marital violence is sustained in the manner in does and *why* agency in marital violence needs to move beyond an essentially individualistic conceptualisation in which women are singularly assessed according to their decisions of leaving or staying without considering the distinct material-cultural constraints- enablers under which they act.

SARMA, Nayani* (JAWAHARLAL NEHRU UNIVERSITY, India)

Teaching during a Pandemic: The Gender Dynamics (Qualitative Research)

The onset of the Covid-19 pandemic in India brought into forefront many pre-existing problems with the different aspects of our society. This paper seeks to focus on problems of the education system brought into limelight from Assam, India. In particular, it is a study on the difficulties faced by the young female teachers (aged 25-35) working in contractual and/or permanent positions in primary and secondary educational institutions (at school) who had to drastically adapt to online teaching due to the lockdown imposed because of the pandemic in the country. It is based on personal in-depth interviews and engagements with my peers from the region who were juggling both research work and academic duties as well as household responsibilities throughout the lockdown. The location of the study is equally important as India's northeast was dealing with problems of digital divide, problems of ICT implementation, problems with technological problems as well as contractual employment of female teachers and salary related issues even in the pre-pandemic era. These problems were further escalated during the pandemic and as it has gradually become apparent to us by now, the implications were even more severe for the female gender in the third-world countries. The study employs activity theory as the framework and uses qualitative methods to collect and analyse data. This study seeks to work in the direction of identifying the gender dynamics of online teaching during the pandemic era where the boundaries of workplace and domestic spaces became blurred and gender restrictions on movement and access to public spaces almost became a norm once again.

Drugs, Leisure and Society in Assam, India : A Sociological Study

Leisure deals with pleasurable activities apart from routine work, which is highly valued by every individual. Drugs in Indian context are those substances as defined by Narcotic Drugs and Psychotropic Substances Act (NTPS), 1985. Narcotic Drugs include coco leaf, cannabis (hemp), opium, poppy, straw and all manufactured drugs. Psychotropic substance means any substance, natural or synthetic, or any natural material or any salt or preparation of such substance.

In this paper, we have tried to depict the picture of the places in and around Kakopothar, Doomdooma, Philobari as well as Margherita of Tinsukia district of Assam which are main pockets of drugs affected areas. We have interviewed 10 police personnel, 5 medical experts, 5 advocates, 30 drug users, 20 staff of rehabilitation centers, 25 senior citizens of the locality, 10 village headmen of the locality and 5 journalists of the locality, that is, 110 number of respondent.

It was found in the study that initially drug users get fascinated by using drugs and they pass very good leisure time. They feel they are in a very different world. But they do not have sufficient money all the time to purchase those drugs from drug peddlers. When drugs become their necessity, they even sell their valuables, household items, land etc. Often they torture their parents to get money to purchase drugs.

Law enforcement authorities are quite strict against the substance abusers even if they use it for leisure and entertainment. Rehabilitation centers are established to control and rehabilitate the drug users and the drug addicts come and stay in rehab due to parental pressure, societal pressure. In case of drugs and leisure, post modernist view is more suitable as it claims that institutional boundaries, moral and immoral codes, boundaries of the right and wrong are all breaking down.

Leisure Activities and Development of Tourism in Leh, India

In this paper, we will try to highlight the major leisure activities in Leh, especially in the two most attractive places namely, Pengong lake and Nubra Valley in Leh which are predominantly tourist places. Traditionally people used to travel to those places either by horses, or Mule etc. Now, lots of bikes are available on rent in Leh city and tourist enjoy bike ride to Pengong Lake and Nubra Valley. Moreover, cars, jeeps and other vehicles now ply to these destinations. Tourists pass leisure time in Pengong Lake by viewing the changing colours of the lake water and the scenic beuty around the lake. They stay there in temporary tents and play different games and enjoy local food there. In case of Nubra Valley, tourists go for camel ride, shooting games, marketing, bike rides, rafting, zipline adventures, visit monasteries and enjoy local food and drink. Also, tourists enjoy bird watching and viewing the rare sight of Himalayan Marmots and wild horses on the way while traveling to Pengong and Nubra valley as such.

At the same time, due to authoritarian controls of different types, people have to take out online pass for visiting these places and also have to bear the trouble of road construction on the way to the above places. Many a times, one has to wait for more than one or two hours to get road clearance. The paper is an outcome of firsthand account and interviews with different tourist groups and local people engaged in tourism industry as well as local inhabitants of Leh.

Planning for the Future in the Shadow of the Crisis: Young Women's Gendered Transitions-to-Adulthood in Poland during COVID-19

While the transitions-to-adulthood have been already taking place in the context of growing uncertainty, the pandemic has challenged this process for individuals even further. The relation between an individual and social structures remains pivotal here: the life plans and decisions are made within certain contexts, in reference to the available (unevenly distributed) resources, social class and gender. Against this backdrop, the paper focuses on the perspective of young women, and their orientations towards planning the future. We ask: How do young women talk about their future? If and how does the pandemic (and other crises) influence planning strategies and future orientations? What resources (structural or biographical) matter in the envisioned transitions and futures of young Polish women?

We conducted an analysis of in-depth interviews collected in the framework of two longitudinal research projects implemented in Poland: ULTRAGEN (*Becoming an adult in times of ultra-uncertainty: intergenerational theory of 'shaky' transitions*), and GEMTRA (*Transitions to Motherhood across three Generations of Polish Women*). Twenty seven young women (aged 18-35) were interviewed for the projects during the pandemic and probed about their pandemic-related experiences, as well as orientations towards their futures.

From a conceptual standpoint, we adapt the typology of facing uncertain futures proposed by Brannen and Nilsen (2002). We discuss the narratives evocative of ideal-type orientations on deferment (focus on the present, keeping future at bay), adaptability (agency, future as malleable) and predictability (long-term future-planning). By focusing on selected biographical cases of young women's accounts, the paper contributes a revision of the typology driven by the observed complexity and intersections of different orientations regarding particular spheres of life (education, work, family, housing). Likewise, we argue that even if the pandemic was a reason to alter future plans, it has not led to the revision of future planning strategies.

Poverty and Social Exclusion As a Main Indicator of the EU 2030 Target: Current Situation and Perspectives in EU Member-States

The composite indicator of poverty or social exclusion (AROPE) corresponds to the sum of persons who are either at risk of poverty, or severely materially and socially deprived or living in a household with very low work intensity. It is the main indicator to monitor the EU 2030 target on poverty and social exclusion and was the headline indicator for monitoring the EU 2020 Strategy poverty target.

The European Pillar of Social Rights sets poverty and social exclusion as one of the three EU-level targets that must be achieved by 2030 in employment, skills and social protection. The number of people at risk of poverty or social exclusion should be reduced by at least 15 million by 2030, with 5 million being children. The 2030 targets are consistent with the UN Sustainable Development Goals. They set out the common ambition for a strong social Europe and will allow the Commission to monitor Member States' progress in the context of the European Semester.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

In 2021, the AROPE indicator has been modified according to the new EU 2030 target. The revision allows to better measure deprivation, based on a revised list of items, as well as to better account for the social exclusion situation of those in the working age group (aged 18 to 64 instead of 18 to 59).

The aim of this paper is to present the situation among member states in a comparative perspective, while at the same time to highlight the most vulnerable groups determined by the composite indicator (AROPE). Using the latest data from Eurostat (EU-SILC), it will be shown that not only the unemployed or immigrants, but even children and young people are among the high-risk groups, signaling the need for new policies and their strict implementation to meet the 2030 target in Europe.

Alternative Space Movements in the Global Sixies: Comparative Urban Sociological Studies of London, Tokyo and New York.

The conflicts between liberals and conservatives, whether in the political field or the cultural one, intensified sharply after the "culture war" of the early 1990s. Now, under the pandemic of Covid-19, the conflict seems to be deepening rather than resolving. In these uncertain times of crisis, how can we think of urban cultural movements as an opportunity for a new era? This paper examines alternative space movements in the global sixties from a comparative urban sociological perspectives. "Alternative space movements" mean the various artist's activities mainly in the late 1960s, in order to pursue art venues without commercial galleries and museums. These movements include various forms of activities from direct action for criticizing the existing art worlds to performative actions without necessarily direct purpose. Alternative space movements have been creating social and cultural bases in urban areas, such as non-profit organizations and alternative spaces, since then those organizations and spaces have been creating various opportunities to protest urban spacial issues during the times of entrepreneurial urban settings. Although alternative space movements are quite important significance for urban environments, there are quite few urban sociological studies. This paper will compare the movements that developed in London, Tokyo, and New York in the 1960s and clarifies the background of such a movements, the mechanisms that drove them, and the potential they had; especially the community arts movements in London, Bikyoto and Bigakko movements in Tokyo, and movements mainly led by Art Workers Coalition in New York.

The Challenges of Young Female Social Entrepreneurs after Covid 19: A Case Study of Mueang Pon Village, Mae Hong Son, Thailand

This research aimed to study the context of social entrepreneurs and to analyze the challenges young female social entrepreneurs face after covid 19. The researcher used the qualitative method by selecting purposive sampling relevance to young female social entrepreneurs in Mueang Pon Village, Mae Hong Son, Thailand. The informants are eight entrepreneurs from different businesses: hospitality, food and beverage, and handicraft. The tools used to collect the data in the study is the in-depth semi-structured interview.

The study's results found that in the context of young female social entrepreneurs after covid 19. The young female social entrepreneurs were developed from the community–based tourism, which is cooperative and self-established. Most young entrepreneurs can inspire unity and consideration for the common good. Moreover, they were continuously learning and developing their potential by adapting to the changes according to development to earn income beneficial to the communities. However, they confront some obstacles, for example, the barrier to access to finance to support the business, the barrier to gaining a network, and the lack of soft skills and hard skills (negotiation skills and conflict management). In addition, based on the finding of this study, it is recommended that young female social entrepreneurs develop self-confidence and risk-taking and become part of business incubation programs to gain financial support and networking to face the challenges after covid 19.

SATO, Akihiko* (Kwansei Gakuin University, Japan)

Between Promoter and Obstructionist of Vaccination: Vaccine-Induced Sufferings and Anti-Vaccination Discourse in Japan

Background: Recommendation of Covid-19 vaccines and adverse reactions to them have bolstered the anti-vaccination movement in the western world. Japan has also encountered the anti-vaccine movement and discourse. Promoters for vaccination often explain that the reason why such a movement has never been terminated is not because of scientific evidence but because there exist psychological bonds among obstructionists. However, the conflict between promoters and obstructionists in Japan is more complicated.

Japan has experienced vaccine-induced sufferings (VIS), authorized by the government. VIS have been treated as evidence for the vaccine being harmful within anti-vaccine discourse.

Question and purpose: Is it appropriate to interpret VIS as evidence of the harmfulness of vaccination? This study reveals the features of VIS and discusses the sociological implications.

Method: Historical documents related to VIS were analysed to reveal discursive features.

Result and discussion: VIS began with the diphtheria vaccine incident in 1948. This was followed by the myelitis problem, caused by the MMR vaccine in the 1980s. There also were similar problems, such as "the vaccine disaster" in the 1960s and 1970s, and the health problem caused by the HPV vaccine in the 2010s. As the analysis shows, VIS do not necessarily consist of the damage caused by adverse reactions, but of social affairs related to the settlement of such a problem. Even the victims of VIS do not always claim that the vaccine is harmful. The cause of these problems is often associated with the negligence of pharmaceutical companies and the government. The analysis suggests that admitting damages caused by vaccination, taking swift measures, and solving the problems promptly is crucial. The irony is that there remains the possibility of occurrence of VIS because promoters of the vaccination often treat it as being infallible.

SATO, Rika Sakuma* (DIPEx-Japan, Japan)

Message from the Frontiers of Cross-Country Comparative Qualitative Research

DIPEx International is a global collaboration of scholars, clinicians, and patients committed to enriching understanding of experiences of health and illness. Fourteen countries are involved in the collaboration (see Our Members - Dipex International). We use the same qualitative research method and publish the findings, illustrated with video and audio interview extracts, on public-facing websites as well as in peer-reviewed journals.

At the beginning of the COVID-19 pandemic, we began exploring the possibility of comparative research on COVID experiences across countries. We convened online to decide on research questions, an interview guide, and a coding scheme. In the Fall of 2021, we made a proposal for a Special Issue of SSM-QHR and our members reconvened with their interview data to identify topics that might prove interesting for comparative analysis. Researchers teamed up for eight papers, dealing with help-seeking during uncertain times, ICU experiences, accessing care for long-Covid, management of isolation, strategies for resisting stigma, troubles at work, social inequities reflected in the COVID discourse, and responses to government policies.

There are challenges in conducting cross-country analysis. Just finding an appropriate timeslot for an international online meeting was challenging. We purposefully avoided translating interview material until late in the process – instead each research group analyzed their own data and themes were explored and developed in collaborative online workshops. We have learnt a lot about the different contexts and systems in which the pandemic has affected lives worldwide, while being careful not to over-generalize from differences. Despite some obstacles, thanks to our shared values and methods we feel that we have started to explore the relatively uncultivated frontiers of 'cross-country comparative qualitative research'. Our international collaboration has also been rewarding, described by one of the co-authors as "making room to welcome and listen to each other with mutual confidence and joy."

Choices of Lifestyles and Identity Construction By Multiracial Youth in Japan

The growing presence of multiethnic/racial people in both identity politics and censuses increased global research on mixed identity. Japan, a country that is falsely believed to be an ethnically homogeneous society, is not the exception. By focusing on individuals born to Japanese and foreign parents who are often labeled '*hāfu*', some of the researchers have explored how their identities would reinforce or redefine what it means to be Japanese. However, in exploring mixed identity in Japan and beyond, a few studies have explicitly examined the cultural practices of multiethnic/racial individuals. This tendency is problematic considering the findings in cultural sociological research: By choosing different lifestyles such as fashions, media, sports, food, or other hobbies and tastes, people make various symbolic and social boundaries, including ethnicity and race. Against this backdrop, this study focuses on the cultural practices of multiethnic/racial youth in Japan. We conducted in-depth interviews with them to explore the following questions: What lifestyles do multiethnic/racial Japanese choose and why do they do so? What kind of identities do they construct or display by choosing different hobbies/tastes? The results show that while a few participants unintentionally choose their lifestyles, the majority of participants intentionally prefer specific hobbies/tastes over others. They differentiate various cultures ethnically and racially and practice them based on the symbolic categories, such as Japanese (e.g., *kimono* and calligraphy), mixed (e.g., Peranakan cuisine in Singapore), global (e.g., Hollywood movies), or African American (e.g., Hip-hop). By doing so, they strategically manage symbolic boundaries among Japanese, mixed/*hāfu*, or

　denotes a presenting author. Abstracts are organized by first presenting author's last name.

American. This study concludes that the salient boundaries between Japanese and foreigners in Japan, the global hierarchy of cultures, and ethnic and racial stereotypes in relation to cultures influence the choices of lifestyles and identities of multiethnic/racial Japanese.

Accelerators of Homophily: Examining the Effect of Actor-Level Network Formation Principles on Whole Network Structure with Agent-Based Modeling and Climate Change Policy Networks.

One of the generally known principles in the formation of social networks is homophily. Actors tend to form ties with those who have similarities, such as opinion, category, and appearance. The degree of homophily and heterophily (the opposite phenomenon of homophily) in networks determines the performance of the social system, such as the speed of information diffusion. Recently, we proposed a new index called the Advocacy Coalition Index (ACI) that measures the degree to which actors collaborate with those who have a similar political opinion to influence the policy outcome. A key feature of ACI is that it can measure the degree of homophily/heterophily with continual attribute variables and valued networks at different levels of observation (i.e., actor, group, and whole networks) in a simple way. While this measure is inspired by the Advocacy Coalition Framework, which is a major policy process theory, we believe that ACI can be used in a wider context, such as collaboration among social movement organizations or connections between immigrants and citizens in a host country.

While the ACI assesses the degree of homophily/heterophily in networks, it is critical to ask how various network formation principles result in a higher/lower score of ACI. In this paper, we use agent-based modeling to investigate how agents' network formation preferences influence the whole network-level ACI. Concretely, we simulate networks by changing the agents' degrees of reciprocity, popularity, and triadic closure and calculate the ACI. Furthermore, we crosscheck our findings from the agent-based modeling with our actual dataset of climate change policy networks in eleven countries. This study shows that a minor tendency of homophily brought by a small number of actors can be accelerated with the other network principles and result in a great degree of homophily at the whole network level.

Opportunity Structures and Advocacy Coalitions in Climate Politics: A Network Approach

The literature on climate change politics and policy making has identified advocacy coalitions as one key factor that shapes national policy responses to the global problem of climate change. These coalitions consist of different organizations – governmental, nongovernmental, business, and scientific organizations – that aim to shape climate policies to match their own policy preferences. One thing this literature has paid too little attention to is the fact that coalitions are likely to be shaped by the broader opportunity structure they operate in. It could be, for example, that pluralist macro-institutional opportunity structures give rise to more adversarial configurations of coalitions than corporatist ones. In this paper, we use survey data and a methodological approach we've developed, called the Advocacy Coalition Index, to compare climate policy networks in eleven countries and investigate the relationship between opportunity structures and the kinds of advocacy coalitions present in each national network. We analyze how different aspects of opportunity structures, including pluralist vs corporatist political institutions and the societal division in the perception of the seriousness of climate change influence the number, type, and overall cleavage structure of advocacy coalitions. In conclusion, we reflect on the consequences of the interplay of macro-level opportunity structures and meso-level coalition structures to national climate change policies.

Is Blood Thicker Than Water? Family Values in Step- and Biological Families at the Empty-Nest Stage in Norway

Modern family forms are complex throughout the whole life course, including old age. Complex families characterized by the presence of non-biological relationships are more and more common at the later stages of life, due to high rates of divorce and remarriage. Given their destandardized trajectories, step-families do not necessarily have the same expectations towards their members than biological families. Although in other countries these questions have been investigated to some extent, there has only been little research on older adults' step-families in the Norwegian context, in which the family is still a central pillar of society. Therefore, the present study sets out to investigate the association between family forms (biological, complex and simple step-families) with the agreement with family-related values in later life. These values include statements such as "Parents should get something back from their children" or "Adult children should make sacrifices for their parents". I use data from the second wave of the Norwegian Life Course, Ageing and Generation Study (NorLAG), which was assessed in 2007. Using logistic regression models, I found that older adults at the empty-nest stage that have complex (both partners have children from previous relationships) step-families have weaker levels of agreement with family-related values compared to their counterparts in biological families. Being part of a simple step-families (one´s partner has children, but the respondent does not) was not associated with agreement with family values. The results illustrate the complex nature of older adults' family forms and underline the importance to investigate those non-traditional family configurations further in the future.

Networks As (new) Structure Method in Social Mobility Studies. Comparative Methodology in Studying Social Embeddedness across European Landscape during the COVID-19 Pandemic

Mobility studies have recently incorporated the social network analysis (SNA) in defining degrees of mobility (precarity) or social embeddedness in various social contexts. Shape and size of social networks as well their geographical distribution are considered responsible for social mobility and various studies investigate their role during the Covid-19 pandemic across European landscape. From a methodological point of view, to the extent the degree of association (leaning toward collective action using formal groups and initiatives, new business and the like) had been considered for quite some time a measurement construct for social embeddedness (integration within host society), social networks seems to have been lately replaced former "community structures". This presentation intends to describe the similitudes and differences of methods studying mobility in a comparative perspective. It uses social data collected at the end of pandemics in European Union countries (March 2022) in order to construct a comparative methodology to be used in social mobility studies.

Retention and Reform of the All Volunteer Force in East Central European Countries

The two social and political encounters that have shaped the East Central European militaries - the post-socialist transition and the integration within Nato and EU – have come to an end. With the beginning of the 2020s, these countries face the challenges to adapt national security policies to the emerging risks and threats in the region and still keep social accesibility and democratic values at the core of such policies. Yet, they have to reform the all-volunteer force in order to meet these challenges as well. This presentation intends to introduce a theoretical framework to make sense of the (new) military in East Central Europe and to present available social data related to civil-military relations, reform of recruitment & retention, rearmament as well democratic control and social resilience. Case studies from Poland and Romania are to be exposed during presentation.

A Wolf in Sheep's Clothing: The Risks of Remote Work for the Future of Labor

Together with the increasing impact of the pandemic on daily life, the ongoing transformation process in the world of labor accelerated as well. The shutdowns, curfews, quarantines forced to the earlier and more rapid introduction of the new forms of work.

The intensifying remote work practices are presented as the protective and safe methods to curb the virus, prevent the diseases and reduce the speed of

the pandemic by the business environments. Although it is true to a certain extent, these practices brought the new problems to the world of labor. In other words, the remote work practices display features having potentials to be used a kind of anti-unionization tool and an interrupter of the other labor rights. Since the workers, who are from the certain sub-sections of the working class, have already had distances to the traditional trade union organizations, the remote work practices can cause a rapid atomization process of their organized struggle capacity.

From now on, the remote work practices seem to be an established pattern in the long run. This will create a significant impact both on the careers and experiences of workers who can be especially classified as the ones doing tasks free from a workplace. In addition to this, by the means of these practices, the intra working-class antagonisms can be experienced over the course of time.

In short, if the practices of remote work become permanent, we can point out that the post-pandemic working experiences look like to create negative impacts on the rights of workers from the right to organize to OHS. These developments can also be the causes of a new kind of a race to the bottom process. Within this context, the paper will focus on the potential risks of remote work in terms of the future of work.

SAWADA, Kayo* (Nara Women's University, Japan)

Low Fertility and the Caring Fathers: The Case of Japan

This paper describes the current status of male participation in childbearing and childrearing in Japan, a society with very low fertility. It will capture Japan's fluctuating fertility rate and the policy response to its declining birthrate, the position of fathers in the response, the current status of fathers' participation in housework and childrearing, men's engagement in childbearing and childrearing, and men's practices and decision-making process as caring father, using data including social statistics and the narratives of fathers raising children.

As caring fathers in Japan, how are men involved in the process from pregnancy and childbirth to child rearing? In Japan, the birthrate began to decline below replacement level in the mid-1970s, and policy responses to the declining birthrate began to be taken in the mid-1990s. In recent years, the impact of husbands' participation in housework and childrearing on fertility has been pointed out, and especially since the 2000s, attention has focused on promoting men's participation in housework and childrearing as an important issue in the policy measures to cope with declining birthrates. While Japanese men's participation in housework and childrearing remains low compared to their counterparts in Western countries, in recent years, there have been signs of change in the rate at which men take childcare leave. Qualitative data through interviews with fathers of child-rearing age in Japan show men's various practices and decision-making processes in having and rearing their children. In Japan, where the social welfare system relies on the male breadwinner model with the modern family based on the gender role division of labor, caring fathers has been increasing, albeit slowly, in recent years as the country has entered the post-demographic transition period. This paper also examines the gender structure in Japan, focusing on the "male experience" of childbearing and childrearing.

SAWYER, Anne-maree* (La Trobe University, Australia)
JAMES, Sara (La Trobe University, Australia)

How to Navigate a Pandemic: Emotions, Selves, and Lifestyle Choices in the Australian Media

As the COVID-19 pandemic caused schools, workplaces, and childcare centres to close, with households across Australia going into isolation, pressures in the home increased. Melbourne, in the state of Victoria, famously became the world's most locked-down city. During this time, social media posts commenting on the challenges of quarantining with children often responded with humour, while cloaking an undercurrent of despair, anger, and exhaustion. As families negotiated homeschooling, working from home, childcare and housework, women took on most of this extra unpaid work. Women were also disproportionately affected by redundancies and decreased working hours, particularly in retail, hospitality, and care services. In addition, lockdowns brought an increased prevalence of family violence. Although women's magazines and newspapers reported on the challenges women faced, much of their advice urged them to stay positive and develop healthy routines—highly individualised solutions to a societal crisis. In this presentation we examine messages on how to cope with the pandemic in several media sources from 2020-2021, namely *The Age* and *Herald Sun*, Melbourne's two most popular daily newspapers, and *The Australian Women's Weekly*, Australia's most popular women's magazine. Based on a qualitative content analysis of these sources, we identified three key categories of advice: transforming the self and society; finding the "silver lining" (making the most of opportunities delivered by conditions of enforced isolation); and making lifestyle choices (drawing on expert advice to integrate specific emotional and psychological strategies into one's daily routines). Drawing on the scholarship of Eva Illouz (2018), we argue that these media publications function as "emodities", reinforcing the dominant cultural templates for ideal selfhood in late modernity: authenticity,

intimacy, and self-improvement. We also argue that the pandemic opened new discursive spaces for working on the self, for responsibilising and regulating our thoughts and emotions.

RC14-213.1

SCHACHTNER, Christina* (Alpen-Adria Universität Klagenfurt, Austria)

Transnational Spaces and Scopic Media. Sociality in Change

The term "transnational spaces" is linked to the concept of "transnational social spaces" (Pries 1998). It is understood as new cross-border interconnections that represent a reference structure for life practices and self-concepts. Transnational spaces have economic, ecological, political, socio-cultural dimensions. This lecture focuses primarily on the socio-cultural dimensions in the context of migration movements. It will explore the role of media in organizing and shaping transnational socio-cultural spaces. Migrants are producers of transnational spaces; they make use of scopic media, which turn out to be instruments, places and products of moving affiliations.

Scopic media are capable of coupling, combining, and augmenting geographically distant situations, thereby opening up spaces of observation and information as new realities (Knorr Cetina/Reichmann/Woermann 2017). This happens, for example, when migrants exchange images with those left behind in the country of origin via WhatsApp, through which distant realities are projected into the reality of the host country and become effective there (Hepp/Bozdag/Sana 2011). Scopic media do not merely depict situations; they intervene. They visualize what is not visible, they detach the observation of others from the physical context, they change the understanding of presence, they establish a new type of interaction and thus promote the transformation of sociality.

The lecture is based on the study "Transnational Lifestyles in the Sign of Media Orientations and Practices". As part of this study, 36 interviews were conducted with people of different genders, ranging in age from their early 20s to about 50. They immigrated to German-speaking countries (Austria and Germany) from various European, African and Arab regions and have medium- to long-term life and work perspectives in their respective host countries. In addition to the concepts of "transnational spaces" and "transtopias" (Yildiz 2015), the concept of "scopic media" will be used as explanatory approaches in the lecture.

POHN-LAUGGAS, Maria* (University of Göttingen, Germany)

Of Glue Dots and Familial Relationships: Reflections on Family Sculptures in Biographical Multigenerational Research

The method of family sculptures originates from systemic family therapy and aims at making the relationships in a family visible. In biographical multigenerational studies of the Holocaust (Rosenthal 1997), family sculptures have been used to examine intergenerational structures and familial figurations, in combination with biographical narrative interviews. The use of family sculptures is a fairly recent development, not as a concrete procedure but in the sense that there has been little reflection on its implementation in biographical research. This paper is an attempt to fill this gap.

Our study focuses on the families of people who were persecuted under National Socialism because they were, for instance, "professional criminals," "asocials," or Jehovah's Witnesses. These groupings have in common that they were not given official recognition as Nazi victims, and that their experiences were not incorporated into the national memories of the post-fascist successor countries. This has an impact on family structures. In contrast to the other groupings, Jehovah's Witnesses form a closed we-group that presents to the outside world the firm we-image of a conflict-free community. In the families of those persecuted as "asocial" the family sculptures correspond to the reconstructed case structures. In the case of Jehovah's Witnesses, they give only limited access to family relationship patterns, but help us to understand the structures of closed we-groups.

With this in mind, we will first discuss in general terms the ways in which family sculptures help us to understand family structures. We will then look at how a closed we-image affects the use of family sculpture in biographical interviews, and ask what insights we have been able to gain so far and what methodological conclusions we can we draw in order to study family structures within closed we-groups.

Ambiguity between Social Stratification and Methodological Nationalism: The Case of High-Skilled Migrants

Methodological nationalism as a critique of container-based and nation-state focused theory and empirical research is currently strongly anchored within migration studies, where it was initially developed. While this has led to extensive literature and critical engagement with methodological nationalism, and ways to circumvent the national trap in many (sub-)disciplines (e.g.,

denotes a presenting author. Abstracts are organized by first presenting author's last name.

migration research, international relations, history, and geography), it has not much penetrated theories of social stratification. This theoretical paper will address this gap by discussing the social mobility and positioning of high-skilled migrants in contemporary stratified societies. This exemplary discussion will bring together a critical perspective of methodological nationalism on class and milieu theory. It will also confront the critique of methodological nationalism with the question of the origin of social power and dominance, which are the foundation of stratification theories. This paper will specifically draw on Pierre Bourdieu's concept of social space and its derivative. Emphasis will also be given to Michael Vester's development of social milieu to highlight their blind spots according to the critique of methodological nationalism. This paper shows that these theories of social stratification did not grasp high-skilled migration thoroughly, but it also outlines that critical migrant theories and studies and their critique of methodological nationalism overlook conveniently the source of symbolic hierarchy, the formation of social stratification and its daily reproduction as symbolic dominance in the physical and bodily space. Thus, both theoretical strands would benefit from a deeper conversation with each other, as my contribution will show.

Vertical and Horizontal Stratification in Higher Education: Students' Educational Strategies for Institutional Distinction

In this paper we reconstruct the relevance and significance of different institutional levels in higher education for educational strategies of socially privileged/upper-class students in a case study in Germany. Whereas in some countries mechanisms of social reproduction in higher education are clearly embedded on the level of universities (e.g. elite universities) due to their vertical hierarchisation, this is less clear in Germany with its historical egalitarian higher education system. Although domestic policies and developments like the excellence initiative try introduce stronger vertical stratification to enhance international competitiveness and visibility of German universities, the German higher education system is still considered relatively equal among universities. Based on 95 interviews with students from different social classes in management, medicine and musicology, we show that upper-class students integrate and use various institutional levels of higher education to improve their educational strategies and their relative symbolic position in the field of higher education. This includes but is not limited to universities and their attributed prestige, but also features the standing and visibility of their faculty, newly designed study programmes and association with renowned individual professors in their discipline. These findings are contrasted with strategies from colleagues from lower and middle class, who's higher education trajectory often represent a learning curve, in which they knew little to nothing about higher education stratification at the beginning of their studies. These case study insights are relevant on a more general and global level, as many national higher education systems undergo very similar or the same transformation in terms of globalisation, marketisation and (re-)stratification, which likewise affects students' educational strategies.

Digital Feminist Activism and Neoliberalism

This presentation is based on 30 qualitative in-depth interviews conducted with digital feminist activists in Germany and the UK in late 2021/early 2022. By exploring and documenting the different ways in which digital feminist activism can be monetised, the article shows that the potential to generate income is at the activists' fingertips. As this article argues, the monetisation of digital feminist activism goes beyond the application of market principles to political protest movements. When activism is monetised, activists' deep emotional investments and passion become mobilised and tethered to income generation. At the same time, and through emphases on self-branding and 'authenticity', activists' selves are partially constituted and reconstituted to adhere to modes of neoliberal subjecthood. As such, the presentation demonstrates that neoliberal rationality structures digital feminist activism in at least three ways: 1) by contemplating or engaging in practices of monetisation, activists apply a market-logic to their activism; 2) by mobilising deep emotional investments and passion in the context of monetising feminist activism, neoliberalism operates at the level of affect; 3) through the emphasis on self-branding and authenticity, activists performatively produce neoliberal subjectivities.

Compromising Care or Masculinity? How Canadian Fathers Negotiate Competing Gender Expectations for Work and Family

Fatherhood today is shaped strongly by conflicts around gender expectations for working and caring. Many fathers feel that they are caught within a push-and-pull of persistent male breadwinner norms of paternal responsibility and emergent care-focused ideals of involved fathering. In this context, fathers may need to negotiate and account for inconsistencies in their gendered visions of how they ought to be a "good" man and parent. We illuminate these negotiations through a qualitative analysis of in-depth interviews with 36 fathers living with young children in Canada. Specifically, we examine how fathers define, evaluate, and act upon gender expectations for their work and family role–identities. On the one hand, we find that fatherhood motivates a gender identity *revision* whereby men adopt more "caring" masculinities that align with their motivations to be nurturing and emotionally engaged parents. On the other hand, we also find that fatherhood remains tied to a gender role *constriction* through structural and cultural thrusts to prioritize work over family. Overall, these fathers perceive a strong sense of ambivalence toward gender expectations for fatherhood and, in turn, make role–identity *compromises* to balance dual devotions to traditional and caring masculinities. We argue that these compromises serve to hybridize fatherhood and masculinity at a micro-level of identity construction and role negotiation in family contexts. We conclude by providing suggestions for reducing gender inequality and promoting care across the work–family interface.

Dinámica De La Contienda En La Organización Del Movimiento De Cartoneros En La Ciudad De La Plata, Argentina

Hace muchos años que venimos estudiando movimientos sociales y acciones colectivas en el Laboratorio de Investigación Movimientos Sociales y Condiciones de Vida (LIMSyC, FTS) de la Universidad Nacional de La Plata (Buenos Aires, Argentina); en el convencimiento de que las organizaciones sociales son agentes de trasformación social y han ocupado un lugar significativo en la agenda de las ciencias sociales, también en la nuestra.

Desde nuestra perspectiva, las acciones colectivas reúnen tanto aspectos particulares como universales y generan oportunidades para presionar a las instituciones planteando todo tipo de desafíos (Tarrow, 2004). En este trabajo, se presentarán los acontecimientos que dieron lugar a la *dinámica de la contienda* (Mc Adam, Tarrow y Tilly, 2005) en un período largo de tiempo, lo que permite identificar *episodios contenciosos* en la historia de la organización de trabajadores informales y organizados que realizan la recolección de residuos sólidos urbanos para su reciclaje, denominados cartoneros, que constituyen el Movimiento de Trabajadores Excluidos (MTE) en La Plata, rama *cartoneros*. El MTE ha desplegado su organización en diferentes ramas como la textil, la agricultura familiar, los trabajadores del espacio público, de la construcción, entre otros.

Se presentarán acciones colectivas (oscilan entre acción e inacción), con el objeto de desplegar una sucesión de procesos en secuencias de conductas colectivas donde identificamos cuatro episodios en este movimiento cartonero de la ciudad de La Plata, desde el 2001 hasta la actualidad: el primero (2001-2007), organizaciones embrionarias no formales de trabajo colaborativo; el segundo episodio (2007-2015), cuando nace la organización de cartoneros; el tercer episodio (2015- 2019), es la incorporación de la organización local al MTE (Movimiento de Trabajadores Excluidos) (Schettini y Herrero, 2021); y, finalmente, (desde el 2019 a la actualidad), el cuarto episodio, la incorporación de dirigentes cartoneros como funcionarios del estado.

Resistencia y Colectivización Frente a Los Desafíos De La Cuarentena En Sectores Vulnerables De Argentina. La Situación Particular De Un Comedor Comunitario De Un Barrio Periférico De La Ciudad De La Plata, Provincia De Buenos Aires, República Argentina

Se dice que el Covid-19 acarrea dos grandes flagelos, uno sanitario, que implicó enfrentar un virus desconocido que dejó miles de muertos en nuestro país y esto fue lo apremiante; otro el económico, implicancias sobre los sistemas productivos y las actividades económicas que se paralizaron durante dos años. Pero, en los países con altos niveles de pobreza y desigualdad como el nuestro, se suma uno tan apremiante como los anteriores, la tragedia social (Schettini, 2021). Quedaron en evidencia los problemas estructurales de la sociedad argentina, mostrando crudamente la violencia de la desigualdad social. Las medidas afectaron a toda la población del país, terminaron por enviar a la indigencia a los sectores más vulnerable, quienes viven en situación de precariedad habitacional, informalidad laboral (como la venta ambulante o la producción frutihortícola), trabajos eventuales, la recolección de residuos; todas actividades, que permiten generar ingresos diarios a una gran cantidad de personas, que finalizaron de un día para el otro.

Este artículo propone un recorrido sobre el impacto de la cuarentena prolongada en un sector popular y muy pobre de la periferia de la ciudad de La Plata, con quienes trabajamos desde el Laboratorio de investigación (LIMSyC)

"Tourism Must Compliment Our Way of Life": Prioritising Wellbeing of Destination Communities

In 1983 Stephen Britton wrote "As a microcosm of metropolitan commercialized life-styles tourism has a widespread reputation as a catalyst for undesirable social, cultural and ecological disruption in non-western countries" (p.v). These sentiments have been echoed many times since then, yet still it was assumed that when the pandemic struck and borders closed, shutting down tourist mobilities, there would be disastrous consequences for tourism-dependent nations. Similarly, some were surprised with the findings of our research in 4 tourism-dependent Pacific island states which demonstrated that, while certainly there were declines in financial wellbeing, many people reported improvements in their social, mental, physical, spiritual and environmental wellbeing. People expressed that they went back to traditional and communal ways of living, growing their own food, taking care of extended family and neighbours, and enjoying the stronger social connections associated with this: "People realised with Covid-19 that they had previously lost connection with family, lost connection with the *vanua* [land]. Because for us growing up in the Pacific, family and community is very important -if something else happens you go back to your support system" (Fijian tourism worker, 2021). As borders have opened to international tourists, some resorts and restaurants in Fiji are now struggling to find skilled employees: some have sought greener pastures and better wages in the Cook Islands or in Australia, where the seasonal migration scheme has opened up to hospitality workers; others are happy to remain working on the farms or in the small business established during the pandemic. In this presentation we ponder on those findings and argue for strategies to ensure that the wellbeing of people in destination communities is prioritised in future planning.

Comparing the Effect of Socio-Economic Status on PISA Scores across Different Immigrant Minorities: Is the Effect of SES on Learning Outcomes Due to the Home Environment or Home External Factors?

The study uses data from the Programme for International Student Assessment (PISA 2018) to compare the differences in socio-economic status effects on educational outcomes across various immigrant minorities in the sample. The analysis was conducted within a multilevel framework; the results reveal not only a significant variation in socio-economic status' individual-level effects across different immigrant minorities, but also that socioeconomic status has significant contextual effects at the minority group level. Thus, a minority's average socio-economic position can statistically explain 50% of the variance in the individual-level socio-economic status effect. These results highlight the importance of home external factors in transmitting socio-economic status to students' learning outcomes for immigrants.

SCHILK, Felix* (Technische Universität Dresden, Germany)

The Metapolitics of Reaction

In contemporary politics, we often see a collaborative approach between political and metapolitical stakeholders. While the former promote specific policies, the latter focus on the fight for the so-called "cultural hegemony", that is, the dissemination of ideas through framing, narrative and discoursive interventions, and ideological innovation. This distinction between politics and metapolitics determines the relationship between authoritarianism and right-wing intellectuals, as it is institutionalised in right-wing populism on the one hand and the far-right movement of the European New Right (ENR) on the other hand.

In my contribution, I will outline the emergence of the ENR in the political sphere of France and Germany since the late 1960s. I will argue that most new right metapolitical approaches were conceptualised not only in the context of Franco-German entanglements but also through the adaption of conservative crisis narratives that have been circulating since the aftermath of the French Revolution.

By analysing the most influential French and German new-right periodicals Éléments, Criticón, and Sezession with the sociology of knowledge approach to discourse (SKAD), I will first reconstruct the most common of these narratives and second introduce a heuristic scheme that aims to emphasise the peculiarities of right-wing metapolitics.

Understanding this metapolitical dimension is essential for mapping fields, spaces, and institutions of contemporary authoritarianism, as it helps to distinguish different modes of action that are prevalent in reactionary ideas, populist discourses, crisis narratives, and authoritarian political practices.

SCHILK, Felix* (Technische Universität Dresden, Germany)

The Narrative Style in Politics or Linking Conservatism and Conspiracy Theory

Conservatism and conspiracy theories converge in an epistemological function as a framework for crises. Both hit the stage of modernity as ideological explanations for the sea change caused by the French Revolution. Both are imagining modern societies in tenebrous colours of disintegration and decline. Hence, their ideological scaffolding is, unlike those of other political ideologies that are defined by values, usually a narrative one. Ever since, the conservative as well as the conspirational style of thought, have been embedded in crisis narratives whose deep story hardly ever change.

However, as Janet Roitman (2014: 49) objects, 'crisis' is not a descriptive epistemological category of ontological reference but rather a post-hoc political denunciation. Crisis narratives may function as a "transcendental placeholder" (ibid.: 69), thus mainly reproducing evidence and signification. Framing social phenomena in terms of crises may go along with the construction of scapegoats and bogeymen that are serving as a means for political mobilisation.

In my contribution, I will tackle such crisis narratives from a sociology of knowledge point of view, by drawing an analytical distinction between a narration as a situational act of recounting and a narrative as a rather latent patternBy analysing contemporary conspirationalist narrations like "the great replacement" and "the great reset" in the framework of the sociology of knowledge approach to discourse (SKAD) I will first reconstruct the deep story of three common crisis narratives, namely diremption, decay, and apocalypticism. In a second step, I will highlight their function as a discoursive pattern of interpretation and mobilisation that is rooted in a religious epistemological and discoursive tradition and informs both conservatism and conspiracy theories.

Perceiving conservatism and conspiracy theories as closely related crisis narratives thus sharpens our understanding of the startling conflation of populism, cultural criticism, and identity politics that shapes most of today's political ideologies.

Young Refugees and Their Education in the Post-Pandemic World

The proposed presentation compares the results of two qualitative studies on young migrants: refugees from Syria (2016-2018) and refugees from the Ukraine (2022), who came to Germany in results of wars. Both studies were conducted with young migrants and teachers of an integration course. Students were asked about their educational projects and future expectations. Teachers were asked to give an assessment of the chances of their students to realize their plans and about their consulting activities.

The students from Syria were forced to bow to the existing structures, which often meant the loss of their cultural capital and of life time in order to obtain the recognition of their qualifications. Their teachers were more pessimistic about their chances to achieve their educational goals.

The study on young migrants from the Ukraine took place only 4 years after the study on Syrian refugees, but the great importance of the pandemic and the technological development involved, allowed very different coping strategies, such as simultaneous online and offline education in different countries. The disadvantages of the pandemic seemed to be advantages for the educational migration.

Although the epidemiological restrictions are easing, the technological change of the institutions remained sustainable. Especially in the Ukraine it is used in order to cope with the destruction of the buildings and the infrastructure and to enable the students an education, "a future". Often students prefer to continue the education in their homeland without a break. Or they remain in the Ukrainian educational system and get additional courses in Germany. This strategy enables a faster graduation, but hinders the adaptation in the new country. The teachers are more reluctant in their counselling, they feel higher insecurity due to the double bind of these students.

The Problematic Nature of Experts and Expertise in the Justice System

The 21 century features an increasingly information/knowledge centric orientation. In this context those claiming expertise, and particularly those

relying upon claims of scientific knowledge, have taken on an influential role in the operation of the justice system. Drawing from the US National Science Academy and complementary independent empirical studies, as well as reporting from court adjudications involving challenges to such evidence, this study has brought to the fore fundamental questions for current and future justice system processes, the role of expert witnesses as well as potential risks that demand moderation. How reliable is such expertise? How reliable is the science? Are there adequate safeguards to ensure the validity and reliability of methods being employed, the quality of operational practice, the accountability of subjective interpretation and robustness of claimed expert opinions? What protections are in place to reduce the risk of confirmation bias and what knowledge and information do the judge and jury require to assess such claimed evidence of expertise? This paper offers a moderated response to such questions.

The Worldwide Spread of the International Baccalaureate: Cosmopolitanism and (Global) Inequalities

The organization International Baccalaureate, a nonprofit educational foundation, and its network of IB World Schools, has greatly expanded, especially since 2000, from 1,052 schools in 2000, to 3,035 schools in 2010, and 5,500 schools in 2022, across 160 countries (IB 2022). It offers an alternative curriculum, recognized by almost all countries in the world.

Legitimated by values such as cosmopolitanism, global citizenship and cultural openness, this rapid growth in recent decades is a phenomenon which is intertwined with spreading economic and education policy globalization. Especially in countries of the global south, it may be understood as a (distinction) strategy for the social reproduction of upper- and new middle-class families, through detachment from national systems and introduction to a global elite.

Firstly, our paper outlines tendencies of the worldwide evolution of IB, employing a global comparative approach. Secondly, we discuss some results from an analysis of the implementation of IB in the metropolitan areas of three Portuguese-speaking countries in different continents: Lisbon (Portugal), São Paulo (Brazil) and Maputo (Mozambique). These analyses include data provided by IB (2022) as well as all websites of IB schools in these regions and other IB-related websites and documents.

Based on previous research in Portugal (e.g. Schippling & Abrantes 2022), the aim of our paper is to present original data from an ongoing comparative project on the global development of IB schools, focused on how they deal with cultural diversity, social inequalities and political participation.

Threats for Works Councils and Trade Unions in the Logistics Sector

Trade Unions are important actors of the social protection of workers. In the presentation on the one hand we try to discuss the central challenges, risks of jeopardizing the traditional, historical developped forms of interest representation by trade unions in the logistics sector. The factual use of digitalization by capitalistic interests and actors in economy changes the modes of mobility, enterprise boundaries structures and networks, as well as logistics processes in an extensive manner. One main trend of the permanent availability of internet access is the exorbitant growth of online shopping and home delivery of consumer goods, which has spread to almost all consumer goods sectors and to previously offline groups of the population. Such a constant stream of consumption requires the availability and performance of a specific type of worker: the parcel carrier in courier, express and parcel services who – quite literally – has to shoulder the burden of increased order volumes. Due to the special characteristics of drivers and flexible forms of employment contracts, the industry remains a precarious and vulnerable environment in terms of labour and trade union policy. We conclude that the trends observed in this sector provide further evidence for the rise of a new "digital Taylorism".

On the other hand we will discuss some recent answers of Trade Unions to accelerating digitalization and transnationalization of service chains and logistics:

- What evidence can be cited that we are dealing with a productive leap in transport logistics with regard to digitization?

- How does the use of digital technology change the possibilities for direct communication and representation between courier drivers?

- What new opportunities does the digital transformation possibly offer for union mobilisation and membership recruitment?

- Do digital technologies allow trade unions and employees to be appropriated in their own interest and as instrument of countervailing power?

SCHMITZ, Wiebke* (Bundesinstitut für Berufsbildung, Germany)

How Does the Covid-19 Pandemic Affect Late Working Life? European Employment Trajectories from 2011 to 2021

Background: One of the immediate impacts of the pandemic was the increase in unemployment and the reduction of working hours - especially among women, those with lower job security and in countries with a weaker social welfare system. The aging society is at further risk, which is already challenged by a growing shortage of workers and the rising costs of pensions. To understand the long-term consequences of COVID-19 for the aging workforce, this paper advances existing research by exploring from a life-course perspective how employment after the COVID-19 outbreak is anchored in larger employment histories (2011-2021).

Methods: Sequence-analyses are applied using retrospective life history data combined with both COVID-19 Surveys (2020-2021) from SHARE including respondents aged 50+. Using cluster-analyses, the resulting sequences are classified into six groups. By applying descriptive-analyses, I examine how these groups differ by gender, work quality, and country.

Results: Older workers – especially men – with continuous full-time employment histories are less often affected by unemployment and fewer working hours during COVID-19. Whereas those – especially women – with disruptive employment and part-time work histories are more often affected by unemployment after the outbreak of COVID-19. Respondents in countries characterized by social democratic welfare compared to liberal welfare regimes are less likely affected by unemployment during the pandemic.

Discussion: The pandemic particularly puts older workers with disruptive employment histories at additional risk of labour market exit. Therefore, policymakers need to address inequalities in earlier life to prevent long-term consequences of social inequality caused by the pandemic.

Critical Methodologies for Gender Training: Working for Intergeneric Encounters

This presentation develops critical methodologies for training university programs for the prevention of gender violence.

We have organized programs in Spain, Colombia, Mexico and Argentina since 2000 for students, university professors and state agents from local and federal governments.

We wander if our methodologies help participants to change violent practices and attitudes during the training process.

Our methodology integrates people from diverse gender identities who find obstacles to feel legitimate each other identities Participants discover their violent mechanisms and start dialogues to listen to each other and become more empathic. The question is how they can find ways to tolerate and respect differences during the learning processes and may discover new mechanisms of relationships based on equal responsibilities and rights.

SCHNAPPER, Quentin* (LaSSP, France)

From Family Businesses to "Houses". Virtues of an Old-Fashioned Anthropological Concept to the Study of Entrepreneurship

In economic sociology, the notion of "family business" appears rather imprecise to describe small businesses, referring either to intra-family business successions or to heterogenous configurations of working conditions. It also fails to grasp non-family forms of business embeddedness. This communication proposes to broker in the anthropological concept of "house" to study both business successions and working relations within and beyond family ties.

Forged by Claude Lévi-Strauss, the "house" refers to a moral person, with a material and immaterial estate, that perpetuates itself through a real or imaginary line expressed in the language of kinship. Mainly used in the 1970's to study peasant societies, it became old-fashioned. Combining it with gender perspectives, we define the "house" as a group of productive cooperation that runs directly or indirectly a material and symbolic estate related to a market activity. Our illustration draws on a 3-years ethnographic fieldwork conducted among shopkeepers in a French village. Shopkeepers use the word "house" to designate their stores ("The house doesn't give credit").

In a diachronic perspective, we'll show how the concept of house enlightens how law frames business handovers in a way that imitates intra-family successions, however rare such cases might be. In a synchronic analysis, it also

enables to precisely study the blurred boundaries of market activities (objects, money, individuals) across domestic and professional spheres and beyond the ill-fitting categories of "family" and "business". The concept illuminates the conflicting "earmarking" (Zelizer) of money and objects within the house between shopkeepers and the State and helps identify which persons are involved in the (re)productive work beyond the professional sphere (household chores) and the family (e.g. a neighbor doing the accounting for free). We'll finally show how local economic reputations extend to all the members of the house (spouse, children, workers), irrespective of their involvement in the business.

SCHNEIDER, Matthias* (Potsdam University, Germany)

Male Violence and Masculinities of Solidarity in Smuggling and Trafficking

Since the fall of Gaddafi and the increasing securing of national borders through EU-funded projects, human smuggling between Sudan and the Mediterranean has become increasingly criminalized, and the line between smuggling and human trafficking has become increasingly blurred. In this context, the business of mobility is almost exclusively conducted by men. Abuse, sexual violence, extortion, killings, starvation, and inhumane hygiene conditions are commonplace in many cases, and some of these can occur regardless of gender. The question arises as to how solidarity is to be understood in this context of violence, particularly as it is interwoven with masculinity. This will be investigated in the reconstruction of the biographies of men who have fled from Eritrea to Germany since 2003. In the reconstruction of three of these biographies, it is shown how trafficked men can not only part of this relationship of violence, but can also try to actively resist it and show solidarity with other refugees. Different situations in different trafficking or detention camps are reconstructed, in which men join forces to prevent sexual violence against a woman, in which cooperation with women starts a plot to get additional food, or how a man, instead of continuing his journey, takes care of the supply of many trafficked persons, who are loaded from a tanker truck after the journey through the desert. At the same time, these situations also problematize how, from an intersectional perspective, while certain actions can be read as showing solidarity with women, they are also used to create ethnicized power relations among men or call into question the extent to which rescue from sexual violence can be read as detached from traditional notions of masculinity. Overall, the article aims open up the discussion of what can be understood by solidary masculinities in the context of structural violence.

Navigating Subtle and Mundane Residential Displacements – Unravelling How Intense Emotions Are Shaping (Im)Material Practices and Urban Experiences of the Viennese Middle Class

The neoliberal production of urban space is manifested in residential housing markets all over the globe. Unaffordable housing shapes various manifestations of urban residential displacements. In Vienna, a city known for its welfare-system and high share of social housing schemes, neoliberal tendencies and deregulations create tensions on housing markets. From this particular urban restructuring mainly mundane and subtle forms of displacement for the marginal middle class in the private rental sector play out. Not only extreme forms of displacements have dramatic effects on persons lives, their experiences and produce intense emotions, but so do subtle and mundane forms. Persons living under displacement feel the effects towards their practices of dwelling and everyday life as these get continuously and gradually destabilized and eroded. As such, displacement-induced processes not only produce various individual emotions but they inform practices of the displaced and navigate or help restabilize their life under displacement. Thus, urban residential displacements affect the material (physical/life-world) and immaterial (cognitive/emotive) dimensions of the displaced at the same time. The under-researched interaction between displacements and emotions will be discussed on the nexus of Schatzki's practice theoretical approach, Lefebvre's production of space and critical phenomenology perspectives. Drawing on visual methodologies with displaced, results disentangle an ambivalent relationship. On the one hand the neoliberal urban production of space fosters a variety of emotions, and on the other hand, the produced emotions shape not only the way the urban is individually perceived but how it is (re)produced. An emotive perspective towards displacements helps to better understand the subtle and mundane forms and the connection between the material and immaterial dimension of these urban processes. A greater consideration of an emotive perspective helps not only understanding urban phenomena better, but it reveals the transformative character of supposedly passive actors in urban space.

SCHNITZER, Anna* (Martin-Luther-Universitaet Halle-Wittenberg, Germany)

Categories and Naming Practices in (Biographical) Migration Research

"What kind of terms do researchers use to make sense of the experiences people talk about? In which ways do researchers' concepts differ from the terms ordinary people use to talk about their experiences, and which consequences can this have? How do researchers find terms and concepts that they consider adequate?"

These questions, the session aims for, come up again and again in the course of my research. Who refers to whom in what way are central questions in qualitative research, especially in biographical research, which is concerned with highlighting the biographical constructions, meanings and relevancies of the research partners. In the field of migration research, these questions arise in a special way. As Gübra Gümüşay points out in her book "Language and Being" ("Sprache und Sein", 2020) from the biographical perspective of a muslim women, naming practices and the associated categorizations are powerful constructions of belonging and alienation. At the same time, naming practices are indispensable, for example, when an informed consent must be obtained in advance of the research, or when specific phenomena of biographical experiences are to be named and described - especially with a focus on social inequalities, discrimination and exclusion.

Based on my ongoing project on memories and biographies of families in the context of flight and migration I will reflect on possible and impossible ways of naming and conceptualisation of categories as a challenge between generalizable analysis and making visible biographical experiences versus inadequate, generalizing and alienating categorization reproducing social exclusion.

Translation and Non-Translation As Forms of Indigenous Resistance

This contribution discusses how translation and its opposite, strategic non-translation practices may turn into forms of resistance against extractivist practices affecting indigenous communities in Ecuador. It will show how translation, but also the (chosen) act of non-translation, of keeping a semantic, pragmatic, emotional or cosmovisional dimension untranslated, incorporates ways of resisting and fighting back extractivist activities directed towards lands and knowledge of indigenous communities. Our analysis of the constitutionalized linguistic and cultural rights in Ecuador including the indigenous concept sumak kawsay (wrongly translated: Buen Vivir, The Good Life) depict the divergence between legal rights and the reality of the Waorani, a recently contacted (1950s to 1980s) Amazonian indigenous people. In an ethnographic description of interpreting a shamanic vision we illustrate how threats to the Tagaeri-Taromenani's (Waorani families who resist contact and pursue a traditional semi-nomadic lifestyle) cultural survival are transmitted through the figure of the jaguar, a key element of Waorani cosmovision. We show how implementing reflexive translation practices influences peoples' self-determination of their cultural practices and their interpretations, and we address the intriguing question if there should also be a right to remain untranslated.

SCHOEGLER, Rafael* (University of Graz, Austria)

Translation: Circulating and Transforming Sociological Thinking

This contribution will discuss translation as a key element in knowledge circulation in the history of sociology. Translation is thereby understood as a mediated form of interaction and takes place in a wide variety of manifestations that shape sociological ideas, sociological research, and thus the development of sociology as a discipline. In a first part, this contribution will reflect upon book translations as circulating artefacts important to the institutionalization of sociological thinking that are an acknowledged mode of knowledge-transmission as well as a means and result of 'canonization-processes'. Data will draw on developments in Germany after 1945. The second part turns to practices of conceptual translation as key instances for the negotiation of meaning in transnational sociological thinking. To reflect upon the concept of "untranslatability" different examples of non-translation important to the history of sociology will be reflected upon (Norbert Elias, see Link (2019), Auguste Comte, see Schlager (2021)) to try and understand the effects of translation practices on the epistemic authorities of different agents involved in translation processes. These two approaches aim at illustrating two very divergent options available in studying translation in the history of sociology and aims at furthering our understanding of translation as a social relation (Bielsa 2021).

The Coloniality of Global Knowledge Production: Understanding Intellectual Imperialism and Academic Dependency

Increasing calls to decolonize global knowledge production highlight the necessity of understanding the causes of inequality in global knowledge production, also termed 'intellectual imperialism' or 'academic dependency.' While theories of academic dependency or dimensions thereof already exist, there is a shortage of comprehensive accounts of the mechanisms creating and re-inscribing academic dependency. Integrating and extending previous theorizations, this article presents such a theory: I show how global academic stratification grants the academic core, and especially dominant group members there (whites, males, heterosexual individuals, settlers, etc.) a standard-setting position, giving it power over the globally most highly valued mechanisms of evaluating research. This pressures academics anywhere on the globe to orient their research toward the preferences of the academic core (i.e., Global North ones). Further, the global stratification of the research degree system, with both core and periphery academic elites being trained in the core, strengthens Northern intellectual lineages and enhances North-to-South flows of academic influence, while disrupting Southern intellectual traditions and stifling South-to-North flows of academic influence. The stronger power of core academics in core-periphery collaborations centers Northern concerns and marginalizes Southern ones. English as the global academic language further privileges academics from Anglophone countries. This creates an inward-orientation of Northern knowledge production, producing over-theorized and Eurocentric knowledge lacking corrective feedback from the South, while creating an outward-orientation of Southern knowledge production, yielding fragmented, undertheorized knowledge disconnected from local concerns.

Whiteness and Privilege at Work in Hong Kong: Why Do White Western Migrants Receive Higher Returns to Education on the Hong Kong Labor Market?

Contradicting mainstream migration theory which expects migrants to experience lower labor market outcomes, white Western migrants experience labor market privilege in Hong Kong. These contradictory findings can be explained if migration is re-theorized from a coloniality of power perspective: Migrants traverse a matrix of power relations and hierarchies nospanning the globe, including economic, racial, and cultural ones. I define 'Northward' migration as mobility towards a more powerful space in these hierarchies, and 'Southward' migration towards a less powerful space. This project is based on 64 interviews conducted in Hong Kong, including 'Southward migrants' and 'Northward migrants,' hailing from Western and South Asian countries and racialized as White, East Asian, South Asian and Black. I show that most negative outcomes that migration theory interprets as intrinsic to migration are absent or reversed in the case of 'Southwards migration.' Economic hierarchies, with Western countries occupying a dominant role in global capitalism, lead to Western—especially White—migrants encountering a large, high-paying economy of Western regional headquarters and offices in Hong Kong, that trust them and value their human capital and language skills. Western customers' globally high buying power increases the value of Western migrants' cultural capital. Cultural hierarchies create associations of Western products with high-quality or luxury, and of Western lifestyles with high social status or class, creating opportunities for Western migrants to work in industries capitalizing on such associations. Cultural hierarchies also strongly decrease Western migrants' need to acculturate. Lastly, global racial hierarchies further increase Whites' labor market privilege: Whiteness is linked to high education, expertise, seniority, influence, and high status, and is assumed to be preferred by many customer groups. Employers strategically hire them to convey favorable impressions to their customers or business partners. In combination, these factors lead to 'Southward migrants,' especially Whites, in Hong Kong experiencing higher labor market outcomes.

SCHOGER, Laura Isabel* (University of Hanover, Germany)

The Role of Education in Coping with Work-Related Stressors

Work is a central area of human life in which stress can affect a person's health over a long period of time, e.g. in terms of working conditions or the employment status (Siegrist 1996; Voßemer et al. 2017). The International Labour Organization (ILO, n.d.) reported that '50-60% of all lost working days are attributed to work-related stress and the number of people suffering from stress-related conditions caused or made worse by work is likely to increase'. From a health sociological perspective I assume that education as a resource is able to support the management of work-related stress(ors) and thus has an impact on health. This contribution deals with the research question of whether more highly educated people cope better with work-related stressors than those people who are less highly educated. Previous research has already proven the relationship between education and health (see e.g. Lunau et al. 2015), but not the role that education plays in the coping process. I use Data from the National Educational Panel Study (NEPS; starting cohort adults (SC6)) and perform a cross sectional analysis. I estimate linear regression models to analyse the effect of stressors at the workplace on work-related stress.

The results show that more well-educated people show a lower level of stress, net of stressors and additional controls. Regarding the moderating effect of education, highly qualified workers are better able to cope with a high level of routine in the workplace. However, more highly-educated employees report higher stress levels related to the threat of job loss or lack of occupational advancement compared to less well-educated employees. The general goal of providing healthy work environments can be reached by helping people to recognize and cope with work-related stressors, and to motivate organizations to prevent their members from harmful stressors.

Patient Generated Data As "Grey Data"

Patient generated data (PGD) from wearable devices such as activity trackers and smart watches occupies an uneasy space between medical and lifestyle information. Medical doctors typically do not trust PGD, nor do they have the time to check large amounts of heterogeneous longitudinal data during patient consultations. On the other hand, the manufacturers of wearable devices make sure that their products are not considered as medical instruments, so not to be liable to any medical claims or charges. Patients who use wearable devices are thus stuck in the middle between these two poles of abstention. We use the term "grey data" as a sensitizing concept to address the indeterminateness of PGD and the efforts of the patients to make their data count. In line with the call, we focus on the modalities through which wearable devices and the circulation of PGD affect patients' experiences and viewpoints of their condition, as well as the care process when interacting with doctors.

We report from a research project in which we study on the convergence of medical and media technologies in wearable devices, smartphone apps, and digital platforms. The research is based on interviews with representatives of patient self-help groups for various conditions as well as medical doctors in Germany. Our presentation will be concerned with the tensions that arise between professional medical knowledge and patient generated data as wearable devices become increasingly popular tools for monitoring vital parameters. The interviews show different practices of negotiation that patients develop to bring the value of their PGD to the attention of them medical personnel. At the same time, patients address the device manufacturers to include or modify specific measurements taken or scores calculated by the sensor devices and related apps.

New It Business Opportunities in Senegal: Policy Measures and Current Entrepreneurship Models

From a few African success stories of digital businesses in the early 2000s, numerous technology start-ups have recently been created. Policymakers and development organizations have begun to consider national digital companies and economies as an important source of economic development (Manyika et al. 2013). Rigorous research in this field is rather scarce in Africa and the question of digital entrepreneurship's importance in economic development needs to be studied (Schuerkens et al. 2019). Where and how entrepreneurial opportunities arise is an idea that this article wishes to explore. In certain recent publications, digital entrepreneurship has been seen as global in nature (Nambisan 2017) and it has been claimed that "Africa is about to be transformed and revolutionized by digital technologies and entrepreneurship." (Friederici 2019: page 11). We will therefore try to determine which entrepreneurial opportunities and practices have become possible by presenting the case study of Cygmatech and investigating which actors are involved in the process of digitalization and analysing what they are doing. By focusing on Cygmatech,

a leading Senegalese start-up, we analyse the introduction and diffusion of ICT that favour an improvement in the performance of the companies that use them. The example of Cygmatech will help us to better understand the real situation of start-ups in the digital sector. Moreover, we give an insight into one of the organizations that support digital entrepreneurship in Senegal, the *Délégation de l'Entreprenariat Rapide* (DER). This is done because DER was created by the Senegalese president and is one of the leading institutions providing financial and professional support to companies set up by young men and women. It is therefore possible to appreciate policy measures and their possible impacts on the IT sector in the coming years that allow young people to go about new ways of doing business.

DIENG, Seydi Ababacar (Université Cheikh Anta Diop, Dakar, Senegal)

Women Entrepreneurs in Senegal

The paper will discuss the theoretical background of studying women entrepreneurs on the African continent. Life stories of two successful women entrepreneurs in Dakar, Senegal will be presented displaying their professional background, their university education and the particular herstory of their enterprises that focus on the African continent while maintaining narrow links to France and further African countries. Both women are successful in fields that aren't open to Western enterprises: the African beauty industry and consulting for enterprises, reuniting Western and African management traditions.

In a second part, quantitative information will be given on women entrepreneurs in Senegal. This contribution attempts to propose an analysis of the factors that explain the performance of women entrepreneurs in Senegal. More specifically, it focuses on the nature of entrepreneurial activities and on the socioeconomic and cultural factors that explain their performance. Performance, a polysemous concept, is approached here through several indicators. These include growth in turnover, the rate of value added, profit and the number of jobs created.

SCHULZ, Manuel* (University of Jena, Germany)

The Existential Veil of Ignorance - Principles of a Neo-Phenomenological Theory of Justice for the 21th Century

For a long time, the disastrous consequences of our global economic system remained an abstract and supposedly distant problem in western societies. Due to an increasing exposure to phenomena like e.g., the impact of global warming or the recent pandemic, this situation has changed fundamentally. Apparently, the increasingly uncertain or even threatening global future starts to throw even the industrialized societies to the ground of the existential facts.

By picking up this constellation, the presentation aims to use New Phenomenology, a hitherto rather little known approach, to develop a normative framework for reshaping society in times of crisis. Coming from the tradition of philosophy of bodiliness (or corporeality), this approach offers a two-dimensional theory of subjectivity. Firstly, there is the 'positional subjectivity' in the sense of self-identification as it is sociologically well-studied since G. H. Mead at the latest.

However, as neo-phenomenological studies showed, this level of self-attribution (with categories like name, age, gender, profession etc.) is necessarily preceded by an involuntary experience of existential self-givenness. The latter one, neo-phenomenologically termed as 'strict subjectivity', occurs to us on the level of bodily sensations like e.g., hunger, joy or fear.

As the pandemic showed very impressively, this sphere of sensible self-being opens up a perspective in which a threatening crisis arises as a justice-theoretical real experiment. By being affected subjectively in the strict sense, we find ourselves reduced to a kind of 'existential interest'. As the latter consists in an experience of fragility and dependence on others which is not determined by the social position of the individual, it complies the basic notion of Rawls' 'original position'. From this perspective, collective experiences of crisis arise as a veil of ignorance that refers to an involuntary sensible source for the normative debate about political acting in times of socio-ecological transformation.

SCHULZ, Markus S.* (Max Weber Center for Advanced Cultural and Social Studies, Germany)

The Predicament of Democratic Authority

The crisis of democracy and the rise of authoritarianism in scores of countries around the world gives cause to revisit the notion of authority. Democracy seems to suffer from too much and not enough authority at once. What kind of authority is compatible with democratic governance? Engaging the conceptualizations by Max Weber, Hannah Arendt, and the Frankfurt School, this paper presents a relational approach to authority and applies it to the Covid-19 pandemic and climate change as two policy fields with global scope but contrasting temporalities. Whereas the outbreak of SARS-CoV-2 required decisions within days for outcomes expected to become noticeable within months, the longer time-horizon of anthropogenic climate change operates at a scale measured in years with most serious disruptive outcomes to be expected well beyond any current electoral terms. The paper explores what authority means when scenarios become a form of governance under conditions of complex uncertainties. How the predicament of democratic authority is addressed has implications for the quality of anticipatory politics.

The Impact of Narratives on the Development of Collaborative Robots. a Comparison of Care Robots and Industrial Cobots

Care robots, robots for performing tasks of care work, are considered to be a promising technology over the last 20 years. Real-world applications that are actually working, however, are still far away for most work tasks. Nevertheless, numerous care robot projects have been financed by funding agencies, conducted by robot developers, and supported by care professionals until today. We suggest to explain this success of care robots as resulting from discursive practices of sensemaking around a strong narrative. According to an extensive literature on narratives, the sensemaking capacities of narratives result from their temporal structure. The plot at the core of a narrative presents a sequence of events as inevitable and thus provides a way of sensemaking that allows to avoid complex and potentially controversial causal explanations. Based on empirical findings from an ongoing research project, we will show how the sensemaking capacity of a predominant narrative we refer to as the nursing crisis narrative contributes strongly to the self-perpetuation of the promise of care robots.

In contrast, for collaborative robots in industrial manufacturing (so called cobots), there are already many real-world applications that are actually working. Accordingly, there should be less need for narrative sensemaking. Nevertheless, there actually exists a strong narrative, a narrative about how the increasing need for flexibility in industrial production calls for industrial cobots. However, this narrative has a storyline, which is much less coherent and manifests in much more different and in more heterogeneous variants than the nursing crisis narrative. Within the flexibility narrative, the meaning of flexibilization has only a vague common meaning, but strongly different concrete meanings for the relevant groups involved. Thus, this narrative may serve as a boundary object. In our talk, we will compare these two narratives and their respective influence on the development of collaborative robots.

Subsidising Jobs or Ecocide? Analysing Agricultural Subsidies through the Lens of Eco-Social Policy

Agricultural policy is a good example of eco-social policy; food access, quality and cost are clearly issues of social welfare, at the same time agriculture is responsible for 25% of global Greenhouse Gas (GHG) emissions. Reducing agricultural emissions will be a challenge for the food system, when demand for food is increasing and the world is facing a looming food crisis. As such, agricultural policy is an interesting case through which to explore eco-social policy as a concept and emerging policy field. We will specifically look at the debate on agricultural subsidies in the EU and USA, alongside debates within leading International Organisations. This allows us to develop a transnational perspective and draw out some potential common tendencies across the cases. This debate is framed around two key arguments 1) the need for national industrial agriculture to feed and employ rural communities 2) the ecological damage caused by industrial agriculture, which is only profitable because of these subsidies. As such these debates and the key actors pushing for each position, offer an interesting if contested lens onto how the eco and the social can be brought together. The methodical approach is based on qualitative content analysis and reflexive thematic coding. First, the paper tries to map the different positions within eco-social policy alongside their understandings of the crisis dynamics to which eco-social policy is responding to. We then discuss how this is reflected in recent debates on agricultural policy, specifically agricultural subsidies. This includes analysis of the material interests and structural pressures that certain actors face in the global agricultural industry in order to understand why they may be framing the policy "problem" and "solution" in a specific way. We conclude by offering some reflections on the underlying tensions and capacity for an eco-social agricultural policy to emerge.

The Impact of the COVID-19 Pandemic on Health Screenings: Trends and Implications for Population Health Disparities

The COVID-19 pandemic has had a devastating effect on the well-being of the U.S. population, exacerbating already-existent racial and age disparities in health and mortality. Although significant attention has been given to the direct health impacts of COVID-19 infection, more understanding of the pandemic's indirect impacts on population health in the long-term is needed. To investigate the effect of the pandemic on the future health of the U.S. population, we draw on the 2019 and 2021 National Health Interview Survey to explore trends in preventative health care (namely, breast and cervical cancer screenings) before and during the pandemic. Preliminary analyses paint a complex picture of the impact of the COVID-19 pandemic on health screenings. We find that one-year prevalence of breast cancer screenings, obtained for either diagnostic or routine screening purposes, declined for all racial and age groups of women between 2019 and 2021, except for among Black women aged 65+. Particularly steep declines were observed among Asian and Hinospanic women aged 45-65. For routine breast cancer screenings alone, Hinospanic and Asian women aged 65+ experienced the greatest declines in screening from 2019 to 2021. Routine screenings for cervical cancer also declined for most women during this period; however, Hinospanic and Black women aged 25-45 and Asian women aged 65+ reported increased screening. These findings differ from previously published estimates that suggest declines in breast and cervical cancer screenings occurred for all racial groups during the pandemic. Thus, our findings highlight the importance of adjusting such prevalence rates by age. Our findings have major implications for health disparities and population health in the United States. Specifically, increased policy attention must be directed towards the health of Asian and Hinospanic women, as these groups may be particularly vulnerable to screenable, noncommunicable diseases in the post-pandemic era.

Algonormative Expectations

Normative expectations are associated with two basic issues of Niklas Luhmann's systems theory when observing the legal system: (a) they differ from cognitive expectations because they have a predisposition to assimilation, while in the former there is no abandonment of expectation in the event of disappointment; (b) they are related to the psychic system insofar as the forced selection, linked to contingency, is carried out by man's senses. However, contemporary society has created another way to reduce complexity: algorithms. Its basic function is precisely to reduce the complexity of expectations – cognitive and normative – and expectations of expectations (legal decisions). In this paper I argue that algorithms influence normative expectations in such a way that an algonormative expectation includes algorithms in stabilizing normative expectations.

"I Struggled to 'Objectify' My Feminism": Examining Feminist Self-Identification through Object Elicitation

Our research explores how young self-identified feminists enrolled in women's studies or gender-themed courses at two Canadian postsecondary institutions conceptualize and represent their feminism through visual and participatory methodologies. Our study comprised two methodological phases. In the first phase, we invited participants to an individual object elicitation interview, a data collection technique similar to show and tell. Here, we were interested in the meanings participants impart to their feminist identities, and the ways they choose to represent these identities through photographs and objects. In the second phase, we invited the same participants to group-based participatory data analysis sessions. Here, we asked participants to respond to the preliminary findings – a process that simultaneously confirmed and meaningfully expanded upon our initial interpretations of the dataset. In this presentation, we reflect on the collective process of visual analysis, and consider the fluid, negotiated, and contested meanings that participants ascribed to their own and others' objects. As one example, some participants pushed against the idea of owning t-shirts with feminist slogans because of its overtness and implied consumerism, while other participants argued that such items offer meaningful and demonstrative forms of representation. We also highlight the ways participants reflected on the process of assigning feminist meanings to their chosen objects, including the sense that they were "objectifying" their feminism (a playful reversal of the negative connotations typically associated with this term). In line with the session theme, our findings

offer inclusive and nuanced understandings of young feminist identities, and integrate conceptual and empirical knowledge from visual sociology, educational studies, and participatory feminist methodologies.

Sociological Theory for Digital Society: The Codes That Bind Us Together

Abstract: The digital revolution has not only transformed multiple aspects of social life – it also transforms some of the most basic and taken-for-granted assumptions that have underlain sociological theory. It thus requires revising sociological theories and core concepts to adapt sociological theory to new techno-social realities. In this keynote, based on his recent thought-provoking book, "Sociological Theory for Digital Society: The Codes that Bind Us Together," Ori Schwarz will discuss the main challenges digitalization poses to different strands of sociological theory, present his elaboration on these strands, and offer paths to adapt them to digital society while discussing key questions, such as: How to adapt symbolic interactionism to the post-situational order, a world where interaction no longer takes place within bounded situations and is constantly documented as durable digital objects? How should we understand new digitally-mediated forms of human association that bind our actions and lives together but have little in common with old-time 'collectives'; and why are they not simply 'social networks'? What makes social networks on "social network sites" inherently different from those traditionally studied by social network analysis? How does social capital and its structural role transform in the era of social media, when it is materialized in a digital form, and how do these new forms of social capital remould power structures? What are the implications of the emergence of new forms of algorithmic power on our very notion of power and on the relations between power and consciousness? How does digital economy transform the relations between work and labour? And how all these transformations reflect on the answer to sociology's key question, namely: What is the social glue that binds different individuals, their actions and their mental states into something bigger?

Should the Government Reward Cooperation? Insights from an Agent-Based Model of Wealth Redistribution

In our multi-agent model, agents generate wealth from repeated interactions for which a prisoner's dilemma payoff matrix is assumed. Their gains are taxed by a government at a rate α. The resulting budget is spent to cover administrative costs and to pay a bonus to cooperative agents, which can be identified correctly only with a probability p. Agents decide at each time step to choose either cooperation or defection based on different information. In the local scenario, they compare their potential gains from both strategies. In the global scenario, they compare the gains of the cooperative and defective subpopulations. We derive analytical expressions for the critical bonus needed to make cooperation as attractive as defection. We show that for the local scenario the government can establish only a medium level of cooperation because the critical bonus increases with the level of cooperation. In the global scenario, instead full cooperation can be achieved once the cold-start problem is solved because the critical bonus decreases with the level of cooperation. This allows to lower the tax rate, while maintaining high cooperation.

SCIALDONE, Antonello* (INAPP-NATIONAL INSTITUTE FOR PUBLIC POLICY ANALYSIS, Italy)

Some Remarks about Collaborative Governance and CO-Creation of Shared Administration

Classical approaches of decision-making inside institutions lose their grip and make way for pragmatically orientated temporary arenas, centered on co-production of knowledge & services. Since activity of civic organizations possesses requirements of correspondence with public action, relations between P.A. and third sector are changing: a long-emerging phenomenon with some degree of institutionalization (not necessarily corresponding to codified forms of legal regulation). New ways of collaboration redefine boundaries between systems: so scholars emphasize relevance of organizational formulas hinged on the principle of connecting.

During last decade in EU Social Investment Package and Social Innovation strategy have been considerable sources for strategic partnerships, including a broad spectrum of intersectoral/multiactor mechanisms. According to recent Third Sector Code, Italian Public administrations are required to ensure active involvement of civil society organizations through *co-programming and co-planning*. This could really be a turning point for public policy but outcomes will depend on a lot of factors and also on intangible infrastructures. Subjects who animate and sustain these coalitions investing high-interest cognitive and motivational resources see opportunities where others simply read problems.

Are there tools/devices that facilitate exchanges and collective decision-making? Networking's success has to do with access to collective learning and change opportunities: different actors are required to invest in generation/transmission of new knowledge and in interorganizational learning. Anyway partnering opens up participation but doesn't necessarily induce widespread capacity to influence decisions: all actors co-involved seem equal but aren't always equal in practice. Furthermore, partnerships generates expectations of dividends to come but bet on deferred impacts over time: are they compatible with short-terms of electoral cycles and political evaluation? Lastly, partnerships can fail and consume or even destroy resources rather than produce added value and save them.

The paper analyzes current implementation of this reform, focusing both on promising experiences and hidden risks of collaborative governance.

What Have We Learned about Building Global Labor Solidarity?

Encouraged by Flora Tristan's exhortation—greatly amplified by Marx and Engels—"Workers of the World, Unite!", activists have been encouraging workers to build international labor solidarity to empower each other and to improve all workers' lives and well-being going back to the First International. The highest development of this was British textile workers' refusal to process cotton from the slave-based antebellum South.

This tradition, while dismembered by the Cold War between the US and the UK on one hand and the Soviet Union on the other, has been resuscitated since the 1970s with efforts to build cross-national border solidarity across the globe among workers, an effort that appears to be growing. This paper, however, argues that building global labor solidarity is no longer just desirable; climate change and environmental destruction has made this a necessity.

This paper examines a number of previous efforts since the 1970s so as to enhance current efforts to build this needed solidarity.

Death Data and the Politics of Preventability: The COVID-19 Crisis and Fatal Violence

Counting and accounting for death during the coronavirus pandemic became a crucial means of interpreting and understanding the pandemic's scale and impact on communities globally, highlighting just how significant enumeration of death is for societies. But death datasets also indicate that the moral weight of death is not restricted to enumeration but extends to investigating, understanding and documenting the circumstances of death. As commentators note, death data are rife with inequities and ellipses. The omission of particular deaths from scrutiny has a long history that predates COVID-19, and counting and accounting for death is still an evolving, and political, process. Ostensibly oriented toward death prevention, state-based practices of tracking fatal violence have evolved into a network of agencies and processes which investigate and record death through statistical monitoring, coronial inquests, inquires and death review. Against this backdrop, state practices of measuring fatality increasingly have been challenged by public and media activism reckoning with violence by using digital databases and other media to push for greater, more meaningful and immediate recognition of avoidable deaths. This paper focuses on death investigation after fatal violence and coordinated state-based practices of enumerating and responding to death during the COVID-19 pandemic. It considers the extent to which scrutiny of fatal violence against women and children during the pandemic has occurred, and how public activism problematises when and how society formally investigates, registers and accounts for death in crises. Contextualised in a discussion of preventability and pre-emption, the paper discusses whether the established network of tracking, mapping and investigating death has adequately responded to fatal violence and the 'shadow pandemic'.

Individual Acts and Institutional Care: Coronial Investigations Following Suicide

This paper examines issues arising from suicide deaths of people voluntarily admitted to a private psychiatric facility. We examine this context of suicide to unpack how in some cases the coronial investigation of suicide disassociates the death event from questions of institutional care and treatment and does not proceed with inquest. The paper explores the social and legal impact of this discretionary dimension of coronial work in Australia, also drawing on insights from overseas jurisprudence. Previous research on bereaved experiences of coronial investigations into suicide has discussed family experiences of investigation and inquest, but has seldom considered a family's fight for an inquest where the coroner holds the discretion. In these latter circumstances, the death event is perceived by families as clearly related to issues of lack of care and neglect in an institutional setting, yet the circumstances of death are interpreted differently by coroners. Thinking about private facilities

as sites of state confinement more broadly asks us to extend our view of how these sites operate as investigatory vacuums, and to consider how the limited coronial acknowledgement of these broader sites of 'care and control' ultimately supports individualistic views of suicide. The process of detaching in law individual acts from institutional control arouses in bereaved people complex emotions and exacerbates trauma. The paper explores these facets of bereaved people's engagement with coronial processes following suicide, at the same time as considering the significance of the decision-making role of the coroner in understanding and responding to untimely and preventable death.

SCRIBANO, Adrian* (CONICET, Argentina)

Inner Planet, Values and Politics of Sensibilities

To elaborate a social theory that decolonizes the forms of depredation of the inner planet, it is necessary to thematize the structure of the political economy of morals, understanding that it is in and through it that such depredation is justified/naturalized in connection with the material conditions of existing. That is why it is urgent to clarify the content of the current situation of the politics of sensibilities that support the differential expropriation of collective efforts to generate and consolidate the values and amalgams that cement the social.

The paper ends by discussing the need to emphasize research and criticism of what is understood by virtues within the framework of a society normalized in immediate enjoyment through consumption. It seeks to emphasize the need that every social theory has to make critical the political character of ethics, aesthetics and morals. To achieve the outlined objectives, the following expository strategy has been developed: a) the salient features of neo-colonial religion are presented, the political economy of current morality and emotions 4.0; b) silence is explored as the starting point of dialogue; c) the characteristics of listening are traced; and d) finally the connections between virtues and Common Life are made explicit.

Social Reproduction Theory and the Informal Economy: Informal Women Workers and Childcare in Ghana

This paper uses the lens of Social Reproduction Theory to analyze the practices of childcare among informal traders in Ghana. Social Reproduction Theory has been primarily deployed to explain the interrelation of unpaid reproductive labour and paid formal waged work. This had focused researchers attention on the economic and political interdependence of these two spheres of labour. Our research examines a context of widespread informal self-employment. However, we start from the assumption that there are still important questions about the economic and political interrelation of unpaid reproductive work and paid self-employment work. Empirically, we are interested in the fact that there are increasing numbers of women who migrate far from their original home and extended family to undertake self-employment activities. Given this physical distance from kinship networks, there is a need for new forms of care to emerge. We focus on both the ways family structures are adapted to provide this care, as well as on the growing role of non-family actors, such as the state, faith-based institutions, and community or co-operative care arrangements. We analyze these emergent forms of childcare through the lens of SRT.

Trade Unions and Public Employment Workers: The Epwp in South Africa

South Africa's EPWP is a public employment programme, initiated in 2005, serves as a centrepiece of the government's policy response to the country's extremely high levels of long-term structural unemployment. Hundreds of thousands of workers each year work on temporary contracts paid below the minimum wage doing work in construction, maintenance, basic health services, child care, and other sectors. From the inception of the programme there has been a debate about the implications of having such a significant number of workers employed on short term contracts with wages and benefits which fall far below the statutory minimums. Workers on the programme have regularly protested, with the most common demand being permanent employment. For many years trade unions were largely absent from these struggles, however, in recent years this has begun to shift. Two factors seem to be important in the growth of union activity. First, is the fragmentation of the trade union movement, with the split, in 2017, of SAFTU from the countries historically dominant federation COSATU, as well as the proliferation of newer "independent" unions. This has led to competition to organize new types of workers, including EPWP workers. Second is the pandemic which both increased unemployment and insecurity, thereby increasing the importance of public employment, while also highlighting the significance of EPWP workers social contribution, especially in the fields of health care and child care. This paper, based on interviews with

unionists and EPWP workers, traces the growth of organizing in this field and discusses the implications for both new forms of organizing as well as for public employment programmes as a policy intervention.

Gaming Gamification: (Not) Walking with Singapore's National Steps Challenge

Over the past decade, wearable technologies and self-tracking applications have become increasingly normalised in urban spaces. The adoption of these technologies by individuals has driven research on the quantified self (Lupton 2016; Moore 2017), and the corresponding generation of big data has led to rising concerns over surveillance infrastructures and data justice (Cieslik and Margócsy 2022). Much research has focused on the quantification of social and economic life in areas of health and fitness, education, work, and tourism (Williamson 2015; Minca and Roelofsen 2021). Less work, however, has focused on how people have responded to state-driven programmes of quantification. This paper addresses this gap by examining the National Steps Challenge (NSC) in Singapore. Launched in 2015, the NSC is a health and fitness programme that to this day remains ongoing as part of the city-state's Smart Nation Initiative. Through government-issued wearables capable of functioning as pedometers and heart-rate monitors, a mobile application, gamification, and financial incentives, the programme encourages participants to track and increase their daily walking. Drawing on ethnographic observations and semi-structured in-depth interviews, this paper discusses participants' lived experiences of the programme. I show how despite the NSC reflecting neoliberal ideologies of individual responsibility for health and self-empowerment, the sociotechnical affordance of its infrastructure works to subvert these very ideologies: participants, incentivised by the programme's financial rewards, turn to gaming the system by tricking their health trackers. In doing so, their actions muddle state-led datafication efforts. Drawing in the literatures of digital sociology and science and technology studies, this paper discusses the implications of these actions for datafication and the pathways of agency, negotiation, and resistance available to the smart city's datafied citizen.

Political Context Matters: A Reflexion about the Impact of Politics on Inclusive Education

The process of radical transformation of contemporary societies leads us to question the way in which in Europe we face the challenges of inclusive education, and in particular those posed as from the political field. The functioning of educational systems evolves today in a framework of a sequence of crises resulting from the transformations of advanced modernity (Beck, 2009; Lash, 1996; Giddens,1990), reflected by the widening of inequalities associated with market deregulation, global environmental and public health crises, increased digitalization and automation, among others. A second aspect of these transformations concerns the resurgence of nationalism, nativism and authoritarianism with direct impacts on the functioning of democratic regimes and policies to reduce inequalities. The successive crises since 20010 (state budgets, migration, Brexit, covid, war in Ukraine) have shown the fragility of institutional orders (Huang and Höllerer, 2020) in Europe, the disruption of functions taken for granted, and, in several cases, serious setbacks in the process of implementing inclusive education policies. Based on research on the impact of these successive crises on the Portuguese education system, we will analyse how the policy responses of different governments over a period of twelve years have impacted differently on inclusion policies. This analysis will highlight the importance of the policy cycle, how inclusion policies are sensitive to changes in government orientation towards social justice, and how different minority groups are negatively affected by these changes.

The Role of Situational Awareness in Countering Disinformation at the Information Battlefield

Cognitive warfare uses our minds as a battle-space. The operations are behaviour-centric targeting to change people's and decision-makers' mindset.

Ukrainian war has demonstrated the importance of information space as one of the domains at the war. This leads us to the fact that a vital part of modern national security is the capability of public authorities to detect and to counter disinformation and other intentional efforts of malicious information influencing. In order to succeed at detecting and countering disinformation, public authorities need to improve their situational awareness at the information battlefield. Furthermore, countering disinformation and other malicious information influencing usually includes communicating fact-based information to citizens. It is essential that both military and other public authorities can communicate clearly, on time, and in constructed manner when a possible crisis occurs. Information resilience is a relatively new, but an extremely important element of the national preparedness system. It refers to the notion that in a crisis situation, it is essential that citizens receive and understand the government's official information quickly and accurately. And then reconsider their behaviour accordingly. As a part of the IRWIN-project (Information Resilience in A Wicked Environment) we have studied the challenges public authorities face when communicating on disinformative and complex spaces such as social media. In addition, we have analysed public authorities' own experiences as targets of disinformation. These studies show that public authorities face major challenges in detecting and countering malicious information influencing as well as in communicating effectively on social media. The results show that the authorities felt open decision-making processes, as well as the transparency and openness of their organizations, factors that render them vulnerable to disinformation. More coordinated and top-down organised strategies on how to detect and counter disinformation are essential while developing improved situational awareness.

Professional Development Gains: COVID-19 Aacs Certification and Clinical Practice

COVID-19 has redrafted professional operational systems in academia. The global pandemic has transformed five key performance areas KPA 1) Teaching pedagogies; 2) Demanded responsive curriculum development; 3) Publications, conferences and professional associations; 4) Student supervision and mentorship. 5) Community Engagement. KPA 1-5 have significantly impacted the career trajectories in higher education and research spaces. Association for Applied and Clinical Association (AACS) Certification and clinical practice have positioned academics favorably. Certification is not an easy process, however with the support of mentorship it will be the most significant professional development decision. The upward career trajectory is made possible by clinical responses to critical social problems that intersected every facet of human existence during COVID-19. The areas linked directly to my 2018 certification experience and subsequent success has produced unprecedented growth opportunities. Medical Treatment Support groups for women diagnosed with breast cancer, relying on lived experience and autoethnographic knowledge. Education Networks with business, teachers and parents from 56 countries with 12000 members that offers free online resources and expertise on zero rated platforms. Death and Dying Assessment and development of mourning protocol amid SARS-Co-V-2 in hospitals, among families and in professional spaces. Social Engagement Collaboration with mental health specialists, psychologists, physio therapists, occupational therapists, speech therapists, behavioral therapists, social workers, dieticians and clinical and applied sociologists to support cognitive and physical growth of children under the age of 12. Curriculum Development and design of a clinical/applied postgraduate Sociology programme in South Africa. The first offering 2022. International journal publications with global scholars. Trans-Atlantic edited book with authors from South Africa, Nigeria, Brazil, India, USA, UK, Malaysia, Philippines and Indonesia. Evidence of Clinical interventions are offered at a micro, meso, and macro level. Employing a Sociological Imagination, deconstructing sociological theory and reconfiguring research methodologies all aligned to the ethical standards of AACS .

Women on the Edge of COVID-19: A Clinical Focus on Family, Work and Community.

Without hesitation, COVID-19 has disturbed lives worldwide, fostering inequality of class, gender, economics, and race, among other variables. Often overlooked characteristics of systems that marginalise women, as mothers, migrant labourers, urban poor and disenfranchised groups, women have experience inequality and injustice, made all the more difficult by the onset of the COVID-19 pandemic. Providing interventions and perspectives from empirical studies that address critical social issues. The surreptitious arrival of the COVID-19 global pandemic has prompted social scientific research as people have tried to adapt to a "new normal" in their everyday lives. Pandemic protocol and legislation saw lockdowns in cities and countries across the globe. The 'new normal' enforced unfamiliar work-life contexts, obscuring the boundaries between work and home life. The significant impact of the

pandemic has culminated in adverse socio-economic realities for vulnerable women from the global south and global north, who grapple with employment and food insecurity. Financial setbacks have impacted migrant labourers, whose vulnerable position culminated in the loss of livelihood and repatriation. Migrants from rural areas largely live in urban slums, an already vulnerable group, occupy overcrowded makeshift homes with inadequate access to sanitation and electric power. Their living arrangements and weak economic position increase their risk of contracting COVID-19. Their cramped lockdown COVID-19 living conditions expose women to increased levels of gender-based violence. This paper focuses on women's lived experiences amid the pandemic, emphasising migrant labourers, ethnic subgroups, the poor and disenfranchised, the incarcerated, and victims of gender-based violence. An increasing set of scientific articles have confirmed pervasive gender inequalities in homes, schools, and workplaces. Alongside national lockdowns, international travel bans and unprecedented layoffs, women workers from indigent backgrounds were the first to lose their income.

SEGRAVE, Marie* (Monash University, Australia)

Precarity, Temporariness and Domestic and Family Violence: Illuminating the Violence of the Border

As the COVID-19 pandemic was declared a global emergency and supply chains, migration routes and lives lived beyond our homes were shut down across the world, concerns were immediately raised about the differential impact this would have on migrant communities, particularly temporary migrants. Global corporations and nation states responded in ways that reinforced the precariousness of temporary non-citizens. In this presentation I will explore the ways in which economic, personal, familial insecurity for temporary migrants was intensified: and argue that the bordering practices of demarcating the limits of state responsibility to non citizens can be identified as a form of structural violence that sustains the insecurity of temporary visa holders.

Chile y España En Perspectiva Comparada: Procesos De Movilidad Social

La comunicación presenta los avances de un trabajo de investigación en curso que tiene como objetivo analizar la desigualdad social desde la perspectiva de la movilidad social comparando España y Chile, países que presentan en común un proceso de industrialización tardía.

En este sentido, se plantea un diseño cuantitativo utilizando fuentes de información secundarias, con bases nacionales para Chile (Encuesta Nacional de estratificación social de 2009 y la International Social Survey de 1999 -2009 y 2019), para el caso español se utiliza la ECV (Encuesta Condiciones de Vida del 2005- 2011- 2019). Se realiza un análisis por cohortes (entre 1939 a 1994) y por sexo. Se utiliza la clase social como eje analítico desde la perspectiva de EGP (Erikson, Golthorpe y Portocarrero, 1979, 1993) y los ajustes propuestos por Ganzeboom y Treiman (1996) que apoyan la comparación internacional, para ello se utiliza una categorización de 6 clases. Respecto de los análisis se realiza movilidad absoluta para observar la estructura social en ambos países y para analizar las oportunidades se utilizan modelos loglineales multiplicativos y unidiff en la movilidad relativa.

Los primeros análisis de los datos disponibles se encuentran similitudes y diferencias en los contextos sociales chileno y español. Como resultado de esta práctica se observan diferencias por género en los procesos de movilidad intergeneracional absoluta. Las mujeres presentan mayores niveles de movilidad ascendente sostenida a través de las cohortes. Tanto en hombres como en mujeres la educación aporta a movimientos ascendente de clase y la experiencia laboral reporta, aunque en menor medida, a la movilidad social ascendente. Con los análisis no podemos concluir que el peso del origen social ha disminuido, pero continúa presente en los movimientos intergeneracionales de clase.

SEIBT, David* (Technical University of Berlin, Germany)

Digitalization As Recombination: New Patterns of Co-Construction between Industrial Organizations and Their Users

When organizations change, so do their users. In this talk, I draw on action net analysis as developed by Barbara Czarniawska to explore the mechanisms that link the current digitalization of industrial manufacturing to changes in the landscape of user roles and identities prevalent in highly technologized societies. My argument is based on insights from a study of the digitalization of the prosthetics industry, a field in which the organizational construction of user roles becomes particularly explicit. I show that the introduction of digital fabrication, specifically 3D printing, changes how organizations design, manufacture, and distribute prosthetic components, and how they react to unforeseen usages of artificial limbs. In contrast to popular narratives about the disruptive force of digitalization and digital innovations, I develop the argument

that digitalized modes of co-construction between industrial organizations and their users start out as flexible re-combinations of already institutionalized patterns of action. On the one hand, novel digital technologies enable new ways of linking heterogeneous actions across time, space, and organizational boundaries, thus offering the potential for innovative recombinations of existing practices. On the other hand, novel action patterns need to be realized against the backdrop of the deeply ingrained institutional and infrastructural orders typical of contemporary organizations and organizational fields. Paying attention to this double dynamic offers a new perspective on the effects of digitalization on the co-constitutive relationship between organizations and their environments. In particular, the notion of recombination of existing action patterns promises a way of linking the discourse on digital innovation to established sociological theories of innovation.

SEILHAMER, Mark* (National Institute of Education, Nanyang Technological University, Singapore)

Intersections of Gender, Age, and Language Learning in Neoliberal Taiwan

In Taiwan, neoliberal discourses of competitiveness and internationalization valorize foreign language skills that the general public lacks, providing the ideal playing field for those in possession of these skills to achieve societal distinction by converting their valued linguistic capital into symbolic capital. Drawing on narrative interview data from a multi-case study of four young Taiwanese women who distinguished themselves from others in Taiwanese society by achieving high levels of proficiency in English and other foreign languages, I will, in this talk, examine the contextual circumstances that structured their success and constrained it, focusing especially on the role that gender played in the process. These women were remarkably successful in befriending foreigners, and the profits that resulted from their interactions with foreign men in both platonic and romantic relationships ranged from increased speaking practice with Skype buddies to trips abroad that were paid for by boyfriends. The findings of this study highlight the fact that copious amounts of linguistic capital, facilitated by classed resources and gender capital, can result in a considerable amount of societal distinction through conversion to symbolic capital. The findings also suggest, however, that the potential to convert the linguistic, gender, and symbolic capital to economic capital might ultimately be quite limited in Taiwanese workplaces, where deployment of Taiwanese women's linguistic skills is generally restricted to specific low-level gendered positions with little chance of advancement.

Animal Welfare Struggles in Japan: Analyses on External Pressures and Internal Incentives

Japan has a relatively shallow history of livestock industry and carnivorous cultures when compared with Western countries, owing to a several centuries-wide religion-influenced ban on consuming mammal meats, followed by a rapid westernization of diet in the mid-19th century. After the World War II, following the industrialization-focused trajectories of the livestock industry in the Western countries, Japan rapidly increased its dependency on imported feeds, including genetically modified crops. In recent decades, the government has subsidized mega-farms, so that the domestic livestock industry can survive under further market liberalization. However, this industrialization-forward policy clashes with the World Organisation for Animal Health's (WOAH, former OIE) increasing external demands for animal welfare standardization and the gradual progression of animal welfare concerns among Japanese citizens. The scandal involving the then-Minister of Agriculture, Forestry, and Fisheries, who receiving bribes from a poultry company between 2018-2019, influenced the relaxation of the international animal welfare standards in the then-OIE, and was convicted in 2022, awoke Japanese consumers. Furthermore, decreased meat and dairy product consumption following the COVID-19 pandemic and the Ukraine War, which caused an unprecedented increase in production costs, incentivized livestock farms to reduce their size of operation and return to pasture-based, therefore more animal welfare oriented and ecological, operations. Employing case studies on pasturage dairy farms and beef cattle production conducted in 2022, this paper aims to reveal Japan's growing struggles in animal welfare, highlighting the external pressures of WOAH and its trading countries, as well as internal incentives associated with the current situation in the livestock industry. It concludes that, while the idea of animal welfare and its standardization helped to transform the Japanese livestock industry, it is hampered by ambiguous policy and the default mindset of livestock sector stakeholders.

Empowerment of Dalit Women in Rural Tamil Nadu, India: Emerging Issues and Alternatives.

Dalits are one of the most oppressed and suppressed communities in India in general and Tamil Nadu in particular.They are faced with many inhuman practices due to Manu Shastra based system of socialstratification.They have been branded as 'untouchables' or Dalits, literally meaning 'broken people ' living at the bottom of India's caste system.The situation of dalit women in India is worst in life and social contacts.They suffer from various problems such as rape, sexual assaults,denial of access to public places, temples etc.The plight of dalit women in rural Tamil Nadu is not better than their fraternity elsewhere in the country.They are subjected to violence, harmful traditional practices including manual scavenging,forced and bonded labour, exploitation etc.Empowerment of Dalit women is essential for integrated and holistic development.

The major issues faced by Dalit women include, victims of inter caste marriage, sexual exploitation, atrocities, economic backwardness, absolute poverty etc. The extreme form of neglect of Dalit women in rural Tamil Nadu manifests also in female infanticide.The study of Dalit women's status is vital to project their vulnerabilities and challenges so as to undertake alternative development strategies for their empowerment (Fourier.1986). Systematic exclusion of Dalit women in resource sharing, social participation etc. and policy of inclusive development ensure social equilibrium (Gurusamy.1996). Empowerment of Dalit women socially,economically,politically solves domination and ensure equality (Vijaya Kumar.2006). Good and decentralised governance will expedite the process of empowerment of Dalit women (Suryakant.2021).

The development alternatives highlighted through this empirical research include Dalit women organization, micro level planning addressing their emerging issues and challenges, inclusive development, micro finance for social entrepreneurship, economic entitlements, reservation in employment, human rights based awareness and social participation leading to their effective empowerment and social justice.

SELLAMUTHU, Gurusamy* (Gandhigram Rural Institute, India)

Social Structure and Status of Girl Child in Rural Tamil Nadu :Implications for Population Change.

Indian Social structure is marked by inequality in view of perpetuation of religious values, customary practices resulted in disparities and differences in gender,caste etc. Consequently problems arose and affected people in social life. The worst victims of this disparity are women and particularly girl children who experience innumerous hurdles and barriers. This is mainly due to the structural units of family and marriage practices particularly male domination due to patriarchy,patrilineal and patrilocal tendencies in social practices which ultimately resulted in these differences and obviously this had direct reflection in the status of girl child (Raja 2009). Moreover rural communities started neglecting the female sex at the time of birth resulting in female infanticide(Gurusamy.2001). Obviously this tendency has further accelerated the negative attitude towards girls and women(Vasanthi.2008). The status of girl child is severely affected in view of social structural obstacles and inequalities reflect only the serious gender based differences and discriminations(Kubendran. 2013).The factor of male preference in rural communities and discrimination against girl child are interlinked(Rajangam.2018). Life cycle ceremonies associated with girls and women further victimized them.Consequently there is a pronounced gender neglect and marginalisation in rural communities in Tamil Nadu, India.This problem has very serious demographic implication of sex ratio.

This analysis is made with reference to the theories of feminism and structural functionalism.The study has revealed structural constraints of gender equality,status of girl child and women, comprehensive problems of these segments which reflected relative deprivations and vulnerabilities. The solution remains in structural change coupled with conscientization of relative deprivation,feminist activism through their organisation and movements. Planned and directed social change with active participation of government, non-government organisations, social workers, policy makers in ensuring gender equality and social justice through empowerment of women and girl children.

SEMBA, Rieko* (Yokohama City University, Japan)

The Relationship between "Ba" and Memory in Art-Based Research: Reflections from Practice with Filipino-Japanese Immigrants Second-Generation

The purpose of this research is to explore the transmission of memory in art places by practicing Art-Based Research (ABR), a research method using art from the perspective of the Japanese word "ba", which means place or topos.

ABR is practiced in many parts of the world today, especially in the study of immigrants and those who tend to be marginalized or categorized. This is partly because the use of art in research can mitigate the Western-centric power of knowledge, the gap between the knower and the known.

However, the relationship between art and place has not been sufficiently examined in previous studies. It has been limited to aspects of material places and representational spaces such as spaces and territories.

In this study, I introduce Japanese biophysicists Hiroshi Shimizu's concept of "ba". The thought "ba" is to view living things from the perspective of the activity of life. Modern science and technology derived from Eastern worldview have been based on a subject-object duality and separatism and have regarded living organisms as object. On the other hand, from the viewpoint of "ba", life forms are considered as entities in "ba" without being separated from environment. An example of a "ba" is the body cells that exist harmoniously, sharing the body as a whole (Shimizu 2003).

In this presentation, using the presenter's art practice with young Filipino-Japanese immigrants second-generation as a case study, we will show that the idea of "ba", through the perspective of "common sense", and attempt to connect it to memory studies. Paul Connerton (1989) states that to study the social formation of memory is to study the act of transmission that makes the sharing of memory possible. We will focus on the physical interaction of art and people in a particular "ba" situation where they are together.

The Re-Thinking Experience of Collaboration between the Sociological Faculty of University and Potential Employers for the Future Sociological Education

Every year, preparing for the new academic year as a teacher of sociology and Head of student internships, I wondered what innovations and new forms of organizing sociological education and forms of cooperation with potential employers I can organize in the coming academic year?Together with students, as part of practical work, we had been conducting research for almost 10 years and now, this article is based on comparative analysis of our past study results 2013, 2016, 2018, 2022 in which took part potential employers and graduates of sociological faculties of Moscow universities. Such longitude comparative research has given the possibilities to track the dynamics of such indicators as experience of different forms of collaborations between the universities and potential employers, the effectiveness of the forms of organization of practical work of students, and professional skills of graduates that are required at the contemporary labor market. This longitude research also has been enriched in 2022 with the latest results of in-depth interviews with graduates and employers which took part in the previous researches. Graduates and employers are based on their professional experience, gave the assessment of effectiveness and proposed new forms of collaboration between the universities and potential employers, and also gave recommendations on the organization of sociological education: which innovative forms of collaboration could be applied in sociological education.

Best Practices for Building Capacity within Environmental Justice Communities

For over 50 years communities of color have advocated for stronger environmental regulations, policy changes, increased fiscal resources, and better-quality infrastructure. Many of these community advocates worked with academics and politicians alike to effectively advocate for these changes. While some of these communities were effective in creating change - other communities are still faced with the burden of injustices and need the tools to increase their capacity to stand against environmental injustices in their own communities. While there has been decades of advocacy and academic research that has supported their work. There have been few studies that have sought to present the best-practices of these profound individuals in a way that others in similar positions can utilize to increase their capacity. This presentation will The K.A.P.S. Disaster Preparedness framework, as a best practices to build the capacity of those living and working in environmental justice communities.

We will present case studies and scenario-based training methods derived from the *Hazard Mitigation Training for Vulnerable Communities: A K.A.P.S. (Knowledge, Attitude, Preparedness, Skills) Approach* book written by Joy Semien. These peer-reviewed methods have helped to increase community capacity and have successfully establish policy changes and prevent the entrance of toxic industries within their communities. Our goal of this presentation is to provide academics and practitioners with a set of tools they can use in their own communities of interest. This presentation will also challenge the audience in developing their own methodology to working with EJ communities using a scenario-based training method. Ultimately, we seek to provide best practices for building capacity within environmental justice Communities.

Midlife Retirement Priorities of Professionals in India

This study explores the perceptions of urban, middle class, white collar employees in India approaching retirement, to unpack post retirement priorities, through a specific sociocultural lens. There is very little research on professionals, particularly professional women and their retirement priorities given their paucity in India and almost none in a life course context. India is aging fast with limited social security. Projected growth during 2000-2050 in the 60+ age group is 326% and for the 80+ age group it is 700%. Prior studies in India largely focused on rural and blue- collar adults. This study involves a sample of 76 people (41 men and 35 women) of relatively high SES in India who completed our survey. Key findings will be presented around how respondents plan to prioritize time post retirement. We considered the salience of religion or spiritual pursuits, hobbies, immediate family, grandparenting, domestic work, voluntary work, paid work, learning a new skill, caregiving and community activities. Gender differences were noted. For instance, despite social constraints 68.58% women agreed or strongly agreed that they prefer a *paid* alternate career after retirement compared with 53.66% men. Another significant difference (p value 0.006, 95% CI) was on the question "I need to be gainfully occupied for my own personal satisfaction" with 100% women reporting they *agree or strongly agree* as compared with 85.37% men. The midlife perspective from India with its socioeconomic and cultural peculiarities, mandatory retirement ages and changing work and family dynamics breaks new ground.

KNOWING THE UNKNOWN SPACE:

Reinventing The Meaning of Home from The Narratives Of (Trans) Gender Persons in Urban Kolkata During Covid 19 Pandemic

Home is the basic unit of society and has continued to provide shelter and support to its members for decades. The various functionings and practices within a family have provided sustenance to an individual to fight against all odds in society. For Transgender Persons in India home has been a site of constant dispute and struggle. Due to stigma and taboo, they suffered huge discrimination throughout their lives and their marginalized position in society has made it incredibly difficult to live a life with dignity at home or in society. Life during Covid 19 pandemic has been miserable for transgender persons who became financially dependent on their families and were forced to spend long hours with their family members who clearly disapproves of their deviance and sexuality. Surveillance of private life, and unleashing corrective measures, domestic violence in everyday lives replaced the softer character of domestic space that was defined by practices like caregiving, kinship, and support. This paper traces the manifold challenges that were faced by transgender persons at home during this pandemic and seeks to analyze the shifts in the patterns of development that took place in the state and society which helped the transpersons to live, survive, and overcome the difficulties and problems. The article throws light on the escape route that has evolved as a panacea to the growing excesses of a neoliberal state and economy.

Parenting a Differently Abled CHILD: Some Aspects of Rehabilitation in India.

A child is always dear to his or her parents. But when a child is not so blessed with natural endowments and suffers from limitations either physical or mental then a grave crisis arises in the family. Parents cannot abandon their children neither they have the special skill to look after the child in the family. Caught in between these two challenges they are often lost and confused and deeply suffers from anxiety and worries. For the not so well-off families this problem gets magnified as their development and personality growth involves methods that are often highly expensive and costly in India. This paper examines the manifold challenges faced by these families and seeks to find out how they can overcome these challenges especially at a time after the parents are no longer here in this world. This paper explores the various ways of rehabilitation that are available in India and how far they are accessible to general mainstream.

By providing examples from different parts of the World the paper tries to trace the evolving character of the developments of rehabilitation that are now offered in the state and societies in India.

SENTURK, Murat* (Istanbul University Department of Sociology, Turkey)

Creating Inclusive and Resilient Communities in the City By Volunteering

This research looks at volunteerism, which plays an important role in social relations, and aims to understand volunteerism's role in the formation of inclusive and resilient communities through social interaction and to develop policies and practices different actors can implement, in particular local governments. Urban studies have revealed the increase in spatial segregation and social inequalities to have opened the gap between different income groups as well as to restrict their areas of interaction. Volunteering has been identified as an important strategy in developing social solidarity and inclusiveness by increasing the interaction areas and opportunities of the various social groups (e.g., poor, elderly, migrant) living in the city. Volunteerism is considered along the axis of social capital and active citizenship; volunteerism needs to be evaluated in the context of social interaction and its contribution to the formation of inclusiveness and resilient communities analyzed. In this respect, the research exceeds the scope of the limited number of works that have focused on understanding the relationship between volunteerism and cities, expands the opportunities for sociological imagining by examining an important case and making comparisons, and conceptualizes the relationship volunteerism has with social interaction by integrating data with theoretical discussions in the field. The research aims to understand the social interaction that occurs through volunteerism based on Simmel's theory of social interaction and to describe the position of this interaction for inclusive and resilient communities. This research will be carried out in Australia and/or Turkey, which has significant historical experience in terms of volunteerism and how it has changed, directed, and developed local governments. The research will use the qualitative research method within the framework of the interpretive paradigm and local governments' and NGOs' activities will be observed, documents will be examined, and interviews will be held with representative within this framework.

Building a Sisterhood across Borders: Marriage Migrant Women's Human Rights Movement in Korea

This paper draws on the human rights movement for marriage migrants in South Korea to show how solidarity can be created between migrants and indigenous women in the feminist movement. Korea is known for its promoting the immigration of foreign women as spouses of its male citizens and implementing a so-called multicultural family policy as a solution to the decrease in childbirth. While multicultural family policy facilitated the integration of marriage migrant women into Korean society to some extent, it also restricted their lives within the marital citizenship regime in which the state regulates the family formation process of their citizens and their foreign partners through immigration and welfare measures. Based on my qualitative research in metropolitan Seoul, I will examine the associative activism between Korean women and marriage migrant women to protest against ethnicized maternal citizenship. By using the theory of political opportunity structure, I will explore the structures and constraints of marriage migrants' political participation, their agency, and the challenges presented in their commitment to the feminist movement. While most of the literature on marriage migrant women focuses on their struggles and resistance to structural constraints at the micro level such as those in the personal relationship in family and neighborhood, this study is intended to provide insights on such practices at the mezzo level, showing an example of transversal feminism developed in the destination country.

A Review Study on the Measurement of Religiosity in Korea

This author published an academic book after collecting, analyzing, synthesizing, and evaluating religiosity measurement tools that meet the religious landscape of Korea, a religious plural society, and are highly utilized in religious sites. The name of the book is "The Principles and Practices of Religiosity Measurement", and it was selected as an outstanding academic book by the National Academy of Sciences in 2022.

This book consists of a total of four parts. First, in part 1, in terms of overviewing the relationship between religion and religiosity, the religious status of Korea and the religious perspective of Koreans were summarized. In addition, as a principle of religiosity measurement, a frame of reference that categorizes 'self' and 'adaptation' was developed to understand the multidimensional aspect of religiosity.

In part 2, the relationship between variables such as religious orientation, spirituality, meaning of life, and self-realization and research on religiosity measurement was analyzed in terms of 'self and religiosity'.

In part 3 analyzed the relationship between various variables such as religious problem solving, religious coping, religious maturity, understanding religiosity and multiculturalism, values, forgiveness, and death acceptance under the theme of 'adaptation and religiosity'. In particular, Zwingmann's research model, which is useful for integrally confirming the multilayered nature of religiosity by understanding it as a complex process rather than a single dimension in relation to religiosity and mental health, was introduced.

In part 4 introduced the theoretical and practical process of the pastoral scale developed to measure servant leadership, a sign of the times. In the appendix, the latest religiosity scale was introduced, focusing on the recent research trends in related fields and future-oriented research,

Regarding measuring religiosity in East Asia, the results of this study are expected to share the trends and characteristics of research on religiosity measurement in Korea.

Social Identities and Mutual Perceptions of the Two Types Migrants Created By the Division System of Korean Peninsula

South Korea has two types of migrant groups produced by the division system of Korean Peninsula formed by the Korean War and the Cold War. One is people who came to South Korea before or during the Korean War from North Korea ("Wolnam-min"). The other is the North Korean detectors who have escaped from North Korea since the Cold War to present ("Talbuk-min"). The former may be referred to as Old Comers, and the later as New Comers. The two groups share their origin or hometown, but since the generations of migrants are different, from the perspective of social adaptation, the former is a host society and the latter is a migrant. By analyzing the social survey data conducted in 2022, this paper examines the social identity of North Korean origin, and social distances and mutual perceptions between the two groups.

Mapuche People in Academia: Challenging Narratives about Displaced Indigenous Identities

This paper explores the trajectories of the authors as indigenous women who are members of the Mapuche people. It focuses on the experience of constructing indigenous identities in colonial urban spaces and positioning in academia. This qualitative study follows a flexible methodology oriented to producing and analyzing personal narratives related to the journey of self-identification and the subsequent insertion in the academic space. The findings reveal the difficulties of constructing indigenous identities amidst the dispossession of land, loss of native language, and diaspora, which are the most notorious consequences of the internal process of colonization promoted by the Chilean state against the Mapuche people. This affects both past and new generations of indigenous people, giving rise to the construction of different profiles, emerging from nuanced circumstances that do not fit in with ingrained beliefs or stereotypes about indigeneity. In the cases of the authors, this means questioning their indigenous authenticity, since they are part of a generation born outside the ancestral territory and have lost their Mapuche surnames. The results also expose the obstacles faced by indigenous people in accessing academia and in validating their perspective of research on indigenous topics. Moreover, this study appeals to the accountability of academic institutions to eradicate the mechanisms through which the exclusion of indigenous peoples is perpetuated.

SERAPIONI, Mauro* (Centre for Social Studies, Portugal)

Public Participation in the National Health Services of Three European Macro-Regions

The paper provides an overview of the state of the art of public and patient participation (PPI) in the NHS of three macro-regions (the UK, Scandinavian and Mediterranean), outlining its evolution over recent decades and the characteristics of the main participation mechanisms and approaches implemented in each country of the three macro-regions. Adapting the Hirschman's approach (choice, voice and co-coproduction) to the field of PPI, it can be seen that patient choice is a widespread PPI typology, particularly in the macro-regions of the UK and Scandinavia. This trend has implied a concomitant weakening of collective participation in the decision-making processes of health institutions. However, it is important to highlight the still relevant role of patient associations which, thanks to their collective action, have contributed to checking the drift of patient choice towards individualism. The third approach

to participation is 'co-production', which requires citizens to play an active role in the production of health care. However, co-production experiences are more common in terms of patients' involvement in decisions about their own care process than they are regarding involvement in the planning, delivery and improvement of health services. In this individual view of co-production there is a risk that user involvement will be more oriented towards consumerism and individual choice than towards deliberative and collective participation. It is noteworthy that analysis of PPI has enabled some similarities and approximations to be identified between social health insurance systems and national health service systems. In fact, reinforced patients' individual rights and expanded patient choice can be observed in both types of systems, as can the increasing influence exerted by patient organizations on decision-making processes. Finally, analysis also confirms other challenges and weaknesses highlighted by the international literature, in particular the complexity of representativeness and the challenge of the effectiveness of PPI.

Representativeness and Effectiveness: Two Critical Dimensions of Participation in Health Systems. a Literature Review

Democratic innovations involving citizens in decision-making processes are increasingly widespread and many participatory practices have been implemented around the world. This debate is actively present within the health systems, where several international organizations have been exhorting national governments to develop public spaces within civil society as the proper spaces to foster health governance and to expand democracy. However, the degree of institutionalization of participation is still far from being satisfactory, despite the many efforts made. Starting from this context, a scoping review was carried out with the aim of analyzing two critical areas of participation in health systems: 'representativeness' and 'effectiveness'. Representativeness emerges as a particularly problematic aspect and many studies have observed that descriptive or statistical representation cannot be considered the only form of legitimizing participation. Classical electoral representation is shown to be limited and incapable of dealing with the complexity of participation, a social activity totally based on voluntary work and associativism. Other forms of representation, for example, symbolic representation or representation based on experimental participation - are more adequate to give legitimacy to social participation in health. These different forms make it possible to represent generally excluded voices and interests and thus strengthen the activities of marginalized social groups. With regard to effectiveness, the analyzed literature has highlighted a consensus, according to which participation experiences should have an impact, both on the participants - in terms of information, citizenship education and empowerment - and on the decision-making processes, thus facilitating the influence of citizens in decisions on health policies and on the organization of health services. Furthermore, many articles highlighted the lack of studies evaluating the effects of participation in health systems and the urgency of designing robust and reliable evaluation models.

Gender Inequalities at the Top of Political and Economic Power in Argentina, Brazil, Chile, Mexico and Uruguay

The paper addresses the problem of gender inequalities between women and men at the top of political and business power in a comparative perspective of Latin America.

The paper shows results of a comparative research of a survey of academic experts in five Latin American countries, conducted by the Department of Sociology (University of the Republic), patronized by CLACSO.

The research inquired about the existence of various differential determinants (socio-cultural, economic, structural and institutional) in the access mechanisms and careers of women and men towards hierarchical and authority positions.

It also investigates the role of public gender policies, organizations and movements that have had on the participation of women.

Perspectives of Family Authoritarianism in a Post Covid-19 Era Causing Entanglement of Family Governance and Challenges of Virtual Learning. Can Diverse Families Function As Their Children's Educators in a Virtual Learning Reality?

The paper presents a research study on the sociological economic and educational impact of global cultural diversity on the role of families as educators, lately, relating to the impact of virtual learning during the Covid19 pandemic. Specifically, it presents the fieldwork and findings of qualitative

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

research, involving educational settings where innovative methods were developed to include families from diverse cultures as educators, thus investigating the entanglement of the family governance.

The study explores methods to overcome the inequality and processes that will build families' resilience thereby promoting equality, helping the family to regain its leadership role assigning responsibility for strengthening their role as educators and culture transmitters.

The study's findings demonstrate that an effective partnership between the family and the educational framework improves the learning process. The study's conclusions show the contribution of families' multiple intelligences to the child's development and to the school's success in achieving its educational agenda. The latest global COVID19 pandemic created a new sever crisis where families faced unexpected technological challenges while their children are engaged in distance learning, suffering from lack of computers and access to internet connection, thus increasing economic and social inequality. Therefore, families' governance is challenged due to lack of technological knowledge or lack of economic resources to provide the technology that enables the students to participate in distance learning. The study shows that the economic crisis, tension and fear of the unknown during the pandemic increased the level of violence entanglement among families and especially among adolescence.

It is also increasing the need for formal education as a vehicle for minimizing inequality and enabling social mobility. The paper will present studies conducted in a widely diverse type of families and schools in Israel along with innovative educational programs developed, tested and implemented during and after the study.

From New Public Management to New Public Governance: Multidisciplinary Health Teams in the Context of the COVID 19

The New Public Governance (NPG), included in the so-called Post-New Public Management reforms, differs from the New Public Management (NPM) namely by presenting reforms that aim to stimulate cooperation. This aspect seems to explain why the healthcare sector has adhered so well to adopting these reforms as an alternative to the orientation towards efficiency present in models inspired by the NPM. The term NPG, referred by Osborne (2006), has been gaining relevance by expressing the context of new institutional and organizational arrangements for the provision of public services. It is a model proposed as an alternative to the NPM standing the government's posture regarding the participation of citizens in the management of public affairs. This is a fertile ground for multidisciplinary health teams to meet their objectives, and the context of the COVID 19 pandemic seems to have accelerated this process. The context of the pandemic and the complex challenges to public health and healthcare systems, emphasizes the issue of interprofessionalism, i.e., on the mechanisms of health team practices that necessarily imply collaboration and communication, effective participation in decision-making, cohesion, coordination of services and problem solving.

As moving out of urgent situations and towards the post-COVID19, we begin to have evidence that allows to understand the nature of these teams, the physical and social devices that facilitate or inhibit interprofessional work, and the extent to which the changes observed among interprofessional teams are sustainable. What lessons to learn from the pandemic? What it shows about health governance models, namely on the future planning of the healthcare workforce? Is this an unprecedented opportunity to learn from the global response to COVID 19 pandemic and build a more cohesive and supportive health governance model?

Youth Digital Activism: The Meaning Making of Social and Political Engagements

Youths are active agents in digital media. As digital natives with mastery of skills and knowledge to explore and exploit digital platforms, their digital activities contribute to the reproduction of online social practices, including engagement in distinctive digital social and political activism. Digitalization characterized by networking and distinctive 'connective action', marks the meaning making of youth's forms and practices of online activisms. The concept of a more open and flexible engagement is among others important elements in digital youth activism. Through examining the issues, we will comprehend the ways of youth positioning themselves as citizens. The study argues that through digital activism the youths have reproduced the ideas and practices of social solidarity and social engagements that fit to their culture and identity. Hence, the 'social' and the 'political' are defined. At the same time, through their social concerns, the youth as citizens claim their critical and political positions *vis a vis* the state. This study employs a qualitative data collection involving youths who are actively associate with various social and political issues in social media platform. The findings of this study indicate that the characteristics of youth identity signify the meaning of activism and social solidarity to be more practical, fluid, 'less ideological' but innovative and inclusive.

You Are Harmful: How Social Science Technology Can Dominate Organizations

Psychic harm claims -- invisible, unfalsifiable forms of abuse, trauma and pain -- proliferate across modern organizational landscapes. It is now quotidian for employees to express being traumatized by colleagues' language, for subordinates to voice emotional harm sustained from a supervisor's joke, and for concerned employees to worry over potential trauma that could befall vulnerable peers if symbolically harmful ideas or people are left unpoliced. In the latter part of the 20th century, the social sciences began crafting novel types of harm that occur in moments of *interaction* between individuals, people and ideas, and people and cultural moments. These varieties of harm, such as emotional and psychological, now operate at the micro level in organizations, and continue to evolve and expand across time as those bearing the harm constructs invented and legitimated by social science gain footholds in dominant cultural institutions.

This paper articulates a micro-sociological process wherein individuals as technical experts of their own subjective realities, imbued with social science meanings, may achieve power when activating psychic harm in organizational contexts. Using ethnographic case studies, this paper showcases how voicing harm to organizational authorities and public audiences can yield professional, moral and status gains, and rather than decreasing stratification (counter to the touted goals of diminishing harm-based inequality by voicing psychic harms and managing them), in fact reifies and expands stratification on the lines of age, education status and cultural background. This paper explores differential access to harm meanings, how harm meanings operate and evolve in organizational networks, and how digital technology perpetuates harm. This work bears consequence for organizations because psychic harm fundamentally drives towards alienation, as the more harm is raised, the more wary all individuals (purported victims, perpetrators and bystanders alike) become of interacting with others out of fear of harming or being harmed.

Femmes Entrepreneures Et Logiques Entrepreneuriales Dans Le Secteur Informel Au Sénégal

Cette étude est réalisée auprès de quatre groupements de femmes du secteur informel. L'approche utilisée est essentiellement qualitative. Elle a consisté à recueillir des données socio-économiques et organisationnelles auprès des femmes entrepreneures et de leurs organisations respectives. Les principales thématiques abordées avec les femmes ont porté sur 1) les caractéristiques socio-économiques des femmes, 2) les conditions de travail et les vulnérabilités, 3) l'accès à la protection sociale, 4) les défis d'organisation dans leur entreprise. La collecte des données s'est déroulée entre Août et novembre 2021 avec des entretiens individuels et de groupe, des focus group auprès des femmes et de personnes ressources. Les focus group ont été organisés auprès de 8 à 10 participants par organisation. Tous les entretiens (de groupe et focus group) ont été enregistrés et retranscrits sous fichier Word. Les données ont ensuite été traitées et analysées avec le logiciel d'aide à l'analyse de données qualitatives Nvivo 12. L'analyse du profil des femmes montre qu'elles sont pour la plupart mariées et vivent dans des ménages monogames ou polygame, avec un niveau d'études primaire pour la majorité surtout pour les plus âgées. On note une responsabilisation de jeunes adhérentes qui sont souvent dans l'entourage des plus âgées et qui ont un niveau d'études secondaire ou supérieur. Les jeunes adhérentes avec un niveau d'études plus élevé sont responsabilisées dans les fonctions requérant des aptitudes à l'écriture : Comptabilité, secrétariat, etc. Les femmes entreprennent avec une démarche qui ne prend pas en compte, dès le début, les préoccupations de formalisation et de compétitivité propre au système capitaliste. Elles se lancent dans un processus entrepreneurial qui met en avant les aptitudes à exercer une activité et la volonté de s'y consacrer. Les préoccupations de formalisation, de rentabilité financière et de mise à l'échelle peuvent suivre après le démarrage effectif de l'activité.

Perceived Stress and Stressors Among Undergraduate Students: A Study in Bangladesh

Background and objective: For a low- and middle-income countries like Bangladesh, it is evident that university students are more inclined to mental health illnesses like depression compared to the general population. The performance of a person with depression is often poor at work, school or in family environment. According to World Health Organization, 2020a, depression is the second leading cause of suicidal death among the age group

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

15–29. The increasing suicidal rate among university students indicating the need to investigate the stress level and the stressors to formulate appropriate support services for university students to ensure mental health wellbeing and suicide prevention.

Method: The study uses a structured questionnaire using a 5-point Likert scale to collect data from 472 university students of Bangladesh. A convenience sampling technique was followed for the Study to collect primary data from. Data entry and analysis were done with the statistical software SPSS version 20. Descriptive statistics Cronbach's alpha and factor analysis were used to examine the demographic profile of the respondents, reliability, significant stressor respectively.

Result: The study investigated several contributing factors of stress, anxiety, and depression among students which includes academic and non-academic stressor like socioeconomic, environmental, cultural to psychological attributes.

Conclusion: As stress have a high detrimental effect to individual and society, there is a need for greater attention to the psychological wellbeing of undergraduate students to improve their quality of life. This study can be used to develop intervention programs and will help adopt appropriate preventive measures and practices to alleviate psychological consequences.

Reinforcing Caste Boundaries in Everyday Social Interactions: A Critical Analysis of Upper Class Bania Women in India

The Caste System stratifies Indian society into a hierarchy where the upper caste groups have more power and privileges over those belonging to lower castes. The Banias are an upper caste trading community who have been the biggest supporting allies of the Brahmins in maintaining the caste order. While it is well documented how Brahmins run the intellectual apparatus of the country, what is often given less focus is the economic and social role that Banias have played in sustaining the caste system. Banias maintain a hegemony over the country's wealth and use that capital to support the Brahmanical ideology that dictates the caste system. The Banias maintain their status as some of the wealthiest people in Indian society by reinforcing social boundaries in their everyday lives. Caste scholar Kancha Ilaiah Shepherd writes about how one of the most common ways to maintain capital within a caste group is by favorable marital matchmaking. Within the community, Bania women play the role of tradable commodities used to cement kinship and business ties between families, ensuring the upper class and caste status of the community. In this paper, I take a critical look at the social relations of Bania women and how caste remains the dominant variable in their everyday social life. To explore how caste and class are linked, I investigate the role of upper class Bania women in reinforcing caste-based boundaries and how they shape their everyday social interactions.

Stigmatization, Differential Treatment, and Social Exclusion: The Lived Experiences of Female Breadwinning Couples in a Patriarchal Society

The world is experiencing a surge in the number of couples where the male partner takes on the caring roles, and the female performs the breadwinning responsibilities—called female breadwinning couples. Although, the ratio of such couples is not statistically significant in developing countries like Pakistan, increasing employment opportunities and education of women and growing men unemployment resulting in changing work-family arrangements. The focus of my study was to answer the research question, how does men's and women's participation in gender-atypical family/work and carer/breadwinner roles transform experiences with regard to societal responses, social stigmatization, and differential treatment for female breadwinning couples in a patriarchal society. I conducted this study through a grounded theory approach where I interviewed a sample of thirty participants (15 male and 15 females). I selected participants from couples where the female partner was the sole or dominant earner for her family in rural and urban areas of Islamabad, Pakistan. The tool for data collection was a semi-structured interview guide. The study findings show that female breadwinning couples confront different challenges and difficulties like social stigmatization, social isolation, and differential treatment. Female breadwinning couples from rural areas with a joint family system are more prone to social stigmatization and differential treatment than couples living in urban areas with a nuclear family system. My study findings extend the debate around negative societal responses in violation of expected gender roles by exploring the variation in experiences of female breadwinning couples across different social categories like residential backgrounds (urban/rural), family types (joint/nuclear), ethnic groups (Pashtun/Punjabi), and social classes (lower/middle/upper).

SHAHDEO, Kunal* (Indian Institute of Technology, Bombay, India)

Angry Hindu Men: The Young Blood of Hindu Nationalism

The paper would seek to understand the overwhelming support that Hindutva (Hindu Nationalism) commands among the Hindu young men in an Indian city of Ranchi. The sociopolitical space of Ranchi has historically been the hotbed of Adivasi (indigenous groups) political mobilizations since the early twentieth century. The paper aims to unpack the complex ways in which young Hindu men have come to participate in the Hindu nationalist project in a highly politicised space of Ranchi. The attempt is to situate the Hindu young men within the larger sociopolitical and economic changes that are unfolding in India. The neoliberal seductions of the market (the aspirations and false needs it creates), the rise of hyper-masculinist nationalism (demands for machismo it makes on the youth) and the socioeconomic constraints to fulfil these demand and aspirations have created a young population which is highly aspirational, extremely angry, and deeply anxious about his own self and future. The article also tries to situate young Hindu men within the regional specificity of Ranchi to unravel their ideological and emotional involvement in the chauvinistic Hindu nationalist project as an elite revenge against the political dominance of Adivasis. The paper would bring to light through ethnographic details the plural ways in which Hindu young men express their anger and anxiety by participating in Hindutva politics.

Indian Professional Education System in the Light of Ukraine-Russian Crisis

Besides upheaving the global order, impacting the national and local economies in different parts of the world, the Ukraine-Russian crisis has significantly exposed the pitfalls of professional education in South Asia. For instance, the Ukraine-Russian war has led to the unprecedented plight of Indian and other foreign students who were pursuing higher education in Ukraine. The long-extended conflict between the two countries has forced the students to return back to their home countries leaving their careers in uncertainty. Several thousand of Indian and other foreign students were evacuated from the war-zone with great difficulty and diplomacy. The unforeseen and abrupt discontinuation of the higher education has left large number students in a chaotic situation. The mass exodus of Indian students has exposed several longstanding latent problems of Indian higher education system which was otherwise invisible. Both Russia and Ukraine were among the top destinations for Indian students pursuing higher education due to affordable low-cost of education and adequate opportunities in terms of number of seats when compared to higher education in other countries including India. Higher levels of competition to get admission especially in medical schools in India had forced many Indian students to seek education in Eastern European where the entrance barriers are lower with low-priced course fee structure. In the light of Ukraine-Russia crisis with the mass exodus of Indian students returning back home, this paper is an attempt to study the strength and weaknesses of Indian Professional Education with due emphasis on medical education.

Innovation, Entrepreneurship and Coworking Spaces in the Knowledge Society

Innovation and Entrepreneurship has been the characteristic feature of digital and knowledge economy. An emerging aspect of the digitalised knowledge society is the collaborative shared workspaces and work-settings popularly knowns as 'Coworking' spaces. While the number of remote workers and freelance professionals has steadily increased in the digital economy, the idea of 'Coworking' spaces has also strengthened simultaneously. The concept of 'Coworking' spaces was largely popularised by entrepreneurs and innovators who shared one common big office space with variety of services such as conference room, photocopying and printing facilities, sitting-lounge, coffee machine, secretarial assistants etc. In the recent past, Coworking' space has been increasingly employed by corporates, freelancers, remote workers and other professionals with an objective to network and share knowledge. Collaboration, openness, community-sentiment and sustainability are some of the values shared by the co-workers. This paper examines the linkages between coworking, innovation and entrepreneurship. Although, collaboration has been the key feature of the innovation-driven economies, there are limited research that explain how 'Coworking' spaces promotes innovation and entrepreneurship. This paper attempts to explore the role of 'Coworking' spaces in innovation and entrepreneurship activities among the entrepreneurs in Bangalore city. The study also highlights how the concept of 'Coworking' spaces has disrupted the traditional organizational work-setting making way for unconventional office-spaces with flexible work settings and potential to impact the organizational professionalism and culture.

Informal Sexuality Education for Trans and Gender Diverse Youth: Implications for School-Based Practice

The capacity for young people to successfully navigate the challenges associated with gender and sexuality relies on their access to reliable and accessible sources of information and support. Traditionally, schools have been entrusted with providing this information, whether it has taken the form of so-called 'comprehensive' sexuality education, or more conservative or religio-spiritual messages about morality, sex and the body. Regardless of the approach taken, schools have struggled to incorporate information that is relevant or useful for young people who are trans or gender diverse. This paper draws on primary data collected on the experiences of sexuality education for trans and gender diverse youth in Australia. While young trans Australians have almost universally negative perceptions of formal, school-based sexuality education, this research reveals the rich and nuanced ways that young trans people are learning about sex, gender, and politics from their social relationships and the media that they engage with in their day-to-day lives. The informal, community-curated, emancipatory pedagogies that proliferate within certain social media platforms raise important questions about sexuality education for all young people, particularly those who are trans and gender diverse. How can schools and teachers complement the experiences of teaching and learning that are offered online? And, importantly, is this possible to do at all, particularly where there are severe political constraints on what is possible in the classroom? This paper serves as a provocation to begin considering these questions, centring the perspectives of trans and gender diverse young people, who are forging their own path to access knowledge, support and wellbeing, against the backdrop of increasingly vitriolic political discourse.

Where Have All the Foxtail Millets Gone? Revitalization of Indigenous Bio-Cultural Heritage in Central Taiwan

Foxtail millet (*Setaria italica* (L.) P. Beauv.) was an important crop for indigenous people in Taiwan in terms of livelihood, institution, and culture. However, under Japanese colonial rule in the early twentieth century and population growth of Han Chinese over the past decades, the agricultural landscapes had been changed and the production of foxtail millet had been replaced by cash crops and market-oriented products in most indigenous communities in central Taiwan. In response to concerns of conservation related to indigenous traditional crops, major causes of missing foxtail millet and practical restorations in central Taiwan are explored through anthropological lens. Our analysis of the agricultural census data and participatory ethnography reflect the economic weakness and alternative revitalization strategies of foxtail millet cultivation The production of foxtail millet in central Taiwan from 1930 to 2021 experienced two waves of reduction. The first wave occurred in the late period of Japanese colonial rule. Both agricultural transition from foxtail millet to rice and resettlement of local indigenous people, which were caused by colonial policy, triggered the reduction of foxtail millet. The second wave occurred after 1970s. With the impact of globalization, foxtail millet was nearly de-embedded by introduction of cash crops. The agricultural transition implied the economic weakness of foxtail millet. To restore the bio-cultural landscapes of foxtail millets, the landraces were reintroduced from the seedbank of National Taiwan University to the original habitus since August 2020. Ethnographical analysis was then employed to record the restoration process developed by local stakeholders. Instead of agricultural income, cultural revitalization was the convergent restoration scenario among all stakeholders. Moreover, local NPOs (such as schools, elder centers, churches, and youth organizations) play an important role in the process. Our research provides insightful direction for future restoration of indigenous traditional crops.

Disasters and the "Other Gender": Experiences of the Hijra Community in Disasters in India

The binary representation of gender categories has dominated the idea of gender in disaster scholarship for a long time. This Western understanding has often overlooked the contextual realities across different societies and been imposed on rest of the world. The synonymous use of "gender" and "women" has resulted in normative policies and frameworks thereby reducing gender down to just a demographic variable, excluding those who do not fit into these normative binary categories. The *Hijra* community, oldest known ethnic transgender group in India, has faced the consequences of this interpretation. Their present day lives have been largely shaped by political and socio-cultural events, languages, empires, and people that have historically dwelled in South Asia. With limited access to education, health services, safe shelter, public programs, employment, they also face verbal and physical abuse, resulting in economic challenges and health concerns and making them highly vulnerable

to hazards. Increased frequency of unprecedented extreme weather events has caused largescale destruction globally and similar was the case of Cyclone *Fani* that hit the eastern coast of India in 2019. These groups were affected differentially because of their existing vulnerabilities, which were exacerbated during this time, and because they have very limited resources to cope. However, this did not stop them from showing their agency as they contributed to relief processes. Learning from these lived experiences, this qualitative research set in Odisha, India, explores disasters from a Queer theory viewpoint and Social Constructivism, their capacities, and challenges, through a critical ethnography approach. Setting the regional socio-cultural and political conditions against the environmental factors, it further explores the idea of gender justice in disaster related policy, practice, and research. This leads to unpacking the broad categories of the 'vulnerable' to explore diverse realities beyond the West, for more gender sensitive and inclusive disaster risk reduction.

GAILLARD, JC (The University of Auckland, New Zealand)

Gender Beyond the Binary in Disasters: Viewpoints from the Hijra Community of India

Disaster studies have largely been focused on the vulnerability paradigm for a long time. And rightly so, as there are certain groups of people that are more vulnerable to hazards than others, based on their position in society. Gender is one of the markers determining the degree of vulnerability. However, it is often used interchangeably with "women" based on the binary categorization, reducing it to just a taxonomic indicator without any subjective context. This Western understanding overlooks the diversity and complexity of gender groups, especially in Southeast Asia. The *Hijra* community is the oldest known ethnic transgender group of India. Living through a long history of events, they have largely been excluded from developmental processes and neglected in the disaster space. However, this has not stopped them to be their own agent of change. The 2019 cyclone *Fani*, that hit the eastern coast of India, showcased their capacities at the time of a disaster. Especially, for mobilizing the community members to safety and helping with the distribution of relief materials to those in need. With more awareness about diverse identities and new inclusive laws and policies, it becomes possible to create a more enabling environment for gender sensitive and inclusive disaster risk reduction. In that light, this qualitative research has been carried out in Puri, Odisha, India, informed by the critical ethnography approach. It aims to re-construct the idea of disasters from a queer perspective, rooted within their contextual realities through the lens of Queer theory and Social Constructivism. It unpacks the broad categories of the 'vulnerable' to look at the diversity and intersectionality of gender with other socio-economic and cultural factors, beyond Western understandings of the same, while exploring the challenges and capacities and the role of inclusive policies in propagating inclusive Disaster Risk Reduction.

Faith-Based Affirmative Action for Environmental Conservation: Empirical Evidence from Pakistan

In recent academic literature, faith and belief are suggested to be strongly associated with environmental conservation in the developing world. Researchers suggest that faith-based approaches are more effective than other non-faith approaches in influencing the attitudes and behaviours of individuals and communities toward environment. As the world becomes increasingly industrialized and development projects proliferate, the natural environment is coming under increased pressure. In an effort to promote sustainable development and conservation practices, many countries have implemented faith-based affirmative action programs. These programs seek to engage religious communities in environmental conservation by targeting specific groups for education and outreach initiatives. Pakistan is one of the countries that has implemented such a program. Despite being the home to one of the largest Muslim populations in the world, living in catastrophic environmental conditions, the role of faith in environmental conservation has not yet been studied in the context of Pakistan. This paper presents empirical evidence from Pakistan on the effectiveness of faith-based affirmative action in promoting environmental conservation. Employing data and field experience from an action-based research project at the periphery of the capital city of Pakistan, we estimate various models to assess whether faith and belief persuade people to take affirmative action toward household solid waste. We also evaluate the impact of religious faith on community participation in household solid waste management. The data shows that the program has had a positive impact on attitudes towards environmental conservation among religious people. The field experiences also suggest that faith-based affirmative action is an effective tool for engaging religious communities in environmental conservation efforts. We conclude that faith-based affirmative action is a promising strategy for promoting sustainable development and conservation practices. The study provides valuable insights for policy-makers and practitioners in Pakistan and other parts of the world with similar socioeconomic and cultural contexts.

Awareness of Sexual & Reproductive Health Rights Among Married Women Working in Higher Academic Institutions: A Sociological Study of Jaipur City, India

Women's Sexual and Reproductive Health (SRH) experiences are increasingly being explored within the context of reproductive justice. Promoting accessibility and improving SRH services are one of the primary goals of the Sustainable Development Goals (SDGs). Considering this, this research study aims to explore the level of awareness and experiences of Sexual and Reproductive Health Rights (SRHR) among educated and working women of Jaipur, the capital and largest city of the Indian state of Rajasthan. An exploratory study was conducted, using mixed method approach, among highly educated married women working in the academic institutions of age group of 21-49 years old (n=40). The data was collected through a pre-tested interview schedule. Narrative analysis and descriptive statistics have been used for data analysis. It was found that only 15% of all respondents had adequate knowledge about all the available choices of family planning methods and contraceptives. The majority of the respondents were following the traditional method like periodic abstinence (70%, n=28), and withdrawal method (62.5%, n=25). Between the couple, very fewer women make the decision of using contraceptives or precautions during intercourse (17.5%, n=07), in most cases, it is the husband's decision (52.5%, n=21) and in quite a few cases, it is a mutual decision (30%, n=12). The analysis shows that 3 in 5 married women experienced pressure from in-laws especially from mother-in-law to have a child immediately after marriage. Even highly educated and working women aren't adequately aware of SRHR, as discovered in this study. To address the issue of gender equality, this study suggests strengthening ability and awareness among women of all sections of the society to exercise SRHR as well as removing unnecessary taboos surrounding their sexual and reproductive behaviour.

Widows of Tradition: Moving Towards Self-Employment

When we take the word 'widow', an image enrobed in white cotton saree, devoid of bangles, vermillion, ornaments and cosmetics. The socially accepted identity of a widow is established for centuries not as an usual widow but "Widow of Tradition", considered as inauspicious. The two major habitats of widow of tradition in Northern India are Kashi (Varanasi) and Vrindavan (Mathura). The number of widows staying in different government and non-government organizations, according to the 2015 report by Lydia Smith, was 38000*. According to 2016 report, Varanasi Ashram had nearly 4000 widows, while Vrindavan had a little over 7000**. All the widows of tradition belong to Hindu socio-religious society. In this backdrop, we have explained the factors of continuity of the widows of tradition, in spite of the takeoff of Indian society on the path of development. There is need to explore the issues in social practices at micro level, and which are removed from the traditional culture and have been evolving new tradition. Present study's major focus included the events of struggle of 'widows of tradition' towards deconstructing gender discrimination and process of rehabilitation of young and old (but capable) by learning entrepreneur skills mainly like sewing, weaving, knitting making baskets and pickles and thus engaging into self-employment. The problem was how to market? What more was needed, is mini training workshop. This study concluded that their entrepreneurship even at a very small level keeps them physically and mentally in a better condition. The Ashrama management as Varanasi and Vrindavan are facilitating the sale of their produce in occasional mela and festivals. But this needs boost-up.

Leisure Activities and Mental Well Being of Youth in India during COVID-19 Pandemic Lockdown

Millions of individuals, particularly young people, have experienced major disruption in their life as a result of the COVID-19 pandemic. The Indian government deployed statewide lockdown measures and self-isolation regulations to stop the spread of COVID-19. Young people, who are more sensitive to peer contact and interpersonal interactions than adults, have almost likely been significantly impacted by the physical separation and other limitations enforced by national and local governments all over the world to stop the virus' spread. The effect of the pandemic and the lockdown on young people's mental wellbeing could be more damaging in the longer run than the infection itself, as the pandemic has posed unprecedented stress to young people. This research paper discusses the change in the leisure activities of the youth in India and evaluates the psychological impact of the lockdown due to COVID-19 pandemic. The objective of the study was to examine the leisure time activities of the youth during the lockdown imposed during the COVID-19 pandemic. Online survey was conducted in about 200 college going youth in the age group 17-25 years to study the change in leisure activities among the Indian youth living in urban areas and its impact on their mental health. The study found that young people now place a higher emphasis on leisure than they did prior to the outbreak of the pandemic. They believe that the pandemic, particularly the lockdown, has impacted their daily routines, leisure pursuits, and mental health and psychological well being. Leisure activities have been shown to be useful at helping youth cope during stressful period. Relationship between leisure activities and overall psychological well being was also established in the study.

Disproportionate Rights and Inequalities of Labour in India

This paper draws conjectures reflexive of the crises reeling under ambiguity across the global institutions triggered by covid-19. There has been huge gap between socio-economic inequality vis-à-vis the labour force of the (un)paid informal structures of the economy. So to look at dynamics of human capital facilitating modalities of service based economy is crucial. Historically, dealing with intersectionality of socio-economic hardships via unprecedented timeline lays impetus to locate 'gender' as a 'referential category' in localized context. Without grasping the 'invisibles-marginalized' living by the periphery of 'South-Asia', the vulnerability of the global population cannot be understood. There had been crises earlier as well, however the reverse osmosis of urban to rural; global to local; multi-nationals to small medium enterprise have accelerated the ramp up action of 'new normal'. Although this been conceived at large has been affected leading to severe problems of inequality, unemployment and poverty due to this global pandemic. More so, the discourse needs to be deliberate upon more than a health emergency subject to the 'lives versus livelihood' of the (un)developed nations.Simultaneously, government policies have also failed to boost socio-economic inequalities considering multiple problems. Does this mean a permanent instability,if not political economy of the ambitious nations?

Unlike anything, it rips apart the memory of stability enhancing the probability of uncertain times ahead of state regulations and policies in 'covid-19' ;the tested impact has far greater repurcussions in living memory than the facts buried in the past. My paper reflects the socio-economic misery of binaries among (fe)male labourers within its historicity of rural-urban divide within already existing stratified society; and secondly the impact of social media on mental well-being beyond the physical health converging caste/class and gender into a unitary category of vulnerability suffered across ethnicity and community with ever more increasing users.

SHARMA, Ritu* (University of Delhi, India)

Socio-Cultural Study of Water and Women in Rajasthan

As it is rightly said that nobody has ever lived without water hence its shortage have become a global emergency. The recent report by the government of India stated –that there would be no drinking water for 40% of population comprising of 600,0000 population by 2030. Water conservation training begins around these water bodies by women accompanied by children and is passed on to generations in the form of folklores and local narratives. Thus, religious practices of community can halt the alienation of ecological consciousness of valuing water not as commodity but as sacred for sustainable use from its practices in Rajasthan.

My focus area is women aiding water management in innumerable ways within private (household)-public space in everyday life..This highlights the importance of developing policies and programmes that address their needs, interests and constraints. The crux of the research problem lies in finding gaps-linkages in Rajasthan, whereby women are uneducated and marginalized and yet they are transmitters of cultural codes to future generation for sustainability; moreso the mechanism to conserve water comes naturally to them? On the basis of these issues the proposed research has sought to explore the position of women to focus on both macro (women and water) and micro (subsidiary issues) pertaining to perspective related to management of deprivation. In this way, this paper would utilize qualitative epistemological position that recognizes the importance of locating cultural materialism as a research method to produce a critical understanding of the values, beliefs, to discern how they connect to the greater social structure within a particular social, cultural, and historical context of gender. Thus, watershed development is a cultural application –that can aid in curriculum development in areas of rainfall harvesting, soil conservation, cropping patterns, revival of rivers and basins, aquifers, depleting groundwater and household consumption.

Solidarities with Difference: Immigrant Workers and Alliance Building in Domestic Workers' Movement in South Africa

This article revisits the familiar thematic relationship between immigrant worker and labor politics, which has largely been discussed in context of Europe and North America, from the Global South. Focusing on domestic workers' rights struggles in South Africa, the article examines how organizations working with native and immigrant domestic workers build alliance with each other while drawing boundaries around key issues of immigration and citizenship. Going beyond the discussion on rivalry for jobs between the native and the immigrant workers, this article shows how the organizations, both unions and NGOs, in the case of domestic workers are overcoming the rivalry by building alliance in the civil society for advancing rights of the workers. However, this alliance is not smooth, and reveals its inherent tensions of how solidarity is articulated and translated into practice. So, even if these organizations work as a united front against both the state and the employing class, the perceived differences between immigrant and native workers reveal key elements of solidarity and difference.

The Personal Is Bureaucratic: Bureaucratic Practices and Paid Domestic Work in South Africa

This paper investigates how state makes sense of the private and public when these boundaries require rethinking through the extension of labor laws to cover domestic space. Drawing on the South African experience, this article examines how the state officials comprehend paid domestic work relations as employment relations when they have to apply 'labor laws' to domestic space. As scholars have emphasized on the intricacies of how state sees the population it governs, in this article, I emphasize *the process* of how state often grapples to 'see' or make certain aspects of society legible and governable through its categories. Focusing on the Labor Centers and CCMA (Council for Conciliation, Mediation and Arbitration), I focus on how labor inspectors (from labor centers) and CCMA commissioners grapple to translate the disputes brought to them into a language of legal facts which can be adjudicated or dismissed. I argue this process of translating experiences and disputes into facts that can be judged based on the labor laws reveal an important process through which state officials bridge the gap between elusive nature of everyday experience and the well-defined, formal categories through which the state governs.

Family Income in Early Childhood and Subsequent Scholastic Achievements in Israel

This study examines the effect of family income in the first thousand days of life - from the year before birth until age two - on the scholastic achievements of students in Israeli elementary school. The study employs a large data base consisting of administrative data that was produced by the Israel Central Bureau of Statistics on the birth cohorts of 2000-2002 and 2004-2005. The data base includes information on family's socioeconomic characteristics, including economic income for each year since conception of the child until age eleven. In addition, data are available on scholastic achievements in 5th and 8th grades. The findings show that family income in the first thousand days of life has strong and statistically significant, effects on future educational achievements, even when controlling for family income at later stages of life and other socioeconomic and demographic variables such as parental education, family size, gender, nationality and weight birth. These findings reaffirm the importance of families' income in the first thousand days of a child's life, as determinants of child development.

Social Justice and Ongoing Healthcare Financialization

The *International Covenant on Economic, Social and Cultural Rights* explicitly states dimensions associated with social justice, among them "the right of everyone to the enjoyment of the highest attainable standard of physical and mental health" (Article 12). More recently, the UN's Sustainable Development Goal 3 proposes to "ensure healthy lives and promote well-being for all at all ages." However, at its 2022 meeting, the World Health Assembly of the World Health Organization endorsed universal health coverage defined by the goal of primary healthcare as prevention.

The interaction of chronic non-communicable diseases with SARS-CoV-2 provides a vivid example of health inequities caused by structural economic and social inequalities. This pandemic presents opportunities to discuss and pursue evidence for solutions to persistent problems related to the capitalist-inspired growth model of preventive primary healthcare, which includes: 1) the assumption that more screening and diagnosing are better than less; 2) aggressive over-treatment, resulting in low-value care, even when de-implementation of screening and interventions for population subgroups is supported by evidence; 3) neglect of upstream causes of disease, despite the reality that clinical care is only one of many determinants of health; 4) de-emphasis of hospital-acquired infections and other iatrogenic effects of medical screening and interventions which can result in clinical cascades that are avoidable causes of death as well as decreased quality of life; 5) inadequate attention to evidence for the effectiveness of low-profit public health prevention programs that not only prevent the transmission of infectious diseases but also the development of non-communicable diseases. The profit-driven economic growth imperative of capitalism can lead to healthcare systems characterized by widespread medical harm at the expense of both care and cure. Implementation of recent evidence can contribute to social justice in healthcare that is consistent with both SDG 3 and the ICESCR.

Effectiveness of E-Counselling Session during COVID-19 Pandemic in Open Distance Learning Programme: A Cross-Sectional Study in India

Purpose – This study aims to examine the usefulness and effectiveness of the e-counseling sessions organised during the COVID-19 pandemic.

Methodology- The International Institute for Population Sciences, Mumbai has been offering 'M.A. in Population Studies' programme through Distance Learning Mode. During the COVID-19 lockdown, IIPS conducted four counselling sessions for its distance learners. The total participants considered 110 learners who were present in the sessions. Data were gathered from the 110 learners using a semi-structured questionnaire developed in the Google Form. The questionnaire included information on online counseling issues and questions on the learners' profile. The Kruskal Wallis test and Chi-squared test were used.

Findings – Nearabout, 43.4% participants were female. The majority of the participants were working professionals engaged in Government and Development sectors. More than 90% of the respondents were very much stratified with the input provided during e-counselling sessions. Almost equal proportion of participants used smartphones (44.8%) and laptops (47.1%) to attend the sessions. However, more than 40% of learners faced Internet break or slow speed problems and found them a significant hurdle for smoothly attending the sessions. All the participants agreed that the counselling sessions would motivate them to complete the course. The feedback on many attributes i.e. usefulness and objectives of the sessions, interaction with the academic counsellors, content used and methodology used by the academic counsellors were significantly positive. More than half of the learners requested to conduct the counselling session once in a month.

Conclusions- The study provides effective feedback to the ODL policy makers and other stakeholders to consider that the counselling session is a pivotal link between the institution and isolated distance learners, resulting in a high completion rate in the ODL programme.

Anxieties after COVID-19: Mobilising Tourism Assets for Children's Wellbeing

During the pandemic, there was a call for a reset to make tourism more sustainable, responsible, and inclusive. But the current "recovery" of the industry seems to be heading towards the re-creation and re-inscription of inequalities that existed prior to COVID-19. There is an emerging crisis of hope and meaning in post-pandemic tourism.

Badly hit by pandemic, residents supported local tourism businesses and visited attractions, for example, families visited tourism attractions in their own neighbourhood and countries. Staycations became popular.

The experience has revealed new inter-connections between the industry and the local community. The global pandemic has disrupted the lives of children and young people but doing tourism in their own backyard has helped them cope with the situation. The industry benefitted tremendously from the local support. So, how can such industry-community connections be better established, and be instituted within the social license of tourism?

During the COVID-19 pandemic, to some extent all children and young people experienced vulnerabilities in the sense of having their sense of safety reshaped. There is evidence that heightened stress can affect the entire life course of the child. What claims then might children and families legitimately make of the tourism assets that are nested in their communities and what contributions might the industry itself envisage to help build resilience and connection with local children and young people?

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

To address this critical issue, we need to interrogate the anxieties about tourism that existed before COVID-19 – anxieties about money, lacking confidence, places and sites not being 'for' them. Drawing on research in Malaysia and Australia we critically examine questions of the entanglement of economic and cultural capital, and why tourism needs to be more ambitious in its social license.

Relational Duality and the Backup Meaning: Money and Love in the Chinese Idol Industry

This article will use the commodification of intimate relationships in the Chinese idol industry to provide an alternative approach to the existing analysis of stigmatized or morally suspicious exchanges in markets, which is divided into clarification practices and blurring practices by Lainer-Vos (2013). I will argue that in market transactions, clarification does not mean elimination and blurring does not equal the absence of shared interpretations. As contextual understandings of flexible values like love and independence have gained attention, we should also explore how people understand their transactions and relations in markets contextually. As people try to earmark their money and attach emotional and relational meanings to their transactions, the monetary elements in their relations never get eliminated but remain unspoken, which I call "the backup meaning" in all kinds of market transactions. In the process of doing market transactions, people build relational packages by connecting ways of doing transactions with perceived relational categories. However, they live in a "relational duality" because the prevailing market context always serves as a persistent institutional background, no matter how hard people try to cover it. When there are changes in the context and the relational meanings of transactions are under threat, transactions' backup meaning as equivalent exchanges comes onto the stage and people turn to such backup meaning to claim their right to ask for economic returns. To illustrate these concepts, I will use my ethnographic data collected in the Shanghai fan community of SNH48 Idol Girl Group to elaborate on the relational duality that fans wield the backup meaning of market money to protect themselves from broken boundaries despite trying to cover it in other situations, all under the fluctuant relational contexts manufactured by the idol industry.

SHER, Chloe* (University of Toronto, Canada)

Race, Nativity, and Inequality in Physical Activity: An Intersectional and Life Course Approach

Being physically active improves health and well-being. Previous research has suggested that racial minorities are less physically active than their white counterparts and immigrants are less active than their native-born counterparts. In this article, we adopt an intersectional and life course approach to consider how race and immigrant status may intersect to affect physical activity across the life nospan. This new approach also helps test the long-standing habitual vs. structural debate in determinants of physical activity. Analyzing data from two recent cycles of the Canadian Community Health Survey (CCHS, 2015-2016 & 2017-2018), we find that physical activity is only lower among immigrants who are also racial minorities and that the gap is most significant during adulthood, but rather insignificant during adolescence and late life. The findings that inequality in physical activity is more apparent among the most disadvantaged racialized immigrants and among working-age adults when structural influences are greater suggest that structural influences, rather than habitual differences are the main factor underpinning the differences in physical activity participation. In discussion, we also show that the widely observed "healthy (racialized) immigrant effect" could be underestimated when physical activity patterns are not considered.

Indigenous Womxn's Embodied Theory and Praxis

We present our main findings from the work we did in the recently published book, *The Oxford Handbook of Indigenous Sociology,* edited by Maggie Walter, Tahu Kukutai, Angela A. Gonzales, and Robert Henry. Our chapter starts from the premise that Native womxn are much more than their experiences of settler-colonial violence. The authors draw from Indigenous teachings to assert Indigenous feminist sociology, in which community, leadership, and accountability are fundamental principles. In the chapter, the authors theorize the importance of "auntie-ing" as a form of Native feminist praxis. They discuss critical contemporary examples of Indigenous feminist theory and praxis, informed by movement spaces around issues such as uranium mining, water rights, and gender violence, and in doing so reveal that "auntie-ing" on the front lines builds and maintains networks and values that "make power" beyond a simplified reaction to the violence that is experienced in the settler-colonial present. They extend Michelle Jacob's concept of "auntie-ing" as a lived methodology in order to highlight its grounded and vital mode of being to a

deeper understanding of Native feminism and a radical potential to transform our settler-colonial realities through their direct engagement on intersecting fronts.

State Repression and Political Orientation of Collective Action in China: A Multiple-Case Study of Student Activism at Peking University

The existing literature that discusses the state responses to collective action in post-1989 China has kept the political orientation constant in their selection of cases, using action repertoires and organizational conditions as explanatory variables. This study proposes a relational understanding of state repression and political orientation of collective action in a high-risk environment lacking organizational infrastructures for activism. By analyzing 14 student activism cases at Peking University with political, quasi-political and non-political contentious themes, and comparatively examining two recent cases at PKU in detail, the author argues that the more political the cases were, the more coercive the state repression would be. The political-themed, offline action suffered the most coercive repression. And political orientation is a more primary explanatory variable than action repertoires in terms of predicting state repression. The study not only contributes to the understanding of the political logic of the repressive apparatus in China, but also underlines the role of political orientation of social movements as a predictor of action outcomes. It also suggests that the scenarios under which state repression is triggered and/or escalated are largely determined by the sources of legitimacy of a given regime.

Human Capital and Lifestyle of the Rural Population of the Central Federal District of Russia: Projections of the Past, Present and Future

The report will raise the issue of the dynamics of the human capital of the rural population of the Central Federal District on the example of the Yaroslavl region in the context of depopulation and growth of return migration. Based on the results of empirical research, using in-depth interviews and a structured questionnaire search, the author examines the way and conditions of life of the rural population in the context of the past, present and future.

The report identifies the key problems that are acutely felt and reflected by the villagers - the lack of jobs, the possibility of a decent living in rural areas, the poor quality of roads and health care, Low level of improvement of settlements and organization of cultural leisure. Also, based on the reasoning of respondents, the author notes the positive aspects of life in rural areas such as a good environmental situation, the presence and work of kindergartens and schools, a high level of development of digital technologies, measured, quiet life.

The author will highlight the key factors affecting the lifestyle and quality of life of rural residents. It concluded that, against the background of the current situation, depopulation and atrophy of rural areas would continue without the intervention of State policy in the development and preservation of human capital.

Management Using "Soft Power" on the Example of International Communications

The report will present classifications and typologies of key manipulative technologies aimed at invading and destroying established and shaping new pictures of the world, to influence behavioral practices in order to implement control using weak signals (hidden suggestions).

From the point of view of the key communication models, examples will be used to examine these impacts and their impact. From the point of view of the pragmatic efficiency of achieving the goal of the manipulator, different options for the development of situations will be considered.

Using the conceptual construct "information war", the author, within the framework of the semiosociopsychological paradigm (T.M. Dridze), will present (using concrete examples of reflecting the confrontation between Ukraine and Russia) the tools of influencing "his" audience and "the enemy" used by the conflicting parties. An analysis of fakes and myths will be presented, from the point of view of their dissemination, and ultimately their introduction into the mass consciousness.

RC21-306.3

SHIM, Hanbyul* (Seoul National University, Republic of Korea)

Hack the Place, Hack the Policy, Hack the Modern: Manufacturers' Struggle for Inner-City Occupation

This study presents a paradoxical epic of the manufacturers, or the small business owners who have been occupying the inner-city districts of Seoul. The manufacturers and their districts have survived the displacement pressure intensified by hostile policy and gentrification wave over decades, though they are still facing constant menace of displacement. By delineating how they kept reconfiguring themselves and their workspace strategically to endure the pressure and to sustain their vitality in the urban economy, I raise a controversial question to be discussed which challenges the prevalent conceptions about productions within urban space. Theories and discourses about creative industry, cultural economy, and cognitive capitalism explain quite well the undeniable attributes of urban production. But they did not take the political struggles in the socio-spatial restructuring of urban space into account enough that they consequently contributed to regard the notion as natural one, that since those small businesses are vulnerable to the pressure by their nature and that their displacement is inevitable in capitalist society. However, the co-presence of recurrent policy interventions and the persistence of manufacturing districts of the case shows that workplace has been the essential resource for production, or the primary object of political struggles and ideological framing. Also, the theories and discourses seem to be obstruction of rediscover the labour that manufacturers perform to produce the 'creative and cultural' products. To conclude, the workspace conflict needs to be conceptualized as social and political struggles over restructuring the urban space where the industrial displacement is not necessarily a matter of economic principle, and the interpretation of the production in urban space needs to re-oriented in terms of rather the nature of labour than the products of transformed economy.

Interplays of Subjective Health, Objective Health, and Health Beliefs in Korea

From the action theoretical perspective of Berger and Luckmann's (1967) social constructionism of reality, individuals live with multiple realities, such as subjective feelings and objective facticities. These different realities are not what individuals shun from but what they inevitably or celebratorily learn to live with in a reductionist, correlative, or consubstantial way. These various possibilities are based on the very fact that these realities are emergent from the allegedly fundamental 'darkness' (i.e. the reality) that only processually comes into existence to human recognition. Human 'health' is one of such reality that incrementally reveals itself through various empirical instances, such as subjective feelings of health, objective diagnostics of health, and even beliefs of what health means. This study investigates how health is socially constructed, that is, processually and varyingly concretized among people in South Korea, by using the data from the 2021 East Asian Social Survey. The survey uses the popular measure of self-rated health for subjective health; the number of physician-diagnosed medical conditions for objective health; and semiotics of health/illness. It shows results from the regression models of how subjective and objective health intersect with each other, sometimes along with the mediation of health beliefs. It also reports results from the Latent Class Analysis (LCA) revealing typical constellations of health among Koreans that cut across subjective health, objective health, and health beliefs.

Who Will be the Agency of Social Change in the Covid-19 Era?

As Beck has diagnosed, "Health risks mutate into threats to the national economy (job losses, loss of wealth, etc.), which in turn jeopardize political and civil basic rights, with the result that authoritarian states in particular are able to 'overhaul' their precarious authority and legitimacy through the 'struggle against risk.'" In this situation, the question I would like to raise is: who will be the agency of social change in the post-Covid-19 pandemic era? Covid-19 was described as "disaster" for women. I would like to focus particularly on young women of the twenties and thirties, since they turned out to be the most suffering from the pandemic, due to job loss, care work, sexual violence, etc. Could it be possible for them to become the agency of social change in the post-Covid-19 era? If so, why and how? I will analyze the question using the survey data conducted to about 18,000 citizens of 33 global cities in September 2021.

Deaths Under the Pandemic: From Simplified Ceremonies to Shrinking Relationships

COVID-19 has brought about various changes in people's behaviors, including the ways they did with their significant others' deceases. During the pandemic, governments, medical associations, and funeral directors carefully regulated guidelines to deal the infected bodies. However, not only the deaths of the corona virus infection, but also a huge number of normal ones must be disposed and decently seen off. How were funerals and memorial ceremonies arranged during the time of large-scale isolation and contact restriction? How could the living maintain their mutual relationships through the bonds with the deceased in such particular situation?

This paper is based on a case study of four persons' death and dying in 2020-2022. In-depth interviews and observations are used with key informants who are intellectuals in Tokyo and Hanoi and lost their spouses or parents in the pandemic. The four cases range from normal deceases but no one could come to either funeral or memorial ceremonies to departing alone in the retreat and to dying of COVID-19. In all the cases, the absence of family members, friends, colleagues, neighbors, etc. was common. The transition from "bonds with the deceased" to "bonds with the living" was interrupted. Behavior restrictions due to COVID-19 greatly hindered the maintenance of social relationships and psychological healing. In Japan, funerals have begun to shrink significantly even before the pandemic. While in Vietnam, modern and large-scale funerals have become increasingly popular under the country's rapid social development. Results from our study helps discuss the transformation of these two trends in the post COVID-19 era in both countries.

Human Capital Discourse and Cultural Resources: A Case Study of Family Education in Japan

Cultural capital and cultural resources are key themes when considering educational equality and unequal social conditions. This study critically traces human capital discourse focusing on family education in Japan, inspired by theoretical frameworks of sociology of education, especially Basil Bernstein and Pierre Bourdieu.

In this study, we suggest that if we look into the cultural resources for families and the community, it is reasonable to consider the model of relationships of family changes and cultural resources of the local community. It proposes a conceptual framework of vertical and horizontal relationships and cultural resources in the local context to examine a new frontier in the equality of education.

This study discusses the findings of research works in Arakawa-ku, Tokyo, conducted between 2020 and 2022, and examines unique cases in Arakawa-ku, in which the local government has tackled child poverty and enriched the cultural environment for citizens through library activities that promote reading in the community.

This study presents a way to address educational inequality by realising cultural practices of reading. The research includes in-depth interviews regarding family reading practices, focusing on elaborated family codes in horizontal relationships among family members.

We also considered cultural resources, especially community-based resources, which include materials, symbolic goods, knowledge, values, human networks, and interaction, are not determined by socioeconomic conditions. A significant issue in creating cultural resources is how to create a culturally sensitive community with active citizenship.

Tokyo Marathon and Japan: In the Situation of COVID-19 and Tokyo 2020

In this presentation, I considered how the Tokyo Marathon has affected running and sports in Japan since 2012.

The survey was based on the media outlets of four major newspapers. We referred to the Tokyo Marathon website, the Tokyo Marathon Foundation website, the Tokyo Marathon Media Guide, the running magazine, and the race program. The results are as follows.

In September 2013, it was decided that Tokyo 2020 would be held, and from the following year, newspapers reported the Tokyo Marathon related to Tokyo 2020. The Tokyo Marathon in 2017 changed the course significantly and it was reported in 2017. On the other hand, media reports about the 2008 Tokyo Marathon, which became a social issue, have disappeared. Since 2019, the marathon has drawn attention for its involvement in the selection process for the Tokyo Olympics.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Due to the spread of COVID-19, the 2020 Tokyo Marathon was held only by the elite. The Tokyo Marathon 2021 was postponed twice the following year and was held in March 2022. Road races, marathons and sports in Japan have been canceled or postponed due to the cancellation or postponement of the Tokyo Marathon. Meanwhile, online marathons and track races for citizen runners are on the rise. I would also like to mention the Tokyo Marathon Foundation's response to the pandemic and its impact on Japanese civic events and sports.

Considering Intersections of Development Issues and Social Entrepreneurs

The effectiveness of business approaches to development has been recognised and keenly promoted by both multilateral and bilateral donors. In the 2030 Agenda, collaboration between the private and public sectors is a means of realising a sustainable society. Under these circumstances, the emergence of social entrepreneurs who challenges issues in less-developed countries is unprecedented. This emergence is partially supported by donors who aim to accelerate development through the diversification of development actors and by multinational companies pursuing their social responsibilities. On the other hand, many social entrepreneurs who address development issues work independently and separately from projects and programmes implemented by donors and companies.

This study investigates the diverse motivations of social entrepreneurs, especially Japanese ones, who challenge development issues and their supporters. The qualitative data have been collected through face-to-face and Zoom interviews, as well as related websites, seminars, and news media. The business sites, types, and targeted social problems of respondents vary: for instance, poverty reduction through handicraft and cacao in Indonesia, the elimination of educational disparity by connecting schools between Japan and less-developed countries, the reduction of the apparel industry's environmental impacts worldwide, and job creation for women through soap-making in Ecuador. Their businesses are start-ups or relatively small. As they are outsiders, their motivations shed light on marginalised social issues which host countries, as well as international donors, rarely touch or prioritise. The findings suggest that social entrepreneurs are motivated not only by sympathy and a sense of responsibility but also by other personal aspects, such as self-fulfilment, social ties, identity, and joy. These diverse motivations contribute to filling, little by little, unmet needs from the margins and become support for the realisation of a sustainable society.

How the Ready-Made Garment Workers of Bangladesh Mobilise Protest Movements at the Verge of Union Extinction?

The study aims to provide an intricate understanding of how ready-made garment workers of Bangladesh mobilise resources for social protests notwithstanding all forms of limitations. Despite pressure from national and international sources, the path to organising factory-level trade union is riddled with bureaucratic complexities. Certain provisions in the Bangladesh Labor Act has created scope for bypassing the trade union, therefore the owners are replacing trade union with 'pocket union' and 'Participation Committee. These committees usually serve the interest of the owner. Consequently, workers take extralegal strategies to mobilise power and leverage outside the production facilities with the help of the workers federation.

Sociomarkers and Connectomes: Neuro-Developmental Imprints in Adolescent Brains

The rapidly growing body of knowledge on the socioeconomic status's influence on the brain development has been accumulated. Development of a brain is shaped by numerous social factors. Relationships between social conditions and childhood neural connectomes are important to our understanding of cognitive development. In recent years, the empirical evidences between multiple socioeconomic status measures and brain structures suggest that various neural functioning influenced by the social conditions. Adverse social conditions invite high levels of stress and reduced environmental stimulation, which in turn has negative consequences on the neural developmet. These distressed social environments are associated with neuroanatomical structure of the brain. While we know that social environments (both home and neighborhoods) are closely associated with cortical and subcortical anatomy, yet the specific morphometric associations to the granular regions of frontal lobe is less known. Thus, the underlying mechanical aspect of the socio-neural association is the urgent matter to fully understand the neuro-cognitive development. Important studies on the relationship between neighborhood conditions and child developmental outcomes rigorously investigated neighborhood-level economic status. Using Adolescent Brain and Cognition Development (ABCD) data - brain imaging and social data

of 12,000 children (ages 8-11), we found that social conditions both at the household and neighborhood level are significantly associated with specific neural connections. We used Support Vector Machine (SVM) classifier and predicted the social conditions of the adolescent using neuronal connections. We evaluated the classification performance of the model using the following four metrics: Area Under the Precision-Recall Curve (AUPRC). The AUPRC was determined as 0.7525 for distinguishing children growing up in highly educated and high income families and limited education and low income families. Insight into social factors that contribute to early brain connectome is critical to rectifying the unfavorable disadvantages of children growing up in disadvantaged neighborhoods.

Covid-19 Pandemic and the Legitimacy of the State in South Korea: Public Health Crisis, Political Contention, and the Public Opinion

The COVID-19 pandemic has caused multiple crises, disrupting the network of trade, labor mobility, capital investment, and everyday lives of the whole population. While the state has tried to respond to the outbreak of the COVID-19 pandemic in many ways, it should choose effective measures not only in terms of public health but also the economic logic and political rationals. Unlike many European countries, South Korea did not take a lock-down, but it imposed social distancing and prohibited mass gatherings from the beginning, generating the closure of schools and shops. There was no political consensus regarding the measures against COVID-19 due to severe political contention between the ruling party and opposition parties. In addition, the government should find out actions against the outbreak and spread of COVID-19 and manage the economy and society. It resulted in the overburdened state in that it should take policy measures to overcome conflicting tendencies of the market disturbance and social disintegration as the COVID-19 pandemic has continued. The multiple crises have caused intensification of political contention between the ruling democratic party and the opposition conservative party further. Since the ruling party took power after the impeachment of former president Park Geun-hye of the conservative party, the hardship of the ruling party caused by the COVID-19 pandemic has led to a more severe political contention. The COVID-19 pandemic has generated the government's crisis and led to the ruling party's loss in the Presidential Election 2022. It might be called a curse of the ruling party during the COVID-19 pandemic since the health outcome and economic performance in South Korea was relatively good compared to other countries. This paper argues that during COVID-19, protest voting played an important role in South Korea, and instability and the volatility of politics increased.

Certified Vs. Unskilled Migrant Care Workers: Work-Family Decisions and Rights

Workers in the world are divided into two groups: highly skilled professionals *vs.* less- or un-skilled ones working under precarious conditions. How do migrant care workers, both certified and unskilled, make decisions on their work and family? And why? What legal and political conditions of the host and home countries affect their work-family arrangements? Studies have shown how strongly demanded care workers are globally; however, we know little about how such workers make divisions over and what determines their work-family matters. This project analyzes surveys and interviews with diverse migrant care workers in Japan. Those from Southeast Asia have grown in the country as the government has initiated a few migrant care worker programs. The Economic Partnership Agreement (EPA) arranges care worker migration plans bilaterally with Indonesia, the Philippines, and Vietnam. The technical intern training programs now include elderly nursing care as well. Vocational schools and colleges began accepting international students as nursing and/or elderly care majors. Some marital partners of Japanese citizens work as elderly care workers as well. Hospitals and care homes have expressed their interests in hiring workers from abroad, at the same time, experienced difficulties in finding quality workers who stayed long enough. Yet little has been analyzed what brings such immigrants to work as care workers in Japan, why they change or quit their workplaces or jobs if they ever do, and how and why they bring in or leave their families. This presentation shows how legal and political conditions, as well as their job (un)skills and residential statuses, play roles in the work-family decisions by migrant care workers and discusses the rights of workers and their families.

SHIRAHASE, Sawako* (University of Tokyo, Japan)

The Gender Gap in Unpaid Work in Later Life in Japan

Japanese society is characterized by a large gender gap, particularly in the labor market. Gender division of labor tends to be discussed within the work and family of working-age people. However, we do not know enough about the pattern and degree of division of labor within households after retirement age. Japan is the most aged society, and it would be an ideal case to see how long the gender gap in unpaid work lasts among those aged 60 years and over.

It has been claimed that a substantial gender gap in unpaid work, regardless of the degree of paid work of women, could be witnessed in the working stage of the life cycle in contemporary societies. Even during the COVID-19 pandemic, mothers with small children were more likely to feel stressed with unpaid caregiving work (OECD 2021), and Japan was no exception (Cabinet Office, Japan).

This study asked the following two questions: First, how much has the gender gap in unpaid work, represented by house chores, changed in late life? Second, how do class and gender impact unpaid work on leaving the labor force in the 60s and 70s? The data analyzed in this study are from a panel study of senior people in Japan (JPSSP) waves 1 to 6, which has been conducted every two years since 2010. The respondents of the JPSSP were men and women aged 50 to 84 years at the first survey.

We found that, for both men and women, their work status affected the time spent on unpaid work while its degree is larger for men than for women. However, how long men and women spend on household chores remained the same throughout later life.

SHIRAHASE, Sawako* (University of Tokyo, Japan)

The Intergenerational Conflict Reconsidered: Focusing on the Intention of Wealth Transfer from Parents to Children

This study examines how wealth transfer from parents to children occurs in Japan, the most aged society. The high speed with which the population is aging could cause serious conflicts in beliefs, social values, preferences, and relationships, particularly within families. However, micro-level generational relations between parents and children are not necessarily consistent with macro-level circumstances. It is a common understanding that wealth inequality has remained substantial and expanded these days (Pocketty 2014) and a positive link between wealth inequality and intergenerational transfers has been found (Alvaredo, Garbinti, and Piketty 2017; Piketty and Zucman 2015). Attias-Donfut and Wolf (2000) state that bequests lead to expanding inequality. The main research question is whether the parental intention to transfer their wealth to children declines as they age, or if parents enjoy social security benefits sufficiently, do they maintain their intention of wealth transfer?

In this study, we test whether the life-cycle hypothesis applies to contemporary Japan, the most aged society in our analysis (Modigliani 1988; Horioka 2010). The main hypothesis is whether aged people are less likely to save once they enter the late stage because longevity is increasing and they expect the possible period without market income to become longer. Parents' motivation to transfer wealth is discouraged as they age.

The data analyzed in this study are from a panel study of senior people in Japan (JPSSP) waves 1 to 6, which has been conducted every two years since 2010. The respondents of the JPSSP were men and women aged 50 to 84 years at the first survey. In our preliminary analyses, we found that the experience of receiving a bequest from parents encourages the intention to transfer wealth to their children, and the intention to transfer wealth does not change with age.

Prenatal Testing and Views of Disability in East Asia, South-East Asia and South Asia

The author is currently running a research project on prenatal testing and views of disability in nine countries in East Asia, South-East Asia and South Asia. In the preceding period, a survey on reproduction, including abortion, was conducted in 14 countries.

In this report, we would like to discuss the macro situation regarding the relationship between prenatal testing and abortion.

In conclusion, the nature of abortion is one of the major factors defining the use of the technology of prenatal testing.

In Myanmar and the Philippines, abortion is banned. Specifically, in Myanmar, abortion is prohibited except in cases where the mother's life is in danger. In the Philippines, it is outlawed without exception and the Constitution provides that the foetus is also protected. In both countries, a strong stigma against abortion is shared by the population.

In Taiwan, as in Japan, there is a double standard: there is an abortion offence in the Penal Code and it is conditionally permitted under the Eugenic Health Act. In Taiwan, the law stipulates that abortion can be performed in cases where pregnancy and childbirth cause damage to physical and mental health and affect family life. Specifically, this includes forced sexual intercourse, pregnancies by close relatives, cases of foetal disorders, etc. in Taiwan.

Abortion is legal in Viet Nam and there are no rules on the number of weeks or conditions. The Law on the Protection of Public Health states that women have the right to have an abortion on request and that the Ministry of Health is obliged to ensure medical care.

In interviews and survey conducted by the authors, in addition to the accessibility of abortion by the legal system, attitudes and ideas about abortion are related to attitudes and ideas about prenatal testing.

The Political Economy of Human Trafficking -- How Neo-Liberalization Enables Crime

Human trafficking is a crime under international law. As an example, the EU Anti-Trafficking Directive requires Member States to transpose its stipulations into national law, includes an EU Strategy for eradicating trafficking, and establishes an Anti-Trafficking Coordinator in the European Commission who supports and monitors implementation of the directive and strategy. However, there is little evidence of significant change. This paper addresses the puzzle of strong and comprehensive international, regional, and national laws outlawing trafficking, and the flourishing of exploitation. Contrary to other critical analyses of human trafficking, which either focus on the agency of victims, or the demand-side, our analysis builds a comprehensive theory of the political economy of human trafficking, highlighting the role of profit-taking, the link between neo-liberal reforms of the regulation of services, labor and the sex trade, and the interface of legal and illegal economic activities in the establishment of human trafficking chains. Neo-liberal reforms, we argue, stand in contradiction to anti-trafficking efforts by facilitating the continued existence of highly criminogenic sectors of activity that build on fields of legitimate services.

This paper focusses specifically on trafficking for purposes of sexual exploitation, the largest sector of trafficking crimes, and the site of debates over what should be and should not be criminalized. It shows how profit-takers in trafficking chains can exploit liberalized services and mobility and evade the law. The analysis addresses the broader set of policy developments that might reduce trafficking in human beings, including the criminalization of profit taking from the exploitation of others and the regulation of private employment services and cross-border subcontracting of labor.

Gender Equity Dynamics and Health Seeking Behavior of Women in Matrilineal Families

Gender Equity Dynamics and Health Seeking Behaviour of Women in Matrilineal Families
Prof. Jayashree Shivananda
Health seeking is the action and practice undertaken by any individual to be healthy and remain free from the occurrences of diseases. It is one of the demand side strategies which includes whole gamut of socio, economic, psychological, cultural and medical issues. Since family structures and kinship patterns have strong preference for men, women's position in a family is a pertinent factor in acquiring health and wellness. Besides these, social constructions of gender influence to excess good health. Thus, women's choices are severely curtailed by these structural aspects of the family and society. Thus, social variables are strong and vibrant in determining the health seeking behaviour of women in midlife. Our knowledge pertaining to life of women in midlife is sparse in many areas sometimes it is biased by ageism and sexism. Midlife issues of women such as menopause have been dealt extensively. However, health related experiences and health seeking behaviour in matrilineal families have not been adequately focused. Matrilineal family is a special feature of coastal districts of Karnataka which has far reaching influence and implications on status and life of the women. In this system women are empowered by birth. Birth of a girl child is celebrated because she is the carrier of family tree. In this system father does not have any right in the possession of property. However, there are lot many changes occurred in these families which is the focal issue of the present paper. Study used mixed methods of analysis, basically based on structured interview method. Besides this, study conducted some in-depth interviews and narratives to unearth the hidden and subtle information from the respondents.

SHMIDT, Mayya* (Uppsala University, Sweden)

On the Concept of Sharing

Sharing is as old as civilization, proven by the well-established body of literatures in the fields of anthropology and behavioral science. Prototypes of sharing are found within kinship-based groups and characterized as empathetic caring behavior helping to create and reinforce social bonds and feeling of commonality. Sharing may have played an important role in shaping human life history, social organization, cooperative behavior. Anthropological studies of the hunter-gatherer societies make it clear that sharing was constitutive of

social relations, a practice of distribution governed by social norms, and the most universal form of economic action, distinct from the narrower notion of reciprocity. The described form of sharing was distinguished by: having roots in moral economy, meaning "to divide into parts", having food and communal infrastructure as its object; existence in kinship-based groups, and most importantly, the practice of sharing was altruistic. Modern forms of sharing are, on the opposite, networked, embedded in market economy, having at least three meanings (sharing of both tangible and intangible objects, emotional states and even "fuzzy" objects such as "belief"), practicing exchange irrespective of the social structure of the group or the structure of relations between members. Sharing again became *distributive* in the context of "sharing economy" - "for-profit and non-profit peer-to-peer sites serving individuals in offline exchanges". The term has entered the mainstream where it has become predominately associated with companies such as Airbnb, and was discursively constructed as digital, highly technological phenomenon. Today's sharing economy is said to be scaling behaviors and forms of exchange that used to be among close-knit communities to a broader loose digital community of anonymous peers. Here lies the principal novelty of today's sharing as compared to pre-modern assumptions. This has been dubbed "stranger sharing" to depict how platforms facilitate sharing between people who lack any common connections.

SHMIDT, Mayya* (Uppsala University, Sweden)

Sharing Economy in Sweden: A Sociological Study of the Organizational Field for Non-Commercial Sharing.

The proposed paper is a part of an on-going dissertation project that examines Sharing economy organizing in non-for-profit sector in Sweden. What came to be called the "sharing economy" – *"for-profit and non-profit peer-to-peer sites serving individuals in offline exchanges"* (Schor 2020) emerged on the U.S. scene in the aftermath of the Great Recession and the Occupy Wall St. movement , as a need to "do more with less". While most accounts on the sharing economy concentrate on the commercial players, as long as the earliest platforms associated with the sharing economy were more or less straightforward extension of market economy, following "business as usual" rules, community initiatives are neglected in academic research. The non-for-profits, however, have been integral for the emergence and development of the field from the very beginning. Research that explicitly addresses organizing of non-for-profits in the sharing economy is however lacking.

Using rich explanatory potential of neo-institutional theory in organizational analysis, this paper has a of purpose of analyzing institutionalization of the organizational field for nonprofit sharing - a community of organizations that partakes a common meaning system and whose participants interact more frequently and faithfully with one another than with actors outside the field (Scott 1995, p.56) To this end, it asks the following research questions: How and why certain actors come together as a field for sharing economy organizations? What participation in a field of SE organizations ultimately means for the inner workings of a non-for-profit organization?

The contribution is informed with 20 in-depth interviews with stakeholders: CEO's and board members of several SE organisations, as well as representatives from municipalities, academia, strategic innovation projects, and a cooperative enterprise. The fieldwork was situated in 4 cities: Stockholm, Gothenburg, Malmö, Umeå

SHOJI, Kokichi* (University of Tokyo, Japan)

A Historical Way to Integrate Human Bodies and Our Planet into a Social and Ecological System

In our planet live eight billion people and they are expected to increase to ten billion in thirty-five years. The surface of the planet has been increasingly disrupted by human activities so that the climate has been changed drastically so as to make geologists say we are getting into a new era called 'Anthropocene'. These whole changes have been brought about by developments of societies after the Ages of Discoveries by European nations of the American Continents and through their inclusion of Asian societies into the world system. Therefore, we have to integrate this accelerating increase of the population with the drastically deteriorating global surface by reflective inquiries of these five centuries. Our contemporary global society must be a dialectical systematization of extremely various human bodies and infinitely variable global surfaces which we should call a complex social and ecological system instead of a simply complicated social system.

Our contemporary world system has been mainly controlled by the hegemony of the United States that was molded as a typical civil society with a political form of republic. It has been quite reasonable that the Transatlantic Civic Revolution from the seventeenth to the nineteenth centuries reached a republic of citizens through great shakings between empires and republics starting from a compromising monarchy. Trials to usurp the American hegemony by the Imperialist Japan, by the German Third Empire and by the Soviet Socialist Empire all failed, since all of these could not succeed in molding a supernation by mixing varieties of nations for superpower to integrate inner differences to fight for a leading position in the dynamically re-systematization

of the slacking world system. As China is an enormously homogeneous nation, a critical point of the twenty-first century global social change would depend on whether it can produce inner varieties to cope with.

RC35-JS-69.5

SHOJI, Kokichi* (University of Tokyo, Japan)

Sociological Ways to Create a Human Society on Networked Contacts and Harmony with the Planet

Sociology must show ways to build a global human society on a sublation of ethnicities. For this, we need an economic basis, a political framework and rules of social contacts. All varieties of cultural contents should be accepted. For an economic basis, we already have a capitalism which allows everybody to do a business of all kinds. Some huge capitals that dominate all economic activities should be internationally regulated by a global political frame with no rested places for tax evasion. Such a political frame should be created on the accumulations of international and global setups as a developed international organization based on the United Nations. All social contacts should be made on the bases backed up by infinite networks of Liberty, Equality, Fraternity and Harmony. It is very important for any economic, political and social activities not only to keep but strengthen harmonious relationships with our planet of the global ecological system.

This formation of a human society should be done with historical considerations of those peoples who have been sacrificed to build the modern world system, such as native American, black African, and Asian colonized peoples. The human society must eliminate any biases and customs to discriminate different people and must continuously try to create jobs which are effective to mix all kinds of ethnicities. Nations should be gradually reorganized into subgroups or subregions like local or partial divisions of contemporary existing nations. China as a key nation should try to respect minor ethnicities and try to divide themselves into democratic subgroups who can play various roles for the human society even on their One Belt, One Road Initiative. India would be able to play roles in order to make the human society more multiple and diverse as a nation who has various ethnic origins and historical experiences.

SHOJI, Ryo* (Toyo Gakuen University, Japan)

Applicability of the Biographical Approach to Resilience Theory: A Case Study of Returnees to an Evacuation-Order-Lifted Area in Fukushima after the Nuclear Power Station Accident

Resilience has been a topic of special interest to sociologists studying disasters. Most studies that have attempted to elucidate factors of revitalization from disasters have focused on social capital in a local community and have conducted structural and formal analyses at the macro-level or meso-level. However, in order to elucidate resilience to disasters that cause specific loss and hardship to people's daily lives, it is essential to employ qualitative methods with a biographical approach to interpret individual disaster experiences.

This study investigates individual disaster experiences of victims and generation processes of micro-level resilience through life histories. The interview data used is from returnees to Otomi District in Odaka Ward, Minamisoma City, Fukushima Prefecture, which was an area under an evacuation order until 2016, following the 2011 Great East Japan Earthquake and Fukushima Daiichi Nuclear Power Station accident.

As a result, it was found that differences in livelihoods and life stages have a significant impact on the emergence of loss and hardship. It is also indicated that occurrences during the long period of evacuation and return should be viewed as disaster experiences that bring about later changes in people's lives. Thus, these experiences affect the generation of individual resilience. It is suggested that these experiences can be positive factors that bring about creativity in the community life, such as discovering new community issues and rediscovering a purpose in life, as well as negative factors such as trauma, injury, and giving up on rebuilding life in the community.

These findings advance our understanding that a small disaster community can be rebuilt only through the collective creativity of returnees' individual resilience. Finally, this study contributes to the theme of this session by discussing the necessity and applicability of the biographical approach to research into disaster experiences from the perspective of resilience theory.

Strengthening Health Practitioner Regulation: A Large-Scale Rapid Systematic Review

Health systems worldwide face considerable challenges in the recruitment, training, distribution, and retention of a sufficiently skilled and competent health workforce. This was brought into sharp focus by the COVID-19 pandemic. Health practitioner regulation (HPR) systems are increasingly recognized as playing an important role in supporting health workforce availability, accessibility, quality, and sustainability.

Commissioned by the World Health Organization (WHO) Health Workforce Department to assist in the development of new global health practitioner regulation guidance, this study aimed to identify the evidence relevant to health practitioner systems and practice to inform governments, regulators, and other stakeholders achieve health system and workforce goals. We identified 410 academic sources and 428 sources of grey literature published between 2010 and 2021. Data from these sources were extracted and synthesised through an integrative approach bridging the wide variety of evidence and data sources.

The imperatives created by the COVID-19 pandemic have demonstrated how quickly scope of practice reforms can be implemented. Some health practitioner groups, particularly nurses and non-physician clinicians, have struggled to secure prescribing and administration authorities, sometimes due to resistance from physician groups. These tensions suggest workforce reform should be core business for governments, and demarcation disputes between occupational groups should be managed in a more interventionist way to increase the pace of reform. These reforms should be evaluated and built on systematically.

Our large-scale review synthesised evidence from a broad range of academic and grey literature sources to inform the first WHO global guidance on health practitioner regulation. Assessing the impact of health practitioner regulation should be prioritised in future research, as should systematically tracking the results of health practitioner regulation studies that evaluate health system and workforce outcomes.

Bureaucratic Training in India: The Ambiguity of Rules in a Bureaucrat's Work

This paper will present an ethnographic insight into one of the several constitutive contradictions which mark the training of the higher bureaucracy in India. It draws on two years of fieldwork in four bureaucratic training academies - the Lal Bahadur Shastri National Academy of Administration (LBSNAA), Mussoorie, the Sardar Vallabhbhai Patel National Police Academy (SVPNPA), Hyderabad, the National Academy of Direct Taxes (NADT), Nagpur and the Foreign Service Institute (FSI), Delhi that conduct formal training programs for the Indian Administrative Service (IAS), Indian Police Service (IPS), Indian Revenue Service (IRS), and Indian Foreign Service (IFS) respectively. It will be argued that the training process strives to produce an 'officer' who is both rule abiding but also knows that rules cannot and must not be followed in their entirety. The 'ideal' bureaucrat is not a Weberian value neutral person but a networked actor who navigates through a web of kin, community and personal affiliations and connections. Rules are presented in the training process as fungible entities with multiple roles. They are functional objects which can be expanded, distorted and even suspended to make room for bureaucratic action. They are also aesthetic objects in that rules must be seen to be followed. Rules are objects treated with cynical distance by the bureaucrats in training, ruing the pointlessness of rule-obsession while also learning to navigate a world bound by them. Therefore, eschewing the approach of studying the bureaucracy by differentiating between the official and practical realms of action, this paper will argue that the training process is geared towards producing an internally split bureaucratic self.

SHRESTHA, Pranita* (School of Architecture, Design and Planning, Australia)

Poverty, Power and Patronage -a Socio-Spatial Network Analysis and the Emergence of Three Squatter Settlements in Kathmandu, Nepal-

This paper uses a *socio-spatial network analysis* to trace the evolution patterns of three informal, squatter settlements in Kathmandu, the capital city of Nepal. A socio-spatial network analysis described in this paper has its theoretical roots within the concept of *relational social capital* as explored by Bourdieu, 1986 and others. Within this concept, the definition of social capital is not limited to measurable asset 'stocks' rather it focuses on one's ability to possess/access durable networks – firstly, in terms of *social relationship* that allows individuals to claim *access to resources* and secondly, in relation to the *amount and quality* of those resources (Portes, 1998). Hence, a more nuanced definition of *relational social capital* is *resources* embedded in a social structure which are *accessed* and/or *mobilised* in *purposive actions* (Lin, 1999).

Empirical evidence for this paper is based on qualitative research fieldwork conducted through in-depth interviews, focus group discussions and comprehensive site analysis. As a framework of analysis, the paper uses a socio-spatial network analysis to identify the (a) *type of network resources*, (b) *linkages between actors and structures*, and (c*) implications of these network linkages* to trace evolution of three squatter settlements. Key finding from this paper uncovers a relational pattern of *poverty*, *power* and *patronage* during the emergence of these settlements. Moreover, findings also point to the significance *one's own connections* (also known as *'afno manche'* in Nepali) deeply rooted in social structure and power hierarchies within Nepalese society.

Role of Self-Help Groups in Empowerment of Indian Rural Women (With special reference to Rewa District, Madhya Pradesh, India)

After independence Indian women paid more attention to their rights and self-Reliance. This change became a positive initiative for their self-Reliance. India's healthy democracy and constitutional provisions made a positive plan for the development of Indian women self-help group.

Self - help groups [SHGs] are small voluntary association of the rural women from the same socio-economic background who work together for the purpose of solving their problems through self - help and mutual help. The women organize themselves at the grass root level to find innovative solutions to the specific problems which develops self- esteem, self- reliance and self confidence among them. It is the need of the hour to analyse the activities of the SHGs.

The scope of this study states that the independent variables like education, income and mass media contact can be positively and significantly related with the role of SHGs

This study will be based on Rewa District of Madhya Pradesh, India. The aim of this study is to assess the role of Self-Help Groups in empowering rural women and to identify the major constraints faced by women.

Tracing Policy Changes in the Indian Climate Discourse: Comparing Policy Beliefs and Advocacy Coalition during Copenhagen, Paris and Glasgow Climate Conferences

The Indian climate policy has evolved as a multi-stakeholder process and the existing literature documents the importance of various actors and their networks in driving different agendas within the policy subsystem. Research is still inadequate on how the climate policy discourse has evolved through the years in congruence with the changes in the actor networks. The current study aims to uncover the patterns of change in the dominant elements of the climate discourse in India and the actor constellations driving them through the years. It employs print media data from three English dailies for three crucial years in the Indian climate policy corresponding to major international climate conferences of parties (COP): 2009, 2015, and 2021. It draws theoretical

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

insights from the Advocacy Coalition framework (ACF). The ongoing analysis has revealed some major shifts in the discourse related to voluntary reduction in emissions and coal phase-out between 2009 and 2015. Further, the Covid-19 pandemic is expected to have some major impacts on the climate discourse in the country in 2021. Based on longitudinal comparison, the findings will provide insights into what composition of actor coalitions leads to a more effective climate action and can provide policy recommendations to manage the multi-stakeholder engagement towards this direction.

Resilient Future Options Following Covid-19 Pandemic Among at-Risk Prisoners with Injection Drug Use History: Insights from Kyrgyzstan

Background: HIV epidemic in Central Asia is driven largely by injection drug use (IDU) that is criminalized and concentrated in prisons. Responding to this challenge, methadone maintenance therapy (MMT) was introduced in Kyrgyz prisons to reduce HIV risks among prisoners with IDU history but operates at 10% capacity. With prisoners' input, to promote MMT uptake during Covid-19 we developed an intervention that includes a 12-hour module teaching peer health advocates how to avoid conflicts and support healthy behaviors.

Methods: In Jan-Sept'22 we piloted training module among 99 prisoners with IDU history from two male prisons near Bishkek. Mindful of within-prison hierarchy we included "regulars" and "sell-outs". A pre-training survey collected information on socio-demographics; incarceration history; Covid-19 experiences; substance use in-prison and pre-incarceration; mental health; and other chronic health conditions. Ethnographic field notes from the training were analyzed for manifest and latent themes. The post-training survey and focus-group gathered participants' feedback for improving the module.

Results: 86% of participants had depressive and anxiety symptoms; 28% had low resilience, and 57% considered their overall health as fair. The biggest stressor was fear of Covid-19 (72%); 62% used drugs within-prison as stress-coping since March'20. However, 79% believed helping other prisoners gave them future hope, and 73% felt they could rely on at least two other persons within prison for social support. Ethnographic fieldnotes highlighted IDU as negative stress-management tool, and peer-support as positive stress-management tool within prisoners' "bread-breaking families", that endorsed MMT use for health needs.

Conclusions: Among prisoners with IDU history, peer-support mitigates stress-related IDU during Covid-19 pandemic and facilitates future health resilience. While violence is present in any prison culture, prisoners also genuinely care for each other's health, demonstrating resourcefulness in providing both emotional and instrumental support to peers. Peer-driven interventions may enable healthier future by bridging prisoners to addiction treatment.

Mobility Regimes and Care Workers Pre and Post Pandemic

Abstract:

Long-term care systems in many high-income countries face chronic care worker shortages, which have intensified over the course of the Covid 19 pandemic. Yet, those systems depend on the expansion of the care workforce to meet increasing needs for care provision. While the pandemic has shone a light on care and its 'essential workers', care remains undervalued both in terms of the pay and conditions of care work and its status in labour migration systems. Who provides care has long depended on the unpaid and low-waged labour of women, racialised and migrant groups. And it has long depended on relationships of mobility and immobility of different groups of workers, both within and across national borders. This paper considers what types of mobility regimes are evident in long-term care; the impacts of the pandemic on those regimes; and the implications as regards policy responses to care worker shortages. It examines mobility in terms of migration policies, but also connections with other areas of policy and practice that shape the im/mobility of care workers into, within and out of care work to other sectors or locations.

In light of the issues raised, the paper reflects on the extent to which care is/should be included within labour migration programmes, and under what conditions, as part of policy responses to care worker shortages.

Intersectionality in Education Policy Documents: Comparative Analysis of Nine European Countries

While educational inequalities have been intensively studied through empirical and academic research over the last few decades, gaps still exist in our understanding of how policies to mitigate unequal access to education evolve over time, especially with regard to the identification and definition of vulnerable groups. Meanwhile, there is a growing recognition that intersectionality perspective is necessary for a nuanced study and understanding of vulnerabilities. With that, this comparative analysis strives to understand how the policy concepts relating to educational inequality are constructed in different countries particularly focusing on the extent that intersectionality has been mobilized in policy documents. To this end, educational policies of nine European countries[1] were analysed in the framework of the European Union's Horizon 2020 research and innovation programme, under grant agreement No. 101004392 (PIONEERED). These sets of analyses served as the foundation of the current comparative study, which demonstrates that indeed, in all countries policy perceptions of educational vulnerability have become increasingly complex over time, recognising that vulnerability relevant to the educational realm is not restricted to pedagogical issues, but also involves multiple forms of deprivation, different needs and conditions of students that affect their ability to perform within the education system, as well as unequal conditions, in which educational resources and opportunities may be distributed unequally. This study takes a unique approach and specifically uncovers the ways in which education policy documents are cognizant of different axes of inequalities and intersectionality in defining vulnerable groups. The study also reflects on the extent that cross-fertilization happens between scholarly work and policy making, highlighting the importance of brining academic knowledge with applied fields.

Negotiating the Future: U.S. Labor Unions and Low-Carbon Energy Transition

In this National Science Foundation-funded study, we examined the views of 10 national labor unions in the United States, eight of which represented workers in the fuels, energy generation, energy distribution, transportation machinery manufacturing or construction industries (workers defined by the U.S. Department of Energy as "energy workers"). We examined data including discourse created by or hosted by each union on its website from 2012-2020, and 101 interviews with labor union members and leaders conducted in 2019 and 2020. The political economic context of the U.S. includes shifting energy policy; market shifts away from coal and toward natural gas and renewable energy sources; skills training provided by unions rather than the state or corporations, and declining private-sector union density combined with limited labor protections. We sought to discover whether the union viewed low-carbon energy transition as necessary, desirable or immanent; the union's position on energy technologies, and which government policies relevant to the development of energy technologies, workforce training and the support of displaced workers unions lobbied for or sought to prevent. We discovered that, while all the unions recognized the need to address climate change by lowering greenhouse gas emissions, unions' strategic approaches to changes in the energy system, and the technologies and policies for which they advocated, were diverse. Diverse approaches to the prospect of low-carbon energy transition were not derived just from differences in the industry or occupation of workers represented, but also from unions' need to reconcile strategic alignments with fossil fuel incumbent industries with the effects of anticipated decarbonization policies, their impact on the market strength of fossil fuels, nuclear power and renewable energy sources such as wind and solar power, and their need to ensure that the renewable energy jobs of tomorrow are well-paid and unionized.

Intergenerational Mobility in Education Among Women: A Micro-Level Study from Weavers' Community of Varanasi, India

Macro-level studies on intergenerational mobility among women in India suggests that, there is a need to further probe certain excluded communities that have a higher likelihood of persistence of educational status among women through micro-level studies. The present study investigates the extent and drivers of high/low intergenerational educational mobility among young women (vis-à-vis their mothers) belonging to the weavers' community of Varanasi, India. Using transition/mobility matrices and mobility measures, along with qualitative methods, the paper builds on a mixed-methods study conducted among 364 households of weavers' community from Varanasi. The study shows that the overall intergenerational educational mobility among women (vis-a`-vis their mothers) from the weavers' community of Varanasi is 0.30 and there is no downward mobility. The qualitative findings further highlight various reasons enabling or preventing high educational mobility in the given context. In conclusion, the paper illustrates several micro-level issues and disparities in intergenerational educational mobility that are not clearly evident through the macro-level studies and further helps in making informed policy decisions.

Disturbing Urbanization: Pro Et Contra of Technical Authoritarianism

By the beginning of the XX century scientific and technological progress was perceived as one of the most important factors contributing to the positive development of mankind, increasing material well-being and improving the quality of life.

During the XX century technological expansion led to the possibility of total control in society (M. Foucault), new frontiers and criteria of power – the power of technology and the technique of power (P. Vysheslavtsev), "science and technology as an ideology" (J. Habermas). Technocracy in the form of the dominance of technical experts in society and politics has turned into an information systemocracy in an information- and system-controlled society (H. Lenk).

Analysis of the nature of social crises, that have become in the XX-XXI centuries, characteristic phenomenon of human civilization, allows us to identify a number of patterns of formation. 1) Excessiveness of any social processes, including economic and development of any technologies; 2) Artificially created subordination of some elements to others, which does not exist at the essential level, etc.

In the report, I refer to the total technization of nature and society as a model for the artificial transformation of natural and social processes. Abandoning technology cannot be the solution to the problems created by technology.

Therefore, I understand the departure from the city not as a departure from the achievements of mankind, but as a rejection of the technical authoritarianism that dominated human civilization.

An Analysis of Education of Junior Officers in the Turkish Armed Forces

Turkey has a strong army in terms of quality and quantity both in the MENA Region and Europe. As the second biggest army in NATO and the eighth biggest military in the world, the Turkish Armed Forces (TAF) took part in many international peacekeeping missions all over the world. The military is also still conducting important missions against terrorism in and out of the country.

The Turkish military is proud of its "modern warrior tradition" stemming from the heritage of the Ottoman Empire and of Mustafa Kemal Atatürk, the founder of modern Turkey. The Turkish military educational system focuses more on values than materialistic goals and this tradition is rooted in the military history of the country the importance is given to values such as patriotism, instead of materialistic (and self-interested) goals of wealth or status.

Even though the military education system has a traditional background, technological, environmental, and social changes are affecting the traditions of the military itself and its training programs. The Turkish Military Academy offered a bachelor's degree, and the training program was a mix of classroom activities and field training. Cadets are also having intensive military leadership training programs.

The Turkish military education system is also influenced by NATO and the UN, which have an important impact on organizational capacity. Furthermore, the Turkish military is an organization that has a unique culture and in the

Turkish Army, values like loyalty to the nation and country, obedience, determination, endurance, courage, bravery, self-sacrifice, getting along with peers, ethical behavior, altruism, professionalism, responsibility for duty, honesty, and competence which have been socially constructed through long years of experience, since 209 B.C.-the accepted the founding day of Turkish Army. This strong cultural background helped the Turkish military to serve the nation.

Prestige Seeking and International Commitments: Turkey's Involvement in the Nagorno-Karabakh War

Third-party involvement in conflicts has been the subject of numerous studies. The motivations behind the interventions of third parties in conflicts vary. Being involved in an international conflict brings with it some challenges as well as advantages. In consequence, foreign policy executives weigh whether the consequences of a possible conflict involvement will be beneficial for their states. This paper claims that one of the main drivers of Turkey's tendency to involve in conflicts in its neighboring geography is to extend Turkey's international prestige. The claim of the study will be supported by analyzing Turkey's involvement in the 2020 Nagorno-Karabakh War. Turkey's open support to Azerbaijan is closely related to Turkey's active foreign policy, especially since 2016. As a region that has grappled with a never-ending conflict since the dissolution of the USSR, Nagorno-Karabagh takes a significant part in Turkey's Caucasus policy. Considering the historical and cultural ties, Turkey is among Azerbaijan's most important international partners. This paper analyzes Turkey's role in Azerbaijan's conflict with Armenia by examining Turkey's military and diplomatic efforts on the issue. The Nagorno-Karabakh War in 2020 certainly marked a new turning point in military relations between Turkey and Azerbaijan. Although Turkey did not directly participate in the war, it was the biggest supporter of Azerbaijan and stated that it would give all kinds of support to Azerbaijan if necessary. Having played a major role in the restructuring of the Azerbaijani army, Turkey has strengthened its military reputation through the superiority of the Azerbaijani forces against the Armenian forces in the 2020 war. Another factor that increased Turkey's military reputation was the development of the Turkish defense industry. Especially the progress in armed UAV technology coincides with the Erdogan administration's effort to increase the prestige of the country by transforming foreign policy into a more military dimension.

SIIMES, Nikolai* (University of Auckland, New Zealand)

A Wine Glass Half Full: Consipience and the Microbiopolitics of Natural Ferments in a Post-Pasteurian World.

This paper explores the more-than-human production of wine through the case of 'natural' (uninoculated) ferments. I ask how microbes, humans, and technology relate, sense, control, and affect each other. In this paper I engage with consipience (Evans, 2022) and microbiopolitics (Paxson, 2008) through a multispecies ethnography of 'natural' wine fermentation. Evan's (2022) conception of consipience—the two-way knowing/sensing between subjects, in this case winemaker and yeast—proves useful as it foregrounds the relational, agential, and sensorial elements of this fermented encounter.

Terroir is a defining concept in the wine world, and the microbial component of terroir has only recently gained recognition. Yeasts and bacteria leave their fingerprints in wine, which can be identified through chemical and sensory analyses (see Knight et al., 2015). There are ontological and epistemological ramification of such microbiome research on our understanding of terroir and quality, mirroring the profound impact of human microbiome research. Fermentation also rethinks biopolitics; we can examine both the politics of life, and the politics over life in the journey from grape juice to wine.

The explosion of fermentation technologies has allowed an increased exertion of biopower, or micro-governmentality over winery microbes. Commercially cultured, standardised, 'predictable', and homogenous yeast strains are sold to winemakers across the globe as 'safer' than allowing a 'natural' ferment. Winemakers have myriad additives, technologies and techniques available, but they cannot control yeasts directly, they can only guide them in economically useful ways. Winemakers' exertion of micro-governmentality relies on their sensory encounters/consipience with microbes and their metabolites.

'Natural' ferments can then be seen as a microbiopolitics of resistance; rejecting the use of commercially standardized yeast cultures and supporting biodiversity and indigeneity of microbial populations. My fieldwork explores whether this is the case, and whether we are witnessing a pro-biotic (Lorimer, 2020), post-Pasteurian turn in wine production.

The Role of Scalar Standards in Qualifying Wines: An Antipodean Study of Biodynamic Wine Values and Valuation.

The esoteric philosophy of biodynamics embodies a usually nature-centric, yet holistic view of wine production and wine economies. Despite plentiful scepticism of biodynamic beliefs and practices, many of the world's most highly economically valued 'fine' wines are produced biodynamically. While for many practitioners of biodynamics attaining economic value is not their primary motivation for seeking certification, the instrumental nature-values that biodynamic producers pursue are still dependent on the exchange or market value of their wines. This raises two questions: 1) what value does biodynamic certification hold for the producers that seek it out? And, 2) how are biodynamic wines valued by market makers? This paper engages with diverse economies scholarship to examine a broader understanding of value and valuation through this case study.

Wine value, often understood interchangeably as 'quality', is a rich source of debate (Brice, 2014; Smith Maguire, 2022). Wines more than any other agricultural product must be qualified and framed: wines that travel internationally require branding and these narratives travel alongside them. This can be achieved in part through global standards and certifications. Despite the potential for 'scalar mismatch' (Liboiron, 2021), biodynamic certification involves demonstrating that production methods are in accordance with accepted large-scale, global and national standards, through meta-organizations such as Demeter. In this research we examine the interplay of biodynamic standards and value, paying particular attention to more-than-capitalist values of wine.

This paper reports late breaking ethnographic and interview data collected with wine producers, intermediaries and industry authorities in New Zealand and Europe. We have three aims: 1) to understand the transnational standardization and scalar synchronization of biodynamic certification, particularly examining the meta-organisations in these relationships, 2) to sketch the diverse values of biodynamic certified wines, and, 3) to examine the processes of valuation and qualification of biodynamically certified wines in global markets.

SIKORA, Joanna* (Australian National University, Australia)

An Unusual Dynamic? How Diverse Student Groups Transitioned from Secondary to Tertiary Education Pre- and during the Pandemic in Australia

Australia's early stages of COVID-19 made international headlines due to its low case numbers. Yet, the country's specific geo-political situation involved prolonged restrictive lockdowns. Historically educational provisions in Australia, a federation of states and territories, have been designed and implemented by local governments in a largely independent fashion. Local governments have also implemented pandemic-containing restrictions to some extent in an independent fashion. This regional variation created unique environments with the potential to affect not only youth who differ by socio-economic status, gender or ethnicity but also those who reside in different jurisdictions.

So far, the literature on the impact of the COVID pandemic has focused on the pandemic's adverse effects on the well-being, education and employment outcomes of Australian youth. However, whether these outcomes are similar regardless of youth residential characteristics is unclear.

Therefore, this analysis compares youths' mental and economic well-being outcomes and the dynamics of educational transitions from secondary education among urban and rural youth across Australia.

I use data from the Longitudinal Survey of Australian Youth (LSAY), the survey collection that started in 2015 and involved Australian Program for International Student Assessment participants who, every year, reported on their educational and work experiences. The most recent wave comes from the second half of 2021 – a time of extended lockdowns across urban and rural Australia.

The analyses reflect the life course perspective, are quantitative and involve regression models with time-varying and time-invariant predictors. Theoretically, this investigation draws on social stratification arguments that expect crises such as pandemics to exacerbate pre-existing inequalities and deepen the educational vulnerabilities among minority students. The second strand of theories that informs this analysis focuses on the mobilising and enabling processes that might emerge during crises, where some vulnerable groups serendipitously gain tangible educational advantages.

Negotiating a Mid-Stage STEM Career in Times of COVID-19: Reflections of Female-Identifying STEM Professionals

Australia, a country with a large migrant population, has relied on overseas-born science workers for a long time. The most recent Australian Bureau of Statistics Census data suggests that in mathematics, physics, chemistry and engineering, the proportion of women employed in the public sector jobs exceeds 64%. It is even higher within academia. Thus, Australian female scientists comprise a large share of migrants.

In this analysis, consisting of qualitative content analysis and natural language processing, I explore the narratives of 49 mid-career STEM researchers who identify as females. Their histories, which involve over half-a-million words in transcripts, were collected between September 2021 and January 2022 as part of the evaluation of the MAGIC (Mentoring And Guidance In Careers workshops for early career female and gender diverse researchers in mathematics, physics and chemistry) held between 2017 and 2018. The data utilized here comprise contextual information on scientists' workplaces and families, often acquired through indirect eliciting.

The analysis focuses on the remarkably different challenges but also some opportunities that scientists who grew up in the Middle East and Asian countries faced during the pandemic compared to their peers who grew up in Australia and other Western countries. Computational and lab-based scientists, parents and non-parents, people living away from their families and those with extensive caring duties shared an array of similar experiences. Nevertheless, migrant scientists negotiated a unique range of challenges as parents, leaders and team members in their workplaces which are seldom recognized in the extensive literature on gender and science. I argue for closer attention to the consequences of migrant backgrounds among STEM workers.

SILVA, Carlos Alberto* (Universidade Federal Fluminense, Brazil)

Discussing Perspectives about Vulnerability and Prisioners of War: American Civil War and Andersonville

The paper discusses the inhumane treatment of the prison population in prisons pointing out the reference with cases that occurred in the Andersonville prison where 13,000 people died. Andersonville is na important milestone about discussion of victims during the most importante conflict in American History: American Civil War. It discusses the importance of understanding the social and psychological vulnerability present in identifying the level of victimization in the situations studied. Allows the understanding of the concept of vulnerability within a social approach, the socio-educational role of prisons, observing authors such as William Hesseltine, Michel Foucault and Eugênio Zaffaroni. The discussion of the vulnerability imposed on prisoners presents a social dimension in the discussions developed by Urich Beck and Katzmann, in addition to a psychic approach with the works of Slavoj Zizek, Theodor Adorno and Hannah Arendt. Through a qualitative, descriptive approach, the research analyzes the treatment of the prison population, and victims of armed conflict. With the research it is expected to understand the socializing role of prison and the improvement of the quality of victims in armed conflicts.

Educational Practices for Disaster Risk Reduction at the Brazilian Federal Network of Scientific and Technological Professional Education

Climate changes and the increase of disasters have mobilized scientists, international and national governmental and non-governmental organizations to discuss strategies to reduce the climate disaster risk. Lots of studies demonstrate the increase in weather extremes and the necessity of effective ways to reduce the exposition and vulnerabilities of the population . Education for Disaster Risk Reduction (EDRR) is framed as an important strategy to disaster risks management, because it has tools that strengthen the resilience and capacities of communities, from basic to professional educational levels. In our research, we analyzed the potential and pathways to include Disaster Risk Reduction (DRR) agenda in the Brazilian Network of Scientific and Technological Professional Education. This Federal Network was established in Brazil in 2008 and currently has 656 units all over the country. Operating with all educational levels, every campus seeks to identify the local issues and social demands to create solutions for sustainable development and social inclusion. In addition, they are based on the joint effort of teaching, research and extension projects, working like an observatory of public policies with possibilities to be replicated to regional and municipal levels. Our proposal is guided by quali-quantitative methods and action-research approaches. The quantitative methods include the spatial analysis of educational buildings in flood- and landslide-prone areas, and a survey to identify the vulnerabilities and capacities of the educational sector working on these hazard-prone areas. The qualitative approach is composed of analysis content of national guidelines, disciplines, and initiatives led by partners of the Federal Network for the last ten years (2012 – 2022), and coproduction of educational and citizen science initiatives in EDRR in a network

hub in São José dos Campos, Brazil. Preliminary findings were identified, showing that there is a lack of national guidelines to include DRR in the National Educational System.

The Existing Relationship between Embodiment and Bodily Practices in the Brazilian Cientific Literature

This work was motivated by the supposed lack of definition regarding the existing relationship between embodiment and bodily practices in the Brazilian cientific literature. Based on this reflection, we ask: if (and how) embodiment and bodily practices are related and through studies available on *Capes Periódicos*. For available analysis, a search was performed for documents available by pairs containing the following keywords: embodiment and bodily practices which was carried out in 28 articles for analysis. The treatment as bodily practices and embodiment are in accordance with the definitions presented by Lazzarotti Filho et al., (2010)/Gozalez and Fensterseifer (2014) and Csordas (2009), respectively. Lima Neto and Nóbrega (2015), Almeida, Wiggers and Jubé (2014) and Cavalcanti and Porpino (2015) land in types of knowledge, as the one about world and about oneself, consequently, embodiment as well. According to the authors, the body flow from *écrans* render able to support a prominent view about embodiment and motion, for each viewer creates their own ideas the motion in question as well as many emotional responses, to wit: perceptions about embodiment, health, aesthetics, body appearance; real bodily prectices; body and health ideologies; shifting in the body appearance; body and fashion; body and biotechnologies. We understand so much that corporeality as traditional announce an approximation of experiences and practices in living related to a culturally referenced body, and it is necessary to understand it as a not only biological element. However, it is necessary to delve deeper into the delimitation of terms.

Digital Solidarity in Intergenerational Relationships

Due to the physical and social isolation of older adults, the COVID-19 pandemic has provided the opportunity to examine digital communication as a source of intergenerational integration. This study investigated whether digital communication between older parents and their adult children represents an independent sub-dimension of associational solidarity and whether such communication off-sets problematic relationship implications when traditional forms of contact are lower than in the past. Data derived from older parents participating in 2016 and 2022 surveys of the Longitudinal Study of Generations. Latent class analysis revealed four patterns based on high and low frequency of contact in person, by telephone, by text, by email, and by social media. These classes were: full contact (37%), no contact (28%), digital contact (18%), and traditional contact (17%). The digital contact class is characterized by high probabilities on all three types of digital communication and low probabilities on in-person and telephone contact. We interpret this class as one in which digital communication compensates for less frequent traditional forms of communication. To validate this conclusion, we examined assessments of the quality of communication with children, finding no difference between the digitally connected and the traditionally connected. This evidence suggests that

digital solidarity functions as an independent sub-dimension of associational solidarity, one which will likely grow in importance beyond the COVID-19 pandemic as the pace of technology adoption accelerates among older adults.

Has Gender Egalitarianism Weakened Religiosity in Baby-Boom Women? a Developmental-Historical Approach

This investigation used long-term reports from baby-boom women to identify whether strengthening gender role egalitarianism from early adulthood to established adulthood predicted change in religious service attendance and religious intensity later in life. The aging of this cohort coincides with dramatic societal shifts in gender roles and religiosity at the population level. Data derived from 350 baby-boom women participating in the Longitudinal Study of Generations a multi-generational multi-time point study that began in 1971 and continued to 2016. Respondents were assessed in their late teens and early twenties and followed through their mid-to-late sixties. Relying on life course and impressionable youth perspectives, we linked change in egalitarian gender attitudes between 1971 and 1988 to change in religiosity between 1994 and 2016. Gender egalitarianism significantly increased from 1971 to 1988 and both religious attendance and religious intensity declined between 1994 and 2016. Growth curve modeling was used to predict religious change as a function of earlier change in gender egalitarian attitudes. Women who became more egalitarian in their gender attitudes experienced sharper declines in religious intensity, but not in religious attendance over the latter period. Controlling for life transitions of graduating college, marrying, having a child, and being employed full-time between 1971 and 1988 did not substantially alter these results. Findings are discussed in terms of the connection between two asynchronous social changes occurring over the adult lives of women in a unique birth cohort.

The Commune Practices in Rural Nepal: A Study of Collectivization during and after the Maoist Insurgency

This paper investigates the social sustainability of the commune created in Thawang, Rolpa, during the Maoist insurgency. A commune is a social structure in which community members cohabitate and collaborate to satisfy their needs through communal farming, cooperatives, and other means. Maoist had started communes as an alternative institution to the existing system and the seed of socialism in Western part of Nepal. However, they were unable to continue these communes in the new political situation of a country following the Comprehensive Peace Agreement of 2006. The 'Ajambari Commune' of Thawang, which had more than 100 members and 33 families, continued to exist even ten years after the peace agreement. The key issues that needed to examine are why individuals joined the commune, why it failed, and what lessons may be drawn from this type of collectivization. In order to find the answers to these issues, I undertook field research and made two journeys to Thawang, Rolpa to meet and interact with the commune's people. I employed the theories of conscientization, social tranformation, and social sustainability to analyze the commune (Freire 1972; Haas et al, 2020; Cuthill 2010). The social sustainability of any type of social activity, such as collectivization and commune, is determined by social justice, social equity, social cohesiveness, quality of life, a sense of belonging, class dynamics, and participation in the decision-making process. According to the field research, the commune relied on cooperatives and collective farming to generate income, but these sources of income were not enough to cover everyone's needs. As a result, the members choose to leave the commune as they lost the belongingness and the class hierarchy of leaderships of the group had grown after the new political change in the country.

Labour Participation of Same-Sex Couples: An Empirical Study from the Spanish Labour Force Survey (EPA)

From disciplines such as Economics and Sociology, not much attention has been focused on how the diversity of sexual orientations influences the way in which people participate in the labour market. This paper attempts to describe the differences in labour market participation between heterosexual and homosexual couples, as well as, within the homosexual couples, to establish a comparison between gays and lesbians. Using quarterly data from the Spanish Labour Force Survey (EPA) from 2005 to 2021, this paper analyses the labour market participation of people between 25 and 54 years old who live in a couple according to several explanatory variables, such as type of couple,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

sexual orientation and legal relationship, level of education, age of each of the partners, the existence of dependent minor children or their origin. Using descriptive statistics and logistic regression analysis methods, we analyse the evolution over time and the different labour market patterns by type of couple. Concerning participation in the labour market, a higher average activity and employment rate is observed, considering both members of the couple, for people living in unmarried couples than for married people. Particularly remarkable is the case of gay couples, whose participation rate is higher than the rest of the types. The probabilistic regression analysis also corroborates the main results obtained through the descriptive statistical analysis, confirming the existence of three different patterns in some aspects of labour market behaviour: heterosexual couples, gay couples and lesbian couples, with the main relevant variables in the analysis being educational level, the existence of dependent children and age.

Paro Oculto y Género En Europa: Una Cuestión De Doble Invisibilidad

Desde la producción científica se ha puesto ampliamente de manifiesto cómo el género determina la forma de experimentar el empleo, existiendo una evidente ceguera en la definición convencional de indicadores como el desempleo, por la cual las mujeres quedan invisibilizadas a ojos de la estadística oficial, que toma a los varones como única referencia.

El objetivo del presente texto es analizar el desempleo de las mujeres desde un enfoque metodológico que permita determinar qué variables influyen en la definición de la situación de doble invisibilidad a las que se ven sometidas como mujeres, y más concretamente como mujeres desempleadas. Con esta finalidad, buscamos adoptar una perspectiva analítica que tome en consideración categorías que tradicionalmente se asocian a la inactividad para construir un indicador de paro ampliado capaz de contabilizar a aquellas mujeres con potencial para incorporarse al mercado de trabajo, pero que no se encuentran en el ámbito productivo como consecuencia, especialmente, de situaciones laborales en que las responsabilidades doméstico-familiares les impiden trabajar remuneradamente, al obstaculizar la búsqueda activa de empleo o la disponibilidad inmediata para trabajar, o hacerlo con la dedicación temporal deseada.

Para elaborar y evaluar nuestra propuesta de operativización del paro oculto, usamos una submuestra anonimizada de los *EU-LFS microdata* para distintos países europeos desde antes de la Gran Recesión hasta 2021, para incluir los efectos de la pandemia de COVID-19. A través de la aplicación combinada de un análisis de correspondencias múltiples y un análisis de conglomerados, nuestro trabajo saca a la luz las diferentes variables y categorías que configuran la definición ampliada de desempleo para el caso de las mujeres, y qué perfiles son aquellos que permanecen invisibles y sufren en mayor medida estas situaciones de paro oculto, en contraposición con las evidencias empíricas asociadas a la medición tradicional de desempleo.

Gender Backlash and Responses in Comparative Perspective: Convergences in Resurgent Right-Wing Politics and in Feminist Responses in the USA and Brazil

This paper has a two-fold objective: first, it seeks to contribute to understand why gender equality is under attack central and the renewed centrality given to gender by right-wing political/ideological organizations/movements. The paper will also explore feminist responses across local and national boundaries.

In order to contribute to the understanding of the conditioning factors of worldwide gender backlash, which has occurred both in consolidated democracies as well as in societies that have recently undergone processes of transition from authoritarianism to democracy, we developed an international comparative perspective to understand the centrality given by resurgent conservative movements to gender issues in Brazil as well as in the United States. In addition to the large differences in national political contexts, feminist movements in Brazil and the United States followed quite distinct trajectories. In Brazil, the current radical conservative backlash gave centrality to the fight against the so-called "gender ideology" that would have resulted from a dynamic, pluralistic and intersectional feminist movement that sought to broaden gender equality through the creation of institutional mechanisms and public policies as a "participatory state feminism" that prevailed under the Workers' Party fourteen years hold of the presidency of the country. In contrast, a reinvigorated assault on reproductive rights (culminating in the overturn of Roe v Wade) and backlash against LGBTQ conquests (such as gay marriage and greater openness to changing gender identities) has gained increasing political centrality in the US, despite the country's position on gender equality indices having remained relatively low in relation to several Global North and South countries. In both contexts, right-wing movements, political parties

and governments have used both more traditional sexism, homophobia and transphobia as well as more modern and subtler forms of sexism related to resistance to changing gender norms and improvements in gender equality.

Historical Change in Society and Nature – before Optimism and Pessimism?

This paper explores both the pitfalls and the opportunities that arise from the transposition of Earth System science categories and geochronologic units to societal change. Thinking in terms of such a transposition in times of entangled planetary and social crises arguably seems to invite a quite significant degree of dystopian contemplations regarding the future of society. We argue, however, that neither pessimism about the future nor, for that matter, optimism concerning the technological-political management of the planet and the sustainability of human societies, serve well as signposts for a future-oriented analysis of historical change. Even though evaluative imaginaries are indispensable when it comes to steer action, prior to all this analysis needs to come to grips with the rather fundamental boundary conditions of social and natural systems alike. While there is a by now a widespread recognition of the Anthropocene both as a planetary condition and a societal predicament, its fundamental implications for society and history still pose a range of difficult questions. Two of these seem particularly pertinent: the question of scale and the question of periodization. First, the implication of society in a natural-cum-social Earth System raises issues about possibilities and limits of system demarcation, and particularly the issues of situating the scales of natural and societal change. The paper will explore the intricate questions that arise in this context both in relation to pertinent systems theories, but also regarding scalar delimitations of Earth System history against historiographical approaches that work on large timescales. Second, we will explore whether the highly differentiated categories of stratigraphy might actually provide useful analogies when accounting for historical change. We argue that there are limits to such an analogy, but they can still provide a useful heuristic if related to the change of clearly defined reference systems.

SIMONOVA, Olga* (Higher School of Economics (HSE), Russian Federation)

The Contradictory Emotional Logic of Contemporary Therapeutic Culture: Between Emancipation and Alienation

The process of psychologization or therapeuticizing of culture and society has been discussed in sociological works for several decades (Reiff, 1987; Furedi, 2004; Illouz, 2008; Cabanas, 2018, et al.), and means the proliferation of the discourse and practices of psychotherapy in almost all spheres of society, with the level of professional psychological approach is not always preserved and sometimes simplified and distorted, adapting psychology and therapy to the goals of the states, corporations, and social groups. In doing so, a special attention is paid to human emotionality. On the one hand, some social theorists see in the prescriptions of therapeutic culture an emancipatory potential and ethical progress, the birth of a new autonomous moral subject consciously building social bonds and new forms of solidarity (see e.g., Hookway, 2015), while others take a critical approach, seeing in the therapeutic culture a new ideological language of power elites, as well as the construction of an alienated "narcissistic" subject, morally insensitive, destroying social bonds (Furedi, 2004, Illouz, 2008; Gill, Orgad, 2015). The latter approach emphasizes the subject's alienation from its own and collective feelings, and from collectives themselves. Hence the therapeutic culture are rather contradictory: on the one hand, the agents of this culture teach an instrumental management of emotions, their suppression and containment, on the other hand, insist on the cultivation of authentic feelings, their spontaneous experience and expression. The report is based on an analysis of the relevant sociological literature and social representations of emotions as documented in self-help literature, therapeutic practices, training, therapeutic discourse, etc. The analysis shows that therapeutic culture as part of contemporary ideology, which had originally emancipatory potential, encouraging care for oneself and one's feelings, can also be a mode of subordination to the neoliberal order, inequality and alienation in different spheres of social life.

SIMONOVA, Olga* (Higher School of Economics (HSE), Russian Federation)

The Post-Soviet Nostalgia or Retrotopia: The Memory of Soviet Times and Fluctuations of Social Order

The paper presents theoretical reflection on nostalgic feelings and their functions in modern societies, and in particular in Russian society, including the function of maintaining collective memory under an authoritarian regime. In late modern societies in the context of extreme uncertainty nostalgia serves as adaptive emotional response. Nostalgia is associated with strategies and

practices of reviving the "unjustly" forgotten past, so studies of collective memory and trauma are directly related to nostalgia (Boym, 2002). Nostalgia is related to political thinking (Macros, 2004) and is often activated during critical periods; this feeling helps people find identity, confidence, and stability (Jameson, 1991). We are interested in mass nostalgia, which can be ideologically constructed by political regime in the new rounds of social transformations. In post-Soviet society since 2000 up to the present an increase in the level of nostalgic feelings for the late Soviet time was recorded in surveys (Levada, 2002). These feelings are associated with the collective memory of Russia's past, its "heroic" destiny, and the stability of the late Soviet period, as well as with the conservative and agressive political turn. It is necessary to emphasize also the macro-social aspects of post-Soviet society – the formation of a renewed capitalist mode of economy, the consequences of which were deep changes of everyday life and severe social problems. The latter factor intensifies nostalgic feelings for the late Soviet times, and the post-Soviet nostalgia turns to retrotopia or production of political myth. Nostalgia as retrotopia fuels discontents of capitalist order, liberal changes, new forms of relations, and the difficulties of modernization. This epidemic retrotopia adds credibility to patriotic ideology and political conservatism. Hence it is necessary to consider the power of nostalgic feelings of various segments of the population, which may contribute to the affective support of the authoritarian political regime.

SIMPSON, Jeremy* (National Library of Australia, Australia)

Decolonising the Risk Society through the Case of Afghanistan: Catastrophe, Class and the Afghan Experience of Risk

A key difficulty for the sociological application of the 'risk society' model in actual research has always been Ulrich Beck's profound ambivalence re fundamental sociological categories of inequality such as class and nationality, where less a-sociological treatment of contemporary categories of inequality relative to ethnicity, culture, nationality, gender and especially 'global class' is arguably essential for a decolonial sociology of risk. The paper argues for a model of risk retaining what is useful in Beck's theorisation, notably use of relations between actual catastrophe and staged catastrophe as risk, and an intervening 'insurance principle' structuring concepts of catastrophe, but dispensing with what is most difficult to operationalise, such as Beck's insistence on the 'unknowability' and 'ambivalence' of risk, and what is normative rather than explanatory, such as the cosmopolitan-normative commitments that underlie his commitment to risk egalitarianism. The basis of the paper is extensive field research conducted by the author in Kabul in 2018, including a year of ethnographic and participant observation and forty in-depth interviews with Afghans on their lived experience of risk. A particular focus of the analysis is the experience of Afghan women, especially their relation to risks to 'honour', and of lower-class Afghans, both historically difficult for metropolitan researchers to adequately represent. The paper analyses the peripheral and postcolonial experience of risk in relation to the observed conditions of risk, framing a postcolonial-global model of class relative to relations of catastrophe and insurance, moving beyond Beck's additive model of risks specific to given social locations, to a general model of risk and catastrophe, incorporating concepts from Pierre Bourdieu's model of class and Toby Ord's model of what constitutes catastrophe. The paper concludes with some points towards a decolonial understanding of class in terms of liability for catastrophe, insurance against risk, and power to address or assign risk.

SIMPSON, Jeremy* (National Library of Australia, Australia)

Reclaiming Bourdieu for a Decolonised Sociology: The Challenge of the Peripheral-Postcolonial Turn

Critiques of metropolitan sociology as mounted by Connell in *Southern Theory*, calls for the decolonisation of the discipline coming from postcolonial and subaltern studies, and the challenge of post-orientalist cultural and critical studies responding to *Orientalism* have highlighted the need for decolonisation of sociology. But how is this to be attempted in practice? In this paper I argue that calls for a complete reconstruction of the discipline, a disciplinary 'year zero' as it were, may not be immediately feasible, and that the decolonisation of sociology should more realistically proceed incrementally, through progressive reconstruction of existing theories and methodologies. I focus on the important postcolonial critique of Pierre Bourdieu, showing that Bourdieu *can* be seen as a decolonial theorist, with reference to his early work on the Algerian colonial situation, and his critique of metropolitan symbolic domination. Bourdieu's *Outline of a Theory of Practice* has been subject to strong postcolonial critique but consideration of context shows a misrecognition of the work as a critique of colonialist discourses. Decolonial sociology arguably should reclaim the "angry" critique of coloniality (Calhoun 2012: xii) of Bourdieu's early works *Sociologie de l'Algerie, Travail et travailleurs en Algerie* and *Le Deracinement: la crise de l'agriculture traditionnelle en Algerie*, as a basis for reclaiming Bourdieu, and enlisting sociologists using Bourdieu in the decolonial project. The paper presents conceptual and analytical points towards a decolonisation of Bourdieu, and of sociology, following Bourdieu's own little-known work, *"Les conditions sociales de la production sociologique: sociologie coloniale et decolonisation de la sociologie"* [The social conditions of the production of sociology: colonial sociology and decolonisation of sociology] 1975, which anticipates elements

of decolonial-peripheral critiques of metropolitan colonial sociology by a generation. I conclude by inviting dialogue on questions of what is meant by 'decolonising sociology', and on 'coloniality' as a key sociological concept.

Weaving Community in the Classroom: Co-Teaching for Community Building in Pacific Island Higher Education

The University of Guam (UOG) is an American-accredited institution situated in the island of Guam, the home of the Indigenous Chamorro of the Mariana Islands. Serving a diverse student body who are mainly Pacific Islanders from across Micronesia, UOG works to find ways to support and sustain the cultural values of the region. For the past four years, three faculty and an administrator at UOG have been working on an evolving model that combines co-teaching, portfolio assessment, and reflective practice in order to develop understanding of how Indigenous Chamorro social structures can inform pedagogy and assessment within university classrooms. Based on Pacific Islander students' realities, the goal of this model is to weave a pattern of shared community space for all students, informed by key Indigenous values. Confronted with the competitive individualism of Western societies, Pacific Islander students are often faced with the tension of leaving their cultural identity at the classroom door. The evolving pedagogical model of this presentation attempts to address that tension through culturally sustainable classroom practice.

"We All Are Kashmiris but...": Competing Masculinities and Militarism in the (re)Production of Identity As 'Mukhbir'

Drawing on the ethnographic fieldwork conducted in 2021 and 2022 in the Indian Union Territory of Jammu and Kashmir, this paper explores the (in)securities and vulnerability of the individuals labeled as 'Mukbirs' (Informants) in Kashmir. Based on participant observation and narratives, this paper highlights the complexities of militarism and masculinity dynamics in reinforcing the patriarchal notions of masculinity. The performance of various behaviors, roles, social symbols, and values, particularly courage, critical, decisiveness, resilient, and assertiveness, creates a superstructure that gives legitimacy to 'men with guns' as ideal in Kashmir. Using the Cornell framework, we argue that the (re)production of the norms and construction of Kashmiri men as someone 'altruistic' legitimizes the hegemonic masculinity in the ongoing conflict. Thus, turning the one unable to take responsibility as 'Namard'(less than men) into a subject of victimization and further strengthening the role of gun culture.

Hurt Sentiments and the Law in Independent India: Liberal Rights, Caste- Hate Speech and Redressal

The claims of hurt sentiments against hate speech in contemporary times have warranted the complex study of these claims vis-à-vis the right to free speech. In recent decades different communities, marginalised and dominant, have claimed hurt sentiment as a basis for wagering state intervention. It is important to determine the differential basis of hurt sentiments when these demands emerge from different communities. This is vital because marginalised communities' claims have more to do with hurt in terms of their misrepresentation which adds up to their further humiliation and stigmatisation. However, for dominant communities it is an expression of insecurity of losing their past glory and pride which is the basis of their place in the caste hierarchy. The issue gets complicated as these claims come in conflict with the constitutionally guaranteed freedom of speech. In this regard, Article 19(1)(a) of the Indian Constitution, which guarantees freedom of speech and expression to all citizens, is assessed in the light of section 3(1)(x) of The Scheduled Castes and the Scheduled Tribes (Prevention of Atrocities) Act, 1989 which penalises casteist speech hurled against a member of a Scheduled Caste. An implicit understanding here is that the offence from casteist speech negates dignity, incites discrimination and thus, cannot be granted protection under the right to free speech. This marks the clear shift in the liberal principle of 'neutrality' of speeches towards the paradigm of 'responsible speech'. Further, this research looks at the redressal mechanism that these claims demand. What role do censorship and sanctions play in preserving the rights of the marginalised? Is there a space for this pluralistic understanding of freedom

of speech and expression within the liberal framework of law? It assesses how judicial interpretation and political aspirations have shaped the culture of free speech and social sensitivity in independent India.

Marginalisation of Soldiers of Sanitation : A Human Right Concern

Valmiki community is also known as Churha, Bhangi, and Lalbegi and second numerically dominant scheduled caste of Haryana. They claim to be descendants of Saint Valmiki, writer of Epic Ramayana. Their traditionally imposed occupation is scavenging including removal of night soil from houses , sweeping and cleaning offices, streets and sewerage systems. They also works vendors, hawkers, selling meats/ eggs. Their presence is felt in Govt. services and politics due to provisions of Indian Constitution and affirmative action of various governments. Among Valmiki community, people who are working as sewer man, also known as manhole worker, gutterman but I usually call them as soldiers of sanitation . They always endanger their life, health and dignity for our healthy life. But they are looked down not only by general society but their own community people. Falling of Prince in borewell makes a national news headline while media has no story on the death of five soldiers of sanitation in Ghaziabad. .

Our study focuses on life of soldiers of sanitation, their social status, their awareness about health hazard and welfare schemes, attitude of people towards them. For our study we have selected 60 respondents from Rohtak city. They were interviewed with the help of local fellow. Manhole site was visited to have first hand information.

After data analysis, we can say that they are prone to every possible diseases. They take alcohol or drugs to overcome the atrocities of their jobs. No one likes standing next to them. They should be given insurance cover and all protective facilities. It is my suggestion that they should be designated as soldier of sanitation.

Sustainable ECO-Tourism in Post Pandemic Era: A Study of Uttarakhand Himalayan Region

During the Covid-19 lockdown, people were isolated for a much longer duration so now in the post-Pandemic period the Government curbed down its restrictions and came up with fresh travel policies. People immediately came out of their houses and crossed distances to reach peaceful hill stations. Although it gave a boost to revive the tourism industry and balance the economic front at the same time it posed a high concern to adopt innovative approaches with adequate Government response to tackle the situation of tourist rush to these places. Rural tourism is the need of the hour to promote environment-friendly tourism with ground-level micro-economic growth. This study explores the various factors that affect Sustainable Ecotourism in the Himalayan region of Uttarakhand. How do the State and Central Government interventions alleviate tourism in this region? Since *"Azadi ka Amrit Mahotsav"* is being celebrated throughout the country, many campaigns have started in various regions to increase tourism sustainably. It also discusses the Reverse Migration of the rural hill population through a sociological lens. The research design for this study is Exploratory and Descriptive. The Data has been collected from various secondary sources; it was analyzed using SPSS version 20. For this study, a systematic literature review was used. We reviewed the secondary databases and reports, generated from various tourism spectrums of Uttarakhand. This study explores how Indian Tourism implements various campaigns for tourism in the Himalayan Region of Uttarakhand. The findings highlight how the Reverse Migrated people of the hilly region of Uttarakhand practiced and adopt the various local professions like farming and as well as they adopted new practices like food processing/ food stalls and homestays. Environmental degradation has highly increased in the Uttarakhand Hills because the pollution index increased after the post-pandemic.

Educational Rights of Persons with Disabilities in Punjab: Prospects and Challenges

Persons with disabilities are the integral part of the society but due to lack of opportunities and negative social attitude they have suffered in all the aspects of life. In recent times, government has taken many initiatives for the education, employment and rehabilitation of persons with disabilities. Various special provisions have been made in the PWD 1995 and RPWD 2016 for their full integration and equal participation in the society. Education is one of the most important factors in the successful inclusion of persons with disabilities. Many research studies have proven that with education and appropriate learning of special skills people with disabilities can become self-reliant and can contribute meaningfully in the society. Despite various provisions, legislations and technological developments, persons with disabilities are facing number of difficulties in getting education. This paper will aim to explore the educational challenges faced by students with Visual Impairment. In this paper an attempt has been made to through light on the opportunities available in the rights of persons with disabilities (2016) and challenges faced by them while attaining higher education in Punjab. For this purpose, sample of 150 visually impaired students who are receiving higher education have been selected purposively for the study. The findings of the study stress the need for the implementation of our PWD Act at the grass root level.

Marginalization in Urban Social Space and Its Implications for Child Health: A Study of Urban Punjab (India)

In the past decade, poverty and inequality were most prominent fields which were discussed a lot, various studies undertaken to ascertain the inequality and poverty levels among different types of societies and its implications for their residents. This paper is a modest attempt to underline the marginalization in urban areas and its impact on health and especially on child health in Punjab (India). It describes the social inequalities and its implications for health even within city. It also describes the health problems from which low-income groups in urban areas suffer more than richer groups including those that are not linked to poor sanitary conditions and those that are more linked to relative poverty (and thus the level of inequality)than to absolute poverty. Studies on the health of rich and poor households within cities show the much larger burden of disease, injury and premature death that low-income groups has been faced. Most of this burden can be easily prevent because it is a result of their unequal access to homes which have provision for piped water, sanitation, drainage and garbage collection, and adequate health care. Thus with this we can say that health inequality never been an independent phenomenon. The present paper also explores trends in urbanization, the effect of these trends on the physical and social environment of urban settlements, and the impact of this environment on child health. By using health and social impacts of urban inequality as a focal point of the discussion, the paper intends to provoke thought on some of the fundamental issues of human development trajectories.

Displacement and Rehabilitation: A Case of Hydro Power Projects in Mountainous Areas of Himachal Pradesh

In a country as vast as India large number of development projects are carried out every year. Forced displacement of millions of local people results into deprivation of their livelihoods and ancestral land. The large scale hydropower projects featuring dam construction causes massive inundation resulting in the displacement of people economically as well as physically, eventually, requiring extra efforts for the rehabilitation of these affected people. Relief and rehabilitation for the people displaced by hydropower projects has always been the primary concern of the Governments of centre as well as states. In the state of Himachal Pradesh, alone there are four large scale hydropower projects and several small scale hydropower projects across the Satluj River. The impact of these projects has been extensive to the people in terms of livelihoods and rehabilitation. In light of the difficulties and problems of the local people of Himachal Pradesh, the focus of the present paper is on the issues and initiatives relating to the rehabilitation and resettlement of the people. The sample has been drawn from the tribal district of Kinnaur of the State who were residing in upstream and downstream areas of the sampled hydropower plants. A total of 300 respondents (150 male respondents and 150 female) were selected for interview by using simple random sampling technique from Jangi Thopan and Karchham Wangtu Hydro Power Projects. The major aim of this research paper is to explore various initiatives under taken for the rehabilitation of displaced people by the government and the Non -government agencies.

Caste Class and Religion in Legal Profession of a Town in Central Uttar Pradesh, India.

Globalization is a process of social transformation rapidly bringing changes in every sphere of socio-cultural life of both the developed and developing societies in a variety of ways. As a structural process it is transforming the occupational structure of most of the societies. This has also affected the professions and professionals in various ways, particularly the structure and functioning of the professions. However, the process of transformation is uneven within a developing society like India. It is more effective among those areas that are well connected but has very little impact in the less developed towns. This is true for the legal profession which struggles with the social and cultural barriers in its transformation. The present paper attempts to analyse the nature of Caste, Class and Religion in legal profession of a town of Central Uttar Pradesh, namely, Hardoi. The empirical study focuses on a sample of lawyers practicing in District courts. It was observed that the undercurrents of Caste, Class and Religion still act as forceful hinderance in the process of transformation of the legal profession.

Human Rights: A Need for Social Justice

Among the different species humans are the most intelligent who can think about his security and the development of society. With the advancement, complexity in society increased and people started fighting for limited resources. To avoid struggle and insecurity people need some rights which can maintain equality among the individuals. With modernization demand for social justice means equal distribution of resources and opportunity. Human are born equal then all are deserved for the distribution of resources equally, which can be achieved through institutions and services to ensure equal distribution of resources to every class of society. In society people are making law and order to maintain equality so they frame Human rights for their own. Human rights were available almost in every society that can be ancient, medieval and Modern societies; however the way of proceeding were different. Now with the modernization problems are increasing, like discrimination on the bases of sex, cast, class, race and ethnicity etc. The human rights emerged due to these inequalities in society. On the basis of human rights people can think about equality and they can raise voice against the discriminations without any fear. This study is based upon secondary methods of data collection, and data was collected from different books, articles, newspapers and scholarly work .The main objectives of data collection is to highlight the values of Human rights to maintain social justice among human beings.

Constituting and De-Constituting the Discursive Social Links in Youtube Comments Thread

Digital media has shifted the dynamics of communication (interpersonal, group, mass, and many-to-many) offering affordability of 'self-expression' to the people who were previously pushed towards the edges of the society. Certainly, there are realities other than the celebrated [also contested] utopian perspectives of hailing the 'digital' as the harbinger of 'communicative equilibrium' and instrument of manifesting the 'true' democracy. The dimensions are not merely changed for 'good', but they are also rendering the hardening of religiopolitical attitudes [online eco-chambers], deterioration of the degree of tolerance towards diverging/dissenting sociopolitical views, self-absorbed [secluded] forms of realities, and fragility and ephemerality of sociality or social links. The people are increasingly submerging themselves within the oceans of information most of which is irrelevant to their lifestyles. This is occurring under the influence of what could be called [as] 'scrolling culture' something like the 'narcotizing dysfunction' hypothesis [of] (Lazarsfeld & Merton, 1948) which states that people tend to 'substitute' information to 'action'. Consequently, the 'social-links' formed within the realms of 'digital' have proclivities of becoming an alternative to similar 'other' links; as the people have too many options to choose from or switch between, that too with the hangover grounded in the myth of doing society a favour by absorbing and reacting to the so much information. This paper is aimed at analyzing the comments thread on the YouTube videos pertaining to the matters of religion and secularism in India. This study will use the critical discourse analysis (Fairclough, 1992, 2010) to answer the following questions: 1) how the self-presentation and 'identities' are formed in comments thread? 2) how and which sociopolitical positions are advanced or denounced on matters of religion and secularism? 3) which ethical proposals deontological, consequentialist or virtue are made for the action? 4) how social links constituted or challenged or quashed?

Alienation, Work, and Pandemic: Precarious India

Under capitalism , work offers a possibility of realizing oneself as well overcoming its alienating conditions. It offers a chance for working people to form solidarity and resistance to how work is organized and wages structured. During the Pandemic and even after it, not only did human life face the most real precarity but the world of work and its meaning also changed. An enduring condition of alienation has set in in a definitional sense. Some forms of job or work have been simply decimated. When the Indian state imposed a lockdown in March 2020, severe restrictions followed preventing any movement of and isolating them in heir homes, preventing them from working people. In fact, there was no work anymore. The situation became penurious and unsustainable. so, an exodus began- an previously unseen migration back to the home states from where people had migrated earlier to the big cities. The sense of isolation and meaninglessness set in more due to loss of work more than the threat of the virus. The economy and its processes of production and consumption were disrupted to the extent that it was accepted that an estimated 2.5 Crore jobs would be lost (ILO) worldwide. In India alone, 12.5 crore working men and (more) women lost their jobs in 2020-21. the middle class salaried people joined the informal sector and swelled its capacity. Jobs they were willing to take were inferior to what they used to do. It was not possible for such people to relate to their work; it was and is neither an extension of their self nor an opportunity for self-realization. In this paper, its is this new situation that has emerged within capitalism making India in particular quite precarious that will be analyzed.

The Power of Social Media and the Crisis in the Indian Cine Industry

Social media in India now has access to a large number of youths both in the rural and urban areas and is capable to construct and spread various kinds of social, political, and cultural narratives at the mass level. In the last few years, Indian Cine Industry popularly called "Bollywood" has been at the center of discussion not only in main media but also on social media for different reasons. Twitter and Facebook are two important platforms that set the trends on social media and have an influence over the main media. In the last three years, a large number of local, regional, and national level journalists have started their YouTube channels and created a separate audience. The Indian Cine Industry faced the wrath of social media in 2020 when a young cinema actor Sushant Singh Rajput was found dead in his apartment. The popular public opinion was that he was murdered and some influential Bollywood celebrities were involved in the conspiracy of his murder. For 3-4 months this issue attracted the attention of national and international media and social media. As the murder mystery is still unsolved many social media narrative setters launch a boycott campaign against Bollywood. This campaign could not very successful till the famous TV show controversy between Nupur Sharma and Taslim Rahmani. created problems not only in the country but also in other countries. In order to counter this and many other issues, the narrative of the portrayal of Hindu gods and goddesses in Bollywood films was brought to the center. The narrative trended on social media in a big way and a number of Bollywood films miserably flopped at the box office. The present paper explores and investigates the factors responsible for such a phenomenon in the Indian film industry.

New Contexts and Changing Contours of Agrarian Protests in India

Since last couple of decades the agrarian societies in India have been simultaneously experiencing the arrival of globalized market driven impulses in all areas of its activities, initiations of populist measures by the state and political parties to bring in quick changes affecting the life and the livelihood of major sections of the agrarian population, unprecedented speed, urgency and fragmentations in social existence and relationships as reflection of post modernity, and persistent effort to politically organize the people through the idioms of cultural politics. The agrarian social structure that experienced new waves of peasants and farmers movements in the wake of land reforms of 1950s-70s and the green revolution 1970s-90s, now experiences the cropping up of new issues and proliferation of new protests. However these protests have been eclectic in nature as the patterns of agrarian transformation has also been diverse. As against these backdrops this paper, focusing on West Bengal and Punjab in India those have long history of peasant and farmers' movements respectively, will examine the following questions:

- How have the economic globalization, populism, hypermodernity and new way cultural politics affected the life, livelihood, aspiration of the agrarian population in India?

- What have been the relationship between agrarian transformation and agrarian protests in contemporary India?

- How do these protests develop alliances with other civil societies?

- What have the role of the state in addressing the issues of the protesting organizations?

The paper high lights the dynamics of mobility, migration, fluidity in agrarian society on the one hand and the processes of anchoring the society through populism and new way politics on the other. It also underlines the new alliances those are being shaped through the agrarian protests in the contemporary society.

Disability, Stardom, Awards and the Comeback Genre in New Bollywood

New Bollywood can serve illustrative purposes of popularising marginality through star performances, making them the critical vantage point of public dialogue. One such theme has been the portrayal of disability. While disability representations per se in New Bollywood may not be novel, the last two decades witnessed a diverse range of disabilities previously unheard of being performed by leading stars. With Shah Rukh Khan acting as a man with Asperger's Syndrome in *My Name is Khan* (2010), Amitabh Bachchan enacting progeria in *Paa* (2009), and Aamir Khan addressing the concerns of a dyslexic student in *Taare Zameen Par* (2007), discussing diverse disabilities and its recognition as a genre. As a result, underlining the incentives of mainstream stars to reinvent their star image by diversifying their choice of roles and film genres, skill set as actors, and appearance through prosthetics and stylisation. For instance, Saif Ali Khan shifted from his usual metrosexual guy image and forayed into performing as a polio-infected man in *Omkara* (2006). Hrithik Roshan also took on reinventing his star image beyond a masochistic dancing hero through performing disabilities in *Koi… Mil Gaya* (2003) and *Guzaarish* (2010). Similarly, Kajol and Rani Mukherjee made their comebacks by performing blindness and Tourette's Syndrome in *Fanaa* (2006) and *Hichki* (2018), respectively. Thus, bearing testimony to how stardom, awards and credibility as actors are intrinsically connected with disability performativity. This article contextualises how these modalities representing diverse disabilities as "challenging roles" foreground marketing strategies and serve as a mode of generating public curiosity through highlighting a star's transfiguration. While doing so, also creating an audio-visual lens for recognising diverse disabilities, stigma and sociopolitics as the nation's preoccupation, making stardom a gateway for the visibility of disabilities. I discuss these interconnections of stardom, disability, and its discursive materiality in filmmaking.

Social Disability As the New Bollywood: Notes on the Scripting Process

I wanted to make something beyond the formulaic Bollywood, but I am not an arthouse filmmaker
- Abhishek Chaubey (Personal communication, 13th March 2022)
The last three decades witnessed a spate of academic scholarship on historicising and discoursing Bollywood as a site of escapism, contestations, political mobilisation, utopia and nation's preoccupations with scarce attention on the writer's vision, journey through developing screen ideas and storyboards. With an ethnographic focus on Abhishek Chaubey's screenplay, this article studies the concept of New Bollywood, screen ideas beyond Bollywood's formulaic conjectures and its shift towards content-driven plots, realist aestheticism and social malaise. In particular, how he draws a disjuncture from the formulaic conventions of writing Bollywood yet remains rooted in some of its generic qualities of casting stars and song picturisation for making his cinema mainstream by adopting a form of in-betweenness as a writer-director. Through an ethnography and discourse analysis of his writing process(es) and descriptive accounts of his screenplays, I discuss what led him to expand the scope of representing social disabilities like caste, class, gender, disability and embedded hypocrisies in neoliberal India's social systems, making it a distinct addition to Bollywood's cinematic vocabulary. Bringing in the screenplay and the screenwriter's experiences, I propose a dialogue on how Chaubey's filmmaking encompasses research, collaboration, pre-censorship practices, market evaluations and reflexivity as a writer-director and researcher of India in the margins. The key questions it raises are: What motivates the writer to portray social disabilities in India? Furthermore, what kind of interdisciplinary research practices it entails? If so, how does the subjective position of the writer come into play in writing straightforward and sometimes open-ended social messages?

Reflecting upon Implementation of Khelo India Programmes: A Study of Participation of School Children in Bihar (India)

Sports is a powerful tool for social development that promotes team spirit, discipline, human values, gender equality, social inclusion and non-violence. It has been widely accepted that Sports not only contributes to the character building of an individual but also acts as a tool for the socio- economic transformation of individuals and the society at large.

In India, most of the traditional educational institutions foster meritocracy via education, which does not consider sports as a part of core education but only as an extracurricular activity. As a result , sports are undervalued in our society and most of the children are not encouraged to participate actively in sports.

In this concern, the government of India initiated a flagship programme *"Khelo India"* in order to change the perception of people and to inculcate a culture of sports in society.

With this backdrop, the present research attempted to know how the newly introduced flagship program "Khelo India School Games" could bring change in the perception of people towards sports and how it brought active participation of children in sports and thereby brought socio- economic transformation of the society .

The empirical qualitative analysis of the present study found that active participation of school children in organised sports has increased and gradually people's perception towards sports participation is changing positively.

SIOUTI, Irini* (Institute for Social Research at Goethe University Frankfurt/Frankfurt University of Applied Sciences UAS, Germany)

Political Participation Processes Among the Younger Generation in Families of Labour Migrants in Germany

The political participation of the younger generation of labour migrants in Germany is still an unexplored research field. Some studies in migration research have addressed the question of political participation among the first generation of the so called "Gastarbeiter". However, there has been no investigation about how the younger generation participated in politics. Traditionally, the epistemic and methodological framing of political participation is dominated by quantitative research perspectives. It took place in the context of the nation-state and is being challenged by the critique of methodological nationalism. A main challenge is to construct an adequate methodology to investigate processes of political participation and their transnational dimensions in (post)migration societies. To overcome the shortcomings of methodological nationalism in investigating political participation processes in a (post)migration society I suggest using the concept of biography as a key theoretical and methodological concept for the investigation of political participation processes. This makes it possible to empirically reconstruct the processuality and complexity of political participation paths. The biography-analytical perspective enables an intersectional investigation of the significance of the migration experience for political participation as well as for the total life context. In this way, we can investigate the emergence and course of political participation in its interplay between individual and societal conditions.

On the basis of biographical case studies from an ongoing research project I will discuss how political participation processes come into being under conditions of migration and discrimination experiences in a (post)migration society. Using a broad concept of participation that looks at biographical construction processes, I will reflect on the impact of a biographical-theoretical perspective in the research field of political participation.

SIRNA, Francesca* (CNRS, France)

"in My Country, I Am a Specialised Nurse… but Here, I Was Hired As a Care Assistant…" the Integration of Health Professionals with Foreign Qualifications into the French Hospital Sector and the « Pandemic Challenge »: A Process of Recognition and/or Exclusion?

The recent health crisis, due to Covid 19, has brought to light a reality that has been decried for decades (Evin, 2009; Juven, Pierru, Vincent 2019) concerning the shortage of hospital staff and the lack of equipment (masks, vaccines, ICU beds, drugs, respirators, etc.) in France. This shortage of professionals is partly made up for by the hiring of foreign-educated care workers with precarious contracts that are less well paid than those of colleagues with French diplomas.

Based on the reconstruction of the migratory and professional trajectories of a group of nurses with foreign degrees in the hospital sector of a large city in the South-East of France, I will examine the processes of diploma recognition and qualification/deskilling (Berset, Weygold, Crevoisier, Hainard 1999) from

an intersectional perspective (Crenshaw 1991). 30 qualitative interviews were conducted with men and women on the reasons for departure, professional integration in France, the different contracts and positions held, professional and/or geographical mobility plans, as well as possible plans to return. Part of the interview focused on relationships with colleagues, difficulties encountered in the integration process, (different) professional practices and relationships with patients, and if and how the pandemic has affected these pathways. The aim was to understand whether within the French hospital sector, which is experiencing a severe labour shortage, there is a hierarchy of these staff according to the origin of their degree, their class, their gender, in other words whether it was possible to understand a segmentation of the sector. Does this workforce face discrimination, deskilling processes, inequalities in their careers? What are the wishes of these professionals in the wake of the ongoing health crisis (demands for training, a change or even an exit from the profession)? These are some of the questions I would answer.

Between Cultural Religion and Laïcité in Québec: Relationship to Religion and Social Representations of Catholicism of Young Québécois Aged 20 to 30

Sociologists of religion who are even slightly interested in Québec society will certainly have noticed the acceleration of socio-religious transformations over the last fifteen to twenty years. From the deconfessionalization of Québec's school system to the implementation of a bill guaranteeing the laicity of the State, the religious question has made multiple irruptions in the social and political discourse. Paradoxically - or consequently? - the rates of adherence to Catholicism, a religion historically linked to the development of Québec's culture, are at their lowest since the beginning of the secularization process in the second half of the 20th century. Whatever the reason for this religious disaffection – whether this is a generational effect or the consequence of an *internal* secularization – more and more young Québécois claim that they do not belong to any religious tradition.

Among them, a significant proportion of young people of "catholic culture" experienced some form of religious socialization during their childhood and adolescence. In the light of the significant transformations that have occurred in the socio-religious landscape in recent decades that have been shown by several quantitative and qualitative studies, what is the relationship of these young people to religion? What are the challenges of studying it at a time when the cultural and identitary attachment of more and more Québécois to Catholicism is crumbling? It seems that the study of the social representations of the Catholic religion in the discourse of certain non-affiliated young people can, without posing certainties, provide some keys to understanding the socio-religious reconfiguration underway in the Québécois society. In this presentation, we will suggest some lines of thought based on the results of a socio-ethnographic survey conducted at Laval University (Québec city) among 38 young Québécois who claim to have no religious affiliation.

Cabral's Ideas and Its Relevance to Africa Agronomy

This paper outlines some of the neglected theories of Amilcar Cabral, the African revolutionary, and attempts to explore how some of the concepts he used to be applied to contemporary Africa. There are two broad areas in Cabral's writing if one can classify his writing at all. The first is theoretical and the other is practical. An example of the first is theory as a weapon and the second relates to agriculture, African culture among others. The aim is to see how these can be applied to the current situation in Africa. One example of his theoretical writings relates to the 'weapon of theory' as a novel social construction of theory with its metaphor of war, and another is his transcendence in theoretical orientation, with its sense of play on how theory may be constructed whether in sense of cultural revolution through popular participation, or by shifting the Marxist view to suit the purposes at hand in the context of revolutionary ideals. Cabral began as an agriculturalist but not simply to related the science of agriculture, but to also find its relevance in contemporary settings, and combined his sense of poetry, social theory, agricultural and agronomy theory and pan-Africanism, to give further meaning to African praxis. This paper explores the relevance of these more neglected aspects of his theories, and how they can be applied to African societies.

Nature and Types of Cyber Crime in a Town of Eastern Uttar Pradesh, India

With the increased use of digitalization, communication technology, and internet-based gadgets in our daily life, the chances of misuse and committing unlawful activities through these devices have also increased. Cyber Crime may be generally understood as "unlawful acts wherein a computer is a tool, a target or both. The terms computer crime, cybercrime, e-crime, hi-tech crime,

or electronic crime are activities done with criminal intent in cyberspace. Cybercrime refers to all the activities done with criminal intention in cyberspace. In the present e-Age, 'Crime' has extended itself beyond physical assault or mental torture; now it also affects our e-life. E-Life means our existence & living in the cyber world. Cyber Crime is a menace all over the world and is the one of most difficult and challenging ones to detect and investigate. The most common types of cybercrimes are phishing scams, internet frauds, online intellectual property infringements, Identity theft, online harassment, and cyberstalking, A person convicted of certain internet or computer crimes may also face a jail or prison sentence. The most serious crimes, such as possessing child pornography, can result in a prison sentence of 20 years or more. The present paper is aimed to explore the incidence of cybercrime in a town in Eastern Uttar Pradesh, India through some case studies and secondary sources of data.

Social Media and Women Empowerment in India

Indian society has been a traditional society with a patriarchal and patrilocal social structure. In such a society, the women folk were having very limited opportunities to interact with people outside the family and kinship relations. The mode of communication was mainly "face to face" and interpersonal which had created a closed world for women. The development of modern mass media and increased level of education, although, opened new avenues for them but the scope of wider interactions was still very limited for them. New communication technologies have revolutionized the communication process with the penetration of the internet and mobile phone (featured as well as smart). These developments in communication technology have generated a new media which is popularly called "social media". Social media has proved to be a boon for Indian women. The access of women to social media not only provided them a chance to interact with persons of their choice but also helped them to make a free choice in consuming information, artifacts, and online shopping. Social media has given a platform to women to share their problems, opinions, and views through blogs, discussion forums, online interactions, chats, etc. The virtual space has enhanced the scope of interactions with the outside world and empowered them. Thus, social media has increased the opportunities for the empowerment of women in a conservative society like India. The present paper is aimed to explore these issues in detail through primary and secondary sources of information.

COVID-19 Non-Vaccination Among the People of Hong Kong: Resistance to Biomedical Hegemony As a Barrier

COVID-19 has been declared as public health emergency by the World Health Organization (WHO). WHO and health authorities worldwide have encouraged people to receive COVID-19 vaccination. As of 27th September 2022, although 94.1% of the population in Hong Kong has received one dose of vaccination, 91.8% has received the second dose, and 77.8% of the population has finished the third dose, the vaccination rate increased only when the Vaccine Pass policy has implemented since 24 February 2022, in which people would be refused to enter certain public premises if they have not finished the vaccination according to the government's dosage schedule.

Almost 6% of the Hong Kong population remains unvaccinated. This study was therefore conducted to investigate about their reasons and experiences of not getting vaccinated. Thirty informants who did not get vaccinated, aged 21 to 64, were sampled for the semi-structured interviews.

The informants were disadvantaged in many aspects of social life following their non-vaccination. Feeling confusion with the biomedical advice on COVID-19 and distrust in biomedicine were the two main interlocking factors for these informants not to get vaccinated. The informants had an impression that the biomedical professionals have always changed the standpoints in the standard of vaccination and infection control measures, making them to feel that the vaccination advice is not a pure medical suggestion. This undermines the informants' trust in biomedicine, and thus its advice on vaccination. Traditionally, biomedicine obtains hegemonic power in most societies, though such situation has been changed as indicated from our study. This phenomenon agrees with Giddens, noting that the decline in tradition increases reflexivity for individuals in contemporary societies, configures a new stage of enlightenment that demands new knowledge and autonomy. The doubts and hesitations revolving vaccination therefore stem from the process of reconstructing values and knowledge in post-traditional societies.

SIVAKUMAR, Vineetha* (Alliance University, India)

Institutional Seclusion and Mental Health

Human beings are always social animals and find meaning for life in interacting with others. It is said that people in the 21st century are more and more individualistic and seldom bothered about their fellow beings. Example of people remaining mute spectators or not responding to events of violence

can be attributed to this individuality. However it needs to be understood that in modern world one's need for higher order needs, according to Maslow, are fulfilled more virtually. Research indicates that limiting peoples interactions with the world outside would result in social seclusion which could affect individual wellbeing. The current research has been contextualized in women prisons, and aims to understand the impact of such seclusion on the mental health of prisoners. Women prisons were part of male prisons for a long period, which limited the level of interactions, in terms of movement as well as access, within a limited space. Since female criminality attracts more stigma than male criminality, public acceptance and availability of bail or parole also gets restricted for many. In addition, nonavailability of programs for rehabilitation also hamper the wellbeing of these women pushing them into mental disorders in the long run. Following a exploratory research design, the researcher attempts to describe this reality of women prisons and suggest models to aid their wellbeing.

The Impact of the COVID-19 Pandemic on the Reproductive Behavior of the Russian Population: Statistical and Sociological Analysis

There are not many events in world history that have had a simultaneous impact on many spheres of society in different countries. The COVID-19 pandemic has certainly become such event in modern history. It has affected economic, social, political, demographic and other processes directly or indirectly. The demographic sphere was the first to "take a hit". Mortality has increased, the number of population has decreased. People began to choose different models of reproductive behavior in conditions of uncertainty. So, the studying of this models is an important area of science, because the results can become the basis for forecasting the demographic development of states and planning measures of state social policy.

A comparative analysis of the dynamics of fertility (including CBR and TFR) in Russia will be carried out for the pre-pandemic and pandemic periods (2017-2022) in this study. This will allow us to record the change in trends during this period and their consequences in the long term. Absolute and relative birth rates will be compared on monthly basis. It will give a detailed assessment of the impact of the pandemic on the reproductive behavior, and will help to detect "compensatory" processes.

The report is also based on the results of the author's sociological studies of fertility which is transformed under the influence of the pandemic. The results of a pilot sociological survey conducted in October 2020 will give a vision of the opinion of the Russian population about the risks of a decrease in the birth rate during this period and an estimation of measures to level out the negative scenario of demographic development. Qualitative methods (in-depth interviews in 2021 and 2022) are used in the report to detect the impact of the pandemic on current and prospective attitudes of reproductive behavior of the population.

RC55-745.4

SKIBA, Regina* (Jagiellonian University, Poland)

Longitudinal Association between Shift Work, Health and Well-Being in Covid-19 Pandemic - an Outcome-Wide Analysis of Polish Garment Factory Workers

Previous research indicates that social network and positive relationships at work favorably affect health and well-being. The SARS-CoV-2 outbreak among others has contributed to organizational transitions in workplaces (e.g. smaller teams of employees, reduction of shift groups, extension of working hours from 8 to 12-hour shifts). In enterprises where it is necessary to ensure the continuity of the production process, it was necessary to reorganize shift work conditions or extend working time. Shift work, that is a rotation of employees at the same positions during the day and at night, negatively affects not only circadian rhythm and health, but also psychological and social well-being. Moreover, social network, social engagement and stress are also indicated as potential mediators of disease in shift workers.

The aim of the study is to examine the pattern of temporal associations between shift work and 26 subsequent outcomes [from the domains of (1) physical and mental health, (2) well-being, (3) family life, (4) social life, and (5) behavioral lifestyle] in the time of Covid-19 pandemic. Longitudinal survey data collected from 631 garment factory workers in Poland in 2018 and followed-up in Sep. 2020 were used.

An outcome-wide approach was applied and the prospective associations were examined using generalized estimating equations [for continuous outcomes - standardized regression estimates, and for dichotomous outcomes – odds ratios – were reported]. All models were controlled for prior sociodemographic variables: gender, age, marital status, education, having

children below 18 at home, taking care of an elderly, job tenure and baseline values of all outcome variables simultaneously (to limit the risk of reverse causation).

Results of the study will reveal the pattern of associations between shift work and various subsequent outcomes in the pandemic and thus, will help formulate recommendations and policies that would reduce workers' exposure to this detrimental work factor.

RC35-525.1

SKOLARSKI, Stephan* (Bielefeld University, Germany)

The Rise of Populism and the Threat to Social Cohesion

Populism poses a far-reaching and immediate threat to social cohesion and is of increasing relevance to sociological research, especially against the backdrop of current and profoundly lingering political-social crises (including the challenges of climate change, the impact of Brexit, the financial consequences of the Covid 19 pandemic and the energy policy decisions in the wake of the war in Ukraine).

This presentation examines social cohesion in the form of a theoretical and methodologically guided perspective on populist attitudes in Germany. The aim of the analyses is to examine the connection between individual assessments of social cohesion dimensions and patterns of populist attitudes. This raises the question of whether and to what extent social cohesion in Germany is at risk and what polarising and divisive tendencies can be identified. Multiple group comparisons with socio-demographic variables (e.g., age, gender, income, education, region) are used to refine the analyses.

Social cohesion is measured by opposing item pairs and guiding principles that represent contrary ideals of living together (e.g., traditional, autocratic or liberal-individualistic ideals). The three factor-analytically distinct dimensions of anti-elitism, sovereignty and conviction of homogeneity conceptualise populist characteristics. Using data from the first wave of the so-called FGZ-Panel (a wide-ranging representative panel survey) conducted by the Institute for Social Cohesion in Germany, the presented questions are examined.

This contribution fits into the questions on socio-political conflicts. In that respect, this study can be located within the framework of the dimensions of social cohesion and conflicts that lead to division and polarisation in German society. With the approach of an analytical perspective and explorative monitoring, this empirical work is intended to contribute to understanding the emergence of political crises and the transformation of social fields against the background of the current central challenges of democratic states in Europe.

SKOVAJSA, Marek* (Charles University, Czech Republic)

Classical Music's Democratic Natural: Dvořák in Europe and America

Classical music is often seen in sociology as the quintessential domain of legitimate, snobbish or elitist culture. One thing this view seems to ignore is the process of democratization taking place within classical music itself in the last two centuries. Among the past musicians enjoying wide recognition today, the Czech composer Antonín Dvořák is well qualified to be pointed out as an example of the uneasy, but robust relationship between classical music and democracy. Of lower middle-class origins and self-identifying as a member of a politically disenfranchised nation in Austrian Empire, Dvořák was able to break through the formidable social and ethnic-political barriers to achieve international success. He did this by shaping the form and content of his musical output to respond to two contradictory kinds of expectations: those of music professionals and art-sponsoring elites and those of the broader social constituencies, whether these were the Czech middle class engaged in collective struggle for national emancipation or the educated public of the democratic United States. The broad, almost popular appeal of much of Dvořák's music as well as its "Slavic" nature can be regarded as its most obvious democratic and nationalistic qualities, but these same qualities have also undermined his reputation as a "serious" composer. This paper explores the changing terms in which Dvořák's music has been evaluated and interpreted since his lifetime, including such misleading binaries as natural vs. artificial, simple vs. sophisticated, passionate vs. rational, or popular vs. elevated. It argues that the progressive democratization of the world's societies has been a conditioning factor that cemented rather than harmed Dvořák's standing as a major classical composer. Yet, the blatant contradiction of democratic habitus within elitist art genre has not been eliminated even in this composer.

RC08-134.8

SKOVAJSA, Marek* (Charles University, Czech Republic)

Two Early Careers in Sociology: Masaryk and Jerusalem

The intellectual development and disciplinary self-identification of early sociologists took place against the backdrop of an increasingly diversified and changing disciplinary matrix which provided openings for individualized and pluridisciplinary academic identities and career paths. The objective of the present paper is to document this with a comparative case study of two important, but nowadays little known Central European intellectuals. Tomáš G. Masaryk (1850 – 1937) was the most prominent promoter of sociology in the Czech lands before 1918, Wilhelm Jerusalem (1854 – 1923) was a pioneer and

an early contributor to what in the last decade of his life became known as the sociology of knowledge. While both were born only few years apart in what today is the Czech Republic, their trajectories followed an inverse geographical pattern. Masaryk studied in Vienna and then was for many years a professor in Prague, Jerusalem studied in Prague and became a professor in Vienna. Neither of the two were pure sociologists. Masaryk graduated in philosophy and much of his work can be ranked as philosophy, cultural history, political theory or practical political discourse. Jerusalem graduated in philology, but along his career he turned to philosophy, psychology, and education science besides sociology. Both had to come to terms with the powerful intellectual currents of their time: Herbartian philosophy and theory of education, Lazarus and Steinthal's *Völkerpsychologie*, French and British positivism, Wundt's experimental psychology, Husserl's phenomenology, American pragmatism as well as Comte, Spencer, Durkheim and other early sociologists. The paper explores the intellectual and institutional contexts in which Masaryk and Jerusalem adopted the description "sociology" for certain parts of their work and suggests some mechanisms that can explain the individual choices for or against sociology by academics in Central Europe in the period 1880 – 1914.

SLABBEKOORN, Jos* (Utrecht University, Netherlands)
MAAS, Ineke (Padualaan 14, Netherlands)
VROOMAN, J. Cok (The Netherlands Institute for Social Research|SCP & Utrecht University, Netherlands)

Benefit Receipt at the Intersection of Gender, Age and Migration Background: The Role of Economic, Social, Cultural, and Person Capital

There are considerable gender, age and migration background differences in benefit receipt. Recent intersectional studies on benefit receipt find that gender, age and migration background are mutually influential co-determinants of benefit receipt, but intersectional effects differ between social assistance and employment insurance. These findings emphasize that inequalities underlying benefit receipt are complex and that it is crucial to consider multiple group membership, since the effect of being part of one social group (e.g., being a migrant) can be affected by memberships of other social groups (being a man and older).

This study uses a resource-based approach to explain intersectional differences in benefit receipt. The heightened vulnerability for benefit receipt can result from deficiencies in resources (economic, social, cultural, and person capital). These resources are valuable assets on the labor market and can benefit individuals who seek employment. They are also instrumental to secure a stable position in the labor market and prevent losing one's job. Consequently, they reduce the likelihood of social benefit receipt. Persistent gender, age, and migration background inequalities in resources are observed in The Netherlands. However, whether certain intersectional groups are especially (dis)advantaged in this respect, and the consequences for the receipt of different types of benefits are still unknown. Therefore, this study aims to answer: *To what extent can intersectional inequalities in social benefit receipt (social assistance and unemployment insurance) be explained in terms of economic, social, cultural and person capital?*

We use a unique combination of datasets: longitudinal survey data (LISS) linked with Dutch register data (SSD). These data provide accurate and reliable information on benefit receipt and a wide range of information on resources for a representative sample of the Dutch population. Preliminary results show that the disproportionate vulnerability for benefit receipt of some intersectional groups is associated with personal resource deficiencies.

CDM Based Exploitation of Natural Resources: A Threat to Existing Traditional Knowledge- a Case Study of Chanju Basin in Churah Tehsil of Chamba District of Himachal Pradesh

The Clean Development Mechanism (CDM) was introduced by US government as flexibility mechanisms under Kyoto Protocol and allows developed countries to meet their emission reduction commitments by promoting clean development in developing countries. As a policy mandate, it aims to design project-based mechanisms to reduce emissions and same are to be subtracted against a hypothetical baseline of emissions in the absence of CDM project. India as a signatory of this protocol have been registered 2313 projects up to August 2010, out of these, 64 projects are of hydro power generation and Chanju power project of 36 MW is one of such projects in India.

The present paper is an attempt of the researcher to document the impact of one of such projects on existing tradition profession of milling in Chanju basin which are facing the danger it's extinction. The results revealed that at the initial stage of project, people were happy because of their illiteracy and not knowing the facts, but now people are facing actual situation. Projects putting question mark on the survival of existing traditional knowledge of water milling and snatching livelihood and creating disturbance in ecological web for the sake of developed countries which are situated far away.

Dominant Role of Women in the Economic Life: A Study of Churah Tehsil, Chamba District of Himachal Pradesh, India

Throughout history, the central role of women in society has ensured the stability, progress and long-term development of nations. Globally, women comprise 43 per cent of the world's agricultural labour force. When both paid and unpaid work such as household chores and caring for children are taken into account, women work longer hours than men - an average of 30 minutes a day longer in developed countries and 50 minutes in developing countries. Women tend to spend around 2.5 times more time on unpaid care and domestic work than men. Women play important roles in the rural economy as farmers, wage earners and entrepreneurs. In rural areas, about one-third of women who are employed are unpaid family workers in the agricultural sector.

The present paper is based on the primary as well as secondary sources of data to document the role of women in the economic life of Churah tehsil. This study is exploratory in nature. Methods such as; observation, personal interviews, etc., have been used. In Churah tehsil, women play a crucial role in the economy of the family. The main sources of income are agriculture, commercialisation of agriculture, etc. At present, women are also earning income from the MNREGA scheme. As men are not actively participating in the household and agricultural activities, it is a woman who is putting efforts to cater all the needs of the family. Men do not participate; therefore, women do more work compared to men starting from dawn till dusk. The paper is an attempt to highlight the dominant role of women in the economy because, despite their crucial role, women are facing inequalities and are not being respected in the family as well as in the society.

Refugees' Precarious Legal Status and Integration Outcomes in Sweden

The importance of legal status for the integration of refugees and other migrants has long been recognised by researchers. Previous literature generally indicate that an unfavourable legal status often has adverse consequences on socio-economic integration outcomes. The aim of this article is to compare the socio-economic outcomes of two refugee groups from Bosnia-Herzegovina who came to Sweden during the 1990s. The two groups are arguably similar, with the principal difference being their legal status upon arrival. To elucidate, one group was able to regulate its legal status after an average of eight months after arrival in Sweden, while the other group waited for longer than four years. We analyse the short- and long-term outcomes of both adult and child refugees. Our results differ from those obtained by most previous studies in other social contexts. We find that the difference in the length of waiting period and the level of exposure to a precarious legal status did not result in a substantial difference in the degree of long-term integration of adult refugees from these two groups. Moreover, when investigating child migrants, our analysis shows that some indicators were somewhat more favourable in the precarious-status group, with all else being equal.

"It's Complicated": Sex Work and Relations in the Family of Origin

In my speech I will discuss the transformation of relationships in families of origin in the context of women (daughters, sisters) who undertake sex work. The provision of sex services is a source of stigma for both the sex worker and her relatives (stigma by association). Hence, looking from the perspective of the family of origin, this undertaking of sex work by its member poses a vital factor in changing (actually or potentially) the social image of the family in question. The consequences of this change can shape family relationships. At the same time, the financial resources obtained through sex work also affect how the sex worker is perceived in the family of origin.

The presentation will discuss the strategies that sex workers adopt as to whether or not to disclose information about their sex work to their relatives. The implications of this disclosure (made in different ways) for relationships with individual family members will also be discussed.

The speech will be based on the results of a qualitative research project on the stigma experienced by sex workers in Poland. In-depth interviews were conducted with women involved in various types of sex work (escorts, erotic masseuses, strippers, porn actresses, and cam girls). The data was analyzed with the procedures of the grounded theory methodology.

Data Arenas or How to Deal with Datafication. Grassroots Data Activism in the Times of Data Power

Data activism is becoming a new mode of contention in digital infrastructures of governance (Beraldo, Milan 2019; Gutierrez 2018), which are increasingly based on the process of datafication, understood as the creation of digital representations of the world through the acquisition, processing, and analysis of data (Couldry, Mejias 2019; Thatcher, Dalton 2021).The paper proposes the relational category of *data arenas* as a field for strategic actors in diverse areas of the contentious politics of data (Beraldo and Milan, 2019) or "open-ended bundle of rules and resources that allows certain kinds of interaction to proceed" (Jasper, 2006: 141). The paper argues that the conceptualization of data activism needs to be related to the immediate data arena in which the action takes place, in order to select the inter-active opportunities and threats for emerging data-driven repertoires of action.

Data arenas enable to detail four dimensions of relational action: 1. actors' strategic goals, involving the introduction of new norms through the use of datafication technologies (Finnemore and Sikkink, 1998); 2. the practices of defining an arena boundary to shape narratives about social and to include or exclude other actors from the arena to more effectively shape the process of agenda-setting on multiple scales (Jasper *et al.*, 2022); 3. the sets of opportunities and threats to allow actors to make alliances and change positions within the arena (McAdam, Tarrow and Tilly, 2001); 4. issues of material and symbolic power that determine the effectiveness of data activism and its political consequences (Bosi, Giugni and Uba, 2016; Bourdieu, 2020). Data activism reveals the asymmetry of datafication power (Dominguez, Lopez 2019), but also creates space for alternative uses of data in disputes around environmental pollution (Sun, Huang 2021 and own research), corruption in the public sphere (Mattoni 2017) and human rights policy (Gutierrez 2018).

RC48-665.4

SLOSARSKI, Bartosz* (Faculty of Sociology, University of Warsaw, Poland)

Environmental Data Activism. the Use of Environmental Data As a Repertoire of Action and „Universal Language" of Nature Governance

The paper aims to introduce environmental data activism as a new mode of participation in the field of environmental policy (Konisky 2020). The process of datafication gains in significance within the environmental policy field (Dauvergne 2020; Machen, Nost 2021). Data mediate the public perception of nature (Gabrys 2016), visualize environmental pollution and climate change on a massive scale (Edwards 2019), and construct nature as the object of governance (Latour 2018; Ribes 2019).

The use of data is behind the emergence of new repertoires of grassroots action – data activism – which is understood as a data-driven practice of meaning-making (Beraldo, Milan 2019) through the use of geolocation tools, big data analysis, and artificial intelligence (Dauvergne 2020). New ways of analyzing data reinforce existing citizen science practices (Franzen et al. 2021), but also enable emerging modes of action, e.g. geoactivism, environmental data justice, and sousveillance or the grassroots observation of environmental data infrastructures (Gutierrez 2018; Rajao, Jarke 2018; Vera et al. 2018). Data provide a universal language through which actors can communicate problems to decision-makers, negotiate solutions (Laclau, Mouffe 2014), and influence the environmental policy agenda on multi-level scales (Risse et al. 2013). Environmental data is used by grassroots actors to fill in the public measurement gaps, and cooperate with authorities and academia, but also to defend the material basis of the data infrastructure (e.g. against defunding).

The paper will draw on the results of the ongoing qualitative case study research, including the Polish Smog Alert, which introduced air pollution into the public debate by 'visually' constructing it based on a bottom-up measurement network, and BirdLife Europe which influence the nature conservation indicators on the European level. It will show how the data repertoire is used as a source of legitimacy in environmental/climate policy, drawing attention to strategic dilemmas and opportunities.

Decolonizing Demographic Data for Tribal Peoples

This paper focuses on some of the most important data central to the governing functions of a nation state: demographic data. It specifically examines demographic data on Indigenous Peoples in what is currently called the United States of America. My main line of inquiry explores the ways in which Indigenous Peoples are made legible to the state through demographic data that serve the needs of the settler colonial nation state while continuing to create harm for tribal nations. I ask two main questions: 1) What does American Indian and Alaska Native (AIAN) demography tell us about tribal populations? And 2) How are tribal nations responding to the limitations of AIAN demography? I show

how the United States federal government continues to control and maintain the boundaries of the AIAN population. I argue that we cannot rebuke AIAN demography, but it is limited in its utility for tribal nations. I then present a case study in which I partner with a tribal nation to demonstrate how tribes must respond to the limitations of AIAN demography by developing tribal population data on their terms as an exercise of tribal sovereignty. This paper advances a new paradigm of tribal demography shifting the power and control from demographic data that reify settler statecraft to demographic data that rebuild tribal nations.

SMETS, Peer* (Vrije Universiteit, Amsterdam, Netherlands)

Arts As a Way of Connecting People in Low-Income Neighbourhoods in Amsterdam. a Matter of Social and Infrastructural Inequalities?

Participatory society asks for different kinds of participation such as care, schooling, and social work. It are often usual suspects who participate, while others refrain from doing so. The Dutch government encourages participation, but participation is not widespread. Simultaneously we see that arts, and more specific community arts, are increasingly aiming at 'improving' the living conditions of residents in low-income neighbourhoods. These participatory approaches are often target-oriented with a specific goal. However, artists tend to deal with unexpected circumstances that trigger interaction between residents. At the roots of community arts are often innovative qualitative approaches and symbolic attributes that trigger unexpected viewpoints and interactions. For example, chickens are placed in a hen house at the border of a neighbourhood, which encourages children en families to visit these places where residents start stroking these animals. These stroking activities brought different kind of people together, even among people who were not used to do so.

One of the challenges is how artist and academics join hands at the neighbourhood level. Both can influence and play a different role that encourages others to participate. For arts the focus is often on the process with unexpected face-to-face and online interaction. To enable some kind of cooperation new ways of looking at the insight of both groups and interaction with vulnerable circumstances are needed. Moreover, we look how interaction can be facilitated by different kinds of knowledge and how new mixes can help neighbourhood development without stepping into the trap of neoliberalism.

International PhD-Students during the Pandemic: Transformation of Migrant Strategies and Career Planning

Relevance. The pandemic of Covid-19 became the most significant phenomenon of the 21st century. In the context of the pandemic science and education were hit hard due to the transfer of teaching and all scientific events to the online format, the temporary closure of research centers and archives, and the break of international scientific ties. Among young scientists, the most vulnerable group was international PhD-students, because their plans and migrant strategies were directly related to the capabilities of academic employment and personal connections with scientists. Due to the pandemic students were forced to adapt their migration strategies and approaches to career planning to new difficult conditions.

Research goal. The goal of the research is (on the example of the international PhD-students in Austria and Germany) to analyze transformations of the individual migrant strategies of the international PhD-students and their perceptions and feelings about prospects for career and new pandemic-related work conditions.

Methodology and method. The object is international PhD-students in Austria and Germany, whose PhD-studies began no later than October 2019 and ended no earlier than May 2020. The method is the qualitative online interview. The recruitment method is the snowball sampling. The number of interviews is 20.

Results. For PhD-students the pandemic is associated with negative emotions and is a deep trauma threatened the future and devalued previous efforts in scientific work and integration.

4 types of transformation in the individual migration strategies of international PhD-students were found:

1) Zero flexibility. Despite covid restrictions, PhD-students leave their migration strategies unchanged.

2) Partial flexibility. PhD-student returns to the country of origin but plans to continue integration and scientific work later.

3) Deep transformation. PhD-student returns to the country of origin and plans to continue carrier there.

4) Self-exclusion. PhD-student returns to the country of origin and stops their scientific work.

Silence of the Labs: Adaptation Strategies of Russian Scholars during the Russian-Ukrainian War

Relevance. February 24, 2022, became the starting point of the new wartime reality. In addition to its devastating consequences in Ukraine, within Russia itself, the war has become a catalyst for an extreme increase in ideological and political pressure and risk in all spheres of life. This has especially affected universities, because of their socially significant functions: In addition to supporting and relaying knowledge, it is the formation of norms and values, which determines the ability to significantly influence young people. Threats of political and ideological pressure and even criminal persecution are forcing Russian scholars, who disagree with the militaristic policy of the government, to develop mechanisms for adapting to the changed conditions of professional everyday life. This is expressed, first of all, in a change in communication and the development of alternative contingently safe forms of communication, such as silence.

Research goal and research questions. The study aims is to analyze the silence of Russian scholars, who disagree with the current policy of the Russian government. Research questions: 1) what is the meaning and function of the silence of scientists in a modern Russian university? 2) Is the "modern" silence, as a form of adaptation, a "restoration" of the Soviet-time silence of intellectuals?

Methodology and method.
Method: qualitative interview.
Number of respondents: 20.
Target group: Russian scholars (with an academic degree of candidate of science or doctor of science) with at least 5 years of experience at the university.
Recruiting: Snowball sampling.
Results. Answering research questions, it was that:

1. Silence remains the only acceptable (not punishable by law) form of disagreement with militaristic policy.

2. Silence serves as a mechanism for subjective exclusion from pro-war activism and pro-war discourse.

3. Scholars note the feeling of "the return of Soviet censorship to universities and the restoration of adaptation mechanisms."

Rewilding Sociology? How Displaced Brown Snakes on the Urban Fringe Can Contribute to Sociological Practice

A key feature of STS scholarship is the destabilisation of orthodox epistemes and the celebration of social entities – be they technologies, environmental forces or social beings – as ontologically fluid, dynamic and contingent. From this perspective, how we think about the social world and do social science needs to be continually reviewed and revamped: our imaginaries, concepts, research practices, objects and outcomes. This entails re-imagining what disciplines like sociology are for and how they can embrace new techniques and knowledges to improve understandings of different forms of social relation. This openness to unsettling – and pushing the boundaries of – sociological knowledge and practice, has acted as an invitation to interrogate ontologically troublesome and slippery subject matter so that new insights can be revealed into how complex socio-ecological systems and actions are structured and relate. It is precisely this commitment to trouble bothersome entities and push disciplinary boundaries that inspired me to commence an experimental socio-ecological study of Eastern brown snakes (*Pseudonaja textilis*), one of the world's most venomous - and widely feared - terrestrial creature. I will discuss how I came to work *with* and *for* these maligned and persecuted figures, and how I am tracking them as they transit through the suburban landscape to map their movement behaviour, habitat utilisation and sociality. I will also outline how I am using technologies to reveal their habits and cognitions, but also to bring more legibility to them as vital environmental servants, in the process debunking their moral representation as unbelonging problem wildlife. This case study acts as a lever for sociologists to reflect on how our discipline can engage in new and generative ways with interdisciplinary problems.

The Elephant in the Gaming Room: The Case of Facial Recognition Technology and Gaming Culture in Australia

As a response to the problems of anonymity, insecurity and duplicity associated with today's hypermediated world, there has been a recent turn to biometric technologies which have the capability to anchor the identity of individuals to the fleshy materiality of the body. These 'recognition' technologies focus on measuring different parts of the body and rendering each into a machine-readable code so that they can be compared with virtual referents. The use of facial recognition technology (FRT) is one such application, as a means of both verifying identity claims for access control but also identifying individuals in real-time or retrospectively. An interesting example of the latter has been the increased use of FRT in gaming venues in Australia as part of harm minimization strategies concerned with managing problem gambling. Those who acknowledge they are suffering from a gambling addiction can voluntarily enrol in a self-exclusion program, which relies on FRT to effect the ban in automated ways. In some jurisdictions, FRT has been mandated in venues that have 30 'pokie' machines. In this context, we see the strategic framing of FRT by tech, industry and state representatives as a figure of virtue to mitigate against the harms that gaming machines and cultures induce. As one official put it, "We want to do anything we can to help those who can't help themselves." Based on interviews with gaming stakeholders, and with gambling patrons subject to these systems, this paper introduces the concept of 'biometric capitalism' to explore the way in which bodily surveillance measures get represented in symbolic, if reductionist, ways as technofixes for the contradictions produced by what is a highly predatory mode of capitalism. And yet these very technologies come in different ways to reinforce these problematic economic relations and add a veneer to the social harms this industry perpetuates.

Networks of Resistance: Tracing the Role of Fetishes in Indigenous/Community-Conserved Areas (ICCAs) in Senegal

My work is on ICCAs (Indigenous/community-conserved areas or 'territories of life'). Specifically, I am working with an ICCA based in the casamance region of Senegal called 'Kawawana'. ICCAs are a fascinating and inspiring example of community-led conservation that you read about here: https://report.territoriesoflife.org/territories/kawawana-senegal/ In particular, my work with Kawawana seeks to explore the role of sacred forests and fetishes (objects indicating the presence of ancestral spirits) in this territory of life. Fetishes are placed by women and indicate certain sacred sites in the territory. My aim is to trace the presence of these more-than-human spirits through varying institutional contexts - from the women's exclusive and situated knowledge of the spirit world in this local context, through to extra-local spaces engaged in national/international conservation discourses. It is in this tracing of fetishes from one institutional context to the next that I envisage adopting an institutional ethnographic approach - specifically, uncovering the ways in which these more-than-human entities are tied into broader institutional contexts and 'mainstream' conservation discourses, which are deeply shaped by neoliberal political economies and colonial depictions of the living world which separates humans from nature.

The Role of Play in the Multifaith Movement in Australia

The multifaith movement stands upon the precipice of generational change, and emerging generations are re-imagining what the multifaith movement is and could be. This presentation describes key findings from the interfaith stream of the ARC funded Religious Diversity in Australia project. It explores how the multifaith movement facilitates respectful encounters and relationships between religiously diverse people in Australia through the lenses of performance, atmospheres, ritual, and play. It begins with a critique of how too much focus on 'dialogue' in the multifaith movement limits its project to a powerful few and excludes marginal voices in the movement. I then highlight how emerging perspectives grounded in material religion and embodiment in interreligious studies are creating new avenues of inclusion. To contribute to this emerging field, I focus upon the performative genre of play and its role in both fostering multifaith relationships and broader social change. Play is a force of disruption, subversion, and renewal. Therefore, I argue that at this point of juncture play contributes to making sense of the shifts currently occurring (or about to occur) in the multifaith movement in Australia.

Metropolitan Imaginaries and Regional Cities in the North Americas

This paper extends a theorisation of metropolitan imaginaries in the Americas to incorporate interconnected regional cities. Following Cornelius Castoriadis, Néstor García Canclini, and others, I have previously utilized a focused notion of *metropolitan* imaginaries in studies of both North and South America alongside of an existing notion of *urban* imaginaries prevalent in Latin American urban sociology. With this theoretical framework, I have distinguished metropolitan cities as crucial destinations in migration and lively centres of a greater magnitude and with international significance. In this paper I extend the theoretical framework to begin to incorporate *metropolitan regions* and *regional cities* in the North Americas under the banner of urban imaginaries. Such centres emphasize provincial and regional connectedness when linked with larger networks of capitalism and the operation of state agencies and multinational organisations. Bringing urban sociologists variously concerned with the connections of regional and metropolitan cities such as Manuel Castells, David Harvey, Néstor García Canclini, Thomas Bender, and Armando Silvia Tellez, to Castoriadis' theory of the imaginary institution, this paper sketches a research program on metropolitan and regional cities and their imaginaries for the Americas.

How Environmental Movements in Indonesia Weave Together Local Knowledges of Religion and Science into New Socio-Ecological Practices

This paper describes how Indonesian environmental movements connect scientific and religious/cultural concepts in the creation of new socio-ecological practices. Environmental social movements in Indonesia often work with local communities to create new ecological practices. Studies of how social movements create these practices often view religious/cultural approaches and techno-scientific approaches separately, partly due to a scholarly tendency to see discourses of 'religion' and 'science' as separate to or in conflict with each other. Theoretically, this paper draws on four approaches: 1) grassroots environmental movements operating at the local level in Indonesia as driving forces and testing grounds for new environmental; 2) local contexts as geographical and conceptual spaces for studying interaction between diverse religious/cultural and scientific concepts and practices; 3) frame theory to explore different ways that social movements bridge between different religious/cultural and scientific concepts and audiences; and 4) focus on creative processes as social movements improvise and embed new socio-ecological practices in conversation with local communities. Methodologically, this paper draws on analysis of a new dataset of 208 distinct environmental movements operating in Indonesian local communities between 1990 and 2022, enriched by qualitative interviews with movement leaders and an ethnography of a grassroots movement operating in southern Java. The paper shares an inventory of new socio-economic practices, and it describe two types of synthesis discovered: 1) frame bridging, where social movements adopt religious/cultural and scientific discourses to appeal to multiple audiences, and 2) the creation of hybridized discourses and systems. Findings are illustrated with examples of adaptive farming practices, water management, forest conservation, and responses to the development of nuclear power plants. It concludes with a reflection on how the quality of local community participation and power dynamics shape the extent to which movements co-create socio-ecological practices with different segments of the local community.

RC47-JS-43.2

SMITH, Jonathan D.* (Universitas Gadjah Mada, Indonesia)

Studying Environmental Social Movements As Sites of (Inter) Religious Cooperation and Transformation in Indonesia

This paper describes how environmental social movements in Indonesia connect multiple religious and non-religious actors and practices in shared campaigns to address environmental crises. Indonesia sits on the global frontline of environmental crises, with a rich history of religious diversity and environmental activism. Previous studies have found multiple examples of how religious actors contribute to social movements addressing climate change, and how participation in these movements challenges religious groups to change their beliefs and practices to meet new environmental challenges. However, these studies tend to focus on one religious group (particularly Muslims and Christians), or they are based on a case study of a single social movement. Theoretically, this daper draws on four approaches: 1) social movements as meeting points for religious actors from different religions and beliefs to participate in processes of social change, 2) local contexts as geographical and conceptual spaces for studying interaction between multiple religious and non-religious actors, 3) frame theory to explore how movements include multiple religious and non-religious discourses, and 4) lived religion as a way to study diverse expressions of religion, spirituality and traditional worldviews without imposing scholarly or official definitions of religion. Methodologically, this paper

draws on analysis of a new dataset of 208 distinct environmental movements operating in Indonesian local communities between 1990 and 2022, enriched by qualitative interviews with movement leaders and an ethnography of a multi-faith grassroots movement operating in southern Java. This study found extensive synthesis between actors from official religions, Indigenous religions, and local traditions and wisdom (often called cultural practices). The paper presents a framework of four types of cooperation between these actors, and it links them to contextual factors that influence distinctive inter(religious) responses. It concludes with reflections on new methodologies for sociologists studying intersections between religion and social movements.

Fair Food Futures: 4 Scenarios for Translating Civic Food Politics into Food System Transitions in Australia

Within the field of sustainability transformations, theories of power argue that accelerating effective transitions require expanding multiple pathways, which includes going beyond co-creating individual change narratives to also engage in more confrontational pathways among diverse societal actors. Contributing empirical evidence for this idea, this paper reports findings from a national study exploring how civic food actors are collectively re-imagining what a better food system might look like in response to multiple food, climate and economic crises, in order to inform directions for policy making around sustainability transitions in Australia. The study's methodology combined participatory futures thinking and visual methods with the theory and practice of food utopias, and engaged over 100 participants in interviews, case studies, workshops and online discussions between 2019 and 2023. This has resulted in the articulation of four complementary *fair food futures* and associated pathways to action based on food justice: The Long Table; Fair Food in the City; Youth, Food and Climate Action; and Technology for the People.

This paper first describes how these scenarios were co-created. Next, I apply theory on 'large systems change' (LSC) to identify what each scenario can tell us about (a) co-creating, (b) supporting, (c) doing, and (d) forcing, change. In line with LSC, our scenarios – as examples of shared narratives about how power might be redistributed in future food systems - incorporate all of these strategies to varying degrees, via their insistence on actions based on solidarity and care, degrowth, reclaiming the commons, respect for ecological boundaries, human rights, and participatory governance. The paper concludes with examples of practical directions for change (such as sustainable food procurement, food policy councils and land sharing initiatives), providing new insights at the nexus of sustainability transitions, food system reform, and futures thinking.

Establishing a Cross-National Study on Experiences of COVID-19 - Methods, Processes, Challenges: The Australian Experience

As the significance of the COVID-19 pandemic became obvious around the world in early 2020, an international group of qualitative researchers interested in patient and health professional experiences of health and illness mobilised to capture the impact of this condition. This group – DIPEx International (www.dipexinternational.org) - includes researchers from Australia, Brazil, Canada, Germany, Japan, the Netherlands, Spain, Switzerland, USA and the UK. Our presentation describes the steps taken by the Australian team to initiate and develop a protocol for gathering people's COVID experiences worldwide, the challenges we faced ensuring a usable and practical protocol that captured multiple researchers' study design preferences, and the evolution of the protocol and data analysis processes. Differences in language, researcher expertise, project funding and research preferences needed to be accommodated.

We further explicate the contribution of our Australian data to two manuscripts emerging from the international study: one involving interviews with 71 people with Covid across five countries and their efforts to negotiate collective and individual candidacy for long Covid healthcare, and the other involving interviews with 115 people with Covid across four countries about disclosure, sickness absence and return-to-work. Whilst there were multiple instances of common experiences amongst study participants, regardless of country of origin, there were also country-specific unique outcomes. These differences were often underpinned by government decision-making and subsequent health directives/policy, as well as the level of healthcare support offered to citizens affected by Covid.

We conclude with some suggestions for streamlining the sometimes challenging and convoluted process of accommodating wide-ranging and differing points of view among researchers involved in international

collaborations, and provide some case examples of how we reached concordance in the theoretical and empirical aspects of data drawn from differing political, economic and cultural contexts and systems.

The Internet: Moving from Failure to Flourishing

The internet, and specifically social media, is often critiqued as a disruption to a functioning society and a threat to democracy , by which the only solution is to 'turn it off'. Critiques of the internet are important work, however, in this paper we seek to move away from 'big critique' (Burgess 2022) and focus on the conditions that help human flourishing on the internet. Drawing from the work of Halberstam (2011) this paper identifies a 'positive' internet that dwells "...in the murky waters of a counterintuitive, often impossibly dark and negative realm of critique and refusal" (2011, p.2). We build our understanding of positive internet through what Halberstam might consider the "rewards of failure" (2011, p.3) by focusing on where the internet has functioned and produced positive and pro-social outcomes amongst its many shortcomings.

We argue that by identifying instances in which the internet fosters social good, we can work towards (re)creating more of the same and thus cultivating meaningful sites of sociality. We aim to ascertain the building blocks of a more positive internet including platform policy, architectural design, and community practices. To date much research has rightfully focused on critiquing 'big tech' pinpointing misinformation, safety, privacy and harassment. In this paper we turn scholarly attention to human flourishing, identifying several dimensions in which social media has had positive effects. Emerging from the scholarly literature we highlight three key dimensions: shared joy, empowerment and resistance and social connection and community. We argue that these three dimensions are the building blocks of a more positive internet, and we examine the affordances and conditions from which these dimensions on the internet emerge.

Comparison Error Lessons from the International Social Survey Programme (ISSP)

The International Social Survey Program (ISSP) has conducted an annual cross-national survey since 1985. It has utilized the total survey error perspective to evaluate and maximize data quality. In particular, it has focused to minimizing comparison error - the interaction of measurement error across countries - and thus maximize comparability. Often the ISSP has found that initial standards and protocols needed elaboration and/or modification to function in an optimal manner. This paper looks at how ISSP has dealt with issues concerning 1. Acceptable Sample Designs, 2. Target Populations, 3. Mode, 4. Weighting, and 5. Validation of Interviews and Interviewers.

Spirituality and Religion: Trends and Cross-National Comparisons

Spirituality is an ancient and core construct of the existential lives of humans and the religions they have formed. It has manifested itself in many ways across societies and religions from the cave paintings of Lascaux to the spirit animals of shamans, the kami of Shintoism, the mysticism of Kabbalah, the whirling dervishes of Sufism, and the Holy Spirit of the Christian trinity. Despite its long historical presence, spirituality has been undergoing important changes and growth in recent decades. Some scholars even see the expansion of spirituality as challenging secularization theory's contention that modernization inexorably diminishes religion as education in general and science in particular undermine religious belief and many governments take over many social functions of religions such as caring for the ill and needy. They argue that modernization tends not to destroy religion, but to transform it and that spirituality has emerged and grown as a result.

Of course spirituality and religion are closely intertwined concepts. This paper disentangles them by looking at them in comparative perspective, by comparing a person's spirituality to their religiousness. First, recent trends in spirituality vs. religion are examined. Second, the correlates of spirituality vs. religion are studied. Finally, the role of spirituality and religion is analyzed across societies.

This paper uses three datasets: 1) NORC's General Social Surveys (GSSs) for 1998, 2006, 2008, 2010, 2012, 2014, 2016, and 2018, 2) the Fetzer 2020 Study of Spirituality in the United States (SSUS) and 3) the International Social Survey Program's (ISSP) Religion IV Study, 2018-2020.

Detangling (Social) Cyber-Deviance: Trolling, Online Harassment and Antidisestablishmentarianism on the Internet

As the Internet and online social media platforms (such as Twitter, Facebook, YouTube and other blog websites) become increasingly pervasive in the everyday lives of their users, theories surrounding appropriate methods for communication between individuals and groups within these online spaces continue to evolve, particularly regarding conflict within public debates. Most of this emerging literature engages with such new theories and evidence surrounding (in)appropriate online conduct within public forums (such as social media websites and comment sections), and the dangers of social deviance present on the Internet (such as cyber-bullying, trolling and the spread of misinformation). The literature under review often confuses and conflates the phenomena under examination and observation, or ignores important caveats to the phenomena altogether. For example, treating trolling and cyber-bullying as the same thing, or failing to acknowledge the ways in which humour might play a part in the motivations for perpetrators. As this research is emerging, there is a need for consistent use of terminology – which is currently absent – and more nuanced understandings of cyber-deviance. This area of study can be loosely divided into 3 styles: (i) trolling, (ii) online harassment and cyber bullying, and (iii) the spread of misinformation and/or proliferation of propaganda – which I label antidisestablishmentarianism. In so doing, I propose the umbrella term of Cyber-Deviance (CD) to envelope the above three styles of CD for researchers studying these phenomena.

SMITH, Vern* (University of Wollongong, Australia)

Individualised and Collectivised Cyber-Deviance

As the Internet and online social media platforms (such as Twitter, Facebook, YouTube and other blog websites) become increasingly pervasive in the everyday lives of their users, theories surrounding appropriate methods for communication between individuals and groups within these online spaces continue to evolve, particularly regarding conflict within public debates. As this research is emerging, there is a need for consistent use of terminology – which is currently absent – and more nuanced understandings of cyber-deviance. Through empirical research and reviewed literature, I propose the umbrella term of Cyber-Deviance (CD) for researchers studying these phenomena. CD can be loosely divided into 3 styles: (i) trolling, (ii) online harassment and cyber bullying, and (iii) the spread of misinformation and/or proliferation of propaganda – which I label antidisestablishmentarianism. The empirical research analysed the comment sections of news and satire posts about the Australian bushfires of summer 2019-2020. This event saw the spread of conspiracy theories, misinformation and climate denialism within general discussions and the media. The findings discuss the ways in which CD unfolds individually and collectively. It also observes how online news and satire content affords and 'encourages' the various styles of CD within comment sections.

Reclaiming Just Transition: Unions and the Fight for Nature and Jobs

Historically, natural resource based unions have often found it challenging balancing the need to protect jobs while also advancing ecological sustainability agendas. Often simplified as the 'jobs versus the environment' dilemma, some unions have sought to advance a enviro-political position which challenged this dichotomy through the development and advancement of the notion of just transition. In this paper we consider the union origins of just transition and its evolution among unions in recent years. Through an examination of union just transition campaigns and narratives in Australia we discuss why unions are becoming prone to abandoning this important concept for less politically progressive ideas such as diversification and decarbonisation. Drawing upon Barca's (2019) work on labour and the ecological crisis and Clark, Foster and York's (2010) notion of capitalism's ecological rift we argue that unions have a critically important role to play in bringing about solutions to the ecological and climate crisis upon us but it will require reclaiming the 'justice' in transition and the struggle over production and nature that underpins it.

SNELL, Darryn* (RMIT University, Australia)

Work in Transition in Australia

This presentation highlights how the world of work is changing rapidly in Australia as a consequence of new business practices, the advancement of workplace technologies, climate change, globalisation and shifting international production networks with varied outcomes for workers and communities. It will make the case that formal labour protections are proving increasingly inadequate, and workers, especially migrant workers, are being exposed to growing employment and social

protection risks. It will argue that the COVID-19 pandemic laid bare the fault lines of paid work exacerbating employment insecurity, underemployment, low pay and poor working conditions for many workers, particularly those in feminised sectors such as retail and care work. While the transition to a low carbon economy offers to revitalise regions and generate new secure job opportunities, the energy transition has often resulted in secure well-paid work being displaced for precarious jobs. New ways of working are emerging in some sectors out of COVID-19, which appear to offer greater 'flexibility', improved work-life balance and hybrid working opportunities, but which have for many workers increased job demands and incursions into family life. The presentation will conclude with a discussion of how Australia's unions and the new Federal Labor-Government are seeking to respond to these changes and challenges in the world of work.

The Patterns of Youth's Usage of the Internet and the Emerging Learning Styles: The Case of Latvia

The paper will provide information about youth's online practices and the patterns of the use of the internet for learning purposes, the habits and cognitive strategies employed by young people for search of information and performing cognitive tasks and their beliefs about possibilities of the internet in the learning process. This presentation will be based on the data which has been collected within the project "The impact of internet usage patterns on the development of youth's cognitive styles". The target group of the research are young people (15 – 25 years old) – pupils of secondary schools and students of higher education institutions in Latvia. The data is collected by using qualitative and quantitative methods – interviews with experts, focus group discussions and a representative survey of pupils and students (2000 respondents). Literature review, interviews with experts and focus group discussions suggest that the internet has had strong impact on cognitive behavior and practices of the young people. The youth rely on the internet as a storage of information and tend to use it as a kind of external memory. Under the influence of the internet their preferred ways of getting new information and reading practices have changed over the last decade. On the basis of the survey data we are going to identify the patterns of youth's usage of the internet and their effects on the learning activity and styles. Information obtained in the survey will enable us to assess to what extent the young people are using the internet in purposeful and creative ways and to what extent they are rather influenced by the powerful environment of the internet, which distracts their attention and has the potential of diluting the learning process.

Defending the "Folk": Heathenry and the Micro-Foundations of the Far-Right

In this paper, we use Heathenry, a pagan religious movement drawing upon Germanic and old Nordic traditions, identities, and mythologies, as a micro-level case study offering a preliminary illustration of contemporary strategies of exclusion enacted in "cultural defense" against the perceived threats of liberalism and multiculturalism. We discuss the intersection of micro-cultural groupings with macro-structural forces and political opportunities. Right-wing Heathenry, along with other meso-level groupings, both *reflects* and *contributes to* these larger sociopolitical changes. Following Fine's (2009) concepts of "tiny publics" and idioculture we propose that most social life occurs at the group level and that what happens at the group level matters. Local Heathen groups provide one example of the micro-cultural foundations of the 'alt-right,' showing how race and racism are "done" beyond establishment political operatives, think tanks, and more organized social movements. In the context of these groups, we show how Heathens "flip the script" of multiculturalism by claiming indigeneity in defense against "colonization" and reframing intolerance to suggest that liberals are intolerant. We demonstrate how recent events (e.g. war, migration), movements (e.g. Black Lives Matter, #MeToo), and the presidency of Donald Trump have accelerated tribalism, nativism, and white ethnonationalism in the US and elsewhere. Initially in this period, right-wing Heathens fused "new" and "traditional" (overt, Jim Crow) racism, suggesting that the political moment – a "Trump effect" - legitimized a reactionary racial discourse, a relative "mainstreaming" of white pride, separatism, and in some cases white supremacy. We conclude by calling for increased attention to the cultural foundations of social movements (e.g. Jasper 2014), including the "hidden spaces" of hate (Simi and Futrell 2015) in the "new global far-right" (Miller-Idriss 2020).

SOARES, Dandara* (UNIVERSIDADE FEDERAL FLUMINENSE, Brazil)

Movements of Mothers of State Violence Victims Against Public Security Policy of State of Rio De Janeiro 2007-2022

The present work goals to analyze the search for justice of Mothers and Relatives of State Violence Victims in Rio de Janeiro State. The research takes place in the Legislative Assembly of State of Rio de Janeiro and in the Court of Justice of the State of Rio de Janeiro. Therefore, it exposes itself the resistance and denunciation of the aforementioned movements to the construction of public security policy of this state in the last fifteen years. Such movements promote acceptance among the families and the indication of judicial and legislative paths in the monitoring of cases of murder of their loved ones. The transformation of mothers' grief into a struggle moves these women. They search at least two types of justice: the consolidation of their children positive memory and the resolution of the cases in courts and legislative institutions that promote state accountability for murder of young black peripheral people and pressure for the resolution of the cases.

The temporal cut was based on the understanding that there is a continuity of the public security policy from 2007 to 2022: the entry of Sérgio Cabral as governor of the state of Rio de Janeiro led to the implementation of the Pacifying Police Units (PPU), a project followed by his sucessors. The PPU should lead to pacification and retaking of slum territories, but according to Leite (2012) is verified that there is little effectiveness of PPU. With Wilson Witzel's victory in the 2018 elections, there is an initial break with the previous public security policy, with the extinction of the public security secretariat. However, Cláudio Castro, Witzel successor post-impeachment, dates back to the continuation of PPU under another name: Integrated City project, because the mentality of the Military Police remains the same: disrespect for the human rights of slum residents.

Anxiety and Inequalities: A Case Study with the Brazilian Mutual-Aid Group Neurotics Anonymous

Anxiety is an increasingly pervasive and uncomfortable emotion in recent decades, with Brazil as a pressing case for the analysis of this emotion, since it's a world leader in the prevalence of anxiety disorders, according to the World Health Organization (WHO). Following a set of researches that approaches an existence of convergence around the socio-economic situation of a social actor and the experience of certain emotions, this work attempts to understand if anxiety, as a situation of mental suffering, is related to different indicators of inequality that increased during the pandemic of Covid 19. More specifically, it aims to comprehend the anxiety social causes and whether its experience reinforces or reproduces social inequalities, based on a qualitative analysis of a virtual mutual aid group - the online group "Caminho Novo" created through the Community of *Neurotics Anonymous* (N/A), which is a voluntary fellowship widely spread in the Brazilian society formed by people who share their experiences to solve their common emotional problems. The axis of the approach is the experiences lived by individuals in anxiogenic states reported on these virtual forums during the period of the pandemic from 2020 to 2021. The research results revealed a correlation between the experience of anxiety and situations of economic and social precariousness. The social structures involved in the experience of anxiety and which are expressed in social action, from this mediator, make the people who experience it unable to leave the immobilizing framework placed by this emotion, reinforcing the situation of economic and social vulnerability. Anxiety is experienced as an emotion that prevents members from entering the job market or remaining in it, it also makes it difficult to experience affective relationships and new bonds, leading the deponents to situations of loneliness and divorce.

SOBOTTKA, Emil Albert* (Rua Prof. Fitzgerald 192, Brazil)

Platform Capitalism and Democracy: Crisis of the Public Sphere in Brazil

The theoretical-political concept public sphere is strongly linked to Jürgen Habermas. In his 1962 published book *The structural transformation of the public sphere,* he adopted a historical-conceptual perspective and deepened the concept in later works. With that, he subsidied a positive expectation for democracy, which Habermas himself called participatory democracy. His new book, *A new structural change in the public sphere and deliberative democracy*, puts aside optimism and asks what future democracy has within the capitalist platform. Since everyday life is highly (in)formed by algorithms that are not focused on understanding or on improving public deliberation, but instead on capturing attention. In light of this thesis, and based on empirical data from newspapers and other documentary sources on projects and public policies in recent years, the text analyzes the state of the public sphere in Brazil and its (in) capacity to foster a deliberative democracy. Which contradicts the expectations that the popularization of new network technologies had brought when they were popularized at the beginning of the present century.

Trivialization of Religiosity: Political Instrumentalization of Evangelicals in Brazil

Since the proclamation of the Republic, Brazilian state policies maintained a formal separation between churches/religions and the state, even though there have sometimes been episodes of reciprocal instrumentalization. In Brazil, the secularization of the personal conduct of life has never reached such a high degree as in several Western European societies. Everyday life has always been imbued with intense religiosity. Syncretism, public demonstration of personal religiosity by political leaders as well as the strong influence of Liberation Theology in social movements and political parties attest that the institutional separation between state and religion did not imply a secularization of individual life. The growing Pentecostal movement – and its variant called neo-Pentecostalism – for a long time cultivated individual and family behavior very intensely informed by religion, and distanced themselves clearly from public life. In recent decades, the formal separation between state and religion has changed radically. This change reached its peak with the ubiquitous presence of religious organizations and arguments in Brazilian public life, during the electoral campaigns, and throughout the presidential administration of Jair Messias Bolsonaro, with his slogan: "Brazil above everything, God above all". From the concrete policy in education to the appointment of occupants in state positions, as in the case of the Federal Supreme Court, passing through countless other areas, the normative foundations derived from religion – in this case: of a conservative root – have become current. The text is based on public manifestations of Bolsonaro and his supporters that justified activities, policies, and claims of policies based on religion to analyze the colonization of public policies and institutions by the political instrumentalization of Pentecostal and Neo-Pentecostal religious movements. Instead of a "return of the sacred" to public life, in Brazil, there seems to be ongoing an evil banalization of evangelical religiosity for political purposes.

The Construction of 'auctoritas' and the 'people' in Turkish Populism

The astonishingly preponderant mobilization of the "popular" in politics in a society that has experienced frequent polarization (Erdoğan and Uyan-Semerci 2018b), has provided the opportunity for insightful work on issues of mobilization, leadership and discourse. However, the centrality of the notion of the people in politics sometimes leads to conceptual laxity and to misreading the ways "the people" is deployed as a political category and gives rise to flaws in the analysis of political discourse, action and mobilization. This paper deploys a conceptualization of populism that retains the critical edge of the concept and allows us to use it in the study of Turkish politics without collapsing all appeals to the people into populist politics. Tracing the emergence "the people" and "auctoritas" as nodal elements in Turkish politics, and drawing on a conceptualization of populism as a political logic that promotes the construction of a polarised political field that favours (and relies on) parental and highly personalistic forms of "auctoritas" that interpret, express and realise the will of a people (posited as the indivisible bearer of rights), at the expense of particularistic or individual rights, this paper examines the impasses of a system that was geared towards creating a compliant people and the appropriation and transformation of the exclusive divides erected by the Kemalist state into resources for populist forms of mobilization and politics by counter-elites, including the conservative-Islamist elites of the past two decades. Zooming into this time the paper provides an outline of the discursive, performative and representation aspects of the populism of the AKP and suggests that the democratic promise of the latter's populist politics (and populism in general for that matter) "effectively" displaces popular sovereignty or divorces it from its material dimension of empowerment.

Navigating the Work-Home Boundary: Socio-Spatial Reading of Home As Workspace

Home-based work is a substantive form of livelihood across cities of the Global South, entrenched in informality of not only space but also livelihood, and occurring in sites that exist in tension with planning and policy. Users of such sites have to further navigate through the myriad complexities, benefits, and vulnerabilities that are resultant from an overlap of domestic and economically productive realms. This paper builds on previous work by the authors on the spatio-temporal reading of home-based work and the interface of domestic and productive realms through what the authors refer to as the work-home boundary (Sohane, Lall, Lala et al, 2021). It explores methods of documenting the work-home boundary – and how it is perceived and articulated by users. It aims to fill a critical gap in the knowledge around home-based work by wielding a socio-spatial lens in reading work-homes, and foregrounding the experiences of users in managing the work-home boundary. The study employs a mixed methods approach of in-depth interviews around the everyday execution of domestic and productive activities juxtaposed with a spatio-temporal study of the work-home, across scales and their engagement with various stakeholders. Through this, the paper aims to unpack the complex agency users exert in managing the work-home boundary and their engagement with other stakeholders across scales, and draw lessons for planning and policy.

Commuting and Return Labour Migration in Russian Scientific Discourse

Commuting appears in a situation where an individual is unable to find employment in a place where she/he permanently lives. On the one hand commuting improves professional skills and the welfare of a household where a commuter lives, but on the other hand it leads to spatial disparities in employment rates, transformation of marriage and family relations. Also it has a negative effect on quality of life, well-being, health, etc. In Russia commuting defines as a special form of migration, to be exact as a return short-term regular labour migration. We have a chance to observe the transformation of women and men participation in commuting since 2011 in Russia. Women's participation is less in short-term regular labor migration (only 22.9% of the total number of return short-term regular labor migrants) due to gender stereotypes and cultural traditions. The frequency of their returns will be different from the male population and besides men are more involved in such kind of migrant activity. Men mainly travel with a frequency of return less than once a month (36% of the total number of return short-term regular labor migrants). Women involved more in daily trips to work in another locality (62% of the total number of short-term regular labor migrants). Return short-term regular labor migration makes it possible to curb population growth in cities, develops transport infrastructure, leads to socio-economic stratification, but at the same time strongly influences on the quality of social connections of a labour migrant, that has far-reaching consequences. It is necessary to improve the quality of accounting of return short-term regular labour migration in order to form an adequate control of the migrant situation for further evaluation of the social, economic and demographic consequences of such kind of migration activity and for improving migrant's policy.

A Socio-Ecological Investigation on Plastic Bottle Waste Brick As an Option for Plastic Pollution Reduction and Construction Block Deficit in Nigeria

Plastic waste and its overwhelming results are not particular to developing countries as developed countries also experiencing it. However, most of the developed nations have made strides towards overseeing it. Unfortunately, less or no efforts are made by the majority of developing countries in dealing with the plastics waste problem and protect our environment, there is an urgent need for the development of a sustainable approach to reduce plastic wastes created from households and ventures, subsequently making reusing plastics a significant part of recycling activity. It is in this view that this study set out to examine plastic waste brick as an option for plastic waste environmental degradation and construction block deficit in Nigeria. The study objectives are to know the scope of plastic waste pollution and cost of block for housing construction; investigate how builders and prospective homeowners consider the cost of blocks as problem in housing construction; find out the understanding of plastic waste brick and its consideration as alternative among prospective homeowners as well as ascertain whether the use of plastic in construction is a potential solution to plastic waste management and the need for housing. This study will be anchored on theories of economics cost of construction, environmental uses and gratifications. The study employed both exploratory sequential designs. The exploratory sequential design include the use of qualitative and quantitative methods. A total of 399 respondents were used as sample for the study. The findings of the study provide information on the perception of builders and homeowners on the current cost of building materials as well as the socio-economic and environmental challenges faced by homebuilders in contemporary Nigeria. It also document the extent to which plastic waste blocks served as an intervention to the issue of high cost of building materials and housing deficit in Nigeria.

SOLANKI, Durgesh* (Johns Hopkins University, USA)

Plaguing the Empire: Repertoires of Colonial Governance

In this paper, I examine the case of a series of bubonic plague epidemics that originated in China in the 1860s and continued through the late 19th and early 20th centuries, spreading to six continents across the British, American, and French empires. I focus on outbreaks in Hong Kong (1894), Bombay (1896), and Cape Town (1901). The colonial administration's response in each city was to quarantine individuals and communities with suspected infections and burn down the houses of those who had contracted the disease. Despite being part of the same empire, each colony had different governance structures, served different purposes and ruled by different jurisdiction. In theory, the response in each of the colonies should have been different, but that is not the case. Through comparative historical research, I ask: Why the response to the disease was similar in all three cities, despite scientific discoveries that demonstrated that the measures undertaken by the British colonial government were unnecessary? Further, why was this response absent in previous or later outbreaks of other diseases in the colony?

To explain these similarities, I advance the concept of *repertoires of governance*, sets of ideas and practices that states develop to govern populations. Through archival research on plague epidemics in Hong Kong, Bombay, and Cape Town, this paper makes two related points. Firstly, based on the similarities between the three cities, I argue that the colonial state and its emissaries identified the disease as existing in the racialized bodies of colonial subjects. This understanding of colonial subjects came from earlier discourse on the English working class, miasma theory, germ theory, and previous experience of dealing with plague. Secondly, this paper argues that successive outbreaks served as opportunities for British administrators to experiment with and refine strategies to govern and exploit colonial populations.

Sociologies of Inequality and Community Wellbeing: Why Positioning Disability at the Centre of the Narrative Enables New Understandings of Inequality in Australia

The impacts of Covid-19 have reminded us of the severe disparities in social inequalities that continue to thrive in our world. For so many of our community members, the experience of Covid-19 was one of repetition. First, the experience of the well-established disproportionate inequities in health and social care systems, delivery and distribution, both prevailed and often, became more entrenched for highly marginalised groups, especially for those living with disability, chronic conditions and ill-health. Second, the experience of being invisible to health and social care systems, services and the workforce because of one's position of marginality were deepened. And third, the absence of social and political representation of our most vulnerable community members in decision making throughout the covid crises, particularly for community members who live at the intersections of racism, classism, ableism and cissexism, was persistent and unrelenting.

This paper will be driven by two core questions that will seek to explore the important role of sociologies of disability in shaping disciplinary understandings within the sociologies of inequality in a post-pandemic world. First, it asks, what role can sociologies of disability play in deepening the epistemological engagement with sociological questions of inequality? Second, it asks, how can we, as sociologists of inequality, engage in co-creating sustainable research practices to broaden out and deepen civil and political understandings of disability inequity – in both its production and reproduction – to address deepening structural relations of ableism in a post-pandemic world?

Does Yes Always Mean Yes? Analyzing Consent for the Prevention of Gender Violence

The spread of the MeeToo movement and the visibilization of multiple and diverse cases of sexual harassment worldwide, have demonstrated the complexity in the analysis of situations of gender violence, as well as the need to go beyond speech acts in such analysis in order to contribute elements to end with this violence. The analysis of consent and its evolution, from "no means no" to "only yes means yes" is still focused on verbal language which limits the understanding the problem within the social context. A verbal "yes" under a situation of coercion may lead to rape. Coercion may be explicit (i.e. showing a knife or five big boys intimidating a girl) or the result of the power relation in the social structure (i.e. the boss talking to a candidate in a job interview). Beyond speech acts, communicative acts include speech, non-verbal communication (such as tone of voice or body language), and the social context in which the interaction takes place. Along these lines, it is relevant to explore the conditions in which consensus takes place, based on dialogic communicative acts, and the conditions in which there is no consensus (and communicative acts of power). In this debate, it is relevant to delve into three concepts in order to

continue advancing scientific knowledge about consent: 1) institutional power, which explains how, beyond physical power, there are situations in which a "yes" does not mean free consent; 2) consequence versus intentionality/claim, which emphasizes the need to consider the consequences of interactions and 3) interactive power, which refers to the power that is created in the interaction itself. This paper will discuss these concepts and provide examples from the results of a research project about "Consent in sexual-afective relations among youth", funded by the Spanish Ministry of Science.

Turning Dialogic: The Role of European Sociology in Breaching the Gap between Science and Society

Social Sciences, and sociology within, emerged with the foundational mission to support citizens in their journey to self-governance. With the advent of Modernity, this original intention has been jeopardized by many theoretical and practical interferences, leaving one part of the European sociological endeavor far away from providing to society the needed theoretical knowledge to better address its most poignant and relevant matters. A clear example has been the role (or the lack of) played by sociology during the COVID-19 crisis. In recent years, the centrality of scientific progress to enhance people's wellbeing and safety has been clearly revealed. The dialogic turn towards open science and societal impact supposes a challenge and opportunity for scientists across disciplines, and a new door for sociology to recover the original mission of social sciences. Europe and its scientific programme are pioneers worldwide in embracing this turn, and sociology has been leading it. European sociologists are contributing to design the theoretical background and concepts to identify, and co-create evidence of the social improvements of citizens' lives resulting from science, showcasing multiple examples of social creations in Europe and beyond. I will discuss the implications that this is having for our discipline, and the manifold horizons opened to sociologists working in both the academic and non-academic realms.

Children's Participation in the Prevention of Violence Against : Fulfillment of Children Right to Participation

Children are the main subject to prevent violence against children. This study aims to explain how the implementation of the fulfillment of children's participation rights in preventing violence against children. Existing studies generally focused on children's participation in the right to education, child-friendly city development, and participation in research. Research on children's participation in the context of fulfilling the right to protection from violence is still limted. The scope of this research refers to Lundy's (2007) conception of meaningful child participation which includes 4 aspects, namely: Voice, Space, Influence, and Audience (Lundy, 2007). The approach used is qualitative with a case study method at the Children's Forum in East Jakarta. The findings of this study indicate that structurally children have been given the space to participate (space) and the opportunity to voice (voice) in the public sphere. However, children are still limited in dialogue with strategic parties, including decision-makers (audience). Even though the child has spoken, there has been no follow-up (influence). It seems that children have not been seen as strategic and influential stakeholders/agents. This is reflected in the weak recognition of children's views/voices, particularly in efforts to strengthen measures to prevent violence against children. This finding cannot be separated from the government's perspective which still places children as objects in the development and organization of the Children's Forum, which only answers the government's agenda. Fulfillment of children's participation in violence prevention has not been meaningful yet for children.

Smart Photos: On Personalized Images in Algorithmic Situations

Tinder introduced in 2016 the function »smart photos.« Rather than the individual deciding which image shows *the best* (or most click-worthy) version of him or herself, it is the algorithm that choses. This example of A/B-testing - adopted from marketing and applied to the field of self-promotion in online dating – is just one feature of the role of *visual internet imagination* in the presentation of the self in digital life. *Image filter algorithms* change the way we look (at ourselves); *sorting algorithms* change our images' position in social space; *face recognition algorithms* connect the online persona to the person moving on the street.

This paper focuses on image algorithms in personal selection processes. Personalized images can be used in contexts of social inclusion (e.g., application images showing affiliation to social groups) as well as exclusion (e.g., police portraits or face recognition within a social credit system). Time and resources are invested to create multiple online personas which make individuals

accountable on digital platforms (e.g., profile pictures on dating or job service apps). Individuals often do not use single images on social media. They create hyper-images, e.g., in the form of iconic image clusters. With the help of sorting algorithms, these are later reorganized into different image feeds.

Case comparisons from historical and contemporary selection procedures are used to understand algorithmic situations as complex social entities. Image processing algorithms (in which the image itself is analyzed) are blended with image algorithms (in which the image is categorized, e.g., regarding how people interact with it). A visual sociology perspective should neither understand image algorithms as simple automatizations nor as black boxes. They should be seen as constitutive parts of a reality that individuals encounter in social situations, which they use for their own purpose, and towards which they adapt their behavior.

Dams, Discourse and Ecology in Neoliberal India

Neoliberalism is the most powerful political ideology which forcibly controlled water resources for economic benefits by building large dams. On the negative side, these dams displaced millions of Indigenous peoples and generated negative externalities on ecology. However, large dams still remained the only developmental option in emerging economies. Therefore, literatures analyzing the rise of dam buildings and its associated effects are well documented, but there is dearth of studies on the rejection or removal of dams in emerging economies. This motives us to discuss the shifting political attitudes leading to the rejection of forest clearance and campaigning for removal in India's Northeast region. Combining discourse coalitions with sustainability criteria, the study can identify both pro-dam and anti-dam storylines in the discourse of dams. Despite the central government's imposition of neoliberal water policies through pro-dam storylines, certain government agencies took the anti-dam position by advancing ecological storyline, which could perhaps herald the potential policy shifts in the dam governance. Such shifts challenged the question of fulfilling sustainability criteria in the existing dam projects particularly on the ecological ground. Alternatively, the study suggests for scientific assessment of dams to check its sustainability issues and calls for removals if necessary. Instead, the study suggests to promote micro hydel projects to reduce the scale of ecological damage and also fulfil community energy needs.

South Asian Dams at a Tipping Point? the Case of Tipaimukh Dam in Manipur, India

While dam building has dwindled in most developed economies, it has seen an increase in emerging economies, particularly in East and South Asia. Even there, however, such dams are facing mounting opposition. This raises the prospect that dam building is nearing a global tipping point. This study examines the case of the Tipaimukh Dam in Manipur, one of the states in India's peripheral northeast, asking how such a major project was stopped despite support from powerful national and regional level actors. To analyze this case, the study builds on the Advocacy Coalition Framework and the analytical concepts of Growth Coalitions and Discourse Coalitions. The joint application of these concepts enables us to link global advocacy coalitions with local pro- and anti-growth coalitions through the storylines they advance, thereby formulating multiscalar discourse coalitions. This allows us to follow the struggles between pro-dam and anti-dam coalitions, as well as trace the shifts in the composition and focus of coalitions over the 75 years since the dam project was first proposed on the transboundary Barak River.

The Latent Classes of the Volunteer Satisfaction Index and Volunteering during the Pandemic

The retention of volunteers amid the COVID-19 pandemic was a severe concern for voluntary associations worldwide. Due to governmental restrictions on face-to-face social interactions, voluntary associations had to curtail traditional volunteer activities and thus experienced a significant reduction in the volunteer workforce. Therefore who stayed in or left the volunteer field during the pandemic is an important question for the nonprofit sector. A plausible mechanism is the effect of volunteer satisfaction that may help keep volunteers working for the public good despite harsh external conditions. The study used the data from the Individual Giving Survey in Singapore. The survey was administered between April and September 2021, a period when the pandemic hit hard the country. The study utilized a Latent Class Analysis of the 26 items of the Volunteer Satisfaction Index (Galindo-Kuhn & Guzley, 2001). The LCA identified five subgroups of the current and former volunteers as follows:

(1) highest overall volunteer satisfaction (14%), (2) high Participation Efficacy and Group Integration satisfaction (13%), (3) high Organizational Support satisfaction (10%), (4) medium Participation Efficacy and Group Integration satisfaction (19%), and (5) low overall satisfaction (44%). A series of regression analyses were applied to various outcome measures of volunteerism, taking the latent classes as the main predictors. The results indicate that those with the highest overall volunteer satisfaction volunteered for significantly more extended hours than the contrast category of low overall satisfaction. Likewise, the highest overall satisfaction class was more likely to be current volunteers and to have volunteered more recently than the other classes. Regarding the breadth of volunteer areas, those in the highest overall satisfaction class belonged to more voluntary associations than the other classes. In conclusion, volunteer satisfaction was a crucial factor that prevented people from ceasing volunteer activities during the pandemic.

The Reciprocal Relationship between Social Engagement and Cognitive Function Among Older Adults in South Korea

The study aims to identify (1) whether informal and formal social engagement is effective in maintaining the cognitive function of older adults and (2) if the cognitive function has a bidirectional effect on social engagement. The literature has more studies that show the impact of social engagement on cognitive function than the other way around. It also lacks bidirectional examinations of the relationship. The study applies a dynamic panel data structural equation modeling with a maximum likelihood estimator (ML-SEM) to the Korean Longitudinal Study of Aging (KLoSA) data. The fixed-effect estimates confirm that both informal and formal engagement protect cognitive function over time. Regarding formal engagement, frequent participation in organizational activities is more robust in its positive association with cognitive function than memberships in voluntary organizations. Concerning the bidirectional relationship, the cognitive function also increases the degrees of both informal and formal engagement. The study thus validates a reciprocal association between social engagement and cognitive function. Developing policies that encourage older adults to engage in interpersonal contacts and organizational activities regularly is crucial to protect their cognitive health.

Multiple Logic, Multi-Governance, and Legal Consciousness: A Legal Sociological Analysis of Urban Drug Management in China

Since the reform and opening-up, drug control and management have become a critical national task in the face of severe drug problems, and a multi-level, complete coverage drug legal system has gradually formed. However, this system's actual operation and social effects have received little research attention, and the black box of legal policy and law enforcement process has not been opened yet. This study investigates the daily work of drug control organizations in City X and the living conditions of People who use drugs (PWUD), then we examine drug laws and the interaction process between law enforcers and law enforcement targets, outlines the current urban grassroots drug organization and practice logic by combining the daily life experience of PWUD. The study finds that firstly the drug laws contain multiple logic of "nation-state," "social engineering," and "correction and rehabilitation," and these logic set contradictory and fragmented identities of PWUD. Secondly, the Narcotics Control Office (NCO), the Police Station(PS), and the Community Assistance Group (CAG) lack inherent organic integration. The three work concepts of "national security," "social order," and "supervision and treatment," respectively, have created the identity dilemma of PWUD in their actions, that is, "non-complete citizenship." Thirdly, the identity dilemma keeps PWUD in "unstable daily life" for a long time. They have not formed a confrontational legal consciousness but have formed "highly normative," "escaping conflict," and "instrumental cooperation," which are quite different findings from similar research.

How Should Organizations Deal with Individual Personalities and Social Aspects?: A Case Study of Japanese Companies' Employment Relationships with Highly Skilled Foreign Workers

By focusing on the relationship between typical large Japanese companies and highly skilled foreign workers, this presentation examines how organizations de-colorize the nationality and personality of their employees, and its effect on individual workers. I have been conducting empirical research on their employment relationship from both the labor and management perspectives. The purpose of this presentation is to highlight how organizations deal with individuals' personal and social aspects by using the case of Japanese companies. The following three points will be emphasized in this presentation.

First, I demonstrate how Japanese companies are attempting to convert immigrants into "docile subjects" through sensemaking (Weick 1995), in which they use their power to subordinate immigrants to the organization's internal logic. The results of my surveys indicate that Japanese companies are attempting to denationalize foreign workers in order to unify their identities as employees. Meanwhile, it is also suggested that Japanese companies have multi-layered expectations for highly skilled foreign workers with the same abilities as talented Japanese employees, but with the heterogeneity of diversity-based innovation.

Second, the institutional pressure of denationalization raises foreign workers' awareness of their individual and collective identity as foreigners. Their subjective meanings of employment in Japanese firms are influenced by their self-perception of how their nationality is referred to in the organization.

Third, the pressure for socialization, or denationalization, in Japanese companies may conflict with social policy norms for accepting foreigners, depriving workers of their freedom of choice. From a sociological perspective, this means that the organization intervenes in the relationship between the immigrants and the state, resulting in an unstable employment relationship.

Recreation Scenario of Bangladeshi Transgender People amid New Normal Era

Promoting non-binary genders' livelihood patter in the academic atmosphere remains quite unusual. Though over a couple of years several scholars have paid attention to researching these specific gender groups, limited research on the changes in the recreation pattern of the transgender people in Bangladesh in the post-pandemic situation has made voidness in literature. Since the coronavirus pandemic has brought a significant change in every aspect of life in each age and sex group so the significance of this scholarship would be a new addition to academia which would help policymakers to understand the value of these sexual minorities amidst the newly developing world. At the same time, recreation as a basic need has been found very important to enhance people's health and well-being, aiding in people's empowerment, and encouraging the growth of inclusive communities. In a line with this view, following qualitative methodology, the researchers have interviewed a sample of transgender people in Bangladesh to explore the way of changing their recreational activities with the new normal situation. In Bangladesh, transgender people are legally recognized as the third gender but still, they are found socially excluded both culturally, economically, and politically. The findings of this study indicate that watching online videos were common nature of recreation of the member of this community. Besides, gossiping with fellow members has found another way of enjoying these people. Findings also indicate that having a cultural program or taking part in any sports activities was relatively absent in these gender-specific groups in the post-pandemic era. Overall, it has been recommended to the policy maker's to increase recreation facilities for these gender-specific groups in order to uphold an inclusive society.

The Impact of the Covid-19 Pandemic on Daily Life: Do Social and Individual Features Affect the Family Atmosphere and the Views on the Future?

According to several studies, by imposing movement restriction, the Covid-19 pandemic has influenced also the home environment and the everyday lives causing tension and, sometimes, conflict among family members. For this reason, in order to explore these domestic dynamics, quantitative research has been carried out with the aim to investigate social issues related to living conditions, ideas and problems of our historical time. In this respect, a web-survey conducted in 2021 on all international students from Sapienza University of Rome (both 'outgoing' or 'incoming') makes possible to examine, particularly as far as this topic is concerned, both national and international perspective in order to deepen if positive or negative attitudes could be transversal (or not) to all different habits and cultures, especially in times of crisis and social uncertainty. To do this, on the basis of a number of variables relating to the emotional dimension that characterized the pandemic period, two indexes have been built on the mental well-being of the people interviewed: the 'distress' and the 'resilience' one.

Results show that people with a high value of distress index are distinguished by an increased tension at home during the 2020 pandemic and, more than the others, affirm to have experienced a negative atmosphere at home during the lockdown; on the contrary, those who have lived a joyful atmosphere are more characterized by a low distress index and a high value concerning the resilience one.

In addition to this, further analysis (like the multiple correspondence analysis) shows that the emotional states experienced during the pandemic also affect the future perspective, regardless the spent home atmosphere during the 2020. Moreover, if during the pandemic some significant relationships are highlighted between the indexes and specific socio-demographic variables, looking at the future it seems that emergencies undo these differences.

"Lifestyles of Gen Z: A Co-Production and a Collaboration with Young People"

Young people represent a majority of the population in most developing countries and the way we engage them today will determine the prospects for sustainable development and peace. The term 'Youth' as defined by the UNESCO – is "the period of transition from the dependence to independence and awareness of our independence as members of a community." Youth are basically the catalyst of new social thinking, economic development and political activity. India is going through a phase of demographic transition due to which the proportion of youth in the total population is increasing. According to the 'Theory of Generations' by Karl Mannheim (1928), people are significantly influenced by the socio-historical environment of their youth; giving rise to social cohorts on the basis of shared experiences, which ultimately shape future generations.

Globally, there is a realization that the involvement of youth is the key to achieve development and therefore, there is a need to discuss how to engage them into research. The intergenerational collaborative research has an impact on career advancement of younger research generations. The collaboration style of the Generation Z is shaped by their interactions and experiences which influences the way they prefer to collaborate in professional interactions. Provided with the necessary skills and opportunities needed to reach their potential, youth can be the driving force for supporting research.

Objective: This paper would aim to find out what we can learn by doing research in collaboration with students at the college level highlighting the advantages, as well as, disadvantages of such collaboration.

Contesting the Framing of Digital Risk in Children's Social Life

Children's social life and practices have increasingly been mediated by digital tools, thereby dissolving boundaries between in-school and out-of-school learning, and rendering new modes of home-school-world relationships possible. Yet, children's digital out-of-school social practices have been associated with risks and harms. Young people are representatives of the future and they have become the key objects of efforts directed at 'bringing the future under control' (Giddens, 1994: 58-9). It is in this context that children as part of risk profiling have come to signify as risk populations (Lupton, 2016) because 'risk' is framed as ambivalence, anticipatory and future-oriented. This framing of children and their digital social life is one of the markers of everyday life in the 'risk society' (Beck, 1992). It justifies monitoring and imposition of constraints in the present, with children's digital engagement a key site of regulation.

In this paper, we examine concepts of 'risk' in the light of the literature, as well as our research on children's experiences of digital engagement. The literature review component brings together recent studies about how children are singled out as sites of risk intervention with a particular focus on their digital engagement. The empirical component is based on interviews with 60 grade 5 children.

We argue that the framing of 'digital risk' is characterised by a double connection: it operates as a justification of control through processes that render them as children-at-risk and children-as-risk. However, both constructions underplay children's agency and voice in a digital environment. Also missing is the recognition that children utilise digital tools to ameliorate other kinds of risk, e.g. social disconnection, and lack of access to timely assistance. We argue that children's engagement with digital risk might constitute a modality by which they can access a range of benefits.

Socialising Feminist Ethics of Care during COVID-19: Multi-Ethnographical Accounts of Early-and-Mid-Career Researchers in the Academy

In higher educational research, there has been much discussion about how COVID-19 pandemic continues to perpetuate the gendered labour of female academics in universities. This paper highlights the perspectives of six early and mid-career researchers' socialisation in a feminist focused support group during the pandemic. Utilising multi-autoethnography, this paper challenges the current conceptions of neoliberal values such as individualism and competition that is normalised in the higher education context. In this collective and collaborative narrative, we highlight the lessons we learned and provide a critique of the norms of academic impact and knowledge contribution that is required of us, as emerging scholars within our fields. Drawing insight from Tronto's notion of 'ethics of care', each author showcases a unique first-hand account of our experience of navigating in an unfixed but transformative space of participating in an informal support group. We conclude the paper with a call for sociology of ethics of care as our multi-autoethnographical accounts reveal the need for de-instrumentalising gendered labour in a post-pandemic academy era.

Refuge-ED: Enhancing the Live Prospects of Unaccompanied Minors in Spain

While consistent data (UNHCR, 2022) shows that an estimated 36.5 million (41%) of the 89.3 million forcibly displaced people are below 18 years of age, within them, the unaccompained minors' (UM) experiences remain underexamined. Data are not systematically collected in any region, if collected at all, little is known about this diverse group, thus, the gender perspective is usually lacking. In Spain, existing wages have put pressure on the Spanish migratory and refugee reception system in charge of hosting UM. As children, UM are entitled to protection that should follow their best interests. Although most migrated in search for a better life, the process of institutionalisation, the quest for legal documentation forces them to live a life on "standby" where their dreams are pushed back. The identification of evidence-based practices to better handle these transition times are crucial for the live of these minors. Thus, adverse immigration discourses are promoting hatred and social rejection which translates into a continuous hindering of their basic rights. The main barriers these children face are legal status problems, precarious access of education and training opportunities and consequently, lack of jobs, which places them in a vulnerable situation. H2020 REFUGE-ED project (2021-2023) has the opportunity to involve unaccompanied children in research and by using the communicative methodology we implement together with the unaccompanied children, educators and other members of the community, actions that promote successful dynamic integration, through education. This paper presents the challenges of carrying out research with this part of the population and presents evidence of the social impact of the research carried out together with unaccompanied children from 3 reception centres in Spain.

SOROKA, Yuliia* (N.V. Karazin Kharkiv National University, Ukraine)

Voiceless People in the Field of (information) War

The war in Ukraine made the issue of people under occupation relevant. Remaining Ukrainian citizens, having survived being captured by enemy forces, having lost access to life support resources, jobs, property, a safe space, a social environment and access to information, these people find themselves under the threat of oppression. All we know about these people come from media with its specific structure of voice domination and order of discourse: others always speak about people under occupation (Ukrainian state representatives and public persons, international organisations and leaders from different parties). The current discourse of people under demonstrates a limited and biased set of nominations: collaborators, resistance activists, people with age-related or health-related limitations of physical mobility, the dead, and the lost. Researching media representation and political aspects of this discourse reproduction, I proposed to use the research findings on the discourse of Muslims and the formula stories of LBG women and transgender people in the Ukrainian media. Both of them are produced for not-in-group customers.

The research methodology is based on Laclau and Mouffe's discourse analysis and Loseke's narrative approach. Among the five discourses of Muslims found, only three ("hero of Ukraine", "protester", and"believer") are inclusive; the other two ("victim" and "terrorist") are much more widely represented and used in othering strategies. The meaning of the sign "Muslim" in the Ukrainian media is extraterritoriality, exoticism, and violence. Formula storytelling about LBG women and transgender people in Ukraine engages sexual politics for geopolitical contestations. Russian-sponsored and oligarchic media use primarily foreign content to reproduce the formula story of these people as outsiders or perverts; The formula story of them as heroes is more prevalent in US-sponsored media. The instrumentalisation of LGBTQ+ lives and identities in our data indicates the narrative cold war.

Literacies of XXI Century: Socially Hidden Factors behind Language Skills and STEM Skills. the Predominat Role of Languate in Social Stratification

STEM (Science, Technology, Engineering and Mathematics) Skills has become a key item to explain growth and employment in developed societies. Nevertheless, a detailed analysis of language (oral, written, reasoning) skills show a more explanatory power when explaining better wages, occupability and increasing positions in social structure (ISEI standard international socio-economic index of occupational status). Data is based on cross-sectional O'Net database, (now O*NET 3.0 database contains 974 and it's compatible with SOC database; and more than300 skills) as well as data provided by ACS-PUMS Survey. We conducted a factorial and cluster analysis, were first factor was Literary vs Manual work and second included STEM vs other skills. Third factor included more complex reasoning skills. As we will show there is enough evidence to support that todays key role of language both soft and hard skills (oral, written reasoning) has bigger explanatory power than other skills in the labor market, in spite of the dominant institutional discourse on STEM literacies.

La Superexplotación Del Trabajo En Las Mediaciones De Segundo Orden De István Mészáros. the Super-Exploitation of Labor in the Second-Order Mediations of István Mészáros.

The super-exploitation of labor is the *key* category of the Marxist Theory of Dependency (MTD). However, its essential role is difficult to grasp at first glance. The hypothesis we put forward in this paper is that its understanding and treatment requires *mediations* in function of the dialectical totality that constitute the category of the super-exploitation of labor itself—that is, an analysis of the unity of the multiple relations, conditions, and determinations that constitute and explain it as a phenomenon. Only in this way can the super-exploitation of labor be understood as a category that is both *determining* and *determined* by mediations in which not only economic but also social and political dimensions intervene.

SOUBISE, Valentin* (Université Paris 1 Panthéon-Sorbonne, France)

Incarnation Charismatique Et Stratégie De La Refondation Populiste Au Sein Du Mélenchonisme En France

Doctorant en science politique à l'Université Paris 1, je réalise ma thèse sur le leadership charismatique de Jean-Luc Mélenchon et sur les effets d'un tel leadership sur le parti-mouvement populiste de gauche La France insoumise (LFI). La stratégie populiste de LFI est pensée comme une entreprise de refondation de la gauche et du peuple français par l'action d'un *héros* charismatique (Jean-Luc Mélenchon). Le leader de LFI croit à une dialectique entre les institutions se dévitalisent et les « grands » hommes et femmes de l'historie dont l'action humaine et vivante est instituante. Le tribun se présente à la fois comme une figure de *passeur* d'une tradition qui risque d'être perdue (l'orateur inspiré au charisme professoral qui transmet le legs et l'essence de la Révolution française de 1789) et de *refondateur* (« J'aimerais bien être celui qui déclenche l'émergence de cette nouvelle France. ») À propos de son action politique, Jean-Luc Mélenchon a développé une théorie de son propre leadership charismatique qui fait échos en de nombreux points à la théorie wébérienne du charisme. Le lien entre charisme et populisme nous paraît déterminante : c'est le leader qui donne le la, en ce qui concerne l'*ethos* et l'attitude morale d'« empathie » envers les classes populaires, qui tendent à dominer au sein de la base militante de LFI, constituant dans une certaine mesure une communauté charismatique. C'est le leader qui incarne le contrat social fondant le nouveau peuple qu'il appelle de ses vœux. C'est la relation affective avec sa personne humaine qui vise à représenter une forme de réconciliation entre la gauche et les habitants des quartiers populaires non-blancs, passant par des émotions de colère partagée, de respect et d'amour

Informal Sport, Belonging, and Cultural Capital Among Hazara Migrants in Australia

Whilst participation in "mainstream" sport within countries of resettlement offers a modality to connect with dominant cultural norms and potentially foster interculturalism, it is often fraught with assimilationist tendencies and experiences of exclusion. In contrast, little is known about engagement in informal sports that migrants have introduced into countries of resettlement,and how this engagement affects their (non)belonging. Drawing on qualitative fieldwork comprising observations and semi-structured interviews with two groups of participants over a 14-month period, this paper examines how Hazara men's involvement in the co-ethnic informal sport of sangarag affects their post-migration experiences of belonging and cultural capital in Australia. The findings indicate that sangarag offers its participants a sociocultural space that invokes strong feelings of diasporic belonging and fosters the maintenance of migrant-specific cultural capital in the face of historical persecution, displacement, and uncertain transitions. Tensions arise from sangarag's existence outside the formal system of "Australian" sports, leaving participants to feel unsupported and misrecognised by public policy. Implications for policy include the need to recognise and support the value that informal sports can have for people experiencing forced migration, dislocation, and resettlement.

Urban Politics of Migrant Hospitality: Homesharing Traditions and Innovations in Bologna and Torino

Private hospitality –sometimes referred to as family hosting (Ran and Join-Lambert, 2020) or homesharing (Bassoli and Campomori, 2018)– sees private citizens hosting migrants for periods ranging from the short-term (a few weeks to 6 months) to medium- and long-term stays. Though private hospitality has roots in long-established practices like child fostering and short-term health stays, contemporary private hospitality in Italy dates back to a 2008 program initiated in the city of Torino. Since then, and with renewed strength and urgency in the 2010s, private hospitality has grown. What started as a grassroots response to housing scarcity and the limited capabilities of institutional reception has now developed into a form of reception that at times includes institutional partnerships. While these new bridges with municipal and state authorities provide funding and access to important resources, they can also cause a shift in the identity and *modus operandis* of private hospitality initiatives. Drawing from ethnographic research carried out in 2022, I will discuss the geographically-specific organization and evolution of private hospitality in Bologna and Torino. Both cities have a history of implementing private reception initiatives supported by local institutions, though Torino sees a more active involvement of religious organizations, while Bologna stands out because of the grassroots organization of host families that was created in 2019, and has been a highly visible source of pro-migrant advocacy since. I will focus on how residents hosts, refugees, and practitioners engaged in private hospitality reflect on the potentials and limits of this mode of reception. Additionally, I will briefly summarize the expansion of private reception programs during the Ukraine-Russia conflict, reflecting on how the Italian Ministry of the Interior and local government relied on homesharing at a time of institutional unpreparedness.

Four Styles of a Religious Critique of Capitalism: The Idolatry, the Eschatological, the Social, and the Moral Critique

The contemporary progressive potential of religion to criticize capitalism is empirically understudied. Drawing on interviews and participant observation among Muslims' and Christians' critiques of capitalism in a major German city, this paper investigates how religious actors criticize capitalism in religious ways. In reconstructing four styles of a religious critique of capitalism, through constant-comparison, this paper shows how religious actors in Galburg criticize capitalism according to the idolatry, the eschatological, the social, and the moral style of critique.

In the idolatry critique actors use religion to criticize capitalism as the worship of the wrong God, and advocate to turn back to the "real God". Whereas in the eschatological critique of capitalism actors take an "otherworldly" standpoint and criticize capitalism for following the wrong rules and advocate instead for the right, godly rules. Characteristic of the third style, the social critique

of capitalism, is that actors take from religion the idea of a "we", and see capitalism as a disruptive force that threatens this unity. In this style, actors try to build a new form of community, a "we" in opposition to capitalism. Finally, in the moral critique of capitalism actors primary criticize capitalism as a morally wrong system and present conversely moral principles found in religious texts.

Importantly, these four styles of criticism are not denomination specific, but are, on the contrary, anchored in a religious movement critical of capitalism that encompasses various denominations. The paper concludes by asking which of these styles are potentially compatible to a secular movement critical of capitalism and where potential overlaps are. In this sense, religion not only offers spirituality and worldviews, but acts as an incubator for styles of critique.

Connecting Fiscal, Monetary and Social Policy: COVID Responses and the Asset Economy

Austerity is a defining element of neoliberal governance, partly enforced by independent central banks charged with meeting restrictive inflation targets. Recently, however, experiences of crisis have challenged this relationship. Following the Global Financial Crisis, some questioned the use of novel monetary policy to bail out 'Wall St' while enforcing austerity on 'Main St'. During the COVID-19 crisis, governments acted more generously, with 17 percent of the world's population receiving government cash payments. Not only did central banks release their hold on state finances, central bankers actively encouraged and facilitated social spending. Discretionary fiscal expansion was often largest in liberal welfare regimes where financialisation and austerity have been most pronounced. It is less clear what lasting impacts this shift entails. As shut downs lifted, policy makers wound back support and reimposed conditionality. Central banks rapidly changed gear to raise interest rates in response to high inflation. Our paper considers the changing relationship between monetary and fiscal policy, and its implications for social policy. We examine documents from the Reserve Bank of Australia to understand how central bankers described their changing role, and critically reflect on what this means for the future of the welfare state. What possibilities did the crisis response reveal, and what are the limits?

Crisis Responses in the Asset Economy: Comparing Social Policy COVID Measures in Australia, Chile and Korea

The COVID-19 pandemic prompted governments to introduce radical, if temporary, social policy responses. Many countries developed innovative policy models, which reflected emerging policy trends towards cash assistance and asset-based welfare associated with financialisation. These policy models included experiments with policies associated with managing household liquidity – cash payments, rent and mortgage freezes and pension withdrawals – especially in less developed welfare states lacking social insurance schemes. We build on recent scholarship that points to a divergence between patterns of income and wealth inequality, linked to differences between the structure of welfare state and housing policies. Our focus is on exploring these connections by examining social policy stimulus measures during the pandemic in three countries not normally considered together – Australia, Chile and Korea. These three countries have welfare models with distinctive uses of flat rate cash benefits and all relied heavily on emergency cash transfers during the crisis. Korea, in particular, has led policy experimentation with forms of Basic Income. Australia and Chile are also notable for advancing asset-based retirement incomes policies, which governments used to support households during the crisis. Our paper attempts to connect existing policy structures, emergency responses and changes in income and wealth inequalities to reflect on how the COVID fiscal response might inform our understanding of the risks and risk pooling strategies of the asset economy.

Theorizing Economic Culture

Economic sociology distinguishes itself in part by its attention to the cultural embeddedness of economic action, challenging universalizing views. Yet research on cultural embeddedness takes a wide range of disparate forms which are rarely considered together, to the extent that claims about cultural embeddedness seem diffuse. Here, I build on cultural sociology's theoretical specification of three different dimensions of meaning-making (Spillman 2020) to analyze distinct ways that cultural embeddedness matters for economic sociology. I then identify three fundamental and distinct aspects of exchange which vary by cultural context. Theorizing cultural embeddedness in this way,

I argue, helps synthesize and compare different and potentially conflicting approaches to cultural embeddedness, and generate new, theoretically driven questions about economic culture.

Gig Work and Employment Relations in Academia

Australian higher education policies, alongside broader shifts in employment structures, have contributed to a steady rise in insecure work in the university sector. While casual or fixed-term contracts were once considered to be a stepping stone to an academic career, there is now a substantial portion of the workforce who are precariously employed for years, and sometimes decades. It is estimated that between 70-75% of university staff are now precariously employed. In this paper, we discuss how university policies and structures create financial, personal and ontological insecurity for a large number of academics. We also discuss the discourses that exist around academic 'pipelines' and 'early careers', and explain how these obscure the experiences of many, including those who have extensive professional experience, and might be considered 'second-career' academics as well as the large number of academics in long-term precarious employment. Our discussion is framed by a backdrop where industrial action is increasingly being proposed as a means of achieving better employment relations and job security in the sector.

SPIRES, Anthony* (The University of Melbourne, Australia)

The Authoritarian Society: Chinese Civil Society and the (Re) Production of Hegemonic Authoritarianism

Can civil society organizations in an authoritarian state be expected to serve as large free schools of democracy? This article addresses this question and aims to show how a long-standing ruling party can be so successful at penetrating and molding social life that authoritarian organizational norms and practices become pervasive features of the everyday exercise of authority, even within civil society. Drawing on data collected in China through interviews and participant-observation from 2005 through 2017, and borrowing insights from Tocqueville and Gramsci, I analyze micro-level practices of hierarchy, autocracy, and the stifling of dissent within civil society organizations. Developing a distinctively sociological definition of 'hegemonic authoritarianism' that builds on Gramsci, I argue that the exercise of power within civil society mirrors practices at work in the larger political system, suppressing democratic yearnings and inculcating within civil society a culture of authoritarianism.

Victoria's Approach to Sharing the Responsibility for Identifying and Supporting People Most at Risk in Emergencies

Introduction
Victoria is continually improving its emergency management system. With each new emergency we experience, we gain more knowledge of how to improve We always look for examples of good practice. An important lesson we have learned is that governments at the local, state, and national levels cannot – and shouldn't – always be responsible for the safety and wellbeing of everyone and in all emergencies. Instead, a more effective role for government is to promote a sense of shared responsibility during emergencies.

In particular, we must focus on the people who are most at risk – before, during and after an emergency – to ensure resources go towards those who need them the most. Shared responsibility isn't a new concept in emergency management - emergency management is everyone's business.

The *Victorian shared responsibility planning toolkit for people most at risk in emergencies* (Planning Toolkit) has been developed to assist emergency management planners identify and plan for those most at risk of emergencies.

About the planning toolkit
The Planning Toolkit includes the following tools and resources, to help emergency management planners identify people most at risk before, during and after emergencies:

- the guiding principles – how we support those most at risk

- a planning tool – to identify who is at most risk

- archetypes and scenarios – examples of when, where, and how to apply the planning tool

- journey maps – examples of how to apply the archetypes and scenarios

- case studies – real-life lived experiences.

The Planning Toolkit:

- can be used can be used when developing or testing emergency management plans at any level

- has been developed using a contemporary emergency management approach

- is grounded in strengths-based risk mitigation, which focuses on how to identify and support people most at risk before, during and after emergencies

- is not prescriptive.

Contested Data: Government Resistance to an Indigenous Data Sovereignty-Informed Response to the Epidemic

There have been significant developments towards indigenous data sovereignty in Aotearoa New Zealand in recent years. These have included initiatives by indigenous organisations as well as government agencies including the national statistics organisation (StatsNZ). These initiatives have involved extensive engagement with indigenous governance structures leading to discussions about co-governance of the official statistics system. Despite this progress, the government's response to the CoVID-19 epidemic ignored these developments and actively resisted calls for an indigenous data sovereignty response to informing national and local responses to the epidemic. This paper will outline how indigenous voices and research were sidelined in the initial stages of the epidemic, government health agencies failed to meet their own guidelines for good indigenous data practice and then actively resisted (and lost) multiple legal challenges to amend their practice. The initial inertia was exemplified by the failure of multiple pieces of evidence about the need for a pro-active focus on equity to protect indigenous peoples to result in an equity-focused response - despite some of that research being co-authored by a future cabinet minister. The delay, inaccuracy and even absence of indigenous data meant local communities did not have the information they required for timely local responses to the pandemic and later the vaccination programme. Indigenous governance was eventually engaged with, but the lack of effective change saw many key indigenous voices disengage. A data sovereignty-focused approach was what was being sought by indigenous governance groups and health experts but the embedded practice proved resistant to change, even with robust scientific evidence and a claimed 'we follow the science' approach of central government. What was lacking was a willingness to share the governance space when confronted with a crisis, despite research and historical evidence indication that the indigenous population would suffer the worst consequences of the pandemic.

Obstacles to Transitions between Occupations with Similar Skill Requirements: A Multidimensional Topological Model of Intragenerational Occupational Mobility in the United Kingdom

The sociological literature on intragenerational occupational mobility focuses primarily on mobility between microclasses, big classes, or across SEI levels. In economics, a more policy-focused literature has developed occupational similarity indices to quantify the opportunities of mobility to skill-similar occupations faced by different categories of workers. In both cases however, these literature focus on a narrow set of occupational characteristics that prevent us from understanding what may be some important obstacles to occupational mobility. More specifically, women and ethnic minorities may experience barriers of entry into occupations where men and white workers are over-represented. Certification and licensing requirements may make certain transitions more costly and close occupational entry to workers unable to obtain those credentials. Finally, occupations are unevenly distributed geographically, making it challenging for workers to transition between two similar occupations concentrated in different regions.

In this paper, we use longitudinal data from the five-quarter panels of the UK Labour Force Survey to build large occupational transition matrices. We combine this data with measures of O*Net skills distance and distance in gender, ethnic, and education occupational composition. Using log-linear models with continuous variables inspired by Hout (1984) and Jonsson et al. (2009), we find that net of microclass immobility and skill distance, differences in the occupational share of women, non-White workers, and less educated workers represent significant obstacles to occupational mobility. These effects vary depending on the gender, ethnicity, and education level of workers.

In sum, our paper provides novel insights on the topology of intragenerational occupational mobility that goes beyond the traditional focus of studies of

    *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

occupational transitions in social sciences. It contributes to highlight what obstacles may prevent upward occupational mobility over the life course. The next version of the paper will also investigate the role of certification requirements and occupational geographic concentration as obstacles to occupational mobility.

Amenable to Removal: The Effects of Ideological and Fiscal Incentives on US County Sherriffs' Entrepreneurial Approaches to Immigration Enforcement

With the exponential expansion of U.S. immigrant detention throughout the past two decades, scholars across a wide range of disciplines have argued that this phenomenon can best be understood within the broader context of the nation's turn to mass incarceration. While the preponderance of these studies provides clear evidence for the importance of the structural relationship between immigrant detention and criminal justice system incarceration, two fundamental administrative differences render immigrant detention the more sensitive of the two to economic factors. First, as a federal government function, immigrant detention levels are not directly related to local social trends and responsive functions of governance; second, the immigrant detention system relies far more heavily on private, for-profit detention providers and contractual relationships with county and municipal jails than regular criminal justice system incarceration. When examining the framework within which county and municipal officials make decisions about entering into detention contracts, however, many scholars have argued that ideological considerations are paramount. This project seeks to further existing analyses of the relationship between economic and ideological incentive structures for these decisions.

STAMBE, Rose-marie* (The University of Queensland, Australia)
PARSELL, Cameron (The University of Queensland, Australia)

Christianity, Helping the Poor, and Relationships to Drive Structural Transformation

This presentation demonstrates that people animated by Christianity draw on their faith to help people in poverty through building relationships. Contrasting with the established idea that relationships are a means to change people in poverty, including through evangelizing, we find that relationships are conceived as an end in and of themselves and directed to the whosoever. Drawing on a two-year Australian ethnographic study with Pastors and volunteers in church-based community centres and people living in poverty accessing charitable care, we illustrate how the realities of living in poverty mean that the relationships intended to help people are difficult to realize in practice. Rather than relationships, or even fleeting ties, people in poverty prioritize their material needs. The challenges developing relationships notwithstanding, we argue that elements of the relationships found in our research represent an opportunity to advance our understanding of what it means to draw on faith to help people in poverty. Relationships formed through a community of difference can be leveraged as a resource to work toward justice through liberating people from their poverty, rather than just assisting them to endure it.

No New Organization. Organization As a Modern Approach on How to Translate Meaning.

If organization is the answer what would be the question? Coordination of action, the chance of collective action, accumulation of power or increasing productivity? Although organizing is definitely not a modern social phenomenon, the bureaucratic organization can be called a true 'creative destruction'. It was a disruptive innovation, which not only shaped organizations, but also framed the societal view of organizations. In a highly differentiated society organization also has done so. Networks, postbureaucratic organisations, communities of practice are possibly new variations of modern organizations. But are they a new answer? What is the answer to the question of organization? I want to suggest a different one, than that mentioned at the beginning. Organization is the answer to the problem of translation inbetween the imperatives of functional systems and social practice like Mölders put it. Regarding to the theory of 'translational relations' i argue that the personal contribution of modern organizations is that meaning from different social systems can be translated into others. This is a crucial function for differentiated societies, because meaning cannot be communicated from one system to another one. (Although social systems can be understood as communication.) In modern society the demand for translation is steadily increasing and how organizations are struggling to handle this expectations can be observed empirically. For

at least two decades scholars have been asking for what will be the next organization, usually called postbureaucratic. But in my argument I will show that organization is still the most efficient concept for the ever growing need of translation and that the formalized (bureaucratic) organization is still the dominant base layout for organizing. An entirely different question is whether there is an alternative concept to organization that is significantly more powerful than this one? In my sense of view, no.

STAROSTA, Pawel* (University of Lodz, Poland)

Patterns of Public Participation Versus Authoritarian and Democratic Attitudes in European Countries

The process of global transformation has various consequences. One of the fundamental theses of globalists assumes that the possibilities of citizens' participation in shaping political and social structures are also increasing (S. Huntington 2004). Opponents of globalization emphasize, in turn, that the processes of globalization lead to completely opposite effects. Social life is becoming more and more privatized and individualized, which in turn leads to a systematic limitation of the civic sphere and activity for the common good realized by conscious social entities (Sennett 1992).

An increase in the popularity of populism has been observed as an ideology referring on the one hand to the interests of the broad social masses, but on the other hand also favoring anti-pluralism and a partially authoritarian vision of the social order. The growing influence of the above ideology was also noted in many European countries.

In connection with the above, an important issue and the aim of the presentation is to explain the relationship between the level and patterns of public participation and the socio-political attitudes of both democratic and autocratic orientation.

We will therefore aim to answer the following questions;

1/ what is the level of public participation and basic patterns of this phenomenon, such as; a / formal membership in associations and social organizations; b / electoral participation, c / participation in collective actions and protests d / campaign participation e / participation to help others in European countries

2 / what is the level of democratic and authoritarian attitudes in European countries

3 / what are the relationships between antisocial and political attitudes and the distinguished forms of public participation in European countries

The empirical basis for the presentation will be the results of the ESS of 2014, 2016, 2018 and 2020 conducted on representative samples of selected European countries

STAUBMANN, Helmut* (University of Innsbruck, Austria)

Emotions and the Crisis of Basic Concepts in Classical Sociology

A sociological account of the emotions and more generally of sensuality and corporeality depends on the understanding of the most basic concepts of sociology which in turn are derivations of paradigmatic assumptions. The legacy of the classics in this respect is highly ambivalent. Weber's social action as meaningful orientation towards others and Durkheim's social fact as a normative pattern reduce the perceptibility of emotions to "meaning making" or to "felling rules". Thereby, they miss the social constitutive significance, the genuine social character, of emotions as such. The reason lies in their essentialist definition of what they regard a social. At the example of the emotions it becomes clear that every other "essence" or matter is excluded by definition. This is more and more felt as a general crisis of contemporary sociology and its basic concepts. A non-essentialist understanding of social processes requires more abstract concepts. Within classical sociology, a good example is Simmel's equation of social with "mutual cause/effect", commonly translated as "interaction". The translation is misleading insofar as it suggests an understanding as inter-action in the sense of action theory or interactionism. However, Simmel's "formal" concept of "interaction" does not presuppose any content or substance which opened it up for contents such as the senses and emotions. The challenges emotions pose for sociology can only be resolved by a revision of its basic concepts in the sense of Simmel's non-essentialist or formal paradigmatic legacy.

Jean Marie Guyau: Theoretical Foundations for Social Aesthetics Beyond Durkheim and Weber

Born in 1854, Jean Marie Guyau belongs to the generation of the classical founders of sociology (Durkheim and Simmel 1958, Weber 1964). Besides the topics of morals and religion, Guyau was particularly interested in aesthetic issues. His *Art from the Point of View of Sociology* appeared in 1889, a year after his premature death. It was edited by Alfred Fouillée, a French philosopher and Guyau's stepfather. The essays collected in the volume might well have appeared under the reverse title: *Sociology from the Point of View of the Arts*. What we find there is the development of sociological concepts out of reflections on the arts and aesthetics, concepts that contrast with or even contradict those

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

that got established in sociology in the wake of Weberian and Durkheimian works. The first chapter deals with social solidarity as a principle of a complex aesthetic emotion. Solidarity in this sense is neither a moral phenomenon in Durkheim's sense nor a social meaning construct. Sociology itself becomes the science of the transmission of emotional and bodily conditions analogue to aesthetic sentiments. Guyau did not have the time to elaborate a full sociology. In this paper I argue, that Guyau's works contain the seed for a new aesthetic paradigm for sociology in general which is in many respects akin to the sociology of Georg Simmel. His basic ideas are a prerequisite for an understanding of the arts and aesthetics as genuinely constitutive factors of the social world.

STAUFFER, Laeticia* (University of Lausanne, Switzerland)

Harmony, Vibration, Karma, Kleshas and Traumas : Yoga and (non-)Spiritual Meaning-Making Regarding Health Condition

Yoga practitioners' quest for health implies involvement in a wide range of multi-layer practices. Often valued for their perceived utility – centred on physical and mental health and "cleansing" – this dimension combines with complex symbolizations and multiple and contextual meanings (Bender, 2003, 2004).

In this communication, I will highlight how yoga practitioners and teachers reconcile diverse health care in their quest for health, and how they use and situate yoga as complementary or in a critical way with modern science.

More specifically, I will show to what extend these practices and discourses are (non-)spiritual resources contributing to a meaning-making process regarding their health condition. We will also see that this healing and sense-making process is not free of specific selections - and sometimes rejections (towards the yoga "traditions" and their contemporary producers as well) -, especially when teaching emphasis on individual responsibility and/or "otherworldly" explanations can unlikely be articulated with yoga practitioners' own networks of meanings.

The underlying hypothesis is that this appropriation process mobilizes diverse types of knowledge. Albeit partially shaped by the belonging to a yoga "community" through shared experiences and system of values, and made of selections of "exotic resources" based on cultural considerations (Altglas, 2014), I will demonstrate that these meanings and actions undertaken towards health are also to be understood with regard to yoga practitioners' sociological biography and health trajectory.

My results stem from a PhD study that I am currently carrying out about worldviews, emic meanings and practices of yoga practitioners and teachers in Western Switzerland and abroad (multi-sited approach). Qualitative data was collected by leading semi-structured and in-depth interviews (52), doing participant observation for three years, and is completed by audio and visual recordings.

STEBBING, Adam* (Macquarie University, Australia)

Asset-Based Welfare, Risk and Inequality: The Rise of Self-Managed Superannuation Funds in Australia

Affluent welfare states have increasingly employed asset-based welfare policies to manage social risk, particularly in housing and retirement incomes policy. Recent scholarship links the shift to asset-based welfare to broader processes of financialisation, which are reorganising the social distributions of risk and inequality. This confluence of policy and economic change is perceived to have made the capacity of households to manage and leverage their balance sheets increasingly important to their wellbeing and broader inequality. In this paper, I explore how financialisation is re-organising risk and inequality by analysing recent developments in Self-Managed Superannuation Funds (SMSFs), which have over 1.1 million members and now account for 26 per cent of Australia's burgeoning $3.3 trillion private superannuation market. SMSFs have a maximum of six members and operate to a highly financialised logic, with trustees responsible for setting the fund's investment strategy and complying with relevant laws. My paper attempts to understand how SMSFs are influencing the distributions of risk and inequality, by exploring existing policy structures, as well as analysing recent data on the profile of fund members, investment strategies and performance.

Could University Education Make Populism Unpopular Again?

Although comparative survey studies (Gonzales-Barrera & Connor 2019; Coenders & Scheepers 2003) provide strong evidence that new generations across the Anglosphere share growing tolerance of diversity, the causes of this cultural change are not well understood. Moreover, in several countries (e.g., Hungary, Poland, Israel), younger generations are not more tolerant of immigrants than older ones (Pew 2018). Therefore, this apparent cultural change seems neither universal nor inevitable.

One line of research argues university education leads to greater cognitive sophistication (and thus less stereotyping), more contact with minorities (and thus opportunity to observe that prejudice is ill-founded), and higher occupational status (and thus less competition with immigrants for jobs and social services) (Meeusen et al. 2013). Increased participation in university education is claimed to provide 'immunity' to populist and extremist ideas (Norris & Inglehart 2019). However, recent European studies (Lancee & Sarrasin 2015; Weber 2020; Kunst 2020) cast doubt on this. Large longitudinal studies with samples of youth in Switzerland, Germany, and the Netherlands found university education has a very small overall effect on students' tolerance for diversity; political outlooks are actually set much earlier, with family a key driver (Crocetti et al. 2021). In Australia, we know that a significant minority of youth are showing signs of political radicalisation (Nilan 2021), but we do not know whether these European findings are applicable.

To answer this question, we analyse *Social Futures* dataset (2006-2019), to understand the longitudinal effects of structural, contextual, and ideological factors on young Queenslanders' tolerance of diversity. Our findings indicate that while university education does seem to make a difference, the effects vary significantly depending on the students' academic field of study. We discuss implication of the results for sociology of education.

STEINFELD, Nili* (Ariel University, Israel)

"the Younger Ones Are Not Interested in These Kind of Stuff": Adolescents, Parents and Teachers Discuss Online Risks for Younger and Older Adolescents

Children receive their first smartphone device between the ages 8-10, and are often granted direct access to the Internet even earlier, through owning Tablet devices or by using their parents' devices unsupervised.

A mixed-method study involved a survey of 357 adolescents ages 12–18 and 156 young adolescents ages 9–11, followed by semi-structured interviews with parents, teachers, and adolescents. The study examined the various concerns that occupy respondents with respect to adolescents' internet use, and focused on differences related to adolescent gender, age, religiosity etc.

The results suggest a dramatic change in concerns over the risks of online use after the child turns 12. Until then, children, parents and teachers are almost entirely concerned over bullying as the major and often the only risk. After the age of 12- concerns over bullying are almost completely absent in interviews as well as in adolescent survey results, and new concerns arrive, mainly over exposure to inappropriate violent or sexual content, exposure of adolescent personal information online, and communication with online predators. Parents consider their younger adolescents less curious and describe their online use as mostly restricted to WhatsApp and YouTube, which they consider less risky (with the exception of bullying on WhatsApp). In the case of older adults- parents describe the use of social media and the increasing curiosity of their children as cause for concerns over more "mature" types of risks.

Parental mediation also changes dramatically at age 12. While restrictive methods are more prevalent for younger adolescents, in the case of 12 year-olds and older adolescents, parents focus more on active mediation and discussions, describing their sense of lack of control over their adolescent internet use. With respect to gender- Girls are described by parents, teachers and themselves as more mature and therefore exposed to "mature" risks earlier than boys.

Atmospheres at the Heart of the Urban Design Processes

Cities, comprised as they are of an interplay of profuse and varied sensory qualities contain atmospheres that touches each and everyone's wellbeing. Atmospheres may be designed, and as such they have caught the interest of several design businesses today.

Through nine consecutive months of workplace ethnography among urban designers, this paper makes the case for a deeper understanding of how atmospheres are not simply end products of design businesses but that they play a vital role to the genesis of design solution – they fuel the *processes* of design production.

The paper emphasizes the empirical connection between resonance, atmosphere and uncertainty, suggesting how designers resonate with their CGI's in various empathic ways atmospherically. The findings hence make it tempting for sociologists and related disciplines to lump together Gernot Böhme's and Hartmut Rosa's concept of resonance respectively which, may leave scholars into the quandary of positioning themselves between phenomenology and critical theory. The paper suggests maintaining a phenomenological gaze in order to propose an emotional engagement within an industry otherwise characterised by rational and evidence-based approaches.

STENSLUND, Anette* (Southern University Denmark, Denmark)

We Know We'Ve Been Innovative When We Don't Win Competitions

Architectural competitions, for centuries, have served as institutional guardiancy of quality and innovation in the field of regional and urban development. Competitions urge the participants to push boundaries of creativity, organisers say, and to think 'out of the box'. Unsurprisingly, competitions serve the engaged parties differently: They give investors the option to choose between solutions, people, companies and their ideas; they provide participants with a low-risk avenue to explore their passion and grow their portfolio; and for the community, competitions might propel public engagement, place identity and quality of everyday life.

This paper considers the contestants' experience of when they are most innovative. Paradoxically, as shows, innovation rarely coincides with their competition practice. Ethnographic work among an interdisciplinary group of artisan and artistic urban designers suggests that competitions' quality criteria are often seen as an obstacle to their innovative enterprise. Creativity, authenticity, and quality I argue require both conceptual and procedural innovation including the artisan's empathy and involvement in materials. There seem to be conflicting perceptions of quality in competitions, and the point is, that the rational framing of competition organisers, with pre-defined briefs and implicit values and expectancies to what quality may be, reinforces elements of predictability and calculation that provokes a conundrum for the crafted design development.

The New Labour Mobility Regime in Leipzig Logistics Cluster after the End of Cheap Labour

After decades of deprivation and deindustrialization, the Leipzig region has witnessed an economical comeback as logistic cluster since the 2000s. Several logistics companies have opened warehouses around Germany's second biggest freight airport and the car plants. The labour regimes of the warehouses are based on the exploitation of cheap labour in precarious jobs which are ruled by a regime of direct control. Until the 2010s, the workers in the warehouses could not find one because of the lack of supply on the labour market after post-socialist transformation.

However, the declining rate of unemployed with permanent demand for new labour power from the warehouses have changed the position of logistics workers currently. On the one hand the market power is growing, on the other hand the logistics companies use new strategies to mobilize migrant workers. So, the class composition has changed. German workers who have been working in the warehouses for years now meet migrant workers from the Middle East and, Eastern and Southern Europe. Furthermore, employers like Amazon have opened warehouses on the Eastern boarders of Germany where they still try to find cheap labour. Those workers are also integrated in the German market.

In my contribution, I will analyze these new labour mobility regimes and examine its impact on workers' daily resistance and the organizing efforts of the unions in a region which is characterized by a strong right-wing environment. However, the organizing of the migrant colleagues and development of transnational connections are crucial challenges for the labour activists who are confronted by a low level of organization. My case studies of workers resistance and union strategies in different warehouse are based on participant observations of workplaces and union meetings, and interviews which I conducted with union activists in warehouses about the conditions of their struggles and their strategies.

Food Crises: What Makes These Perfect Storms so Perfect?

In the last 15 years, the world has experienced three global food crises: during the 2007/2008 global financial crisis; the COVID-19 pandemic; and Russia's invasion of Ukraine. The causes of these food crises are complex yet, each crisis has been described as the result of a "perfect storm" that has deepened food insecurity around the world. A perfect storm connotes a rare and severe event, arising from a confluence of unpredictable circumstances. But these perfect storms have increased in their frequency, leaving some to question if food crises are more of a standard feature than an anomaly of our contemporary global food system. Given the regularity of these events, it is evident that the international community is falling short in terms of reforming food systems and in turn leaving millions vulnerable to shocks. Gaining insights into how these crises are positioned and consequently governed by powerful actors sheds light on why responses have been so ineffective to date. This article analyzes the interpretive politics of food crises to better understand how these food crises are framed and responded to by decisionmakers. The goal of this exercise is to identify which contributing factors are prioritized over others and provide recommendations about factors that are frequently overlooked but require more attention. This article contributes novel insights to food policy debates at the international level. This article employs discourse analysis of press releases associated with global governance actors including international organizations, global non-profits and transnational agribusiness corporations to interpret the policy responses to these crises. Discourse analyses have been conducted of the first crisis but, as food crises increase in frequency, there is a need to compare these discourses over time to better understand how they are understood and responded to.

Nothing Ventured, Nothing Gained? Exploring the Shift in Venture Capital Investments Toward e-Grocery

The agrifood industry represents one of the most promising areas for addressing complex social and environmental challenges like climate change, biodiversity loss, health, and inequality. The potential sustainability gains of transforming the industry have motivated the development of a slew of start-ups that promise to solve critical issues in the agri-food system and has, subsequently, attracted a rush of investment from venture capitalists. In 2021, venture capital investors funnelled $51.7 billion in agrifood technologies, an 85% increase over 2020 and over a 1,500% increase over 2016. These investments could support a shift towards more sustainable food systems, for example by enhancing carbon sequestration through soil management, improving efficiencies in livestock production, and reducing food waste. The areas of the agrifood value chain that hold the greatest potential for climate impact are on the production, or upstream end of the value chain. However, in 2022, the bulk of venture capital investments shifted away from upstream, digital agriculture technologies towards e-grocery, which raises critical questions about the role of venture capital in supporting transitions towards more sustainable food systems. This study contributes novel insights to the budding literature on digitization of food and agriculture which has overwhelmingly focused on the development of upstream technologies, even though the bulk of investments are now geared toward downstream innovations. Through an ethnographic approach, this study involves participant observation at major North American agrifood tech investment conferences, semi-structured interviews with venture capitalists investing in agrifood tech and document analysis. It advances critical analysis of the digitization of downstream agrifood tech and argues that this shift influences the way that power is distributed along the food value chain, with profound implications for sustainability trajectories. Understanding the shifting distribution of power in food systems sheds light on which levels to pull to deliver more sustainable and regenerative outcomes.

Homeland Socio-Spatial Class, Differential Subnational Memberships, and the Strategic Citizenship Choices of Chinese Labour Migrants in Australia

China does not permit dual nationality, meaning migrants to Australia must evaluate the benefits of Chinese versus Australian citizenship. Decisions about competing memberships are informed not only by this prohibition of dual nationality but also by individual migrant's classed positions within China. By comparing the choices of labour migrants with heavy trade skills who come from different backgrounds in China, this paper shows that homeland social class is a key factor in decision-making processes, particularly the uniquely Chinese spatial expression of class manifested through the hukou system

　　*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

and the differential local citizenship this entails. An analysis of representative cases operationalises Bauböck's (2010) constellations approach, illustrating the complexities of evaluating memberships acquired through migration, where full social inclusion in the host society may be contested, and nested memberships resulting from local citizenships within China, which entails unequal access to the rights and benefits of urban residency. People from different backgrounds and, importantly, different places in China's socio-spatial hierarchy, value their Chinese legal status differently. This difference affects how they calculate both the instrumental and the affective worth of competing citizenship statuses. These findings demonstrate the economic inequalities and cultural distinctions engendered by citizenships operate not only between but also within nation-states, and result in varied and contingent experiences of in/exclusion and un/belonging.

Past Decisions, Present Challenges and Future Anxieties: Chinese Migrant Grandparents' Reflections on (Grand)Parenting Expectations and Choices over Time

This paper explores how past migration decisions resonate in family presents and futures in ways that are unpredictable, that shape intergenerational care exchanges, and that introduce previously unanticipated states of migrancy, liminality and uncertainty into the lives of older adults. Chinese grandparents who provide transnational care for grandchildren in Australia do so in response to the practical needs of their adult children whom they previously supported to study overseas. Their actions align with culturally informed intergenerational expectations regarding the obligations of older adults to support their descendants' economic and social wellbeing. Yet in choosing to travel to provide intergenerational care in a foreign land, these migrant grandparents risk harmful impacts to multiple aspects of wellbeing, including financial insecurity, social disconnection, or poor physical and mental health. Such risks increase with age as they contemplate futures where they must either grow old away from the familiarity and established social networks of the homeland, or away from the filial support of their only children and grandchildren.

Case studies drawn from collaborative research with Loretta Baldassar and Raelene Wilding illustrate the temporally inflected tensions, anxieties and ambiguities that are generated through family decisions to support or encourage migration at different points in the life course. Ageing parents who worked hard to send their only children overseas as international students during the early 2000s now commonly express regret, or at best ambivalence, at the unanticipated consequences of these past family decisions to fulfil cultural imaginaries of study abroad. Reflections on and rationalisation of their choices and actions then and now are framed with reference to shifting expectations of what constitutes good parenting, expectations that are as subject to changing cultural imaginaries within the homeland as they are to differences that may exist or be perceived between 'home' and 'host' societies.

Labour Unions and Green Transitions in the USA: Contestations and Explanations

Green transitions have been the terrain of profound debates and conflicts amongst US labour unions, as has been the case around the world. This paper builds on earlier research that covered US labour environmentalism up to the end of 2018 and will explore the impact of the massive green policies of the Biden Administration. While these policies irrevocably upgrade the position of green capital and the green state in the USA, there are significant differences and tensions regarding this emergent hegemonic block, including within labour. In the first part of the paper I will outline an analytical scheme based on the breadth/inclusiveness, depth/socioecological priorities, and ambition of the policies and views examined. In the second part I will briefly outline and interpret the environmental policies of the Administration and their implications in terms of upgrading the role of green capital and the green state. In the third part I will focus on the responses of unions, particularly in manufacturing and physical infrastructure, and their allies within the environmental movements, to identify the ecosocial views these responses reflect. Based on my previous research these ranged between a largely instrumentalist view of the environment and weak ecological modernization and consistently emphasized national production and international competitiveness. Given developments within labour environmentalism and the massive commitments of the Administration, it is important to ascertain whether the pattern remains, whether new tendencies have emerged, and whether and how labour is influencing this emergent green hegemonic block. I will close by commenting on the national and global implications for this emergent 'clean energy' hegemonic block in the USA.

The Environmental Politics of Global and Regional Union Organizations: The Impacts of Positionality and Ideology

Most global and regional unions organizations have been very active in promoting environmental priorities, particularly just transition as an integral part of climate policies. In fact, most of the limited if strong research on these organizations focuses in climate politics and just transition. In this paper I plan to continue past research, also drawing on primary and secondary sources, including interviews, in order to explore the full range of the environmental issue areas and ecosocial views advanced by global and union organizations at present. In the first part of the paper I will outline an analytical scheme based on the breadth/inclusiveness, depth/socioecological priorities, and ambition of the views examined. In the second part I will identify the range of environmental issues that global and regional organizations work on to ascertain whether these issues, and their framings, vary by sector, e.g., manufacturing vs services, more or less formalized constituencies, more or less women or immigrant constituencies, and the place of these organizations in the world political economy, e.g., North and South. Based on these findings I will explore whether the ecosocial worldviews of global and regional organizations do vary and whether and to what degree this variation is due to configurations of positionality (e.g., position in work process and geography) and ideology. It is important to note here that I will not solely employ positionality and ideology as competing explanations but will also explore their existing articulations.

STEWART, Callum* (University of Melbourne, Australia)

Race, Nation, and Age: Theorising White Settler Futurism

Social and political theory predominantly takes modernity, or the modern age, as its object of study. Modernity is widely conceived as the present and final age of human civilisation. Through their histories of modernity, however, decolonial theory and settler colonial studies argue that modernity is defined by the colonial structures of race and nation respectively. My research therefore seeks to shift critical attention away from modernity towards the possibilities of decolonial futures by asking, 'when is the end of modernity?'. I explore this question through consideration of the colonial temporal structure which I refer to as White settler futurism. White settler futurism works to affirm, valorise, and reproduce colonial structures of race, nation, and age. It renders the White settler future of modernity as the only possible future. By bringing into view the end of modernity, my research aims to reorient White settlers away from the White settler future of modernity, and towards Indigenous resurgence and decolonial futures.

Why Do Some Children Perform Better Than Others? Genetic and Environmental Differences in Learning Growth

Why do some children perform better and learn faster than others? And to what extent do schools play a role in this? Studies measured the extent that children change in their educational performance over time (e.g., learning gains/growth or value-added models) to better assess the role of schools. This is not without problems because it cannot be assumed that gains are solely due to the contribution of schools. Yet, the reasons why some children learn faster than others are largely unknown. It could related to schools and families, but may also largely lie at the individual level instead. In this study, I provide more insight into this by investigating children's reading, spelling, and mathematics development during primary education. I do so using data from the Netherlands Cohort Study on Education, which comprises longitudinal measurements of students' performance on standardized tests from age 6-12. I use biometric latent growth models to decompose the variance in initial performance (age 6) and learning growth into genetic variance (A), shared environmental variance (C), and non-shared environmental (E) variance. Additionally including measured information of the family and school environment will provide more insight into their contribution in explaining learning differences and the (re)production of inequality. Preliminary results show that when children enter school, they already differ substantially in their performance, largely attributable to genetic differences between them. The reason why some children have higher learning growth rates, on the other hand, is largely related to shared environmental factors. Depending on the domain (reading, spelling, or mathematics), these are shared environmental influences that affect both growth and initial performance, as well as new shared environmental influences coming into play during schooling. There is a compensatory growth pattern where children with lower initial performance grow faster, which is largely accounted for by shared environmental influences.

Sensory Focused Moving Image Practice: Methods for Challenging an Agenda of Rapid Modernisation in Hcmc

This paper presents how urban experiences can be captured, sensorially, through a moving image practice that employs post-production techniques to explore the how ordinary spaces in the city are felt. These moving image reconstitutions of place provide critical observations, and provocations that can inform the development of a more nuanced approach to the modernisation process of the city.

Through an ambitious process of modernisation in HCMC, there is a focus upon the speed of re-development rather than a more considered and suitable response to the culturally specific needs and wants of the city. This is a result of global practices that offer cookie cutter solutions to developing the built environment, as quick solutions to 'luxury' housing and modern office requirements. The vision of concrete, glass, and steel developments appeals, but ultimately struggles to knit into an urban fabric that forms the identity, of the city. This identity emerges through the relationships between urban communities and their spaces of habitation, developed through the deep bonds between family and the community.

Specific methods of filming, reflection, and editing the moving image sequences, provide a visual archive of qualitative experiences. In particular, the films explore the atmospheres of place, sense of duration, movement in and through place, colour and how the films reflect built density. The sequences offer ways of looking at urban space that often do not feature in the planning and design processes of rapid urban modernisation. The filmed and edited sequences act as a provocation in prompting an understanding of the importance of unique and localised cultural behaviour within the design and implementation of the re-development, and secondly as a tool to ensure the tourist experience is rich, localised and memorable, post-modernisation.

Climate Heroes, Villains, and Climate Justice: Instagram As an Arena for Counter-Discourse and Mobilization at COP26

The COP26 Conference of the Parties on climate change took place in Scotland in November 2022. The outcome of COP26 was the Glasgow Climate Pact, but COP meetings are also significant beyond their formal agreements. They provide regularly scheduled critical events that social movements and other non-state actors can use to engage in climate change communication and mobilization through in-person and online spaces. We focus on Instagram as an online arena of climate communication and mobilization during COP26. In contrast to other social media platforms, Instagram is a distinct arena for eco-political communication and activism because of its visual focus and younger user base. Sampling from the hashtag #COP26, we analyse 2,417 posts from the period October 27 through November 16, 2022. Using a Discourse Network Analysis approach, we examine relationships and alignments across discourses, imagery, and actors. Key actors include those affiliated with NGOs and social movements, businesses, media outlets, governments, and political parties. In contrast to the language of the Glasgow Climate Pact, Instagram serves as a space to articulate critical counter-discourses of climate justice, Indigenous rights, and individual action as a response to perceived failures of COP process. At the same time, images of celebrities and politicians structure much of the Instagram discourse network. This highlights how Instagram contributes to a celebritization of climate politics, with individual political actors positioned as climate heroes or villains. We conclude by arguing that researchers should address a broader range of social media arenas and should pay more attention to the role of visuality in studies of media, climate politics, and mobilization.

Regionalizing the Sustainable Development Goals for Coastal and Island Communities: Lessons from Iceland and Newfoundland and Labrador

The United Nations Sustainable Development Goals provide a framework of 17 discrete goals that make the fuzzy concept of "sustainable development" more tangible and actionable. Several goals – such as SDG 14 (life below water) and SDG 13 (climate action) — are particularly salient to the pursuit of marine justice and social-ecological wellbeing for coastal communities. To be successful, the goals need to be enacted by decision-makers at the national, subnational, and local levels. The nature of coastal communities – where political jurisdictions overlap in complex ways with land and oceanic ecologies — makes

the question of who is responsible for SDG implementation and governance particularly important. This means that the goals need to be interpreted as meaningful and actionable by decision-makers and broader publics. In this paper, we compare SDG interpretations and perceptions of SDG governance in Iceland and Newfoundland and Labrador using survey and focus group data with stakeholders from government, business, labour, civil society, academia, and youth. Our research questions are as follows: First, how do research participants view the SDGs in relation to ensuring sustainable futures for their respective coastal communities? Second, how do research participants view the roles of government and other institutions in implementing sustainability in policy and practice? In answering these questions, we gain insight into a third theoretically valuable question about SDG implementation: Is it the state versus subnational jurisdiction distinction, or is it the common small polity/island dynamics of these cases that appear to be important for understanding the interpretations of the SDGs and their implementation? The interpretations of regionalizing and localizing the SDGs are surprisingly similar across our two cases, despite differences in political scale and jurisdiction. This lends support to a small polity/islandness explanation for how the SDGs are interpreted as meaningful and actionable for coastal and island communities.

#Metoo and Sexual Misconduct in Entertainment: Worker Perspectives on Labour, Activism, and Unions

In arts and culture short-term and precarious conditions have long been the norm, while collective representation and unionization have never been as common as in other sectors. While this has contributed to high rates of sexual harassment and violence in creative industries, a recent Canadian survey (AMT, 2020) found that unionized workers have experienced or witnessed sexual harassment more than non-unionized workers. What role can and should unions place within the arts and culture sector with respect to sexual harassment and violence? What relationship can these unions have with social movements and activism surrounding #MeToo? This paper draws on qualitative interviews with workers in the Canadian film and television industries, as well as members and executives from national and local chapters of a Canadian union for those working in film, television, and radio. Findings suggest that from the perspective of workers, collective representation is important but complicated and a double-edged sword when it comes to dealing with sexual misconduct. Workers report benefiting from supports and resources offered by the union, but also experience feelings of distrust and betrayal with respect to union responses, partly stemming from what some perceive to be a conflict of interest and partly due to a minimal ability to enact change as a result of the project-based, network-driven, and gender-based hierarchies that define work in this sector. This paper advances a growing body of literature that argues that labour movements must find new and creative ways to operate and align themselves with broader social justice goals.

STOLTZ, Dustin* (Lehigh University, USA)

Theorizing Imaginative Labor

How do we imagine economic objects, processes, and actions? If the future is inherently uncertain what limits the range of possible imaginings such that economic actors can coordinate? Furthermore, what role does labor play in producing, evaluating, and spreading these imaginings? Here, I outline a cultural models approach to imagination and imaginative labor in economic sociology grounded on the insight that embodiment is central to the capacity for exploring possibilities for action. I then use this framework to shed light on the field of elite professional advisors. Within the frontstage discourse of this field, economies and organizations are conceived as unstable substances. This reinforces the need for the advisory industry as a source of smart intellectuals and innovative thinkers who can respond quickly to this ever-changing competitive landscape. In contrast, the backstage work of recruiting and hiring relies on a cultural model of economies and organizations as modular structures, which can be decomposed into atomized units. Despite an ethos built around disruptive innovation and divergent thinking, elite professional advisory firms aim to oversimplify the complexities of economic situations and recruit a workforce that shares similar cultural models, fostering epistemic agreement in the face of uncertainty.

A Counterexample to Secularization Theory? Assessing the Georgian Religious Revival

Secularization theory allows for transitory religious revivals under certain conditions, such as extreme societal crises or state weakness. The country

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of Georgia has witnessed the most important religious revival of Orthodox countries and one of the most striking religious resurgences worldwide. This paper gives both a statistical and historical description of this revival and asks whether it is a counterexample to secularization theory. We show that the main thrust of the religious revival in Georgia lasted 25 years and seized the entire society in what was mainly a period effect. The most important cause for the revival was an important societal and economic crisis in the 1990's combined with a very weak state, creating massive individual insecurity. In these circumstances, the Georgian Orthodox Church was able to provide identity for individuals and legitimacy for governments. Other possible causes of the revival - state funding, a modernization shock, or emigration - can be excluded as possible causes. The Georgian case shows a situation in which secularization theory expects transitory revivals and is thus not a counterexample.

Indigenous Justice Inequity and Solicitor Conduct: Judicializing Indigenous Cultural Security in Legal Practitioner-Client Relations

Over-representation of Australian Indigenous people in the justice system is arguably supported by judicialization of the social 'problem' of Indigeneity. Indigenous inequity is also supported through a non-Indigenous system network of administration, procedures, and personnel. Legal practitioners are an integral part of this system. Legal practitioners in Australia are governed by a three-layer judicialized approach to managing the social problem of solicitor misconduct. The first layer is notions of professionalism, the second is fiduciary duties and the third is prescribed ethics. Each layer is designed to reduce the risk that the Australian public will lose faith in the system of justice. These layers of professional governance all omit consideration of client Indigeneity. This omission constrains the opportunities of solicitors to practice in culturally safe ways. Until professional practice which challenges inequity is supported by legal practice governing structures which acknowledge Indigeneity, solicitors may contribute to the social problem of Indigenous injustice.

Indigenous cultural strategies offer potential as methods of supporting changed professional practices. They operate at the collision point of healthcare professional practice and Indigenous health equity, disrupting business-as-usual dyconscious racism. The strategies contain a large family of related terms. Approaches such as Indigenous Cultural Safety are incorporated in medical professional ethics codes, and governing body statements. Approaches such as Indigenous Cultural Competence are incorporated into organisational policies and plans. Healthcare profession and organisational intent to make health environments safe for Indigenous people has been enacted through consistent communication to staff about expectations of cultural competence, staff training about Indigenous culture and history, and performance review inclusive of Indigenous Cultural Competence. Foucauldian discourse analysis of governance texts and interviews with legal practitioners has shown the potential of these strategies for both raising critical awareness of whiteness amongst solicitors working with Indigenous clients, and for implementation across legal practice.

STORM, Georgia* (James Cook University, Australia)

Meeting in the White Space: The Discourse of First Nations Client and Legal Practitioner Relations.

Australian First Nations People are over-represented as clients of solicitors, yet there is little research into the professional relations between solicitors and First Nations clients. Solicitors and clients meet in a 'white' legal space confounded by the compound complexities of Australia's colonial past and colonised present. Discourse analysis of documents and interviews with 12 practicing solicitors in 2021 shows that within this space solicitors practice as subjects in rebellious ways. By practicing law 'differently' with First Nations clients they seek to subvert professionalism and enact procedural justice. Largely unaware or in denial of their position as subjects within a repressive white governmentality, solicitors continue to experience the frustration and distress of seeking justice for First Nations clients from within a systemically racist system. Methods of supporting changed legal practice and positive client relations remain inconsistent and uncertain. Practice strategies widely implemented throughout medicine and health organisations, such as Indigenous Cultural Competence, seem to offer potential. Using discourse analysis, this chapter discusses the potential of these strategies for both raising critical awareness of whiteness amongst solicitors working with First Nations clients, and for implementation across legal practice.

Indigenous Neighborhoods in the 21st Century: Food As a Connection to Culture and Community

This study provides insight into the relationship between gentrification through food and its effects on indigenous peoples' sense of identity, examining specifically the impact of the influx of specialty crops and American restaurant franchises. The most vulnerable are impacted by this phenomenon, which occurs in cities, villages, and smaller neighborhoods. As Guam prepares for the military build-up, the community anticipates another wave of military personnel and their families living on the island, creating rapid changes to the landscape of their neighborhoods. This is significant because indigenous peoples derive much of their identity and sense of community from their neighborhoods. This study uses convenience sampling survey techniques, in addition to interviews, as its primary research methodology. Along with examining participants' relationships with food and culture in their changing neighborhoods, the study also explores the overall impact of gentrification on indigenous communities. Factors that contribute to gentrification, such as rent prices, employment factors, and food costs are also explored.

Sociology Around the World: Mapping and Content Analysis of Bachelor's Programs

The tradition of content analysis of university sociology curricula is more than 120 years old. The exciting and challenging premise of this research tradition lies in the statement: "Sociology is what sociologists teach". The article presents the results of an ongoing research project that continues and significantly expands this tradition by developing innovative analytical and research approaches to answer the questions: When and what sociology is taught at the universities around the world? In what way and where the sociology programs are similar or differ? How do they define the discipline of Sociology?

The study is designed as explorative, cross-sectional and cross-national content analysis. The paper explains the elaboration of new instruments for data gathering and analysis to measure and compare the heterogeneous and complex content of the sociology curricula. Some of the opportunities of the online available free tools for research purposes are also discussed.

Mapping and analysing the content of the university sociology curricula in more than 130 countries outline in comparative perspective the main trends of the current understanding of "what sociology is" – its theoretical frameworks, thematic fields, research methodologies, methods and approaches in terms of different social institutions and social problems. The long term outcome of the study is the creation of a rich and exhaustive international database of the curricula and the syllabuses of current sociology courses which could be used both for basic and applied research purposes.

Knock-Offs, Lock-Ins and Kick-Ons: Assembling after Work Drinks in Hospitality

Public health advocates have been concerned about the harms associated with drinking and particular industries, such as hospitality, where there is a higher prevalence of alcohol consumption. Public health efforts to address alcohol often emphasise individual responsibility without acknowledging the contextual variation in how drinking practices materialise, the role of workplaces in shaping drinking practices and the affordances of drinking practices.

We explored how after work drinks in hospitality workplaces materialise and the socio-cultural and material elements involved. Drawing on assemblage theory and analysis of 40 qualitative interviews with male hospitality students and workers in Australia, we examine three after work drinks assemblages, including "knock offs", "lock-ins" and "kick-ons".

Knock offs were described as one or two drinks at the end of a shift, often while completing cleaning duties, to debrief and resolve tensions that arise during service, and relax with other staff. *Lock-ins* typically involved a longer duration of drinking at the workplace after service when the venue is closed to patrons. Unlike knock offs, staff from other hospitality venues may be permitted entry to a lock-ins. Kick-ons typically involved leaving the workplace to attend another licensed venue or someone's house with other hospitality staff. While affording opportunities for pleasure, intimacy, social connection and relaxation, lock-ins and kick-ons were sometimes implicated in undesirable effects.

After work drinks are multiple, situated, dynamic and have diverse effects. Elements that influenced drinking among hospitality staff, including inhospitable work rhythms, conditions and environments, are often overlooked in public health efforts and interventions. Public health efforts to address alcohol consumption in the hospitality industry could benefit from acknowledging and cultivating more hospitable work conditions and environments for staff.

STRAUME, Madara* (University of Latvia, Latvia)

The Role of Social Networks in the Development of Career of Professional Athletes

The aim of doctorate thesis "The role of social networks in the development of career of professional athletes" is to research how athlete's family members, coaches, teachers, friends, teammates, fans, partners, acquaintances, idols in sport, sponsors, sports organizations, tournament organizers, broadcasting organizations, competitors, physiotherapists, and social networks (Facebook, Twitter etc.) are connected to the development of athlete's professional career (how they impact that the athlete chooses the particular career and to continue it as well as that he/she achieves something in his/her career). In previous research comparatively more attention has been paid to the youth sport and the socialization process of children in sport, influence of athlete's social networks on athlete's dual career development in sport and education as well as on impact of social networks in athlete's transition from sport career to life after it (how the athlete after career in sport successfully continues career in some other field or by working in sport field, but not as an active athlete anymore). Less accent has been on role of social networks in professional sport – what roles take the people who are in lives of professional athletes in the development of athlete's professional sports career - athlete's career choice, continuation, and achievements. Study's theoretical basis looks at Bronfenbrenner's ecological systems theory, Granovetter's strength of weak ties theory, Kram's mentor role theory and Burt's structural hole theory. In qualitative study's phase 20 structured in-depth interviews with professional athletes will be performed, which will include name generator and name interpreter questions. In study's quantitative phase social network mapping will also be performed. All that will be done to reach the aim of the study and answer the research questions. Key findings of the study are yet to be determined.

Hour-Glass Ceilings: Long Hour Limits to Employment Equality in Germany and Australia

In all countries where it is measured, men work more hours for pay than women do, and these hours deliver them better jobs, earnings and opportunities. While gender gaps in education are closing, gaps in work hours, earnings, status and job security persist. Our study offers new theory and evidence on work hour limits to gender equality in Australia and Germany. We use representative, longitudinal data from both countries (103,015 – 109,886 observations), modeled with 3SLS approaches, counting paid and unpaid hours to assess the point at which working harms health. We find tipping points (when mental or physical health declines) that are far lower than the maximum set by the ILO, averaging under 40 hours a week in both countries. However, these health tipping points differ by gender: men in both countries are able to work an extra 11 to 15 hours every week (up to 46 hours a week) before they compromise their health, relative to women, revealing an unacknowledged driver of employment advantage. We further show how longer unpaid hours in the home comprise women's capacity to compete for long hour jobs. We call these hidden health advantages and disadvantages the *hour-glass ceiling,* a phenomenon that challenges what a fair working week should be in a gender-mixed workforce.

STRECKER, David* (Goethe University of Frankfurt, Germany)

The Social Cohesion Bias: Conceptual Blind Spots in the Contemporary Discourse on Societal Integration

The notion of social cohesion has lately been increasingly used to mark what is perceived to be endangered by crises of contemporary society. Like related semantics as community, solidarity, or social trust, cohesion refers to what in social theory has traditionally been conceptualized as integration. Discourses centered on the respective notions react to distinct challenges in specific socio-historical contexts. Hence, they carry more or less unique connotations. This paper identifies the peculiar meanings of societal integration which are accentuated by the contemporary uses of the notion of cohesion. After having sketched the elements on the formal concept of cohesion and then distinguishing it from substantive conceptions of cohesion, as well as having shown how cohesion is part of a semantic field which thematizes the issue of societal integration, the paper substantiates its central claim that cohesion in contemporary discourse tends to overemphasizes both the aspects of collectivity (at the expense of differences and power relations between individuals) as well as culture (at the expense of material and economic aspects) and therefore leads to a truncated and distorted theoretization of societal integration. This results from the origins of the current discourse on cohesion in developments in scial-structural analysis which has then influenced policy strategies and then been 'reimported' into the social sciences.

Ray-MON: Monitoring Erasmus+/Yia from 2014 until 2020

The Research-based analysis of European youth programmes (RAY) Network is an open and self-governed European research network, dedicated to conducting mixed-method research on international youth work and the European non-formal education programmes. The core of our work form different monitoring projects with which we have been following the European Youth Programmes ever since 2009. RAY offers unique longitudinal research into non-formal education and international youth work in Europe, fighting for evidence-based policy and practice and an increased recognition of youth work.

In this presentation we will discuss RAY data on the previous Erasmus + / Youth in Action programme generation (2014-2020). Apart from sharing key findings, for instance regarding young people with fewer opportunities, we will showcase advantages and challenges of working with such a huge database (53.144 fully valid responses of project participants). The current programme priorities (diversity and inclusion, digital transformation, environment and sustainability and participation in democratic life) give us an ideal lens to show the immense contribution our data can be for evidence-based youth policies and practice, but also the limitations we face. We will focus particularly on issues with comparability and adapting to changing times, on translation quality of the multilingual survey, online application and increasing survey fatigue particularly among youth.

We are currently revamping our surveys, aiming for a shorter and more attractive presentation through modularisation, mixed-device adaptability and youthful functions, such as emojis and voice notes. Technological and ethical challenges are manifold, e.g. regarding the opening up of our database to interested researchers and stakeholders. Assessing the impact our research is having at different levels and thus fostering it further is yet another marker on our roadmap into the future.

"But then I Came to my Senses": Australian Women's Stories of Becoming Non-Religious.

This paper considers how and when women in Australia become non-religious and engage in humanist and atheist groups. It further explores why some women subsequently leave the non-religious community and what this means for their belief system. The non-religious movement has a visible problem with gender balance. Statistics continue to show that worldwide women are more religious than men, so what are the reasons that Australian women leave religion? This presentation will draw on preliminary data analysis from participant observation and interviews with 30 women affiliated with humanist and atheist groups in Australia conducted for my PhD research project on 'Gender and Inclusion in Non-Religious Groups in Australia'. I show that most women I interviewed, who have been raised religious, started to reject their parents' belief system during adolescence and early adulthood and subsequently self-identified as atheist or humanist. During my data collection, I found a variety of reasons for why women, who have been brought up religious, became non-religious. However, I argue that, for most women, this was borne out of increased independence and development of critical thinking during the transitional years. In addition, I show that even women who are not active in the non-religious community any longer, keep their non-religious belief system and behaviours, and that most women activists in the non-religious community in Australia today are over 50 years of age. This indicates that younger women sustain their non-religiosity without joining an atheist or humanist group, that they tend to leave groups more easily than older women and that non-religious groups in Australia are unattractive for younger people. Ultimately, this paper aims to contribute to the knowledge of non-religious life trajectories, focusing on women.

technologies from the Big Tech sector. The technological solutionism that pervades these imaginaries has been subject to ongoing criticism from energy social scientists. While emerging energy technologies can clearly contribute to decarbonisation, they are also embedded in visions that contribute to the continuation or increased resource-intensity of western lifestyles, at the expense of potentially more sustainable alternatives. In particular, masculine lifestyle visions promoted by Big Tech leaders (especially charismatic and overconfident men such as Elon Musk, Saul Griffith and Mike Cannon-Brookes) are now central to the social and political ambitions of the energy transition. This paper critiques these visions as gendered, colonising and capitalist, and identifies how they are counterproductive to achieving more sustainable ways of living in a climate-constrained world. Such visions exclude many alternative perspectives which are attuned to how climate change actions are currently being pursued in people's everyday lives. Drawing on digital sociology and future-focused design ethnography research with Australian households, this paper draws attention to alternative everyday imaginaries that people have for living with climate change in near (2025-30) and far (2050) futures. These imaginaries include alternative housing and community structures, 'low-tech' devices and interventions, models for shared mobility services, sharing excess solar power, and everyday sustainability labour to reduce wastage and balance energy supply and demand. Imbued by a feminist ethics of care towards people and the environment, everyday imaginaries for living with climate change can provide desirable and more plausible social and political ambitions for the necessary decarbonisation of people's lifestyles.

How to Become a (temporary) Member of a Ranking-Producing Organization

Besides large International Organizations like the UN or IMF, the realm of global governance is populated by many smaller Non-Governmental Organizations (NGOs) that seek to influence political processes in many different policy areas. One common strategy of the latter type nowadays is to publish rankings that assess and compare policy performances of individual nation-states, thus creating pressure on states to adapt to certain global norms and standards.

In our presentation we will offer our sociological reflection on the process of becoming a temporary member of such a ranking-producing NGO. Drawing from the respective experiences of our ethnographic fieldwork, during which we became temporary members of two NGOs and participated in their daily work routines, we will discuss socialization processes. In this reflection on socialization, we will focus both on the formal level of concrete tasks and expectations as well as more informal dynamics playing out between new and established members of the organizations. Specifically, we will focus on the acquirement of knowledge peculiar to these organizations, their respective policy fields, and the institutional networks in which they are embedded. Both NGOs can be characterized as being members of highly specialized expert cultures. In our presentation we will reflect on the onboarding processes used by the organizations to integrate temporary members into their ranking team, position of temporary team members within the organization and the use of digital media for transnational work relationships. While there are many similarities between the two organizations and the processes in which we became members, the comparison offers insight into different dynamics of becoming a member and learning to "see like the organization".

Voice Assistants at the Center of the Smart Home: How Alexa Controls the Smart Home

While consumer technologies are becoming both more sophisticated and affordable, big advance the idea of smart technologies permeating social life. The Smart Home (SH) is one idea of further digitising social life through technology. The SH in its current state is mostly heterogenic with multiple manufacturers producing different SH-technologies, with various development standards. This can lead to interoperability problems and complicated use and set-up practices. Voice Assistants (VA) like Alexa or Google Home are marketed to fill in this gap by providing a platform technology that can control *all* devices by incorporating different communication standards.

This promise in mind, the political economy surrounding VA should be regarded. Developed by these companies and due to their popularity, VA offer the opportunity for the heterogeneous field of original device manufacturers (OEMs) to access a larger market. Considering Amazon's practices in other business ventures, however, it's questionable what the costs and conditions of this market access are. Scrutinising the political economy surrounding platforms like Alexa therefore is likely to reveal inequalities and diffuse power relations that will help Amazon or Google to increase their monopoly on technology and data. A twofold investigation is supposed to reveal practices by Amazon when dealing with OEMs for the SH: First, a study of certificates offered by Amazon (like 'Certified for Humans') that exercise soft control over OEMs was conducted. Second, qualitative interviews with OEM developers active in the SH will be conducted to research the impact of Amazon's attempts at controlling the market on OEMs. By infrastructuralising Alexa as a platform,

the VA and its development tools become vital to the whole sector. This way, companies wishing to compete in the market are forced to develop with Alexa in mind giving Amazon access to more development and user data, further consolidating their hold on the market.

What can be learned from Ombudsman mistakes?

The institution of the ombudsman is one that, in public law, demands accountability of non-democratically appointed public departments that make decisions as to citizens rights and entitlements. In doing so the Ombuds centres transparency, fairness and integrity – a moral form of administrative law. Yet, the office itself does not always adhere to these same principles it applies to the behaviour of others. This paper explores 4 such cataclysmic events in the history of ombudsmanship (black swan events) to examine both the resilience of the ombudsman institution and what may be the systemic flaws in the operation of the institution that causes such dark underbelly events.

The Border within: Vietnamese Migrants Transforming Ethnic Nationalism in Berlin

When the Berlin Wall fell, Germany united in a wave of euphoria and solidarity. Also caught in the current were Vietnamese border crossers who had left their homeland after its reunification in 1975. Unwilling to live under socialism, one group resettled in West Berlin as refugees. In the name of socialist solidarity, a second group arrived in East Berlin as contract workers. *The Border Within* paints a portrait of these disparate Vietnamese migrants' encounters with each other in the post-socialist city of Berlin. Journalists, scholars, and Vietnamese border crossers themselves consider these groups that left their homes under vastly different conditions to be one people, linked by an unquestionable ethnic nationhood. I unpack this intuition and reveal instead how these Cold War compatriots enact palpable social boundaries in everyday life. This book uncovers how 20th-century state formation and international migration—together, border crossings—generate enduring migrant classifications. In doing so, border crossings fracture shared ethnic, national, and religious identities in powerful ways.

Embodied Truths: Gender, Sexualization, and Fieldwork As Relational Meaning-Making

Hoping to avoid the "ethnographic fixations" (Hanson and Richards 2019) on solitary research and danger, we traveled together to Berlin for the first time in 2013. As sisters who grew up in the same household and studied in the same grade–and often the same classes–until college, we largely shared a subject position. In this paper, we reflect on how our shared and individual fieldwork experiences speak to the possibilities for ethnographic revisits and collaboration as well as the difficulty of replication.

While surveying an eastern Berlin neighborhood for preliminary fieldwork on Vietnamese migration to Germany, we were followed for blocks by men making lewd comments. One of us left this experience wary of situations obviously imbued with racialized sexualization, and did not study gender; the other leaned into it. The latter would eventually immerse herself in the study of gender, reproduction, and power, examining brides from Vietnam to Taiwan and South Korea as well as the male counterparts who stayed behind. In conversations with marriage brokers and other male respondents, she had to humor sexualizing gazes and remarks. She felt viscerally the "costs of conducting the kind of ethnography that does not conform with feminist expectations" (Hoang 2015: 192). We explore how social situations produce situational selves, including selves we may not even recognize (Verdery 2018).

We offer suggestions for building, maintaining, and highlighting the relational work of ethnography. Because fieldwork is a social occasion, no two ethnographers–even sisters who shared a virtually identical milieu–experience situations and interactions identically. But although replication is difficult, we find ethnographic revisits and triangulation fruitful. These comparisons can often be built right into our explorations, in particular by seeking out and making opportunities for other researchers in the field.

Becoming a 'good Producer' in the Agri-Environmental Project Organisation

Agri-environmental projects have been portrayed as tools for climate change adaptation and mitigation and as solutions to processes of deforestation, soil erosion, water availability and biodiversity loss. This study is concerned with the social organisation of knowledge around agri-environmental projects offered to farmers in the department of Caquetá in Colombia. Using Institutional Ethnography (IE), we start with the experiences and work practices of campesinos to explore how these are coordinated with the work of other people also involved in the organisation of agri-environmental projects. We analyse what we identified as the ideological code of the 'good producer' and argue agri-environmental projects are part of the wider 'project economy'; an institution that shapes campesino practices and ours as researchers within academia. Our research contributes to the growing body of social studies about agri-environmental systems and explains how such interventions may not only reinforce unsustainable developmentalist agendas that risk replicating modernising logics of accountability and efficiency. These interventions also risk eroding the confidence of those whose work is needed for conservation efforts, those who work with the land such as the campesinos we learned from in this study.

Life of a Woman Vendor: Economic and Political Empowerment in Juxtaposition to Social Empowerment

We as a society have come a long way regarding women and their empowerment – economic, political and social. Laws have been laid down in our Constitution to secure the equal treatment of men and women before the law in terms of the right to live, earning a livelihood, freedom of speech and expression, property, marriage, equal pay, etc. Despite such efforts at the legal level, these laws and rights fall short regarding women and how they live their lives, stating culture as the reason behind it. Through the narrative of my mother, the paper will highlight the life of a woman vendor - her journey as a daughter, wife, mother and widow. Having grown up in a family with my mother as the primary breadwinner, her impression was that of a shrewd woman in control of her life - economically, politically and socially. Widowed at 33, she provided for her two young children, managed the household, and worked tirelessly in an unforgiving occupation as a vendor. Despite her struggles as a vendor, she has achieved economic and political independence; however, the reality is different socially. Her journey as a woman has been rife with many instances which highlight the societal expectation placed on women, which put obstacles to their social empowerment.

Multiple Visions of the Future: Or Why Generals Usually Prepare for Past Wars

Views of the future as a dimension of the life of human individuals and society have been shaped and transformed in long-term historical development. This development included ideas of a cyclic nature (the myth of eternal returns), religious expectations of an eschatological nature, the philosophy of history, the idea of progress, and finally the concept of an open future. Along with this, efforts to know the future and opinions on how to prepare for it have also changed. In sociology, many scholars share the opinion that for sociology to be a full-fledged science, it must be able to make predictions. However, this idea itself became problematic in the 20th century. One of the difficulties encountered is what, along with Hegel, can be described as the irony of history, and what Merton identified in sociology as the unintended consequences of intentional social action. In this contribution, we discuss the possibilities and limits of our thinking about the future in the perspective of historical sociology.

Progress, Utopia, Imagination and Ideology

Early modernity - to use Ulrich Beck's term - was a time in which progress was believed in, a new, better society was anticipated, and these expectations were supported by the development of science, the introduction of new technologies, and nourished by concepts that had – to use postmodern language – the character of great narratives, and at the same time a number of utopian visions and projects. During the twentieth century, however, this was confronted with reality, and new ideas that greatly problematized such expectations. One of the characteristic features of contemporary thinking is disbelief in universal progress, resignation from the possibility that the future could be better than the present, and the spread of foreboding and often even

apocalyptic visions. A new imagination can become a counterweight to these visions and moods, provided, however, it finds forces in the social world able to develop it.

SUDO, Naoki* (Hitotsubashi University, Japan)

Why Did Increasing Number of Newly Infected Individuals Positively Affect Trust in the Government during the COVID-19 Pandemic?

Social survey data conducted in Japan has clarified that the central government of Japan had acquired highest evaluation for infection control policies and high level of trust from citizens when the COVID-19 pandemic had been most dispersed in Japan, in Spring, 2022. To explain this paradoxical phenomenon, I explored the relationships between trust in the central government, changes in infections rate by prefectures, and timing of vaccination. Thereafter, by using fixed effects regression models, I analyzed data from the *Social Stratification and Psychology Survey in 2021*, which is an online panel survey conducted in Japan from March, 2021 to 2022, and the open data of the COVID-19 pandemic provided by the *Ministry of Health, Labour, and Welfare in Japan*. The results of the analyses revealed that number of newly infected individuals by prefecture was positively associated with respondent's evaluation for infection control policies and trust in the central government. Thus, individuals living in highly infected areas are more likely to positively evaluate infection control policies of the central government and highly trust the central government. However, after controlling for the effect of vaccination on evaluation for infection control policies (or trust in the central government), positive association between number of newly infected individuals and evaluation for infection control policies (or trust in the central government) disappeared and, conversely, negative association between them could be observed. This implies that as vaccination tends to be promoted in highly infected areas rather than lower infected areas, vaccinated individuals, who tend to positively evaluate infection control policies (or highly trust the central government), had increased in the highly infected areas. Conclusively, the paradoxical phenomenon that increasing number of newly infected individuals positively affect trust in the government could be rationally explained based on self-interest.

Attitudes of Obstetricians and Gynecologist Towards Prenatal Testing and Abortion in Japan

The thalidomide epidemic around 1960 triggered the Western acceptance of abortion, which had previously been prohibited.

Japan had the second highest number of thalidomide victims after Germany. However, as abortion was already feasible through the Eugenic Protection Law (now, Maternal Protection Law), the ideological shift of allowing abortion to be a woman's prerogative did not occur.

Whether an abortion procedure could be performed, that is, whether a pregnant woman's physical and mental health, financial situation, and criminal provisions were applicable under the Maternal Protection Law, was left to the judgement of a legally-designated obstetrician/ gynecologist.

However, this has caused friction in various situations.

For example, it is problematic for women to express their opinions on abortion procedures and safety, and the spousal consent clause, which protects doctors from claims by husbands, prevents women from undergoing abortions.

Moreover, as there is no clause for fetal disability, if a pregnant woman wishes to have an abortion, the designated physician performs it based on the economic clause.

Although this avoids a direct confrontation between the groups opposing abortion because of fetal disability and women who wish to have abortions, it has created a suppressive attitude towards prenatal testing in the obstetrics and gynecology community.

Pregnant women who did not comply with the strict rules of obstetrician-gynecologist organizations for undergoing non-invasive prenatal testing (NIPT) ended up being tested at non-obstetrician clinics.

In this context, this study conducted interviews with obstetricians and gynecologists from 2021, and the results of interviews revealed that their conflicts with prenatal testing varied depending not only on their personal beliefs but also on whether they perform mid-term abortions. This may be due to the fact that most abortions from fetal anomalies are performed in the second trimester of pregnancy, and mid-term abortions are legally treated as stillbirths.

Why Inclusive Drr Is Needed "Now" in Japan, a Disaster-Prone Country: The Structure of Disaster Relief Legislation System and the Position of the Third Sector

The third sector's participation in disaster relief has been limited for two historical reasons in Japan. One reason is that for more than a century,

government certification was required to start up public interest organizations. This has seriously limited third sector involvement in disaster management/recovery until the end of the 20th century. Another reason is that although the Allied occupation policy after World War II encouraged third sector involvement, the post occupation national government twisted the interpretation to imply that the role of providing assistance to disaster victims was solely that of local government under national government supervision.

The fact that only local governments were mandated to provide assistance to disaster victims had a serious negative impact on disaster relief. Because natural disasters characteristically only strike a certain area occasionally, it is rare for individual local government administrators to respond to disasters more than once, and knowledge and experience in providing assistance to disaster victims does not typically accumulate within their organizations. As a result, poor shelter conditions not meeting Sphere standards have persisted throughout the post-World War II period.

This structure of the disaster relief legislation system has also prompted responses, as real disasters create challenges. Some of the municipalities affected by the 2011 Great East Japan Earthquake have developed models for victim support in subsequent large-scale disasters, with the participation of the third sector. In addition, a formal government committee to re-examine the current institutional structure of support for disaster victims is scheduled be established in 2022. One of the main agendas for this committee is expected to recognize and formalize the third sector involvement in supporting disaster victims.

Changing and Unchanging Farming: Farmland Consolidation and Diverse Reactions Among Farmers in a Japanese Community

To increase agricultural productivity and deal with labor shortages in aging and depopulated communities, Japanese agricultural policy has promoted farmland consolidation and community-based agricultural corporations that cultivate the farmland collectively and intensively. Through a case study, this paper examines how small Japanese landowners have reacted differently to farmland consolidation and national policy within a community and how their diverse reactions affect farming and social relationships. Farmland consolidation entails dramatic changes for small local landowners—who are mostly subsistence farmers—in terms of their relationships with their ancestors' farmland and their identities as farmers. Since most small local landowners supported the national agricultural policy, many gave up farming and now rely on community-based agricultural corporations for cultivation. However, a minority has resisted national policy and continues to engage in individual or family farming. They continue farming independently by maintaining strong connections with their farmlands, families, and consumers and by sharing or selling the rice they produce on small farm lots. The landscape after farmland consolidation seems orderly; however, it is a mixture of farming by community-based agricultural corporations and small landowners. The aim of farmland consolidation is to increase standardization, efficiency, and productivity; however, local resistance, diversity, and inefficiency persist. This research illustrates the heterogeneous nature of landowners and their agriculture and reconsiders the contested impacts of agricultural policy on a local community in Japan.

Market Economy for Non-Market Value: A Community Development Project in a Mountainous Area of Japan

Japan has been depopulating and aging since the 2000s, and mountainous communities have been particularly affected. In Akita Prefecture, the local government promotes community-based businesses to revitalize mountainous communities by directly selling non-timber forest products, such as edible wild plants, to urban consumers. It is based on cooperative shipping and selling, which relies on local knowledge of geography and plants. It also requires collective action among local people to meet product standards, such as size and quality, and the particular order quantity from the urban shops. Through this project, local people can receive supplemental income and enhance community bonds. Despite the project's bottom-up design, few community members participate in it due to the seasonal nature of the natural resources, the hard work required to harvest them, and the small amount of money that it provides people. This means that participants who benefit most from the project are those with social and psychological motives rather than economic ones. Thus, they use the market economy to obtain non-market values; opportunities to enjoy working with nature and neighbors enable them to satisfy their social and psychological needs. This paper discusses the benefits and limitations of community development using mountain resources via a case study conducted in Japan.

SUGIMOTO, Yasukiyo* (University of Miami, USA)

Pedagogy of Life: Reexamining and Eliminating Fundamental Social Inequalities

This researcher proposes an alternative philosophy of education, that is, a *pedagogy of life*. The alternative philosophy encourages ethnoracially minoritized youth to alter their existential suffering to a *moment* of self-affirmation, which enables co-productive agency. Henri Wallon, a French psychiatrist and pedagogist, discussed that adolescents and adults have the faculty of abstract thinking, and many of them continuously reorganize their worldview centered on their self-concepts. Importantly, the oppressed are made to internalize the imposed negative collective self-concepts. Their worldview can be greatly different from the one that the oppressors have—the former might be a pessimistic one, while the latter will be optimistic. The oppressed are forced to adopt another world of meanings. They are even aware of this invisible, decisive social division. Minoritized youth can experience cumulative cultural oppressions, from microaggression at school to institutional racism. Some come to suppress their everyday feelings and avoid critically examining sociopsychological problems. This survival technique may alleviate their existential suffering centered on the *Who-am-I?* strain, explored by medical doctors José Rizal and Frantz Fanon. In serious cases, however, this cultural alienation could lead to social deviancy, such as peer delinquency, harming others, and possibly suicide. The pedagogy of life addresses this cultural conundrum. Arthur Kleinman, an American physician, asserted that their social suffering is a product of societal contradictions. As Japanese psychiatrist Masatake Morita suggested, this existential suffering is also based on their orientation toward life—the negation of their real suffering means the negation of their existence. Instead, the *pedagogy of life* is built upon this very suffering and suggests a way forward led by minoritized youth to eliminate the suffering. This philosophy is the *Aufheben* of Eastern and Western philosophies: the integration of respect for sentiment and affirmation of life into a developmental theory of social agency.

Political Imaginaries of Solidarity in Transnational Social Movements: Barriers and Opportunities

My presentation discusses the impact of political imaginaries in facilitating or hindering sustained solidarity with the Boycott, Divestment, and Sanctions (BDS) movement in Toronto. In conceiving of the BDS movement as a space traversed by differentiated forces, where multiple actors and groups come together, where practices emerge and acquire meaning, and where various subjective dispositions come into play as actors engage in solidarity relations across time, this presentation highlights the convergences and divergences in political imaginaries and strategies among actors that may facilitate or hinder their efforts to sustain solidarity. By sustained solidarity, I mean the continuity of solidarity relations over time toward the fulfillment of particular social justice claims. By analyzing the constellation of internalized ideologies, practices, strategies, and political realities shaping the activists' political imaginary and its effects on the BDS ability to build sustained solidarity, this article argues that the plurality of political imaginaries and solidarity practices among BDS activists in Toronto contributed to the weakening and scattering of the BDS movement, relative to its strength a decade earlier. These political imaginaries oscillate between a) an anti-colonial Third World Internationalist imaginary and a pragmatic rights-based imaginary; b) converging and diverging secular and religious imaginaries. The article is based on a fieldwork from 2014 to 2019, combining in-depth interviews, archival work, and participant observation.

"Impect of Climate Change on Apple Farming Based Rural Livelihoods in Shimla Ranges of the State of Himachal Pradesh"

1. Dr Rekha Suman, Assistant Professor (Sociology), UILS, Ava Lodge Shimla, HP- Email: dr.suman152@gmail.com
2. Ranjit Singh, Dept: Establishment Branch, Guru Nanak Dev University, Amritsar.

The Himalayas are sensitive towards changing climatic conditions adversely affecting the crop and fruit based livelihood security of its rural inhabitants. The state of Himachal Pradesh situated in the north western Himalayan region is known for apple farming .Apple farming contributes greatly to the state economy in terms of income and employment generation besides nutritional security. The contribution in terms of contribution to the state economy is more than Rs 4000 crores on annual basis. Shimla ranges are the major apple production sites of the state where the climate change has started showing its impact on apple farming in the state. The extreme events such as heavy or no rainfall, floods, a reduced amount of snowfall etc. are observed. Pests and diseases are fast emerging leading to increased use of pesticides. The apple belt is shifting from low and mid hills to high hills due to warming of local

climatic conditions. The problem of climate change has further led to related social, culture, political and health problems. The present study was therefore made study to highlight the attention of society towards the effect of climate change. This study focuses on changes in apple based rural livelihoods of rural inhabitants due to climate change. Different issue related to the impact of climate change on social, cultural and economic status of the rural inhabitants are studied. Policy issues are also suggested for the protection of apple based rural livelihoods.

Family without Children? Women's Perspectives in a Qualitative Study in Lithuania

In Lithuania, women's experiences of not having children were not analyzed until recently. As in other Eastern European countries, women in Lithuania experience a pressure of a pronatalist society (Gedvilaitė - Kordušienė et. al. 2020). This presentation will analyze interviews of 12 women still of their reproductive age (29-47 y.o), conducted in 2017. [1] The paper's primary focus is the complexity of circumstances, cultural norms, and autonomy in decision-making about children during their life course. When obstacles to having children have faced, the wish for children needs at least some reflection to identify authentic desires (Mayers, 2001, Letherby 2002). Almost all interviewed women in their youth imagined a future marital life with children. Despite having a partner family often meant the extended families – parents and other relatives. Those women, who stressed raising children as the meaning of life, took measures to implement their wishes when restraining circumstances appeared on the way. They tried to get pregnant, underwent fertility treatment, and considered adoption alternatives. In the case of child-freeness, the woman disclosed continuous agency and self-confidence in her decision not to have children while facing the expectations for children from her romantic partners during her life. Some women who stressed their relationship with their partner as most important left the desire to have children behind when they faced complex impending circumstances, and their partners opposed alternative ways of having children. Feelings of sadness led to the reconciliation of not having children, as this decision was taken away from their agency.

Acknowledgments

A Glimpse into the Invisible Life of Working Mothers with Disabilities

The paper aims to identify challenges faced by women with intellectual, psychosocial and sensory disabilities in Lithuania in combining the roles of 'mother' and 'worker'. The paper is based on semi-structured interviews with twenty working mothers with disabilities.

Worldwide, mothers with disabilities face both objective challenges, including health-related issues and limitations and subjective challenges, including negative societal attitudes and stigma (Corrigan, 2007). The sphere of maternity is still driven by stereotypes and women with disabilities can be perceived as 'unsuitable' for maternity (Wolfe and Blanchet, 2000).

This exploratory study confirms the impact of disability on access to and participation in work by mothers with a disability and illuminates how structural inequalities exacerbate that experience (Buckingham et al., 2020). The findings describe the challenges that mothers with all types of disabilities face in the realm of employment and charts how mothers negotiate these experiences with emotion-focussed coping strategies (Folkman and Lazarus, 1988) and self-adaptation (Rout et al., 1997) rather than challenging the system, revealing the internalised oppression (Freire, 1978) and self-sacrifice.

The invisibility of working mothers with disabilities somewhat explains the lack of initiatives for systematic, structural changes in the Lithuanian disability policy, which also mirror the general trends in other post-socialist countries. Therefore, this research could contribute to the change in the disability discourse and multidisciplinary professional practices throughout the region. This has the potential for meaningful practical implications for the lives of working mothers with disabilities.

Changing Geographies of Stigma Following Deinstitutionalization

The presentation will start by discussing stigma surrounding large residential care institutions and their residents, persons with intellectual and psychosocial disabilities in the Post-Socialist countries. Then I will briefly analyse the turn in disability policy towards deinstitutionalization: context, underlying reasons, main actors, achievements and obstacles. A special attention I will pay to the research focused upon the manifestations of stigma at the local community level and how it affects political decisions and the general opinion.

I will present the research implemented in 2020 and 2021, including participatory research in the local communities, interviews with community members and persons with disabilities. The analysis will help to reveal the changing geographies of stigma following deinstitutionalization.

Three strategies for changing attributions about severe mental illness; information, contact and protest (Corrigan et al., 2001) will be employed as an analytical framework. It will help to reveal the lack of information exchange; absence and avoidance of "interactions between citizens and persons with psychiatric disabilities" (Corrigan et al., 2001, p. 188). Most interestingly, the research demonstrate that protest was used to express (instead of suppress (Corrigan et al., 2001, p. 187)) negative attitudes and representations of mental illness.

Pitfalls of Popularity: The Dynamic of the 1989 Tiananmen Student Movement

In this article, I investigate the 1989 Tiananmen Student Movement asking why the movement became radicalized after the regime offered concessions. I argue that a symbiotic dynamic between radical activists and regime hard-liners led almost inexorably to the movement's tragic demise. When regime soft-liners offered concessions to the students, moderate students were willing to negotiate. The more radical students, however, rejected dialogue and staged dramatic actions that captured media attention, tilting powers toward radical mobilization instead of organizations. Spectacular but nonviolent tactics of hunger strikes undermined the position of both the moderates and regime soft-liners, leading to a movement-regime stand-off. The hard-liners exploit this stand-off to marginalize those soft-liners and repress the movement. I show how this dynamic led to violent repressions and consolidations of authoritarian rule.

RC48-672.5

SUN, Zitian* (McGill University, Canada)

The Art of Blaming: Repression in the 2019 Hong Kong Protest

Under what conditions does repression against a social movement succeed? Existing studies show repression is most effective when the state can minimize legitimacy loss via legal repression or when the movement embraces violent struggles. I propose an alternative argument with a mixed-method investigation of the 2019 Hong Kong Protest that the state can weaken the movement's abilities to extract a concession with intensified violence. I allocate three dimensions of repression to elaborate on this claim. First, repression is counterproductive in Hong Kong but stimulates a violent response. Second, when repression increases the costs of protests, the movement modifies its nonviolent repertoire to incorporate violent protesters, expanding its mobilizational base for further struggle. Third, however, this incorporation allows the state to intensify its repression and use propaganda to undermine its legitimacy, incentivizing the movement to decentralize. Collectively, mobilizations via social media allow the movement to continue, but they undermine the concession extraction capabilities of formal organizations. My research demonstrates how an authoritarian state uses repression to reinforce its governance and avoid offering concessions to popular protest.

Caste Capital, Social Psyche and Humiliation: An Examination of Dalit Women Experiences in Higher Educational Institution in Eastern India

As a system of privilege and power in society, caste is becoming increasingly determined as an elemental sociopsychological impact on Indian social life. Employing Ambedkar's theory 'caste is the notion of mind', it comprehends the significance of caste for psychological processes and how this upper caste social psyche influences higher education, where Dalits face discrimination. The upper caste receives advantages of caste capital without considering how their caste identification affects them, but for Dalits, their identity is

unavoidable and follows them even to universities. Upper Caste hold caste capital through social privilege, education monopoly, and all benefits (including power and wealth) from being an upper caste. Due to the social psychology of the upper caste mindset, it is hazardous to negotiate university spaces for Dalit students because any visibility of Dalit is perceived as unwelcome, discrimination and humiliation in caste capital universities. However, the experiences of Dalit women with the residue of gender and caste segregation have had little examination. This paper foregrounds the voices of Dalit women attending university in Odisha, India. It reports upon an ethnographical study as a part of a PhD thesis analysing 11 in-depth interviews and three focus groups with 15 Dalit women students. As an insider, the researcher's positioning will underscore the nuances of Dalit women students' experiences in regional universities of Odisha, India. This study highlighted how the upper caste carries their caste capital through the social psyche and how this social psyche creates unequal space in higher education. The paper argues how the means of discrimination are different and intensive when we talk about Dalit women's experiences. This analysis offers a unique psycho-social redefinition of trauma that foregrounds the relationship of the upper caste social psyche and how it impacts Dalit women's lives in higher education.

Multilayered Difficulties and Covid 19: A Case Study of a Pregnant Migrant Woman in Japan

The epidemic of the new coronavirus has had a significant impact on women globally. While many women lost their jobs due to the economic downturn caused by the pandemic, they faced domestic violence and shouldering care responsibilities at home due to restrictions on movement to prevent infection. Women faced challenges both inside and outside the home.

However, even in countries in the global North where large numbers of migrants are supposed to live, studies on "pandemics and women's difficulties" have focused exclusively on women who are "nationals" of the country, ignoring the difficulties faced by migrant women.

Based on a qualitative study of migrant women from Vietnam and other Southeast Asian countries living in Japan, this paper aims to clarify the difficulties migrant women face, especially pregnant ones, by focusing on their residence status, nationality, and government policies. Specifically, the study shows that women technical intern trainees working under the Technical Intern Training Program (TITP) were dismissed because of pregnancy; at the same time, they could not return to their home countries due to movement restrictions imposed by infection control measures. At the same time, pregnant migrant women without residency status lacked health insurance and public assistance for childbirth and could not return home due to movement restrictions. The pandemic threatened the Sexual Reproductive Health and Rights(SRHR) of migrant women working in the exploitative labor market, as their rights were severely restricted by their residence status, nationality, and government policies.

War Generation Mothers and Doi Moi Kids: Analysis of Migration with the Perspective of Gender, Capital, and Age

In recent years, the number of Vietnamese, including women migrating to East Asian countries through regular channels, has been increasing, with many Vietnamese going to Japan and Taiwan as migrant workers. Regarding the cross-border migration of people from Vietnam, there are studies on labor migration, international marriage migration, migration to former socialist countries, etc. However, there is not enough research on "who" is a migrant in the case of labor migration from Vietnam to the East Asian countries. There are cases where Vietnamese migrant workers face difficulties such as exploitation and human rights violations in Japan and Taiwan. It is essential to understand the background of migrants to protect their rights by defining who migrates across borders. Therefore, this paper will use the data of semi-structured interviews with over 170 Vietnamese who crossed the border to other countries, including Japan and Taiwan, between 2000 and 2019 to find out who crossed the border. The paper focuses on the gender, capital, and generation of migrants. It shows that women or "War Generation Mothers" were deprived of educational opportunities and work experience due to the Vietnam War and have a gender responsibility as good mothers have been canalized to Taiwan as domestic workers. The study also indicates that young women and men or "Doi Moi Kids" born in rural areas after Doi Moi, the market opening policy in 1986, and have a responsibility as good daughters or good sons in the patriarchal society were placed on labor migration as factory workers in Taiwan and technical intern trainees in Japan. The study will show that from 2000-2019, vulnerable women and youth from rural Vietnam were channeled into exploitative labor markets in the Global North, such as Japan and Taiwan.

New Forms of Secularities: Values and Latent Secularism in Everyday Life in Turkey

Secularization debates have been among the most important dynamics in the formation of the public sphere in Turkey for a century. The secularism policies implemented by Turkish modernizers using top-down bureaucratic devices constitute an important dimension of such debates. State-sponsored secularization reflects one of Turkey's important social feature. While formal institutions such as law, economy, and education were transformed, secularism was turned into a public ideology. It is not difficult to guess that this public ideology received various social reactions and gave birth to its opposite. However, the comprehensive social change experienced in Turkey in the last forty years reveals different dimensions of secularization. This social change is related to Turkey's greater integration with the world with an open economy at different levels and dimensions. On the other hand, with the spread of diversified media and the internet, social changes have started to accelerate. Thus, the formation and manifestation of values in daily life gained new forms. More pervasive, popular form of secularism began to emerge, unlike the previous authoritarian, and narrow forms of secularism associated with a restricted elite. The paper discusses the change of values and the implicit secularism in daily life, within the framework of Max Weber's concept of worldliness, based on the research data released every five years by the World Values Survey since 1990. In this sense, the genesis of secularism will be analyzed by focusing especially on the use of time and the change in the meaning and form of social ceremonies.

Change in Social Network Types Among Older Adults before and during the COVID-19 Pandemic

Background
Studies report that older adults are more vulnerable to social network contraction during the COVID-19 pandemic. Nevertheless, two questions remain. First, the contraction may not occur uniformly among different components of social networks. Second, the contraction may not be solely due to the pandemic; it can be part of the socioemotional selection process in later life. To address these questions, this study explored patterns of change in social network types among older adults, before and during the COVID-19 pandemic.

Methods.
Data were on 5,383 older Koreans from four waves of the Korean Longitudinal Study of Aging, collected in 2014, 2016, 2018, and 2020. Random-intercept latent transition analysis (RI-LTA) identified different types of social networks at each time point and their stability and change over time.

Results.
Across the four time points, five social network types were identified. These were (1) diverse, (2) unmarried and diverse, (3) spouse and friend, (4) spouse, and (5) restricted, from the most to the least diverse types. About three-fourths of older Koreans remained in the same type between two time points. Of those who transitioned into different social network types, more expanded their social networks than contracted between 2014 and 2016. However, social networks began to contract from 2016 onwards, and the contraction was particularly pronounced during the pandemic in 2020. Those who were older, urban residents, and who expanded social networks earlier were more likely to contract social networks during the pandemic.

Discussion.
The findings confirm that older Koreans lost diversity in their social networks during the pandemic. Attention should be paid to those who were more likely to experience social network contraction and those who remained socially isolated, in the spouse and restricted types over time.

Profiles of Volunteer Motivations during the COVID-19 Pandemic and Their Implications for Volunteer Activities

Introduction.
What kind of people were more likely to volunteer during the COVID-19 pandemic? This study investigated distinct profiles made up of volunteer motivations and their implications for volunteer activities during the pandemic.

Methods.
We used data on 1,093 current or former volunteers from the 2021 Individual Giving Survey conducted in Singapore. Latent profile analysis identified distinct volunteer motivation profiles out of a 30-item Volunteer Functions Inventory. Multivariable regression estimated the association between latent motivation profiles and hours, frequency, types of volunteer activities, and future volunteer intentions.

Results.
We identified four distinct motivation profiles: moderately motivated (40.5%), highly motivated (25.5%), value/understanding oriented (18.3%), and less motivated (15.7%). Compared to less motivated volunteers, highly motivated

volunteers and volunteers whose motivations were oriented toward values and understanding tended to volunteer (1) more hours, (2) more frequently, and (3) for a greater number of organizations. They were also more likely to (4) hold a stronger intention to volunteer in the future.

Discussion.

Our findings captured heterogeneous subgroups of volunteers who have differential types of volunteer motivations. These latent profiles of volunteer motivations affected the likelihood of taking volunteer activities in the Covid-19 pandemic period. Also, they were significantly related with future intention of volunteering.

Young People's Emerging Democratic Participation: A Mixed-Methods Case Study Exploring 'Youthful Politics' in a Rural Community in Germany

The context for this paper is the debate about a 'crisis of democracy' which has received increasing attention in the literature. This crisis is, on the one hand, characterised by citizens' disengagement from traditional venues such as party politics and, on the other hand, marked by increasing participation in emerging democratic participation contexts such as through consumer choices. This paper contributes to our understanding of young people's role in this crisis by exploring their emerging contexts for democratic participation, through a case study of a rural community in Germany. I decided to focus on a rural community, because research on young people's emerging democratic participation often exclusively focuses on young people from urban areas, neglecting the large number of young people living in rural communities. Based on reviewing current research, I propose seven emerging contexts for young people's democratic participation, namely unofficial, individual, glocal, sporadic, online, issues-based, and justice-oriented. I translated these contexts into a framework which I introduce and explore in this paper. To explore this framework, eight focus groups (n=26) and a qualitative questionnaire (n=106) were conducted with young people aged 13-17 from a rural community in Germany. Results suggest that the proposed framework extends previous conceptualisations of emerging democratic participation by looking beyond citizen types and taxonomies to explore the spaces, modes, goals, and frequency of young people's engagement. Participants' emerging democratic participation was particularly characterised by being glocal, unofficial, sporadic, and issues-based and to a lower degree individual, online, and justice-oriented. While participants were engaged in many activities that contribute to sustaining a healthy democracy such as volunteering, participants also disengaged from some official democratic processes which can be harmful to the future of democracies. Results also indicate that participants' rural context and high socio-economic background influenced their uptake of emerging contexts for democratic participation.

When Are We at Home

Where are we at home? This question has been posed among others by Agnes Heller in the pages of *Thesis Eleven*. Today, we might ask, when are we at home? For the places we inhabit can also be uncanny, *unheimlich*, as when our cities empty under COVID lockdown. This reminds us that home is not only a place but a set of relationships, and atmospheres that are created within them, which can, to our surprise, be vacated, rendered empty. In the last ten years I have lived in three cities: Melbourne, Stellenbosch-Cape Town, and Chengdu. I have published two small projects on these places, 'mapping miniatures' and 'watching the crown: tangible uncertainty'. These combine photo images and text, seeking to establish something of the flavour of these places – what are their everyday rhythms, how does it feel in a vibrant city and in a silent city? For this presentation I shall draw on my research into these places and offer some provisional insights into these issues.

How Religious Becomes Political? Studying a Heterodox Sect of Varanasi

The Hindu Society is divided into a binary of sect and non-sect. These sects have challenged the mainstream religious teachings at different stages of Indian Society. These sects result from social movements and have a broader base of followers. However, a clear-cut difference exists between a believer and a follower. The working of these sects is based on their social code of conduct, and their internal organization is guided by a guru or a central religious authority. The main character of these sects is heterodoxy. These sects have challenged the caste system of India from time to time and also tried to secularize the Society. However, in recent decades, it has been widely noticed that these sects have gained a status of political authority and reversed the process of secularization of the Society. The present paper tries to understand the process of secularization in Hindu Society by studying the role of religious

authority and preaching and practices of an orthodox Hindu sect of Varanasi. The findings suggest that in Hindu Society, it is challenging to alienate the role of a sect in the process of secularization and a further reversal of it. The paper is based on the ethnography of Aghoris of Varanasi. The study and its results are part of my PhD at Jawaharlal Nehru University, New Delhi.

SURAJ, Arvind* (Jawaharlal Nehru University, New Delhi, India)

The Dynamics between Faith, Healing and Hansen's Disease in a Hindu Sect

Every religious scripture has a special mention of Hansen's disease. The old scriptures like Manu Smriti and Mitaksara lay the foundations of contemporary social behaviour in Hindu society. The fear of infection continues after death also, and the religious beliefs guided and moulded the death rituals. The concept of pollution and purity is inherent to Indian society, based on the caste status of a person. A leper has its own tainted identity formed due to discrimination in every walk of life. Healing a leper's body is no doubt important. But what is more important than physical healing is spiritual healing. It is also important to note that there is a psychosomatic basis for sickness, and it is also why spiritual healing is essential. Based in the old city of Varanasi and scattered throughout the Indian state of Uttar Pradesh, the Kinarami lineage of Aghoris has a distinct identity of saints who can cure Hansen's disease with their blessings and medicines. Aghoris are a heterodox Hindu sect who opposed the strict caste system of Hindu Society by their social practices. Their social practices also opposed the untouchability of lepers. Religious authority, faith and healing have a complex interplay here. The present paper tries to understand the above-stated interplay and also tries to understand the linkage between religion and healing by exploring the social practices of Aghoris. The study and its results are based on an ethnography as a part of my ongoing PhD work at Jawaharlal Nehru University, New Delhi.

Effects of Migration and HIV Status of Bridge Groups on Their Families in India.

Migration is a complex process which has number of outcomes in terms of positive and negative. When it is carried with deadly or hazardous HIV, it impacts physical, social, psychological and emotional state of the families. Numerous studies have been done on HIV/AIDS and are centred on individuals focusing on prevention strategies to cope with the disease. At the global level, sex workers of all genders continues to face disproportionately high risk of getting infected with HIV. There is multi-layered reasons for high risks populations to get infected due to behavioural and social environment experienced by the sex workers. On the other hand, truckers and migrating workers are highly vulnerable to HIV and are prone to sexually transmitted infections due to nature of their work. Due to lack of information of bridge population about sexual behaviours, limits the decision to initiate HIV prevention interventions. This paper intends to study the impact of migration and HIV status especially on the family of bridge groups called truckers and migrants. Secondary sources and existing literature have been used. Data has been analysed thematically and results were classified into four themes (I) family status (ii) social stigma: (iii) feeling of isolation and guilty; (iv) coping strategies. The paper recommends to prevent the spread of HIV through sex education, rigorous programs and distribution of condoms, mobile provisions for prevention of STI with IEC activities in the country.

How Platforms Reconfigure Professional Groups. the Confrontation between Connective and Protective Professionalism Among Swiss Hoteliers

The arrival of platforms in a professional group impacts the status and skills of professionals. Our paper takes this line of research further to examine how platforms are reconfiguring professional groups and transforming key elements of professionalism. It takes as an empirical case a heterogeneous professional group, the hoteliers, and a type of platforms, the On-line Travel Agencies, that are still understudied. We used a qualitative method based on interviews with hotels managers, hotels owners and representatives of the main hoteliers' professional organisation in the Swiss context. Though these interviews, we show that the hoteliers' capacity to control their jurisdiction is being transformed on basic dimensions by the establishment of booking platforms: rules setting and relationships with clients. Among hoteliers, we identify two main ways of dealing with these challenges which correspond to the organisational division of labor specific to different categories of hotels (family run versus chain hotels). On a more general level, our paper argues that

   *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

platforms are ushering in a professionalism marked by the establishment of new boundaries, anchored in technological and management tools, and less based on the defence of the previous professional jurisdiction.Our contribution is, on the one hand, to highlight the differentiated effects of platforms within a professional group and, on the other hand, to discuss these effects in the light of current debates on recent developments in professionalism.

Smart Kids? Children As Protagonists of Smart Societies

Reflecting on the link between innovation and cultural reception (Iannone et al. 2019; Vanolo 2013) necessarily requires also considering the role of childhood.

Are children necessarily victims or in their own way protagonists of the advent of smartness?

It is well known that there are many studies focusing on the dangers to children from new technologies and digital media in particular. However, in my contribution I will also and especially take into account a different sociological approach to childhood, an approach that emphasizes children's agency (Corsaro 1997).

From this perspective, children are not simply passive subjects in the face of innovation but, while obviously needing special attention, possible active agents of change.

Episodic Interviews and Reconstructive Analysis in the Investigation of Safety Events in the Oil and Gas Industry in Brazil

The oil and gas industry has multiple facets that draw sociological curiosity. The present research explored offshore platforms in Brazil, investigating their realities and proposing an intervention in the way safety events are perceived and handled in this industry. This process was guided through the interdisciplinary perspective of Human Factors and originated from a research team that formed an Operational Safety Event Analysis WG. During the phase of data collection, the conduction and analysis of biographical narrative interviews and other qualitative instruments were able to reveal that one of the critical points in offshore work is the conduction of incident investigations. The examination identified that the linear methods currently being applied serve insufficiently their purpose of creating a safer environment and instead fuel a punitive system that finds culprits. Seeking theoretical and methodological foundations in the field of Interpretative Sociology, the outcome here presented is an adaptation of Episodic Interviews and Biographical case reconstruction approaches. Its focus lies on the preliminary stage of incident/accident investigations, in which evidence is collected for the inquiry of the event under analysis. The objective of the suggested tool is to lead the implementation of new interviewing practices among the participant offshore investigation teams, and its development process is the content of our presentation.

Reconstruction of James' Biographical Case: Work Paths between Struggles and Opportunities

The interview with James was conducted online and asked him to speak about his work and life experiences. James was born in Nigeria in 1992 and currently lives in the Netherlands and works as a freelancer data analyst. The analysis of the interview with James followed the method of biographical case reconstruction and aimed to understand his professional trajectory and experiences and how it developed intertwined and informed by broader contexts such as the cultural, territorial, economic, and family aspects that had impact over his opportunities and choices. The reconstruction also focused on the interviewee's present perspective to understand what are the thematic fields that appeared in his narrative and how these current lenses informed the ways he framed past biographical situations. The analysis showed, among other findings, the central role that the family background plays in James' life course and how the family influence is seen by him in a dubious way: as an enabler of concrete conditions for developing certain professional competences, but also as an absent support structure that impedes him to follow his desired personal preferences. Analysis also showed how technology and online work platforms can have a central role in fostering technology careers but also work-related informality to people with moving biographies and coming from developing countries.

Preconditions to Follow Hygiene Routines Among Temporary Aged Care Workers in Sweden during and after COVID-19

Working conditions in aged care have been identified as demanding with high workload and little influence in work. Research indicates that these problems worsened during COVID-19.

Temporary employments are common in aged care. In Sweden, where this study is conducted, approximately 25 percent of the staff are temporarily employed per the hour (on-call workers). During the COVID-19 pandemic it was argued in the public debate that the large proportion of on-call workers resulted in spread of infection due to on-call workers insufficient knowledge of hygiene routines.

In other sectors, temporary work has been associated with work environment challenges such as high job demands or less influence at work. If on-call workers are stressed due to high job demands and has limited prospects use their judgement, i.e. to exert influence over work, it is possible that any problems in following hygiene routines is due to poorer conditions, rather than insufficient knowledge. During COVID-19, the workload for on-call workers was unusually high as many regular workers were on sick leave. Therefore, associations seen during COVID-19 do not have to apply after the end of the COVID-19 pandemic.

The aim of this study was to analyze to what extent job demands and influence at work is associated with preconditions to follow hygiene routines in aged care work and a) to what extent these associations are moderated by type of employment contract b) to what extent this association is the same after COVID-19 as during COVID-19.

Longitudinal questionnaire data from 500 on-call workers and 107 regular workers workers were collected May 2021 and October 2022. Preliminary analyses of baseline data indicates that job demands is negatively associated with conditions for following hygiene routines and that temporary workers report poorer conditions for following hygiene routines than regular workers.

SVETLOVA, Ekaterina* (University of Twente, Netherlands)

Methodological Relationalism

Methodological relationalism (MR) seems to be a strongly underappreciated concept in the field of Economy and Society. It suggests that the appropriate unit of analysis is *a relation*, and helps to overcome thinking in entities (such as individuals, institutions or collectives). This approach takes social research beyond *methodological individualism* and *methodological holism.*

Although the importance of MR has been recognized within *sociology* (Schmitz 2020), this framework has been insufficiently applied to analysis of economic phenomena. The closest concept used is certainly "a network"; however, it does not fully appreciate the strengths of MR. Networks are fixed and "sparse social structures, and it is difficult to see how they can incorporate the patterns of intense and dynamic conversational interaction, the knowledge flows, and the temporal structuration [...]" (Knorr Cetina and Brügger 2002, p. 910). In contrast to networks, MR questions *what relations are* and *how they come about* (the problem of emergence, see Svetlova 2016); it considers occurrences and work *within the relations* (shifts, upheavals, stabilization phases, sensemaking etc.) as central, necessitating a detailed empirical (incl. ethnographical) research on them (Arjaliès et al. 2017). Thus, MR entails not only relational but also *processual* thinking.

This type of thinking has insufficiently been applied to analysis of economic phenomena such as expectations, interest rates, debt, cost, inflation etc. In my contribution, I will use the concept of "equity valuation" to demonstrate the advantages of MR. Equity value is based on the ongoing flow of numbers, narratives, expertise, money, and impression management performances within the relationships of various professional groups (e.g. asset managers, analysts, regulators, consultants and clients).

More general, I will argue why MR could become the overarching framework for economic sociology: It allows to systematically approach the issues of what relevant units of analysis are and how to investigate them (relevant methods).

SWAIN, Dhiren* (Indian Institute of Technology, Madras, India)

Politics of Committees: Bureaucratic Authority and Democratic Negotiation in "Jaga Mission" Odisha, India

At a policy level, India sees a shift in its approach, post-2000, in its city infrastructure and governance programs. The aim has been to be part of the global cities and hence part of global financial markets. Urban renewal through policy missions like JNNRUM emphasized this goal. Integrated approaches to health, housing, and employment are the key components of these policies. In my paper, I look at a program called 'Jaga Mission' primarily an in-situ slum upgradation project, adopted by the government of Odisha in India. This

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

project aims to give liveable habitats and regularize claims to the spaces in the urban local bodies. This policy idea has been adopted by several governments like Punjab and Assam. It also wields the support of practitioners across ideologies. The urban policy in practice gives power to executive bodies of the State and bureaucratic experts. Here, I analyze how neo-liberal policy missions in practice prioritize 'results' over the complexities of democratic processes. It pushes everyday politics to the background and tries to achieve the goals through 'other' means and parallel legitimation of authority. I explore 'Land' as an ontological category in my paper to unpack the materiality and politics around urban governance. These bureaucratic machinery are the vestiges of the colonial past. The parallel authority that the bureaucrats create, displays entanglements of power and expert knowledge at the ground level. In my paper, I use grounded theory and ethnographic methods in my paper I look at day-to-day discourses inside political 'committees' at the local level, documents, and cases around local level meetings, financial negotiations, and regularization of land to show how the sub-set of bureaucratic authoritarianism work in urban policies in the global south.

Human-Elephant Interactions: Perspectives of Young Stakeholders on Conflict Mitigation and Conservation

Expansion of human settlements, population growth, and infrastructure development have been widely attributed as major drivers of landscape alteration, depredation, and the fragmentation of elephant habitats. As a result, conflicts between humans and elephants over space, food, and water are on the rise, resulting in consequences ranging from loss of livelihood to injury and loss of lives. This has caught attention of conservation scientists, ecologists, and policy makers to study and propose mechanisms for mitigation of damages and addressing conservation concerns. To understand and mitigate human elephant conflict (HEC), researchers have mostly focused on elephant ecology, elephant behaviour, efficacy of mechanisms for conflict mitigation and damage control, community perceptions and conservation education. However, not many studies have considered engaging with local communities that is vital for the success of conflict mitigation and conservation efforts. Only a few research have analyzed perceptions of adult members of local communities and even fewer have considered the future stakeholders- the children. It is argued that children's connection with wildlife is complex and significant, and their involvement in environmental education is considered crucial. The children are also seen as competent social actors with unique perspectives and hence constitute an important category of stakeholders in wildlife conservation. The United Nations identifies children as a major stakeholder in their sustainable development programmes. Albeit small in number, studies have flagged children's understanding of sustainable development, environment, and wildlife conservation. As future decision makers, children have great potential to influence the rate and extent of ecosystem transformation, as well as the fate of elephants in the region. In this study, we have used draw-and-write method and thematic content analysis using MAXQDA to understand the children's perceptions of elephants and human-elephant interactions, and to explore possible measures that could be employed to improve awareness of elephants and augment conservation education.

Precarity of Contract Teachers: A Qualitative Analysis of Lived Experiences

School enrolment rates in the developing countries has increased substantially over the past few decades. However, due largely to budget constraints, hiring contract teachers has become an *ad hoc*, yet popular solution to teacher shortages in Asia, Africa, and Latin America (Fyfe, 2007; Chudgar et al., 2014). Studies concerning contract teachers have primarily focused on their performance, efficiency, and cost-effectiveness (Atherton & Kingdon, 2010; Goyal & Pandey, 2013; Muralidharan & Sundararaman, 2013; Duflo et al., 2015). In the light of the literature on precarity (McKay et al.,2012; Alberti et al., 2018) specifically, precarity of contract teachers in developed countries such as Australia (Cuervo & Chesters, 2019), this paper seeks to explore how contractual employment affects teachers in developing countries. Obtained through semi-structured interviews, this study analyses narrative data from seventeen contract teachers working in Odisha, a state in eastern India. Thematic analysis of the qualitative data indicates that participants experience precarity in six different ways. These six dimensions contribute to the demoralization and disempowerment of teachers. Considering the criticism of the contract teacher hiring policy, we examine the possible reasons for its continuation. There is a need to reconsider this policy and to adopt teacher hiring and management practices that ensure teacher dignity and well-being.

For a deeper understanding of this topic, further research should be conducted in a variety of contexts, and it is also important to examine the agency of teachers to resist precarization.

The Ideals of Justice and Equality Vis-à-Vis Indian Legal System: Assessing Requirement of Special Hate Crime Laws in India

Crimes driven by communal hostility are back in the focus of popular academic and legal discourse in India. A sudden rise in incidents of violence targeted against religious minorities in India, especially in the form of mob lynching has exposed both- the vulnerabilities of the minorities in India and the limitations of the Indian criminal justice system to ensure safeguards for them. The crimes against minorities which are often motivated by the prejudices of the offenders qualify to be perceived as Hate Crimes but the Indian legal system does not officially recognize any crime as a hate crime. Without any recognition legally, these crimes are treated as ordinary offences without considering the additional harm they present to society at large. An overview of existing provisions under the Indian Penal Code (IPC), the official criminal code of India and the judicial interpretations of the same present a highly problematic picture of the biases of the criminal justice system in India where practices of majoritarianism seem to undermine the ideals of justice and equality enshrined in the Indian constitution. The absence of special protection provisions for minorities which take into account their vulnerabilities due to the stigmatization of their identity and the universal application of some existing laws meant to deal with hate crimes in India end up adding to the systematic practices of marginalization of these social groups. The institution of law, in a highly hierarchical society like India, appears to perpetuate structural inequalities and thus invites critical reflections. In this light, this paper presents a critical analysis of existing laws that are employed to deal with such bias-motivated crimes to make a case for the differential treatment of these crimes and hence the requirement for separate hate crime laws in India.

Epistepraxis: Recognising the Practices of Youth in the Global South As Knowledge

Practices such as hustling, navigating, fixing, waiting, being on standby, silence as protest, and life-writing are common amongst young people in the Global South. They contribute to the way loftier concepts such as personhood, intersectionality, violences, post-coloniality, consciousness, precarity, ontological insecurity, collective agency, and emancipation, amongst others, are theorised and understood. The term 'epistepraxis' coined by Cooper, Swartz, Batan & Kropff Causa in *The Oxford Handbook of Global South Youth Studies*, offers productive contours and handholds in the quest for epistemological and cognitive justice in the twenty-first century decolonial turn. In short, the term refers to the way in which young people's everyday practices can be interpreted as knowledge practices. In doing so, not only are knowledge and practice re-united, but politics and the quest for social and structural justice are reintegrated into the knowledge project. This kind of knowledge-seeking forms part of a sensibility that is constantly in dialogue with those most affected by Global inequalities and social injustices, aspiring to validate—as knowledge— people's strategies to cope with oppressive realities, while simultaneously taking theory seriously. Epistepraxis, as an alternative theory-method has the potential to both renew and reform existing subjectivities.

The Incompatibility and Dialogue between Theoretical Perspectives: Habitus, Absorbed Coping, and Embodied Understanding.

Theoretical perspectives diverge in what they allow us to see. The phenomena observed cannot be separated from a theoretical sensibility making particular features of the social world visible. In this sense, the empirical mapping of the social world cannot be performed without the implicit or explicit guidance of a conceptual scheme — a way of looking at and speaking about the world — which establishes the phenomena relevant to us. Therefore, making sense and talking about our social theories also depends on the highlighted, perceived, and the observed world we can discuss. To reflect on the possibilities of dialogue between incompatible perspectives and the inevitable connection of observation to theoretical preconceptions, I will focus on the genealogy of three interrelated concepts: the sociological concept of habitus, the philosophical concept of absorbed coping, and the psychological concept of embodied understanding.

The Concept of Societal Brittleness and Its Relevance for a Sociology of Climate Change

The social science literature on environment devotes much attention to – and affection for – the idea of *resilience*. Given conditions around the world, it might be more to the point to focus, instead, on resilience's implied (but often unspoken) opposite: what we might call *brittleness*.

A thing that is *brittle* is liable, when stressed, to crack, break, shatter.

To make the point as sharply as possible, consider this sequence:

resilient society → climate shock → moderate impacts → painful but successful adaptation

and contrast that with this one:

brittle society → climate shock → severe impacts → extreme adaptation measures; adaptation fails; crisis

Assessing any society's (nation's, region's) climate-relevant brittleness requires specific, detailed historical investigation – i.e. what was happening *before* climate change to increase that society's brittleness – but one can list some kinds of brittleness that are likely relevant in many cases: a political economy already grossly maladapted to local conditions; extreme inequalities of wealth and poverty; systemic racial/ethnic inequalities [NB: here the analysis of brittleness intersects with concerns about climate justice]; a dysfunctional, incompetent or corrupt political system; elites militantly committed to hanging on to the privileges that have accrued to them in the *status quo*.

Putting the concept of brittleness front and center in a Sociology of Climate Change sharpens one's understanding of how, exactly, climate change is most likely to impact society, and helps identify responses that are most likely to decrease society's vulnerabilities as the planet warms.

In this presentation, we: (1) offer an empirical example, economic and political developments that increased Syria's brittleness before a climate-driven drought pushed that nation into crisis; (2) define the concept of societal brittleness (more specifically *climate-relevant* brittleness) and argue for its usefulness; and (3) offer an initial, partial list of ways that societies can be climate-brittle.

Using the Photographer's Eye. Visual Competence As a Cognitive Tool in Biographical Research

The practice of street photography became a refuge for me from the confinement of a small flat during lockdowns. As I developed my photographic workshop, I began to reflect on how this new mode of representation at hand – but also a perceptive and cognitive tool – could be incorporated into my research work.

The thick, palpable concreteness of a photograph can not only contain knowledge but also successfully act as an anchor for abstract generalizations or new concepts. It is similar in this regard to narrative or literary techniques used in academic writing.

However, previous attempts at adding a photographic component into social research have often ignored the fact that the visual medium requires a broad set of technical and practical skills that can only be developed through long-term *deliberate practice*.

These are not only technicalities of operating the camera or the selection, editing, presentation, and archiving of images. Composition techniques, the ritual of interaction with people during a session or a street situation, the sense of observation or the ability to achieve a unique state of heightened attention – these abilities also require reflection.

The photographer's eye seeks satisfying relations of shapes in the frame, intense patches of colour, contrasts of shapes and colours, faces that are young and conventionally pretty, what is rare and unique. The sociologist's eye may rather look for what dominates, what is typical, what is representative or what saturates a most diverse spectrum of phenomena.

These are clearly divergent inclinations. However, harnessing both in research work could prove they can work together in creative tension.

These remarks will be grounded in two research projects combining biographical, discursive and visual research – one based on autobiographical narrative interviews with renowned contemporary visual artists, and the second based on interviews with Poles of African descent.

European Sociological Theory Thirty Years Later

Thirty years ago I have co-authored the project evaluating the condition of European sociology in the wider world (B.Nedelmann and P.Sztompka, *European Sociology in Search of Identity*, Berlin, New York 1993). In the present paper I will focus on the changes in European sociological theory (EST) during that period confronting it with the predictions formulated in the volume mentioned above. I will ask and attempt to answer the following questions: (1) Have we overcome what Ulrich Beck called "methodological nationalism" and turned toward more cosmopolitan, European focus? (2) Has EST preserved its identity and specificity vis-a-vis theoretical ideas coming from other continents, particularly the US and the Global South? What is the specifically European contribution to the universal canon of concepts, models and theories? (3) Is there some central focus of current EST or is it notoriously fragmented and diversified? Are the sociologists still living in separate and mutually impenetrable theoretical "schools"? (4) Is EST peculiar with respect to its closest interdisciplinary links: with history, psychology, economics, cultural anthropology, philosophy? (5) Have we brought the "long nineteenth century" to an end, going beyond the explications, interpretations and variations on the themes of classical authors: Marx, Weber, Durkheim and Simmel? Which of the masters are still potentially relevant and which are obsolete? (6) Is the current EST catching up with the tremendous social, economic and geo-political changes occurring in the twenty first century, or is it lagging much behind, providing only *post-factum* interpretations? (7) Are there any contemporary European theorists whose impact could be compared with that of Giddens, Bourdieu or Habermas at the end of the twentieth century?

Childhood and Aging: Connecting Generations

The talk connects research on childhood and older age in a life course perspective. It offers theoretical reasoning and empirical results. The focus is on the relationships between children and parents. Previous studies have focused on intergenerational bonds either in childhood or in adulthood. However, due to missing data, there is a lack of research directly linking children and parents in young and old age.

Recently, we have collected a wide range of new information on intergenerational relations from early childhood to late adulthood. The representative survey (SwissGen) for the whole of Switzerland includes over 10,000 respondents with more than 20,000 dyads. Both current relationships of children with living parents and previous relationships with now deceased parents are examined in detail.

Questions include: How do early intergenerational relationships in childhood affect attachment in adulthood and into old age? What role do early conflicts and separations of parents play, as well as tensions and quarrels between the generations? To what extent do parental rules, punishment, pressure, reliability, love, and praise during childhood affect adult relationships? What are the consequences of early experiences for later ambivalence, stress, conflict, and estrangement, on the one hand, and attachment, proximity, help, and care, on the other?

The analyses confirm: Childhood matters immensely. This especially applies to early conflicts and affection. Conflicts during childhood lead to significantly more ambivalence, stress, conflict, and estrangement in adulthood – and to much less cohesion including help and care for parents. Showing affection for offspring during childhood consistently strengthens lifelong bonds. Early experiences at a very young age greatly matter even for very old age, up to the last time with the parents before their death. Childhood experiences do indeed cast very long shadows, and studies of childhood provide a far-sighted look into the future.

Inequality across Multiple Generations: The Case of Inheritances

Inheritance is a central factor in the intergenerational reproduction of inequality. Received inheritances offer significantly better living conditions, and anticipated bequests can provide a secure life path with many options. However, due to lack of data, previous inheritance research is primarily limited to two generations. The talk is based on new data which go beyond that and offer a multi-generational perspective. It is about direct inheritances, but also about the indirect estates that the parents previously received from their parents.

Questions include: What is the significance of direct and indirect bequests for social inequality? Is it more important to have rich parents or rich grandparents? Do affluent classes receive more if the parents have already inherited (a lot)? Do most (large) inheritances go back to the parents' own acquisition of wealth, or are they already heirs themselves? Which part of direct inheritances are actually indirect ones?

The analyses are based on SwissGen, a new representative survey for

Switzerland with more than 10,000 respondents from all parts of the country. Switzerland is ideal for inheritance research: it is a country with large fortunes and many inheritances (and thus a high number of cases). The study does not only ask about received and expected inheritances from the parents, but also about inheritances that these have received from their parents.

The findings clearly show that wealth transfers are by no means limited to two generations. It is by far not only the parents who are of great importance for social inequality, but also the grandparents in particular. A large part of inheritance is not consumed by the heirs, but passed on to the next generation. Some of the assets are used up, and some of the assets received from the (grand)parents are increased. Reproduction of inequality across generations is indeed a multi-generational topic.

Gendered Expectations of Motherhood in Abortion Narratives

In my PhD project, *Post-Abortion Narratives shared by Perth women (Western Australia)*, I investigated the process of personal decision-making within a particular social context. The narratives that the participants shared were laced with gendered expectations of 'good mothering' performed as 'intensive mothering.' This presentation explores the social pre-conditions for 'good mothering', and the responsibilisation of decision-making that comes to the fore in the presentation of the alternative option of abortion as the kinder solution when faced with an unplanned pregnancy.

This presentation leans into the feasibility of 'good enough mothering' coupled with 'good enough fathers', a 'good enough state' and a 'good enough workplace' to ease the pressure on women to perform the gendered expectations of 'intensive mothering'.

Visualising Relational Autonomy in Abortion Decision-Making

In my PhD project, Post-Abortion Narratives, I investigated the process of personal decision-making within a particular social context. In order to locate the individual as decision-making agent, I devised a method which I call 'mud maps.' The freestyle drawings produced during the interview give both the participant and the researcher a view into the position of self and the flow of knowledge in the decision-making process.

This insight is particularly pertinent when faced with a foetal disability diagnosis. In this presentation, I share the mud map of one participant with a Trisomy-18 pregnancy, who placed herself, her partner and the obstetrician as equal decision makers in the centre of the social network. I also share the mud map of one participant who indicated the flow of knowledge from the medical clinic to herself and on to her partner.

These findings speak to the patient relationship within the medical field and the position of the decision-maker *vis-à-vis* the medical practitioner, unsettling understandings of the free and autonomous decision-maker. I employed a 'relational autonomy' understanding of the individual in order to investigate and explicate this relationship. This research contributes to wider understandings on abortion decision-making processes especially in the context of foetal diagnostic testing.

TABARA, Joan David* (Sustainabilogy.eu - Autonomous University of Barcelona, Spain)

Towards a Theory of Possibilities for Regenerative Sustainability. Repositioning Transformative Human Agency for the Emergence of Positive Tipping Points.

In theory, moving contemporary societies towards sustainable development pathways is possible. However, an integrated social science theory explaining the necessary conditions and processes for such a prospect is mostly absent. Current social-environmental analyses and visions on sustainability transformations are constrained by the lack of an explicit, operational and non-exemptionalist characterisation of individuals, organisations and societies as coupled social-ecological systems; and also, by how human agency and emancipation is conceived in the context of accelerated global environmental change. Using a relational whole-systems' worldview, a theory explaining how to increase the possibilities for global transformative change towards regenerative sustainability is outlined. It is argued that learning how to enact positive tipping points towards global sustainability requires the coordination and confluence of multiple transformations *at the same time* in the following subsystems, all of which can be reconfigured in alternative, regenerative ways: Structural and institutional arrangements (S), Energy and natural resources (E), Information and knowledge systems and, most of all, turning how humans deal with accumulated environmental change (C) from destructive to regenerative global systems' interactions. To apply this regenerative vision of sustainability to particular social-ecological contexts, an initial set of actionable propositions are also provided.

The Role of Stock Trading Apps and SNS in Generational Justice: The Case of Youth Financial Civic Movements in Taiwan and Japan

In recent years, the wealth inequality between elders and youths has become a serious social problem. Based on science technology and society (STS), financial exclusion, and generational justice, this study attempts to analyze the process of youth's self-representation and empowerment in financial accumulation by breaking the wealth gap between generations through stock trading apps and SNS. East Asian countries with history of developmental states and authoritarian regimes, such as Taiwan and Japan achieved rapid economic development from the 1960s to the 1980s. However, since the 1990s, due to the economic development of emerging countries and the impact of the global economy, the younger generation in these countries has been exhausted by the global competition and suffered from downward rigidity of wage and precarious employment. Thanks to the job security system before the expansion of neoliberalism and global economy, the older generations enjoy the condition of accumulating wealth. In contrast, the younger generation is excluded from the means to accumulate wealth and worried about the future. However, with the rise of online financial transactions, stock trading apps for beginners have emerged, and young generations in Japan and Taiwan are trying to overcome financial exclusion and challenge the accumulation of wealth by trading stocks. In Taiwan and Japan, elderly people used to invest in stock market with large amount of money. The younger generation has difficulty accumulating wealth through buying stocks because of the lack of money and low financial literacy. However, our preliminary research found that with the emergence of stock trading apps and online stock trading platforms, small investments became possible. Coupled with youtuber and twitter users initiating a civic movement to develop financial literacy, youths in Taiwan and Japan challenge to invest in stock market and promote their empowerment to overcome the economic gap with the older generations.

TABOADA GOMEZ, Victoria* (Georg-August-Universität Göttingen, Germany)

Indigenous Women's Strategies Against Outsiderness: A Biographical Perspective on Historical Colonial Processes and Current Power Dynamics in the Paraguayan Chaco

What can indigenous women's biographies tell us about power dynamics taking place in the Paraguayan Chaco and what can their strategies to negotiate their right over resources tell us about the historical processes that shaped current figurations here? Which are the discourses that legitimize or enable their positions in social relations, and what do their biographical presentations tell us about how they counter a highly invisibilized and stereotyped perspective on their role?

I will address these questions based on a biographical analysis which is historically located in the long-standing occupation of the Central and Southern part of the Paraguayan Chaco's territory by indigenous groups and the more recent missionary and agricultural-cattle production activities of Mennonite colonies, who have established a colonial socioeconomic system since 1927, where the systematic exploitation of indigenous peoples is a fundamental component (Canova, 2021) until nowadays. The case study refers to an indigenous woman belonging to one of the most numerous groups among the Enlhet-enenlhet linguistic family, with an established use of the group language, and with certain access to traditional cultural practices and collective history. In this presentation, I will analyse how collective and biographical processes on family history and leadership projects from an indigenous woman navigate between her establishment within colonial structures, strategies for gaining autonomy, and improvement of life conditions for her community, with the aim of depicting ongoing historical processes in the Chaco region based on the biographer's experiences.

TACASA, Glen Christian* (University of the Philippines Los Banos, Philippines)

A Pedagogy of Ambiguities and Silences: Analyses of the Philippine History Education on Marcos' Authoritarian Regime

Philippine History Education has been subjected to its own ambivalence as situated by the Philippine Department of Education (DepEd) itself. With DepEd's basic education overhaul, the K-12 curriculum has relegated Philippine History courses to primary education, rather than secondary education. Concurrent with the prevailing historical negation, and historical distortion, the historical truths grasping the brutal history of Ferdinand Marcos' authoritarian regime are under threat. The electoral victory of the dictator's son, Bongbong Marcos to the Philippine presidency is considered as the apex of a perennial effort to revise and distort the brutal history of his father's authoritarian rule. Subsequently, historians and educators are alarmed by the appointment of Vice President Sara Duterte as DepEd secretary. It is due to the feasibility that historical distortion on both Marcos and Duterte strongmen regimes can materialize in the pages of history textbooks. This study examines the pedagogy of authoritarian history in the Philippines, its overlap with government-sponsored historical negation, and historical distortion, and the role it plays to the restoration of strongman rule in the country. In the course of its inquiry, it employs an analysis of DepEd learning materials published from 2013-2022 as part of K-12 curriculum, which are compared with the history curriculum of Germany, and Indonesia; supplemented with structured interviews of stratified sampled students. Based on the textual and interview analyses, authoritarian atrocities are being juxtaposed with a fabricated history of 'Golden Age', resulting in an ambiguous image of dictatorship with 'a lot of killings' and 'some good things'. Moreover, history textbooks were observed

denotes a presenting author. Abstracts are organized by first presenting author's last name.

to be silent with the narratives that would indisputably portray authoritarian rule as vicious. The history of Marcos' authoritarian regime is being taught inconclusively and incompletely in the present K-12 curriculum. It fails to place Marcos' dictatorship, and the Filipino people in their proper historical contexts.

TACASA, Glen Christian* (University of the Philippines Los Banos, Philippines)

Towards a National Democratic Sociological Imagination

C. Wright Mills' magnum opus "The Sociological Imagination" (SI) is considered to be the classic overview of the field of Sociology, which aims to instill a quality of mind that navigates the individual into a broader societal and historical context, and begs to realize that personal troubles are indifferent to public issues. However, the augmentation of Mills' SI has its fair oversight of authoritarian politics not only in today's context of its reemergence, but also by the decades following its publication. This study functions as a groundwork that critically evaluates Mills' SI. It is tasked to revisit and re-shape SI towards a new framework borne out of contemporary issues and public dilemmas. It aims to integrate the emphasis on the emergence of subaltern perspectives in line with the crises from the Global South. In the course of this groundwork inquiry, it deploys historical analysis of Mills' SI in its Cold War milieux, and examines its influence and reception on Third Worldism. Subsequently, Mills' SI and its definition of democracy were put under critical interrogation by the resurgence of authoritarianism, and post-truth politics. The promise of *National Democratic* Sociological Imagination (*NatDem SI*) that gives great emphasis on a mass-oriented praxis is central to its formulation. *NatDem SI* extends the scope of Mills' SI, that is altogether attached with the living conditions of the masses, to possess an extensive view of the social realities from the peripheries. It ascertains the prevailing hegemonic powers in order to accost its mechanism. Moreover, this grounded theory saw the potential to empower the inherent role of the people as the primary history-makers. Ultimately, *NatDem SI* sets a challenge directed to the field of Sociology not only to imagine, or assume the role of 'the interrogator', but to be at the forefront of emancipation from hegemonic entities.

Seamless Application of Gene Editing on Agriculture and Beyond: Farm-Nature Assemblage on the Horizon

Genome editing technology has been spreading to various fields of application since the advent of CRISPR/Cas9 in 2012. The agricultural sector is no exception. Crops and livestock are being improved, and it is predicted that genome editing technology will be applied not only to these but also to various organisms in the environment, such as plants and microorganisms that interact with crops and livestock, thereby deepening intervention in agricultural ecosystems. The scope of such interventions is expected to expand to natural ecosystems as the impacts of climate change increase. In many countries, Assisted Evolution may be applied beyond agroecosystems, as DNA mutations such as SDN-1, which can also occur naturally, are not subject to regulation. This paper considers to what extent and how to intervene in society in response to such changes and decisions.

TADA, Mitsuhiro* (Kumamoto University, Japan)

Talcott Parsons' Monolingualism and the Age of the National Society

This presentation clarifies Talcott Parsons' methodological-nationalist view on language, reflecting his sociohistorical context. Parsons believed that members of American society shared as the foundation of social integration what Robert N. Bellah called "civil religion," but simultaneously assumed a common language to be a necessary condition for integration: a common cultural code is required, through which actors interact, giving cultural or symbolic meaning (subjective meaning) to their actions in a normative way. Thus, from Parsons' viewpoint, multilingual societies, like Canada and Belgium, suffer difficulties in integration. However, such monolinguistic view of his was derived from civil-linguistic, liberal nationalism rather than such exclusionary conservatism as the later Official English movement beginning in the 1980s. In this sense, it was closer to Emile Durkheim's linguistic view in France, which was combined with the civic community ideal. Meanwhile, Parsons was less assimilationist than Durkheim, since he had in mind the overtly multiracial reality in the United States, where he lived, and thought that a social community with unified diversity was more evolved. Yet Parsons' idea of English monolingualism in the public sphere will consequently overlap with the Anglo-Saxon conformism. In this regard, his monolinguistic theory of social integration could even justify the 1906 shift in the U.S. naturalization policy that resulted in the denial of citizenship to non-English-speaking immigrants. Originally, the modern society to be integrated that Parsons discussed was basically a "national society." Thus, his monolingualism accidentally accorded with the nationalist ideology of "one nation, one country, one language." In fact, linguistic homogeneity was the typical self-image of many Western countries

in the age of the national society or the "short twentieth century." However, in today's global society, where people increasingly move across borders, sociology can no longer take for granted such methodological-nationalist assumption of linguistic homogeneity.

Commercialization of Land and Commodification of Housing in the Neo-Liberal Era: A Sociological Study of Hyderabad City

This article critically engages with the nature of globalization and neo-liberal ideology and its inherent feature of capital accumulation by dispossession. The such characteristic feature of capital has a quest for the appropriate social spaces for accumulation. The objective of this paper is to study how the neo-liberal economy is influencing agricultural and industrial lands as a production of space for capital investment in the global south. This process led to capital accumulation for real estate and dispossession of peasants, labourers, workers, particularly the lower classes and the marginalized castes. This paper intends to focus on the process of urbanization, sub-urbanization, growth of cities, re-territorialization and socio-spatial transformation Indian cities which led to infrastructural development projects, commercialization of land and commodification of housing in the neo-liberal era largely in India cities with a focus on Hyderabad city in Telangana state in 21st century. This paper explores the relationship between state and political economy, real estate capitalism and regional landed dominant castes and classes, socio-economic inequalities and housing affordability. This paper also conceptualizes how secondary circuit capital is restructuring of suburban spaces in the neoliberal era. It is difficult for affordable a house for poor and marginalized communities in suburban and Hyderabad city. Thus, it draws sociological attention to how spatial inequalities embedded in built environment and further excluding and marginalizing the urban poor in housing the neo-liberal economy.

Participatory Democracy for Sustainable Development - FIELD Experiment to Understand and Identify the Process.

PARTICIPATORY DEMOCRACY FOR SUSTAINABLE DEVELOPMENT FIELD EXPERIMENT TO UNDERSTAND AND IDENTIFY THE PROCESS(ES)
Dr.Nagender Swamy Tadepally
Traditionally, the Indian village was more independent than it is today. It even made and implemented its own laws. Post-independence and modernization coupled with urbanization have impacted the 'independent village', in ways detrimental to Gram Swaraj

India, the largest democracy, can be proud of being a successful democracy in terms of holding regular elections to the houses of people's representatives. The quality of persons we elect is a different story. Nevertheless, periodic, and regular elections are indeed the strength of our representative democracy as a political system.

A nation of over 1 billion population cannot be effectively or efficiently managed by any centralized system, be it at the central, state or district level.

All efforts have been top-down. What is required is a bottom-up approach. Unless representative democracy blossoms into a participatory democracy, grassroots democracy will continue to be a dream. While Legislative assemblies and Councils at the state and houses of Parliament at the Centre are critical for democracy to be alive and functioning, the Gram Sabha at the village is just as critical.

Villages in Partnership (VIP) has been instrumental in promoting intra and inter village partnership in Mahbubnagar district. People's partnership in development is now an accepted and oft repeated concept. After having experimented and successfully demonstrated, VIP has, since 2006, been working on facilitating "**A vibrant grassroots participatory and responsible democracy, for enhancing people's self-respect, mutual trust, love and concern for the village through just and judicious use of public funds, local resources and people's contribution**."

In eight villages the recently elected Gram Panchayats are being facilitated to be informed, interested, and involved in making the Village Panchayat the village government with focus on renewing **Trust, Confidence. Concern and hope**

Intermediaries As Facilitators of Lay Participation in the Criminal Justice System

Intermediaries in England and Wales were first introduced by the Youth Justice and Criminal Evidence Act 1999 (YJCEA). The role's core function is to facilitate communication between individuals with communication needs and the criminal justice system. Intermediaries can assist witnesses and suspects at

the police station, work with lawyers to ensure questions are appropriate for the vulnerable witness and intervene during oral examination, when necessary, to ensure comprehension.

As neutral communication specialists, how do intermediaries facilitate participation? In seeking to answer this question, this paper draws on findings from 31 in-depth, semi-structured interviews with intermediaries and judges in England and Wales and Northern Ireland. It examines how the intermediary role is inextricably tied to the different ways in which vulnerable individuals participate within the criminal justice process. The data presented suggest that the communication difficulties experienced by defendants result in a form of participation which is distinct from witnesses. While the defendant's individual right to 'effective participation' is recognised through caselaw and relevant guidance, the experiences of intermediaries provide a unique insight into how the role adapts to differing participation roles and is, in turn, shaped by them. Differences in the participatory roles of witnesses and defendants have led to the emergence of what I term 'defendant intermediary work' and 'witness intermediary work'. This paper explores what these terms mean and how they should inform our understanding of lay participation in the criminal process.

Realising the Promises of Big Data in Agriculture through a Māori Data Sovereignty Approach

Proponents of digital agriculture often use promissory narratives to legitimise the role of agricultural technologies (AgTech), and the big data they produce, in shaping the future of agriculture. These include promises of increased sustainability and efficiency in agriculture as well as on-farm decision-making support. However, the current trajectory towards increasing digitalisation in agriculture raises important questions about the role big data extracted from AgTech can, and should, play in shaping future agricultural trajectories. In this presentation, we begin by thinking through current examples of who benefits and who loses when it comes to big data in agriculture and consider how principles of Māori data sovereignty can help to alter current trajectories so that AgTech and big data might have a better chance of living up to their promises. Our analysis is situated within Aotearoa New Zealand—a settler colonial nation with two founding constitutional documents (He Whakaputanga and Te Tiriti o Waitangi) and commitments to the 2007 United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). We consider how commitments detailed within these treaties provide the foundation, and outline clear obligations, for ensuring agricultural big data is collected and used in ways that promote data sovereignty and ensures the benefits of big data in agriculture are distributed more equitably. We argue that due to their particular treaty obligations, publicly funded projects developing AgTech and big data analytics must begin exploring and testing-out what equity- and sovereignty-promoting data management might look like in practice—both in design and commercialisation. We believe engaging with and putting the principles of Māori data sovereignty into practice can begin paving a path towards a future for AgTech and big data in Aotearoa that will bring us closer to realising some of their promises, particularly those related to social and environmental sustainability.

Massive Information Flow and Social Reality: A Sociocybernetic Consideration on the Social Construction of Meaning

Radical modern art has been challenging the existing meanings (including norms, values, and normal ways of understanding). In dada, surrealism, and the literature of the absurd, Baudrillard (1994) saw the destruction of the order of meaning. Modern art intentionally "infected" itself with mass culture, consumerism, and even politics (Groys 2018). This indicates the will and consistent efforts of art for its permanent innovation. Regarding our knowledge of social reality, journalism is playing a key role in providing daily updates. However, journalism's monopoly in disseminating socially relevant information has been undermined, especially since the 2000s, when we saw the proliferation of major social network platforms.

Web 2.0 has brought about the diversification of content generators on the web. Experts, journalists, politicians, and laypersons with diverse social and political interests are participating in the massive transaction of information today. The expansion of information flow is accompanied by the problem of misinformation and disinformation. Pomerantsev (2019) reports the concern about the accuracy of information has been spreading in Europe, Asia, and North America. Are we witnessing the destruction of the life-world based on reliable information and knowledge?

Building a wall is a familiar way to protect the "order" inside from the "chaos" outside. The same logic has been driven in the communicative process of the online public sphere, especially through algorithmic filtering and echo chambering. People may form virtual or face-to-face forums to share and exchange information and opinions. However, our perspectives must be open to considering investigated facts and distancing from themselves in order to avoid tribalism. Journalism, science, art, and a sense of humor should be the salt of the public sphere. This presentation will focus on the role of experts and investigated materials in discussing public issues and examine today's condition of the social construction of meaning.

Reconstruction Process and the Problems on Evacuation Area in Fukushima Daiichi Nuclear Power Plant Accidents

This presentation attempts to introduce the reconstruction process in the area struck by the Fukushima Daiichi Nuclear Power Plant accident and to clarify the problems involved.

In recovering from the nuclear accident, the basic policy of the Japanese Government is to encourage the evacuees to return to their hometown. To this end, the government has been decontaminating the areas contaminated by radioactive materials and building infrastructures for the evacuees to return their homes. On the other hand, more than 10 years have passed since the nuclear accident, many evacuees are rebuilding their lives in their evacuation sites and are abandoning the will to return to their hometown. The returning rates of residents originally living in the evacuation area remains very low. The Japanese government has thus failed in its reconstruction policy. Few residents have returned to the affected areas, despite the enormous expense involved in decontaminating the affected areas from radioactive materials and promoting the return of the evacuees.

The main reason for this failure was the public works-oriented reconstruction policy. The Japanese government has historically rebuilt disaster areas by reconstructing infrastructures through public works projects. The government has adopted the same policy for the case of the nuclear accident, despite the very low rate of returning residents.

From the evacuee's point of view, they had received little financial support from the government. The reconstruction of the lives of the evacuees has been supported by the compensation from TEPCO, not by the financial aid from the national government. Additionally, evacuees lost their hometown communities and are still unable to rebuild them in the long-term displacement. As a result, they are becoming increasingly separated and fragmented. However, they have yet to be rebuilt under the public reconstruction policy and has not received compensation from TEPCO for the loss of hometown communities.

Prescientific Experience As a Ground for Critical Theory: Schutz, Habermas, and Honneth

Alfred Schutz's phenomenology and Critical Theory have been regarded as "oil and water." For Critical Theorists, who orient themselves toward the "abolition of social injustice," his phenomenology remains a traditional theory because it considers social scientists as "disinterested observers." However, recent studies pay attention to the phenomenology's possible contribution to the development of Critical Theory. This study demonstrates the usefulness of Schutz's concepts for Critical Theory by focusing on the "emancipatory interest" and its relation to prescientific experience.

When Jürgen Habermas introduced this concept, he emphasized the dependence of scientific knowledge on the prescientific life-world. However, he failed to theorize how the emancipatory interest generates from prescientific experience. It was Axel Honneth who emphasized prescientific experience as an indispensable ground for Critical Theory. He advocated a critical science that is based on people's feelings against injustice and investigated how the experience of disrespect results in the struggle for recognition. Nevertheless, he did not completely articulate the process in which the "feeling of disrespect" turns into a problematic experience for an actor in the natural attitude.

Schutz's concepts of topical, interpretive, and motivational relevance are useful in this context. The initial phase of the feeling of disrespect lies at the pre-predicative level. It appears as "imposed topical relevance." However, the actor does not necessarily interpret it as an injustice. Among the several schemes of interpretation, the scheme of claiming the injustice needs to be selected. Moreover, the actor must be motivated to assert the injustice. Even though the actor interprets it as an injustice, the motivational relevance for standing up against it might be absent. With the help of the Schutzian phenomenology, we can identify the challenges that hinder criticizing the injustice. Phenomenology and Critical Theory can be combined to analyze the experience of disrespect and its relation to sociological knowledge.

The Impact of COVID-19 on the Succession of Traditional Festivals and Community Resilience: The Case of Yama, Hoko, Yatai Float Festivals in Japan

This paper discusses on the impact of COVID-19 on the succession of intangible cultural heritage, especially traditional folk festivals. These festivals display the social customs of each community and their prosperity from the past to the present. Residents participating in them gain a deep understanding

of their personal importance within the community. These festivals are also important spectacles and sources of entertainment for communities. They draw large crowds that dress up, eat, drink, participate in and observe the activities.

However, many communities were forced to cancel their festivals since 2020. They bring many people together with endless opportunities for conversing, eating, and drinking. In addition, large-scale festivals are crowded because they attract so many participants and spectators. Though all these factors can lead to the spread of the virus, people continue to make efforts to somehow carry on the festivals. This paper explores the possibility of succession of festivals and the resilience of the communities that conduct them.

We examine the case of the Nagahama Hikiyama Festival, one of *Yama*, *Hoko*, *Yatai* float festivals in Japan which were inscribed on the Representative List of the Intangible Cultural Heritage of Humanity by UNESCO in 2016 and demonstrate the resilience of traditional communities that carry on the festivals. In 2021, the communities attempted to reinstate their traditional festivals and resumed the festivities with infection control measures in place. How did people resume festivals and what were the conditions needed for them to reengage with their traditions? This study analyzes the reasons for and process of reviving and subsequently implementing traditional festivals and clarifies the positive factors contributing to the resumption of festivals. It examines the sources of resilience that have been cultivated in these communities and explains how their social capital bridges the gaps between local governments, schools, and local broadcasters.

Father's Side or Mother's Side? Lineage Differences in the Role of Grandparental Resources on Grandchildren's Education in Japan

While conventional research on social mobility has relied on the two-generation model for many years, recent studies pay more attention to how inequality is accumulated across multiple generations. Previous research on this topic is very sparse across the globe due to the less availability of the data set. This study examines the effect of grandparental resources on educational attainment among grandchildren in Japan after controlling for the effect of parental resources because Japanese people tend to exchange resources and support between elderly parents and adult children more than people in North American and European countries, due to the norm of filial piety under the Confucian ideology. We compare the role of grandparents in educational inequality between the paternal and the maternal sides. We investigate how grandparental coresidence and their wealth transfer shape enrollment into a university among grandchildren in Japan. Based on the filial piety, we assumed that grandparental resources on the paternal side would play a critical role in intergenerational relationship and grandchildren's schooling. Empirical findings of this study show that both the paternal and maternal grandparents matter in affecting grandchildren's schooling. The Japanese case also indicates that both coresidence with and wealth transfer from grandparents affects the outcome of interest. This result reflects the significant change in intergenerational relationship in Japan during the time of demographic transformation. We conclude that social mobility across multiple generations is linked to extended family structures, and future studies should explore multiple generations of inequality in different institutional settings.

Multiple Interpretations of Non-Binary Gender Identity Categories: An Analysis of the Narratives of Gender-Nonconforming People in Japan

This study examined gender-nonconforming people's narratives to clarify the multiple ways of self-positioning of non-binary gender identity categories in Japan, where the inception of the medical concept of "gender identity disorder" in the late 1990s engendered the gender binary norms of gender transition among gender-nonconforming individuals. Previous studies have focused on such gender binary norms, and how non-binary subjects began to assert their existence in each transgender community has been insufficiently discussed. Therefore, this study analyzes the ways in which "*X-jendā* (X-gender)" and "*non-bainarī* (non-binary)" were used for self-positioning in the interview data of gender nonconforming individuals who retrospectively related their identity to the practices within their groups.

The results revealed that individuals positioned themselves under nonbinary categories in different ways depending on the knowledge they possessed. Informants who belonged to communities where "*X-jendā*" had been used since the 1990s viewed "*X-jendā*" as a subcategory of "*toransu-jendā* (transgender)." Contrarily, young informants who had discovered "*X-jendā*" on the Internet in the 2010s perceived "*X-jendā*" separately from "*toransu-jendā*," affected by the presentation of "*toransu-jendā*" as a binary concept in the mass media. It also became normative at this time for "*X-jendā*" to be a plastic category defined by the individual; therefore, "*non-bainarī*" was used as a category that

referred to people who needed non-binary medical treatment, distinct from the ambiguous "*X-jendā*." This suggests that the meanings of the nonbinary categories were multi-layered rather than consistent, and were affected by the narratives shared in a particular group and the contexts in which individuals were placed. This study showcases the history of non-binary categories in Japan, which have been neglected in transgender history studies focusing on North America and Europe. Additionally, it describes that the self-positioning of non-binary categories, which is often seen as a resistance to dualism, also includes conflict.

Collective Memory Re-Reconsidered--Memories of Japanese American Incarceration Looking through the Oriental Thoughts and Philosophy

There is a new turn in the field of Collective Memory studies that includes peripheral perspectives such as Japanese Buddhist philosophy. This paper addresses the possible retake on the analysis of texts created in the Japanese American Concentration Camps.

This study is situated within a trend (e.g., Anna Lisa Tota 2016) to rethink sociological theory and empirical analysis of the phenomenon from the perspective of Eastern thought, which has been attracting attention from Western sociological societies in recent years. The "Eastern philosophical perspective" in this study is based on Japanese Buddhist thought as philosophically examined by Kitaro Nishida, and is a perspective that looks at the situation in which humans create places "Ba"(boundary zones) while interacting with society, nature, and other environments, and create the world together through their interactions. I have conducted continuous fieldwork on a pilgrimage to the site where Japanese Americans were incarcerated during World War II, and has "reconsidered" the collective memory theory proposed by French sociologist Maurice Halbwachs in the early 20th century through detailed observation of the sites where memories are generated. In this new study, I will "re-reconsider" the accumulation of previous research from a more elaborate Eastern philosophical perspective. Specifically, I will reinterpret how the "Western ego" and "experience" emerge as themes in literary works written by Japanese American second generation educated in Japan ("kibei") based on their experiences of incarceration, using primary and secondary sources to examine changes in their discourse.

Identity Politics and the Evolution of Happiness in Taiwan, 1999-2021

Taiwan is the post child of democratization in Asia. It had been governed by a single party with authoritarian rule and martial law for four decades, before undergoing a peaceful democratic transition in the 1990s. Since 2000, Taiwan has gone through a change of the ruling party every eight years—an unprecedented period of political turnovers, social identity reshaped by a steady evolution in ethnic demographics, and the economy witnessed a tumultuous transformation and external shocks.

This study examines the relative impacts of identity politics and national economy on happiness during two historic decades of Taiwan. The statistical analysis is based on 22 waves of the Taiwan Social Image Surveys, augmented with contextual data obtained from other sources (Taiwanese identity, pro-independence and status quo maintenance, economic growth, earnings growth, and income disparity). We find that the evolution of happiness from 1999 to 2021 is the outcome of two countervailing forces: happiness initially suffered from an under-performing economy but boosted by identity politics in most recent years. The happiness dividend due to a strengthening Taiwanese identity and support for *de facto* independence buffer the happiness deficit caused by under-performed economy. The relative impacts of politics and economy appear to depend substantially on a respondent's identification with the ruling party.

"out of Sight, out of Mind" the Politics of Waste in Darjeeling Himalayas, India

Everything is waste (Müller 2018). Notably, waste has its own life of production, distribution and rejection that plays a vital role in shaping human society, culture and their interaction with the environment. In many societies in South Asia, the concept of waste has shaped the social segregation and caste hierarchy in their interaction with the waste. For instance (until today), the cleaning of waste and its associated works has mostly been assigned to lower caste who are socially consider as filthy and hence "untouchable caste". Today, the problem of waste has become one of the most challenging issues in many cities of India and waste management has become a site of political contestation. This paper will examine the contestation and histories of waste

　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

management in one of the hilly town in the Eastern Himalayas. Historically, known as the queen of the Hills, Darjeeling Hills in India has been famous for its scenic beauty, cool climatic condition as well as "tea". Through ethnographic engagement with people involved in various level of waste collections, managements, policy makers, and also with common people who produce and discard waste, this paper will highlight the life of the waste and its impact in shaping the politics and social structure of our society. Many activists have also questioned nature of dumping waste and its harmful impact on environment and health. By interrogating historically the management of waste in the British colonial town, this paper seeks to understand human-waste relationship and hierarchy it creates in society. It intend to unearth the untold life of the waste that intersect with human society in multiples way and at multiple level. Therefore, this paper perceive waste not just an object of rejection but consider it as a vital complement of human society that determines power and transformation.

Understanding the 2021 Colombian Protests: Places, Spaces, and Bodies of Resistance and Solidarity

On 28 April 2021, different protests and demonstrations began across Colombia, initially in opposition to a proposed tax reform. Colombian President Iván Duque Márquez argued that the reform was crucial to overcome Colombia's economic crisis and mitigate post-pandemic unemployment. The reforms involved a rise of taxes on basic products including food and utilities, moving middle-class earners into a higher tax bracket, and making the health care system more privatised. The reform aimed also to eliminate tax exemptions to lower-class individuals, as well as increasing taxes imposed on businesses. After four days of protests, the government withdrew the tax proposal. Nevertheless, demonstrations regarding a range of diverse issues, including economic inequality, police violence, unemployment, and poor public services, continued until July 2021.

One of the main characteristics of these protests was the involvement of diverse urban and rural constituencies in a single national protest, where young people made up the core of the demonstrations. In Colombia's history of protest, the 2021 mobilisations are the most serious public unrest in recent memory. According to Human Rights Watch (2021) and Amnesty International (2021), 68 deaths occurred during the four months of demonstrations. The principal responsible of have committed these killings against mostly peaceful demonstrators are the members of the Colombian National Police.

In this context, this paper aims to analyse how the 2021 Colombian protests can be understood as an act of social solidarity. It will explore how the intersection between the symbolic reconfiguration of public spaces (streets, squares, public roads) during the protest, and the impact of police violence on demonstrators' bodies, is showing new dimensions of social solidarity where the body becomes a place of resistance and the public space a site of civic solidarity.

Matching 'Comfortable Others': Private Employment Agencies Response to an 'Intimate Workplace Crisis' in South Africa's Domestic Sector

This paper discusses the debates regarding the role of private employment agencies (PEAs) operating in South Africa's domestic sector. The overemphasis on informal agencies, which continues to undermine state-led initiatives to transform and improve the condition of domestic work, limits insights into the transformative potential of PEAs aimed at promoting a culture of labour compliance among employers and for domestic workers. Despite scepticism regarding PEA's role, this paper argues that increasingly domestic workers attempt to use the services of PEAs to access 'decent' work but also employers who can be described as comfortable others because of their effort to be labour compliant. Similarly, PEAs attempt to match employers with ideal type of domestic workers – comfortable others – because of employer's demand for an intimate work culture that does not challenge their role as employers. Drawing on ethnographic research and in-depth interviews that examines hiring and employment histories among employers, domestic workers and PEAs, this paper frames the notion of comfortable others as a response to an intimate workplace crisis – a crisis for domestic workers struggling to realise their employment rights and a crisis for employer's need for trustworthy, reliable and productive domestic workers. The findings show that ultimately, PEA's response to an intimate workplace crisis is a response to a 'crisis of representation'. In other words, PEAs potentially represent the interest of both domestic workers and employers but with an emphasis on an intimate work culture employers' demand because of the personalised nature of the employment relationship. This paper concludes with insights into how domestic workers use the services of PEAs to obtain market-related salaries instead of minimum wages.

The Types of Japanese Nationalism and Authoritarian/ Democratic Attitudes : A Quantitative Analysis of the Relationship between Nationalism and Democracy

The purpose of this presentation is to reveal the relationship between several types of nationalism and authoritarian/democratic attitudes in recent Japan. Japan is a typical ethnic nation, but the number of foreign residents increase steadily, and it doubled in recent 20 years. However, prime minister Shinzo Abe who was often seen as the "revisionist nationalist" regarded them not as "immigrants" but just as "foreign human resources". Because Abe was also notorious for his hard-line political stance, his opponents called him "the destroyer of Japanese democracy". Therefore, I inquire about the relationship between types of nationalism and democratic/authoritarian attitudes in recent Japan. I use 4 time-period (2009, 2013, 2017, and 2021) data collected by nationwide quantitative mail surveys. The latent class analysis extracts 4 classes that imply types of nationalism in each period. The first class is the "pro-Western" who show positive feelings toward Americans and Western-European but exclude other foreigners. This class shows the most favorable feeling toward Abe and held the strongest authoritarian attitudes among the 4 classes. The second class is the "ultra-nationalistic" who bear strong nationalistic sentiments in all subordinate concepts, and they also like Abe and are relatively authoritarian. The third one can be called the "civic-liberal" who thinks civic elements such as self-identification are needed to be conditioned for "truly Japanese" and cherish relatively strong patriotism. But they don't show xenophobic attitudes towards foreigners from all nations. They have the weakest authoritarian attitudes among the 4b classes, but they are not politically activated like no voting. The "xenophobic" is a fourth class who has relatively weak patriotic feelings but shows strong xenophobic attitudes toward foreigners, especially for Chinese and Koreans in 2013 and 2017. This fourth class show relatively low authoritarian attitudes and inactive in political attitudes and behaviors.

Sustainable Human Life As Function of Technometabolism

Human life in 0,02 till 0,2 person per square kilometer historically has proven to be **sustainable** for tens of thousands of years in Paleolithic times. Denser populated cultures still owe a similar proof as their technometabolism has arisen relatively to the more condensed population. **Technometabolism** is defined as the pattern of flow of energy and materials into, through and out of a human population that results from technological processes. It contrasts with biometabolism, which is the flow of energy and materials into, through and out of human organisms themselves. This perspective, effectively introduced into the social sciences by Stephen Vickers Boyden („Biohistory", 1992) has since enabled to understand humans in a rather materialistic manner as part of the environment, not as counterpart. Consequently then there was no agrarian revolution, but rather a **domestic transition** (Boyden). In the end a critical assessment of that amount of **technoaddiction** becomes possible that would allow a sustainable existence on earth. (156 words)

An Anthropometric Assessment of Nutritional Status Among Birhors of Central India: A Tribal Group Facing Double Marginalization

In India, National Food Security Act, 2013 was enacted with objective to provide food and nutritional security at affordable prices to 75 % of the rural and 50 % of urban population through Targeted Public Distribution System (TPDS). Next year, it is going to complete one decade but rather than improving India has slipped down in the ranking of Global Hunger Index from 63 in 2013 to 101 in 2021 out of 116 countries. Situation is really worrying for Indigenous communities especially, Particularly Vulnerable Tribal Groups (PVTGs) like Birhor residing in remote tribal areas of central India. To assess the actual status of nutrition a cross-sectional study was conducted among the Birhors of Korba district, Chhattisgarh, India, and prevalence of low BMI-for-age was calculated. Anthropometric measurements were done on 357 Birhors (aged six and above) of Korba and Pali block using stratified random sampling. The prevalence of thinness was assessed using WHO z-score growth reference (2007) and WHO-BMI (1995) classification. The overall prevalence of thinness among Birhors was 61.9 % (66.5% male and 57% female). There was significant difference found between male and female (x^2=7.80, $p≤0.05$). The researcher's results were compared with the National Family Health Survey (NFHS)-5 findings. It was found that the prevalence of <18.5 BMI was much higher among Birhors than national and state figures. Findings indicates nutritional status of Birhors is in

very critical condition especially, in these two blocks of Korba district compared to other PVTGs in this area; and they need special and urgent intervention from the state authorities to check the under nutrition.

Intercultural Competencies and Role of MEDIA

A few years ago , a project was undertaken to reconstruct the notion of nationhood, unity and diversity, as well as knowledge beyond classrooms, by *bridging boundaries and differences*- spatially as well as symbolically. Students and teachers from Delhi university set out on a 'Gyanodaya '(enlightenment) mission in the train itself, treating it as a field site,as much as the state to be studied.The objective was to bring a hitherto unknown region into the mental landscape of the entire nation.Students interacted with co-travellers, from different parts of the country , especially North eastern India.

This paper discusses how long distance train travel facilitated a feel of the field, besides 'verstehen'(interpretive/empathetic understanding)of Manipur state- its language, food habits, values, ethics, perception about women, as well as challenges of being a conflict prone state.It also allowed for intercultural competencies to be tested.

Role of media, especially social media becomes very significant in understanding relatively unknown regions of the country.Media can help proactively in bridging boundaries across ethnic, class and linguistic lines. Besides promoting tourism media can collaborate for 'Gyanodaya' of lesser known regions/marginalised communities and cultures.Media could highlight the connection between sportsmanship and cultural values of a region,especially indigenous sports.

'Thang-Ta',a martial arts of Manipur, as a culture is quite different from it as a sport. Thang-Ta related to culture has been modified in order to fit in the realm of sports. Thang-Ta as a cultural tradition is a part of the philosophy of life, and involves religious connotations in it. However, the modern version of Thang-Ta is only about winning and achieving medals.Sports is linked to values and ethics of Manipur society as a whole and Thang-Ta is just one aspect of it. Bodybuilding is treated as akin to character formation.

TANDON, Achla* (Hindu college, Department of Sociology, India)

Mediating Visibility Postulates

Threats to an imagined majority plus resistance to slogans demanding freedom is becoming the new normal in urban India today.Why is 'azaadi' (freedom) such an uncomfortable term? The same word meant the ultimate in nationalism, when we achieved our Independence. A slogan which beseeches civil society as well as rulers to free the marginalised from authoritarianism, casteism, gender violence and accompanying prejudices, has lately attained the status of a cry towards anti-nationalism. This paper makes a plea for revisiting the concepts of race, caste, gender and ethnicity and even class as independent concepts.The new world order, especially in conflict ridden nations, problematise their isolated constructions.Teaching about them in different courses of sociology as a discipline become a constant challenge.

For instance, race is visualised and theorised with reference to largely those societies where it has historically been the driving force for unequal and oppressive settings.Same principles of institutionalised inequality apply to theoretical and ethnographic representations of caste as a system of stratification. My contention is that the 'visibility postulate'(Gupta,1991,Social Stratification,OUP) applies to various forms of marginalisation, besides caste,in contemporary India.This is true of negotiations around race too.The fact that these dimensions are intersectionalised in our everyday realities, makes it even more complex. This offers hope for debunking stereotypes and even disturbs the canvas of thoughts of those who look at the world around binarised lines only. Social and other media visuals of Muslim women taking to the streets as well as university campuses as vocal and vociferous voices,upsets many commonsensical ideas as well as intellectual mindscapes about a community as well as gender, besides citizenship. Classroom teaching involving such discourses becomes quite a difficult trajectory.

Strange Ways to Connect – Entering Agtech Settings to Conduct Ethnographic Fieldwork

As an STS scholar, I aim to gather data about actual, situated practices within AgTech environments to study the details of *plants' agency* (Lawrence, 2022) and *affects* (Calkins, 2021) in these settings. These elements are difficult to explore without direct observations. To do so, I must gain access to these spaces, connect with its participants, and create a minimum of trust and confidence. For this presentation, I will use the material gathered during preliminary conversations with different AgTech participants, including a startup promising sustainable solutions while funded by a major financial trust

devoted to big operations in food production and distribution. I will address several dimensions of this critical turning point: What is at stake in the way I frame my project to make it "audible" to academic researchers, AgTech startup managers, or state agricultural department agents? Are *plant agencies* and *affects* benign enough in their mainstream definitions, thus furthering my argument that they are too often overlooked both in innovation promises and their critiques? Finally, although not framed as a collaborative project, I will draw insights from Rabinow and Stavrianakis's *Demands of the Day* (2013) to ponder if and how my inclusion in these settings, not only *after* but also *during* fieldwork, could potentially contribute to framing both tools and sustainability concepts with more STS perspectives into it.

The Social Networks and Mental Health of Chinese Older Adults Who Have the Only Child

China has implemented a strict family planning policy since late of 1970s. As a result, there are considerable size of older population who have only one child in the cities. The supports coming from children might be affected due to the obvious reduce of children number. This change has significant impact on older adults of China, a country stresses the filial piety and responsibility of family. Based on the data of CLASS 2014, 5496 older adults were included, with 1438 having the only child (parents of the only child) and 4252 having more than one child (parents of non-only-child). The difference in family ties, friendship ties and depressive symptoms between two groups were compared, and the associations between there variables were analyzed. Due to less child, the family ties of the parents of the only child are significantly smaller than that of parents of non-only child, but the friendship ties are larger. The older adults having the only child expand their friendship ties to compensate the shrinking family ties that was caused by the reduce of child number. Although family ties are important in Chinese context, the depressive symptoms of parents of the only child are not higher than that of parents of the non-only-child. The quality of family relationship, instead of size of family ties, and the friendship ties might protect the mental health of parents of the only child. Children are vital support resource for Chinese older adults, but the number of children might not be matter.

Public Sociology in Authoritarian China: Collaborative Auto-Ethnography about an Internet Academic Talk Show on Weibo

This paper uses a three-year collaborative auto-ethnography to document Internet public academic talk shows from two perspectives: the project founder/influencer's narrative and the audience/volunteer's narrative. Author A, an early career academic, started to produce sociological talk shows on Chinese social media platforms since 2019. The shows have received more than 3 million views in total on Weibo, the dominant Chinese microblog social media platform where the videos are best received. Author B watched some episodes and started following A on Weibo, which led to B choosing sociology as their major and later joining the production team as a volunteer. The paper contributes to three areas of debate: public sociology in authoritarian states; Chinese internet studies; and sociological education in China. Sociology in China is dependent on state, resulting in local "critical sociologists" being incorporated (Bian & Zhang, 2008) while oversea Chinese scholars take up the role of aligning with civil society to do critical and public sociology (see e.g. Minjian or intelligentsia). What's more, the access to sociological knowledge is limited outside the university, and usually, only privileged urban middle-class students may know about the discipline during their high school (Hannum & Meiyan, 2006; Li, 2016). More than 80% of the active users on Weibo are born after 1990s (data.weibo, 2021). Since its introduction to China, the Internet has always been a contested place for political and cultural contentions that gave rise to online community and activism (Yang, 2004; 2009). Other than direct civil society engagement, which is the goal of public sociology for Burawoy (2005, 2007) whose knowledge production is based on western liberal-democratic-capitalist models, we wish to unveil the more nuanced social change via public critical sociological education on social media in authoritarian China where market, state and civil society have a different relation.

Suicide and Political Crisis: The Perceptions of Hong Kong Young People on Protest-Related Suicides

Youth suicide rates are rising in many countries. Political unrest is thought to be a factor associated with heightened distress among youth. In conflict-affected areas, suicides are sometimes used as a means of protest. While mental health reasons are often used to explain suicide, individualistic and psychocentric explanations of suicide are inadequate for generating understandings of suicide as a political act. Collective meanings attributed by community members to protest suicides are important to exploring more fully how a culture considers these suicides as understandable and imaginable. They may also throw light on whether changes have occurred in the socio-cultural norms regarding suicide as a response to political crisis.

This presentation reports on research that explored how young people in Hong Kong made sense of a series of protest-related suicides which took place during the Anti-Extradition Bill movement in 2019. These were the first ever protest-related suicides in Hong Kong history. The first incident was broadcast live on social media. Six more suicides took place that were reported as linked to the protests. All those who died by suicide were under the age of 35.

In-depth interviews were carried out with 35 young people aged between 19-35 who self-identified as supporting the movement. The focus was on understanding their perceptions of suicide before and after the protest-related suicides. Findings indicated that participants considered suicide as an understandable, but not endorsable form of political actions. Social media apps played a key role for protestors to express grief and anger after hearing about the incidents. The solidarity among protestors led them to look out for each other, creating an ad-hoc safety net in the community. Drawing on these findings, implications for suicide prevention were considered with reference to the role of social media.

The Power Structure Analysis of the Precarious Labor Situation and Production Relations of Ride-Hailing Drivers

This study focuses on the precarious labor status of ride-hailing drivers behind the beautiful slogan "a touch on DiDi, a trip with a good feeling (滴滴一下，美好出行)." and explores the structural causes behind the vicious ride-hailing incidents. (1) Through interviews with Didi employees and observation in ride-hailing driver communities, this study demonstrates the precarious situation that ride-hailing drivers fall into the "network of risks" -- the "survival domination" caused by ride-hailing regulations from the government and the manipulation of "permitted car models" from the platform, which is the structural prerequisite to push drivers to other dominance and control relationships. Furthermore, this study emphasizes the characterization and classification of two dimensions of "labor control": power domination (survival domination/process domination) and rational control (conscious or approved/ unconscious or acquiescence). (2) By comparing the transparent platform and information model (both are neutral algorithm platform models) with the actual "drivers - platform - passengers" triangle power structure model, this study reveals the power structure distortion and its dynamic process: by symbol planting and mediating and processing information to the agents, the platform agent and overhead the meaning expression, feedback, and negotiation between the driver and passengers. (3) Through a double-agent distortion of the structure, the platform centralizes its power. It deepens the drivers and passengers into the precarious situation, which not only improves the relative surplus value exploitation to the drivers, dominates the passengers, effectively supervises and controls the driver's labor process, but also hides the platform from intensifying "drivers-passengers" relationship, concealing the true relationship of domination and production and avoiding censure.

TANG, Wen-hui* (National Sun Yat-sen University, Taiwan)

Trasnational Hybrid Mothering

The subjects of this study were 34 middle-class women who immigrated from Taiwan to the United States after the 1980s. Using a Transnational Institutional Ethnography (TIE), the researcher conducted field observations and interviews in both the United States and Taiwan to explore the migration trajectories and daily practices of immigrants. The study found that despite having high "mobility capital" and " privileged domesticity", immigrant mothers often face "disjuncture experiences" of emotional conflict within the intertwined constraints of transnational multiple institutions. Within the situational constraints of the immigration context, they forge "mixed identities" to exert "gendered agency" and deploy "flexible" work and life balance strategies for both personal and family needs. Through transnational mobilization and participation in ethnic network communities, they compensate for the lack of social capital of immigrant families and present "transnational mixed" family characteristics. From the perspective of "gendered migration", this paper compares how four types of migrant women, namely, "family migrants",

"transnational marriages", "study moms", and "trailing wives", fulfill the dual social expectations of "good migrants" and "good mothers", and analyzes the important social meanings behind them.

Changing the Way We Think about Change

Sociology has historically treated social movements as agents of social change. Social movements transform society, politics, and culture and build new social systems. Sociologists find the seeds of a new movement and try to measure the power of that movement. Social activists believe, sometimes seriously and sometimes to inspire themselves, that this movement will transform society. The question of this presentation is "Do such perceptions about "change" really lead society to change?"

The presenter has been conducting fieldwork on social movements in Japan after Fukushima disaster, especially the anti-nuclear movement held in front of the Prime Minister's Office and the Nation Diet. Since 2011, the area in front of the Prime Minister's Office and the National Diet has become the main venue for protests. Many social movements that desire social change have developed there. It is rare for large-scale protests to occur so frequently in Japan, and they have attracted the attention of many people. It was hoped that this social movement would bring about a major change in Japanese society. And the activists believed so. However, the subsequent development of Japanese politics was not what the activists envisioned.

We are looking for new ways of thinking about social change. It would not be to view society as an external entity that stands, nor as a construct that can be changed at will by a particular entity. The position that sees society as an external entity would be too large an estimate of society. On the other hand, the position that regards society as a discursive construction reduces it too much to a matter of symbolic manipulation. In this presentation, I will discuss the view of the relationship between social movements and social change, based on the Actor Network Theory's view of society.

Gendered Struggle of Bangladeshi Women in Coping with Climate Change: Need for Gender Transformative Approaches

Bangladesh is one of the most climate and vulnerable countries in the world. Climate-induced disasters affect a wide range of communities in Bangladesh, among them women are the most affected group. Climate change increases their socio-economic vulnerabilities via directly impacting their families' food security, water consumption, health, and overall livelihood wellbeing. Unlike in many patriarchal society, Bangladeshi women are often confronted with unequal social relations and hierarchies which enforce gender differentiate vulnerabilities. Hence, women have had to develop a wide range of coping strategies in order to deal with the hostile situation. In this context, this paper intends to reveal what barriers Bangladeshi women face and how they cope with many uncertainties relating to changing context particularly at household, community, and institutional level. Data for this study is drawn from the author's PhD research which was carried out in four districts of Bangladesh focusing on four types of climate change impacts and adaptation practices. Data and information were collected through qualitative research methods-Focus Group Discussions, In-depth Interviews with women and observation of their household and community level activities. Further Key Informant Interviews conducted with local and national level experts, government officials and development workers to reveal institutional issues confronted by women. Systematic coding and thematic analysis were adopted during data analysis. Findings explores women's gendered struggles in preparing for and responding to climate change through their lived experiences. Women's struggle as individual or as a group member reveal their significant presence in climate change adaptation. Moreover, it sheds light on limited gender responsive environment which drawing attention to the need for strategies and actions for gender transformative approaches to develop climate resilient household and community with women at the centre.

How Students Developed Coping Strategies during COVID-19? a Sociological Study Among University Level Students in Dhaka City, Bangladesh

Background
The COVID-19 posed multifaced challenges to all sections of the population, among them students are impacted critically. Students experienced inevitable changes in the trajectory of their lives, including lifestyles, relationships with

family and community. As the pandemic-ordained lockdown required virtual learning, students found themselves unprepared, anxious, and ambivalent. This study aimed to explore the socio-economic challenges of the students and their coping strategies addressing the role of social capital for resilience building.

Methods

A qualitative research approach case study was carried out to achieve the overall objectives of the study. Data were collected through in-depth interviews (IDIs), focus group discussions (FGDs), and key informant interviews (KIIs) to explore socio-economic challenges and coping strategies of the university level students. The study population aged between 19 and 24 was selected from 6 different universities in Dhaka. A thematic analysis was adopted by categorizing codes into sub-themes leading to major themes.

Results

The study findings revealed multidimensional challenges such as adjusting to online education, restricted life, financial hardship of the family, social and public health crisis encountered by the students. The transition to a virtual platform resulted in changes in sleep time and quality; electronic gadgets based online dependency and new assessment through online. Negative attitudes towards quarantine, a drop in confidence level, loss of spirit, and emotional reactions were the reported barriers for students. Class and gender had differential impacts were observed and support systems were also influenced by their socio-economic background. Social capital acted as a significant supportive mechanism for deploying their coping strategies.

Conclusion

Students in public and private universities experienced several challenges socio-economic and academic challenges disproportionately, and their coping strategies also demonstrated uneven. Individual level social networks and institutional level financial subsidies offered support and demonstrated a substantial increase in students' resilience to overcome the COVID-19 challenges.

Who Wants to Live in the City Anyway? Exploring the "End" of Precarity through the Rural and Northern Immigration Pilot (RNIP)

In 2019, Immigration, Refugees and Citizenship Canada (IRCC) launched the Rural and Northern Immigration Pilot (RNIP), a pathway to permanent residency focused on expanding the benefits of immigration in northern and rural communities (CIC News, 2022; IRCC, 2020). The RNIP, which has since been extended until 2024 as a result of COVID-19 pandemic related restrictions, aims to address the challenges faced by remote communities experiencing the effects of labour market shortages as a result of an increasing retiring population, declining birth rates, and the "out-migration" of youth to more urban areas (Sano et al., 2020). Unlike other programs aimed at attracting skilled workers, the RNIP is based on a "community economic development-driven model" where local employers and community partners assist newcomers in finding employment and provide services and mentoring support to encourage long term settlement (IRCC, 2020). Using the RNIP as a case study, this paper examines selected communities within Ontario and British Columbia by comparing the IRCC's website outlining this program to those of individual municipalities in both provinces. Through a discourse analysis, the varying agendas and mechanisms used to attract skilled workers will be identified. Overall, pathways to permanent residency provided through pilot programs targeting specific communities can pose as attractive opportunities that address economic and legal status precariousness to some degree, but their effectiveness in serving as a long-term solution to Canada's labour market shortages remains understudied. Without addressing the lack of infrastructure within these communities that make long-term settlement difficult and unattractive to locals, newcomers that aim to settle in these communities may be exposed to forms of precarity that have not yet been considered.

The Invisible Sexual Minorities: Queer Men's Sexuality and Identity Construction in Australia

Men's sexuality has been a popular topic in academic discourse. Most of these studies examining men's sexuality, masculinity and sexual behaviour are centred around heterosexual and gay men. However, other non-normative male identities and sexual practices remain understudied. This study aims to address the academic gap by sharing findings on individuals from other invisible sexual minorities subgroup. The researcher conducted eight semi-structured interviews with Australian and Chinese AMAB (assigned male at birth) interviewees in Australia, aged 18-32, who identified as either asexual, pansexual, gender-fluid or non-binary. This research relevels queer men's unique ways of understanding and practising sex and constructing their non-normative male identity. The findings suggest that (1) asexual men tend to question, challenge and resist existing mainstream sexual norms and assumptions around men, trying to unbind themselves from traditional masculinity ideology and construct their unique male identity; (2) Some pansexual participants who identified themselves as non-binary or genderfluid tend to view sex as a meaningful practice in exploring their genderqueer identity and pursuing their ideal sexual self; (3) In some queer men's understandings and practices of BDSM (bondage, discipline, dominance and submission, sadomasochism), certain BDSM sexual relevant activities are significant in self-exploration or actualisation of their ideal gender or sexual identity. Beyond physical sexual pleasure, they can be linked with personal meaning-making and a form of resistance to traditional gender stereotypes or male ideology.

Teacher Activism: Struggles over Public Education in Chile

While much has been written about the neoliberal privatisation of education in Chile, less attention has been given to teacher activism around similar educational matters. In this paper we contribute to the field of teacher activism as a social movement to resist the global education reforms of neoliberal education policies/practices. Data for the study was generated through yarning, photo-yarning, and *testimonios*, methods often deployed in Indigenous and mestiza feminist research. Basil Bernstein's theoretical work on pedagogic rights and democratic formations, initially developed in Chile, was used to analyse the data. Teacher activists argued that their collective work has challenged the neoliberal educational agenda in Chile and redefined what constitutes the public of public education. However, struggles over public education remain ongoing. New ways of privatising education are being enacted in Chile which are harder to resist, challenge and change.

Les « Bons » Notables De l'Empire Redéfinition Des Qualités Politiques En Configurations Monopolistiques

Dans quelle mesure le passage à une configuration autoritaire s'accompagne-t-il d'une redéfinition de la valeur des dispositions et ressources nécessaires pour accéder au nouvel espace politique ? Le Premier et le Second Empire français offrent un regard singulier sur des bouleversements politiques qui restreignent l'entrée dans le champ politique par la redéfinition de ses modalités d'entrée.

En 1848, le renouvellement politique s'associe à une transformation des caractéristiques sociales du « bon » candidat à la députation sous le Second Empire. Sont ainsi valorisés des hommes nouveaux, industriels, banquiers, grands propriétaires terriens et officiers généraux au détriment des avocats, médecins, ingénieurs, journalistes, alors beaucoup plus nombreux dans l'assemblée de la IIème République. Devenir député constitue alors une véritable consécration sociale par une conversion d'un capital économique en capital symbolique pour des individus qui n'étaient auparavant que de « simples » acteurs économiques ou petits notables locaux. Ce moment de reconfiguration des attendus politiques rebat donc les cartes du jeu politique en évinçant des élus établis ou promouvant de nouveaux parlementaires : il est tout aussi bien une fenêtre d'opportunité qu'une barrière d'exclusion d'agents sociaux.

En 1799, la constitution du Consulat est, elle, écrite dans l'optique principale de permettre aux agents du coup d'Etat de contrôler l'accès aux emplois d'Etat. Face à la crainte d'un gouvernement populaire (Jacobin) ou aristocratique (royaliste), les agents du coups d'Etat sont d'accords pour mettre en place un système de dévolution des emplois à même d'empêcher toute incertitude par l'usage intensif de la cooptation à travers un système électif indirect. Dans la pratique des luttes pour l'accès aux positions de pouvoir les plus diverses, on assiste à l'instauration d'un système de patronage informel par des campagnes d'enquête visant à instruire les titulaires du pouvoir de cooptation sur les qualités et défauts des notables susceptibles d'incarner l'Etat.

Unusual Experiences with Secular and Spiritual Meditation in the US: Prevalence, Predictors, Endorsement, and Valence Perceptions

Meditation is a widely used health promotion and spiritual development tool. In general, and particularly when practiced outside of traditional religious contexts, secular and spiritual meditation practices can generate experiences that are unexpected and considered unusual by the practitioners. Beyond health and performance benefit measurement, meditation research has typically asked about either meditation-related adverse effects which imply negative or harmful experiences, or mystical experiences framed as positively valenced phenomena. To date, no study has allowed participants to subjectively assess the valence of unusual experiences in meditation.

We aimed to estimate the prevalence of unusual experiences and their self-endorsed valences, and to explore their relationships with social, health, and contextual variables. We also aimed to assess whether endorsement rates vary depending on survey framing. We surveyed 1100 US meditation practitioners selected to approximate the US population of meditators as outlined in a 2017 nationally representative survey. Participants were asked about their sociodemograhics, meditation practice, mental health and substance use history in addition to existing and new measures of unusual experiences in meditation.

Preliminary analyses suggest unusual experiences are far more common than previously thought. We will present full results at the conference. These findings will contribute to anticipating and preparing for experiences within the different population and practice groups, and to developing better ways of eliciting reports that capture a broad range of experiences. Ultimately, these contributions may lead to safer, more transparent and more informed secular and spiritual meditation practices.

The Intra-Couple Wealth Gap in the UK: A Longitudinal Perspective

Over the past few years, the study of the gender wealth gap and its intergenerational transfer has become increasingly important in western societies. As has been widely reported, women tend to accumulate significantly lower levels of assets than their male counterparts along their lives and are also less likely to receive intergenerational wealth transfers from their parents and families. Despite this, less attention has been paid to the study of intra-couple wealth inequality and the socioeconomic and demographic factors affecting it from a longitudinal perspective.

This paper aims to better understand the determinants of the wealth gap between female and male members of couples in the UK, with a particular focus on the transitions of couples who live together into marriage and parenthood. Using data of cohabiting and married couples from the UK Wealth and Assets Study (2014-2020) and fixed-effects regression models, our preliminary results suggest that having a child is associated with a reduction in the wealth gap between couple's members but this phenomenon is not observed in the case of marriage. Our findings also indicate that female education, employment and earnings are wealth equalisers between couple's members but the opposite occurs with male education and earnings. Moreover, our study finds no empirical support for the idea that couples who share bank accounts, have common savings and incurred common debt exhibit less wealth inequality than couples who manage their finances individually, as some previous studies on this matter had assumed.

Improving our understanding of the life-course factors explaining intra-couple wealth inequality is very important from a family policy perspective. Gender differentials in wealth strongly reflect the costs, disproportionately borne by women, of children to parents' careers and they can negatively affect the welfare of families who experience partnership dissolution, especially among unmarried couples.

WG06-787.3

TARTARI, Morena* (University of Padua, Italy)

Between Mothers' Needs and Judicial Actualities: The Experience of Single Mothers Who Are Victims of Domestic Violence with Children Custody Proceedings

Within the framework of Institutional Ethnography (IE), the research study STRESS-Mums focuses on the standpoint of single mothers about the issues that they face with judicial professionals and judicial institutions during their transition from in-couple parenting to single parenting. Furthermore, it collects the experience of judicial professionals (lawyers and court-appointed experts) about the difficulties that single mothers face during this transition and how they negotiate with the dominant definition of family and the multiple situated definitions that they embody in their everyday life. In particular, the research study pays attention to the period of judicial evaluation for child custody and judicial decisions concerning allowances and other obligations.

The study collected data in four European countries through in-depth interviews with single mothers, judicial professionals, and gender issues activists, and photo-voice sessions involving mothers and professionals. The sample (ten single mothers for each country) includes women with experience of domestic violence.

This paper presents the findings of this research study by focusing, in particular, on the experiences collected through the photo-voice sessions and highlighting the *disjunctures* that the mothers with experience of domestic violence underlined between their need for protection and the judicial texts that actually rule the protection of them and their children.

This paper aims to add an empirical contribution to the discussion of the application of Institutional Ethnography in the field of socio-legal studies and discusses, through the study's findings, the potential of Institutional Ethnography to offer contributions to changing the law and procedures which rule the everyday life of single mothers victims of domestic violence.

The research project received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Sklodowska-Curie grant agreement no 843976.

Public Pro-Environment Activism and Socio-Ecological Practices Promoted By the Humanist Movement in Europe

This paper originates in the research project RE-Green funded by the University of Padua's Supporting Talent in ReSearch Programme. The project investigates practices of contemporary parenting focusing on an under-researched social movement: the secular International Humanist Movement.

The project focuses on the pro-environment activism of members of this movement in the public and private sphere and their work to socialize the next generation to socio-ecological practices and responsibilities toward the environment's future. The project considers the Humanist system of meaning - different from that of religions - and humanist ethics as emergent perspectives useful to reframe citizens' environmental responsibilities and draws on the concept of environmental responsibilities.

By combining different theoretical debates and methods within the framework of Institutional Ethnography, the project focuses on three countries (Norway, the UK, and Italy). The project collects data through desk research, in-depth interviews, diaries, participant observation, focus groups, and Delphi method by involving Humanist activists, parents, and children.

The research study starts with a content analysis of texts available online regarding environmentalist campaigns promoted by the Humanist movement in Europe and the selected three countries.

This paper discusses the socio-ecological practices promoted by these groups through these campaigns during the last five years, the disjunctures between environmental public policies and parents' (and their children's) everyday needs that these groups highlight, and how the climate change issue is framed by these campaigns. Furthermore, the paper analyzes how humanist ethics and beliefs affect the promotion of such socio-ecological practices.

TARUMOTO, Hideki* (Waseda University, Japan)

Migrant Citizenship and Inequality in East Asia

Since the late twentieth century, cross-border movement of people has become an everyday phenomenon all over the world, making the make-up of societies more diverse and causing competition, conflicts, and inequality. The state struggles to regulate the flows of international migration and to socially integrate them. One practical solution is to grant full or partial citizenship to migrants. But citizenship is not the unique thing that remains firm and unchanging. Although national citizenship became a strong and important de facto world standard in the post-World War II period, it is often argued for decades that national citizenship has been challenged by international migration, resulting in a shift to more liberal forms in terms of inclusion, erosion, withdrawal and expansion such as "citizenship light" and its percussion into "earned citizenship" in the "comfort zone" countries of North America, Western Europe, and British Oceania. However, compared to plenty of academic works on the comfort zone countries, there is much less research

denotes a presenting author. Abstracts are organized by first presenting author's last name.

on countries outside them. This paper examines the relationship between citizenship and inequality, focusing on three East Asian democracies - Japan, South Korea and Taiwan. Citizenship in East Asian tends to create significant inequalities between nationals and foreign migrants, based on jus sanguinis principle of nationality transmission. In addition, foreign female spouses are often the main target of multicultural policies and/or excluded from social rights provisions. At the same time, however, there are signs of migrants' rights being expanded, such as the granting of local suffrage. The introduction of language tests, citizenship tests, and ceremonies at citizenship acquisition is clear evidence that East Asia is moving closer to the comfort zone countries. Thus, the transformation of citizenship in East Asia provides a good opportunity to reconsider the relationship between citizenship and inequality in the globe.

RC12-188.2

TARUMOTO, Hideki* (Waseda University, Japan)

Migration, Citizenship, and Gender in East Asia

The problem of female migrants suffering from inequality have prevailed all over the world. One of several causes is citizenship. Citizenship as the entitlement of various rights can function as a barrier to the enjoyment of rights by female migrants. But do citizenship rights work in the same way in countries outside the so-called 'comfort zones' of citizenship, such as in Western Europe, North America and British Oceania? This paper discusses the relationship between citizenship and female migrants, focusing on three democracies belonging to East Asia - Japan, South Korea and Taiwan. Female migrants from the Philippines and other countries in Japan pursue to stabilise their residence status by obtaining a Japanese spouse, while their lives are rapidly becoming unstable with losing the status due to the separation of that spouse. In Taiwan, foreign female spouses have also been forced to borrow money when asked to prove their income or assets in the application process of naturalisation, and female workers have been deported after their health check-ups revealed that they were pregnant. In South Korea, while the 'multicultural policy' allowed foreign female spouses and their children to receive services for social integration, the policy was almost always based on the expectation of assimilation into South Korea. Thus, female migrants in East Asia experience such inequalities in terms of citizenship. These inequalities are mainly caused by the ethnonational citizenship concept, family registration systems, and the patriarchal social norms.

The Gbv-MIG Project: A Collaborative, Conceptual and Contextual Global Understanding of Gender-Based and Intersectional Violence

Gender-based violence (GBV) is a major infringement of women's human rights, and an obstacle to sustainable development as set out in the Sustainable Development Goals (SDGs). GBV against migrant and refugee women is widespread, but often remains invisible and under-analysed both in academic research and policy-making. Our research takes a feminist, intersectional, multi-scalar, contextual and country-team approach to understand GBV in the context of migration, analysing the ways in which discriminations and inequalities based on gender, race, nationality, ethnicity, sexual orientation, gender identity and age, interact to make certain women more vulnerable to GBV and less able to access support and services for survivors than others. While we start from the lived experiences of women and persons working with them so that we can identify the particular forms that GBV may take in a context of migration, we engage meso and macro-level analyses of border practices, reception conditions, policies and legal systems that exacerbate their plight in order to understand the underlying dynamics that re(produce) patterns of violence. The research goals are to make policy recommendations for reducing migrant and refugee women's vulnerability to GBV and increasing their access to services. Research teams from seven countries have participated in this international project which is a winning project of the Gender-Net Plus Consortium. The project is based on common, collaboratively developed theoretical and methodological approaches, while the country-based research teams have adapted the methodologies to contextual local and national research needs and conditions.

TATSUMI, Mariko* (Osaka Metropolitan University, Japan)

Can Caring Masculinities Achieve to the Gender Equality?
：Child-Caring of Japanese Fathers and Masculinities of Ikumen

This paper describes the issues of caring masculinities in Japan. "Caring masculinities" is a new concept of masculinity for gender equality, and includes care considered femininity. It is an important strategy in EU to make men caring. Can caring masculinities achieve to the gender equality in the country where gender gap is very big like Japan? Japan is the bottom country of the G7

in the global gender gap index. This paper examines *Ikumen* figures shown in the leaflets and posters used by Japanese policy "*Ikumen* project" from 2010 to 2018. *Ikumen*, who are child-caring fathers, are recommended in Japanese media and policies. The Health, Labor and Welfare Ministry started *Ikumen* project to promote taking paternity leave from 2010. *Ikumen* is a father figure who not only takes child-care well but also works hard as a breadwinner. *Ikumen* takes almost same contents of child-care as mothers, but they have less time for child-care than mothers. And the work-style of *Ikumen* is influenced from the Salaryman masculinity, Japanese hegemonic masculinity after World War II. Therefore, *Ikumen* cannot achieve to the gender equality of child-caring. The strategy of caring masculinities to include care considered femininity can make it easy for both masculine men and companies to accept caring men. However, this strategy also has a problem that it is difficult to exclude the domination of hegemonic masculinity from caring masculinities. For the gender equality of care, it is important to exclude any gender from care, as argued by feminist care theories, especially in the country where gender gap is very big like Japan.

TAVAGNUTTI, Vittorio* (University of Milano-Bicocca, Italy)

Political Generations and Gender in the Romanì Ethnic Mobilization in Italy: An Intersectional Perspective

Echoing what emerged in both youth studies and social movement studies, recent works focusing on Romanì youth highlight the specific action repertoires and framing processes it employs, which differ from those of older political generations active in the Romanì ethnic mobilization throughout Europe. However, this body of work so far mostly focused on youth networks and organizations and has so far overlooked how different systems of oppression intersect in influencing young people's engagement in the broader Romanì mobilization. By drawing on the work of Nancy Whittier on political generations and on the body of work on intersectionality, this paper aims at contributing to filling this gap in Romanì studies by shedding light on how racialization processes, generational belonging and gender influence the engagement of Romanì people in the Romanì ethnic mobilization in Italy and in turn on the interconnected processes of change happening within the mobilization itself and in the broader contexts in which people engaged in it operate. The paper relies on semi-structured interviews I carried out from February 2022 with Romanì men and women belonging to two distinct political generations engaged in Romanì-led organizations and networks operating in Italy or involved as unaffiliated Romanì activists, artivists and digital activists. The work at hand also relies on observations and informal conversations gathered at various online and offline initiatives organized from November 2021 by the different actors engaged in the mobilization under study. The study suggests the younger political generation makes greater and more strategic use of social media and tends to conceive one's enactment of political agency as part of one's daily life. It also highlights how Romanì younger women's life experiences shape their contribution to the mobilization. They foster a greater focus on Romanì sub-groups and strive for the creation of broader coalitions with other discriminated groups' struggles.

TAVASSOLI, Afsaneh* (Alzahra University, Iran)

A Sociological Approach to Understanding the Term Feminism (From women's rights to stigmatization)

"Feminism" is considered one of the most controversial social and intellectual movements of the 20th century. The feminist movement in developing countries, including Iran, is still being pursued as a social concern. Feminism has been formed as a social phenomenon in the form of social movements in recent decades with the aim of eliminating existing inequalities and women's rights. Although the word feminism has many concepts and includes from activism to the school of thought and theory, but the approaches to this word are different.
It seems that feminism is seen as a type of anti-men and confrontation with men in the stereotyped ideas of society and the mental space of some people, and favoring feminist attitudes brings the stigma of anti-men and fighting against the male gender to people.
Referring to the ideas of Goffman, this label and the fear caused by its application sometimes causes many people, especially among women, to pursue women's demands and their rights with some kind of fear, and many of them may refuse to demand they have to withdraw their social rights and benefits due to the fear of this label. On the opposite point, some people with a radical perception and understanding of the word feminism may be in the direction of inducing their extreme and directional thoughts, which seems to be the growth of such thoughts and tendencies among educated groups more than other groups. Therefore, in this research, we tried to study, discover, describe and understand it positively or negatively, considering the importance of understanding the attitude of different groups of society towards the term "feminism". The results showed that the attitude of different social groups to the term "feminism" is different and depends on many variables.

TAVASSOLI, Afsaneh* (Alzahra University, Iran)

Affinity and Inconsistency between Islam and Feminism in Contemporary Iran

Affinity and Inconsistency between Islam and Feminism in Contemporary Iran

For years, feminism and the idea of women's rights and demands have been raised in the academic circles of the world. The main factor of this debate is the deep gender inequality that exists in many parts of the world regardless of whether the society is religious or secular.

In Iran as well, women say that they witness discrimination in various fields like in other parts of the world. Considering that Islam is one of the most influential religions in contemporary history, some analysts believe that this discrimination is caused by the unequal rights of men and women in religion. In order to prove this claim, this researcher puts feminism in front of Islam with comparative studies and with stereotypes and biases and concludes the necessity of inequality in the rights of men and women as an idea arising from Islam.

Also, some believe that religion's emphasis on the family is one of the excuses that admits that the presence of women in the social space has caused them not to play their role in the home and family. Therefore, due to possible damage to the foundation of the family, women should be prevented from entering the field of employment, education and business.

But despite what is going on in the society, the research in Islamic texts shows that the inferiority of women is more than derived from religion, it is caused by the domination of patriarchal culture, which casts a shadow in the social atmosphere by using tradition based on religion and not the reality of religion.

In this research, it has been tried to discover the congruence, kinship and inconsistencies of Islam and feminism by emphasizing religious texts and looking at what is happening in society.

Legal Mobilization Against Extractivism in Mexico: A Comparative Analysis

In this paper mobilization against extractivism in Mexico is examined from a comparative perspective. The paper explores the use of legal resources and legal discourse in opposing destructive mining projects. ¿How do legal mobilization impact movement outcomes? It looks, in particular, to six successful instances in which communities have succeeded in putting a stop to mega projects. To analyze the resistance to extractivism, I draw upon social movement literature. In methodological terms I use Quantitative Comparative Analysis. Research contributes to a burgeoning literature on mining conflicts in Latin America. By focusing on successful cases of resistance against mega mining projects I aim at showing how social movements, community-based struggles and non- governmental organizations are defying extractivism and in so doing are introducing a transformative perspective on the processes of production and reproduction of capital all over the region.

Navigating Aspects of Control in Response to the 2022 Eastern Australia Floods

For many years those working in emergency management in Australia have advocated for greater 'shared responsibility' in disasters. Individuals and communities have been encouraged to engage in disaster risk reduction activities and assist in disaster recovery in response to natural hazard events such as bushfires, floods, and cyclones. However, shared responsibility also requires shared control. Despite broad support for this concept, command and control approaches led by emergency services persist as the dominant approach and are, mostly, the expectation of communities.

In this presentation we will report on findings from a mixed method study of community experiences of the eastern Australia flood events in 2022. More than 200 flood-impacted residents of New South Wales and Queensland were interviewed about their experiences of the floods.

The complexity of several interfaces between the emergency management system and communities have emerged. Frustration at the lack of acceptance of local observations in advance of flooding was reported by residents in upstream communities. The lack of localised information and blanket advice resulted in greater reliance on the advice of neighbours and those with prior lived experience of floods.

Another early observation from the research is tension between dependency and self-reliance. In communities prone to extended periods of isolation during flooding the additional support received through improved responsiveness of emergency management service support, e.g., helicopter food and fodder drops, and boat deliveries of fuel and supplies is felt by some to be eroding community self-reliance and creating greater expectations and dependencies on outside agencies.

These are examples of a broader set of themes that will be explored outlining the complexities of navigating 'control' as reported in the recent floods. They will be accompanied by examples of how community members are working together with and without emergency services and other organisations to overcome some of the challenges.

Abortion Decision Making in Africa from a Religious and Cultural Standpoint

Abortion issues are integral part of reproductive justice, an important component of life. The world over, reproductive health is taken seriously as it is the life wire of nations. Discussing issues of abortion in the African context borders so much on culture, religion and/or morality rather than as a part of the developmental process of human beings. Data from selected Africa Health Surveys indicate high mortality and morbidity among women of reproductive age. Abortion contributes about a quarter of deaths and other complications due to induced abortion. There are strong laws forbidding abortion in majority of African countries unless under certain restrictive circumstances. Apart from the national laws, there are aspects of religion and cultural barriers that prohibit accessing abortion service, as a result, many women and girls use illicit means of terminating pregnancy thereby endangering themselves. Cultural values have been found in many studies and oftentimes uncritically, to annul the equal dignity and worth of women and girls. Likewise, religion, often undefined, but embedded in culture used to hinder equality for women and the right to make choices as to whether to have a child or to terminate a pregnancy. We therefore consider the intersection of religion, culture and reproductive injustices as an impediment in the construction of women's self-hood; the integration of religious beliefs and practices as forms of restriction on African women reproductive rights. We suggest that for many women, religious doctrine embedded in culture may be balanced with health logic as both are important and inextricably linked determinants of decision making about their reproductive health choices such as the decision to have an abortion.

This paper seeks to understand the decision-making process women go through to have abortions, especially clandestine ones, from a religious and cultural stand-point.

We Do Not Have COVID-19 Here: Community Understanding of the Causes, Signs and Symptoms and Management of COVID-19: Implication for Vaccine Acceptance

The world came to almost a standstill in 2020, with the emergence of SARSCoV2, a deadly virus that causes COVID-19. The government of Ghana quickly put in several measures such as social distancing, hand washing, wearing of face masks and ban on social gathering at curbing the effects of COVID-19 on the general population. Ghana was the first African country to receive the first consignment of COVEX doses of COVID-19 vaccines. Vaccine acceptance is low due to high levels of misinformation about the disease thriving on social media and most rural and some urban communities. The study delves into community understanding about the causes, signs and symptoms and management of COVID 19 and their implication for vaccine uptake. The study was qualitative in nature and purposive sampling technique was used in selecting twenty-five (25) participants through face-to-face interviews. Findings suggest that vaccine acceptance and uptake was dependent on knowledge of the causes, signs and symptoms and management of COVID-19, and the erosion of perceived side effects and misinformation of the vaccine. Majority of the participants had shallow knowledge of COVID-19 and its origin, and attributed the disease to end-time prophesies in the Bible, and the Western world creation in controlling the world. As a result, many claimed the vaccine is meant to control humans thinking and submissive to evil forces. In effect, majority at the time of the study, had not taken the vaccine, for fear of the unknown. The study recommends that stakeholders work to dispel such misinformation about COVID-19 vaccine using the Metropolitan Health Directorate and the Information Service Department to lead a campaign in dispelling the myths surrounding COVID-19 misinformation and vaccine hesitancy.

Educational Equity in Times of Crisis

The COVID-19 pandemic has presented both a global shock to education systems as well as an opportunity to radically reconsider what educational equity means in times of crisis and disaster. In such times, attending to educational equity is essential to support all children and young people to have opportunities to live meaningful and fulfilling lives.

Crises compound the pressure on schools to care for all learners. However, historical crises teach us that emergencies tend to exacerbate inequities, as well as deepen the reliance of marginalised students on the emotional, material, and learning supports provided by school.

Based on our own research into education during the COVID-19 pandemic as well as extensive analysis of historical and current literature we outline three key dimensions. First, provision of material basics - such as food; safe and suitable housing; and access to (digital) learning materials is an essential prerequisite for learning. Second, emotional wellbeing impacts on learning. Crises exacerbate prior concerns about student wellbeing while also making visible the key contribution of schools and early learning centres to wellbeing. Third, access to learning is challenging when crisis responses usually include relocating students - to other schools or to learn at home. During COVID-19, growth in formal and non-formal learning reduced overall, with students from low socio-economic backgrounds especially negatively affected.

Action is required across all three dimensions and at the layers of schools and school systems (as well as societies as a whole) to generate hope for a more equitable future, not only as we emerge from the COVID-19 pandemic, but also so that we are better prepared for inevitable future crises. We draw out lessons from the evidence of deepening educational inequity as well as of promising innovations, and - crucially - from the voices of children and young people.

Social Justice in Youth Justice: Participation in Education By Incarcerated Young People

Education is widely recognised as a key social structure in relation to youth justice, both to prevent youth crime and to support rehabilitation. However, incarcerated young people face significant challenges for accessing equitable education. This paper explores barriers and possibilities for socially just education in the context of youth prison. We apply Nancy Fraser's three-dimensional framework of social justice to analysis of our empirical research in Australia as well as international literature. We examine what action is needed to support parity of participation: for incarcerated young people to be able to participate in education on par with their peers in schools outside the walls of youth detention centres.

For the dimension of distribution, actions relate to supporting learning; providing high-quality curriculum and strong post-custody pathways; providing appropriate learning resources and spaces; and making good use of time. For the dimension of recognition, we discuss notions of recognition through relations – in terms of care, inclusion and transformation – and of knowing, being and enacting difference. For the dimension of representation, we point to the role of recognising silence as a call to action; creating conditions for voice; and listening to young people. Applying some of Fraser's specific conceptual tools to education in youth custody we propose three additional, overall actions required to work towards parity of participation in education for incarcerated young people: recalibrating the power balance between security and education; responding to the role of prior disadvantage and trauma; and regarding young people in custody as human beings.

Overall, Fraser's framework of social justice proves to be a strong conceptual foundation for analysis as well as a powerful lens for developing practical implications for improving the conditions required for equitable education for young people in custody.

The Interpretative Challenge Posed By the New Peripheral Literatures: The Brazilian Case

The literature produced in Latin America has been for decades the object of many analyses interested in offering a reading that would highlight a certain notion of autonomy and authenticity. The notion of nation that sediments the most canonical perspective of some of them, especially the Brazilian literature, was at the base of an analysis that sought to consolidate the foundations of this autonomy and sanction its authenticity. However, these canonical perspectives are absolutely undermined in the face of the production of part of contemporary literary movements insofar as these analyses have generally been presented as readings that tend towards homogeneity and make the nuances of their internal components disappear. The purpose of this paper is to scrutinize some of the theoretical implications caused by the self-denominated peripheral literary production to the more canonical conceptions of Brazilian literature as it wages a political struggle to gain space in the sphere of the sensitive, as proposed by Jacques Rancière. This is not a simple valorisation of new voices in the context of literary production but an assessment of the theoretical disturbance in the space of knowledge promoted by the aesthetic-political struggle waged by this new literature which is at the base of the symbolic conception of democracy proposed by Rancière.

Food Movements in the Brazilian Amazon: Struggles for Socio-Ecological Transformation

This paper analyzes the role of social movements in the struggle for food transformations in the context of the climate crisis in the Brazilian Amazon. In doing so, it seeks to identify and understand the main political subjects, claims, forms of struggle, alternatives and the context in which this struggle takes place. This research aims to theoretically contribute to the social sciences debate about socio-ecological transformation, focusing on the role of social movements in relation to other-then-human for this process. The research is developed through qualitative methodology. It includes observant participation in activities and events (multi-site ethnography), mapping of actors, analysis of documents and interviews with social movement activists. The preliminary results of the research have pointed out the importance of debating the framings of what is understood as the Amazon region, adopting more holistic perspectives that comprehend the struggles for food transformations beyond the dichotomy between humans and nature, and giving centrality to the political subjects of the region in pointing out alternatives to food issues in a context of the climate crisis.

Three Models for Decolozing Critical Theory

In contemporary debates on critical theory, the claim that this tradition of thought would benefit from coming to terms with its Eurocentric aspects - in other words, from being decolonized - is becoming ever more widespread. Far less agreement is to be found, however, as to what this process of decolonization would mean in concrete terms.

In this systematic paper, we identify three broad strategies for the decolonization of knowledge in general, and of critical theory in particular: a. the inclusion of the knowledges of the marginalized alterity in the pantheon of hegemonic knowledges; b. the replacement of hegemonic knowledges by those of the marginalized alterity; and c. the subversion of hegemonic knowledges by those of the marginalized alterity, based on the unveiling of the asymmetrical and authoritarian interdependence between them.

In the first part of the paper, we present in more detail and in a systematic way each one of these strategies of epistemic decolonization. We then illustrate our proposed categorization with a case analysis of different attempts to decolonize G.W.F. Hegel's writings, specifically with regard to its Eurocentric, racist aspects. Hegel's case is an interesting one because, while he is the main proponent of the dialectical method that would inspire Marx, and thus as a forerunner of critical theory and other subversive theoretical strands, his writings also contain extremely problematic, to say the least, considerations about non-Europeans, and thus calling for a decolonial critique.

From this analysis, we intend to provide greater clarity about what is at stake in each of the paths that attempt to decolonize critical social theory.

Contextualizing the Impact of Neonatal Intensive Care Unit (NICU) Transitions from Open-Bay to Single Family Rooms

Infant mortality is higher in the U.S. than in other highly developed nation-states (5.8 per 1000 births in the U.S. versus 1.9 in Japan). The U.S. also has substantial disparities in infant mortality by race, ranging from 4.9 per 1000 births for white non-Hinospanic infants to 10.9 for Black non-Hinospanic infants (Population Reference Bureau 2017; National Center for Health Statistics 2017). Infant mortality is a metric of nation-states' ability to provide optimal conditions, including medical care, for infants to thrive. Neonatal intensive care units (NICUs) are critical to providing high-quality health care and ensuring optimal health outcomes for sick and premature neonates. Although NICUs began as open-bays with multiple neonates admitted to large rooms of variable size, a growing trend in NICU design is single-family rooms with one neonate admitted per room and accommodations for at least one parent to stay with the neonate. A proposed benefit of single family room designs is increased parent-neonate bonding time. Some nation-states offer universal health care and provide maternity and paternity leave supporting parents' ability to room in their babies, leading to benefits such as increased parent participation in neonatal care (van Veenendaal et al. 2022a, b). In contrast, the U.S. does not have universal health care and relies on employers to provide maternity leave. The U.S. Family and Medical Leave Act provides unpaid leave that generally benefits economically privileged women, potentially leading to disparities in rooming-in (Rossin 2011). In this presentation, we compare and contrast international and U.S. findings on the efficacy of NICU design transitions from open-bay to single family rooms while exploring the potential impact of contextual factors that may serve as mechanisms that either mitigate or reproduce inequality. Our data sources include the scholarly literature, electronic health record data, patient and employee satisfaction surveys, and interviews with NICU stakeholders.

Public Measures, Risks, and Changes of Life during Covid-19 Pandemic: A Quantitative Analysis

The global crisis poses a threat that affects people's beliefs and attitudes, but how do religious people observe public measures and respond to the risk and changes in social life caused by the COVID-19 pandemic? Using the multiple standardized survey questionnaires designed by the board and regular members of the Research Committee of (RC36) of the International Sociological Association, we interrogated religious individuals on what public measures, threats, and changes caused by COVID-19 are to their lives. We equally examined current literature produced by cross-sectoral studies to advance our knowledge of how people observe public measures and respond to risk and anxiety and changes during the pandemic. We find that while the threat and stress of COVID-19 continue to disrupt families, workplaces, and businesses, most individuals during the pandemic contributed to the rule of law and have developed public measures to protect themselves from the virus. While it is true that religious people are not exempted from deep anxiety caused by COVID-19, religious people have interplayed strong religiosity and creative activities that strengthen their social relationships as COVID-19 ravages their health and social life. Religious people continue to experience negative influences by the perceptions of the risk of infection and being infected by the people they can get along with, health and financial challenges, and other social consequences of the crisis. These factors contribute to the higher stress and lower mode of religious people that disorient or reorient their lives to be resilient and creative in many ways.

"My Life Has Become a Never-Ending Sunday…". Everyday Life and Risk-Management Strategies Among the Spanish Youth during the COVID-19 Pandemic

Uncertainty has become an omnipresent concept in the analysis of contemporary societies. In studies on the everyday life of youth, it is described as a series of challenges in the form of precariousness, volatility and risks with varying degrees of complexity. The situation triggered by the COVID-19 pandemic in early 2020 offers an exceptional context to analyze what we call "scenarios of heightened collective uncertainty" and the perspective of young people regarding the effect of these scenarios on their own lives, both present and future. This paper investigates the definitions elaborated by young people regarding the risk brought about by the pandemic, their attitudes towards this phenomenon, as well as the creative-reflexive practices they have conceived and deployed to navigate a "new normality" in constant mutation. To the extent that it has been one of the countries with the highest rates of contagion, mortality, mobility restrictions and post-pandemic economic decline, Spain constitutes an exceptionally relevant scenario for investigating strategies for the reinvention of everyday life. Data analyzed in this paper come from a qualitative study based on 20 in-depth interviews and 9 focus groups with men and women between 18 and 34 years of age living in the Basque Autonomous Community. The fieldwork was conducted between March and June 2021, marking the first anniversary of the pandemic.

Climate Crisis, Socio-Ecological Practices, and the Impact of Social Mobilization

The purpose of this paper is twofold: a) to present a series of socio-ecological practices aimed at resisting or reversing the process of change in climatic conditions that is leading the planet to a global crisis; b) to identify the reasons and motivations of people in different social and political contexts who are mobilizing against climate change. Building public will to address the climate crisis requires more than changing opinions about climate change (Nulman, 2015) or engaging more people in activism (Raile et al., 2014). The climate movement is stronger today than ever before: more people taking action, more financial resources, and deeper concern. Yet despite increasingly widespread popular demand for sensible climate solutions (Hestres and Nisbet, 2018) and extensive organizational infrastructure to support climate activism (Brulle, 2014), public will that acquires the political power needed to effect meaningful change has been elusive (McAdam, 2017). How can research build bridges between opinion and action, and between action and power? This project addresses the question of the conditions that make it more likely that human and non-human agents (Haraway, 2019) will act around climate issues by changing practices. The opinion-action gap is well known (Kahan and Carpenter, 2017), and burgeoning research in many social science fields seeks to bridge it (Rickard et al., 2016; Feldman and Hart, 2018) proposing, in some cases, the innovative character possessed by "negotiating the landing on a ground" (Latour, 2019: 82) generating a renewed vision of the world and of life, of bodies, experiences and subjectivities (Tsing, 2021). We are interested in the question of how and through what social mechanisms these actions can be translated into political influence. Through a multilevel methodology we want to find out which aspects drive mobilization and its effectiveness, and which barriers hinder its extension and social and political impacts.

Children's Rights within the Digital Practices of Ukrainian and Moldovan Transnational Families

Within the CASTLE EU-funded Romanian-Ukrainian-Moldovan action research project, we have investigated the digital communication practices of Ukrainian and Moldovan transnational families, and specifically, the manner how these function as a space where their children's rights may be exercised.

Background. In transnational family research and studies on digital family practices, it has been shown how efforts for keeping the family together, or doing family, as well as monitoring, provision of care, support, guidance, and

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

education are performed from a distance by transnational parents through digital co-presence. This, however, has certain limits when compared with physical togetherness and produces new patterns of family co-agency.

Method. Empirical data was collected through 102 semi-structured interviews and 10 focus groups with adult and child transnational family members and caregivers, and 24 interviews with experts from relevant organizations.

Results. Through digital communication, parents supervise and assess children's well-being back home. However, limitations in access to the Internet and technology, the availability of adults, the practice of secrecy, selection, and blurring of information may restrict children's rights to information and participation.

Conclusion. The *registers of presence* emerging through digital togetherness offer the opportunity for new iterations of functional, emancipatory relationships within families. This is, however, conditioned by the provision of information and communication capabilities through access, skill, and transparency.

Implications. Family, state, and civil agents are advised to raise awareness and enhance capacities pertaining to children's participative rights in a digital context, including provision of access and availability, interruption of virtual relationships by physical visits, campaigns, counseling and training for improvement of communication, and moderated platforms for sharing experience.

The Effects of Structural Vulnerabilities on Climate Change Risk Perception: International and Historical Comparative Perspective

The aim of this presentation is to investigate how the impact of structural vulnerabilities on the perception of climate change risks has evolved over a decade in different countries around the world. We employ the concept of structural vulnerability (HDR, 2014) and follow the intersectional risk theory (Olofsson et al, 2014) to explore the effects of overlapping constraints on risk perception, and if/how the effect has changed in a decade marked by diverse risk events. The empirical analysis of this presentation is based on the data from International Social Survey Programme (ISSP) "Environment" module, comparing 2010 and 2020-2022 waves in international perspective. Presentation will look into the changes of climate change risk perception over a decade identifying regional differences and will discuss the effects of structural vulnerabilities (based on gender, social-class, place of residence, employment status and similar) on the climate change risk perception. Discussion will contextualize the findings in the light of regional differences in climate crises, distribution of social vulnerabilities and probable attenuation of climate change issue in the pandemic years.

This work is part of the KLIM-KOM project, that has received funding from the Research Council of Lithuania (LMTLT), agreement No. S-MIP-22-26.

Illusions That Control: Disaster Risk Reduction and Counterterrorism Preparedness in a Never-Ending Security Crisis

In a world that has become "uncertain", governments urge populations to be prepared and "resilient" in order to "live with risk". Over the last two decades we have experienced a financial crisis, a security crisis marked by terrorist attacks, disasters and the return of war in Europe, a health crisis shaped by the COVID-19 pandemic, and a climate crisis whose mismanagement has been highlighted by IPCC reports. How is it that we came to think of our world as being in a permanent state of crisis, liable to be governed by requesting citizens to be prepared and resilient? On what basis do emergency management experts urge populations to be in a permanent state of awareness? Why is this state of awareness said to reduce vulnerability to multiple threats? This paper examines these questions by analysing empirical similarities of two case-studies deemed to be inherently different: disaster risk reduction and counterterrorism community-level interventions. We argue that in both cases community-level programs promoting participation and self-reliance, as key elements to teach citizens how to live with risk, create the illusion of controlling uncertainty. The illusion of control is not the result of a top-down dynamic where experts impose new norms on communities. It is rather a jointly developed process leading to the responsibilization of citizens and a State which mutates towards a technical role. Accordingly, both cases illustrate how the State is no longer uniquely involved in the handling of the emergency services but also the preparation of citizens to provide assistance to emergency service professionals and address their own vulnerabilities.

RC39-574.2

TELLERIAS, Piero* (University of Paris Pantheon-Sorbonne, France)

The Social Conditions of Policy Ideas' Transformation: Computational and Field Theory Analysis of the Disaster Reduction Literature and Practice

In a world that has become "uncertain", governments and experts urge populations to be prepared and "resilient" in order to "live with risk". Using the case of Disaster Risk Reduction (DRR), this paper aims to identify the latent structure of ideas in which the scientific literature in instruments of circulation (i.e., journals) can be organized inductively. The field of DRR is built upon the "circular circulation" of the idea that policies can "prevent new disaster risk, reduce existing disaster risk and manage residual risk, contributing to the strengthening of resilience and reduction of disaster losses" (UNDRR, 2022). While the field of DRR relies on the circulation of practices and ideas between experts sharing the mental schemes from which these were elaborated, we examine whether this process also produces an auto-confirming effect reinforcing the integration of these experts within this field (Bourdieu, 1976; 1979; 1980). In this case, the ideas and practices constructed within the field of DRR and international organizations such as the United Nations Office for Disaster Risk Reduction, the North Atlantic Treaty Organization and the World Bank. From a methodological perspective, the paper employs quantitative and qualitative tools to study the evolution and structuring forces of the DRR scientific field. Accordingly, we adopt the latest developments in computational text analysis (Grimmer, Roberts, and Steward, 2022) to analyze academic production in the field of DRR. Likewise, our qualitative analysis focuses on the conditions in which DRR ideas and practices are constructed and mobilized. The way in which politicians, diplomats, soldiers and civil servants negotiate DRR policies depends on the skills and capacities that stem both from organizational cultures and from the circulation of knowledge and know-how in the practice of negotiation.

RANGEL, Felipe (University of Sao Paulo, Brazil)

Contesting Low-Cost Workspace Landscapes: Experiences from Sao Paulo and Mexico City

Struggles for low-cost workspaces are at the heart of low-income vendors' politics in Latin America. The production of popular marketplaces, formal or informal, is one of the main objectives of these struggles, as they produce the spatial configurations that sustain their communities. Thus, composites of carts, tents, stalls, stands, trolleys, blankets and other infrastructures create unique workspaces central to urban economies. Fixed or mobile, permanent or temporary, these spatial configurations infuse the notion of low-cost with distinctive popular textures, cultural and political. However, in the past decades, neoliberal policies in the region have sought to eradicate, transform and enclose these workspaces, particularly in "prime" urban areas. Rooted in modernising and formalising narratives (Mackie et al., 2014; Gonzalez, 2019), these policies tend to displace and marginalise low-income, small-scale vendors. This paper focuses on the politics of street vendors and market traders and their struggles to access, produce, adapt, and control low-cost workspaces in Sao Paulo and Mexico City. The paper conceives popular marketplaces as low-cost workspaces and highlights the strategies used by vendors to consolidate them. By discussing spatial and political continuities and discontinuities between these two cases, the paper problematises the material and symbolic configurations shaping the notion of low-cost. Street vendors' and market traders' experiences provide insights into the contentious processes that facilitate or disrupt the encroachment of "high value" sectors in the urban space. They also shed light on the strategies that legitimise the production of "popular" workspaces vis-a-vis struggles for the right to subsistence, work, infrastructure and stay put (Scott, 1976; Crossa, 2009; Corsín, 2014; Weinstein, 2014). A focus on Latin American cases seeks to problematise further the notion of low-cost workspaces, thus contributing to developing an integrated approach to what drives and influences their production in the Global South.

TENDULKAR - PATIL, Anagha* (Sophia College for Women, India)

Feminization of Ageing: Reflections and Apprehensions

Feminization of Ageing, Population Ageing, Life cycle approach

Population ageing is one of the consequences of demographic transition. Increased longevity, lowered birth rate and mortality rate have resulted in an unprecedented increase in the number of elderly members in India. An additional salient feature of this scenario is the Feminization of Ageing. This implies that in the older population; women constitute a bigger group than men.

After factoring in enhanced longevity, the observation of women being more in number than men in the category of 60 plus population, though, appears to be a logical demographic conclusion to arrive at; it is quite a complex situation with multi-layered implications particularly in India.

The main objective of this paper is to review the phenomenon of feminization of ageing using quantitative as well as qualitative metrics. The additional aim is to study the interplay between gender on the one hand and variables like class, education, marital status, family composition on the other in the process of ageing. The paper comments on the triple marginalization faced by this group due to their gender- identity, age-identity and citizenship of a conservative developing country. It studies its consequent impact on the senior women's mental, physical and social health. It studies the social, cultural impediments in the life cycle of women to trace the quality of the process of ageing for women. The markers of social role acquisitions contribute to the exceedingly impoverishing ageing.

The paper utilizes a feminist theory perspective to explore the impact of the feminization of ageing on social processes. The life cycle approach is utilized while scanning through the narratives provided by elderly women. The researcher hopes to arrive at suggestions and guidelines for meaningful interventions and policy making for elderly population through this research study.

TENDULKAR - PATIL, Anagha* (Sophia College for Women, India)

Sociology of Ageing: Potential and Fallacies

Population Ageing, Epistemology of Ageing, Sociology

Population ageing, which entails an increased number of older persons in the population has become an empirical reality, even in the Asian parts of the globe. Elderly members no longer constitute the abysmal minority, yet the phenomenon is treated like a marginal issue, and elderly people are ignored as an insignificant, vanishing category.

Study of ageing has not found its due attention in the academic discourse in India. There is a dearth of scientific data and reliable information in this field. The main objective of this paper is to comment on the nature and scope of the discipline of Sociology of Ageing in India. This paper reviews the situation of Ageing and assesses the concomitant development of the discipline of Sociology of Ageing in India.

The paper essentially utilizes the qualitative paradigm to review the emergence and growth of ageing studies, it analyses methods and techniques utilized by researchers while studying the phenomenon of Population is ageing. It interrogates the boundaries of the discipline and assesses the probable potential of the same to remedy or at least mitigate the impact of the 'gray explosion'. It comments on the guided trajectories of the discipline engineered by the academicians, researchers and charitable institutions and NGOs to revisit the epistemology of ageing. It consciously distinguishes between the sociological path, psychological directions and community interventions in this field. It engages with the parallel disciplines that engage or have the potential to engage with ageing discourses in academia.

Researcher wishes to arrive at a curated space for Sociology of Ageing nested more in sociological theories with the axial principle as the elderly. It does not intend to isolate aspects of gerontology, but sort it out to arrive at a more meaningful academic discourse.

TENENBAUM EWIG, Gabriel* (Universidad de la República, Uruguay)

Los Protectores Del Capital: Los Servicios Que Brinda Uruguay Al Tráfico Internacional De Las Drogas Ilegales.

América Latina y el Caribe reúnen condiciones climáticas y geográficas excepcionales para el florecimiento de las sustancias psicoactivas naturales. Algunos ejemplos son la hoja de coca en la zona andina y amazónica, la adormidera –de la cual se extrae el opio– en Colombia y México, y el cannabis en Paraguay, Jamaica y México. Este medio ambiente ecológico se combina con la corrupción política y policial, y un menú variado de servicios comerciales, de distribución y financiero en jurisdicciones flexibles y paraísos fiscales que facilitan la legitimación de la renta criminal del mercado de las drogas ilegales. Estos fenómenos y el tejido que los enreda, son impulsados por la globalización económica, la sociedad en red a través del desarrollo de las comunicaciones seguras (área, terrestre, marítima, radio, digital, etc.) y el contundente fracaso de las políticas hemisféricas contra las drogas. En este contexto, la ponencia intenta responder qué lugar y qué función tiene Uruguay en la división internacional del trabajo del mercado de las drogas ilegales. Con base en una reconstrucción sociohistórica, se aplica un análisis de redes de las organizaciones criminales más importantes del mundo que operaron en Uruguay desde finales del siglo XX. A su vez, se plantea la construcción histórica de la arquitectura normativa financiera que hizo y hace al Uruguay una jurisdicción atractiva al capital internacional dentro del cual se cuelan los activos originados en fuentes ilegales.

Participatory Revitalisation of Urban Environmental Infrastructure in North-Western India: Some Evidence from Recent Studies

Urban environmental infrastructure in India including in the North-western region has been one of the important concerns due to neglect by the local authorities and lack of adequate support from the state governments. This has been forcing local communities in several cities to devise participatory tools to revitalise the urban infrastructure and services which has been experiencing deficiencies and deprivations. Some studies by the author under the series 'State of Cities in North- Western India' & some other studies have documented few such initiatives. While some initiatives have sustained over a period of time some of them have failed due to withdrawal of support from the donors and higher level of governments. The paper is on effort to discuss some of these initiatives from North-western region of India compressing Punjab, Haryana and Himalayan states of Himachal Pradesh (HP), Jammu and Kashmir (J&K) and Union Territory of Chandigarh. The factors for success and failure of the participatory initiatives have also been discussed. The perception of the people makes an important part of the city case studies of Srinagar (J&K), Amritsar (Punjab), Faridabad (Haryana), Shimla (HP) and Chandigarh. Both primary and secondary data was collected from the field.

Towards Participatory Irrigation and Forest Management in Foothills of Shivalik Range of Himalayas for Climate Change Mitigation: A Re-Study of Sukhomajiri Experiment

The irrigation and forest management have been important issues in Himalayan regions. In the light of climate change, these issues seem to have acquired even greater importance. The development practices adopted by the policy makers in the past seem to have affected the water resources and forests in Himalayan states. The un-sustainable practices and initiatives in natural resource management coupled with the poor role of institutions have affected the already deteriorating rural ecology. Some innovative initiatives to promote participatory joint forest management (JFM) and joint irrigation management (JIM) with the support of donors and local people have shown the way but they remained fragmented due to limitations of funding and support. The rural India experienced a good initiative in Sukhomajiri village in foothills of Shivalik range of Himalayas in late 1970s. The initial impact of the joint irrigation and forest management through a Hill Resource Management Society (HRMS) were very positive and were well documented. The Author also carried a study of Sukhomajiri experiment for fulfillment of M.Phil. dissertation in 1994. Recently efforts were made to revisit Sukhomajiri to explore continuity and change in the joint irrigation and forest management initiatives and see how human nature interactions have been influenced with the growing economic and social needs. The re-study found that Sukhomajiri experiment has continued despite the withdrawal of donor agencies and other public institutions. The concept of social fencing evolved with the progress of project has been strengthened with declining dependency on forests and growing dependency on agriculture and dairying for meeting day to day requirements. The replication and sustenance of Sukhomajiri experiment is crucial for climate change mitigation there is a need to further strengthen the above initiatives with even greater support from the people as well as from the international non state entities including industry.

The Phenomenon of New Karbi Politico-Religious Reformation Movements: Interventions, Associations and Continuity

India is a multi-ethnic, multi-lingual, and multi-affiliate melting pot. When it comes to identity and affiliations, whether they be political, economic, religious, or cultural, India is home to several tensions and contestations. At present, the plight of marginal communities is complicated by the dynamics of majoritarian state-run homogenized politics.

My paper will be a contextual study on the Karbi people of Assam, a major indigenous group in the North east India. The Colonial administrative policies and majoritarian classification biases have a history of misrepresenting and appropriating the Karbi people. Social exclusion, marginalization, and other forms of historical oppressions continue to subject Karbi identity. The Karbi people revere spiritual protector deities, worship ancestors, live close to nature, and practice religious ideals of reciprocity in the traditional sense.

Recent trends in the Karbi landscape project a drastic boom in the development of New religious reformation movements. These religious reform movements arose in response to mainstream conversion and assimilation politics. However, the baggage of this ongoing re-negotiation of identity and agency stems from the aftermath of Colonial policies on territorial designs. Using the theoretical framework of religious-economic theory, I will concentrate on *Lokhimon* and *Sottism*, two well-known divergent religious movements among

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the Karbi, to better understand the phenomena of the growing complexity of reformation movements. In contrast to the institutionalized majoritarian religions, namely Hindu and Christian. I inquire as to how conflicting interests are moderated when various parties are engaged. The two rival strains in this vortex contend with stresses both from without and from within. The fringes have dispersed attitudes while the majoritarians have political and economic clout. Who is determining the New Karbi's politico-religious identity? If so, in whose image?

Housing Inequalities in Aotearoa New Zealand: Insights on the Role of Racism and Discrimination

In Aotearoa New Zealand, the uneven spatial distribution of racialised communities as well as persistent racialised housing inequities have been substantially documented. In the context of staggering unaffordability, housing has become a key factor in entrenching social inequalities with Indigenous Māori as well as Pasifika and communities of colour experiencing significantly poorer housing outcomes than European New Zealanders. At the same time, there is a paucity of research that critically examines how these inequities are reproduced, what needs to change to achieve racial equity in housing and how transformation can happen. To address these questions, I will share research insights from a project on the geographies of racism and exclusion conducted as part of the Working to End Racial Oppression (WERO) research programme. Based on a survey tool especially designed to gather information on the factors that shape people's housing patterns and residential trajectories, this presentation specifically discusses findings that illuminate the role of racism and discrimination in securing and maintaining housing and their impact on people's housing aspirations and plans. I will situate these insights from ongoing work in relation to extant international scholarship on racism and discrimination in housing and suggest avenues for further research and theorisation.

Rethinking Residential Segregation through an Anti-Racist Lens

Segregation indices have long been a prominent indicator of the uneven spatial distribution of urban residents along lines of ethnic affiliation. While much effort has gone into developing sophisticated ways of measuring levels of segregation, the field has continued to build on assumptions first formulated in early twentieth-century US-based scholarship. Driven by expectations of immigrant integration and concerns about social problems arising from concentrations of poverty, segregation studies have predominantly examined patterns of concentrations of ethnic minorities and socio-economically marginalised groups. Such approaches to knowledge production have perpetuated deficit perspectives and, in conjunction with the disemination of such knowledge, have made minoritised and marginalised populations amenable to being monitored, managed and, at times, displaced while doing little to address the structural causes of spatial stratification. This presentation offers a critique of the white racial frames that underpin epistemological approaches to measuring segregation and argues that the field must be deconstructed as a technology of racism.

Leisure-Time Physical Activity in Context of Gender Differences

Leisure time for women could be less in comparison to men because of the fact that though women are more commonly occupied in part-time work than men, they expend more time completing unpaid work such as household tasks and childcare. Because men and women have diverse levels of physical activity, and the variables associated with activity levels are not constant across the genders, interventions promoting physical activity should take these differences into account.

The objectives of this analysis is to explore the association between gender and leisure-time physical activity in a population-based sample of adults living in Kanpur City (India) and to study a variety of variables possibly associated with physical activity levels. A multistage sampling of households was undertaken in Kanpur, the biggest city in terms of population in the State of Uttar Pradesh, India. Leisure-time physical activity was measured using the long version of the Physical Activity Questionnaire. Data on potential predictors of leisure-time physical activity behaviour were collected using a standardized questionnaire. 50 men and 50 women were interviewed. Several definitions of moderate and vigorous-intensity physical activity were used.

Dancing with Differences: Case of Kathak Dance in London

Dance is an art and a representative of a culture(s). Every culture dances. Moving our bodies to music is universal throughout human history and across the globe. Yet, little is known about how dance is needed for social cohesion- a glue that keeps societies from breaking apart despite differences.

This paper explores the relationship between culture, dance, the body, and emotion from the perspective of sociology of dance. The aim is to understand how embodied movements through dance practices brings people together and teach things about different culture beyond its historical, ritual, control, and regulatory roles in the traditional and modern communities in which they are (re)produced, and practiced. The paper explores the case of Kathak dance in London using tools of ethnography, namely participation observation, focus groups and semi-structured interviews. The unit of analysis are children learning Kathak, an Indian classical traditional dance in London, a western society. The article illustrates the interrelation between cultural meanings and dance movements, which leads to emotions of 'oneness' and better understanding of 'self' and 'others.'

The results of the study show how dance is a human activity that connects the individuals with the collectives, bringing people with different backgrounds together. The findings of the paper shed light on the importance of studying embodied dance movements in sociology to better understand the society.

Measuring Leisure Practices and Sports through the Lenses of Their Contribution to Education

In today's world, both leisure and sports play a very noteworthy role in being a pivot force for humanity. It has the authority to bring people together as it encourages free spirit and instills a sense of discipline. The topic of leisure practices and sports is very broad: it can serve as a form of therapy as well as a tool in different aspects of life which can help to change the world. Leisure and Sports play a great role in advancing education and in enhancing knowledge. Siergel. D. (2001) opines that, sports have become a universal medium through which people of different countries, socio-economic levels, cultures, races, genders, and ages can communicate and set standards of excellence which all can admire and for which all can strive. In many ways, sports and leisure practices have become a modern art form which is accessible, understandable, and cherished by people around the world. The trend presently is the issue of many parents enrolling their kids into different leisure activities at a very young age.. However, the aspect of sports being a tool for educating children informally has not been explored to a greater extent when compared to leisure. Many studies have proven that sports are more often played for competitive or recreational purposes, thereby under-estimating the educational value and benefits of sports in the lives of children. The purpose of this study will be to find out how leisure and sports can be a means not just for entertainment, pleasure and physical activities, but also for its educational benefits and impact on the lives of children through extra-curricular activities. In addition, the study aims at finding the positive and negative outcomes of leisurely practices and sports in the lives of the children.

Research in Sociology of Sports in India and Possibilities for the Western World

This paper focuses on the state of Sociology of Sport in India, a country with a population of 1.3 billion and a sport culture that seems to show particular characteristics, but remains relatively under-researched. This could offer an abundance of opportunities for Indian scholars, as well as foreign ones. The objective of the paper is to reveal some of these specificity of the Indian context, relying on the conceptual work of researchers from Europe and other parts of Asia such as China, Japan, South Korea and Taiwan. One of the issues to be discussed is the attitudes of parents towards sport as a recreational activity and as a prospect of career growth. Another concern, which requires investigation, is the place of sport in the public education system, which puts much more emphasis on academic subjects at the expense of physical education. All of these features of the Indian sport culture hinder the participation of youth in sport and physical activity, and, to address this challenge, the paper aims to identify the potential priorities of a sport sociological research agenda in India. With this background, it is trusted that this piece shall contribute towards a better understanding of the sociological factors which can be instrumental in the promotion of sports and physical culture, the development of youth and the nation.

Hybrid Sociology Pedagogy As Post-Pandemic Adaptation

Drawing on primary teaching strategies in *Sociology of Gender* (SOCI 303) at the University of Calgary and *Global Pandemics* (SOCI 290) at the University of British Columbia, we share how we have adapted our pedagogy in response to COVID-19. While we refer mainly to our experience teaching specific classes, our presentation will also address broader strategies, taking into consideration factors such class size, level of class, and differences between required and elective courses. We conclude the presentation with reflections on how a hybrid model may be beneficial going forward for both students and educators, and outline some challenges embedded in this approach to teaching sociology.

Post-Industrial Waterfronts As Inclusive Live/Work/Visit Places

This paper examines the rise of the post-industrial landscape as a site for economic, cultural and social production. From the 1960s onwards, cities were impacted by shifts in the global economy enabled by technologies. The relocations of heavy industries to urban fringe led to the abandonment of factories, power stations and docks near city centres. Having laid dormant and contaminated for years, from the 1970s onwards governments around the globe began exploring these spaces' potential as new live/work/visit quarters, featured by commercial and residential zones and as affordable workspaces for emerging creative industries. Despite receiving capital investments from governments and developers, many post-industrial developments are beset by issues such as homelessness, gentrification, and inclusivity.

Considering this phenomenon, this research analyses 10 post-industrial projects to identify common issues, opportunities and development strategies that have and continue to impact the sites as they evolve. Waterfront sites are selected as they are usually located near or at the heart of city centres, possess optimal locations for major urban transformation initiatives, yet face various environmental challenges. The paper reviews relevant planning policy, historic and contemporary post-industrial designs, considers the performance of the projects as new productive landscapes against notable urban development theories. It reveals the (little) capacities of these mega projects in providing affordable live/work space for diverse occupiers, especially small-scale, low-yield businesses.

This research advances knowledge of post-industrial design practices to be utilised in future urban waterfront revitalisation projects. It uncovers tensions between existing tactics towards renewal between top-down vs bottom-up approaches, private- vs dweller-led developments, limited accessibility, gentrification, diversity of uses, and sense of belonging. The paper contributes to the development of a more innovative and nuanced vision of future renewal sites that governments can utilise when developing abandoned waterfront landscapes.

Sociology and Social Sciences in India: Connections and Closures

Social Sciences witnessed tremendous growth in post-Independence India owing to a variety of factors. The inauguration of a democratic polity and the attendant democratization of higher education facilitated the creation of a congenial setting wherein social sciences could go for massive growth and expansion. India's preoccupation with planned economy propelled economics on a higher pedestal among the social sciences. However, other social sciences like sociology, political science and psychology could also partake of the state-bestowed legitimacy and support by making their claims for 'relevance' through their contributions to our understanding of cultural impediments to development, challenges of nation-building and social psychological aspects of development and change in general. Invariably, the historical trajectories of development of the social sciences have been even. Whereas economics has been the most prestigious as a policy science with firmer institutional scaffolding, sociology, political science and psychology have primarily grown around university and college departments. Indeed, some of them have also found a secondary place along with economics in interdisciplinary research institutes and public policy think tanks.

Expectedly, the differing status of social sciences has impacted on the nature of conversations among them: economics being most insular as a confident social science and sociology being most open given its perpetual quest for identity as an academic discipline. Political science and psychology figure somewhere in between along this disciplinary spectrum. Based on the Indian Council of Social Science Research (ICSSR) Surveys of Research in these four disciplines, this paper proposes to synoptically map out the contemporary state of connections and closures among these four academic disciplines. It will examine the cases wherein productive exchanges among disciplines have

enriched a given interdisciplinary field (such as political sociology) and cases where stunted conversations have marred the efflorescence of a disciplinary field (economic sociology).

THAMILARASAN, Mahamuni* (University of Madras, India)

Rural Indian Women's Outlook: Venture on Achieving the Gender Equality (5th SDG)

Women in Indian society are engulfed by traditional practices, discriminatory attitudes and deprivation. The UN Women stated that in developing countries, 43% of the agricultural labours are women where as in global scale the women landholding is only 20% and two third of the world illiteracy are women. The World Bank in Gender specified that investing in women and people of all gender will build a productive and inclusive society. The United Nation adopted Sustainable Development Goal with the principle of 'leaving no one behind' which focuses on holistic approach on achieving the 17 SDGs. Goal 5 of the SDG is on Gender Equality considering the fact that it is not only fundamental human rights but also necessary for a sustainable world. The 2022, World Economic Forum Global Gender Gap Report shows that of eight region covered, South Asia ranked the lowest with only 62.3% and India ranked 135th ranked. Much efforts have been made in order to achieving the gender equality, but the problem remain unsolved. United Nation International Children's Emergency Fund reported that among the large nations, India is the only one where girl child death is higher than boy child. Gender equality has association with several indicators, especially in nation like India where it is been age- old and rooted deep, thus making it complex. The present study is descriptive in nature and conducted through the secondary resources with content analysis method. The study is intended to conceptually address the issues and indicate the underlying indicators that encumbers on achieving SDG and provide remedial alternatives which can indorse significant development on venturing towards achieving gender equality and promote Sustainable Development.

The Intersection of Gender, Socio-Economic Class and Migration in Elderly Care: Sweden and Germany Compared

A long-standing but expanding trend in Western societies is the involvement of migrants in the elderly care sector. Characteristic of this trend is the emergence of new patterns of inequality based on the intersection of fundamental dimensions of social inequality such as gender, socio-economic status and migration status. Despite these general trends, cross-country comparisons indicate clear differences in the mode and processes of integration of migrant care workers and the emerging patterns of social inequality. Decisive for these country differences are the design and the interplay of policies in the areas of elderly care, professionalization, employment and migration. The focus of this paper is a cross-country comparison of the mode of involvement of migrant care workers in elderly care, the emerging patterns of inequality as well as the underlying policies and their interplay. Sweden and Germany are selected for the comparison as two countries that differ significantly in these policy areas and in their interaction. The comparison aims to reveal the impact of the design and interaction of the policies on the mode of involvement of migrant care workers and inequality-related patterns. Conceptually, the paper draws on approaches developed in international comparative welfare research on elderly care, professionalization and migration, which will be combined within an own concept. This will be complemented by approaches created in the area of multi-level intersectionality to analyze processes and patterns of inequality. The empirical basis is provided by a systematic comparison of the policies in both countries as well as an evaluation of statistics and research results in both countries.

"Sport on the Warpath": An Figurational Reflection on the Role of Sport in an Interdependent World

Once more, there is war in Europe. To understand the interdependency of sport and society, and highlight the disenchantment of sport, we analyse the current war situation in Europe and its interdependency with sport in general. Norbert Elias himself was a refugee during World War 2. Fleeing Poland/Germany and leaving his family behind, gave him and extraordinary perspective and background for understanding violence and aggression in society. With the emergence of modern society's state organization, nation-state formation and parliamentarism, the thesis of Elias is that the state has gained a monopoly on the control of the aggressive human emotions through the military, police and judiciary. Therefore, the opportunity to unfold, create and discharge aggression, which are defined as some genuine, socially shaped operating categories, are gradually being taken over by the domain of sport in modern Western society (Elias & Dunning 1986). In this paper we argue that sport is not an a-political activity, as sport is interdependent and related to general social processes. By focusing on cases from both Denmark and Norway,

at the time the war between Ukraine and Russia broke out, we problematise the understanding of sport. This historical and comparative gaze provides us with useful sociological knowledge, which can teach us to understand sport as part of a survival unit (Kaspersen, 2014), binding nations together – also in time of war. Even though several key actors; writers and researchers have pointed out the political importance of sport, there has, nevertheless, been a relative consensus to sanctify sport, in order to keep it away from the political corridors of power. Since Vladimir Putin invaded Ukraine and violated the country's sovereignty, sport has been used as a political counterforce.

What Is Co-Research Anyway? Advancing Theory and Practice

Research suggests that active participation of young people as *co-researchers* has benefits for the research process and its outcomes (Kirby, 2004; Tisdall et al., 2009), and is essential if young people's rights are to be truly respected (Alderson, 2008). But how might we conceptualise co-research with young people? What might it mean for young people, senior researchers, the research process and its findings to attempt to situate young people as equal partners in research from conception through design, data collection, analysis and dissemination? In this paper, we - a collective of researchers, young people and practitioners - develop a concept of co-research as reflexive, relational practice designed to unsettle the usual power relations between senior researchers and young people and generate change that is meaningful from the perspectives of young people. We discuss a case study of a four-year collaborative research initiative to transform the role of young people in research. Initiated by the Centre for Multicultural Youth (CMY) and developed in collaboration with the Centre for Resilient and Inclusive Societies (CRIS), we discuss the way practitioners, researchers and young people have worked together to transform the role that young people play in research, and the challenges we have confronted in this process. We first describe how CRIS researchers, CMY practitioners and young people have co-created, tested and refined approaches, practices and resources for youth co-research. We then analyse the practices, principles, knowledges and artefacts that can help scaffold co-research, including the importance of institutional champions for co-research with young people, and research training and support to upskill both young people and senior researchers to work together. We conclude by discussing the implications of co-research for reconfiguring established power relations between young people and those who seek to advance research with them.

RC18-268.2

THIREAU, Isabelle* (Centre for Studies on China, Korea and Japan, France)

From Public Gatherings to Intermediary Publics: Acting Together in Tianjin (PRC)

Despite their diversity, authoritarian regimes are often characterized by the existence of intermediate spaces between state and society that defy the usual dichotomies in political science. At one end of the spectrum, there are state actors leading private institutions or private initiatives that promote state action by circumventing the constraints or perceptions of the state's own administration; and at the other end of the spectrum, non-state actors engage in actions that involve various forms of interaction and cooperation with representatives of the ruling parties and the state. These complex spaces are more or less institutionalized or fragile. Embedded in various forms of local and national connections, they are often multi-faceted and involve relationships that are based upon, but also reconfigure, existing patterns of distance and proximity. This contribution aims at exploring the concept of "intermediary publics" (Cottereau 2002) in order to identify relevant criteria to allow for some form of discrimination between the spaces observed. Among these criteria is the way in which these spaces organize or not, in their effective practices, a confrontation between a plurality of normative principles and sources of legitimacy. More specifically, this contribution draws on recent research conducted in the city of Tianjin (PRC) on several types of 'public gatherings' as places where coexistence between fellow citizens is shaped and where concerted action takes on different forms.

THOEMMES, Jens* (Université Toulouse-Jean Jaurès, France)

Collective Bargaining of Distant Work in France and Germany

This contribution presents research on collective bargaining for distant work during the COVID-19 pandemic. 13 case studies in France and Germany with 100 interviews in companies of different sectors and sizes show the diversity of the implementation of distant work. The main results indicate a company culture resistant to telework, a significant progression of the theme

in each company, and difficult negotiations on the distance/residential trade-off. Negotiations are dependent on the variability of the types of company. The rules seem particularly fragile. They are adapted according to the health situation and feedback from experience. Negotiation is permanent, broken down into phases and punctuated by agreements and amendments. The rapidly expanding topic of distant work raises questions about the future of collective bargaining and the traditional conception of workplaces.

Bureaucratic and Organizational Amenability to the Racial Diversification of Immigrants: The Intersectional Subversion of White-Only Immigration Policies By the Point System

Many scholars have observe how'd after immigrant-receiving countries adopted policies to admit immigrants irrespective of nationality and race, the racial composition of immigrants did not immediately diversify. It only diversified after their governments adopted "point systems" to recruit immigrants with the education, language ability and skills believed to increase the migrant-receiving economy's productivity. Why? I draw on two months researching previously restricted archival documents and quantitative data of all immigrants governments admitted into both Canada and Australia to reveal how in the cases of Canada and Australia both the organizations of consular institutions and practices of bureaucrats limited how much immigrant sources diversified because they continued to prefer to recruit and select Europeans as immigrants. However, the more productive immigrants in white-majority countries lost interest in immigrating and the more non-white people in migrant-sending societies increased their formal education, language mastery, and technical skills, the more frequently bureaucrats became amenable to admitting immigrants racially dissimilar to the general population but more economically productive than white immigrants. This emerging preference later stimulated the Immigration Departments to decide to geographically expand their organizational infrastructure to many countries and regions that Immigration had not before serviced, thereby facilitating further non-white immigration as more people became aware that this was a possibility. This study illustrates how scholars through a more intersectional lens can better potentially understand changes in how institution and norms change over time, formerly prioritizing only one axis of identity (race) to over time increasingly admitting a minority of non-white immigrants that are exceptional with respect to an increasingly valued aspect of their identity (productivity to the economy). This research contributes to the literature on the sociology of organizations and bureaucracies, international migration, and race and ethnicity, comparatively noting both historical similarities and differences and similarities in Canada and Australia.

THORPE, Amelia* (UNSW, Australia)

Bodies on the Line: Performing Post-Automobile Citizenship

This paper examines People Protected Bike Lanes, a series of interventions in citizenship on city streets. Participants put their bodies on the line, quite literally, standing in traffic to temporarily create safer spaces for cycling. People Protected Bike Lanes can be understood as 'acts of citizenship' (Isin and Nielsen 2008), interventions deployed to (re)constitute the scope of citizenship rights. They contribute not just to the material form of the city, but to the city-citizen relationships at the heart of urban governance.

My interest in these practices flows from ongoing work on public participation in city-making: who gets to have a say, and how. A central concern is the interaction between formal and informal planning systems, drawing on pluralism and performativity to highlight the contingent and socially constructed nature of the rules that structure the city (Thorpe 2020). In exploring participation and the entanglement of the formal and the informal, I am interested in whether People Protected Bike Lanes might disrupt and reshape city-citizen relationships by acting as if they were different.

By putting their bodies on the line, participants make claims not just about particular streets, but more general claims about their rights as citizens. Participants engage in subversion – making visible and uncomfortable the unequal mobilities and citizenship practices that result from car-oriented infrastructure. They also go beyond this, providing a material demonstration of how streets could be different, how a citizenship decoupled from automobility might look and feel. Connecting to events like Reclaim the Night, the bodies on the line are often female, and pay particular attention to women, children and more vulnerable road users. People Protected Bike Lanes enact a form of citizenship in which cycling is accessible not only to the brave, but to everyone: a basic part of citizenship in the city.

THREADGOLD, Steven* (University of Newcastle, Australia)

Between Youth and Young People: Living Breathing Young People and Their Conceptual and Disciplinary Doppelgangers.

This paper speculates about how the terms we use, the context we use them in, the actual everyday lives of our research participants, and the institutional/

structural contexts in which we do all of this converge to have very real affects on young people's lives and how the general population perceives 'youth'. The very object of youth studies – 'youth' as a transition phase between being a child and an adult – has been problematised by the field's own findings. Youth cultures are not the domain of just young people, as older people continue to participate in them, while, as always, youth cultures are co-opted and commercialised. As 'youth' is cut loose from age brackets, it becomes an affective figure used for an array of vested interests. The space between 'youth' and 'young people' is how the immaterial and figurative notions of youthfulness are central to capitalist value creation. But, importantly, what is often left out of these considerations are the actual bodies of living, breathing young people. This paper will discuss these aspects using empirical examples from research on punk, hospitality work and experiences of debt. Drawing on this analysis, the paper will conclude by making some general definitional claims about what youth studies should be. Youth studies needs to be defined more specifically as research done *with* youth, not *on* them, and should advocate from their world view, rather than from the viewpoint of governmentalised and often well-funded research that either sees young people as a problem or wants to fix them.

RC30-JS-20.2

TIETJE, Olaf* (LMU Munich, Germany)

Migrant Cooperatives within the European Border Space

The linking of the migration regime (Mezzadra/Neilson 2013) and the labour regime (Moulier-Boutang 2007) are producing border spaces. Those border spaces are constituted by practices, techniques, and technologies of actors and actants. They are produced apart from the geographical demarcation line of a frontier and are part of the everyday life of immigrants. Bureaucratic practices, language barriers or the stratification of civil rights are some examples of conditions re-structuring spaces (e.g., administrations, schools, or the working market) into border spaces (Tietje 2021).

Reflecting methodological nationalism (Urry 2012) and focusing a non-essentialist perspective on immigrations my aim is to analyse the way migrants are on the one hand part of the production processes of border spaces. On the other hand, my research interest focusses on the way migrants interrupt the production processes of border spaces. By doing so, they are able to establish better living for themselves but are also transforming (parts of) the society as a whole.

In my contribution I will show how self-organized cooperatives of migrants are intervening into precarious living conditions generated within this border space. I will show this following my research in Barcelona (Northern Spain) on the everyday organizing of migrant workers in small self-constituted cooperatives. For this aim I will *first* describe the situation of immigrants in Spain and more in detail in Barcelona. *Second,* I will present how the migration regime and labour regime are interwoven in the city and *third* show - following some empirical examples - how groups of immigrants are using the legal opportunities in southern Europe for formalizing their businesses.

Digital Technology in US Store-Based Retail: Toward Job Upgrading or Degradation?

Digital technology in US store-based retail: Toward job upgrading or degradation?
Françoise Carré and Chris Tilly
Two broad arcs in the literature on technology and work have debated the likely impacts of digital technologies on a variety of jobs. First, a long tradition extending back to Marx and Keynes has predicted displacement of workers by automation. In a particularly crisp formulation, Autor, Levy, and Murnane (2003) posited that digital technologies would facilitate the automation of tasks that can be fully specified and thus routinized. However, in a recent update, Autor (2022) notes that the spread of machine learning and artificial intelligence now allow digital systems to learn and perform non-routine work. A second body of literature focuses on the *nature* rather than *the* number of jobs. Braverman's *Labor and Monopoly Capital* (1974) launched decades of debate by contending that employers use technology to deskill and control labor, but others, such as Kochan and Osterman (1994), have argued that technology opens the way to "high performance" systems expanding worker discretion and judgment. In short, the likely implications of digital technologies for work remain unclear and require empirical study.

We examine how new digital technologies are transforming labor processes in frontline jobs (cashier, stocker, salesperson) in the retail sector—one of the largest employment sectors in most middle/high income countries, and one incorporating varied non-routine tasks (interacting face to face with customers, managing stock in an environment constantly changed by customer actions). We study the USA. Our national-sectoral framework (Carré and Tilly 2017) predicts further job degradation, whereas other observers predict job enrichment. We draw on interviews with technologists and retail executives (~100 "mini", 17 longer) and workers (30+), plus observing trade conferences and webinars and reviewing trade media. Preliminary evidence, while mixed, points to several specific forms of job degradation.

Unequal Pathways to Vlogging: How Social Class Shapes the Career Aspirations and Professional Routines of Youtubers

Video blogging (vlogging) as one of the new generation's top career choices worldwide is often portrayed as a game-changer equalizing pathways of digital entrepreneurship in that creative newbies coming from humble families can kick off self-enterprises of digital entertainment using a smartphone. While an encouraging possibility, it raises question of whether professional vlogging is essentially a privileged career choice, especially when digital divide and class rigidity persist even or more so in the social media age. Drawing insights from contemporary theories of practice and critical sociological studies of stratification, this research examines how social class comes to shape the career pathways and professional routines of YouTubers from different class backgrounds, who variously engage in professional vlogging on a day-to-day basis. Based on an analysis of in-depth interviews and online ethnographic data, it reveals the roles played by classed family history and early-career socialization in creating distinction in the mobilization of resources and networks for initiating the self-enterprises of digital entertainment. A close examination further discloses a dramatic divergence in the habitus and cultural repertoires internalized by the vloggers with different tastes and know-hows tied to their class positions. By illustrating the distinctive pathways to professional vlogging, this research reveals the reproduction of class privileges that (continue to) underpin the new creative industry, especially in times of uncertainty and crisis.

Hidden Drivers of Sustainable Energy Transition: The Effects of Economic Growth, Democracy and Gender Equality on the Development of Renewable Energy

Prior studies have indicated that gender matters in pursuing sustainable development, especially remarking women's contribution in conducting more pro-environment behaviors and having more ecological reform capabilities than men. Questions remained that the women-environment associations and women-led sustainable energy transition were the products of other social reforms or progress such as economic growth or democracy. To examine the effects of gender equality on the energy transition, we conduct a fixed-effects panel data analysis containing 184 countries from 2000 to 2018. Our results indicate that when controlling economic growth and democracy, gender equality and women's rights, measured by women's economic entrepreneurship and political participation in the congress, are productive to the development of renewable energy. In addition to the clarification, these findings help shift the focus from women's household pro-environment behaviors to gender roles and power relations in the public sphere.

Juventud y Precariedad: Reflexión Sobre Las Transiciones a La Adultez Para Comprender Las Disonancias Intergeneracionales

De un tiempo a esta parte, en el seno de la sociología de la juventud proliferan los estudios sobre, por un lado, el cambio generacional, y por otro la precarización de las condiciones de vida del colectivo joven. A su vez, en este quizá algo crispado contexto, parecen emerger disonancias intergeneracionales que ahondan en una falta de entendimiento entre jóvenes y adultos. El reciente cambio social multifactorial condicionado (entre otros aspectos) por la individualización señalada por Beck, por la ruptura entre la expectativa (de una generación) y la experiencia (de otra generación) detalladas por Koselleck trae, en consecuencia, que las dispares vidas de un padre y un hijo relatadas por Sennet en *La corrosión del carácter* aumenten su distancia entre sí. Todo esto hace que nos encontremos ante un momento idóneo en el que el análisis intergeneracional, con especial énfasis en la precaria vida joven parezca pertinente e incluso necesario.

La precariedad padecida por la juventud basada en la devaluación, pero simultanea exigencia de los títulos académicos, las condiciones laborales y el bloqueo de la emancipación hace que se dé lo denominado como prolongación de la juventud. Sin embargo, desde nuestro análisis creemos más atinado referirnos a un bloqueo de la adultez que encuentra su base en la precariedad. Ante la descrita situación, las generaciones adultas (también influidas por un clima mediático que no favorece las vías de entendimiento) observan las transiciones juveniles actuales como una prolongación del hedonismo asociado a lo joven, pero en la (in)voluntariedad de esta dilatación de la juventud reside el eje de lo disonante. En síntesis, planteamos una discusión teórica que imbrica alguna pincelada cuantitativa para tratar de facilitar vías de entendimiento ante las dispares vivencias y perspectivas intergeneracionales.

Traditional Ethos and Adivasi/Tribal/Indigenous Religious Practices and Learnings: A Case Study of Sarna Sthals in Jharkhand, Eastern India

Religious beliefs and practices are universally found in all contemporary societies. The domain of religion in *Adivasis* has important dimensions like nature God, spirits, a series of rituals and the role of religious practitioners. '*Sarna* Movement' has gained tremendous popularity among the *Adivasis/* tribals in Eastern India. In the last two decades, this movement has been able to bring a reawakening among the tribals of Jharkhand for religion, culture, identity, land and language. The movement started as socio-religio revivalism among the followers of *Sarna* beliefs to assert their indigenous practices. Different strategies like prayers, devotional songs, sermons and teachings on leading good lives have been used to create awareness about *Sarna* religion. It has played an important role in spreading the distinctive '*Sarna*' identity in the villages. In the initial days of the movement the women who wanted to enter the *Sarna* (Sacred Groves), for prayer and worship, received opposition from the community elders. The movement broke the tradition of preventing women from entering the *Sarna*. This movement has accommodated women who have gradually become agents of *Sarnaism* in the capacities of healers, worshipers, leaders, teachers and propagators. Under their leadership, *Sarna Sthals* (Place of Worship) have transformed into a place of miracles, divine experiences, visions and healings. This paper explores the lived experiences of women, folk religion, their traditional ethos and healings through prayers in the *Sarna Sthals/* Sacred Groves. The study has tried to understand the magico-religious practices of the region, its history and its significance to prayers and healings. This study of religion and the art of healing through prayers has been based on the indigenous knowledge system.

TIRYAKI, Muhammet Esat* (Humboldt Universität zu Berlin, Germany)

Conflicts in Marketplaces: A Comparative Study at the Maybachufer Market, Berlin and the Fatih Çarşamba Market, Istanbul

Recent scholarship has analyzed street markets as settings of friendship and sociability assembled through fluid encounters. Despite the multivariate practices that prompt friendship and solidarity among vendors, these temporary urban places are not free from the idea of conflict. While much of the literature has devoted its attention to the conflicts related to the survival strategies of street vendors against external forces such as market management and local institutions, conflicts among vendors arising from their daily practices have often been overlooked. In this paper, through a comparative ethnographic study, I will focus on the practices of conflicts generated by the everyday practices of vendors. Based on ethnographic fieldwork I conducted between 2019 and 2021 at the Maybachufer Market in Berlin and the Fatih Çarşamba Market in Istanbul and in-depth interviews with street vendors, I will demonstrate how street vendors generate conflicts among themselves and how these conflicts impact their sense of belonging to the market and neighbourhood where they work. By conceptualising conflict as inevitable market practice, I will address two types of conflicts: a) conflicts produced by the everyday practices of street vendors, and b) conflicts produced by the competitive desires of street vendors.

TITARENKO, Larissa* (Belarusian State University, Belarus)

Consequence of the War in Ukraine on Global Sociology

Most people in Eastern Europe are far from politics. They are alienated from making political decisions and not responsible for military decisions of the national governments. Regardless of the war situation, common people in Russia and Belarus keep friendly attitude towards the Ukrainians.

As a sociologist from Belarus, I can make some general comments on the situation that are mainly based on the theory of late modernity by Antony Giddens. First, we are engaging with a changed and changing reality. The global and regional situation is not stable because the world is uncertain and unpredictable. People lost trust to science and progress. No forecasts are reliable. Turbulence has become the main feature of this world. Second, the war made the existing crisis in sociology even deeper and added new dividing lines in sociological community. Cancelling the EU visas for Russians and flights from Russia made it almost impossible to participate in the international conferences. Crisis put an end of the "world of mobility" constructed by John

Urry. Isolation of Russian sociologists is a consequence of this crisis. Staying at home they are afraid to express oppositional views, while in the western countries their papers are often not acceptable. There is a risk to lose a regular communication within the global community of scholars. Third, it seems that the global world has passed the bifurcation point and will not return back to its previous state. However, the morality of the "Old Testament" is not a way out of this situation (even in regard to authoritarian states) as it can return Humanity to the medieval past. The idea of "Cancel culture" is not a human solution. Future is open. The non-standard approaches and actions are highly required. Perhaps, this congress will help to produce them.

RC48-674.1

TIWARI, Devika* (Lady Shree Ram College for Women, India, India)

The Negative Impact of Authorianism on Women:with Regard to Body Autonomy

The effect of authoritarianism has been strongly seen on women. The rise of global right-wing orientation and religion has acted as a catalyst in legitimizing the atrocities and control of the state. This can be seen with regard to various laws and orders passed to suppress the liberty of women all around the world. Women can 'control their reproductive lives' without access to abortion; they can do so by refraining from sexual intercourse. (Amicus brief, july 2021, by Texas Right to live). This statement clearly shows that even big powers in the world, like the USA haven't been the kindest to women.

The stigma around the sexual health of women has added to the difficulty. The intervention of the state with its rigid stance can be seen not only in the east, but in the west as well. The recent developments in the USA have put an end to the hope that liberation and autonomy were just around the corner, after decades of suppression (Sutton et al.,2022).

The very issue of abortion speaks about the lack of choice to make a decision about their own body and health.The judgements given by certain judicial authorities with regard to marriage with the rapists without thinking about the future consequences and threat of domestic violence proved that women in most countries are seen as nothing but a piece of flesh. It also brings into light, the little say women have in the process of family and society.

The UNFPA report (State of world Population, 2022) turns the attention towards the very issue of lack of female autonomy specially regarding pregnancy and sexual health. This stigma and disgust extends to taboo around menstruation and contraceptives. This makes it an important global phenomenon to be studied through the social, economic and political lens.

Self Identity and Sports: A Sociological Study

Authors: **Dr. Rakesh Kumar Tiwari**, Assistant Professor, Buddha Institute of Technology, GIDA, Gorakhpur, Uttar Pradesh, India

Dr. Ravi Prakash, Associate Professor, Government Degree College, Nanauta, Mughalsarai, Varanasi, Uttar Pradesh, India

Abstract: Sport is a group activity, an universal phenomenon. From childhood individuals start to take participation in the sports, an organized game.

Sports, its rules and processes have close concern with the individual behaviours and groups involved in these activities. It reflects the norms and values of the general culture of society. It play significant role in

shaping and developing personality, identity of the participants and practitioners as well.

Objective of the Study: The purpose of this sociological study is to explore the ideas about role of sports in "Development of Self identity" of sports practitioners.

Method of the Study: It includes an analysis of concern literature which covers various aspects of the development of self of an individual participating in organized physical activities and games that play an important role in formation of their social world.

The results of the study: The analysis of the given sociological study manifest that sport is instrumental in creating, developing and maintaining self identity of sports practitioners, players and coaches through their interactions with groups involved their identification with specific teams and players as well.

Globalization, Modernity and Traditional Ideology: An Analysis of Conflicting Situation of Afghanistan

Globalization which emerged as an economic phenomenon in the last quarter of the 20th Century has now undergone a deep crisis not only

denotes a presenting author. Abstracts are organized by first presenting author's last name.

economically but also politically and culturally. Afghanistan is one of the examples of the clash between modernity and traditional ideology which led to the deep social, cultural, and political crisis in the last few decades. The forces of globalization which represent the transformation of modernity in the West have to deal with forces that are radicalized and insist on the practice of the traditional way of life and opposed modernity in toto. The efforts to modernize such societies lead to a resurgence of insurgency and terrorism with the support of regional and global power players. Information technology while facilitating the process of economic, political, and cultural globalization, on the one hand, it also helps in establishing global linkages among different terrorists and insurgent groups operating in different parts of the world. In the case of Afghanistan, traditional forces have overpowered the population who have modernized over a period of more than two decades. Many of these people left the country and today become refugees in different countries of the world. The present paper attempts to analyze the conflicting situation in Afghanistan from the perspective of globalization.

The Role of Health Professionals in Combating the Crisis of Covid-19 in India

Pandemic Covid-19 originated in China and has circumnavigated the whole world in a very short nospan of time. In India, the govt. has declared 21 days total lockdown in the whole country in March 2020 to save the life of the people at any cost. This step helped not only in breaking the chain of the Coronavirus but also provided sufficient time to the state and national governments to gear up their health machinery and to enhance needed medical facilities in all the districts of the country to face the challenge of the virus. At that time, India was not having sufficient PPE kits for medical doctors and health professionals, and also lack of testing kits (one lakh kits were immediately imported) and equipment like ventilators. Even more than 70% of alcohol-based sanitizers were also not manufactured on a large scale. India also imported N-95 masks for doctors and health professionals at that time. The national government took initiative to produce all these items at the local level. The doctors and health professionals also used their talents in curing the Corona patients diagnosed with available symptomatic drugs. The rate of recovery from Corona is also very high (between 40-50 percent) in India. The health professionals have done a commendable job to combat coronavirus and worked round the clock to save the life of the people, The success in manufacturing the vaccines by India has also helped in dealing with the crisis. The doctors, health workers, scientists, and pharmaceutical company professionals worked very hard to control the coronavirus. The present paper is aimed to analyze the role of health professionals in combating the crisis of Covid-19 in India.

TIWARI, Sweta* (MAHATMA GANDHI CENTRAL UNIVERSITY, India)

From Farm to Platter: Gauging the Impact of Act East Policy on Indigenous Food Practices and Culture of Konyak Nagas of India

Recent history has seen several examples of boycotting food products from a particular nation as a form of protest, as well as wars and climate change that led to an increase in food prices and scarcity of food worldwide. Food appears to be used as an easily accessible tool to express political motivations and permeates all aspects of our existence, regardless of caste, colour, class, and other factors. Cast in the shadows of liberal multiculturalism, what one has on the platter is a potlach of interplay between habits and habitat, traditional knowledge and modern science, climate change and sustainability, class, caste and gender- a cultural keystone of the community. The simple transfer of what they produce to their platter is a schema of socio-historical systems of existence they have preserved over time. By bringing the simple element of physiological and cultural survival i.e., food as an agency, heritage, and culture to the forefront of policy and development paradigm, the article attempts to capture the multi-scalar engagement of Indigenous community, which may necessarily be subsumed by the political capitalism and profit-oriented policy engagements. The article uses the Konyak Nagas' culinary traditions as a case of how the global national policy, i.e., Act East Policy, interact with the histories of food production, procurement, and consumption among indigenous communities. The Act East Policy anticipates developing the North-eastern region of India, which is home to 200 indigenous tribes. The economic tendencies of the policy are likely to affect the means of subsistence of the pre-industrial societies bringing plethora of changes to their platter. The article examines the worldview of Konyak food culture while also questioning foreign policies that have an inclination to overlook the efficient and sustainable forms of food culture, which are an integral element of the cultural fabric of the community.

Unmasking Emotional Cartographies of Culture and Community in the 'Fieldwork/Field'

Couched in the cultural and ideological imaginations, till date, fieldwork is the hallmark of anthropological studies. The physical location becomes the starting point of ethnographic inquiry. The tapestry of socio-cultural practices in any community is made meaningful through the exploration of/ intellectualizing the place/field. The conventional anglophonic depiction of fieldwork is deceptive. The field is reduced to backdrop in which people perform their everyday life. But it is the insinuating 'emotionscapes' between people and place that produces pervasive imageries of the field. It was during my fieldwork among the Konyaks of Nagaland, India, I realized that the Konyak culture was deeply entrenched in the emotional configurations of landscape that we refer to as 'field'. In this article, I argue that places serve as ground for fieldworkers to turn from strangers to marginal natives. I emphasize the significance of making sense of emotional cartographies to see the cultural logic of the community. The field can be categorized into active and passive zones of social actions and underlying social relationships. Yet, we consider 'field'; as isolated physical entities. In this article I attempt to see 'field' as an institution ordering the social life of people as well as researcher. It can be construed as a container in which all the social interactions take place. The presence of fieldworker has the potential to destroy the natural place of the natives. Instead of abandoning the idea of place, considering it truly geographical, we can engage in unmasking the cartographies of culture by acknowledging field as a spatial production and enter the cognitive mapping that the community has lived.

TO, Clara Wai-chun* (The Education University of Hong Kong, Hong Kong)

Conflict Resolution Strategies and Marital Stability in Cross-Border Stepfamilies in Hong Kong

This article examines the dynamism of conflict management and the effects of women's resolution strategies to stepcouple relations and marital stability in Mainland China–Hong Kong cross-border remarriages. Remarried women comprise a significant proportion of foreign brides in Asian and western societies. In Hong Kong, over one-third of Mainland Chinese brides in cross-border marriages were remarried women, whereas the number of divorcees has mushroomed. Research has shown that intermarriage between foreign-born migrants and natives and remarriages in general are prone to conflicts and instability. Although stepfamily studies have elucidated the various styles of conflict resolution, little is known about the dynamics and processes of conflict resolution in international remarriages and its effects on marital outcomes. Based on in-depth interviews with 35 remarried Mainland mothers, this study investigated the strategies deployed by these women in interaction with their spouse, children, and external social institutions. Five types of resolution strategies in two broad categories of conflict styles are identified, whereas each conflict style may equally precipitate into remarital dissolution or harmony. The engagement and response of family members, especially husbands, to women's efforts and external social support are paramount to marital stability. The results indicate the utility of treating couples as individuals with different strategies and the limits of binary approaches to conflict strategies and their outcomes.

TO, Clara Wai-chun* (The Education University of Hong Kong, Hong Kong)

Divorce As a Strategy of Empowerment: Remarried Chinese Immigrant Women Navigating Immigration and Social Policies in Hong Kong

Emerging research on transnational divorce shows that the influences of immigration status, citizenship and social policies are mixed. Discrepancy in immigration and family laws of the countries of origin and destination of foreign spouses may delay divorce decisions and create obstacles to immigrant women's remarriage and claim for child custody. Yet, residency and support from the welfare state may facilitate union dissolution and liberate foreign-born women and their children from dysfunctional familial life with social protection. Based on in-depth interviews with Mainland Chinese single mothers who remarried Hong Kong men, this article argues that exclusionary immigration laws and social policies have posed significant challenges for cross-border stepfamilies and increased the likelihood of marital disruption. Instead of viewing immigrant women as victims, it explores the ways by which these women activate divorce or create split households as "strategies of empowerment" to navigate the restrictions imposed by these policies and gain access to social entitlements when their husbands fail to provide. The influences of these policies and the strategies that women employ to navigate policy restrictions vary according to women's immigration status, stepfamily configurations and relationships, husbands' living arrangements, and women's

earning capacity. This research fills major gaps in the literature of marriage migration in two ways. It explores the role of state power in divorce in transnational remarriages. It focuses on an understudied yet significant group of marriage migrants in Asia and the West, namely immigrant women of higher order of marriages who brought their children from previous relationships to their remarriage, and demonstrates their agency in navigating exclusionary policies.

Collision, Separation and Appreciation of Home and School Lives in Covid-19 for Children and Young People

The Voices project engaged with 1860 children and young people aged five-to-18 years over 21-months during the pandemic about their experiences of COVID-19 across multiple life facets through participatory methods using drawing, writing, focus groups, comics and action cycles. They were from 70+ mostly economically disadvantaged schools and groups in North East England. We heard what it was like doing online schooling at home and attending school with Covid-19 arrangements, and we heard about varied and complex aspects of informal learning and experience. This project was co-produced by researchers and practitioners from Newcastle University (UK) and the charity/ NGO Children North East.

This paper considers questions raised by children's appreciation of home and school and activities at home addressing elements of all three key challenges of the session. We consider what arose for children as home school boundaries collided in a number of ways not all of them expected. Children largely enjoyed increasing digital activity for games and social connectivity during the pandemic and felt this not understood by adults. Returning to school was much preferred to online home-schooling.

We discuss the possibility that official place-based education has longevity due to its materiality and relationality despite the proliferation of online technologies (Facer and Selwyn,2021). Consequences for conceptualising home-school relationships given the positive value of home-school separation for children are discussed. We consider kinds of learning enabled by digital tools in the out-of-school environment, and other informal learning during the pandemic. We also discuss children's valuing of non-digital informal learning during the pandemic and implications for transmedia skills (Masnet et al,2019).

Combining Research Grade Accelerometers, Activity Trackers and Survey Data to Measure Physical Activity

National organizations typically measure physical activity through surveys. Accelerometers – both research grade as consumer owned like smartwatches and Fitbits- can be used to augment or replace surveys. This presentation investigates how the use of accelerometers relates to survey measures when it comes to Total Data Error **Methods & Data:** Data come from the Dutch LISS Panel, a probability-based online panel consisting of about 8000 individuals. The panel was asked to complete the Dutch National Survey on Physical Activity, as well as questions on ownership on activity trackers, donation of activity tracker data, and willingness to wear a research-grade device in a follow-up. Survey data were collected in October 2021, the follow-up study where participants wore the research-grade accelerometer ActivPal for a week, will be conducted between November 2021-Februari 2022. **Results:** Results show that about half of the participants abide to the norms of Physical Activity as determined by the World Health Organization. About half of the panel owned an activity tracker such as smartwatch of Fitbit. About half of that group was willing to donate their data. In our presentation we will focus on predictors of device use and physical activity based on covariates from the panel (analyses still to be done). In addition, we will report on the results of the accelerometer, and look at validity between survey data, research-grade accelerometer and personally owned activity trackers. **Added Value:** This presentation shows how to use different types of sensor data to augment or replace survey questions. It informs on hybrid data opportunities in social research.

RC33-493.1

TOEPOEL, Vera* (Utrecht University, Netherlands)

Using Sensor Data to Augment Surveys

Relevance & Research Question: Lack of Physical Activity (PA) has been identified by the World Health Organization as fourth leading causal factor for death. National organizations typically measure PA in the population through surveys, however, surveys might not be the best method. Measuring PA is difficult because it requires remembering activities, estimation about intensity and duration of specific types of activities, complec calculations (in total, on average, usual) and intensity of PA is a relative issue. Furthermore, questions on PA are susceptible to social desirability bias. Accelerometers – both research grade as consumer owned like smartwatches and Fitbits- can be used to augment or replace surveys. This presentation investigates how the use of accelerometers relates to survey measures when it comes to Total Data Error **Methods & Data:** Data come from the Dutch LISS Panel, a probability-based online panel consisting of about 8000 individuals. The panel was asked to complete the Dutch National Survey on Physical Activity, as well as questions on ownership on activity trackers, donation of activity tracker data, and willingness to wear a research-grade device in a follow-up. Survey data were collected in October 2021-July2022. **Results:** Results show that about half of the participants abide to the norms of Physical Activity as determined by the World Health Organization. In our presentation we will focus on predictors of device use and physical activity based on covariates from the panel. In addition, we will report on the results of the accelerometer, and look at validity between survey data, research-grade accelerometer and personally owned activity trackers. **Added Value:** This presentation shows how to use different types of sensor data to augment or replace survey questions. TOHIDLOU, Somayeh* (Assistant Professor of Institute of Humanities and Cultural Studies, Iran)

The Constitutional Movement and the Continuation of Its Religious Activism until Today in Iran

Historically, have known the constitutional movement (1906) as the transition of Iran from tradition to modernity and its effects have continued until today. The well-known conflict in this movement is the conflict of legitimacy and constitutionalism, and various religious activists, including religious authorities and students, have been active in it. The concept of equality and law are two concepts that they differed in their definition and application. This article aims to show a range of opinions with the method of conceptual history (Reinhart Kozelek, 1923-2006) and with reference to the historical conversations of 30 constitutional religious elites. This theoretical spectrum will include: traditional legalists, traditional constitutionalists, believers in religious democracy, believers in indigenous modernity compatible with Sharia, and secular progressives. And it will also examine how dialogue and coalitions between different groups on the spectrum have been established and how they have continued to this day. Considering that the two concepts of equality and law are under the larger concept of justice, we have used a set of traditional to modern opinions about justice, to show the difference between these two views and the replacement of each part of the spectrum in the applied theories. Historically, it seems that whenever the middle groups of the spectrum have gained power and had the ability to talk with each other, popular movements such as the constitutional movement (1906), the national oil movement (1951) and the reformist movement (1997) in Iran has occurred. And whenever the power has sided with groups that are inclined to two ends of the spectrum, such as the case of Reza Khani'sdiscovery of the hijab (1936) or the forced hijab after the revolution (1979), it has had opposition on the side of the people and has been unstable; Referring to the protests of Iranian women (2022)

TOMASELLI, Charlize* (University of Cape Town, South Africa)

Policy, Participation and Empowerment: A Case Study of Community Resistance Against Authoritarian Neoliberal Policy.

Habermas has noted that policy can be either a tool of emancipation or oppression. The judicial system is the arena in which this distinction is made. This case study is an illustrative example of the conflict that can arise when a fight for policy domination exposes an authoritarian state with a neoliberal macroeconomic regime versus a people-centred and democratic participatory community. The paper focuses on how the conflict in South African policy is played out using a recent Shell seismic survey court case. The methodology employed was a case study design based on the Judgments in three sequential court cases (2021 – 2022) using thematic analysis as the data analysis method. The conceptual framework utilised Jürgen Habermas' instrumental reasoning as a high-level framework and was operationalised through the heuristic modules of Sherry Arnstein and Jules Pretty. The research makes the case that issues of public participation in this instance are a result of the different understandings and expectations of the required level of public participation

between the two groups, the local fisher community on the one hand and Shell and the Government on the other. The claim is that this is a result of the conflicting and sometimes opposing policy rhetoric within national South African policy. The findings underscore the central importance of appropriate levels of public participation as protected by the South African Constitution in the process of Exploration Right Applications in order to minimise conflict between different stakeholders.

TOMASSETTI, Julia* (Swinburne University of Technology, School of Business, Law and Entrepreneurship, Australia)

Original Content Producers and Contemporary Debates on Labour Law and Policy

This paper studies 'original content producers' (OCPs), meaning individuals who produce original content for user-generated content platforms, such as TikTok, Bilbili, YouTube, and Instagram, and who seek to make a living, or part of a living, from their production. The paper explores how we might fold OCPs into contemporary debates on labour law, and how incorporating the experiences of these workers can inflect or alter the debates. While other social science and humanities disciplines have shown moderate interest in OCPs, labour law and policy scholars have dealt little with these workers. This paper argues that, although OCPs are a small percentage of the workforce, we should consider their experiences and labor arrangements when deliberating upon the most useful notions of non-domination and non-subordination at work. The case for this investigation is even stronger when we consider recent economic and technological changes in the production and consumption of creative works. OCPs should interest labour law and policy scholars for three reasons: (1) as a labour-capital relationship, their work shares features with other contemporary work relationships—both standard and nonstandard—and we should better center these features in our debates for intellectual and political purchase; (2) their work brings into focus two discourses within our intellectual economy that pose real political obstacles to change—those of the 'platform economy' and non-capital capital, namely 'human capital' and 'social capital'; and (3) OCPs' experiences as subjects, particularly with forms of neoliberal agency, should help us better understand the bases of meaningful collective action in today's economy, as well as contemporary obstacles to effective labour struggle.

Labour Market Outcomes of University Graduates of Migrant Background in Australia: The Relevance of Cultural, Linguistic, and Educational Capital in the Country of Origin

Australia is an ethnically and culturally diverse country. According to the latest Census, nearly 30% of the population declared born overseas. Although many migrants were born in culturally similar countries such as New Zealand or the United Kingdom, a growing proportion comes from countries such as India, China, the Philippines, or Vietnam. While migrants are an important category in Australian policy and academic research, existing studies fail to recognize the diversity of the migrant population. This study seeks to address this gap by using unique linked-administrative data to examine the labour market outcomes of university graduates by their country and region of origin. The study investigates the role of quality of education in the country of origin, cultural and linguistic proximity as well as age at arrival as potential mechanisms that explain the differences in labour market outcomes of different migrant groups. Our analyses are based on administrative records extracted from the Higher Education Information Management System (HEIMS) linked to the 2016 Australian Census of Population and Housing that captures a range of labour market outcomes: income, occupation, and full-time employment. The extract contains higher-education records of all domestic undergraduate students who graduated from an Australian university between 2005 and 2015 (n = 800,618 graduates, including 141,890 foreign-born individuals). We find evidence of significant differences in labour market outcomes between Australian and foreign-born graduates as well as within the migrant population. Furthermore, we demonstrate that cultural and linguistic proximity, as well as educational expenditure in the home country, are related to better labour market outcomes. Our results highlight the need for policies facilitating migrants' labour market integration, even among highly educated migrants such as university graduates.

"It's Not Only about the COVID-19 Pandemic!": Future Post-COVID-19 Expectations of Young People in Turkey

Young people are one of the most important demographic groups affected by the COVID-19 pandemic. While the pandemic affected many areas in the lives of young people, such as education, economy, family, and friendship relations, it left them in a web of change that they had to cope with and adapt. Moreover, issues such as unemployment that they were exposed to before the pandemic became stronger in this process. The negative effects of the pandemic also affected their expectations for the future. This study aims to reveal the post-COVID future expectations of young people in Turkey. The study's data is based on the project carried out during the first period of the Covid-19 pandemic, which aims to understand the strategies of youth to cope with the pandemic. In-depth interviews were carried out with 40 young people between the ages of 18-30 and were asked about their future post-COVID expectations. The study shows that young people are quite pessimistic about the future post-COVID-19. However, it is not only the pandemic experience that underlies these negative future expectations. Firstly, young people are worried that their freedom will be further restricted due to the existence of authoritarian AKP rule in Turkey. Secondly, they think that the neoliberal economy, which is effective both in Turkey and in the world, affects them negatively, and it will be almost impossible for them to find a job in the future. Finally, the climate crisis emerges as another significant issue that worries young people who think they will face a food and water crisis in the future. Although most young people have beliefs that the negative situations they experience will not improve in the future, others prefer to control negative emotions to increase their productive capacity because for them being pessimistic is not a solution.

"Only When I Achieved Success, I Realised We Needed to Focus on Gender Equality"- Power Struggles in Female Academic Trajectories

Higher education is a particularly pertinent locus for analysing occupational gender segregation at the global level (Connell, 2019). Whilst the effects of the feminisation of higher education have long been documented (Leathwood and Read, 2009; Winter, 1991), segregations persist, both at the horizontal and vertical levels, in many different academic contexts (Carvalho, White and Machado-Taylor, 2013; Carvalho and Diogo, 2018; Husu, 2001, 2013; Morley, 2013, 2014).

This presentation draws from a larger project that addressed Gender Equality in Higher Education Institutions (EEA Grants), analysing both qualitative (4 case-studies, 25 interviews with academic leaders and 9 focus-groups) and quantitative data, namely statistics and trends over the last two decades across Europe. In this paper we present evidence of the main obstacles encountered by a set of 11 Academic Women with successful careers, interviewed about their professional and academic path.

As found in previous research and reported in the literature, these women have faced numerous obstacles to achieve leadership positions and academic success. However, we also found that their perception of the existing gender bias in favor of men increased throughout their careers and specifically when they started to occupy positions of power previously dominated by men. In contrast with male academic leaders, women displayed a greater need to justify their professional choices considering work-life-balance. These outcomes will be discussed in the context of the different scientific areas to which these women belong and the structure of opportunities created by the deep transformation of the Portuguese and European university landscape that took place over the last decades. The results of this research are very relevant to debate and develop new public policies to decrease occupational segregation in Higher Education.

Relocation of Culturally Significant Values in the Recovery from Disasters

Los desastres tienen el poder de irrumpir severamente en las esferas material, emocional, cognitiva, conductual, social, cultural y espiritual de la vida de las personas. En ese contexto, la destrucción del patrimonio cultural representa una pérdida de valores e identidades que afecta todas esas dimensiones. Ésta puede entenderse como un tipo de duelo que los individuos y las comunidades atraviesan.

Para alcanzar una recuperación significativa en torno al patrimonio cultural, los individuos y los grupos deben atravesar varias fases: 1) aceptación de la dimensión del daño en su dimensión material y no material, y su impacto para la comunidad; 2) situar el origen del daño o pérdida tanto en la amenaza como en las vulnerabilidades materializadas para poder identificar (y atender) la raíz del problema; 3) los afectados deben decidir si los valores y funciones del patrimonio perdido pueden y deben ser recuperados, y poner en práctica mecanismos de recolocación (temporal o permanente) de los mismos; y 4) trazar posibles formas de recuperación del patrimonio cultural a partir de los valores, significados, usos y funciones significativos localmente.

Esta investigación se centra en el proceso de recolocación de valores registrados en varios casos de estudio afectados por los sismos de 2017 en México. Éste se observó como un indicador de la capacidad de adaptación sociocultural a realidades post-sismo, del nivel de organización previo, pero también como reflejo de las formas alternas (no institucionales) de comprender el patrimonio que surgen desde, y dan forma a, discursos locales de la cultura y la identidad. Estos, según fue registrado, priorizaron la dimensión inmaterial sobre los aspectos materiales del patrimonio, integrando elementos como el territorio y el paisaje como parte de la memoria cultural colectiva. Finalmente, se proponen rutas para estudiar, preservar y fomentar dichas iniciativas como parte de los sistemas de recuperación cultural vigentes.

TORRES, Maria* (Universidade de Coimbra, Brazil)

A Populist Contitucionalism As a Challenge for 21st Century Democracy'S: An Analysis of Hungary Under the Orbán Regime

Governed by a conservative nationalist party, in 2011 Hungary replaced the 1949 constitution with the Hungarian Basic Law. However, from a constitutional process of doubtful legitimacy, a document was produced that has been much criticized due to the insertion of political-ideological elements that reflect the populist ideology of the government in leadership. It was observed considerable democratic backsliding in the sense of moving away the liberal principles of the state, which currently no longer includes itself in the roll of full democracies, but in the sphere of hybrid regimes, by virtue of being an illiberal democracy. The work aims to approach the Hungarian populist constitutionalism and the illiberal reflexes on democracy. It is intended to strengthen the study by building a firm base for political science and sociology argumentation, delimiting basic concepts that circulate the theme. Subsequently, it is dedicated to the theoretical development of abusive constitutionalism and the influence on the populist phenomenon. At the end, it is proposed to reflect on Hungary's political situation. The investigation adopts a quantitative approach, and it is developed from the inductive method. The theme is approaching in an argumentative-expositive speech, exalting the use of bibliographical referential, technical-scientific articles, recent law and jurisprudence. It is also emphasized the use of authors mostly in English and Hungarian, which stand out for their sophisticated knowledge and authority on the subject. The result is that Hungary has always been a country of nationalistic thinking. The avalanche of cosmopolitan ideas after the end of the Cold War, together with the implementation of liberal democracy, caused a cultural reaction that was broken in the last years by the leadership of the conservative populist government. Based on this opportunity, it employed abusive methods of constitutional changes to essentially turn the country into an illiberal democracy.

TORRES BERNARDINO, Lorena* (TRIANGLE UMR 5206 / SCIENCES PO LYON, France)

Movimientos Sociales Contra El Extractivismo Hídrico: Coaliciones Multinivel En Los Conflictos Por El Agua En México

Esta ponencia hace un análisis de coaliciones multinivel, a partir del conflicto por la presa El Zapotillo. Este conflicto detonó mediáticamente en 2008, con la fuerte defensa de los pobladores de las tres comunidades que se verían afectadas por la construcción de la presa. Esto ha provocado el despliegue de una serie de coaliciones que han instrumentalizado acciones de carácter legal, político, mediático y discursivo, para sostener su causa, e incluso ampliarla hacia mediaciones internacionales de justicia ambiental contra la ola extractivista en México.

Se hace énfasis en que el conflicto hídrico es público porque su argumento es parte de las narraciones contemporáneas. Éste es tomado por una minoría

territorial o asociativa en situación de exigencia colectiva. En un conflicto, el discurso oculta las motivaciones e intereses de diferentes actores, subraya el análisis de los discursos, e identifica la adaptabilidad de las causas defendidas. En este sentido, los conflictos por el agua son procesos de interacción, en torno a uno o más aspectos de la manera en que se gestiona, accede o se usan los recursos hídricos. Son resultado de los dilemas que enfrentan los actores y por tanto son parte de la dinámica de todo sistema social, y de los procesos de apertura de las políticas públicas del agua.

El primer objetivo es proponer un marco de reflexión, a partir del análisis del conflicto como constructor del proceso de política, y de su reconocimiento como "detonante de cambio" en la trayectoria sociopolítica del agua. Para esto, la presentación se divide en tres momentos de reflexión:

1. Marco de coaliciones multinivel en las movilizaciones sociales contra el extractivismo hídrico

2. Construcción de coaliciones en el conflicto por la presa "El Zapotillo": ¿permanencia o negociación?

3. La reconfiguración en los instrumentos sociopolíticos: cambios en la política hídrica de México

Covid-19 Pandemic: Alternative Methodological Approaches Using Big Data & Machine Learning Techniques for a Massive Literature Review and Understanding the Social Media Discourse

The health crisis induced by COVID-19 has become one of the most relevant topics in international scientific production in all areas of knowledge. Knowing the academic advances in this matter has been fundamental to understanding the state of the question and the social effects that a world in pandemic implies. This paper aims to evaluate different machine learning techniques for the extraction and analysis of data that allow the understanding, from alternative research methods to the classic ones, the COVID-19 as an object of scientific knowledge production and as a sociological phenomenon.

First, a literature review of scientific articles published on COVID-19 in the field of sociology in the Web of Science and Scopus databases from 2019 to 2022 was carried out. For the analysis of the articles, natural language processing techniques such as the Latent Dirichlet Allocation (LDA) algorithm are applied, where, through unsupervised learning applied to the text corpus, the modeling of the topics contained in the literature is made possible.

Secondly, the possibilities offered by the google trends platform were investigated. The potential of the analysis of itineraries users' search in the sociological study of social phenomena was evaluated.

Finally, a massive download of data from twitter where the word "covid" is mentioned was carried out, extracting a sample to which topic modeling techniques were applied, offering the possibility of comparing the most relevant topics on the object of study both in the international scientific debate and social media discussions.

From the evaluation of the different strategies and the nature of the data, it is hoped that progress will be made in the incorporation of new research methods into the study of social phenomena.

The governance of school-work alternance in Italy: salient features and ways of improvement

The school-work alternance is a useful pedagogical approach to reduce the mismatch between school learning and labour market needs, improving the employability of adolescents and their future professional experience, as well as promoting democratic participation in education. However, school-to-work transition is diversified at territorial level and regional disparities in opportunities may increase inequalities. In Italy, the reform of the education system recently introduced the Pathways for Transversal Skills and Orientation (PCTO), mandatory for students in their last three years of upper secondary schools: in this policy a central role is recognized to the acquisition of soft and transversal skills, as well as to the orientation purpose.

This paper presents the main evidence emerged from two studies, part of the national research project "Evaluating the School-Work Alternance: a longitudinal study in Italian upper secondary schools". An exploratory analysis included qualitative interviews involving stakeholders of upper schools and public institutions of two cities in Northern Italy: it highlighted PCTO

denotes a presenting author. Abstracts are organized by first presenting author's last name.

objectives, functioning, obstacles and facilitating factors, organizational and implementation strategies. This led to a study focused on PCTO governance, conducted with semi-structured qualitative interviews with stakeholders of institutions at national and regional level representatives of both the world of school and the business world. The results focused PCTO implementation strategies, the relations between business and schools' worlds, as well as roles, activities, and way of coordination between public and private sectors. The different stakeholders underline the complexity in activating networks that adequately connect central and local level of education systems and the school side with the business side. Emerges a dynamic and fragmented portrait of PCTO in Italy, underlying how a more effective and shared governance could improve the future planning and implementation of this policy, contributing to reduce inequalities between students in different regional education systems and to improve their opportunities.

Contagious Freedom. How the Far Right Has Ridden the Free-Vax Movements between Mistrust and Moral Panic

This paper aims to analyze some specific aspects of the events that, following the first pandemic wave of 2020, filled public spaces in Italy against the confinement measures first and subsequently against the vaccination campaigns and the decision to impose the green certificate (Green Pass) as a necessary tool for every citizen to carry out their work and to attend public places. Specifically, this analysis will be structured around two thematic macro-axes: i) *the relationship between the far-right and the anti-vaccine movements*. The demonstrations of recent months have been, in fact, a prolific terrain of diffusion and contamination for the far-right, which has found thanks to these movements a new and unexpected visibility and wide margins of action, due to the strong political, social, economic and cultural heterogeneity that makes up these movements, and the encounter between right-wing radicalism, conspiracy theories relating to the imposition of a New World Order by global elites, xenophobic and anti-Semitic positions; ii) *the affirmation of a simplified concept of freedom*. The meeting between the instances of the opposition movements to vaccines and No Green Pass on the one hand and the radical right on the other is inherent in the two main characteristics of the reflective late modernity: the radicalization of processes of individualization and the denial of the impartiality of scientific knowledge. In fact, the first phase of industrial modernity was characterized by processes inspired by rationality, trust and optimism in science, while the second modernity, typical of post-industrial societies, is instead characterized by a reflective dimension in which the universalistic narrative of collective movements of the past have been replaced by another increasingly polarized towards dynamics typical of an exasperated individualism that leads to singularism, and in which the role of super-partes legitimation of applied policies played by scientific knowledge has disappeared

Ethical Meat As Both Cultural Hegemony and Sustainability Leverage Point

Concerns over the environmental and animal welfare impacts of meat have given rise to two food trends: (1) more meat-free products, such as hamburgers made with plant-based Beyond Meat, and (2) more meat options that boast meat from "ethically raised" animals. While the first trend presents a route for popularizing diets supportive of animal rights discourses that oppose the consumption of animals, the second trend is more supportive of the animal welfare status quo wherein meat is considered morally permissible when animals are deemed to have been treated humanely before and at slaughter. The focus here is on the latter trend, for example, across the United Kingdom (UK) and Canada the advent of "humane" meat has become a well-established option, with most supermarkets offering a certified "humane" option for most types of meat. Importantly, some animal welfare organizations like Animal Justice (based in Canada) have criticized "humane" meat certifiers for misleading consumers and not going far enough to improve animal welfare (AW) conditions. "Humane" meat discourses therefore risk being coopted by large corporations wherein animal welfare is treated as a quantifiable target and unique selling proposition. Yet smaller scale farms, adopting sustainable farming practices like agroforestry and regenerative agriculture may be improving animal welfare conditions without the financial benefits that come with growing/selling certifiably "humane" and "ethical" meat. To explore this dilemma, this paper combines Gramsci's contributions to power theory with the concept of leverage points from sustainability literature. Gramsci offers a means to view "humane" meat as cultural hegemony, wherein changes are made to bring further regulatory consensus while dominant ideologies of meat production and consumption remain. Systems thinking literature, and the concept of leverage points, provides a means to imagine animal welfare interventions via the incentivizing of sustainable agricultural practices that prioritize animals as well as the environment.

Speaking for Sociology (and the social sciences): Computational Text Analysis of a Century of Presidential Addresses to the Disciplines

Drawing from theories and case-studies in digital historiography, we describe the process of building a novel data set of Presidential addresses to major US social science associations. From the late 19th century, these addresses have been preserved as archival records of particular disciplines, typically analyzed using conventional historical methods, and conceptualized as authoritative representations of the disciplinary field, of particular research agendas, or of departmental or individual biographies. Efforts to digitize and release archival material related to the historical evolution of the disciplines presents researchers with both novel opportunities for discovery and risks of destabilizing settled narratives and professional identities. The uneven pace of digitization also makes it challenging to construct representative – or even systematic – data sets that are of sufficient scale to utilize computational text analysis methods. We seek to overcome these challenges through the creation of a corpus of Presidential addresses to the American Sociological Association, and neighboring social science disciplines, since their inception. This data set represents the full universe of structured performances over a long historical period and is designed to be amenable to both computational grounded theory and traditional historical methods. Our aim is to shed new light on old questions about the parallel and overlapping development of social science disciplines as well as the relationship between modern social science disciplines and other social fields, such as politics, media, and empire. In addition to traditional publications, research output includes the data set and data infrastructure.

Gender-Based Violence on Instagram between Stereotypes, Prejudices, and Social Innovation. a Visual Analysis of the Imaginary of #Violenzadigenere

By presenting the first results of an analysis conducted on a corpus of images extracted from Instagram in Italian, my purpose is to understand the imaginary of gender-based violence and the forms of violence to it connected.
For this purpose, the posts containing the hashtag #violenzadigenere were extracted. By categorizing the posts according to the textual content, a connection with other forms of violence was identified and posts containing the following hashtags were subsequently extracted: #cyberbullismo, #femminicidio, #revengeporn, #violenzadomestica, #violenzapsicologica e #violenzasulledonne.
Based on this first level of analysis it was possible to collect 1200 images. Subsequently a Qualitative Content Analysis was conducted using the visual field as a unit of analysis in order to understand, through the representation of gender violence, how the symbolic order manifests itself on social media, what are the forms of social reproduction of roles and gender stereotypes, as well as forms of social innovation in terms of visual representation of gender violence.

TRANTER, Bruce* (University of Tasmania, Australia)

Attitudes on Climate Change in Australia

Australians' attitudes on environmental issues vary considerably according to social and political background. While attitudes are far from perfect predictors of behaviour, environmental attitudes provide a useful gauge of one's willingness to act on environmental issues. Previous research has shown that younger, tertiary educated Australians are far more likely than others to accept the veracity of anthropogenic climate change (ACC), and to vote for Green political parties. Alternatively, those with conservative political leanings tend to be sceptical of human caused climate change.
However, low public trust in climate science also stands as a barrier to action on climate change. While an estimated 97 per cent of climate scientists agree global warming is occurring and is mainly caused by humans, nationally representative surveys show that only about two-thirds of Australian adults accept the scientific consensus.
Analyses of recent data from the Australian Survey of Social Attitudes show that trust in climate science mediates the influence of social background and political party identification on accepting ACC in Australia. This suggests that environmental sociologists would do well to consider how institutional trust influences environmental attitudes and behaviour, particularly in relation to climate change.

Worker Representation in the Green Transition

This paper speaks to the RC44 call themes around the evolution of a new green politics that challenge the assumptions and traditions of organised labour and its institutions. Addressing the challenges of climate change will call for dramatic shifts in the way societies produce and consume. Yet there is limited understanding of how workers view these changes and how unions represent their interests in the processes of social and industrial change implicit to successful climate mitigation policy. While recent research has begun to explore how IR systems might shape union voice within regional 'green economy' policy making (Stroud et al 2018) or union collective bargaining strategies on environmental issues (Tomassetti 2020) we contend that a broader understanding is also needed of workers' perceptions of the climate crisis and demands of the so-called 'just transition'. Reporting on data from national level surveys of 4,000 German and UK workers conducted in 2022 and a mapping of trade union environmental policies in these two countries, we explore the ways in which workers view green economy transitions and their preferences for how the implied restructuring should be managed and whether and how this is currently be represented by organised labour in these two countries. Our study examines if and how worker climate perceptions appear to be represented by organised labour in two countries with broadly similar CO_2 emissions profiles and making some progress towards decarbonisation, but with different employment models. The implications for worker representation are also considered.

TRAUE, Boris* (University of Luxembourg, Luxembourg)

Reconstructing Sympathy through Relational Theory

Since the 1940s, a near complete disciplinary division between psychology and sociology has occurred. This allowed both disciplines to sharpen their epistemic claims - at the price of also *losing* explanatory potential. In Mead's and Simmel's works, psychological and sociological styles of thinking are held together by the concept of *sympathy*. While sociology had gathered around the problem of social order, and psychology had gathered around the cognitive processing of perceptual information, both have mostly abandoned the idea of human relations as governed by 'sympathy'. This 'lost ontology' of sympathy was also very much alive in the works of other authors of the era such as Martin Buber, Max Scheler, Theodor Lipps, Peter Kropotkin and later, in a philosophical style, Emmanuel Levinas as well as – in a negative gestalt – in Giorgio Agamben. In this sense, the concept of sympathy has retreated into philosophy, where it has lost an empirical perspective and practice. The presentation explores the importance of sympathy in the writings of Simmel, Mead, and other Belle Epoque scholars. Subsequently, revivals of 'sympathicist' tropes in current social theory will be discussed: The notion lurks in socialist writings and regularly erupts in sociology, such as in Habermas' theory of communicative action, in Hartmut Rosa's theory of resonance, theories of emotional intelligence and in neurosciences ('mirror neurons') as well as in popular writings such as Rutger Brekman's. I will discuss where these neo-symphathicist writings succumb to romanticism instead of providing analytic capacities. Finally, possible venues of reconstructing a *theory of sympathy* through relational sociology will be explored, as well as its potential analytical usefulness for understanding 21st century societies.

Community and Conflict in Retirement Villages

Retirement villages in which older people live independently in age segregated communities have expanded as a type of housing. They are seen by government as having health benefits for residents, and social benefits in reducing pressure on housing markets through down-sizing. Yet there have been consumer complaints about predatory practices and calls for stronger regulation. This paper reports initial findings from a mixed methods study commissioned by the Commonwealth government. Drawing on a survey of 800 residents, 36 interviews with residents and 10 interviews with stakeholders, it describes the appeal of community living in retirement villages, consumer complaints and disputes, stakeholder perspectives, and regulation by the state.

Looking at the Advancement of Artificial Intelligence and Human-Machine Interactions through the Lens of Social Analytics: Basic Theoretical and Methodological Approaches

There is an enormous flow of research publications dealing with AI. However, the 'Big Three' dominates in this flow: computer science, cognitive science, and philosophy. Most recently, in the Western world (especially in the US), there is a surge of publications coming from the humanities and critical theory. These publications concentrate on social justice, privacy, and ethical issues.

Simultaneously, such well-established fields as science and technology studies (STS) and communication theory have started to claim quite strongly their interest in examining the reality of AI technologies.

The paper we propose to the ISA Congress in the framework of the RC-23 Session deals with the theoretical and methodological potentials of social analytics in researching current developments in AI technologies.

The basic argument of the paper is that Human-Centered or Human-Centric but not Technology Centered approach must be the primary orientation for those who are dealing with AI.

The recognition of the demand for a Human-Centered AI highlights the urgent need to develop a deep understanding of how to introduce students of the social sciences to AI and how to support social sciences professors in this endeavor. However, AI has been conspicuously absent from social sciences education, and there has been limited research examining AI learning and teaching in social sciences and humanities programs. A key open question for AI social sciences education is how students can be introduced to the fundamentals of AI in the context of its application to solving core societal problems.

The authors also argue that AI progress turns human-machine interactions into human-algorithms interdependence.

Global Mobility Aspirations and Orientation Among Students at a Private Japanese University

We will present results from a questionnaire survey, focus groups, and interviews of Japanese university students we conducted in 2022. The study focused on the global mobility aspirations of these students in the context of pandemic-induced transformation of access to information about living and working abroad, such as lost opportunities to study abroad and interact with international students, while also having more social media and internet content consumption time. We examined how the students' views on working abroad and interest in the world was affected by the transformation into an online learning environment and Japan's global travel lockdown. We found that students most interested in a global nomad lifestyle and global connections have values that are aligned with globalism and exhibit academic outcomes and choices that are consistent with desirable international education objectives. Previous research has shown that young Japanese have become less globally oriented in recent years (Japanese Cabinet Office 2019) than youth from other nations. This data contributes to the ongoing investigations into globalization within the context of Japanese cultural and educational norms.

Our research methodology combines a self-administered online questionnaire using Freeasy with additional focus group interviews. The survey included demographics, course selection, language study interest, self-reported English proficiency, social media and consumer behavior, and attitudes toward globalization. The questionnaire was administered to all 2nd and 3rd-year students in the College of Arts and Sciences at a private university in Tokyo (n=204). Correlation and regression analysis support the hypothesis that global mobility aspirations and orientation are not common among Japanese youth and are associated with a global world view and positive educational outcomes. We also will present results of our focus group and interview studies, which provide insights into pandemic-induced transformations in Japanese society.

Critically Examining Proposed Pathways to Net-Zero By 2050 for BP, Chevron, Exxonmobil and Shell

The global transition to carbon neutrality requires rapidly downscaling fossil-fuel production. So-called oil and gas 'majors' like BP, Shell, Chevron and ExxonMobil have historically hampered this transition, lobbying against climate policy, spreading disinformation, and withholding spending on renewables. Yet since around 2020, all claim to be transitioning to clean energy, announcing goals to reach net-zero emissions by 2050. But inspecting these announcements and corresponding decarbonisation strategies reveals worrying loopholes escaping the attention of existing literature. These concern intentions to use offsets, differing scopes for emissions targets and ongoing plans to produce and sell fossil fuels.

Accordingly, this paper examines proposed pathways to net-zero by BP, Shell, Chevron and ExxonMobil. Analysing qualitative evidence from each major along with quantitative data from carbon offset registries, I ask: 1) What are the similarities and differences in each major's decarbonization objectives for 2050? Do these include plans to scale-down the supply of fossil fuels?; 2) How are offsets levered as a decarbonisation and business strategy?

Findings show Chevron and ExxonMobil omit the emissions from energy products (scope 3) in net-zero targets. Meanwhile, no major has an explicit plan to downscale their supply of fossil fuels inclusive of those produced inhouse and by third parties. Reaching net-zero consequently relies heavily on offsets.

Yet the quantitative analysis reveals widespread use of offsets with questionable climate benefits. Most are issued from avoidance-based projects that do not contribute to the direct removal of carbon from the atmosphere. Furthermore, the analysis reveals that the majors are overall actively purchasing aged credits that do not support climate mitigation actions today. Such evidence indicates that no oil major can be considered as transitioning. Furthermore, due to reliance on low-quality, aged offsets with dubious climate benefits, this empirical evidence challenges the authenticity of claims around net-zero and carbon-neutral fossil fuels.

Societal Attitudes Towards Male Childlessness in Europe

Even though both women and men have children, historically studies of fertility and reproductive behavior focused on women. Recently, however, the importance of men's role in reproductive decision-making has been increasingly recognized, thus, leading to more studies on men's fertility behavior. It has been shown that both male fertility and birth rates decline with age, so postponing the birth of the first child too long might lead to negative outcomes for men in the same way as for women. In fact, studies show that the rates of male childlessness are even higher than that of women. As the level of childlessness has been increasing all over Europe it is important to investigate whether it has been accompanied with the change in societal attitudes. Traditionally, societies put more pressure on women to become mothers, however, with changing gender roles and demographic context more is expected of men in the family domain. In this paper we use the data of the European Social Survey: round 9 (2018) and round 3 (2006). We aim to investigate if (how much) societal attitudes towards male voluntary childlessness have shifted in 25 European countries and whether there's an association with increasing levels of male childlessness. We also compare attitudes towards male reproductive nospan and related childbearing behaviors. Research project is financially supported by the Research Council of Lithuania (LMTLT), agreement No. P-MIP-22-286.

Pentecostal Political Activism in 2022 Brazilian Federal Elections

The Pentecostal presence in the Brazilian political scene has been growing since the 1980s. The Evangelical Parliamentary Front (FPE) was constituted in the National Congress in 2003 and, since then, has acted in defense of a Christian moral agenda in legislative decisions. Pentecostal political activism also interferes in presidential elections, where the evangelical electorate

proves to be crucial for the dispute, considering that since 1989, all the elected presidents have counted with the support of the leaders of the largest brazilian Pentecostal churches. The present research analyzes the relationship between religion and politics in the current national democratic scenario, from a perspective on the 2022 presidential and legislative elections.The methodology includes the analysis of campaign materials, polls of vote´s intentions, debates among candidates, interviews, public statements, and posts from the candidates' social networks. The candidate with the most important support from this religious group is the current President Jair Bolsonaro, running for reelection. Several studies show that the support of the evangelical segment was decisive in the result of the 2018 elections. In a poll of voting intentions released on 09/15/2022, Bolsonaro leads the votes of evangelicals (49%), while Lula has 32%. On the other hand, when we consider the whole population, Lula has 45% of the intentions while Bolsonaro has 33%. Two days before the elections, polls indicate that, for the first time since 1989, Brazil may elect a president of the republic without having the official support of the main evangelical leaders in the country. The final results will still be analyzed, as well as the composition and support of these religious leaders to the new elected government, raising the debate on secularity of the Brazilian State and the growing influence of this sphere of Christian power in the Brazilian society of the 21st century.

Portability of Concepts and Language across Countries: Equity and Diversity

Equity and diversity are important policy imperatives related to migrant integration as well as to minority accommodation in Canada and other major migrant destination countries. Migration researchers, in particular those who have worked in diverse geographical contexts, need to be aware of how the concepts, such as equity and diversity, travel and translate between disciplinary boundaries, historical and political periods, as well as academic and public discourse. Drawing on our international research experiences on migrant integration in Greece, Italy, Denmark, and Canada, we analyze how these concepts, i.e., equity and diversity, are defined and understood in diverse research contexts and public discourses. It is worth noting that these concepts present different challenges in terms of translatability and contextual understanding. Equity is not easy to translate into a word and usually gets confused with equality while diversity is easily translatable but may incorporate invisible nuances as to what type of diversity is the focus. We employ the notion of transcultural capital to discuss how migration researchers' understandings of the portability of concepts across countries can enhance their skills and knowledge to critically reflect on their scholarly work and personal lives. This paper discusses how definitions of the national ingroup, the migrant 'outgroup', and the values of the nation-state can shape the meaning of equity and diversity. It explores how these concepts travel and become adopted but also integrated into local contexts of meaning, thus contributing to public discourse about migrants and migrant integration.

Portability of Concepts in Migration Governance

There are many concepts in migration studies that are contested – even the very notion of migrant and refugee or asylum seeker – is one of those. Moving between world regions one realizes that an asylum seeker in Europe is a refugee claimant in Canada and so goes for many other countries where they may be refugees. In English and in Italian, or French --we may distinguish between an emigrant and an immigrant but in many other languages there is no way of indicating if someone is leaving a country (emigrating) or going to a destination (immigrating) and the two can simply be different words or a distinction may simply not be available. Language is not just a medium of communication but also a way of organizing our thoughts. This paper will focus specifically on the notion of temporary vs permanent migrant discussing the academic, lay term and policy related definitions of each. We look at Canada and Singapore as two migrant destination countries that use English as their official language and investigate how these concepts reflect different realities on the ground. We then take two countries that have been mostly known as countries of migrant origin notably Greece and the Philippines, whose national languages are less known, and their use of English as a second language in governance. Through these we look at the notion of temporary or permanent emigration, the corresponding concepts (and policy terms) of diaspora and discuss how these are defined in legal and conceptual terms. Our aim is to show similarities and differences and the interplay between historical experience,

denotes a presenting author. Abstracts are organized by first presenting author's last name.

policy and scientific terminology, and see how the two former define the latter and also to discuss how transnational terminology can be incorporated into the national jargon, and eventually may see its meaning and semiology changed.

In a Liminal Space: Filipino Migrant Nurses in Ireland and Their Conflicting Class Status and Lifestyles

In this paper, we sought to understand from a translocal frame the class conditions and experiences of Ireland-based Filipino nurses as a middle class, highly skilled group of professional migrant workers. We looked into differences in their income distribution across different countries of employment, their consumption patterns, and their experience of social mobility as they moved from their country of origin to an intermediate country, for some, and finally Ireland as their destination country.

Based on mixed methods research involving 61 semi-structured interviews and 421 survey respondents, we sought to understand the shifts in their class status and the changes in lifestyle and consumption patterns that have accompanied their migration.

We used Philip Kelly's concept of class as performance in his class analysis framework of migrant labour, which focuses on the consumption of goods and the practice of "culture," "lifestyle," and "taste."

We found out among others not only the improvements in their socioeconomic conditions with their migration but also how their persisting connections to the home country puts many migrants in a liminal space. Sending remittances and engaging in initial investments to the Philippines while carving out their life in the destination country puts them in a conflicting and unstable class condition and sets them back in terms of fully enjoying their middle-class status as migrants. Some engage in strategies like living in rural communities and city peripheries to stretch financial resources. Many only enjoy their middle-class lifestyle fully only when their financial obligations back home cease. Some find themselves investing initially in the Philippines, only to regret this decision later on.

This paper contributes to a better understanding of how translocal connections shape the experiences of highly skilled, middle-class migrant workers and contributes to their consumption patterns, lifestyle choices, and class experiences.

TRIONFETTI, Maria Cecilia* (Université libre de Bruxelles, Belgium)

Rethinking Forms of Resistance through the Prism of Occupational Health

In Belgium the healthcare crisis appears as the point of the iceberg of a sector under stress I terms of working conditions and care model, long before the covid19 outbreak . The situation of the sector is illustrative of a trend towards the commodification of healthcare in Europe through the processes of privatization, concentration, financialization and private development with public money.

From a ground based perspective the concepts of precarity of living conditions, atypical work, racialized labour and sexual division of work are central to the understanding of care work. Actually, in a neoliberal context, nursing homes are an extremely profitable sector that relies on low-skilled, female racialized work with insecure employment and working conditions. Market logics and the introduction of lean management model hinders "work well done" while subjects bodies to productivist work practices. This is what workers express when they talk about the "institutional abuse" that both, workers and residents, are being subjected to within these nursing homes.

Despite this, forms of resistance more or less formal exist to face the demands of work. The conflict in the sector during the pandemic enabled the visibility of short-term demands for better safety and hygiene conditions. However, in the medium and long term, to what extent did social conflict led to new strategies of collective action? Did this unprecedented crisis break with the tradition that placed workers as passive subjects of an occupational health prevention policy determined by others? Was there a shift from the visibility of occupational risks to the dispute over labor processes? Presentation will draw on qualitative data collected from semi-structured interviews (N= >20) with workers and union representatives, since May 2021, as part of an ongoing doctoral research on union strategies and mobilization of collective knowledge to make occupational risks visible in the care sector.

Urban Marginality in the Post-Covid World: Re-Imagining Universal Housing As Infrastructures of Care

Housing, according to the WHO's Social Determinants of Health, along with infrastructure, socioeconomic conditions, and social exclusion, is a key determinant of population health. India has the largest inadequately housed population in the world with around 24% of urban dwellers living in slums. Indian cities are inhabitance sites of various kinds of informal, precariat housing arrangements. Most of the urban poor engaged in various kinds of economic activities house themselves in such precarial housing arrangements. The current COVID-19 pandemic situation forces us to reflect on the embodied, relational and affective cartographies of the space in our inhabiting practices in the urban.

Apart from vaccinations, the most potent response to the COVID-19 pandemic is social distancing serving as the most effective containment measure. However, it's simply not possible to follow social distancing norms in the densely populated informal settlements in Indian cities. It is estimated that social distancing norms will become more commonplace in future as human populations become more susceptible to zoonotic infections and the spread of pandemics.

Therefore, it is pertinent to upscale the housing infrastructure in a big way to make our cities more secure, habitable, and sustainable. It can be achieved through a policy push like 'Housing for All' seeking universal social housing while at the same time, discarding markets as the most rational and efficient allocator of public goods. Apart from the large-scale social housing projects, Indian cities also require affordable and decent rental housing provisions for the migrant workers, and shelter homes for the socially excluded and vulnerable sections of the society like the destitute, abandoned elderly and mentally ill, and homeless population groups. Thus, we need to recognize the role of universal housing as the pivot of social care for all sections of society and its transformative potential for the cities of the future.

Digital Dalits Constructing Subaltern Public Sphere with Their Political Engagement

In India, the digital media has become a facilitator for Dalit politics. According to the 2011 census, around 16.6 percent of India's population is comprised of Dalits, a disenfranchised community. Dalits with a higher socioeconomic standing are building a subaltern public sphere via the construction of websites, discussion forums, and groups on social networking sites. This public sphere covers caste-related issues, discriminatory practices, and Dalit history, as well as demands for leaderless demonstrations and assemblies to demonstrate their political engagement. Social networking sites promote connected action, which enables Dalits to share thoughts and establish viewpoints that they may not be able to express openly with their higher caste counterparts. Beth Kolko argues that local cultural traditions influence Internet usage and growth. According to Nayar [2010], technologies have effects on real lives, bodies, emotions, the locations from which they function, and the economy. Whereas other media scholars assume that the political application of social activities determines whether online media are exclusive or inclusive. Dalits' online activism has resulted in the formation of counter-publics, as they continue to challenge the dominant paradigms and mainstream ideology of secularism and democracy, and bring attention to their grievances. Subaltern public sphere has led to widening of debates in Indian democracy and created platforms for alternative voices.Dalit Blogging has been interpreted as the re-creation of their self-image on the Internet, producing new narratives and identities in the virtual world. This study attempts to examine the formation, dynamics, and characteristics of the subaltern public sphere. It would also draw analogies to the alternative public sphere that exists in other nations, such as among African-Americans in the United States. It will also explore the issue of unequal access of Dalits to the digital world, resulting in the exclusion of the vast majority, particularly rural Indians.

Economic, Diplomatic and Geopolitical Narratives of Russia Ukraine Crisis By Media: A Study of Select Digital Print Media of India and West

Since the recent military flare up between Russia and Ukraine, news media has been covering day to day occurrences of war scene and also setting narratives through views of opinions regarding the reason, repercussion and ramification of crisis. Right from the onset the conflict has impacted the world economic scenario, diplomatic stand of nations concerned and international relations as influenced by geopolitical factors. While some write ups and illustrations of digital platforms of print media cover the conflict objectively, a narrative is set in accordance with the affiliations and strategic stand adopted by the nations belonging to the media, in views and opinions.

World has witnessed impact of war on Sri Lanka, Food grain supply shortage, various sanctions imposed by NATO against Russia, strategic procurement of weapons for Ukraine by NATO, protest against war in Russia. All major ramifications of war are being actively covered by media. In the present study, a discourse analysis of Indian and prominent media of NATO nations will

be conducted to understand comparative priming, framing and positioning of the conflict. The study would also endeavour to find out the narratives set by different medium in broader sense to disseminate information and build perception about conflict among their respective audience. The study would take up texts of articles, news analysis, editorial views and illustrations published on digital print platforms of prominent media for the analysis. Significant developments since the beginning of the war will be identified and related coverage of the occurrences and views/ opinions will be analysed to understand the dimensions of dissemination of information and building up audience viewpoint regarding the conflict between Russia and Ukraine.

Riot-Induced Displacement and Migration By the Tribals of Kandhamal: A Post-Facto Study

Kandhamal riots of 2007-2008 were the worst form of ethnic violence that Odisha has experienced. After the reported large-scale violence (732 FIRs), 15,000 people were shifted to relief camps ran by the state Government. Kandhamal riots were manifestations of an ongoing conflict between two major religious groups there (e.g. Hindus and Christians) as well as manifestation of the economic conflicts between a Tribal group (Kondh) and a Scheduled Caste group (Pano). Riot-affected people were shifted to 10 relief camps who stayed there for almost two years. Thereafter they were rehabilitated in three colonies set up by the state Government. In the backdrop of religious conversions and riots in Kandhamal causing displacements/ forced migration, this paper aims at two objectives: (1) to study the Kandhamal riots' causes and its implications for inter-community relationships, (2) to study the role of civil society organizations (NGOs and Voluntary associations) in the context of Kandhamal riots. Primary data were collected through in-depth interviews conducted from among the riot affected people of both the communities and members of CSOs working among them. The Social constructionist theory is used as a theoretical framework for studying the perspectives of affected people of both the communities and CSOs. According to the data collected and interpreted, the relationships between both the communities have undergone a qualitative change in the post-riot period where in the role of the state government and CSO have been decisive in matters of R and R. Although 14 years have passed, the feeling of ethnic hostility and trust deficit persists among the affected people in the rehabilitation colonies. Several CSOs (e.g., Vanvasi Kalyan Ashram, Jan Vikash, Sneha, Aina, Swati, etc) have been working for relief, rehabilitation and reconciliation measure among the riot victims. But the ethnic hiatus and rivalry continues, as indicated by the field narratives.

TRIPATHY, Sandeepan* (National University of Singapore, Singapore)

Being in Debt to Avoid Poverty

The paper explains how the precariat uses debt as a strategy to prevent themselves from acute poverty. The paper argues that the role of debt is buying time from an imminent crisis. Drawing from Wolfgang Streeck's work on Buying Time and ethnographic research, the paper highlights how debt's social and moral connotations intersect with the economic meaning. The paper focuses on a region called Aska in India, which attained the status of Notified Area Council (NAC) in the 1990s. After two decades, the region remains a NAC. Its inability to become an urban center from a NAC is characteristic of people's use of debt and availability of debt. Ethnographic research shows that households incur debts to start a small business. They take further debts to start different businesses after failing to break even or earn money. This vicious cycle continues indefinitely and carries on from one generation to another through forms of socialization and social networks. The paper argues that such a process is a deliberate strategy to avoid poverty and resist migration. While debt 'itself' is not seen as a debilitating force, the effects of debt, such as livelihood problems after starting a business or inability to sell, are construed as "cruelty to others." The paper demonstrates how debt as a strategy to avoid poverty canvasses the innate failure of neoliberal logic as mores or folkways of people.

As such, the paper argues that 'debt' became a strategy due to the failure of not the availability of social welfare mechanisms but the lack of communication and information regarding the availability of social welfare schemes. Documentation ensures the creation of various welfare cards required to avail of welfare; what precisely that welfare is remains unknown. The paper argues that debt has become more accessible than welfare.

TROSZYNSKI, Marek* (Collegium Civitas, Poland)

Refugees, Immigrants and Invaders. How the Language We Talk about Migrants Is Changing.

"Language is one of the key aspects of migration and social mobility", and this also applies to the language used by the media to comment on migration

and migrants. In my paper, I want to discuss the evolution that the language of public discourse on migration has undergone, by focusing on the media debate in Poland (press and social media), and comparing it to that in Great Britain.

The example of the evolution of Polish discourse seems to be particularly important, with the crisis of 2015 heralding the advent of the debate on migration in Poland (Krzyżanowski, 2018). A comparison with the British debate on migration (Allen, 2016) will allow me to show two different media systems described from the perspective of the duration of this phenomenon and its respective historical backgrounds.

The media content analysis was based on the monitoring of the press and social media. The following research techniques were applied: (1) quantitative analysis employing corpus linguistics (CL), (2) qualitative analysis using critical discourse analysis (CDA). The idea of combining these two research approaches has been frequent in the past (Fairclough, 2000; Piper, 2000; Baker, 2006).

CL allows one to answer the following research questions: what collocations in the media discourse accompany the refugee or migrant category? How do they change over time? In what thematic contexts do they appear?

CDA makes it possible to indicate the political context of language changes in the discourse on migration. It also enables one to show the differences between individual communication channels (social media, press) and opinion-forming circles.

Conclusions are formulated based on analysing large corpora of texts from the mainstream press and selected sources from social media (Troszyński & El-Ghamari, 2022).

TRUDA, Giovanna* (University of Salerno, Italy)

Poverty: Beliefs, Emotions and Rights

The Italian director Lina Wertmuller, in 1992 proposed the film "Io speriamo che me la cavo". The story of an elementary school teacher and the vicissitudes of his pupils. For a spelling mistake in the name of the country, he instead of being sent to a country in the rich north of Italy in one in the south of Naples. The film tells the socio-economic dimension of a country in the province of southern Italy, a reality made up of poverty, at times extreme, often accompanied by cultural poverty and school dropout. A dimension in which precariousness is structural and yet one learns to "ride", and also emotional poverty, where there is probably no time for emotions. A political-social dimension where the fear and insecurity of life are faced with the hope of divine intervention or by delegating to apotropaic tools such as the "horn" that subtracts as a tool that exorcizes and cancels "misfortune" and protects from harmful events of life and gives a little luck. Gordon (1985) hypothesizes that emotions are transformed into feelings through three processes, one of these is the adoption of models through which the experience gained is learned by the members of a culture. This attitude puts people in a condition of expectation, personal intervention is limited and devoid of great possibilities and where external help is expected. If on the one hand these emotions manage social conflict and take the form of ways of being and feeling the community (MacIver and Page, 19761) (Pollini, 1987), on the other hand they place themselves in a situation of immobility. Faced with these emotional dynamics, how can public institutions and associations respond adequately to the new social risks and economic challenges of the pandemic and war? And how can they activate processes of change?

TRUDA, Giovanna* (University of Salerno, Italy)

The Society of "Women's Rights". Socio-Economic Dynamics and Political Dimension

Configuring the relationship between fundamental rights and "society", in a sociological perspective, therefore different from that of the jurist, means referring to the concept of equality; however, if one delves into the equal-unequal scheme, one realizes that - the very claim to achieve equality by referring to the law produces difference - (De Giorgi 1991). It is not enough to identify them and understand their functioning, genesis and evolution, but consider them as facts characterized by a certain 'fixity', being rights therefore expressed in some legal act, that is, formulated in a sufficiently precise way and endowed with binding force for a certain community "(Finco 2017: 2). The economic, social crises and political changes that in Italy, Europe and the world are facing in this last decade and in particular in this last period, have called into question the rights of the weakest, of the disadvantaged and, one more time, women's rights. Very often we run into the error of thinking that an acquired right, albeit foreseen and protected by law, and that resists the attacks of conservatism, however we should ask ourselves about the fact that when it comes to spaces of freedom there are no permanent achievements. An open and democratic system can evolve and improve, consolidate or lead to authoritarianism. Are we willing to put ourselves at risk to defend them whenever they are threatened? And how can you think of doing it? can only women's activism be the solution? De Giorgi R. (1991). Modelli giuridici dell'uguaglianza e dell'equità. Sociologia del diritto, 1, 19-33. Finco M. (2017). Diritti fondamentali e diritti umani: il contributo della sociologia di Niklas Luhmann. Revista Direito Mackenzie,11, 152-191.

Decolonial City Walks and Feminist Re-Negotiation of Urban Space As Alternative Approaches to Teaching: Unveiling Different Histories Beyond the Coloniality of Gender

Post- and decolonial city walks provide different perspectives and stories that pervade hegemonic historiography. They allow new and sometimes irritating encounters of urban spaces: as places of global historical entanglements, places of colonial injustice, places of (in)visibilization or places of social hierarchization and classification (along intersectional systems of oppression such as race, class, and gender). Critical engagement with colonial sites of memory, however, can also pave the way for anti-racist and feminist politics of memory. Thus, in the sense of a "postcolonial didactics" (Spivak), critical city tours aim to disturb and subvert dominant perspectives on belonging and to unlearn Western ideas of civilization, superiority and violence.

Our contribution is based on our scholarly activist engagement in decolonial groups in Cottbus and Kassel. Linking concepts of feminist postcolonial and decolonial thought (Connell, Lugones, Spivak, Mbembe, Sinha, Maß, Tlostanova) to local and specific colonial heritage in the two medium-sized cities in East and West Germany, we examine how Western urban spaces have continually been racialized, gendered, and sexualized. At the same time, we aim at strategies for spatializing and provincializing Western urban spaces. Reflecting on four stations of the city tours in Cottbus and Kassel, we discuss how local sites of colonial heritage are entangled within a colonial and gendered matrix of power. Moreover, we consider how an anticolonial and feminist approach to urban history can succeed. Furthermore, we discuss which didactic means and political interventions - for example in the form of scholar activism - can be considered in order to reconceptualize memory cultures. We tie in with actions like "tear this down" and invite imitation in many other cities!

TSAI, Chia-jung* (Pompeu Fabra University, Spain)

Explaining the Negative Attitudes Toward Refugee Population— an Online Survey Experiment

In recent years, a "progressive dilemma" between ethnic diversity and solidarity has been the main challenge for welfare states. In this context, hostility to outgroups is usually triggered by threats to solidarity. After the refugee crisis in 2015, a "new" progressive dilemma between diversity and female rights has been raised in Europe— the skewed sex ratio of the refugee population intensifies threats perceived by native residents, and then leads to an increase in anti-immigrant attitudes and far-right support. To better explain the negative attitudes toward the refugee population, an online experiment will be launched on Facebook Ads Manager in Germany, to explore if the sex ratio of the refugee population is the main attribute to affect Germans' hostility to refugees. We will vary our treatments across nine attributes of a refugee group to see if respondents accept this group to settle in their neighborhood: sex ratio of male, the reason for coming, country of origin, family status, group size, language skills (English), the ratio of age 15-25, ratio of higher education, and their future plan. We generate a set of images of refugees from an AI platform with different features, such as age, gender, and skin color. This experiment aims to clarify the mechanism of occurrence of the negative public opinion toward outgroups in Germany.

Einverständnis: A Neglected Concept in the Tradition and Field of Economy and Society

Max Weber, an influential sociologist with his contribution to the field of Economy and Society, developed a triple-typology of action in his 1913 essay, On S*ome Categories of Interpretative Sociology*, which was set as guideline of his mega work, *Economy and Society*. The concept Einverständnis, misunderstood as consent, played a crucial role of theorizing action and order. However, modern sociologists are more familiar with Weber's four-fold social action in his *Basic concept in Sociology* in 1920. According to the *Categories* essay based typology of action, Einverständnis contains some importance: 1) it orients to a "as if" order that constitutes a key linkage between normative and empirical orders; 2) it performs as a transitional stage between non-rational and rational action, which detours the trap of binary opposition; 3) it helps sociologists of explaining the differential mechanisms from action to order. In this paper, I attempt to broker Weber's Einverständnis into the contemporary Economic Sociology.

Revisiting the neglected concept, Einverständnis, not only reveals a Weberian viewpoint of "Economy and Society" that should have been framed as "Economy, Legality, and Society", but also advances a boarder vision in which sociologist could focus on the crucial moment that actor's subjective believing coincided with an ever-changing order. Nowadays, the various digital labor issues under the ICT technologies constitute a theoretical case for bringing Einverständnis(handeln) into sociological vision. Under the circumstance called Digital Economy, individual workers might produce value through their interaction with the "as if" order, such as the data-generating digital platform or social media. The temperal, short-lived nature of Einverständnis(handeln) would deliver a sociological explanation about how the virtual "as if" order not only links digital worker's illusion of non-rational action and expectation from a rational action, but also integrates the normative and empirical dimensions.

The Appear and Disappear of Doctor's Opinion Paper in Long-Term Care: An Institutional Ethnography of Pgy Training in Discharge Plan

Although PGY training in Taiwan has long emphasized the importance of discharge plan, institutional implementing the continuity of care still faces obstacles in frontline work. This article conducts an institutional ethnography of doctor's opinion paper (DOP) in long-term care, drawing its implications in medical education. During 2018 to 2020, investigators collected three kinds of qualitative data, including policy documents at different levels, 27 semi-structured interviews, and participant observations in PGY training for one year. The secondary textual data were generated from legal articles, executive orders, and training manuals; the primary data were gathered in a medical hospital in Northern Taiwan. The appearing process of DOP enforced by three institutional moves. First, the amending of Long-term Care Services Act confined the irreplaceability of DOP with case abstract or certificate of diagnosis, second, both central and local government of health affair proposed financial subsidy for issuing DOP, third, Taiwan Association of Family Medicine hold lots workshop for years to promote and teach physicians to issue the DOP. Even with the institutional forces, DOP, however, seemed to disappear in frontline work because of misrecognition that DOP belonged to family medicine specialist, passive division of labor between attending physician and resident or nurse practitioner, and prejudice that nurse as discharge planer rather than physician would be appropriate to lead the discharge plan team. An viewpoint from Dorothy Smith's IE theory and methods facilitates us of scrutinizing the opposing interests between institutional and practical levels. In sum, we argue that promoting DOP in the PGY training offers an opportunity to enhance physician's engagement in discharge plan, yet instructor should help PGY and resident of building confidences through issuing DOP, rise their constant contributions in the discharge-plan team, and cultivate the future attending physicians recognizing its importance.

Psychostimulants, Gender Norms, and Transformative Self: The Medication Practices for Young Adults with ADHD in Taiwan

For persons with ADHD diagnoses, the use (or non-use) of psychiatric medication is one of the most salient issues in their daily experience. Current research on the relationship between ADHD subjects and pharmaceuticals is almost situated in the context of North America and other Western countries, and consistently finds that adult consumers (mostly college students) use psychostimulants strategically in response to middle-class performance ethics and to fulfill the neoliberal cultural demand for rational self-governance. The present study was conducted in the context of East Asian, interviewing 30 young Taiwanese adults with ADHD diagnoses who had left school and entered society to elucidate what local socio-cultural dynamics enact their practices of self-medication, and to examine the relationship between the individual-level pharmaceutical self and the collective structural conditions, especially the dominant gender normative, that shape their use and interpretation of medication. The tentative findings are that traditional gender norms in Chinese culture have shaped the medication logic of men with ADHD relatively strongly, not only expecting male adults of all social classes to pursue founding their own family and career, but also setting the "social clock" of "30 years old" and thus reinforcing their anxiety about whether they are developing a stable career. Therefore, taking medication becomes a strategic means for them to achieve their traditional masculine self. In contrast, although women also used medication to cope with the stresses in the workplace, they rarely sought to develop a enterprise self and were fully aware that they still had the "privilege" of choosing full-time motherhood under traditional gender norms, and used the creativity and energy brought by ADHD in their caregiving practice. Nevertheless, their different social position and life histories with ADHD enact their heterogeneous engagement in these dominant discourses and produce divergent relationships between self, ADHD, and medication.

Transforming Exclusive Migration Regime? Opportunities and Challenges of Reforming Taiwanese Immigration Policy

Since early 2010, policymakers in Taiwan have introduced a series of pro-active immigration policies to recruit more "skilled" immigrants to settle due to decline of birth rate and labor shortage across a wide range of industrial sectors. The new policies, considered significant reforms, are exclusively skills-based, categorizing migrants according to their skill levels, with ensuing differential degree of employment freedom, scale of social rights, and possibility of acquiring permanent residency and hence citizenship. Investigating policy impacts on skilled migrants, this paper unfolds various layers of precarity experienced by an increasing number of migrants working at the lower end of white-collar job sectors without reasonable prospect of acquiring permanent residency and citizenship. Their legal resident status depends on continuous employment, with unfulfilled social rights in a structure of civic stratification created by ever-differential skilled migration regime. The policy literally makes them working and living in a host society as *de facto* guest workers indefinitely. As it currently stands, Taiwan's immigration policy reforms have consolidated the exclusive migration regime characterized by increase in immigration without settlement. This paper argues that the presence of long-term temporary skilled migrants in Taiwan is due to the commodification of citizenship that ties the migrants' rights with their market values. Taiwan's policy makers need to consider moving towards decommodifying labor immigrants, so that the legal frameworks of settlement take into account of social logics of fairness, instead of exclusively relying on economic calculations of who deserves more rights because of their market worth.

Listening to Women's Accounts of Psychiatric Coercion.

This presentation will present findings from a project exploring the experiences and effects of involuntary mental health services on women, and the perceptions of mental health workers on what it is like to be employed in settings that do not require consent for treatment to occur. Binary and carceral thinking, underpinned by legislative frameworks for responding to distress and 'risk', create conditions whereby psychiatrised women are responded to with force, as distinct from every other healthcare context. In contrast to the messages disseminated by mainstream mental health campaigns, many women reported that involuntary mental health treatment was the most traumatic experience of their lives and that consequently they will never seek support from mental health services again. Making space for participants' resistances has led to more hopeful, meaningful and nuanced responses to women's distress, situated beyond the constraints of the biomedical approach. Through inviting creative practices, including poetry and artwork, the project has explored the potential of collective, embodied and affective knowledges to contribute new understandings and to imagine futures where harm is not done in the name of 'help'.

Constructing a Singular Profile As a Freelancer: The Tension between Independence and Self-Exploitation

In the analysis of the biographical narrative we will focus on the processes of subjectification in the cases of young platform workers in the context of the creative economy of post-industrial societies. The biographical narrative analysis will focus thematically on the following points: (a) how career plans are constructed biographically and which social factors ("resources") emerge as important in the articulation and implementation of these plans; (b) what forms of educational services contribute to the construction of a professional identity as well as its reformation; (c) through which processes and practices does the employee seek to produce a "singular" professional profile in order to find his place in a globalized labor market mediated through platforms; (d) What precarious forms of labor are experienced by freelancers, who operate on international platforms? (e) How connections and transitions are achieved in biographical construction between local, national and transnational as distinct symbolic spaces. The biographical analysis will be based on the principles of the reconstructive biographical approach and draw on elements from thematic, structural and dialogic/performance analysis. Concepts of theoretical sensitivity will be drawn (a) from texts by authors in the Foucauldian tradition who explore how subjectivities are reconstituted under neoliberalism, showing that the neoliberal self is constructed as an entrepreneurial subject; (b) from texts by the German sociologist Andreas Reckwitz who describes the formation of the modern employee of the creative economy as a process of Singularization and the Self-singularization of working subject.

Sustainable Development: Looking the Culture and Communication of the Past As a Way to the Future of Sustainability in Greece.

100 years after the Asia Minor Disaster, the subsequent refugee crisis, and the settlement of the Greek refugees in Greece, there is a ghost over Greece today, that of A. Papanastasiou. Papanastasiou shows us the path to sustainable community development. He calls us to understand how socio-political communication led by the Greek State organized the settlement of Greek refugees succeeding in settling over 1.3 million refugees of Greek heritage from Anatolia (Asia Minor) to Greece. A country devastated by the previous 10 years by wars having limited production of wheat not sufficient to even feed the local population. Papanastasiou organized rural coops for the settled refugees constituting a unique agro-ecological system (designed by Papadakis). As a result, wheat production was almost tripled saving the country from a dramatic civil conflict. Today Greece, after receiving 180 billion euros from the EU, it needs to import 90% of its cereal needs. The Papanastasiou socio-political system has not been in place. Papanastasiou was the founder of Greek Sociology. He orchestrated a system of cooperation where specialists in the field were in place. Papadakis, after his rural reform success in Greece, went abroad at FAO, the US and was invited to Argentina to set up the country's agro-ecological map. As Greece struggles with its debt now and the food imports it needs to rediscover the miracle of the 1920s whereby community cooperatives supported by the Government applied novel agro-ecological methods. The community-based knowledge alliance of that past saved the country from hunger. Such an action of sociological management is required now to apply the Sustainable Development Guidelines (SDG's) today.

The Reconstruction Process and the Function of Community Resilience in Tsunami-Affected Areas of the Great East Japan Earthquake: The Case of Onagawa Town

The Japanese government institutionalized group relocation and land readjustment as reconstruction projects after the Great East Japan Earthquake. Group relocation and land readjustment involve the rights and interests of local residents and businesses. Therefore, the affected local governments make political decisions based on their understanding of the demands of the active social groups in the region and after coordinating their interests. The ability of various social groups to collectively coordinate their activities—community resilience—is a key factor in the rapid recovery of tsunami-affected areas.

This study aims to clarify the function of community resilience based on the field survey of the reconstruction process in Onagawa, Miyagi prefecture. Before the disaster, fisheries were Onagawa's core industry. However, it's decline coupled with urbanization had resulted in a decrease in population and stagnation of the related industries. Nevertheless, Onagawa's reconstruction was prompt despite the enormous damages. The findings of our study are as follows:

First, community resilience formed in the pre-disaster stage continued to function in the post-disaster stage, and continuity between the two stages was observed. The fisheries industry had flourished in Onagawa before the disaster; however, as the process of construction and operation of the nuclear power plant progressed, multiple community organizations emerged, and closer collaboration among community organizations were observed. Onagawa's post-disaster reconstruction consultation system inherited this inter-organizational cooperation. Second is the dysfunction of community resilience on the nuclear powerplant issue. A nuclear power plant has been in operation since the 1980s in Onagawa. The Japanese government ordered the temporary shutdown of nuclear power plants in Japan after the disaster and then encouraged restarts. However, Onagawa town did not create any forum for public debate on whether to restart or not. This suggests that depending on the political issues at stake, community resilience may impede democratic policy procedures.

The Competencies of Inclusion Managers: From "Boundary Crossing" through "Boundary Spanning" Toward "Empowerment/Strength-Building"

In the 2011 Great East Japan Earthquake disaster, the mortality rate of people with disabilities (PWD) was more than doubled in Miyagi Prefecture, where normalization was advanced and widely practiced. Once the disaster

happened, however, these services discontinued and PWDs were left behind. The root cause of high mortalities was attributed to the siloization of normal time social services and emergency time responses. It is therefore proposed that the fundamental solution is to seamlessly connect those two silos by involving professional social workers who coordinate normal time formal social services as well as emergency informal evacuation/sheltering supports involving local neighbors. This seamless connection would lead to the all-of-society engagement and partnership for which the Sendai Framework for Disaster Risk Reduction (DRR) 2015-2030 calls.

An action research project was initiated at Beppu city, Oita, Japan starting from 2016 to develop disability-inclusive DRR. Through the project experiences, it was learned that the key to success in engagements/partnerships with PWDs, local community representatives, social service providers, the city social services and disaster management organizations relied on the role of an Inclusion Manager (IM), who would coordinate within and across sector services/supports. From the Beppu project, a competent IM was identified, the interviews were conducted several times over a five-year period, and the interview corpora were analyzed. As a result, three conceptual clusters (Boundary Crossing, Boundary Spanning, and Empowerment/Strength-Building) were extracted by content analyses based on the affinity diagram method. The study's major findings conclude that: 1) the mission- and evidence-bases within the IM enabled the act of Boundary Crossing, 2) which led to the Boundary Spanning of multiple stakeholder groups/organizations, 3) which eventually made it possible for the local community to be Empowered and the involved PWD's Strength to be reinforced.

Return Migration and Intentions to Emigrate Again: A Study of Indian Nurses Returned from Gulf Cooperation Council Countries

Gulf Cooperation Council (GCC) countries depend largely on foreigners for their health workforce, including nurses. As they do not usually offer citizenship or long-term visas to such workers, foreign trained nurses arrive there understanding that they must leave sometime in the future and, until that time, regularly renew their job contracts. For nurses trained in India, migration to GCC countries is relatively easy because there is no language proficiency test for foreign-trained nurses and it is less expensive for Indian-trained nurses to move to these countries in terms of travel costs, recruitment fees and other related expenses. For these reasons, GCC countries are often regarded as steppingstones to working in Western countries.

This presentation aims to examine factors that affect future prospects of returned nurses based on primary data on Malayali nurses who have returned from GCC countries. Data were obtained using a questionnaire survey of 200 participants conducted from December 2020 to October 2021. Nurses came back to India for various reasons, but family-related reasons dominated over economic and other ones. The analysis shows that their return is not the end of their journey; nurses working in private hospitals, where salaries and employment conditions are inferior to those in the government sector, are willing to go abroad again to provide for their futures. The analysis indicates that nurses are willing to work abroad until they can permanently settle in developed countries or obtain permanent positions in government hospitals in India. The presentation discusses the policy implications of this finding.

TSUKADA, Yusuke* (University of Hawaii at Manoa, USA)

Life Satisfaction Is Influenced By Perceived Job Insecurity Among Japanese Workers.

Life satisfaction is widely accepted as a cognitive aspect of subjective well-being. Although various factors influence life satisfaction, this study focuses on the effect of perceived job insecurity on life satisfaction among Japanese workers based on the stress process model, using the Japanese Life Course Panel Surveys. *Perceived job insecurity* can be defined as a threat of job loss, and it is regarded as a chronic stressor because of its lasting and enduring nature instead of a life event stressor such as unemployment and a loved one death. Perceived job insecurity is becoming prevailing in Japan. In response to increased global competition and economic recessions, Japanese companies have downsized and used non-regular employment instead of full-time and permanent regular employment since the 1990s. This restructuring has spread the general insecurity and uncertainty about future employment among workers. In this trend, perceived job insecurity is important to understand workers' well-being. In addition to investigating the relationship between perceived job insecurity and life satisfaction, this study considers the "length of exposure" to perceived job insecurity from the life course perspective. The concept assumes that more prolonged exposure to a given state impacts our lives more, so this study also deals with the nature and extent of the effect of prolonged exposure to perceived job insecurity on life satisfaction. The result shows that perceived job insecurity is a vital stressor damaging life

satisfaction among male workers but not among female workers in Japan. Besides, prolonged exposure to perceived job insecurity adversely affects life satisfaction more than acute exposure to perceived job insecurity among male workers but not among female workers. This study adds some knowledge to studying workers' well-being in Japan. Furthermore, it sheds light on the gender differences in the relationship between perceived job insecurity and life satisfaction.

North American Unions and Response to Covid-19: Enabling or Resisting Authoritarian Populism?

The impact of COVID-19 on workers has been well documented. Displacement, workplace transmission, the struggle for protective equipment, recruitment and retention issues, the rise of homework, and increased focus on 'caring' labour have all been discussed as the global pandemic extended months into years. Less researched is the discursive response of organized labour to the pandemic as unions struggle to represent the concerns of workers. This paper is a content analysis of pandemic related statements from unions is selected North American cities from March 2020 to July 2022. Statements were analyzed with pandemic related themes identified using an open-coding method. We argue that the unions were implicated in a complex discourse around border closures, vaccine mandates, mandatory testing, and a range of other pandemic related to state pandemic policy. The paper discusses the implications of organized labour's reaction to pandemic policies and how the issues shifted over time and space. Of particular concern is how unions were largely reactive rather than generative in the midst of crisis. Unions demonstrated an ability to respond to the issues of the day, but did not necessarily engage broader issues of transition to a greener and more caring economy. Further, a discursive window was left open that allowed right-wing elements advocating for 'worker freedom' to seize part of the agenda. Indeed, in some cases unions are implicated in movements against state pandemic management echoing right-wing populist sentiments. Here, we see that unions are not necessarily organizations that only resist right-wing movements, but in some cases may enable them.

TUIDER, Elisabeth* (Universitat Kassel, Germany)
SPIES, Tina (Professor of Sociology at Univ. of Kiel, Germany)

Intersectional-Decolonial Subjectivation Research: Analyzing Othering and Counter-Positions in Postmigrant Societies

Migration, according to the tenor of critical migration research in recent years, can no longer be considered and analyzed as an exceptional phenomenon, but is the structural feature of society, a so-called "postmigrant society" (Tsianos/Karakayalı 2014; Yildiz 2015; Foroutan 2019). Transnational family references and plurilocal localizations, international biographies, relationships, and everyday arrangements have become established, as have positionings of multiple affiliations (cf. Mecheril 2003) and multihomeland experiences (cf. Yildiz 2018). Contrary to the still dominating public discussions about migration-related demands for integration, a postmigrant perspective does precisely not stand for a culturalizing othering 'us' vs. 'the others' and an accompanying homogenization of those considered to be 'other', i.e. refugees, (illegalized) migrants, BIPoCs, and people who are read as 'others'. Rather, it is about making visible and questioning relations of power and domination, processes of inclusion and exclusion, of making foreign and attribution.

Nevertheless, a racializing and ethnicizing othering, partly closely interwoven with a binary-gendering and sexualized othering, has not dissolved in postmigrant society (cf. Tietje/Tuider 2019; Tuider 2020; Brodersen/Spies/Tuider 2022). This can currently be observed especially in the example of welcoming refugees in Germany in the context of the war against Ukraine, where whitening and feminization of refugees permeates the current 'welcome culture'.

In our lecture we are concerned with the question of how these articulations of othering in postmigrant societies, but also how the ways of rearticulating these common discriminatory categorizations can be captured methodically? In this context, we will present and discuss the perspective of an intersectional-decolonial subjectivation research. Following the theoretical-methodological traces of Stuart Hall, Judith Butler and Ernesto Laclau, we want to clarify an understanding of the subject with which research can be conducted on powerful positionings of privilege and marginalization, articulations and re-articulations, positionings and re-positionings.

Root Crops for Food Security and Community Resilience

Root crops are considered resilient crops that can thrive in various cropping systems and climatic conditions. They are an essential source of food and nutrition and other industrial products that also provide a substantial source of health benefits (Philrootcrops, 2022). The most common root crops in the Philippines are sweet potato (Ipomoea batatas. (L.) Lam.), cassava (Manihot esculenta), taro (Colocasia esculenta), yam (Dioscorea alata).

The Philippine Root Crop Research and Training Center (PhilRoots) was established in 1977 to conduct research on the production, post-production, and utilization of root crops, as well as promote the technologies developed on a national scale. Through its Integrated Extension Program on Root crops (IEPR), it is able to address the various needs of the root crops clientele at each node of the root crops value chain, particularly in the geographically isolated, disadvantaged, disaster-prone and conflict-affected communities.

In the 2000s, the IEPR focused more on the support of the cassava industry, together with modalities such as pilot testing of rootcrop technologies, and pathways that feature the importance of intertwining public-private partnership; the role of champions, and adequate institutional support systems.

The experience of super typhoon Haiyan in 2013 highlighted the importance of root crops as a disaster/calamity crop essential to food and community resilience, food and nutrition security, and climate-smart farming.

This paper will discuss how root crops is contributing to food security and community resilience and the role of women root crop farmers toward this end.

The Political Socialisation of Second Generation Migrants

Political socialisation is the process by which one becomes a member of a political community. There is a close connection between this and the broader process of socialisation because of the overlaps between the political dimension and other aspects that mark each person's life. It is necessary to consider the interaction and exchanges between generations and the multiple agencies involved, in an active and changing pathway that each actor contributes to creating, unweaving, and reweaving, giving new forms to the threads that unite values, political orientations, worldviews, representations of politics and society, perspectives, and political behaviour.

What happens, however, when the actors of political socialisation are not the natives, but the subjects that fall within the 'set of second generations', given that the forms of political participation, of consensus or dissent, of trust in others and institutions or of disengagement and disenchantment, begin from childhood and are closely linked to socialisation agencies and culture?

The paper, starting from the cognitive question posed, will refer to a theoretical framework on political socialisation and the problematisation of the categories used to refer to 'second generations migrants'. The focus will be the presentation of exploratory case studies conducted on the political socialisation of second generations, through interviews conducted in the city of Palermo.

The red thread that will unite the cases will be the focus on the everyday aspects of political socialisation and the power relations experienced by the young participants in the research, observing their peculiarities and dynamics.

TUMMINELLI, Santa Giuseppina* (University of Palermo, Italy)

Vulnerability and Well-Being: Female Unaccompanied Migrant Minors in Italy

In recent years, greater emphasis has been placed on the vulnerability of unaccompanied foreign minors who have arrived and continue to arrive on Italian shores. The concept of vulnerability indicates a life situation in which the autonomy and self-determination capacity of individuals is permanently threatened by an unstable insertion within the main systems of social integration and distribution of resources (Ranci, 2002).

The condition of being a minor represents in itself an element of fragility due to the difficulties in being able to take care of oneself and being in a fragile developmental stage that is affected by cultural elements, but not only. These are minors who have faced a journey without adults, experienced violence and trauma during the migration phases (before, during and after the journey) and re-traumas (during the journey and after arrival). The dramatic experiences they have faced turn into traumas and become risk factors for the child's well-being and mental health. All factors that, as emerges from the UNICEF report, can be represented as a triangle, at the apexes of which we

can place separation from reference figures remaining in the country of origin, the reasons for departure and threats to their safety and the experiences they experience (2021:9). But what if we change perspective and paradigm, and analyse the condition of minors from the point of view of well-being? What are the risks and protective factors for the achievement of well-being? By adopting a model proposed by Prilleltensky (2008), wellbeing for migrants as a social phenomenon will be analysed through the identification of four levels and the results of the analysis of the life stories of young women, collected in the regional territory, will be presented.

TUNCBILEK, Seyda* (Istanbul University, Turkey)

The French Sociologist-Anthropologists or Anthropologist-Sociologists: Durkheim, Mauss, and Lévi-Strauss

Claude Lévi-Strauss, in his article "French sociology" published in 1945, declares that sociology in France is the heir of the first anthropological thought experiments represented by Diderot, Rousseau, and Montaigne, and defends the idea that the permeability of sociology and anthropology disciplines is an *exception française*from the beginning.

Émile Durkheim, who set out with the aim of establishing a positive science of society, in time turned his direction to distant and different societies to find the evidence that provides grist to new science's mill with -and thanks to- his nephew Marcel Mauss. First, he published the *Primitive Classification* in 1903, and then his *opus magnum, The Elementary Forms of Religious Life* in 1912. The Sociology chair, founded by the election of Mauss to the Collège de France in 1931, practically functioned like an anthropology chair despite its name. The compilation, which brings together posthumously Mauss's articles published in *L'Année sociologique*, was titled *Sociology and Anthropology*. Lévi-Strauss, who started his academic career in Brazil as a sociologist who refused to teach Durkheim's theory, set off from the principle of reciprocity developed by his *Cher maître* Mauss in *The Gift* while developing his theory of structural anthropology. When he returned to France years later Lévi-Strauss became also the paradoxical disciple of Durkheim ("We still believe that social facts can be studied as things" or "I am probably at this moment nearer than any of my colleagues to the Durkheimian tradition" in the pages of *Tristes tropiques*).

The relationship between Durkheim-Mauss, and Durkheim-Lévi-Strauss are still a divisive subject that is open to different interpretations. This presentation follows the line of Durkheim, Mauss and Lévi-Strauss through continuities and differences, and focuses on the coexistence and intertwining of the disciplines of sociology and anthropology, which were still in formation.

TUNCBILEK, Seyda* (Istanbul University, Turkey)

Un Sociólogo Rebelde: Los Años Brasileños De Claude Lévi-Strauss (1935-1939)

"Mi carrera se resolvió un domingo de otoño de 1934, a las nueve de la mañana, con una llamada telefónica" dice Claude Lévi-Strauss, en las páginas de *Tristes trópicos*. Era Célestin Bouglé, director de la Escuela Normal Superior, "Presente su candidatura como profesor de sociología en la Universidad de São Paulo (USP)".

USP, fundado con el decreto del 25 enero 1934, con la iniciativa de Georges Dumas (el padre de la misión francesa en Brasil), fue el fruto del deseo de las élites paulistas de reconquistar la vida intelectual y cultural tras la llegada al poder de Getúlio Vargas en 1930 y más particularmente después del intento fallido de golpe del estado paulista en 1932. USP era un símbolo de la ambición modernista y a la vez una respuesta a la crisis de la oligarquía en Brasil.

Lévi-Strauss (1908-2007), uno de los antropólogos más destacados del siglo XX, empezó, en realidad, su carrera académica como sociólogo de izquierda en USP que se negó enseñar el positivismo de Comte – todavía muy vivo en Brasil en esta época- y la sociología "doméstica", así como "metafísica" durkheimiana que le parecía el arma ideológica habitual de las oligarquías contra el poder personal. Entre 1935 y 1939, permaneció en Brasil, país al que fue con el libro de Jean de Léry en el bolsillo y del que regresó como etnólogo autodidacta.

Esta ponencia, que se basa en una investigación realizada en los archivos ubicados en el *Laboratoire d'antropologie sociale* et *Bibliotheque national de France*, se aproxima a los años brasileños de Lévi-Strauss sociólogo. También se abordan, en el contexto de las condiciones sociales e históricas del país en rápida transformación en la década de los 1930, el enfoque sociológico y los cursos de Lévi-Strauss, así como sus relaciones con los estudiantes, colegas y políticos.

Binary Sports As a Cage for Women and Gender Minorities

Recently, several states in the U.S. have enacted so-called "fairness" laws that categorically exclude transgender athletes from female athletic programs and competitions. These reactionary laws remove progress toward greater inclusivity in athletics and reinforce the significant harms caused by

rigid segregation of male and female athletes. Segregated sports purport to provide a protected space for females to compete free of "unfair" competition but ultimately trap them in a tier of athletics society assumes to be inferior. The system supports marginalization of female and gender minority athletes alike. It has roots in a view of masculinity that depends upon differentiation from the presumed weaker female body, a view that is equally incompatible with a female athlete competing against a male as it is with a transgender woman's femininity. Female athletes enjoy lesser resources and opportunity while transgender and nonbinary athletes are often forced to compete as male in violation of their sense of self. In an article to be published in Winter 2023 by the St. Louis University Law Journal, I analyze this problem from an equity perspective and urge a one-sided integration model for school athletics that would replace all-male teams with integrated merit-based all-gender teams while retaining opportunity as needed through underrepresented gender teams. By moving away from male-female labels and forced segregation, athletic programs can permit every athlete to find their ideal competitive fit and maximize their athletic excellence while creating an inclusive environment in which biology no longer serves to cap athletic potential. The arguments have broader implications outside of athletics as replacing heteronormative structures with inclusive solutions can erode barriers to equal opportunity faced by women and gender minorities.

Stepping in and Stepping Away: Variation in How Children Navigate Responsibilities Stemming from Paternal Incarceration

Despite reasons to believe paternal incarceration has heterogeneous consequences for children, little research explores the processes underlying variation in children's responses to paternal incarceration. We use qualitative data from the Jail and Family Life Study, an in-depth interview study of incarcerated fathers and their family members (including their children), to document the processes through which children respond to their father's jail incarceration. Longitudinal interviews with 53 children show that the carceral system imposes symbiotic harms on children of incarcerated fathers. First, we find that exposure to an incarcerated father restructures the lives of children, with children describing how the criminal legal system socializes them to take on emotional, instrumental, and financial responsibilities in response to their father's incarceration. Emotional responsibilities included concealing their own emotions from their family members (including from their mothers, siblings, and fathers) and providing consolation to these family members. Instrumental responsibilities included maintaining relationships with the father through visitation and other forms of contact, managing aspects of the father's incarceration, and taking on caregiving responsibilities for the father and other family members. Financial responsibilities primarily included putting money on their father's books. Second, we find that within the three domains of altered emotional, instrumental, and financial responsibilities, children expressed considerable variation in their responses to their fathers' incarceration. Some children reported seamlessly stepping into these new responsibilities, while other children reported consciously stepping away from these responsibilities or experiencing relief from these responsibilities during their father's incarceration. Third, we find that children's responses to paternal incarceration varied according to their age and father's incarceration history. By documenting the processes through which paternal incarceration affects children's wellbeing and how these processes vary across children, these findings provide new insights into how the unintended consequences of the expanding penal system transforms the life course of children.

Assessment of the Commitment of Citizens to Public Policies Using Sentiment Analysis and Social Network Analysis on Twitter through Machine Learning

In this work we apply a procedure that we have developed in the Grupo Decisión Multicriterio Zaragoza (GDMZ), within the framework of the multidisciplinary project *Cognitive Citizen Participation in Public Decisions. Socio-sanitary applications* of the Government of Aragon, to identify the affinity of the social mood with that of those responsible for decision-making (politicians, administrations) at critical moments. The method is based on the analysis of the messages published on Twitter, through which indices of influence and emotional valence (positive or negative) are obtained from the different participants in the decision-making process and from society as a whole, using techniques of social network analysis and sentiment analysis. The results show that it is possible to evaluate the degree of harmony that exists between political leaders and citizens, which can be useful to assess the impact of public policies and the involvement that citizens will have in critical decisions such as those recently taken in some countries, including Spain, regarding energy restrictions, rising interest rates, taxes, public expenditure restraint, etc.

Equal Pay for Disproportionate Work: Assessing Cultural Taxation in the Legal Profession

Though law firms are becoming increasingly diverse, do minority lawyers still have to pay a surcharge to match their white counterparts' achievements? The concept of cultural taxation was initially developed to explain ethnic minority university professors' disproportionately high participation rates in professional organizations and committees to overcome perceived prejudices or to satisfy organizational pressure from universities, which might expect accolades for having racially or ethnically diverse committees and organizations. However, institutions seldom reward this extra labor via promotions or pay raises. This paper tests the notion of cultural taxation in the legal profession. Using panel data from the American Bar Foundation's 2003, 2008, and 2013 After the JD project, which follows law degree holders over successive surveys, I test relationships between race and professional organization membership as well as leadership in professional groups. The results indicate that although Black attorneys serve in a significantly higher number of professional groups than white attorneys and are also significantly more likely to hold leadership positions in these groups, this number of group memberships does not have a stronger effect on their income over time compared to their white counterparts.

Processing Societal Expectations: Decision-Making on Entrepreneurial Education in a Research University

Starting from Schumpeterian economic concept of innovation this paper moves towards sociological direction to understand social innovation in organizational terms. More specifically, it addresses a case example of a traditional European research university, which seeks to engage in entrepreneurial education by applying experimental organization development methods. Aligning its work with Luhmannian systems theory, the paper addresses the transformative organizational change process by analyzing dynamic interplay between two modes of administrative decision-making communication, namely, the traditional public administration and new-public-management-oriented managerial techniques that were both used to translate the societal conditions into the university's decisions about an entrepreneurial education initiative. The article contributes to the social innovation research by showing that the university's professional administration is a discrete organizational function internally differentiated into specialized administrative branches, each of which operates according to a sense-making regime associated with its primary societal system reference, such as education, science and the economy. The article also demonstrates the structurally conditioned differences in branch-specific temporalizations of the entrepreneurial education initiative during the organizational decision-making process. Inspired by the systems theoretical view on temporality, it demonstrates the ways in which administrative decisions needed for the implementation of the novel organizational practice synchronize the structural time horizons within the university administration. Focus on temporality thus allows us to see how the NPM-inspired managerial techniques are operationalized in administrative communication at universities. Consequently, the paper argues that the university administration is a complex dynamic entity, which varyingly aligns itself to national policy scripts, and only selectively enacts features of a global trend known as the new public management when engaging in social innovation.

Who and What Is Essential?: COVID-19 Quarantine Guidelines in the Provinces in Samar Island, Philippines

This paper explores the quarantine guidelines adopted in the provinces in Samar Island, Philippines, to prevent the spread of COVID-19 in the context of a national program in 2020 that sought to decongest city centers by assisting returning residents back to their hometown. Since the implementation of the program, we also saw a spike of COVID-19 cases in the provinces. By examining the social aspects of categorizing individuals according to their travel history and whether they or their travels and gatherings are deemed to be essential or non-essential, dichotomies are made between aspects of our social life such as work and leisure and regular and curfew hours, and identities as authorized and non-authorized persons, the young and the elderly, and those with co-morbidities and the able-bodied. These dichotomies and identities have been made obvious and thus became a ground for contestation and negotiation. While the government's information campaign to prevent COVID-19 enumerated interventions depending on where individuals are— at home or outside in public places, workplaces and commercial establishments, it is

summarized in the observance of the following minimum health standards: wearing of face masks (and for a time, face shields), frequent hand washing, physical distancing, and getting the right information. By constantly reminding individuals of interventions that they have control of while the rest of public health standards go unchecked, it is argued that quarantine guidelines have put more emphasis on individual responsibility rather than institutionalizing public health mechanisms.

Transducing Scheler through the New Mobilities Paradigm

In this presentation I revisit Max Scheler's (1992) reflections on the ways entanglements of feeling, knowing and valuing structure the sphere(s) of values in social life. I approach the social from the perspective of academic scholarship. I argue that Scheler's "community/vicarious feeling" converges with more recent deliberations on (a) the power of affect to produce resurgent communities (Ahmed, 2004) and (b) act as scholarly multitudes in the age of multiple crises.

First, I unpack the processual nature of emotions as rational responses to events – a theme shared by Scheler (1992: 55, 59-60) and Guattari (1996: 271). All scholars cultivate through their work particular sensibilities of disciplinary comradeship, which attune them to particular projects of socio-political depth. This attunement is calibrated through what Deleuze and Guattari (1987) call refrains: not mere repetitions of signs across scholarly territories, but transductions/transformations of the affective/normative forces guiding scholarly paradigms.

Second, I will concentrate on the ways the "heritage" of the increased complexification of capitalism and the ensuing social-systemic and environmental problems it induces are addressed in the "new mobilities paradigm" for a "live sociology" (Sheller, 2014). Founded by renowned world sociologists John Urry and Mimi Sheller, and developed by scholars across different academic institutions, the paradigm addresses the ways dark futures can be re-designed to ensure planetary recovery from various crises. I will show how the transduction/refrains of this scholarly project, which attempts to realise "now-topias" of flourishing, revives Scheler's vision of knowledge/feeling/valuing as a dynamic model of social change.

Gender and Sexuality in Asian Societies: Issues of Comparison and Interpretation

This presentation builds on an archive of writings on the theme of Asian sexualities that were collected and selectively translated from various Asian languages by scholars from Japan, Korea, China, Taiwan, Vietnam, the Philippines, Indonesia, Thailand and India for publication in the 4-volume set, *Asian Families and Intimacies* (Sage Publications, 2021). Obviously, the Asian societies represented are quite various, with fundamental differences in their kinship systems (patrilineal/matrilineal/bilateral) and in their associated procreative ideologies, incest prohibitions, rules of marriage, residence and inheritance, household types, modes of production, and ethnicities. At the same time, they have also been geo-culturally interconnected through millennia, and similarly imbricated in varying degrees in historical processes of 'Confucianization', 'Sanskritization', 'Islamization', colonization, modernization and globalization, inflecting both sexual ideologies and practices.

While the overall project of *Asian Families and Intimacies* aims to foreground contemporary 'insiders' perspectives' on Asia's academic and intellectual heritage, a key feature of many of the contributions is a critical interrogation and revaluation of both insider and outsider scholarship on Asian sexualities from contemporary, often gendered and/or subaltern, perspectives. Reflexively, new questions may come to be posed to the received theories, assumptions and methods of global social science in relation to the study of Asian societies.

By way of illustration, I will take up just three papers for detailed discussion: a critical feminist re-reading of the text, context, and evolving history of Vatsyayana's *Kama Sutra* and its English translation by the British adventurer, spy and Orientalist, Richard Burton; Japanese social historian Ujiie Mikito's fascinating account of institutionalized male homosexuality as an intrinsic feature of the *samurai* warrior class culture of pre-modern Japan; and Thai sociologist Thanes Wongyannava's decoding of early sex advice manuals, pioneering the new 'science' of Sexology in 20th century Thailand.

New Gender Segregation through Privatization?: The Role of Private Sectors in Shaping the Underrepresentation of Women in STEM and Selective Colleges in Japan

There has been persistent horizontal stratification in higher education by gender despite the gender gap reversal in higher education enrollment in many wealthy countries. This study examines the role of privatization of higher education in shaping the underrepresentation of women in STEM and selective institutions by leveraging the case of Japan, where higher education expansion has been characterized by the growth of institutional heterogeneity thanks to the proliferation of lower-tier private institutions. I specifically test the hypothesis that these private sectors often target the historically marginalized population in higher education, which is women in the Japanese context, to argue that the privatization maintains the underrepresentation of women in selective colleges and creates new gender segregation in terms of fields of study. Drawing from large-scale qualitative interviews with high school students in 12 competitive high schools, this study examines institutional mechanisms through which few women apply for STEM departments and selective colleges. Results indicate that female students tend to have more clear occupational plans and care more about the relevance of college majors to their future occupations than male counterparts. By contrast, male students, who are more ambiguous about their educational or occupational plans, tend to believe that the name of the school they will eventually attend helps them not to miss future job opportunities. Department-specific entrance exam and the limited application opportunities for selective colleges also contribute to reinforcing the gender difference. Eventually, more female students than male students, even if their academic achievement is comparable, switch to less-selective schools, which tend to offer occupation-relevant majors such as nursing or social work. Quantitative analysis using college enrollment data also supports this claim. I conclude that a seemingly meritocratic selection through high-stakes exams may have an unintended consequence that maintains the underrepresentation of women in selective colleges and STEM.

The Association between Mental Health and Overall Health, Safety Behavior,and Social Relationship Among University Students in Cambodia

Mental health is one aspect of overall health and well-being, and it is important to maintain and promote mental health in order to encourage healthy adolescent development. Mental illness in adolescence has been associated with an increased risk of mental disorders in later adulthood.

In Cambodia, after the civil war of the late 20th century, people developed mental disorders, affecting even younger generations that did not directly experience the civil war. A previous study reported some Cambodian university students have experienced moderate depression, anxiety, and stress symptoms. Currently, Cambodia lacks adequate mental health care services for mental health problems. Therefore, it is an urgent issue to increase the promotion of mental health and the dissemination of knowledge among university students.

This study aims to clarify the association between mental health and overall health, safety behavior, and social factors among university students.

A self-administered questionnaire survey was distributed to 305 fourth-year students at two teacher training colleges from Phnom Penh and Battambang in Cambodia from May to June 2022. The survey items included sociodemographic status, mental health variables such as loneliness, thinking too much, self-rated mental health, and overall health and safety behaviors. Binomial Logistic Regression Analysis was conducted to examine how mental health is associated with other variables.

Responses were obtained from 290 (95.0%) students. Results showed that mental health problems are significantly associated with poor dietary habits, lack of social support, and poor academic performance. There were no significant differences by gender. Study implications are discussed.

'Shared Spaces or Shared Bushes?': Land-Use and Economic Implications of Terrorists' Reintegration in Northeast Nigeria

My PhD fieldwork reveals striking scenarios of the impact of government's ongoing reintegration of Boko Haram (BH) members on land and economic activities. One of the respondents submitted thus;

"Currently, we can access our farmlands, but there is a limit to where we go. Some times you will see the BH members up there looking at you with their guns but won't attack. They will even greet you but you don't have to cross the line they have drawn".

KII/2022/Male/Maiduguri/Farmer

Applying conflict-sensitivity model (Akinyoade, 2019), these data uncover economic improvements in the study areas. However, evidences of informal affordances of 'shared bushes' have bifurcated land ownership between government and terrorists in the affected region - a new trajectory in land use in Nigeria. This study set out to inter-alia explore the socioeconomic implications of the ongoing terrorists' reintegration program. Knowledge that life in BH affected communities is mostly agrarian and economic activities hugely revolve around the use of land (Adelaja & George, 2019) made this study pertinent.

The study adopted qualitative cross-sectional research design which helped to draw insights from the lived experiences of the study groups. The study areas were Mallam Sidi, Chibok and Maiduguri in Gombe and Borno states respectively. The study population comprised ex-BH members, staff of the IOM, UNICEF, Ministry of Women Affairs and Social Development and Operation Safe Corridor. Also, community members/leaders, religious leaders, BH victims and IDPs were drawn to make up 74 sample size. They were selected through the careful application of multi-stage non-probability (purposive and snowball) sampling techniques. Key informant interview, in-depth interview and focus group discussion guides were adopted as instruments. Thematic and descriptive data analysis methods further formed the analytical tools for the study.

The Welfare State Can Alleviate Hardship for Temporary Migrant Workers: Evidence from Two Lockdowns in Australia

Most developed countries exclude temporary migrant workers from some or all aspects of the welfare state. The Covid-19 pandemic in Australia provided a natural experiment to test the assumptions of policy makers – which we call the 'self-insurance model' - against the 'state insurance model'. The self-insurance model predicts that temporary migrants can protect themselves during adversity, while the state insurance model predicts inadequate self-protection in times of hardship. We compare the experiences of international students – the largest *de facto* temporary migrant workforce in Australia – during two Covid-19 lockdowns. In the first, temporary migrants lacked access to unemployment benefits, while in the second they could access the same relief as citizens. The 47 qualitative interviews of South Asian international students who lost their jobs during the Covid-19 lockdowns showed that during the first lockdown many participants reported inadequate income for housing and food, as well as poor psychological health. In contrast, during the second lockdown participants reported adequate income for necessities and good psychological health, which they attributed to government support. These results confirm that self-insurance provides inadequate social protection for temporary migrants, and that citizen-like incorporation of temporary migrants into the welfare state would alleviate significant hardship.

When Development 'Becomes a Threat' to Society: An Examination of Risk Perceptions and Social Vulnerability in the N2 Toll Road Project in South Africa's Wild Coast Region

The Wild Coast region of the Eastern Cape province is home to various communities, some of the most beautiful touristic attractions, mineral resources and a rich coastal biome in South Africa. Despite these natural resources, the region is arguably the most infrastructurally deprived in South Africa – a state of impoverishment dating back from the years of Apartheid system of government. In the post-1994 era (post-Apartheid years), several attempts have been made by the government to launch infrastructural development of the Wild Coast with emphasis on road construction, mainly, the building of the N2 Toll Road project, designed to connect the coastal communities of the Eastern Cape with KwaZulu Natal province on the Southeast. While the road project has been lauded for its 'developmental agenda', it has equally been opposed by several local communities and environmental advocacy groups who see the road as a major risk to their communities, a 'veiled plan to mine titanium' in the region, and an invitation for environmental disasters. Using a mix of qualitative data, the study examines the sense of vulnerability and perceptions of risks associated with the road infrastructure by different communities. The study highlights the intersections in the notions of development between different stakeholders associated with the project, and how their perceptions of risk and vulnerability drive their policy choices.

Keywords: risk perceptions, vulnerability, communities, mining, road construction, environment, wild coast

Global Ideas and Domestic Politics: Nigeria's School Feeding Program before and after Covid-19

School feeding (or school meal) programs are an essential social policy instrument, especially in low- and middle-income countries across the Global South. If well designed and sufficiently funded, school feeding programs can not only increase food security but also school enrollment rates and thereby educational outcomes. However, the social policy literature has so far paid only limited attention to explaining the development of global and comparative school feeding policy. This paper contributes to filling this gap by first tracing the development of global policy ideas and recommendations on school feeding programs, with an empirical focus on the activities of the World Food Programme (WFP) and the African Union (AU) as well as the global promotion of the Brazilian model of school feeding. In a second step, the paper conducts a case study of the development of Nigerian school feeding policy, with an empirical focus on the introduction and implementation of Nigeria's current National Home Grown School Feeding Programme (NHGSFP) in 2016.

Particular attention is paid to the challenges that the Covid-19 pandemic created for school feeding policy and if and how these were causally connected with the expansion of the program in 2022. Methodologically, the paper relies on process tracing based on document and interview data. Theoretically, the paper focuses on examining the relative influence and interaction of global policy ideas and recommendations and domestic political processes in the expansion of Nigeria's school feeding program.

From Deferral to Denial? a Comparative-Historical Analysis of Exclusion within Nationalist Projects in India

This paper investigates the relationship between nationalism, democracy, and fascism in India. On the surface, India's two main nationalist movements differ starkly. India's secular nationalism is considered to be a democratizing force, first, as part of the struggle for national liberation, and later as part of the postcolonial state's commitment to protecting religious minority groups. Religious (Hindu) nationalism, on the other hand, is often described as fascist because of its ideological commitment to Hindu supremacy and its use of violence against religious minority groups in this endeavour. This paper challenges some of the binaries that are used to contrast India's two nationalisms in terms of their relationship to democracy and fascism by comparatively analyzing the nature of exclusion of religious minorities in the civil society activities of each movement. Several scholars in India have offered critical insights on the areas of similarity between secular and religious nationalisms. I contribute to existing efforts to dismantle the binaries between the two nationalisms—which has often taken the form of comparisons between the political regimes of the Indian National Congress Party and Bharatiya Janata Party— by shifting the comparative focus to India's leftist parties, who also espoused a form of secular nationalism. I draw on historical and ethnographic evidence on the ideologies and practices of leftists and Hindu nationalists working in the labor movement in the southern state of Kerala, which is heralded as a paragon of grassroots democracy and religious harmony in India. I demonstrate that each movement practiced exclusion of religious minorities in their civil society activities. What differs across secular and religious nationalisms is the justification of this exclusion. In the former case, the exclusion was deferred, while in the latter, it is denied at the outset.

Conflict As a Global Social System: A Treatise on Sociological Theory

While politics, sports, science and religion have been studied as globally extended systems in Luhmannian world society theory scholarship, similar analyses of conflict are yet to be undertaken. A global conflict is conventionally grasped as an institution which enmeshes as many populations and territories as possible across the globe in one and the same conflict (e.g. WWI, WWII, Cold War, etc.). While undoubtably correct, it reduces globality to factual territorial expansion. In line with world society theory which underlines the societalizing effects of communication technology, I shall present a conception of global conflict as a worldwide self-referentially closed nexus of spatially dispersed conflict parties which—communicatively—mutually refer to one another. This mutual referencing will be specified along the three meaning dimensions. In the fact dimension, they must cater to a similar thematic specification. In the social dimension, they must attribute responsibility to a common culprit. In the temporal dimension, finally, conflict parties mutually observe one another as sharing similar histories. The case material is drawn from the political and ideological literature of Palestinian factions, the African-American civil rights movement and the anti-apartheid movement in South Africa from the 1930s until the 1980s. As a treatise on sociological theory, this paper shows how the convergence of social imaginaries across the globe results in world-societalization (*Verweltgesellschaftung*) by means of the emergence of a single context of specialized communications. Sprinkled in along the way are the comparative advantages afforded by world society theory in contrast to extant theories of globalization in the study of said imaginaries.

Doing Research Together: The Role of Reflexivity in Increasing Inclusivity of Participatory Approaches with Older Adults

Ageing research has traditionally been planned and implemented mostly top-down without involving older adults actively through the research process. Whereas participatory research on ageing is a clear directive of the Madrid International Plan of Action (MIPAA) we still lack guidance on creating an inclusive and enabling environment for participatory approaches with older adults. To bridge this gap, we discuss findings from the Austrian project SEVEN, in which older adults co-created research about social exclusion in later life. The participatory design entailed a range of methodological challenges that served as a basis for creating a four-dimensional model

of research reflexivity for harnessing the potential of inclusivity of participatory ageing research. We present this model and discuss its potential and limitations.

I Protest, Therefore I Am. an Analysis of Youth Political Mobilization in Colombia (2019-2021)

During the period 2019-2021, young people from different social and economic conditions became the main political subject of social protests against the economic measures proposed by the Colombian government. Although this country has public policies aimed at providing conditions for the social, economic, and political inclusion of young people; the massive presence of this population in the different waves of protest accounts not only for the limited scope that these norms and policies focused on youth have had, but also for the central role that young people have in the consolidation of democracy and the social development of the country. Even though youth political mobilization reflects a strong commitment and interest of young people in public affairs, this phenomenon has not received the attention it deserves in both the academic and political spheres, and some studies even insist on the thesis of the supposed apathy of young people towards politics. Therefore, the present research proposal seeks to explain the participation of young people in the cycles of social protest carried out in Colombia between 2019 and 2021 from the identification of the social, economic, and political factors that integrated the opportunity structure for youth political mobilization. For this purpose, a mixed research approach is employed that complements the case study with dynamic time series models to statistically estimate the effect of social, economic, and political variables on the protest cycles where young people have had a significant participation. In this way, it is expected to contribute to the production of socially and scientifically relevant knowledge that will serve to find solutions to manage social conflict in a peaceful, dialogical, and democratic manner.

URIBE MENDOZA, Cristhian* (Universidad Santo Tomas, Colombia)

The Impact of Evangelical Movements on the Recognition of Lgbti Rights in Latin America

Latin America is one of the most advanced regions in the world in terms of the recognition of LGBTI rights. According to data from the Observatory of Political Reforms in Latin America (1978-2022), more than 65 initiatives linked to the legal recognition of civil, social, political and sexual rights of people of sexual diversity have been implemented in the last 20 years; however, these normative changes have not been without controversy. While feminist movements, LGBTI collectives and other progressive social sectors have been conquering rights and mainstreaming in gender public policies, evangelical, Catholic and other conservative movements have reacted against laws, judicial decisions and public policies that recognize equal marriage, homoparental adoption and comprehensive sexual education, among others. Thus, this paper asks the following question: what has been the impact of evangelical movements on the recognition of LGBTI rights in Latin America? It is argued that the political influence strategies of evangelical movements help explain the variation in the recognition of LGBTI rights across countries in the region.

On-Site Animosity and National Identity: Business Travelers on Stage

The study introduces the term "on-site animosity" with respect to expressions of hostility against travelers' nation during their stay at the visited destination. Behavioral responses to on-site animosity are examined by focusing on performances of national identity among Israeli business travelers while interacting with locals and host colleagues. Based on the analysis of in-depth interviews and in line with a Goffmanian perspective, the study presents four performative strategies that nospan across two dimensions of situational behavior: the inclination of the travelers to conceal or display national identity and their motivations to do it. The study advances a fresh perspective and provides an empirically based conceptualization regarding the influence of animosity

URSIC, Matjaz* (University of Ljubljana, Faculty of Social Sciences, Slovenia)

Studying Interdisciplinary through the Analysis of Cognitive Networks between Scientists in Spatial Sciences – the Case of Slovenia

Based on data from the research "Mentoring relationship in the context of scientific cooperation and knowledge production" (Kronegger, 2021-2024) the paper analyses cognitive networks in spatial sciences through the relationships between mentors, their mentees and scientific environment in which they are embedded. The evolution of scientific ideas and the production of knowledge are concepts strongly connected with the social structure of science and the various ways of collaboration among scientists on the rise of their career, the forms of trust and division of labour and acknowledgments among scientists, which is required to make effective scientific progress (e.g., Herrera et al., 2010; Mac Cain, 2016; Muldoon 2013). In this regard various dimensions related not only to basic PhD mentoring but also empowering and engaging with the larger scientific community (Coromina, Coenders, et al., 2011; Lee, 2008) are analysed in order to identify the volume of interdisciplinarity elements in the production of knowledge. The paper focuses on the analysis of interdisciplinarity in the field of spatial sciences, where interdisciplinary cooperation between various disciplines (e.g. architecture, construction, landscape architecture, urban sociology etc.) plays a vital role in order to produce quality spatial planning and interventions in space. By using various layers of data related to mentoring relationship in the context of a scientific field (e.g. co-mentorship, co-citing, selection of thematic etc.) it is to analyse whether the cooperation, exchange of knowledge and mutual scientific permeability between various spatial sciences is well developed, closed (autarkic)/open, democratized or hierarchical, monopolized by specific branches of science. From the analysis of interdisciplinary in the field of spatial sciences it is possible to extrapolate specific influences on the decisions in spatial planning that affect the quality of life in local communities and have consequences for the larger strategic (infrastructural) spatial development in countries like Slovenia.

URSIC, Matjaz* (University of Ljubljana, Faculty of Social Sciences, Slovenia)

When Is Local Too Local? - New Localism and the Potentials of Immovable Cultural Heritage

At the declarative level, immovable (physical) cultural heritage is a convenient subject of a variety of programs, conservation approaches and legislative processes supposedly tied to spatial development plans that are connected to various groups of stakeholders. The declarativeness of immovable cultural heritage integration processes is often materialized in spatial antagonisms based on frictions between local communities and, on the other side, conservation approaches, development aspirations of investors, political structures and other actors who try to assert their interests and needs. Conflicts and consequently non-optimized or imbalanced relations between actors lead to reinterpretations of the roles of immovable cultural heritage and partly limit the use of socio-cultural capital, which is attached to it. In doing so, specific parts of socio-cultural capital belonging to less dominant social groups are pushed to the periphery and used only in the most rudimentary form - like for example, as a welcome sidekick element that helps creating adequate ambience for the offer of consumable goods in the context of tourism or promotion. The paper will analyze the mentioned frictions within the local environment on the basis of the findings from the project "Heritage for Inclusive Sustainable Transformation: HEI-TRANSFORM" (2022-2025). Special focus will be put on the possibilities to develop new potentials for connecting up to now less involved or insufficiently empowered groups of users of immovable cultural heritage (e.g. younger generations, nonlocal actors, etc.). From this point of view, the project envisages the loosening of still too hierarchized and rigid local networks through the implementation of specific (intergenerational, global, sustainable) elements of the "new localism" (Strassoldo, Tessarin, 1992). The analysis of this dialectic relationship between (old, autarkic) localism and new localism will be based on the case of Slovenia, which will be supplemented by comparative case studies from different parts of the world.

URWASI, Wara* (Northwestern University, United States)

Evict or Invest: Community Distinction and Variations of Urban Informality Governance in Jakarta's Democratic Setting

Why do some informal neighborhoods get evicted, and others get improved? This paper explores the reasons behind the patterned variation and uneven governmental responses to urban informal settlements in the Global South's metropolises based on the case of Jakarta, Indonesia. Urban informality governances vary based on their exclusionary consequences and the state's involvement with the informal community. These two dimensions constitute different government actions, ranging from violent evictions, permissive by the forbearance of eviction rules, and accommodative through community-based distributive interventions. These parallel operations of coercion, neglect, and care logics toward informal settlements suggested a more heterogeneous state's impulses in governing marginality than what is often portrayed in literature. Dominant theories in political economy and postcolonial literature have difficulties in elucidating intra-city variation because they view urban poor expulsion as an inevitable impact of global capitalism and colonial legacy. Studies in comparative urban politics have highlighted the uneven public goods distribution among slums through extensive patron-client relationships. Still, they are insufficient to explain why Jakarta's government evicted its constituents.

I approach this study by focusing on local politics, particularly the relationship between the government and informal communities, which influences the government's assessment and action. The research applies a comparative analysis of multiple informal communities in Jakarta based on field observation, interviews, and government policies. The findings suggest that government interventions are highly dependent on community distinction factors, mainly the degree of conflicting interests over a particular land, formal and informal leadership, and informal community linkages, cohesion, and strategies. These factors provided decision makers with incentives and constraints in selecting their responses. The study contributes to the scholarship on urban governance and inequality by emphasizing informal communities' roles in contesting the government's response, creating negotiated fields with their resources and strategies, and diverting exclusionary outcomes.

Promises of Horror Cinema for Sociological Imagination in Troubled Futures

Both Anthropocenic and pandemic scenery consists largely of disorder, disorientation, unpredictability, incomprehensibility, and the extinction of more-than-human worlds, showing that it's no longer safe to lean on the old habits of any disciplines and we're all -although not equally- becoming refugees who are left homeless, insecure, and fragile. As such, it speaks directly to the worlds that horror cinema has created and in which it carried away its audiences. These cinematic worlds, which aren't at peace with absolute knowing, certainty, ordering, and being out of trouble, can multiply stories of being-with as well as create other possible stories, alliances, shelters, and futures. Doing so could open an alternative channel for addressing our current experience/engagement with the world, and obligations of being-with, as it can generate responses that are intensely affective and embodied. If these responses that horror cinema evokes could guide us away from the comfort of the anthropocentrism that we've come to realize we can no longer take refuge in, maybe sociology should also be willing to learn from such cinema. Particularly because, sociology has an established tradition to lean on very neat, ordered, and linear arguments and thus often overlooks other forms of knowing. Though, horror cinema is an embodiment of an embodied form of knowing, mostly based on negative affect and the insistence on thinking the unthinkable. Therefore, in this presentation, I'll pursue the following questions, focusing on examples from contemporary and 1950s horror cinema based on eschatological fears: How can we weave ties between horror cinema and sociology, that could lead to more responsible ways of entangling with the world that doesn't seem all-too-human, thinkable, secure, and ordered? How could this lead up to avoiding domesticating negative affect, daring to think the unthinkable, approaching ethics of care and entanglement more radically, and troubling the sociological imagination?

UZOIGWE, Anthonia* (University of Auckland, New Zealand)

Food Insecurity Among University Students in Aotearoa

Hunger is a significant problem in the world, afflicting 821 million people, which represents 8% of the world's population. Food insecurity is an important topic because of its detrimental effects on human' physical, social, emotional, and cognitive development throughout life. While this topic has garnered global attention, the discourse on this issue among university students is often neglected and is particularly limited in New Zealand. Students' food insecurity is a problem because the experience is traumatic, stressful, and detrimental to one's health and well-being. Researchers have found that food insecurity can negatively impact the emotional well-being and academic performance of vulnerable students. Although there are indicators that it is a significant problem in Aotearoa, the degree, prevalence, and source of the problem in Aotearoa Universities have been understudied. To address this gap, I pursued a mixed-method approach, which included survey data and in-depth interviews with undergraduate students at the University of Auckland. My findings indicate that 53% of students at the University of Auckland are food-insecure; and this condition is mediated by a range of factors, including low socioeconomic standing, the high cost of campus meals, rising tuition, high living and housing costs, declining state support for students and privatized food outlets on campuses. Moreover, I have found that the University of Auckland lacks intensive institutional policies or programs that effectively cater to campus food security and support for students experiencing food insecurity. These findings suggest that if we are to significantly reduce food insecurity amongst New Zealand university students; we will need to acknowledge it and establish effective initiatives and policies, such as providing subsidized healthy meals on campus, and incorporate food security as a central element in student wellbeing programs.

Reproducing Scientists' Mobility: A Data-Driven Model

High skill labour is an important factor underpinning the competitive advantage of modern economies. Therefore, attracting and retaining scientists has become a major concern for migration policy. In this work, we study the migration of scientists on a global scale, by combining two large data sets covering the publications of 3.5 million scientists over 60 years. We analyse their geographical distances moved for a new affiliation and their age when moving, this way reconstructing their geographical "career paths". These paths are used to derive the world network of scientists' mobility between cities and to analyse its topological properties. We further develop and calibrate an agent-based model, such that it reproduces the empirical findings both at the level of scientists and of the global network. Our model takes into account that the academic hiring process is largely demand-driven and demonstrates that the probability of scientists to relocate decreases both with age and with distance. Our results allow interpreting the model assumptions as micro-based decision rules that can explain the observed mobility patterns of scientists.

Indian Villages: An Authoritarian Caste-Ruled Re-Publics

As the Indian society was/is very stratified society needed to adopt a constitution based on freedom, equality and justice. The Indian state became a republic after adopting the constitution but, most of the Indian villages remained under the regimes of authoritarian caste supremacists. The various development projects and agendas of the Indian state failed to eradicate the authoritarianism of the caste supremacists in Indian villages. Indian villages are still seen as caste republics as the caste drives all the major phenomena in Indian villages from economy, politics, culture and social norms.

The Indian villages are characterized by the uneven distribution of economic resources, political power and cultural status among the people which is based on the castes. The Indian state is implementing various development agendas throughout the country as the objectives enshrined in the constitution as well as being a member of the global society, but, most of the Indian villages are still free from freedom. Dalits, a downtrodden caste, face very brutal violence, exploitation and deprivation in Indian villages as they are placed at the bottom of the caste system whenever they claim freedom, rights and justice. The Indian society can be seen as an example of a paradox of development where the "lower castes" specifically Dalits are brutalized, exploited, humiliated and marginalized and at the same time, the "upper castes" are the biggest beneficiaries of the various development agendas.

The present paper is looking at the development discourse from the perspective proposed by the Indian economist and philosopher Amartya Sen who sees development as freedom. This perspective believes that development is needed for the removal of sources of unfreedoms like poverty, deprivation, exploitation and violence. The present paper critically analyses the development as a phenomenon to free Dalits from exploitation, deprivation, marginalization and violence.

Feminism and the Women's Movement in Bulgaria: Dynamics of Change in Activism after the Rejection of the Istanbul Convention

This presentation will provide a summary of findings of the sociological survey conducted among organizations and activist groups throughout Bulgaria working in the area of women's, girls' and vulnerable groups' rights and gender equality. It seeks to identify the difficulties that civic organizations and activist groups face. In 2021, when the survey was carried out, the debates related to the ratification of the Convention of the Council of Europe on preventing and combating violence against women and domestic violence (the so-called "Istanbul Convention") and its final rejection by the Constitutional Court, followed by protests against the National Strategy for Children 2019-2030 and the Social Services Act, put their mark on human rights non-governmental organizations and informal activist groups. Consequently, the presentation will focus on the following issues: On the one hand, what is the structure of activism and how do the activists emerging in view of it perceive the current context in which they pursue their activities? What are the possible ways they see to build a social movement, impact, and change?

The presentation will be based on the study, which consists of two parts. The first one, the qualitative part, based on a standard questionnaire, was carried out in the period 03.02.2021 – 04.03.2021. It involved 114 respondents out of a total of 452 who received an invitation/query as per the database of the Bulgarian Fund for Women (BFW). A field study was carried out in June – July 2021 for the second part (the qualitative) part. It included 39 in-depth interviews with representatives of the organizations and activist groups. On the basis of the interviews, I will delve deeper based on the data identified in the quantitative survey.

VALDIVIEZO-SANDOVAL, Rene* (Universidad Iberoamericana Puebla, Mexico)

The Nationalist Project of the Mexican Government. Democracy or Authoritarianism?

Modern Mexico was built after the Mexican Revolution (1910-1917), with a very strong presence of popular and nationalist ideology. This line of thought was strengthened firstly with the creation of the National Revolutionary Party (PNR) in 1929 and then with the government of General Lázaro Cárdenas (1934-1940). Until 1982, the governments of the PNR-PRM-PRI (Party of the Mexican Revolution and the Institutional Revolutionary Party), preserved this ideology, which was the base of the Mexican model of the Welfare State. Starting in 1982, governments abandoned this ideology and developed Neoliberal thought. The governments of both the PRI and the right-wing PAN (National Action Party) plunged the country into deep social inequality that, in 2018, led to the electoral victory of the left with the National Reconstruction Movement Party (MORENA). With this government, the basic postulates of post-revolutionary Nationalism were once again positioned at the center of the national project. Especially in economic and social policy, directly confronting the Neoliberal right-wing thought. The measures taken by the MORENA government have been pointed out as authoritarian, and the current government confronts the opposition regarding the country's democratic project. This paper briefly exposes the antecedents of nationalism in modern Mexico and presents the central features of the current government project, analyzing its nationalist perspective and its democratic or authoritarian behavior.

Militant Research and Autonomous Politics in Post-Uprising Chile

In this presentation, I will discuss the relevance of militant research as a collaborative and politically-engaged approach for the study of social movements. Drawing on my experience as militant researcher in Chile and Latin America, I advocate for a research approach that goes beyond the understanding of the world, in order to actively engage in the transformation of it. From this approach, militant research can be understood as a collaborative process of knowledge production in which activist scholars and social movements come together with the aim of challenging social injustices (Otto and Terhorst, 2011) and fostering critical reflection amongst activist communities (Russell, 2014). Following the insights of militant research experiences carried out with autonomous movements in post-uprising Chile, I explore the epistemological assumptions underpinning militant research as both a method of political action and a form of knowledge. This epistemological stance rejects the idea of seeing social movements merely as objects of research interest, thus challenging the Cartesian and positivist epistemologies (Casas-Cortés et al., 2008) that are present in traditional social movement research. Furthermore, I discuss the ethical and methodological challenges in carrying out collaborative processes of knowledge production, performed from within rather than outside social movements. Finally, I suggest to embrace militant research as a '*sentipensante*' journey: a decolonial entangled process of feeling and thinking the world (Fals Borda, 2015), where activist inquiry is neither a discipline nor a method. In a context of deep political crisis, the invitation is to experience militant research as a '*vivencia*': an 'open-ended process of life and work' that requires an ethical stand, political commitment and self-critique at all levels (Fals Borda and Anisur, 1991, p.29).

Animal Welfare in the Negotiation of a Social License to Farm

Animal welfare is an intriguing part of the negotiation of social licence to farm. The meeting and breaching of animal welfare standards has important consequences for establishing oneself as a 'good farmer', deserving of the licence. This, in turn, shapes consumer behaviour in complex ways. This paper reports on a range of places and processes where the social licence to farm is being negotiated, such as through initiatives and events (such as Edible Canterbury, Open Farms, Field Days, A and P shows), placed-based programmes (e.g. Pest Free Banks Peninsula, Hurunui irrigation, Thriving

Southland), art, digital records (NAIT), popular media (Facebook, Country Calendar) and legislation (National Policy Statements, Long Term Plans and City/District Plans, Environment Court).

Some of these enable close face-to-face contact between producers and consumers (e.g. prosumerism), others rely on apparently trusted intermediaries (SPCA ✓), whilst others assume a more contractual aspect (legislation).

We report here on the various ways in which social licence based on the 'good farmer' is negotiated, and practices that influence that negotiation. Based on these findings, we suggest opportunities whereby industry bodies, NGOs, and Territorial Authorities (through statutory and non-statutory planning processes for peri-urban areas) can foster less adversarial – more 'productive' - relationships between producers and consumers.

Killing the Digital Deer: Innovative Technologies and Animal Welfare

It is not uncommon to hear claims that digitalisation will significantly improve our primary industries and promote better economic, environmental, and social outcomes. This belief informs significant investment in agri-tech and a drive towards the digitalisation of agri-food systems. Yet, somehow, this optimistic and positive view of digitalisation does not appear to be resonating with practitioners who, it has been noted, are slower to adopt new technologies than those in other industries and sometimes even express misgivings about its benefits. In this paper I present a series of accounts about the digitalisation of animal welfare that, while gathered from several different projects, are being used to inform the development of a larger and more formal research project. These accounts highlight several themes:

- Sharing data about animal welfare and disease

- Digital animals 'milked to the number' from afar

- Discrepancies between the digital readings of animal welfare and farmers' observations; who wins the war

- Data ghouls

- Data deserts

- Digital midwifery and the changing dynamics of who knows best

These themes inform the development of alternative approaches to animal husbandry that may challenge the prevailing governmental discourse of digi-optimism.

Temporal Dynamics of the Interaction between Education, Class Origin and Class Destination: How It Has Evolved in France Along the Educational Expansion

In several countries including France, using period analysis or cohort analysis, recent research on intergenerational class mobility has documented trends in the direction of increasing social fluidity (or relative mobility rates). Several mechanisms have been identified in explaining such a (relatively modest) increase in societal openess. Among them, there is an interaction effect between education, class origin and class destination, coupled with a compositional effect: first, the partial association between class origin and class destination is generally weaker among people with more qualifications; second, the educational expansion increases the relative importance of these more qualified groups; finally, the combination of both facts therefore results in an overall increase in social fluidity. In this communication, we go further than the general and static expression of this mechanism to address a research question that has been rather neglected. Has the capacity of high degrees to weaken the direct association between class origin and class destination remained stable over time? Or has it weakened with the increase in the number of these degrees, i.e., with the educational expansion? The latter result would be compatible with interpreting the role of the diplomas as a 'signal' (Spence, 1973) as it would suggest that the strength of the signal associated with a given diploma weakens when the distribution of this diploma becomes less rare. We systematically examine the aforementioned research question, using log-linear and log-multiplicative modelling techniques, for both men and women in France, in both a period and cohort perspective, with a series of high-quality and representative statistical surveys conducted by the French Statistical Office in 1970, 1977, 1985, 1993, 2003 and 2014-2015 (the Formation & Qualification Professionnelle surveys).

Ideal Type of Sport: A Weberian Approach

Max Weber's comprehensive sociology has, as one of its pillars, the use of the ideal-type, an heuristic tool. Conceived as an instrument to provide parameters for research, it consists of an exaggerated and simplified generalization of a given theoretical-conceptual object, forming a mental construction of reality. The set of imagined characteristics of each ideal type make it possible to schematize, compare and classify observed realities with the theoretical construct of the researcher. In our study, we seek to present how sport was thought of by Weber in his work "Economy and Society" and, by this way, operationalize an ideal type of sport along with other typologies from Weber, such as rationalization, secularization and bureaucracy, to try to establish mechanisms of comparison of what we understand by a contemporary and western sport with its different manifestations in times and places.

Early Experiments in the Creation of Sociological Belief: Louis De Bonald and the Christian-Sociological Culture of Prediction

I will start my presentation by advocating for a history of sociology based on Michel de Certeau's historiography of beliefs. Beliefs, for de Certeau, are a social practice, something that is constructed through tactics and techniques in order to found a community of believers. This approach can be a fruitful perspective for the history of sociology, which was not just an epistemological undertaking, but also a social operation dependent on the successful negotiation of communal epistemic beliefs (Bourdieu). After elaborating on what a Certallian history of sociological belief looks like, I will focus on a historical case, the proto-sociology of Louis de Bonald and the Christian-sociological culture of prediction. The context of Bonald was determined by two events, the Enlightenment and the French Revolution. Both were seen as a catalyst for a crisis in *belief*, leading to an increasingly disbanding society. Turning to a 'science of the social' as a solution, Bonald identified two groups which needed to be brought together into a community of 'societal believers': those followers of the Enlightenment, rational and individualist, and the Christian flock, collective and prone to superstition. Throughout his work, Bonald balanced both groups in the construction of a new language of belief: taking from *philosophes* the social and propositional understanding of beliefs while preserving the principles of transcendence and self-sacrifice which characterized Catholic Christianity. In other words, Bonald aimed to forge a new sociological belief-community through narrative negotiation, one able to believe in a natural society governed by divine social laws. By analysing Bonald and the context in which his social system arose, we gain a better understanding of how belief came to play such an important role in the history of thinking the social and why it continues to function in such a dynamic way in today's sociology.

Vulnerability and Resilience in Young Men Who Unintendedly Become Fathers

In the past twenty years, scientific attention for fatherhood has surged. However, a group that we still know little about are young men involved in unintended pregnancies, even though these pregnancies comprise almost half of all pregnancies worldwide. Unintended pregnancies are, especially among young parents, associated with disadvantageous health outcomes for both parents and children. Paternal involvement has been demonstrated to improve the well-being of families. A caring and involved father thus likely forms an important protective factor in unintended pregnancy. The stereotype around these young men however portrays the image of an often racialized, irresponsible, and absent father.

Insight is needed on how challenges that young fathers experience in employing their care practices can be overcome. We studied this through the notions of vulnerability and resilience, which have implications for how young fathers employ care practices. We conducted semi-structured interviews with 14 young Dutch men who became fathers recently. Most of the young fathers interviewed were lower educated. The transcripts were thematically analyzed, with deductive coding focused on vulnerability and resilience and additional themes that were inductively coded.

Preliminary results indicate that one of the main vulnerabilities was an unstable relationship with the mothers of their children, in which they often felt limited or even excluded in their involvement by her. Young men also indicated a lack of social connection due to not knowing any peers in a similar situation and feeling disconnected from their friends due to diverging life circumstances. Their resilience consisted of their own pragmatism and motivation as they rearranged their lives to be responsible fathers, which often meant reducing unhealthy habits and providing sufficient financial support. These findings disprove the stereotype of the young 'deadbeat' dad, showing that young men who unintendedly become fathers want to be involved but might experience barriers to do so.

VAN DE VELDE, Cécile* (Université de Montréal, Canada)

Inequality, Injustice... Anger. Dynamics of Revolt Among Young Adults.

This paper aims at a better understanding of the links between the experience of inequalities, the feeling of injustice and social anger: how does one go from an experience of inequalities to a feeling of injustice? Under what conditions does this feeling of injustice translate into social anger, and conversely, in what cases does it not provoke a revolt? To answer these questions, we rely on the comparative analysis of more than a hundred interviews conducted with young adults in Madrid, Paris, Montreal, Santiago de Chile and Hong Kong, and dealing with the social ordeals experienced, the emotions they generate and their modes of politicization. By bringing out the « common script » of all these narratives, we can shed light on the emotional dynamics that mark the experience of injustice among these young adults. In particular, we show the existence of an emotional spectrum potentially ranging from *Engagement*, to *Frustration*, to a sense of *Injustice* and finally to *Anger*. These circuits are not linear, and we identify the conditions of passage between these different social experiences. Moreover, beyond this common framework, we will show the existence of three main « circuits of anger » fundamentally linked to the type of injustice felt -*Dispossession*, *Wear and Tear,* and *Rejection*- and which will each lead to a different form of politicization and collectivization.

VAN DE VELDE, Cécile* (Université de Montréal, Canada)

Listening to Anger : Youth Voices and the Transformation of Democracy

Massive social movements, populism, voluntary abstention: youth anger is now a « latent energy » of our democracies (Morin 1968, Mishra, 2017), and one of the political forces of the coming decade. In this paper, we would like to explore the current links between youth anger and democracy, in order to understand under which conditions these youth angers can dynamise and regenerate democracy, or, on the contrary, threaten it. Drawing on a comparative study on youth anger, we identify the tensions and critiques addressed to broader institutional and political systems shared by young people at a global level, but also the different political pathways they may take (alternatives, anti-system speech, abstention, radical votes, populist sensibilities etc...). The paper will show that beside the rise of a « generational voice » within social movements, we also find a wave of « invisible anger » among younger generations, ranging from long-standing frustrations to radical system dismissal. We argue that there are« competing angers » in our democracies: while some youthful anger can be more easily collectivized and have legitimate access to a public voice, others remain invisible and sediment in the life course. As a result, a growing challenge for our democracies is the expression, listening and transformation of this political anger into effective social change. To respond to this challenge, we identify the current obstacles - political, institutional and social - to this « positive » transformation of anger, and develop some avenues for renewing democratic practices.

The Question of Natural Limits in the Work of István Mészáros

In 1970, István Mészáros published *Marx's Theory of Alienation*, in which he makes an interpretation of the *Economic-Philosophical Manuscripts*, trying to show how alienation was a fundamental problem for the whole of Marxian work. Among the various dimensions that he analyzed, Mészáros mentioned Marx's indications about the separation between human beings and nature under the alienated production based in capitalist private property.

In *The Necessity of Social Control*, his Deutscher Memorial Prize acceptance speech, Mészáros advanced these considerations, and more than two decades later these problems were developed in what is considered Mészáros' major work, *Beyond Capital*. There, in general terms, Mészáros refers to two dimensions of the relationship between human beings and nature: first order and second order mediations. The first refer to a transhistorical set of social relations responsible for social metabolism, which does not necessarily need to assume a hierarchical character. The second order mediations, on the other hand, point to a historical set of hierarchical relations aligned to capital – from the nuclear family to the world market – that shape the reproduction of life.

According to Mészáros, the uncontrollable capitalist social relations of reproduction have reached a point of structural crisis, from 1970s onwards. This multiple dimension crisis is activating capital's absolute limits. Among them, the destruction of the metabolic conditions of social reproduction.

These analyses by Mészáros become particularly interesting in the context of Anthropocene/Capitalocene debates. However, they demand a more precise reflection on what Mészáros was referring to when he spoke about "absolute limits"; on what empirical or theoretical materials he relied on when he reflect about nature; and how this dialogues with part of the contemporary critical debate on natural limits. This proposal, therefore, will seek to address these aspects of the relationship between humans, nature and crisis in Meszarian work.

Visual, Emotional and Interactive Aspects of the Life History Calendar Method

The Life History Calendar (LHC) is a visual data collection tool that is applied in both in-depth and standardized interviewing to record the answers of participants about (sequences of) past events within multiple life domains. Core to the LHC is the use of a graphical timeframe that aims to facilitate access to long-term memory and help participants to interconnect events mentally and/or visually. Central to this paper is the visual function of the LHC tool and the role that it may have in coping with sensitive information, as well as its role in moderating the interaction between interviewer and interviewee.

Research indicated that on the one hand the visual display of the LHC-tool may make it easier to refer indirectly (e.g., without words) to sensitive topics, resulting in more self-disclosure. On the other hand the visual display of sensitive information in the tool (e.g., stressful events) may evoke emotional reactions in interviewers and interviewees, heightening emotional distress (Yoshihama, 2009; Martyn, 2009).

Often less emphasized, but important to this paper, is the possibility to employ the LHC as a cooperative effort between interviewers and participants. The LHC-domains, time units and interview sequence can be co-constructed by interviewee and interviewer. The impact of co-construction on the power relation within the interview setting - and thus on rapport and self-disclosure - adds to the impact of the visual data collection tool. Research suggests that such an open LHC-approach not only helps build rapport but also especially enhances capturing narratives of emotionally sensitive events (Nelson, 2010).

This paper examines theoretical ideas, and provides empirical examples, on the impact of diverse LHC approaches (regarding design, interaction and hermeneutic interviewing) on the quality of data collection on sensitive issues.

VAN DOOREMALEN, Thijs* (Centre for Sociological Research, KU Leuven, Belgium)

The Political (in)Significance of Extreme Weather Events in the United States and Europe

Tackling the climate crisis in an appropriate way proves difficult. A much-given explanation for this problem is the fact that many of the crisis' consequences are only about to happen in a distant future complicates making them visible and tangible in the present (the so-called Giddens Paradox). However, extreme weather events (e.g., floods, heatwaves, hurricanes) might have the potential to break this pattern. They bring the crisis' consequences to the here and now, and might thus foster rapid changes in climate change perceptions and actions.

This paper investigates this potential, through analyzing the political impact of extreme weather in the American, Dutch, and Austrian public spheres. It uses a mixed-methods combination of text analysis approaches (computational methods along with qualitative content analysis) to investigate the framing of a wide variety of cases (in terms of location, time, type of disaster), within parliamentary debates, newspapers, and policy documents.

For all events, it analyzes: a) the *extent* to which they affect perceptions of the climate crisis, by looking at the amount and intensity of references to it; b) *how* the events affect crisis perceptions, through investigating the repertoires of action (proposals for change) that are formulated in response to them; c) *explanations* for variations/similarities in impact, by linking them to characteristics of the events and of the national contexts of perception (e.g., the discursive power of various political parties and public actors, the recent occurrence of other significant events or crises, or dominant cultural repertoires).

Through understanding the political (in)significance of extreme weather events, this paper adds to both the fields of environmental sociology as well as the sociology of events.

Power and the Social Unconscious: Mario Erdheim on Power and Collective Fantasy

This paper will discuss the ways in which the work of Swiss ethnopsychoanalyst Mario Erdheim on 'the production of unconsciousness', as well as various other scholars engaging with the concept of the 'social unconscious', can illuminate the relationship between power relations and habitus formation. The general concern is how the psychoanalytic understanding of unconscious mental life can contribute to an improved understanding of processes of civilization and decivilization. One focus of Erdheim's writing is the problem of the continued, unconscious operation of aggression despite having been 'tamed', that is, the 'dark side' of processes of civilisation, in which aggression directed upwards against 'the King' (or 'the System') is displaced horizontally or downwards onto aggression against various manifestations of 'the Other': the devil, Jews, witches, Liberals, and so on. He argues for the need to link state-formation and indeed the civilizing process to accompanying cultural and psychological processes such as witch hunts and other forms of persecution of 'outsiders', informed by a theory of collective fantasy and the social unconscious. From this perspective, the civilizing process involves the historical production not just of new forms of consciousness, but also of new forms of unconsciousness.

VAN TOORN, Georgia* (University of New South Wales, Australia)

Disability, Deservingness, and the Quantification of Bodily Difference

Life changing decisions about people with disability and their eligibility for social assistance are increasingly being made using algorithmic methods of data processing, or "scoring". Though often presented as technocratic and politically neutral, these scoring algorithms are imbued with ideological preconceptions of who counts as disabled and how we should determine the boundaries of this administrative category. At the centre of this politics of counting is the question of how disability itself is defined and quantified. Through two case studies of automated scoring algorithms used to determine eligibility for disability benefits and services, I examine how concepts of disability and deservingness are encoded in computer algorithms. These case studies offer different illustrations of the ways algorithms both reflect and produce a particular view of disability as fixed medically in the body and amenable to measurement. Disability scores function politically to legitimate certain power arrangements which limit social assistance to those among the disabled who are considered most 'deserving' – a form of algorithmic social sorting which, this paper argues, can be fruitfully understood as the enmeshment of eugenicist science with neoliberal political rationality.

VAN WICHELEN, Sonja* (University of Sydney, Australia)

Governing Fecal Microbiota Transplants: Biovalue and More-Than-Human Legalities

Research into the human microbiome has grown tremendously in the past decade. One of the therapeutic treatments coming out of this research has been Fecal Microbiota Transplantation (FMT). This promising therapeutic intervention restores normal gut microbiota and treats associated diseases without recurrence. Interest in the procedure is growing tremendously resulting in a push for regulation. My paper for the workshop investigates two issues in the legal regulation of stool. The first concerns the debate around the legal categorization of stool: is it a drug or part of human tissue like cells and blood? This legal exercise in categorizing reveals the exemplary status of stool in the regulation of biological and pharmaceutical material and prompts new ways of valuing human waste. Second, I'm interested in exploring the social life of human waste and how this social life—through research on the microbiome—becomes entangled with the corporeality of the body. Here, microbiome research might prove useful in rearticulating the relationality between body and environment encouraging new narratives for law.

VANDEBROEK, Luka* (University of Antwerp, Belgium)

Memories of Congo: An Autoethnographic Exploration of How My Grandparents' Generation in My Belgian Family Negotiate Colonial Memories Using Photo-Elicitation

Since memories and photographs do not objectively capture and present a factual past, revisiting them may lead to negotiation. Using oral history and photo-elicitation interviews, I studied the memories and meaning-making of six elderly on the paternal side of my Belgian family. I focused on how they narrate and make sense of their relationships with their Congolese domestic helpers and other Congolese during the colonial period of Belgian-Congo. This led to their negotiation of collective memories of Belgium's colonial past in Congo. Concepts discussed in the literature study include the politics of memory, collective memory's identity function and collective guilt, the role of photography in negotiating colonial memory, Marianne Hirsch' 'familial gaze', and Sandrine Colard's theory of the promotion of a "Belgian-Congolese" family in Belgian colonial photography. My findings address the inclusion and position of black domestic helpers in the Belgian family photographs, how photographs were used to argue for amiable relationships beyond the photograph, and how looking at family photographs led to discussing and revealing colonial discourses in Belgian society. By the intragenerational disagreements within one family, it becomes clear how complex the views of Belgians on our colonial past are and how more subjective, qualitative research adds value to this discussion. Lastly, open conversations without immediate defensive reactions are encouraged to continue the negotiation despite controversy and with the help of photographs or other tools.

RC46-JS-104.5

VANDEKERCKHOVE, Wim* (EDHEC Business School, France)

Role-Prescribed Whistleblowing and Social Injustice.

Safe and effective whistleblowing is a crucial instrument for good governance. Many countries have adopted whistleblowing legislation providing whistleblower protection. An often-occurring loophole in whistleblowing legislation is the lack of protection for 'role-prescribed whistleblowing' (ILO-term) or 'duty speech' (US-term). This paper argues the importance of closing that loophole for achieving social justice and good governance.

The problem arises for every worker who has, as part of his or her normal duties, been assigned the task of detecting, reporting or investigating wrongdoing and, in fact, reports that wrongdoing through normal channels. When these channels malfunction and the worker experiences retaliation *before reporting their concerns through a designated whistleblowing channel,* the worker may find that they are not covered by whistleblower protection. Indeed, the worker may make a report through a channel designated in an organisational policy as a whistleblowing channel, or to a competent authority, outside of the normal channels. These disclosures would be covered by whistleblower protection legislation, but not the retaliation experienced by the whistleblower when they used the normal channels.

Workers caught in this loophole are typically in oversight roles, such as internal and external auditors, auditors-general, procurement officers and heads of procurement, accounting officers, fiscal and judicial agents, stock verifiers, or prosecutors. Vital roles for good governance, yet legislation often excludes them from whistleblower protection.

The paper provides case examples to illustrate the problem. The paper argues that this loophole is underestimated in the EU Directive 2019/1937, and can only be closed by explicitly addressing it in whistleblowing legislation, such as by the WPA amendment in the US [5 USC 2302(f)]. When not explicitly covered, workers may be left in the cold. They believe the whistleblowing legislation would protect them, but when they seek redress in court, they find the legislation does not protect them.

Existential Anthropology: Facing the Body with David Le Breton

Abstract   Text:
With over 40 books, 2 novels and a 16 mm. film, David Le Breton's anthropology of the senses and sociology of the body is well known in France and beyond. In this paper, I will present an overview of his whole work with special emphasis on the internal relation between sense (meaning) and sensibility (body). In the tradition of Merleau-Ponty's existential phenomenology, Marcel Mauss's anthropology of the body and Georg Simmel's sociology of the senses, Le Breton conceives of the anthropos as a sensing, sentient, sensible and signifying being in a world that is always already signified and covered in meaning. The loss of meaning is a constant threat, however. Faced with extreme levels of anomie and meaningless or insufferable pain, human subjects may throw themselves desperately into risky adventures in order to resuscitate life from death.

First principles: A Declaration of Interdependence

Sociology is the continuation of moral and political philosophy by its own means. A sociology of sociology that inquires into the moral and political presuppositions of sociology will reveal that its critiques of social injustices and social pathologies basically adhere to the repertoire of "liberal communitarianism". Sometimes it veers more towards the communitarian pole of identity and authenticity; at other times towards the liberal pole of autonomy and justice. When the discipline is attacked by authoritarian or "austeritarian" regimes, it is important to reconfirm its first principles – lest the discipline itself disappears with the world it was supposed to analyse and defend.

Relational Loneliness and Mead's Theory of the Self

Loneliness is an experience discussed with increasing frequency within both academic and public spheres. To date, little sociological qualitative research has explored the everyday, lived experience of loneliness for Australian young people. With insight drawn from 40 semi-structured interviews and digital diaries, I elaborate conceptually on an inductive understanding of loneliness that took shape when participants recounted experiences of loneliness and connection. Participants felt an intense pressure to be and live socially expected and acceptable ways. They felt apart from others when they did not live a life understood and accepted by those around them, which could lead to confusion about how they might relate meaningfully with others and where they might belong. There was, to varying degrees, a dual estrangement of the individual from their sense of self because of their estrangement from the social whole to which they belong. I call this experience relational loneliness to acknowledge the self as a product of relating with others, where this loneliness is a felt loss of relatedness between self and other. Symbolic interactionist approaches help explore the significance of others in the development and experience of the self. For the father of symbolic interactionism, George Herbert Mead (1934), the self is a product of social processes that reflect the structures of the social whole to which the individual belongs. Yet Mead's conceptual framework lacks attention to how emotions shape our understanding of self, others, and the social world (Greco, Holmes & McKenzie 2015). To balance his over-focus on the cognitive and linguistic, I aim to extend Mead's theory to include the role that emotions play alongside cognitive evaluations in everyday sense-making praxis, which becomes especially evident when considering loneliness experiences.

Effects of COVID-19 on Mental Health in Mexico, from a Syndemic Perspective

The pandemic generated by COVID-19 gave rise to various economic and structural disruptions, given the prevention measures implemented to curb the contagion. In Mexico, millions of people had faced the pandemic's consequences, such as layoffs, loss of income, human casualties, and the consequent emotional disruptions caused to the population since the end of April 2020, when COVID-19 was established as a health emergency.

The present study aimed to measure the effects of COVID-19 on recovered patients with symptoms caused by COVID with prolonged effects (called long-Covid) from the socio-historical perspective, for which a syndemic approach is used (Singer,2009). In addition, we analyze the long-term sequelae of this disease to understand its cumulative and lasting effect beyond hospitalization and mortality. The study emphasizes the impact of this disease on the psycho-social and economic dimensions. The findings will help characterize the demand for mental health care and its interactions with social determinants.

The study provides insight into the effects of COVID on mental health, physical health, and family economics from a sydemic perspective. The key findings indicate that there is deterioration in mental health (depression, stress, and anxiety, high levels of post-traumatic stress disorders), physical health, and other affectations.

Those effects reduce the peoples' functionalities at work and social life, which could be related to loss of employment and diminished capabilities.

The study aims to reinforce health policies to establish mental and physical health care measures as a priority for the general population and infected medical personnel.

Decolonization or De-Brahmanization: Revisiting Hindutva As a Decolonial Praxis in India

Current Indian political discourses envision a politically homogenized state under the governance of Hindutva ideals. The radicality of Hindutva is to reconstitute and restitute the ontological and epistemological rootedness of Indic civilization and consciousness. It challenges destitutions in the name of modernity, rationality, and emancipated thinking. It indeed calls for an epistemic delinking from oppressive and embedded Eurocentric notions of ontology and epistemology, providing space and place for pluriversal explorations. However, all these discussions come at the peril of essentialized notions of nation, consciousness, civilization, and religion that obfuscate lived in realities of centuries-old moral and social conditioning. Also, western colonial interventions created multiple subjectivities and relationalities interacting with universal notions of history, identity, and consciousness. Current nationalistic discourses in India employ decolonial frameworks without acknowledging embedded misconceptions of homogenization. In search of an indigenous monotheistic Indian consciousness, premodern and precolonial scholars use decoloniality as the entry point and schema (means and end) of an exclusionary form of nationalism. While raising questions about the current nature of indigeneity, these discourses fail to adopt a from-with decolonial approach (Mignolo). In this context, the paper explores the feasibility of a de-brahmanized decolonial praxis that allows bottom-up processes of indigeneity, e.g., Dalit consciousness (Ambedkar), self-respect movement (E V Ramaswamy), social reforms of Sree Narayana Guru. We examine how a pedagogical response that involves opening an ethical, political, and epistemic decolonial space can be adjudicated. The paper exposes the cracks and fissures of decolonial praxis in the Indian context bridging the gap in current research methodologies that advocates a nationalistic reading of history, culture, and memory.

Transforming Community through Painting: The Emergence of Macromurals in Latin America

This paper traces down the emergence of the phenomenon of macromurals in Latin America. In recent years, macromurals have become a major trend and the most visible forms of art through which various actors try to transform marginalised communities in cities by painting their houses. The making of macromurals is then characterized by a tendency to chase magnitude resulting in their extraordinary visibility on urban surfaces: for instance, Parque de la Muralla was inaugurated as the biggest macromural in Peru, Macromural de Pachuca is considered the biggest mural in Mexico, and La Mariposa in Bogotá was even classified as the biggest in the world. Relying on ethnography of circulations, the paper shows how this politics of macroscale specifically shapes the way how the idea travels between cities and how is locally applied. In particular, while individual actors very often know about other cases—when aimed at achieving their various size-oriented goals—they are designedly only vaguely inspired. Thus, rather than a matter of mutation, the variability of macromurals is, to a certain extent, a result of multiple emergence. The paper argues that only by tracing these diverse partly independent trajectories of the making can one fully understand and evaluate the complex effects of macromurals on communities and cities.

Linguistic and Communicative Strategies of COVID-Trolling in the Russian Social Network "Vkontakte"

Information and technological features of communication in social networks have expanded the possibilities and the extent of the potential influence of trolling as a verbal and psychological strategy of aggressive influence. The reasons for the large-scale spread of trolling in social networks are the anonymous nature and the possibility of false identity of network communication, as well as the emergence of special automated programs (bots) that allow the spread of trolling content with unprecedented speed. At the same time, online trolling is taking over more and more thematic areas of the media sphere. In the COVID-19 situation in particular, trolling extended influence by taking advantage of crisis uncertainty, when large groups of people showed a tendency to challenge the official point of view, to COVID dissidence, to protest movements. Analyzing this problem, the authors present their own research, which represents the first experience of analyzing the communicative strategies of COVID-trolling implemented in the Russian social network "VKontakte". This research was based on an unique methodology to detect trolling accounts based on the analysis of bursts of network publication activity through comments, combined with the profiling of trolling accounts, allowed us to identify a number of trolling accounts in the social network "VKontakte" from March 18 to June 10, 2020 according to the specified keywords. The content of trolling accounts is identified in terms of the representation of these strategies. As a result, it was shown that the analyzed trolling accounts use both overt and covert strategies of influence, with the more aggressive (overt) communicative strategy predominating.

Reporting Racism: Empowerment to Speak out or a New Civic Duty for Those Facing Racism?

As the under-reporting of racism is widely acknowledged and the persistence of racism has been increasingly acknowledged in Australian society, calls to report racism have been more frequently articulated by a range of statutory agencies and academics. While these encouragements are important and

well-intended, we argue in this presentation that there is a risk that they can also put pressure on those who face racism and create an environment where reporting these experiences of racism can be seen as becoming an additional 'civic duty'. This is particularly problematic when the existing reporting pathways and support services are not sufficiently aligned with the needs and expectations of those who experience racism. Here, reporting can be a disempowering and potentially re-traumatising experience. Individuals must weigh the high emotional costs and resources required to report racism and the expected outcome and benefits of reporting. Related to this, external calls to report challenge individual agency in deciding whether to report or not to do so.

In this presentation we discuss these complexities based on our findings from several place-based research and community engagement project, including a survey of around 300 respondents from communities impacted by racism and close to 30 community focus groups in Melbourne. Instead of viewing (non-)reporting as a singular decision, we will explore various factors that shape the highly individual journey that may or may not lead to reporting and how reporting pathways (and related support services) can be better tailored for the different community needs.

Religion and Attitudes Toward Migrants: Understanding the Role of National Religious Contexts

The state of research on religion, nationalism, and attitudes toward migrants has been characterized as mixed. Studies are divided on if, when, and how religion contributes to a receptive environment toward migrants, with some studies finding religious advantages while others associate secularization with receptive social climates. Utilizing recent, representative global data from the joint World Values Survey-European Values Study dataset, I take a more multidimensional approach than is typically seen. First, I argue that the reason results have been so mixed is because there are few, if any, generalizable differences between those who belong to religions and those who do not, when it comes to attitudes toward migrants. However, religious service attendance is generally associated with positive attitudes toward migrants. Finally, I argue national religious characteristics play an underappreciated role in predicting attitudes toward migrants. In several contexts, national rates of religious practice are associated with generous attitudes toward migrants. I conclude the study by detailing how national religious contexts effect general attitudes toward migrants as well as particular religious adherents' attitudes toward migrants.

Religion and Support for Far-Right Platforms: Comparing Italy, Hungary, and the Netherlands

Much research takes a one-size-fits-all approach to understanding how religion contributes to support for the new far right, certain populists, and/or authoritarians. Theories of Christian nationalism and assertive secularization are frequently cited to frame and interpret elections and changing policies in these contexts. Utilizing the most recent representative data from the World Values Study-European Values Study, I find evidence complicating these narratives. I find evidence associating religiosity with support for far-right political outcomes in Hungary, breaking with some recently published research. However, in the Netherlands and Italy, the opposite is true. In both countries, irreligiosity is associated with far-right outcomes, but in different ways. In this study, I discuss the implications of these results and argue that only a comparativist approach can properly interpret how religion, secularism, and new far right political changes are associated.

Reflections on Doing, Thinking, and Writing Institutional Ethnography

My presentation will focus on my experience of IE as a researcher/author, editor, reviewer, and mentor to students. From each of these activities I have learned about doing, thinking, and writing IE. More recently while reviewing for journals, writing proposals, and meeting with students in the WG06 mentoring seminars I have come to understand that some of the same gatekeeping mechanisms I confronted years ago are still in place while many of the opportunities for grasping the breath of institutional ethnography as an alternative sociology are still in place.

I begin with a short history of me taking up institutional ethnography and why my own rejection of traditional sociology was fundamental to thinking in new ways. As part of the process of learning IE, I discuss my first attempts to write IE grant proposals and to publish articles from our research on the transformation of housing. I examine conversations with these reviewers who were important in gaining a deeper understanding of the ontological commitments in IE. Most

of this dialogue was with qualitative sociologists (Smith & Griffith, 2022). Our responses often required lengthy paragraphs teaching people IE. Recently, my hunch is that IE has come of age and our writing should be bold and focus on the content of what we have to say rather than writing lengthy text about what IE is. Next, I reflect on teaching a standalone graduate course in IE, reviewing for journals and edited volumes, and mentoring. Here I focus on how these conversations in writing or in talk are a collaborative IE project of learning and creating what is IE. Finally, I reflect on my own practices as I guide IE researchers including contemplating my own fraught relation with them as a gatekeeper as I navigate reviewing IE chapters, dissertations, and articles.

Evaluation of a Finnish Youth Crime Intervention Model

Evaluation of a Finnish youth crime intervention model

In recent years, the Finnish Ministry of Justice has piloted a new intervention model for young people who have been suspects of several and serious crimes. In addition to crime prevention, the aim of the work is to promote social inclusion and wellbeing among targeted youths. The model is based on the Nordic diversion approach, and the aim is to intervene in the criminal behavior of young people with social political interventions instead of the mere criminal process. In the intervention, the support and services for the treated youths are collected in the same unit, and one professional is given an overall responsibility for the young person and their life situation. Furthermore, the young people are not only referred to the services but they are also guided to new activities such as sports and hobbies. In this presentation, I will utilize a mixed methods approach in analyzing the intervention model and whether it successful in helping the targeted young people. In the statical analysis, I will use a quasi-experimental research design and Finnish register data to estimate whether the model is effective in reducing recidivism and increasing social inclusion of targeted young people. In the qualitative analysis, in turn, I will explore young people's past and current experiences of criminal justice system and the studied intervention model. Thus, the qualitative analysis produces information of factors that makes the intervention potentially a transformative experience. Our main conclusions concern the role of comprehensive social policy interventions in the prevention of juvenile delinquency. However, interventions must be based on research, and young people must also be able to participate in their evaluation.

VAZQUEZ, Mayte* (Centro de Investigaciones y Estudios Superiores en Antropología Social, Mexico)

Trabajo Del Hogar, Movilidad Social y Estigma: Una Mirada Auto-Etnográfica

Esta auto-etnografía, enfocada en describir y analizar cómo ex – trabajadoras del hogar que ahora emplean trabajadoras del hogar viven con el estigma que conlleva este empleo, fue inspirada por mi experiencia limpiando casas a cambio de una remuneración económica durante una estancia estudiantil en Copenhague, Dinamarca. Incapaz de comprender porqué me provocaba tanta vergüenza hablar sobre mi experiencia, decidí escribir al respecto. Tomando mi experiencia como parteaguas, indagué en mi historia familiar y su relación con el trabajo del hogar, dándome cuenta de que, tanto mi madre como sus hermanas, habían sido trabajadoras del hogar en su juventud, y así como yo, rara vez hablaban al respecto.

Considerando lo anterior, la pregunta que guía esta investigación es ¿por qué no hablamos de nuestras experiencias como trabajadoras del hogar? Para nosotras, más que una profesión, dicho empleo representa una posición social de la cual constantemente intentamos alejarnos, por lo que ocultamos nuestras experiencias como trabajadoras, y demostrar la movilidad social ascendente que mi familia experimentó. Esto partiendo de la idea que la construcción y pertenencia a una clase social es relacional, y que ser parte de la clase media está en constante amenaza.

De esta manera, problematizo los sentimientos de orgullo y vergüenza que tanto fueron mencionados, haciendo énfasis que ambos sentimientos cumplen cierta función para la construcción de imaginarios sociales sobre las trabajadoras del hogar y la continuidad de la cultura de la servidumbre. Además de hacer una indagación profunda del silencio que rodea nuestra experiencia, también escribí la tesis con el propósito de cuestionar la normalización y perpetuación de la cultura de la servidumbre, y el efecto deshumanizante que ésta tiene en las y los trabajadores del hogar.

Labor Reform in Mexico 2019: Lessons and Learnings.

Currently the world is characterized by having experiences of changes and great transformations, this work addresses an experience of change from the implementation of the reform to the Federal Labor Law in Mexico that came into force in 2019. The purpose of the study is to document the experiences and

learnings of organizations that have lived the process of the implementation of the labor reform, to propose mechanisms, actions and recommendations to the organizations that are in the implementation stage and for the continuation of the labor processes that are presented in the organizations and that must be attended to in the light of the reform. The theoretical approach of the work deals with organizational theory in particular the contributions on institutionalism and isomorphism whose approaches will allow to understand the process of change, in this case, the reform of the labor law. Next, an overview of the background that gave rise to the labor reform is presented; Subsequently, the main characteristics of the reform are analyzed, to give way to the description of the organizational experience of the implementation of the reform, where the main lessons and experiences that allow the elaboration of reference frameworks with mechanisms, actions and suggestions that may be useful for other organizations that are in the implementation process are highlighted. It is qualitative research, using the case study as a methodological instrument.

Laboring Under Authoritarianism and the Pandemic: Workers' Repression and Resistance in the Philippines, Myanmar, Hong Kong and Indonesia

The rise of authoritarian regimes around the world since the 2008 Great Recession has been the focus of much attention. In Southeast Asia, the persistence of illiberal governments amidst economic growth has been observed even before the global crisis. With the onset of the COVID-19 pandemic, the turn to authoritarianism has been consolidated with draconian restrictions on civil liberties. This has intersected with increased suppression of opposition groups by authoritarian regimes along with heightened abuse of working classes by capitalist elites. Using the notion that authoritarianism is integral to and not a pathology to neoliberalism, the study examines the impact on workers of measures undertaken by governments and capitalists in the Philippines, Myanmar, Hong Kong and Indonesia. Through key informant interviews of labor movement activists and observers in the four Southeast Asian countries and a desk review of events during the pandemic, the study analyzes the responses of labor movements to the oppressive actions of regimes and elites. The study finds the working classes and labor movements in the four countries similarly bearing the brunt of oppression though differences in the intensity exists. Likewise, similarities and differences occur in the labor movement responses. An initial typology of the workers' resistance to repression by authoritarian regimes and their capitalist allies is presented.

@Minority Voices: Racialised Communicative Labour and Anti-Racism in Singapore

For a very long time ethnic minorities in Singapore were unable to express and share their experiences of racism. The everyday and casual nature of their encounters of racial discrimination were difficult to pin point because they were subtle, deemed trivial and often framed as banter among friends or colleagues. Even though racist incidents occurred in public settings, racism was endured as a personal experience; a product of personal prejudices and not a social failing. There were no spaces to speak out and be heard. However, in recent years, young Singaporeans have turned to the internet and social media to convey their testimonies, express the emotional toll and debilitating effects of racism and orchestrate anti-racist actions. This paper examines the various ways in which young ethnic minorities who have experienced racism are using digital media to create awareness, share its effects and confront it. This work we argue constitutes a form of racialised communicative labour. This paper contributes to the scholarship on antiracism, a relatively new and emergent phenomenon in multiracial Singapore.

VELIKAYA, Nataliya* (Institute of Social and Political Research of Russian Academy of Science, Russian Federation)

Alternatives to the Future Development of the Country from Russians' Point of View As a Factor in the Political System Transformation.

Interest in the future and in attempts to construct and predict possible trends in the development of society are actualized in times of crisis. At the same time, the imagined vision of the future reflected in the public consciousness makes it possible to assess the existing risks of social development and identify the dominant social fears. The report is based on data from the research project "Forecasts and alternatives for the development of Russia (How social strata assess the future and prospects for the development of the country)" (the method of focus group interviews) and data from the sociological monitoring "How do you live, Russia?" (1992-2022). During the research we identified collective ideas about the future that dominate in certain social groups.

This picture includes ideas about the economic, political, social and cultural prospects of the country's development, about the main risks and threats that hinder the sustainable development of society.

The near future is seen by the respondents as a continuation of the current situation and the overwhelming majority in all focus groups express doubts about significant improvements in the life of the society, inclyding doubts about the ability of the authorities to solve current problems in the best way. Our informants see the distant future as more favorable, but the specific content of the image of the future depends on the socio-demographic characteristics of the respondents and their political culture. Assessing the existing social risks and threats, our informants give more weight to the internal threats. The image of the future in the mass consciousness of citizens is determined by the actions of the authorities, their policies in various spheres of social activity, the dominant social mood and current well-being in society, which affects the legitimization of the current political regime and the political behavior of respondents.

WG01-769.2

VELIKAYA, Nataliya* (Institute of Social and Political Research of Russian Academy of Science, Russian Federation)

Public Legitimization of Political Power in Russia in the Context of a Special Military Operation

The study of the state power legitimization is especially relevant during crisis periods as well as during military conflicts. In the report, we plan to consider the prerequisites and mechanisms of political power legitimization in dynamics over the past 20 years and, in particular, during the period of a special military operation in Ukraine.The empirical base of the report is the data of the monitoring "How do you live, Russia?" (1992-2022) of the Center for Strategic Socio-Political Studies of the ISPI FNISCS RAS.

We proceed from the fact that in a modern democratic society, the legitimacy of the government largely depends on the level and quality of interactions between the state and civil society. Our data shows that respondents are increasingly critical of the functioning of civil society, especially when it comes down to such indicators as freedom of political choice, freedom of speech, tolerance of other people's opinions. It reflects the peculiarities of the political process, which is characterized by a reduction in the space for free discussion and in the competitiveness of the system. At the same time, according to the answers to direct questions about the support of the president and the government there can be seen some increase in it, which can be explained by the emerging atmosphere of control and pressure over public space during the period of special military operation. Although party system does not meet the public demand, and the activities of political parties do not solve the problem of aggregation of the social interests of individual groups of Russian society. The existing party landscape causes dissatisfaction in society. Almost half of the country's citizens (46%) do not support any of the existing political parties, which can provoke delegitimization of both the legislative process and the political system as a whole.

VELLOSO, Joao* (University of Ottawa, Canada)

Exception, Policing and Executive Power during the Ottawa Occupation By Freedom Convoy Protesters

A series of mass protests occurred in Canada against COVID-19 vaccine mandates and restrictions in 2022. The main one was called Freedom Convoy and it started as a convoy of heavy trucks departing from the West coast (Prince Rupert, BC) on January 22, crossing the country and growing bigger until their arrival to Ottawa (Canada's capital) roughly a week later. The protests in front of Parliament on the weekend of January 29 quickly became a three-week occupation of the downtown area of Ottawa with an estimate of around 200 trucks and over 900 personal vehicles until multiple police forces cleared the occupied area. Most of core protesters were calling for the arrest of recently elected Prime Minister Trudeau and therefore a new government. This Occupation was accompanied by blockades of key border crossing roads for the trade between Canada and USA.

Another particularity of this political crisis was the lack of action from police officers. They barely enforced any laws within the occupied area for 24 days, regardless the many reported illegalities and various legal tools available, which included regular laws, injunctions (court orders) and exceptional legal tools related to declarations of State of Emergency from all three levels of government (municipal, provincial, and federal).

This paper discusses the Schmitt concept of "exception" (*Political Theology*; *Dictatorship*) and how it was mobilized during the governance of protesters during the Ottawa Occupation. In this sense, I will problematize the idea that the sovereign has ability to transcend the rule of law in moments of crisis. The Executive branch of all levels of government did indeed declared emergency, but it was the police, a particular actor representing the Executive, that really had the power to transcend the rule of law and decide what was the legality enforceable, or not, in the occupied area.

RC30-441.2

VENDRAMIN, Patricia* (University of Louvain-la-Neuve, Belgium)

Effects of the Pandemic on the Value of Work for Young People

In Western societies, work is supposed to meet three types of strong expectations shared by workers: instrumental expectations, i.e. to meet one's needs and ensure a secure existence; social expectations, i.e. social links, exchanges, integration into social networks; expressive expectations, i.e. personal fulfilment, recognition, a feeling of usefulness, the development of skills, a social identity. These three types of expectation, as shown by numerous successive international surveys (ISSP, EVS, etc.), are particularly high among young people. Work remains the social integrator par excellence. The changes in work during the pandemic have upset the parameters of how work is defined and performed. The pandemic has had the effect of making visible the contrasting realities of the world of work: hidden or tolerated precariousness, salary inequalities, poor quality working conditions, alongside protected and privileged situations. It has also been a formidable accelerator in the use of digital technologies, while also accentuating the digital divide in the world of work and in society in general. The pandemic has also introduced new divisions in the world of work, between those who can work remotely and those who must work on-site. It has also created new labour market shortages and labour displacement, thereby transforming existing power relations. In this new landscape, this contribution questions the transformation of the relationship to work among young people. Is work still the key social integrator for them? Has the relationship to the collective been further eroded or transformed? The contribution will be based on recent work carried out in Europe.

Learning Sexual Pleasure: The Discovery of Affordances As Tacit Knowledge Production

Sexual pleasure is an excellent site for investigating the intersection of body, practice, and meaning. The experience of sexual pleasure is inevitably embodied, but it is influenced by discursive and tacit knowledge, as well as by physiology. Drawing on life history narratives from thirty women and Assigned-Female-At-Birth (AFAB) individuals, we describe the pursuit and experience of sexual pleasure as a cumulative learning process. Participants' accounts reveal the central role of material objects in this process, as moments of bodily insight, sensation, and pleasure emerge in interaction with both non-sexual household objects (e.g., vibrating toothbrushes and zucchini) and unambiguously sexual objects (i.e., sex toys). Encounters between individuals and objects may be understood as opening up *affordances* for action and sensation. These affordances are seeded in the minute material qualities of the object and depend upon the tacit and discursive—or formal—knowledge the individual brings to the interaction. As individuals move through their environments over time, their experiences of bodily sensation and pleasure with a variety of objects accumulate into sexual self-knowledge through a perceptual learning process. If an interaction with an object affords pleasure (or forecloses it), that experience provides the individual with transferable embodied knowledge about possible future affordances for pleasure that might be activated with different objects. Our participants carry past insights about their bodies and their sexual pleasures into future interactions with objects and partners. We theorize this perceptual learning of affordances as a form of tacit knowledge production, offering a new account of sexual pleasure that foregrounds materiality and memory.

VERLOO, Nanke* (University of Amsterdam, Netherlands)

Political Rigor. Reflections on Power and Positionality in Ethnographic Action-Research.

In this paper I will explore the notion of 'political rigor' to address methodological issues in the practice of Ethnographic Action Research in municipal institutions. Traditionally, ethnographers are uniquely equipped with a wide array of practices to reflect on their own positionality in the field and the meaning of their embodied bias in interpreting data. When doing community-engaged institutional ethnography or ethnographic action-research, scholars collaborate with (policy) actors to produce scientifically and socially relevant knowledge and transformative action. The underlying principles of action research - (1) generating actionable knowledge, (2) recognizing, working with, and strengthening relationships, and (3) critically and constructively transforming hegemonic systems (Bartels and Wittmayer, 2019) push the positionality of institutional ethnographers to political engagement. As a result, the boundaries between the self and the other, the researcher and the field, the cause and study become even more slippery. This positionality requires reflection beyond academic rigor.

Political rigor uses as its departure point the acknowledgement of the inherently political, culturally and historically situated nature of knowledge production and the observation that all research, science and forms of knowledge production are inherently political enterprises, impacted by unequal power relations (Temper et al., 2019: 4). Temper at all (2019) offered a valuable overview of researchers attitudes vis a vis political activism. By reflecting openly and honestly on my own positionality, I seek to push the notion of political rigor further by exploring how it could contribute methodologically to rethinking power dynamics, ethics, and validity.

Ecological Crisis, Climate Change and Its Impact in the Himalayan Region: Some Case Studies

Natural environment has been adversely affected with the onward march of industrialization and urbanization in the modern age. The situation has got highly magnified with rapid industrialization and changing values and consumerist lifestyle under the contemporary market-led development model of neoliberal globalization. Natural resources are degraded and social exclusion of the marginalized people has increased. Efforts have been made at both global and national levels to figure out and deal with the problems of environmental degradations and its socio-economic consequences. However, the magnitude of the problems does not seem to reduce much or to get eliminated. The same is proving true in the case of Himalayan region which is one of the youngest mountain range and is considered as the third pole of the world and 'water tower of Asia' due to its reservoir of frozen water. It is also a key source of energy, carbon stock, rich bio-diversity, hydropower potential etc. However, due to continuous invasion of human beings for their fulfillment of various needs, even the most isolated valleys have been touched by climate change and a host of other problems including ecosystem degradation, out –migration and air pollution. Melting glaciers, food insecurity, malnutrition, changing water flow patterns, lack of clean energy for cooking, increased hazards of disasters, habitat loss, increase in poverty are most visible results of the change in Himalayan landscape and eco-system. Therefore, the perennial situation seeks immediate attention of the academia, intelligentsia and the policy-makers to plan seriously about safeguarding the environmental and ecological serenity of the region. In this backdrop, the paper seeks to advance its argument with a few case studies conducted recently on Himalayan region underlining the state of ecological crisis and climate change and its impact on the natives, society, economy and most importantly ecology and environment.

WG05-JS-106.1

VERMA, Manish K.* (Babasaheb Bhimrao Ambedkar University, India)

Environment, Development and Sustainability in India

Due to upsurge in human population, development endeavors have increased manifold during the past centuries and passed through different catalyst phases such as industrialization and globalization. These landmark phases accelerated the process of mass production and consumption through the introduction of mega industries and machines, easy transportation and communication channels diluting the geographical barriers along with strengthening of trade and commerce. All this is witnessed at the cost of scarcely available natural resources.

India, being the fastest growing economy and largest democratic country having second largest population in the world, also could not remain untouched from the emergent development pre-requisites and have got carried away in the wave to meet growing market demand of consumer products. Due to incessant harnessing of natural resources beyond its carrying capacity, recent decades have shown disturbance in natural ecosystem which is not only causing manifold environmental problems but also looming as a threat to human existence and survival. Consequently, fast depletion of natural resources, environmental catastrophe and most importantly widening of social and economic disparities amongst people are quite apparent today. The mad race to meet the development endeavours of a growing population not only marred the interests of the weaker section of the society in India but also created large scale social and economic rifts, ecological imbalance and environmental destructions. In this background, the paper provides a comprehensive account of asymmetric linkage in the trilogy of environment, development and sustainability and its impact on society reflecting on the Indian experience. Moreover, by examining the recent trends of development and recording the dilemmas which are creating ecological imbalances, it tries to explores some alternative ways of development to achieve a sustainable planet earth.

Linking Professionalisms for Sustainable State : New Dialectics of Control

The new Professional Regulations in a destabilized conditions require strong mobilizations combining stabilization and acceleration of trajectories (environment, capitalization, risks). They extend dynamic controls for bifurcative modernization (Rosa 2015, Browne, 2017)

A/The dialectic of control over professional works in the multinational firms concerns the differential valorization chains in a neo-liberal State (Michalet, Dorre). The regulation of transnational companies combines stabilization mechanisms and controls of dynamics (guidance, monitoring) (Richard Scott, Abbot). Environmental trajectories are coordinated between stabilization devices (protection, sobriety) and dynamic controls (rules, monitoring). Social trajectories during the pandemic crisis must combine containment devices and control of the virus trajectory facing social vulnerabilities. The coupling between stabilization devices and the control of dynamics may constituted a new experimental paradigm of environmental -economic regulation (Rosa 2015). It therefore affects professional regulations by their societal dimensions (territories, sustainability). Transnational consulting is only one possibility (Adams, 2020).

We may distinguish the professionalism on site (by classic corporatism and community), the connective professionalism on networks (Nordegraff,2020), the sustainable professionalism promoting shared society (Tejerina, 2018). The advanced differentiation of professional networks diffract solidarist professionalism. The pandemic crisis accelerates the breakout of professionalism inside the hospital system between the professionalism of care, the managerial professionalism of doctors, the competitive professionalism in bio-medical laboratories (Pierru, 2019).

The fascist regimes in the 1940's have combined a defensive corporatism and a technocratic dirigism, so to manage the war economy and reconstruction (France, Italy 1939-1945) (Paxton, 1977, Faye, 1975). The articulations between stabilization and acceleration would reset the alliance of corporatism and dirigism. But it requires support of middle classes who manage the expertise devices and the stabilization devices and now the dynamic control. Diagnosis will be developed for France and Europe

VERPRAET, Gilles* (University Paris Ouest Nanterre, France)

Zeit Diagnosis and Dialectics of Control : Contribution of Configurational Analysis

Zeit diagnosis supposes to compose different temporalities and different social beings. In sociology, the social groups and subjectivities are conceived inside a composition of temporalities between experiences and expectations (Gurvitch, Koselleck). The analysis of configurations specifies this dialectic of temporalities and social control by institutions (Elias). Relational sociology sustains the notion of social space under symbolic domination (Bourdieu, 1977), challenged by symbolic performances (Alexander, 2006). Tensions between figuration and configuration concern mainly precarious subjects.

The analysis of configurations contributes also to evaluate power configurations and resistances. It helps to clarify the tensive relations between interdependences and autonomy. The dialectic of control was developed in the Fordist labor between bureaucracy and autonomy (Naville, Lockwood), between the ethos of power and expanded democracy (Castoriadis, Browne). These asymetric processes are enlarged in the field of transnational work as chain of dependence (Michalet, Dorre).

Contemporary conditions of uncertainty (science, environment, covid) imply to renew the diagnosis on multiple temporalities and social beings (Beck, 2002, Rosa, 2015). The field of the environment developed the analysis of powers and counter-powers (Beck 2022) , shaping the communities of risks (Beck 2012). Between horizontal and vertical societies, environmental solidarities articulate diagonalities between territorial solidarities and more global connections in a relative universalism.

Conclusion and development : The new social theory responding to these issues question the contradictory networks and collective intelligence framing these social and environmental dynamics. It analyzes multiple configurations of knowledge and subjectivities as classic sociology. It also studies the configurations of power facing assembly of subjectivation (Butler 2015). This vision intends to clarify the relations between the configuration of knowledge, temporalities, type of democracy

Willingness to Strike Among Flight Attendants

This study aims at assessing the willingness to strike among flight attendants against the background of the COVID-19 pandemic and the resulting crisis in the airline industry. We examined the influence of perceived psychological contract breach by both, the employer and the union, and job insecurity on flight attendants' willingness to strike. Furthermore, we assessed whether procedural justice, union support, and trust in the employer moderate the hypothesized relationships. Based on survey data from $N = 403$ German flight attendants collected in summer of 2022, we found that lower procedural justice, higher union support, higher qualitative job insecurity, and lower trust in the employer predicted higher willingness to strike among flight attendants. Perceived psychological contract breach did not predict willingness to strike, but psychological contract violation (the affective component of psychological contract breach) did positively predict willingness to strike. Test of interaction effects revealed that trust moderated the relationship between job insecurity and willingness to strike. This study, hence contributes to a further understanding of mobilizing factors and sheds a light on flight attendants' perceptions of the circumstances during the COVID-19 pandemic.

Labour and Socioeconomic Conflicts Under an Authoritarian Project: A Case Study on the Textile and Coffee Production Chains in Brazil

In Brazil, the current authoritarian government acted by denying the existence of the pandemic and minimizing the suffering of Brazilian workers who had their lives put at risk. If during the Covid pandemic labor exploitation across GVCs became even more critical, in Brazil, this reality was also no different: both the industries most inserted in the GVCs, as for example the production of primary textile products, and the agribusiness sector were marked by an absolute drop in consumption of their products, which led to new processes of transferring the costs of the crisis to the workers at the very end of production chains. In the case of the textile industry, thousands of subcontracts were terminated without the guarantee of payment for services already completed. This situation of insecurity also led to growing conflicts in the areas of agricultural production. Since the seasonal harvest is considered an essential activity, such activities were conducted even though this meant increasing risks for seasonal workers, who are often subjected to situations of forced or slave-like labour. The pandemic only worsened a reality that had already been becoming problematic over the course of the authoritarian government of Jair Bolsonaro. Based on the data gathered in the case study carried out in Brazil in 2022, in the framework of which we investigated working conditions in the textile and coffee sectors and dynamics of associational change, I present central findings on current conflicts and potentialities of collective organization of workers. The current Brazilian context is marked by the removal of labour rights protections – as for example through the "defunding" of labour inspections – as well as by an authoritarian context that legitimizes practices of forced labour and the persecution of union leaders, especially the ones engaged in collective grass-roots organizing.

VIANNA SENTO SE, Isadora* (Universidade do Estado do Rio de Janeiro UERJ, Brazil)

The Increase in Feminicides during the Pandemic in Rio De Janeiro: Reports from Legal Operators

Brazil is the 5th country in the world - out of a group of 83 - where more women are killed, according to the 2015 Map of Violence, organised by the Latin American Faculty of Social Sciences (Flacso). In Rio de Janeiro, data made available by the local police report that, during the pandemic, there was an increase in the most serious violence against women, including feminicide. The "Feminicide Law" was created in 2015 and provides a qualifier, increasing the penalty for the murder of women, motivated by domestic violence or by contempt for the condition of the female "sex". This paper analyses, based on reports by legal practitioners (police officers, prosecutors, judges and public defenders) who act in the four jury courts in the city of Rio de Janeiro, how the dynamics of these crimes of feminicide, as well as the procedural dynamics of the cases were impacted by the pandemic.The research has an ethnographic character and was carried out during the year 2021, in the forum of the capital. It also takes into into consideration the criteria used by them to define, who are the women likely to be victims of this crime, in which contexts the feminicide occurs, and what is considered "contempt for the condition of the feminine sex". In the results, it is highlighted how the analytical scope of the operators of the law aims to punish aggressors when the crimes happen in the domestic environment and there is a clear relationship of "subjugation", reinforcing traditional gender roles and, excluding from the network of protection women who do not fit into a pre-determined analytical scope.

Sociology of AI Expectations: Visions about the Roles of AI in Society

The presentation argues for the usefulness of applying the perspective of the sociology of (technological) expectations (SE) in the sociological study of AI. Much discourse on technologies is related to their future potential and risk,

denotes a presenting author. Abstracts are organized by first presenting author's last name.

and even with respect to AI one can meet with future projections on many levels. SE is well-suited to providing a basis for analyzing expectations linked to AI and their consequences. However, sociology not only lags in terms of the study of the social aspects of AI, but in dealing with the future. For the main part sociology has not occupied itself much with the future, although a growing body of studies are now starting to take the future into account. Sociology of expectations, one such perspective, looks at the role of visions in the present and argues for their constitutive role in attracting resources, as well as legitimizing and coordinating action. The presentation illustrates, via three studies conducted by the author, how SE can be a fruitful theoretical backdrop for drawing on in the analysis of AI expectations. The studies analyze: 1. expert expectations in the future of work debate, 2. visions of human-centered AI, and 3. expectations of AI present in the American media. Shortcomings of the approach will be also touched upon, including the exclusion of certain kinds of expectations from the locus of analysis, and challenging issues as regards the relationship of expectations to material circumstances.

The Bachillerato Popular Travesti/Trans Mocha Celis: Collaborative Knowledge-Making

A multitude of challenges based on sexual orientation and gender identity (SOGI) have a lasting impact in school completion chances. Transgender students are particularly susceptible, given how they are commonly expelled from their homes and bullied at school. As a result, survival prostitution serves as income earning under precarious conditions; migration to large cities often follows. This presentation showcases the Argentinian *Bachillerato Popular Travesti/Trans Mocha Celis*, the first community-led high school for trans and *travesti* people in the world (*travesti* is a classed and racialized term; it does not mean transvestite or cross-dresser, rather, it is similar to transgender, although it counters it – transgender is a globalized/imposed term).

Located in Buenos Aires, the Mocha Celis was founded in 2010; it has adjusted to the conditions most trans women face, operating in the afternoon hours. Teachers are generally gay men and transgender women. The school operates under a community-based approach that strives to make education more inclusive with partial government funds and community efforts. Since its foundation, the school opened up its doors to non-trans high-school dropouts, grandmothers from the neighborhood, and South American migrants, and those coming from other provinces. Trans/*travesti* peoples are centered in the educational experience, but they do not exclude others – given how they have often been excluded.

This presentation seeks to remedy absences in sociosical knowledge production about inclusive education, SOGI communities, and community-based approaches to education. Based on collaborative participation with teachers and students at the high school -serving as a capacity building consultant to strategic planning processes, gathering information for website updates, and supporting the completion of a book on first person accounts- this case study illustrates the power of collaborative work among scholars and activists who further transforming inequality through a trans-centered educational praxis, in spite of economic crises in Argentina.

VIDAL-ORTIZ, Salvador* (American University, United States)

Translating the Queer of Color Critique: The Impossibility of Applying a (racialized, queer theory-based) U.S. Concept in Latin America - for a Truly Hemispheric Approach

An incisive contribution expanding the study of race and sexualities while helping dismiss facile "add diversity and stir" approaches in queer studies, the queer of color critique has remained a U.S.-based formation when empirically applied outside the U.S. Facing countries' different racial formation histories and raced systems is one step to actually bridge not just the queer of color critique –in projects and spaces where it might be applicable– but also in approaches to better theorize queered racialization today. Inherently, the queer of color critique requires adjustment when applied elsewhere. I place in conversation three interrelated aspects. First, I focus on the (un)translatability of racialized frameworks embedded in the formative aspects of the queer of color critique. Then, I illustrate the limited uses of the queer of color critique in Latin American countries, and the extent to which the queer of color critique is tacitly imposed, or applied in a rather simplistic way to those sites of study. This, my theoretical discussion's corpus, disentangles the impossibility of the movement, migration, or translatability of the queer of color critique by looking into published works from social scientists focused on the region such as Tanya Saunders, Jafari Allen, and Marcia Ochoa, and bridging those with U.S.-centered works by Susana Peña, Carlos Decena, even the late Lionel Cantú, Jr. I finally turn to the most recent translation of queer theory, with even most recently, queer of color critique texts, in Latin American contexts. In closing, I offer a sense of what the possibilities of a transnational, truly hemispheric and translatable engagement (at multiple levels) might be. Ultimately, I seek to push the operationalization of queer of color critique's own borders, as it clashes not only with other racial formations, but as importantly, queer theory's reception and resistance outside the U.S.

Elder Abuse and Neglect Phenomena in Czechia: First National Prevalence Study

Elder abuse and neglect which by the definition type affect 2-30% of older persons and is predicted to affect 320 million victims globally by 2050, is not just another form of domestic violence against women/men and takes place not only in private but also in (semi-)public or online spaces. It encompasses a range of attitudes and behaviours from disrespect and discrimination to physical and sexual violence. It strongly affects both the individual's quality of life and efforts to create a just, inclusive and sustainable society

Only a fraction of EAN phenomena are identified, reported, addressed and punished. Usually, this process is only initiated when escalation has occurred and the conduct fulfils the essence of the crime. In the complex relational networks of EAN actors, restorative justice appears to be significantly more effective than punitive approaches that focus on proving guilt and punishing the perpetrator.

In this paper, we present the results of the first-ever prevalence study on the EAN in the Czech Republic, based on a representative sample of community-dwelling older adults with N= 2000+. The data collection commenced in September 2022 as a part of the RESTABUS ČR Éta project No. 05000516. Besides the prevalence of the various types of EAN, we also collect the attitudes of the respondents about the restorative justice practices and perceived fit for the elder abuse and neglect cases.

We present practical considerations for the practicionairs in care facilities as well as the justice system.

VIDOVICOVA, Lucie* (Masaryk University, Czech Republic)
NEDVĚDOVÁ, Světlana (Masaryk University, Czech Republic)

The Front-Line Responses to Crises and Older People in Czechia

The available international and review studies agree that crises among older people increase the risk of death as a direct result of the event, reduce life expectancy and quality of life, significantly reduce access to health care, and complicate or make impossible the treatment of chronic diseases (diabetes, cardiovascular disease, dementia), have significant impacts on the mental and physical health of seniors, expose seniors to increased risks of severe infectious diseases, affect the quality of nutrition, and have a number of other impacts on the psychosocial and economic aspects of life in older age. International experience shows that the vulnerability and specific needs of many older people can become a serious challenge to health, survival and well-being in different types of crises. The global group "Help Age International" has identified a number of risk factors, including that older men and women are more likely to be victims of crises than their proportion in the population would suggest (e.g. 75% of the victims of Hurricane Katrina in 2005 were aged 60+; 56% of the victims of the 2011 tsunami in Japan were aged 65+; similar proportions have been reported in e.g. reports of forest fire victims in Portugal, or reports of excess mortality in heat waves; and the notorious proportions of older victims in the COVID-19 pandemic, etc.). In our paper, we localize these valuable foreign experiences, i.e. transfer them to culturally, geographically and systemically relevant contexts within the Czech Republic. We describe the process of developing a methodology that builds on multi-source data and offers possible directions for addressing health care "on the frontline".

VIDU, Ana* (University of California, Berkeley, USA)

Uniswithheart: Student Networks Leading the Struggle for Universities Free of Sexual Violence

Scientific literature has already shown the importance of solidarity networks and of protecting both direct victims and those who protect victims of gender-based violence; whom, if this protection is not achieved also for them, may become victims of Isolating Gender Violence (IGV). The concept of IGV raises awareness on the need to protect not only survivors but also those who actively support them in order to contribute ending sexual harassment. Within this context and aligned with the EU-funded Marie Sklodowska-Curie research project "UniswithHeart" (aimed at studying how social movements struggle to contribute to the creation of networks of support in academia; inquiring on social actors engaged and resistances faced), this paper aims at shedding light on how IGV operates, the negative consequences it has for survivors' supporters, and how it prevents victims to feel confident to speak up. In other words, this abstract raises the need of protecting survivors' protectors, focusing on how to prevent Isolating Gender Violence. In doing this, we discuss how survivors have created the "World MeToo University" network, knitting allies with those already organizing in other networks worldwide, as well as with researchers who are taking the lead in denouncing cases of sexual misconduct in their institutions, asking for transparency in administrative procedures and positioning with survivors. Our findings suggest that mechanisms of prevention and action need to include not only the protection of direct survivors but also of those who dare to protect them. Also, the role of solidarity networks has shown as being key to both support survivors and putting pressure on achieving

denotes a presenting author. Abstracts are organized by first presenting author's last name.

institutional change. We conclude that to successfully protect victims and have zero-tolerance with GBV within academia, tackling the connection between solidarity networks and IGV becomes crucial for survivors to break their silence and keep forward, continuing their personal and professional paths.

VIEF, Robert* (Humboldt-Universität zu Berlin, Urban and Regional Sociology, Germany)

Rent Increases, Mobility Patterns and School Segregation

Over the last decades, the link between residential segregation and school segregation has become more and more complex. Past research commonly identified the growth of legal choice mechanisms within the public and the increase of the private school sector as determinants of a loosened neighborhood-school segregation link. This study, however, focuses on the relationship between gentrification, the general crisis of housing affordability and its linked sharp increases of rents and housing prices on school choice and school segregation pattern. While some researchers already underlined that for example gentrification might weaken the link between school and neighborhood segregation (Candipan 2020, Boterman 2022), most research has been done contexts where parents in gentrifying neighborhoods encounter many legal school choice options within certain geographical ranges. Additionally, existing studies most often focused on newly arrived gentrifier parents and did not address the role of citywide housing (un)affordability pattern for school segregation. This paper, in contrast, addresses the case of the segregational development of elementary schools within Berlin, Germany, from 2010 to 2019 – where significantly fewer (official) school choice options exist. It investigates whether the extreme rent increases across the city (and disproportionately high in gentrifying neighborhoods) and strong gentrification mechanisms in some parts changed channels of school choice, as young families who might have moved in the past to other neighborhoods can find less and less affordable housing in other parts of the city – therefore re-shaping their means and strategies of school choice.

More Than a Gig: Algorithmic Management and Human Authority in Salaried Platform Work - Implications for the Future of Employment

Labour platforms' governance through algorithmic management is attributed by extant literature various pernicious attributes: surveillance, control, discrimination, intensification, unfairness. However insightful these analyses are, in most cases studied, workers operate as (false) independent contractors. As such, it remains to be clarified whether the conclusions reached about the impact of algorithmic management in the framework of Platform Work derive from algorithmic management *per se* or its perverse combination with workers' misclassification.

Until recently, the answer to such interrogation could only be speculative; however, the introduction of a new law (so-called "ley rider") in Spain forced delivery platforms to hire all workers as employees with open-ended contracts. This change offers a setting in which the effects of algorithmic management can be teased out from those of misclassified statues. Sparked by the possibilities offered by this background, the present paper takes stock from semi-structured interviews conducted with workers and non-participant observation.

The data collected offers mixed evidence. On the one hand, the new regulatory framework contributed to mitigating some of the unaccountability arising from platforms' discretionary resort to algorithmic management – offering hopes of a future where human participation in various stages of algorithmic decision-making obliterates unfair treatment. On the other hand, various platforms' resort to algorithmic management as a means to exert control and surveillance, and induce work intensification suggests that recent positive developments seem to be contingent on each platform's goodwill, workers' ability to resist and individual managers' characteristics rather than on the single-handed merits of employment status' reclassification. If anything, while before human supervisors were virtually absent from the labor process, now they are brought back in with exacerbated powers derived from the data collected and organized by algorithms. All in all, there is still a path to be walked to convert algorithmic employment relationship into true standard employment relationships.

VIEIRA MEIRELES, Gustavo Henrique* (Kanda University of International Studies, Japan)

The Migration Process and Integration Strategies of Brazilian Migrants Living in Okinawa Prefecture

The present paper proposes to investigate the migration process and integration strategies of Brazilian migrants living in Okinawa Prefecture, Japan. To do so, we focus on the activities of associations that provide support for the community and on the transnational connections those associations have developed over the years. The rapid increase in the number of Brazilians living in Japan is usually associated with the 1989 reform of the Immigration Control and Refugee Recognition Act. The migration process was facilitated by the broker system initially established by first generation Japanese that had migrated to Brazil and upon returning to Japan became aware of the shortage of workers that loomed the country. While in most of Japan recruiting agencies and brokers play an important role in the migration process, in the case of the Brazilian community in Okinawa Prefecture we find that migrants often rely on kinship ties to provide the necessary social capital in the host society. Therefore, while for most Brazilian migrants of Japanese heritage the prefecture of origin of their ancestors is of little importance in defining their destination in Japan, we observe that many of those living in Okinawa are people of Okinawan descent. As a result, one important partner of associations that provide support for the community is the network of ethnic association of migrants originating from Okinawa (Prefecture Citizens Associations, or *Kenjinkai* in Japanese). Our analysis will be based on field work in Okinawa, as well as surveys conducted during the "The Worldwide Uchinanchu Festival", a celebration of Okinawa heritage that was first held in 1990 and has happened every five years since then. We intend to highlight the specific characteristics of the Brazilian community in Okinawa and to explain how transnational networks have influenced the migration process and integration strategies of these migrants.

RC05-JS-84.5

VIETEN, Ulrike M* (Queen's University Belfast, United Kingdom)

Liquid Citizenship and the Post-Migration Condition

'Liquid life' (Bauman, 2005) could be characterised by *temporality* and *uncertainty* shaping the contemporary world on the move, but also the individual options to settle in a country and be granted full citizenship. Citizenship – though in transformation and being contested – remains the strongest rights container offering legitimacy to remain in a country. With the UK's 2016 decision (Brexit) to leave the European Union (EU) and an ongoing rise of far-right populist parties in various other EU Member states, access to different layers of rights is under thread for minority citizens. However, the shift and U-turn in broader equality policies and citizen right frameworks affects majorities, likewise. Thus, what is named here as 'Liquid Citizenship and post-migration condition' refers to the encompassing condition of a fragile, temporal and in-stable civic status for de facto and de-jure citizens. To understand how the gendered post-migration condition is impacting newcomers' experiences as citizens and their feeling of belonging, but also transforming the local spaces they live in, material from two case studies is introduced and discussed. The first refers to EU citizens/ migrants post-Brexit, who settled in the UK since being granted freedom of movement rights in 2004, and threatened with deportation unless being rightfully registered by December 2020, and the second, the so called, Windrush Scandal, affecting mainly Afro-Caribbean migrants, who settled in Britain, mainly between 1948 and 1973, and faced deportation in 2017.

These case studies show the transitional space between citizenship rights and multi-sited belonging, and how alien status as well as claims of being included are constructed, shifting and fragile.

Can Trust Issues Lead to a Lack of Civic Engagement in Non-State Actors Activities for Climate Change Mitigation?

Global environmental challenges require multiple actors to take responsibility and implement effective solutions to mitigate climate change. Corporations, governments, and other high-level actors are expected to be the key players in this area. However, civic engagement plays a critical role in creating new lifestyles and changing attitudes toward a more sustainable future. The current crisis in the energy sector around the world poses a major threat to various climate agreements and national policies as energy security becomes a top priority issue. Imminent increases in energy prices open a gap that, on the one hand, forces society to opt for more affordable alternatives and, on the other hand, prompts self-consciousness and concern for the environment to seek more environmentally friendly options. The increasing tension requires quick and trustworthy solutions, as public sensitivity skyrockets after years of endless challenges. Therefore, trust in institutions could be a key to success in such challenging circumstances and a good starting point to maintain or

even increase individual responsibility and environmental concerns among the public. Thus, this study aims to analyze how social and institutional trust influence participation in supporting non-state environmental actors. There is a reasonable amount of literature on how different types of trust influence civic engagement in other domains. And the results show that high levels of trust positively influence engagement. The relevance of this work is demonstrated by using the newly published and representative ISSP EnvironmentIV survey data, which allows comparison between different countries, and by including the specific context of high and low trust societies in the EU for research on environmental civic engagement. In this research overview, the main trends of trust and environmental engagement are identified, providing a better understanding of the phenomenon to promote behavior change.

Research funded by a grant (No.S-MIP-22-26) from the Research Council of Lithuania.

„German Angst? Authoritarian Mobilizations and Rhetorics Surrounding Gender"

As in many other regions, gender is an effective mobilizer in populist, mainly authoritarian, illiberal, anti-democratic movements in Germany. Loaded with immense affective intensity, ‚gender' has become a highly effective political signifier, linking otherwise heterogenous actors in the political and cultural field. ‚Gender' is at the center of culture wars, which also interfere with actual wars, e.g. and most prominently in the Russian war against Ukraine. Rooted in the international state of the art resp. empirical and conceptual social research, the paper will examine the specific German case of ‚anti-Genderism', focussing on the interesting convergence of 'East/West' rhetoric. It will address the social, economic, and cultural dimension of the anxiety around ‚gender' as element of authoritarian dynamics, seeking to understand the actual social conflicts underlying the strident media and cultural wars.

Quieter, Powerful and Uncontested: Implications of Methodological Changes in Population Censuses

What are the effects of the increasing digitalization of population registers and the systematic abandonment of traditional population censuses? While the transition to digital technologies appears as an inescapable next step in the methodological renovation of censuses, this discreet transition leaves the study of its implications unexplored. The literature objectifying censuses has been focused on the problematization of inclusion/exclusion of questions, the legitimacy of the operation, and the implications in the production of technoscientific imaginaries. However, there is less attention trying to detect the repercussions of the methodological switch as a whole: from a physical, visible, and contestable operation to a digital, silent, and discrete one. This paper contributes to this debate by identifying this change's material and symbolic consequences and interpreting the implications for subsequent scientific production. Methodologically, the paper takes advantage of the crisis of the COVID-19. The pandemic provoked changes or adjustments to census methodologies in the United States, Colombia, Mexico, and Ecuador. Through archival methods and in-depth interviews, I analyze official statements and methodological archives supporting and documenting the decision to modify or justify changes from traditional formats to digital versions. The study found three effects. First, it reduced the expectations of understanding the operation as a civic engagement exercise. Second, the transition implied increasing expectations to enlarge access to personal information without explicit consent. Finally, the transition to digital operatives downplayed the role of activists who are generally vocal in negotiating questions, categories, formats, and communicational campaigns. In sum, the dynamic transformed the conceptual understanding of the census within the actors in charge of its execution, creating a quiescent device with enhanced capacities and reduced possibilities of reactions from society. The study contributes to the understanding of quantification, expanding the comprehension of mechanisms behind silent processes of inscription, translation, and enrollment.

Connection with God in Times of the Pandemic: Association between Mental Health, Substance Use, and Spirituality Among Young Adults in Peru and Ecuador

With the majority of Latin America identified as Christians (90%), religion and spirituality can have a favorable impact on individual-level health, especially during stressful times such as the pandemic. However, spiritual believers who have lost their connection with God may be at an increased risk for mental health and substance use problems. This study aimed to evaluate risk and protective factors associated with substance use and pandemic stress among university students who identified as spiritual believers. We hypothesized that university students who identified as spiritual believers and felt no connection with God were significantly associated with increased substance use and pandemic stress compared to those connected with God. This was a cross-sectional study among 915 university students in Peru and Ecuador. The measures included: the AUDIT Score, UCLA Loneliness Scale, mental health DSMV Scale, Modified Perceived Stress Scale, Household Environment Scale, Religious Spiritual Scale, and connection to God (Yes/No). We used the backward elimination model to identify risk and protective factors associated with alcohol use and pandemic stress. Results showed that depression and age were significantly associated with alcohol use [F (2, 406) = 37.1, p < .04, R2 = .140]; intellect, anger, and anxiety were significantly associated with pandemic stress among university students not connected with God [F (3, 346) = 5.53, p < .001, R2 = .318]. Whereas, greater spirituality was significantly associated with less alcohol use [F (1, 3.11) = 27.1, p < .03, R2 = .190]; and depression and anxiety were significantly associated with pandemic stress [F (2, 477) = 5.23, p < .001, R2 = .277] among university students who felt connected with God. These results highlight spirituality as a protective factor for alcohol use among believers connected with God and anxiety as a risk factor for pandemic stress for both groups.

Mothers' Employment in Times of COVID-19: Assessing the Impact of Employment History in a High Mortality Context

This study investigates the impact of *mothers' pre-pandemic work trajectories* on their own employment outcomes during the pandemic. We focus on Peru, a country with a high share of informal, precarious labor. Currently, Peru is also the country with the world's highest death rate due to COVID-19 (Johns Hopkins COVID-19 RC, 2021). In a broad sense, we would expect that weaker attachment to employment, low work intensity, and work in the informal sector *before* the pandemic will be associated with unfavorable/worse work outcomes for mothers *during* the pandemic. In contrast, we may expect that a history of continued employment and access to 'better jobs' could provide mothers with a larger and better-positioned network of employment opportunity during the crisis. However, the noted relationships are not easy to anticipate given the severity of the employment crisis originated by the pandemic. We capitalize on rich survey data, nationally representative and longitudinal—the Peruvian Encuesta Nacional (ENAHO Continua). The ENAHO-Continua was designed as a short-panel for 2016-20, with annual visits, and field work was adjusted to preserve the sample during 2020. Its design includes all members in the household, which allows for constructing short-term employment trajectories for all co-resident family members. Longitudinal data is rarely available in non-wealthy countries, while the emergency of the pandemic resulted in few sources of longitudinal information available even for wealthy contexts. We are able to examine changes in employment, hours of work and hourly earnings as outcomes of interest, among mothers with co-resident minor children. Our preliminary results present a complex picture, with trends that depart from those found in previous economic shocks. A segment of advantaged mothers, with favorable employment histories, retreated from the labor force, in a pattern that points to the strong motivation for avoiding the health risk of working during the emergency.

VILLANUEVA, Aida* (University of Massachusetts Amherst, United States)

Mothers' Paid Labor and Household Dynamics in the Context of the COVID-19 Pandemic: Evidence from a High-Mortality Context

This study investigates potential associations between household composition and mothers' employment in the context of the COVID pandemic. We focus on Peru, a country with a high share of informal labor, where access to remote work is rare. Currently, Peru is also the country with the world's highest death rate due to COVID-19 (Johns Hopkins COVID-19 RC, 2021). More specifically, we explore associations between mothers' work outcomes during the pandemic and a) coresidence in multigenerational households, and b) coresidence with same-generation kin. These associations are not straightforward. Access to "additional adults" has been found advantageous for women's employment in previous research; yet it could also result in additional sources of constraint to mothers' paid work during the pandemic, due to factors such as increased needs for unpaid care work. We capitalize on rich survey data, nationally representative and longitudinal—the Peruvian Encuesta Nacional (ENAHO Continua). The ENAHO-Continua was designed as a short-panel for 2016-20, with annual visits, and field work was adjusted to preserve the sample during 2020. Its design includes all members in the household, which allows us to map familial relationships between all co-resident kin. Longitudinal data is rarely available in non-wealthy countries, while the emergency of the pandemic resulted in few sources of longitudinal information available even for wealthy contexts. We are able to examine changes in employment, hours of work and hourly earnings as outcomes of interest, among mothers with co-resident minor children. Our preliminary results present a complex picture, with trends that depart from those found in previous economic shocks. A segment of mothers with access to relatives in the household retreated from the labor force, in a pattern that suggests that access to kin became a resource that allowed certain women to avoid the health risk of working during the emergency.

Social Imaginaries and the Civil Sphere: A Cultural-Sociological Typology of Solidarity and Conflict

Taking up Binder's call to consider the complementarities between social imaginaries and cultural sociology (2019), this paper proposes a typology of solidarity and conflict in the civil sphere. I conduct a close reading and reconstruction of Alexander's references to class conflict in *The Civil Sphere* (2006) and his classic article on Watergate (1984). In the Watergate piece, Alexander proposed three macro-level, ideal-typical relations between "society" and "culture" – specification, columnization, and refraction. It was the latter – refraction – which served as the basis for Alexander's arguments about civil repair in *The Civil Sphere* many years later. For Alexander, refraction allows for open-ended resolutions to social conflict, which gives us a link to the creativity Castoriadis theorized in social imaginaries. However in the intervening years, Alexander abandoned the other two categories, losing useful conceptual tools to point to conditions of close social and cultural integration (specification) and implacable conflicts (columnization).

I revisit these three concepts, move them from the macro to the meso level, and redefine refraction as a continuum wherein solidarity and conflict vary by the degree to which the civil sphere and noncivil communities are articulated (or "refracted"). Orthogonal to that dimension, I place Alexander's notion of "social power" – the material-realist externalities to the civil sphere – which for him explain the relative power of class interests versus "civil" interests. Using these dimensions, I explain and sketch some empirical cases for four types of social imaginaries underlying different conditions of solidarity and conflict: Columnization (low refraction, high social power), Hegemony (high refraction, high social power), Populism (low social power, low refraction), and the Civil Imaginary (low social power, high refraction). In defining these ideal types, I aim to show how each contains collective understandings of what characterizes conflict and their implications for political change.

The Unmaking of the Public University in Brazil: From the Ministry of Education to the Police Pages

This paper analyses the relationship between the disinformation campaigns against public universities and the government measures on higher education and science and technology institutions, in Brazil, during Bolsonaro's term. Based on three sets of data: (1) measures and bills on higher education published in the Official Journal; (2) the Minister of Education posts on Twitter and declarations in the media; and (3) a sample of social media postings from pro-government influencers. The data collection for this article focuses on the period that Milton Ribeiro has been Minister of Education, form July 2020 to March 2022, when he asked for exoneration after corruption

accusations. The identified disinformative narrative portrays public higher education institutions as places of sexual orgies, drug abuse, and communist indoctrination. This narrative echoes the same threats used during the military dictatorship, calling up to the middle class's worst fear: the breakdown of its moral universe. The paper presents a timeline of the budget cuts and the dismantling of the Brazilian public educational system, including infrastructure and personnel. Identifying how the Disinformation Ecosystem is being used to legitimise Bolsonaro's far-right agenda is key to tackle such toxic disinformation strategies, which jeopardise healthy public debate and institutions.

The Ethics of Quantification: Investigating the Uptake and Use of Situational Judgment Test Scores in Medical School Admissions

Since the mid-20th century, the United States medical profession has struggled to maintain public trust. Therefore, identifying future physicians who will provide ethical care to a diverse patient population is an important concern of the profession, but this has been difficult to accomplish using conventional admissions processes. To select future physicians, admissions committees rely on high-stakes test scores. However, these tests measure performance in a limited number of areas. Personal statements that accompany these test scores are considered of limited trustworthiness, leaving admissions committees in a tough position. Drawing on qualitative and historical data, I investigate the uptake of a new test into admissions processes: the situational judgment test (SJT). SJTs use challenging everyday scenarios to learn about the courses of action an individual would take if confronted with them. SJTs are marketed as helping medical schools learn about the attributes of applicants that are not well represented by other aspects of the application packet. SJTs aim to measure individuals' ethical responsibility to self and others, empathy, service orientation, and professionalism. SJTs are a common part of medical school admissions in the U.S. and globally, including in Australia. But important questions about how to best use these test scores remain. It might seem self-evident: the test raters produce a score, and medical schools can trust that the score is a meaningful representation of an applicant's interpersonal skills and personal traits, and therefore a trustworthy metric for evaluating applicants. However, sociological literature on quantification technologies shows that it is not so simple. This investigation takes up a call made in recent scholarship (Espeland & Yung 2019) to attend to the ethical aspects of quantification in contemporary society by investigating how schools use this new quantification to make admissions decisions.

Social Connection and Belonging at University during the COVID-19 Era: Challenges and Opportunities for Young People

It is widely accepted that belonging and social integration are important factors in young people's successful transition into and through university (Maunder, 2018). Importantly, establishing and maintaining social relationships is central to young people feeling a part of university life (Maunder, Cunliffe, Galvin, Mjali, & Rogers, 2013; Wilcox, Winn, & Fyvie-Gauld, 2005). Since 2020, the COVID-19 pandemic has challenged these social connections by necessitating a shift from in-person to online and hybrid social interactions at universities and in wider society. In this paper, we will explore the ways in which the pandemic and its consequences have impacted young people's relationships in the higher education sphere by focusing on two core questions: 1) how are young people experiencing the profound changes that the COVID-19 pandemic has made to their relationships with peers and teaching staff at university?; 2) In what ways has this change in relationships influenced young people's sense of belonging at university?

This paper will draw on data collected since 2019 from two ongoing longitudinal, mixed-methods studies with over 700 young people who are university students at a research-intensive urban university in London, United Kingdom. The dataset provides a unique opportunity to understand how the abrupt transition to online interactions in 2020 impacted young people's peer networks, and their relationships with members of teaching staff. The data demonstrate that this change left some young people with a sense of disconnection from their university and from each other, while simultaneously challenging and enabling young people to create new peer networks informed by, and for, their new reality.

Enrich the sociology of tax evasion. Preponderance of British Virgin Islands in the architecture of offshore financial circuits extracts from data leakage

From empirical investigations on tax optimization and tax practices, we propose to present and to defend our last research in an oral communication based on our last French article (untitled - we translate - "Enrich the sociology of tax evasion. Preponderance of British Virgin Islands in the architecture of offshore financial circuits extracts from data leakage", forthcoming publication in the French academic review Sociétés Contemporaines). Tax evasion progressively became an object of sociological studies. But, without a specific access to big data, structure and social organization of fiscal transnational practices stayed in the shadow. More, previous works often oscillate between a social critic of tax inequalities and an analysis of tax practices as white-collar crime or deviance. Concerning transnational architecture of tax evasion practices, we propose a third sociological research way. We defend a quali-quantitative approach to understand current tax optimization practices. Our first findings are based on a combination of statistic method (opened thanks to data opened through "Panama Papers") and of socio-historical perspective. Our oral communication based on this article aims at explaining daily practices - even professionalized - and at enlightening tax structuring from topologies and tax jurisdictions which organize them.

High School Reform and Teaching Profession

The high school reform in Brazil (Law 13415/2017) has affected the daily life of schools and teaching. Hence the guiding question of our study: how did this reform echo in the lives of teachers? To this extent, the objective of this study was to apprehend the effects of the recent high school reform on the teaching profession. Considering that teachers, with their practices and experiences, are the ones who operationalize the curricula, understanding what affects the teaching activity becomes relevant for formulating or reorientating public policies aiming at the quality of education. With this intent, for data collection, qualitative methods were used to apprehend the subjective perspective of the teachers, and quantitative methods paid attention to what the analysis of statistics or correlations between variables revealed. More precisely, documentary analysis (laws, resolutions, lesson plans, school newsletters, and guidelines from the Secretary of Education), together with questionnaires, interviews, informal conversations, and observations of daily school life were used. The sample was composed of teachers who work in 62 state high schools in Porto Alegre/RS/Brazil, who were interviewed between 2022 and 2023. Variables such as the perceptions and practices of teachers regarding working conditions, curriculum changes, methodologies, evaluation processes, continuing training, and power relations were considered. The results, although partial and with variations, showed that there was disorganization of classroom hours, an increase in organizational work, uncertainty, and precariousness in the operationalization of the reform since teachers have not been trained to work with the new curricular components and the school has difficulty in offering continued training and in organizing collaborative planning. Although the reform has intensified the dialogue among teachers, feelings of fear, insecurity, and anguish are evident.

VITE PEREZ, Miguel Angel* (UAM, Mexico)

Extractivism As an Interpretative Concept of Urban Development in the Global South

The objective of this analysis is to construct a theoretical interpretation of the urban surplus concept not only as a social fact linked to the economic interests of private companies, but also as a specific means to extract benefits from the urban environment and contribute to the accumulation of private capital. In this way, the concept of extractivism is extended beyond its classical reference of natural resources in a rural landscape and applied to the appropriation of value of the urban built environment. This is a substantial part of what real estate companies are developing in the cities of the Global South, which can be considered as a way of revaluing the residential space as well as the establishment of commercial activities. From the above perspective, urban renewal policies become, from a general point of view, a support for the revaluation of middle- and high-income groups' housing spaces and to facilitate the location of private businesses. Therefore, the urban use of the concept of extractivism allows us to observe it as a business, which finds its social meaning not only in the residential space, but also in the consumption of the population with medium and high incomes. (The presentation will be in Spanish, with English PowerPoint slides).

La Desigualdad Social Espacial ¿Causa De La Violencia Social Urbana?

El objetivo de la ponencia es la elaboración de una interpretación sobre la probable relación de las actividades económicas informales en un vecindario o colonia, llamada Zona Escolar, localizada en una alcaldía de la periferia norte de la ciudad de México (Gustavo A. Madero) con algunas prácticas colectivas realizadas en los espacios públicos, es decir, en calles y avenidas, que tanto las autoridades como algunos vecinos, han considerado como parte de la reproducción de un orden social paralelo, clasificado como ilegal, y en consecuencia, como una posible causa de comportamientos delictivos.

Por tal motivo, se procederá a través de la ubicación de los sitios públicos donde, de acuerdo con algunos testimonios vecinales, se organizan interacciones entre jóvenes, acompañadas por el consumo de alcohol y drogas, con fines de convivencia, que según la autoridad policial de la localidad, sobre todo en los fines de semana, han derivado en conflictos, transformados en violencia contra la vida de alguno de sus participantes o en actos de robo contra los vecinos.

Pero en la colonia Zona Escolar, desde un punto de vista territorial, se ha caracterizado por una desigualdad espacial en el acceso al servicio de transporte, lo que ha obligado a plantear la siguiente hipótesis: La desigualdad espacial ha multiplicado los servicios informales de movilidad, lo que ha sido visualizado por vecinos y autoridades como el origen de un posible problema de criminalidad, ligado al robo.

Lo que se concluye, finalmente, es que la informalidad por sí misma no genera violencia, sino que esta última aparece cuando se reproduce una relación social asimétrica y basada en la violencia.

VIVIANI, Lorenzo* (University of Pisa, Italy)

Towards a Weberian Theoretical Framework on the Differences between Charismatic and Populist Leadership

By differentiating the dynamics of charisma in leader democracy from those of populist leadership, this paper provides a theoretical framework to investigate the different processes of personalization of leadership and disintermediation in contemporary democracies In the first part, the paper develops the main features of leader democracy from a Weberian perspective, highlighting how the plebiscitary linkage creates a disintermediation that reduces the power of parties as intermediate bodies in favour of a more direct relationship between leader and voters; however, I also note that this process does not entail a partyless democracy. The second part focuses on the disintermediation process in populist leadership, which represents a particular form of plebiscitary politics that does not reduce to appealing to the people or politicising the opposition between pure people and the corrupt elite, but rather entails a representative twist in an anti-pluralist direction. The proposed theoretical framework diverges from the stream of the literature on populism, which tends to equate populist leadership with charismatic leadership. In particular, it points out the substantial differences between the personalisation of the populist and charismatic leadership styles by comparing the key issues of populism and charisma in the processes of personalisation as well as provides an interpretative framework to resolve the contradictions among the dominant interpretative frameworks.

Gender, Social Lives, and Older-Adult Alcohol Abuse: A Comparison between USA and Ireland.

Alcohol is the most commonly abused substance among older adults, and the prevalence of this abuse continues to rise. Unfortunately, when compared to other age groups, little research has examined the correlates of problematic drinking behavior among older adults. In particular, there is little focus on how family and friends can influence drinking in older ages; and how this might be impacted by decades of gendered social norms.

This study has four aims. One, it will demonstrate how older adult alcohol consumption *and* its social determinants differ by gender. Two, it will demonstrate how the various definitions of "alcohol abuse" almost never center older bodies. Three, it will draw attention to one possible negative effect of strong social bonds in older ages. Four, it will highlight and challenge stereotypes of "Irish drinking culture".

For the United States data, this research utilizes the *Wisconsin Longitudinal Study*, following 7,007 respondents for approximately 18 years (from age 53 to 71). For the Irish data, I use five waves of *TILDA* (The Irish Longitudinal stuDy on Aging); following 8,466 individuals aged 50-plus over eight years.

Preliminary results indicate that associations between marital status and drinking behavior differ by gender. For example, being divorced or widowed increases the odds of at-risk drinking for men, but not women. I also find gendered differences in the associations between social participation and alcohol consumption. For instance, men (but not women) who regularly meet

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

their friends tend to drink more frequently than those who do not. Last, there is evidence that regularly attending religious services is associated with lower odds of alcohol abuse, but greater odds of being alcohol-dependent. Formal comparisons between the Irish and United States data are in-progress and will be finished by the end of 2022.

Scarier Than the Flu Shot? the Social Determinants of Shingles and Influenza Vaccinations Among U.S. Older Adults

BACKGROUND: Although more than half of older adults receive the annual influenza vaccine (flu shot), only about one-third have ever been vaccinated for shingles. With this in mind, our study examines how the associations between sociodemographic characteristics, health behaviors, and vaccine uptake differ between these two viruses. In doing so, it also investigates whether the social predictors of shingles vaccination changed after the rollout of a new vaccine in 2017.

METHODS: Data come from the 2017 and 2020 waves of the Behavioral Risk Factor Surveillance System survey, using a subset of older adults aged 60-plus (*N*=389,165). We use logistic regression models test for associations between individual-level characteristics and vaccine uptake.

RESULTS: Our procedures led to five important results. One, for both years, when compared to (non-Hinospanic) Whites, Black respondents had approximately 30% and 45% lower odds of having received the annual influenza vaccine and shingles vaccine, respectively. Two, self-rated health was negatively associated with having received the influenza vaccine, but showed little relationship with shingles vaccination. Next, men were less likely than women to receive both vaccines in 2020. Four, older adults who abstained from alcohol were, generally, less likely to receive either vaccine, when compared to both moderate and heavy drinkers. Finally, we found that the release of a new shingles vaccine in 2017 (Shingrix) had little effect on vaccination prevalence or its social determinants.

CONCLUSION: Our study demonstrates that the importance of social groups, health, and health behaviors on vaccination status may be disease-dependent. These results also provide possible guidance to health care providers and public health organizations looking to increase vaccine uptake among older adults, which may have more urgency since the arrival of COVID-19.

VOGLINO, Michela* (University of Milan-Bicocca, Italy)

Future Landscapes of Aesthetic Accumulation in the Real Estate Market

Architectural renderings are today the most widely used tool worldwide to communicate, market and legitimise urban transformation projects. Atmospheric and hyper-realistic at the same time, these visions of ideal spaces and urban societies are exclusive and exclusionary, proposing similar urban iconographies, modes of consumption and lifestyle all over the world. But as much as these images can sometimes appear almost utopian, we should analytically consider them rather as 'imagined realities' since (i) they tell of spaces to be built with bricks and steel, and (ii) they contain photographic fragments of reality. Indeed, contemporary renderings are produced entirely digitally with different design and graphics softwares, but the elements that decorate the virtual perspective of future spaces are photographs of real existing human beings, plants, public transport, meteorologies and so on, that are photoshopped onto the final scenario.

However, while most analyses of renderings have focused on public-led urban projects, little has been said about the same kind of visions promoted and sold on the private real estate market. This research therefore investigates the visual practices used by real estate developers and agents to sell new residential projects under construction in neighbourhoods undergoing regeneration processes. Drawing on a comparative visual analysis of multiple property renderings of nascent real estate markets in two multiethnic, peripheral areas of Milan and Turin (Italy), the aim of this paper is to explore (a) the socio-spatial housing imaginary under construction but already for sell and (b) its exclusionary future-led aesthetics in relation to the present stigmatised neighbourhoods. Using visual content analysis of real estate advertisements and the technique of re-photography (present-future) to map the urban change, this paper outlines how social and physical problems of suburbs can be flattened and apparently resolved through future-oriented artefacts, digital atmospheres and fictional positive expectations created by private actors.

VOGT, Hans* (German Center for Integration and Migration Research (DeZIM), Germany)

Institutional Racism between Medical Education and Medical Practice in Germany: A Participatory Explorative Analysis

The impact of racism on health and the quality of health care services for racialized patients have been the object of prior research (especially in the US and UK). The positions and experiences of racialized medical students and

physicians, who operate in a field of tension between natural sciences, practical application and health outcomes and between social capital (e.g. "medical habitus") and discrimination and marginality, have hardly been examined to date. The education of (future) physicians is an especially fruitful research area in the context of institutional racism in the health care system, as informal everyday experiences come together with formal knowledge and normative learning.

Based on expert consultations and preliminary interviews with civic stakeholders, teaching and learning materials in German medical studies were randomly sampled and used as a starting point for qualitative guided interviews with physicians and medical students in Germany who are themselves affected by racism. The results of the analysis of these interviews have been reflected upon in two focus group discussions with the interviewees.

The study is particularly concerned with the question of how to approach "institution" and how certain dimensions of racism are combined in it. This is concretized in different levels of knowledge, in the relationship between formal and informal (hidden) medical curriculum as well as in the interweaving of everyday practices/experiences and teaching materials.

First results indicate important elements of an intra-institutional circulation of racism which includes othering, stereotyping and omission of racialized patient groups, individual defensiveness strategies of medical profession, reinforced by racism being an institutional taboo, anti-racist "troublemakers" being silenced, racialized students and physicians having problems to identify with medical institution or staff or to maintain motivation to proceed in their studies and career.

Neoliberal Authoritarianism? Knowledge Economy, Nativism, and National Branding in Qatar

Over the last two decades, the oil-rich monarchy of Qatar has invested billions in national development, with the goal of transitioning a petroleum dependent economy to one that is "knowledge-based" and self-sustaining. Higher education, R&D, sports, arts and culture, and medicine have all been defined as key pillars to this new economy, and Qatari leaders have wooed prominent US universities to set up branch campuses, created sporting stadiums (the most high profile being for the 2022 World Cup), opened high-tech hospitals, and funded the parastatal Qatar Foundation which oversees most research and higher education activity in the country. While Qatar's private sector workforce is almost completely composed of immigrant workers, the intention is to increase the participation of Qatari citizens, who make up less than 15% of the total population. To this end, the government has implemented "Qatarization" policies, which afford privileges to citizens in higher education and employment. These policies go hand in hand with social welfare subsidies, such as free healthcare, free education, low-cost housing, etc that have been common within the Gulf states since oil wealth as a way of privileging citizens as a class apart from noncitizens. However, the forms of higher education and employment valued in knowledge economy development also focus on the production of neoliberal subjects who are self-regulating and not over-consuming—with state rhetoric focused on "austerity" and "entrepreneurship." How does this newer neoliberal orientation of the state work with longstanding nativist policies? What does neoliberalism look like under an authoritarian regime? While most scholarly explorations of neoliberalism focus on democratic states and the undermining of social citizenship by privatization, in the case of Qatar social citizenship has continued to grow alongside neoliberal reforms. I will explore some of the contradictions and unexpected effects of these seemingly disparate projects in Qatar and the Gulf.

HARDY, Anne* (University of Tasmania, Australia)

Human Rights, Travellers and Tourism: Towards a Research Agenda for Understanding Tourists' Perceptions of Human Rights Abuses

Tourism is a manifestation of the globalised world that we now live in, and it intertwines with the notions of human rights on a multitude of levels. However, tourism research that focusses on human rights is fragmented and minimal (Higgins-Desbiolles and Powys Whyte, 2015). While significant attention has been given to the role that tourism may play as a catalyst for social justice and the attainment of human rights and issues such as women's rights, LGBTQI+ rights, workers' rights and indigenous rights, the singularity of the issues in these studies has been critiqued. What appears to be lacking is research that focusses on tourists' perceptions of human rights abuses. Higgins-Desbiolles and Powys Whyte (2015) argue that the neoliberal notion of tourism as an industry has placed undue pressure on communities, where economic growth is put before wellbeing, and ignores issues of displacement and commodification of culture. Similarly, Burns (1999) argues that that neoliberal ideology of tourism puts the industry, rather than development, first. Arguably, a significant gap exists

　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

pertaining to the dissonance that occurs between tourism and human rights abuses. In particular, little is known as to why tourists do - and do not- react to human right abuses when making travel choices.

In this presentation three case studies will be presented that unpack this issue. We will explore why tourists' reactions to abuses of human rights are so layered, often contradictory, and nuanced. Five possible reactions will be presented: ignorance, denial, gaze, care, and boycott. Our goal is to review the literature on the intersection of human rights abuses and travel choices and develop a research agenda for understanding tourists' perceptions of these issues.

VRATUSA, Vera* (University of Belgrade, Serbia)

Globalization of Democratic Participation Self-Governance Versus Globalization of Oligopolistic Markets Totalitarianism

The paper re-examines the fashionable theme "globalization of markets" in the light of the several centuries long process of world-wide violent expansion of capitalist social relations. It focuses its present culmination in the neo-liberal policy variant of the capitalist strategy of privatization by less than 500 controlling package owners of the biggest supra- and transnational industrial corporations and financial institutions. Presented are the devastating consequences of the implementation of this strategy. Paper further critically re-examines the XXth century "real-socialist" negative experiences of the "dictatorship over the needs". It points out some lessons that can be learned from the Yugoslav self management experience for the present and future attempts at the re-conceptualization of the alternative post capitalist strategy of social development at the local, national, regional and world level.

VRATUSA, Vera* (University of Belgrade, Serbia)

Is the World Social Forum Dead?

The author in this paper will attempt to find an answer to the question, often posed during the last decades, what are the perspectives of the World Social Forum, whether it should remain solely an open space for discussion, or should it mobilize social movements affiliated to it for self managed and self organised collective action oriented on active intervention in the present world social relationships of capital accumulation that reproduce and exacerbate social inequality, exploitation, pollution, exhaustion of nonrenewable resources, global worming, patriarchy, authoritarianism and fascism.

The main method used will be the content analysis of texts available on internet concerning the perspectives of WSF, especially those uploaded since the WSF in Mexico 2023 available at The texts on the past, present and future perspectives of the World Social Forum, Los textos sobre las perspectivas pasada, presente y futura del Foro Social Mundial

RC53-729.3

VUCIC, Basia* (Maria Grzegorzewska University, Poland)

Children's Rights As the Weapons of the Weak.

Many academics open the conversation on children's rights by highlighting that the 1989 United Nations Convention on the Rights of the Child (UNCRC) enjoyed the fastest and most widespread ratification of all human rights treaties. The rapid process often misleads advocates into assuming consensus in the UNCRC draft process rather than a series of conflicts, eventually reaching an uneasy compromise. Instead of espousing peace and stability, this research illuminates the underlying principle as *conflict is creative*. Child rights researchers and practitioners rarely refer to the individuals, processes, and struggles before the ratification of the UNCRC. Official historical accounts have favoured a Western European narrative, despite Poland being under communist rule when proposing the Convention. This retelling recognises Poland as repeatedly setting off chains of events that led to new nation-States after World War I, then later the fragmentation of the Soviet bloc. Meanwhile, Polish history highlights struggles against Empires and racist oppression from the West, thus providing a rich and non-Western source for study.

In contemporary society, the primary legislator of the catalogue of human rights is the State, which is generally applied so far as it is aligned or beneficial to its own interests. Conversely, rights are also a political instrument levied against State leadership and laws. Although many socio-political movements seize upon rights in struggles against powerful oppressors, rarely are children's rights considered as weapons in the hands of the weak. These powerless, non-State actors advocated subversively using the master's tools to chip away at power from within. The challenge is critically adopting the existing legal, political, economic, and educational tools when aiming at a radical purpose. Thus, this research examines the role of prefiguration as communities transform social relations to reduce coercion and increase self-government, refashioning their culture and society.

How to Destroy an Empire - By Herbert Hoover & Friends

Descriptions of the past decade often represent a crisis in democracy and human rights, while many scour historical precedents for examples of action and policy. This research draws upon historical archives to detail overlapping spheres of action by non-state actors to shape the trajectory that changed the face of the 20th century. The military history of World War I usually overshadows a democratic revolution born out of multiple emergencies. Revolutions ride in on a Trojan horse of "emergency" by becoming the justification of subsequent so-called necessary steps – it was the tactic used by Lenin and … Herbert Hoover. The war, epidemic and famine created conditions that facilitated such influential people and civil society to change political institutions, rewrite legislation, and challenge existing hierarchies. The propaganda employed the language of emergency, child welfare and cosmopolitanism to disguise political action from below. It justified subsequent steps to facilitate the break-up of colonialist empires and the emergence of democratic countries such as Finland and Poland. These strategies to grab power during multiple emergencies are paradoxically like those today employed by autocrats worldwide. There is a flaw in Western narratives citing Hoover's adherence to laissez-faire caused by an individualist view that labels the Eastern European's involvement only as soldiers or passive victims. Therefore, academics fail to recognise that Hoover cooperated with existing socio-political movements favouring mutual aid over competition and using economic mechanisms such as consumer cooperatives. Alongside feeding starving populations, the cooperative networks prioritised restoring economic production, rebuilding a comprehensive rail and communication network, supporting the scientific capacity of populations, the economic management of immature governments and creating an entrepreneur class to counter profiteering. This research sits within the trend of applied history and delivers a new, usable past with a hopeful message for individuals and organisations during crises and challenging times.

The Sources of Support within the Slovenian Military Family's Ecosystem

Our study is based on a model of risk factors for military family health and well-being. In subsequent phases, we first tested a model of risk factors and second developed testable models of how theory-based protective factors affect military families' mental health, i.e., depression and PTSD. Our goal was to identify how protective factors at the micro, meso, and macro levels influence (reduce or enhance) existing mental health risk factors.

At the micro level, we examined: 1) work environment support, 2) extended family support, and 3) spouse support. At the meso level, we tested community support. At the macro level, we tested: 1) support from the Slovenian armed forces and 2) national family policy, government policies, and work regulations. We applied modified CES-D and PCL PTSD scales to a sample of 460 respondents, service members and spouses. To conduct the tests, we calculated 14 linear regressions. Our analysis showed that we cannot claim that a specific and only one type of protective factor contributes to the reduction of PTSD and depression. Micro-level (spouse or family) and meso-level (community) support reduces the negative impact of risk factors on military families' mental health. On the other hand, workplace or institutional support and support from national family policies are highly beneficial, but not for both mental health problems measured. Moreover, the analysis shows that women are more successful in addressing risk factors when they are offered support, either at the micro (spouse) or macro (military institution) level. We cannot say anything similar for men.

Visual Construction of the City in Education and Emerging Methodological and Ethical Issues

Contemporary urban context is a mixture of different spaces, atmospheres and temporalities as well as urban actors that (re)produce complex urban sceneries. When teaching about the city, visual sociology is a powerful tool that can be used to show different urban layers to students. It can empower them to search for different social phenomena and hidden sides of the city in their everyday life. This paper will focus on:

1. educational use of primary and secondary visual data material on urban spaces in order to connect it with sociological concepts and theories (examples),

2. teacher's competences for instructing students to conduct project assignments related to urban spaces while using different research methods, and possible shortcomings of this teaching method, meaning both methodological and ethical issues.

First objective of this paper will be achieved in presenting different cases of educational use of visual material on urban spaces, namely use of visual in research regarding the creation of sacred (public) space (ethnography of activities of the '40 days for life' initiative), visual research of urban transformations and identity markers through time, and their impact on local community. Second objective is focused on teacher's competences for complex methodological, ethical and educational issues such as teacher serving as a partial principal investigator on research using different methodologies, ethical issues such as ethics approval for conducting small scale research/project assignments, and considering possible ethical issues emerging while on field (like violation of privacy of persons in urban spaces).

Regardless of all possible problems, visual sociology has a specific kind of advantage - it is very attractive to students, and when applied to urban space it is also very helpful for interdisciplinary research cooperation and the exchange of (sociological) knowledge with different actors.

Parental Concern and Teacher Recognition of Student Speech and Language Needs: The Role of Fundamental Causes in Schools As a Standardizing Institution

Childhood speech and language (SL) disorders are associated with lower academic achievement, which can have cascading effects on later life-course events. Further, existing inequalities are perpetuated if diagnosis is disparately stratified across class. Within sociology of education, debate surrounds whether schools act as relatively standardizing institutions by reducing inequalities. Within medical sociology, the Theory of Fundamental Causes describes how individuals lacking resources, power, and knowledge are less able to take advantage of such institutional benefits. By examining a health-related outcome in SL development, we bridge these subfields by examining the role of parents' SL concern on whether a child's teacher recognizes the student's need for intervention. We use the intergenerational, prospective UK Millennium Cohort Study, a longitudinal and nationally representative sample of infants born September 2000 to January 2002. We consider how recognition of SL needs by teachers (age 7) is predicted by (1) the Foundation Stage Profile assessment of communication and language given to all students (age 5), and (2) parents' concern for their child's SL ability (ages 3 and 5). Across assessment scores, we find a significant gap by parental concern in the probability of teacher SL needs recognition, but this gap is greatest for students most in need of SL services. For example, at the lowest assessment score, the probability of teacher recognition is 0.414 when parents express concern, but only 0.142 when they do not. We then examine how measures of fundamental causes, such as parental education, explain these gaps. Finally, we show how parent concern and teacher recognition interact to predict later educational scores. Empirically, we demonstrate that parents' SL concern affects institutional recognition, even when assessment indicates the student requires intervention. Theoretically, we link medical sociology to sociology of education by considering how fundamental causes interact with schools' ability to act as standardizing institutions.

We'Re in a Bit of a Situation: The Embodied and Material Realities of Data-Driven Work

This study presents empirical qualitative research on the bodily consequences of a managerial belief in the power of information for keeping workers safe. The research is based on fieldwork at the Dutch police, conducted over a period of five years, through which the physical implications of the use of mobile databases to gain real-time access to information surfaced. Most importantly, the introduction of the mobile database led to two unintended consequences: passive listening 'in' to others' situations decreased, and active consultation of the database required bodily work that, at times, clashed with the need to remain aware and responsive in potentially dangerous encounters. We explore how this 'sensory insulation' stemming from the provision of a mobile information database can lead to police officers becoming what we call 'de-situated' from their physical environment, while their bodies and sensory faculties are concerned with the digital search environment of their mobile phones.

We analyze the unintended consequences of the introduction of digitalization by problematizing the concept of situation awareness in the face of how embodied technology use plays out in practice. Situation awareness is a military concept concerned with "the ability to maintain a constant, clear mental picture of relevant information and the tactical situation including friendly and threat situations" (Dostal, 2001 in Suchman, 2015). The concept is relevant to police officers who need to assess and act quickly and responsibly to ensure their own and others' safety. We wish to highlight that the embodied, sensory, and perceptual nature of police (and all) work is highly relevant to understanding how situation awareness is achieved, which will allow us to unpack and move forward in augmenting (instead of undermining) situation awareness when introducing new ways of accessing information in the field.

COVID-19: Social Impacts on Delawareans with HIV

In early 2021, researchers from the University of Delaware's Disaster Research Center conducted a study of the impacts of COVID-19 on Delawareans living with HIV. At the time, over 60,000 Delawareans had tested positive for COVID-19, and over 1100 people had died from COVID-related causes. We know, however, that those numbers likely do not fully capture the extent to which COVID-19 spread throughout the state. Although understanding the direct health risks to individuals with compromised immune systems is critical, this qualitative study examined the social and community impacts of the crisis. Our focus was on those Delawareans living with HIV in greatest need of economic and health care assistance: Those who qualify for benefits supported by the Ryan White HIV/AIDS Program, through which grantees receive Federal funding to provide HIV/AIDS treatment and related services to people living with HIV/AIDS who are uninsured or under-insured. The Delaware HIV Consortium is one of seven Ryan White Program care providers in the state. Drawing on the Consortium's client database, we spoke by Zoom/telephone with 55 people (approximately 12% of their clients). Participants discussed a broad range of issues and described in detail their experiences since the pandemic began. This article is based on an earlier project report (Wachtendorf, et al. 2021) that provided immediate input to the organization on the challenges their clients faced as well as the steps they took to meet those challenges. While many issues mirrored those faced by others around the country, participants also described ways that their concern about their heightened susceptibility to COVID health impacts intersected with economic strain, exposure to others in their household, fear of exposure, and the protective actions they took. Experience with the HIV/AIDS pandemic also impacted their views about the COVID-19 pandemic and the sources they trusted.

WADE, Matt* (La Trobe University, Australia)

Christian Nationalism and the Movement to Build an 'Alternative Internet'

Amid the resurgence of the far right in the United States many social media platforms, online marketplaces, and digital service providers have attempted to de-platform and de-monetise actors promoting extremist views. Such efforts greatly accelerated following the violence of the 2017 Unite the Right rally in Charlottesville. This event, among others, began what far right figures described as the 'Great Purge', where major platforms sought to deny access to domestic extremists. The 2021 Capitol attack further motivated de-platforming efforts, including the expulsion of Donald Trump from Twitter and Facebook.

In response, far right supporters now seek to build a 'Second Internet', free from both state interference and 'Big Tech' censorship. Varieties of Christian Nationalism are a major cultural driver of this strategy, with alternative social media platforms, payment transaction providers, and secure web hosting infrastructure all envisioned as means to protect freedom of expression and faith against an apparent 'woke authoritarianism'. This paper explores three platforms, GiveSendGo, Gab, and Epik, who are seeking to build a 'parallel Christian Economy'. GiveSendGo is a crowdfunding platform willing to host highly contentious causes or entities by appealing to the virtues of Christian accommodation and patriotic duty to defend free speech, with CEO Jacob Wells arguing that GiveSendGo is the 'tip of the spear' in bringing down 'Big Tech'. Gab, meanwhile, is a popular platform led by a self-declared Christian Nationalist, Andrew Torba, endeavouring to establish 'a parallel Christian society on the internet', beginning with his own 'digital Noah's Ark'. Epik, finally, is a web hosting service that has established their reputation on their willingness to host far right websites, with their founder, Rob Monster – a self-proclaimed 'Christian Libertarian' – declaring their purpose is to resist 'cancel culture'. The credibility, potential, and wide-ranging implications of these developments merit close and urgent investigation.

The Demand for Good Feelings during Bad Times: Automated Hiring Software and the Growing Affective Gap between Employers and Job Applicants

Few settings are more fraught with anxiety than the job interview, where insidious and persistent biases and discrimination can enter every stage of the recruitment process. Moreover, recruiters now contend with a growing volume of applications, and must increasingly assess for so-called 'soft skills' in an accelerating 'war for talent'. Such capacities are elusive, labour intensive, and time consuming to evaluate, and hence the insistent drive to rationalize the 'hiring funnel' entails more efficient methods are always sought. This has led to efforts to automate the recognition of affective attributes, including through AI-based assessment of video interviews. In such interviews, applicants record responses to pre-set questions that are then assessed by proprietary software. No human interviewer is present, and applicants may be algorithmically ranked without a human assessor ever looking at the video applications. Recruiters are thus unburdened of any empathetic reciprocity typically expected during a live interview. Applicants, however, remain beholden to 'hegemonic positivity' and 'emotional extraction', expected to offer effusive displays they hope prove 'machine-readable'. This demand for taxing performative labours – and active refusal by employers to reciprocate – points to a growing affective gap, one that now extends beyond the recruitment of applicants and into the uptake of workplace surveillance software designed to monitor the emotional self-regulation of employees. Under this subsumption to the automated gaze there is no promise of either affective reciprocity (i.e. the possibility of sympathy, empathy, or even basic recognition of a person-to-person exchange) or material compensation (i.e. the data exhaust of applicants' labour will be used to further refine AI models, but they are not entitled to share in this added value). This paper explores the rationales and implications of these trends, where increasingly granular but black-boxed data is used to assess evermore complex attributes and determine access to life-altering opportunities.

Looking at My Field without and with the Camera: Filming As a Method for Migration Studies

After publishing a book on Indian migrants in Tokyo (Routledge: 2021) with a chapter focusing on women's lives, I decided to make a documentary about them – 'Finding their niche: Unheard stories of migrant women'.

The protagonists of this documentary are women I had been in contact with since I moved to Japan (2007) and who later were among the interlocutors for my research. At my request in 2020, they agreed to be a part of my film. Looking at their lives through a lens revealed many surprises and other aspects of their life, which, although known to me, had a much more profound impact on my thinking as I worked through the material in the editing room. In making this film, I felt that I attained a deeper understanding of their emotions and their transition from daughters to wives, mothers and migrant workers in a foreign land. Making this feature-length documentary took me back to my past and, collectively, with my protagonists' experiences, led me to rethink the concept of migration.

In this presentation, I would like to reflect on my research experiences without and, later, with the camera. I will also talk about my journey to becoming a filmmaker and aim to reflect on the research experiences and discoveries made through working with a lens and how they differed from when I conducted my research only using traditional methods. Additionally, I intend to talk about existing migration theories and how they are reflected in the film.

WADSWORTH, Yoland* (Foundation for Human Inquiry for Living Systems, Australia)

From the Paradigm Wars to a 'New, New Paradigm' of 'Full Cycle Science' As an Inquiring-for-Life Meta-Epistemology – the Making of a Trans-Disciplinary Sociology for a New Era

In a narrative sequence traversing five decades of practice-based sociological research and thinking, I tell a story of a search for a 'new Zeitdiagnosen' culminating in a 'mental architecture' identifying a cyclic meta-epistemology able to account for the dynamic formation, persistent patterning and generation of individual-within-social systems, cultures and practices 'for better or worse'. The theory integrates insights from active service in the Great Paradigm Wars of the 1970s; efforts to demystify and popularise social research in the 1980s; develop critically reflexive co-inquiry dialogic methodologies with stakeowners and multiple stakeholders helping pioneer the 'evaluation turn' in the 1990s, and in the 2000s and 2010s synthesising and applying all this with the 'new systems thinking' to the conditions for both desired change and stabilising. The synthesis brings together multiple disciplines starting with my root discipline of sociology and then integrating organisational studies, a Jungian Myers Briggs psychology, ecobiology and the new physics. I map underlying corresponding cyclic logics in each, and introduce new concepts of 'inquiry capabilities', 'inquiry preferences' and favoured inquiry 'reach'. The resulting transdisciplinary meta-epistemology of human inquiry for living systems addresses the same challenges that led C.W. Mills to propose a sociological imagination 'at the intersections of the personal and the public', Giddens his theory of structuration, and Marx's observation of agency and structure at work simultaneously in our (paraphrasing) 'acting, but not under circumstances of our own choosing'. It offers potentially a new way of sociology making sense of how personal-social life forms, stabilises and either rigidifies or changes, using the 'new new paradigm' concept of 'full cycle science' to illuminate how life-seeking inquiry is 'writ small' in every individual person (and life form) and 'writ large' as relational organising processes/organisational culture for socio-political-bio-economic life in every human social formation (and eco-systemic/system).

Critical Digital Skills of Young People: Social Disadvantages Continued Online?

Today, young people grow up and live in an interactive world with increased uses of digital technologies in all spheres of life such as education, employment, and politics. Consequently, the young digital citizens need digital skills for being able to fully participate in society. Recent research based on young people's self-assessment shows that they have good digital communication and interaction skills but poor digital media literacy regarding information and navigation (Waechter, 2021). In this session, we will present new empirical results on 1) young people's digital skills focusing on critical media understanding as well as 2) the impact of SES on the development of young people's critical digital skills.

Our research is part of the ongoing European (Horizon 2020) research project "YouthSkills" investigating digital skills of young people (aged 12-17) in six European countries (Estonia, Finland, Germany, Italy, Poland, Portugal). To answer the research questions, we used data from the first two waves (2021 and 2022) of the large-scale, longitudinal, school-based ySKILLS survey (n1=6221; n2=7133), including two special modules of "performance tests" (n1=774; n2=724). In this study, critical digital skills have been measured by young people's self-assessment as well as by testing their skills with practical tasks such as evaluating websites and social media content regarding authorship, reliability, etc.

The results show that young people have advanced skills in some aspects of critical media literacy (e.g., which information of a third person is allowed to share) but lack skills in other aspects (e.g., differing between commercials, fake news, and reliable sources; understanding processes of algorithmically engineered information). While age and gender seem to have little influence, SES is significantly and positively correlated with critical digital skills. For enhancing young people's digital skills, we have developed a tool for digital media education which we will also show in our presentation.

WAECHTER, Natalia* (Ludwig Maximilian University Munich, Germany)

How to Become a Political Activist in the FFF Movement? Reflexion on Biographical Narratives of Young Activists.

The transnational social movement "Fridays For Future" (FFF), whose origins go back to the school strikes of the Swedish student Greta Thunberg on August 20, 2018, has not only surprised the general public, but has also surprised researchers to some extent. While young people have found to

be not particularly interested in politics for decades (see e.g., Schneeklot/ Albert 2019), the majority (84%) of the FFF protesters are young people in their teenage years or in their twenties (Sommer et al. 2019). Applying an biographical approach and in-depth interviews, in our research we aimed at identifying the most relevant persons in young activists' social environments (family, friends, school, etc.) to further find out how those influenced their lifestyle, their attitudes and their motivation for political participation regarding FFF and climate change activism. The interviews were carried out with seven young men and nine young women aged 16 to 25 who, with one exception, were in school or university education at the time of the research and who were active members of the FFF movement. Narrative analysis shows that on the one hand, the interviewed young people mainly participated in the „strikes" and in the movement with friends and/or schoolmates, and despite emphasizing intergenerational aspects in the movement, they have developed an understanding of a „generation" in Mannheim's meaning. On the other hand, their parents and other family members have shown to be crucial for the young activists' development of environmental political interest. This supports the theoretical assumption that political interest tends to be related to family socialization while actual political participation is rather related to peer socialization. Finally, the conference presentation will reflect on the benefits and challenges of using a biographical approach in the field of political participation and in particular in the context of young people's activism.

Beyond the Horizons: The Eu's Narratives on Post-Transition World

The global competition in technological development has become more visible in the last years. One of the technologies defined as crucial for economical and social progress is AI, which is linked to the necessary development of energy technologies. While the usefulness of AI for energy efficiency and flexibility within the energy system is addressed by the policy narratives, it is rarely discussed that AI technology development needs more energy resources, including rare minerals. It needs new trade partnerships and new geopolitical alliances which means that the EU's policy narratives are intended to go beyond Europe and the present. As such, they can shape the visions of the post-transition world that is offered not only to the member states but to the global world.My presentation aims to reflect on how these two influential narratives are represented in EU policy documents. Specifically, I would address the following questions:

- How have energy issues been associated with AI development in EU policy narratives? What values are they mobilizing?

- How AI is imagined concerning energy sectors?

- What kind of post-transition world is presented as anticipated in these narratives?

- What are the temporalities of anticipated changes? Who are the main actors and how are their partners in the stories? What are the challenges, risks, and uncertainties

In other words, what EU's visions have to offer to the world.
The model and results of narrative analyses of policy documents will be discussed in reference to the literature of the subject.

Co-Producing Vaccine Hesitancy in the Pre- and Covid Discourses on Immunization: A Comparative Study.

The Covid- 19 pandemic influenced the way that the media portrayed vaccines and discussed the factors influencing vaccine hesitancy. In European countries, the Covid-19 related discourses were in the center of media attention. The significant differences diagnosed in different dimensions of comparison: the pre-Covid period and Covid- pandemic period, between countries and finally, in the context of relations between the mainstream and alternative, vaccine-skeptic discourses, shed some new light on co-producing vaccine hesitancy.
The aim of this paper is to better understand how different actors in different media spheres mobilize the symbolic resources (such as knowledge, authority, values, power) to co-produce vaccines. Comparative analysis of 7 European countries was focused on identifying the main similarities and differences. The rich methodological approach, including semantic field analysis, rhetorical and discourse analysis of mainstream and alternative media, allowed us to reconstruct the set of meanings related to vaccines that can influence

vaccine hesitancy. It led us to redefining vaccine hesitancy as related to public expectations on dealing with uncertainties. Results were obtained during the VAX-Trust project funded under the Horizon 2022 framework (Grant Agreement No 965280).

Pedagogical Insights from a Course on Reducing University Students' Ecological Footprints

There is a need for research on "pedagogy in practice" in the field of sustainability education (Sandri & Holdsworth, 2021). This paper presents pedagogical insights from a case study on reducing university students' ecological footprint (EF). Students in a master's programme were required to develop and reflect on interventions to reduce their EF. We report on the quantitative data from an EF calculator measuring the results of the intervention as well as the qualitative data on the student participants' reflections. The participants all reduced their EFs by implementing sustainable lifestyle strategies that they had researched and designed. Their reflections on these self-developed interventions are described in four themes: (1) The role of environments in facilitating decisions, (2) Financial incentives, (3) Relational aspects, (4) Self-efficacy. We discuss the implications of using this teaching methodology for sustainability education.

Using or Losing a Participatory Video Approach in a Doctoral Study during COVID

The COVID pandemic and the measures instituted to mitigate its spread have wreaked havoc worldwide, affecting all facets of life without exception. The ability of researchers in the social sciences to conduct research, especially qualitative research, has been similarly affected. The current PhD study was conducted at the height of the pandemic, which necessitated fundamental modification to ensure adherence to the COVID mitigation measures. The study aimed to employ PAR, using Participatory Video Approach, to collaborate with post-graduate psychology students to contribute to developing a decolonised research curriculum within psychology. This approach aimed at exploring students' voices and actively involving them in developing ideas for decolonising the research curriculum within psychology. This paper outlines the disruptions to the PVA process and the implications thereof for the study.

Globalization and Nonviolence in the 21st Century

Please join to Prof. Steger's roundtable on globalization
Gene Sharp's *From Dictatorship to Democracy* and his similarly named film about the downfall of Slobodan Milosevic, "Bringing Down a Dictator," provides lessons and instructions on nonviolent resistance (alternatively "civil resistance") to authoritarianism. Specifically, Sharp shows how even authoritarian regimes are dependent upon cooperation from the ruled and teaches, both in theory and practice, how to refuse an illegitimate authority. This insight is not merely an historical artifact of the Gandhi led Indian independence movement, King's Civil Rights Movement, or the movements to end the Cold War or bring down dictators by the likes of Václav Havel or the Mothers of the Plaza de Mayo. If rule, authoritarian or otherwise, is dependent upon cooperation of the ruled, then it makes sense that the more these ideas have spread around the globe, the more they may be employed to refuse illegitimate rule. This is especially true in the current era of rising fascism and right-wing anti-globalist populism.

This essay evaluates the globalization of nonviolence in the 21st century by drawing on the ever-growing body of work on civil/nonviolent resistance, rising fascism, and populism studies. As illegitimate rule increases, then resistance and refusal to and of it should also increase. Published research and recent journalistic accounts show that protests increased in the United States during the Trump years and that in Putin's Russia protests erupted in opposition to his military draft. Moreover, the globalization of nonviolence and nonviolent consciousness merits attention for its ability to guide not just those responding to seemingly obvious cases of authoritarian rule but also in resisting what some refer to simply as "flawed democracies." Looking at the instances of resistance to authoritarianism, especially through the lens of globalization and nonviolence, is an excellent way to analyze global resurgent authoritarianism.

Politics By Design: City Production Meets Democracy Building at a Housing Project in South Africa

This research centers on the role of space and materiality in urban governance. It focuses on how poverty is governed as a spatialized problem and the material turn of political resistance when institutional channels are flawed. This research presents an in-depth study of the housing redevelopment in Joe Slovo informal settlement in Cape Town, South Africa (2004 to present) which initially deployed an inclusionary policy that resulted in exclusionary housing design practices, causing political contestation among the original residents of the informal settlement. Facing a lack of desired outcomes in traditional forms of participation and protest, the community took a spatio-material turn in their struggle for housing and urban rights. Through creative examples of 'design from below,' residents not only re-defined the housing project's original architecture but also challenged institutional spaces. The use of space and materiality did not extinguish during the initial resistance; it became a permanent mode of citizenship enforcement and a means for new leadership roles in the local territory.

Despite this important shift in power and control, the findings reveal multidirectional design politics between governments and communities that occur when the state loses control over design decision-making processes. The community's right to not be displaced to distant locations was guaranteed by reducing the state's implementation and delivery capacity; thus, half of the families are still waiting for their housing solution. This tension exposes the challenges of dismantling the state's administrative capacity without a clear alternative governance strategy.

In an urban world where normative planning loses the capacity to manage city production, this case offers insights into the importance of situating spatialized political tensions and conflict at the heart of the analysis of urban governance. It also opens a window into understanding design in terms of realizing political interests rather than issues of taste or aesthetic values.

The British Empire's Regulation of Sexualities and Genders Beyond Heteronormativity: Global Historical Sociology and the Queer Analysis of Colonialism

The British Empire's criminalisation of sex between men, and sometimes between women, endures in laws of most states that are formally members of the Commonwealth - while being contested in transnational LGBTI (lesbian, gay, bisexual, trans and intersex) and queer politics. However, histories of British colonial regulation of sexualities and genders beyond Eurocentric heterosexual norms have thus far lacked the insights of historical sociology, especially from the current third wave of global historical sociology which displaces the nation state to focus on transboundary processes - particularly within empires. This paper offers a synthetic overall account of the British Empire's regulation of queer lives outside heterosexuality, looking at both law and wider social regulation, while seeking to engage global historical sociology as well as postcolonial and decolonial perspectives. Previous legal histories focused on how Section 377 of the Indian Penal Code commenced criminalisation from 1862 and was extended variably to Australia and Africa, whereas the paper - from which the presentation will selectively draw - commences from the sixteenth century emergence of English buggery laws associated with English Reformation and racialised imperial wars in Ireland; and by addressing sexual regulation through slavery in the Caribbean. The paper thus offers a new, more historically and spatially expansive social analysis of the British Empire's regulation of sexualities and genders beyond heterosexual norms, highlighting where historical sociological perspectives increase analytical depth, and suggesting present implications. Sources include archived crime statistics and legal statutes (eg from Kenya) showing racialised practices. The paper is in progress as a chapter for *Colonialisms and Queer Politics: Sexualities, Genders and Unsettling Colonialities* edited by S. Corrêa, G. Gomes da Costa Santos and M. Waites (Oxford University Press, forthcoming 2023), comparing eleven empires. The presentation will focus on specific contexts and insights, and will include comparative comments on empires.

Political Economy and Violence: The Implications of Taking Violence Seriously for Theories of Hegemonic and Counter-Hegemonic Forces

What difference does it make to a theory of society to take violence more seriously? What difference does it make to political economy, including world systems theory, when treating violence as a distinctive basis of power irreducible to other forms? The paper argues that taking violence more seriously makes gender inequalities more visible in social theory. It argues, further, that recognizing the importance of violence, with its consequences for highlighting gender inequalities, improves the analysis of counter-hegemonic forces and practices. The massive and repeated mobilisations of feminists around the world on violence against women are typically marginalized in left theories of politics. This paper challenges the theoretical basis of this marginalisation. It establishes how and why violence should be treated as an institutional domain alongside economy, polity and civil society, drawing together the multiple practices of deployment and regulation of violence in society and their interconnections. It provides an analysis of the cascade of the crisis from finance to economy to polity to divisions in civil society and to more violence. The paper re-theorises the relationship between violence and political economy, to better understand potential and actual hegemonic and counter-hegemonic forces. Mainstreaming violence and gender into theories of political economy and of society can enable a better understanding of social change.

WALKER, Andreas* (ADG Scientific - Center for Research and Cooperation e.V., Germany)
ISACK, Katharina (ADG Scientific - Center for Research and Cooperation e.V., Germany)

The Digitisation of Cooperatives during the Covid-19 Pandemic

The Corona pandemic led to greater reflection on the systematic relationships between social and economic issues. Phenomena of globalisation, economic interconnectedness, and economic interdependencies increasingly came into focus. Regional economic activity, a core concept of cooperatives, was given a more sustainable focus. At the same time, however, the Corona pandemic led to a greater focus on digitisation, either because internal communication channels or external customer relationships required it or because new lines of business were to be developed.

In recent years, digitisation has become increasingly important in almost all areas of life. This does not just mean the use of digital technologies, but also a restructuring of the world of work and life by means of digital technologies. This restructuring of society by means of digitisation also affects the cooperative world, whether internally through the increased use of technologies and changes in communication tools or externally through new forms of communication with customers, new forms of offerings for customers, and the development of new areas of business.

The question we faced in the last two years concerned the resilience of cooperatives in times of the pandemic, which also brought an acceleration of the digital transformation. Therefore, we have designed two empirical studies: The first explores qualitatively (by means of workshops and interviews) the needs and requirements of digitalisation among cooperatives. The second study uses questionnaires to explore the resilience of cooperatives in times of the pandemic, with the transformation of the working world through digitalisation also being a central aspect here. At the conference, we would like to present the results of our studies with the focus on how these changes affect the organisational structure and working processes from a cooperative perspective.

WALKER, Sarah* (University of Bologna, United Kingdom)

From 'Child' to 'Worker' or How Precarious Legal Status Trajectories Shape Former Unaccompanied Minors Long-Term Social and Economic Well-Being and Differential Inclusion. an Italian Case Study

This paper examines how precarious legal status *trajectories* shape former unaccompanied minors long-term social and economic well-being and differential inclusion. Attention is placed upon young African men who have made the perilous, illegalised, journey across the Mediterranean Sea to Italy, where they are bureaucratically labelled as 'unaccompanied minors' and afforded the socio-legal rights this status grants them as children. However, once unaccompanied minors turn eighteen years old in Europe, the protection granted to them based on their status as *children* ends. At this point, their rights and access to support changes significantly. They risk ending up without status and without the support and accommodation available to them as children. Italy is taken as a case study as, at least in theory, it has a more protective system than other EU member states and the law grants unaccompanied minors additional support to achieve independence beyond childhood. Data is drawn from ethnographic/ participant observation in 'Giallo', a reception centre for male unaccompanied minors in northern Italy in 2017/18. Using the transition to adulthood as a lens, I unravel the moralistic temporally-limited forms of support and rights these young men can enjoy as *children*. As they 'age out', their legal right to stay is often tied to employment, their 'deservingness' shifts to their status as 'workers', as opposed to children. I present how, owing to racial capitalism and the general economic climate in Italy, they risk returning to a space of marginality they sought to escape through their migrancy. Through the lived experience of these young men as they transition to adulthood, I reveal how they are at risk of constantly being relegated to an 'elsewhere', whether normatively or legally, and thus temporized belonging. It is not just temporal governance, then, but racialised borders which enhance migrant precarity and sense of (un)belonging.

WALKER, Sarah* (University of Bologna, United Kingdom)

'God's Plan': Young African Men in Italy and Their Use of Hip Hop and Faith to Counteract the Negative Mental Health Impact of Anti-Immigrant Rhetoric

Far-right political parties are increasingly gaining ground across the EU. Italy is no exception. In 2018, a coalition government formed of the far-right League and the populist Five Star Movement was elected on an overtly racist and anti-immigrant platform. The coalition collapsed and a period of centre left government followed until 2021. A national unity government then took over until it also collapsed. Now, the post-fascist party The Brothers of Italy, led by self-titled 'Christian mother' Giorgia Meloni, looks set to win the September 2022 snap elections. In this paper, I take the 2018 and 2022 election campaigns to examine the impact of anti-immigrant rhetoric on the mental health of the targets of that rhetoric. In this case, young African men, hosted as 'unaccompanied minors' in 'Giallo', a reception centre in a northern Italian town. Data is drawn from ethnographic/ participation observation and interviews enhanced by visual methods conducted in 2018 and 2022. Increased racism resulted from repetitive anti-immigrant and racist rhetoric on TV during and after the election of the far-right coalition in 2018. Racist terminology became normalised, affecting everyday behaviours – racially motivated attacks in Italy tripled between 2017 and 2018. A similar picture is emerging now. Drawing on the feminist concept of weathering, I situate the success of these overtly racist election campaigns within the historically rooted racial landscape of Italy. Whilst the young men may be forced to weather these hostile environments, they also produce ways to resist. Smartphones in Giallo often resounded with the Canadian rapper Drake's 'God's Plan' (2018), emblematic of how hip-hop and faith are important pillars of strength for these young men. This paper focuses upon the diverse temporalities and intensities of racial violence unleashed through creeping authoritarianism as weathered by those exposed to it, and the mechanisms they utilise to resist.

Making It in the Academy: Self Reflection of Challenges and Successes

Before We Can Imagine
Before We Can Inspire
Before We Can Celebrate Womxn
We need to have an honest discussion about what goes on in the Academy – one womxn at a time. Self-reflection must be the starting point. We must be willing to take the time to honor and respect the individual narratives and stories across all experiences and backgrounds. This paper will describe the challenges of marginalization, branding, isolation, and exclusion felt by womxn of color in the Academy. The themes of navigation, affirmation, identity, mentorship, and connections identified in *Unquiet Voices* will serve as solutions. Notions of worth, esteem and power, the building of coalitions and securing allies are anchors in voicing, cataloging and giving stories merit. The words of Anna Julia Cooper (1895) frame this paper,

It is not the intelligent woman v. the ignorant woman; nor the white woman v. the black, the brown, and the red, it is not even the cause of woman v. man. Nay, tis woman's strongest vindication for speaking that the world needs to hear her voice.

Personal examples will be shared.

Social Research and the Operationalisation of Indigenous Data Sovereignty in Australia

Indigenous Data Sovereignty and its operationalisation are key in prioritising Aboriginal and Torres Strait Islander social research needs. The Indigenous Data Sovereignty movement is a powerful force in the reshaping of the social research landscape. A central ambition is the centring of Indigenous priorities and needs over the usual practice of prioritising the *wants* of non-Indigenous institutions, policy entities, and researchers. The sought result is a reduction of BADDR data-based research (Walter 2018): that is data that leads to blaming, aggregated, decontextualised, deficit focused and restricted analysis and publications. Yet while the Indigenous Data Sovereignty movement has been very successful in raising awareness of Indigenous data rights, enactment of

those rights within social research has been harder to achieve. This presentation addresses the topic of operationalisation through the presentation of three distinct case study examples. The first examines Indigenous Data Sovereignty within a localised community project centring D'harawal Storytelling run by the D'harawal Traditional Descendants and Knowledge Holders Circle. The second examines the actualisation of Indigenous Data Sovereignty within the work of the Yoorrook Justice Commission. The final case study speaks to the process of operationalising Indigenous Data Sovereignty in the Mayi KuwayuNational Study of Aboriginal and Torres Strait Islander Wellbeing.

Clinical Sociology: Moving from Theory to Practice

The author will provide an overview of the book by discussing the current state of sociology and putting forth the argument of moving beyond the fundamentals of sociology. The argument stems from the varied roles that sociologists could play across the basic and applied sociology continuum and the need to engage in collaborative work will also be elaborated. This session will then focus on chapter 6 of the book, attracting the clinically inclined through contextualizing sociology in developing countries. As much as the development of sociology in knowledge building and social critics are important, the author argues that the rise of clinical sociology is imperative to enable sociologists and students of sociology who are enthusiastic to apply their sociological lens and attitude as the agent of social change. Recommendations to set up social clinics as well as to review the current curriculum will be highlighted. The presentation will end with the authors' experience and sharing of 'expectations' publishing with Springer international.

Driving Forces for Taiwan's Childcare Policy to Adopt Regulated Market and Its Divergence

This research aims to analyze the emergence of the quasi-public childcare policy in Taiwan and its two divergent divisions: systems for children under 2 years old and for those from 2 to 6. Embarking from the theoretical approaches that explain how ideas, actors and institutions shape and formulate policies, this research takes on a qualitative methodology bridging hermeneutics and historical paradigms.

The quasi-public childcare system stems from private-childcare-going-public policy in Tainan City, which emerged from institutional change of layering between two old systems - public childcare and early childhood education voucher. The driving force behind the change came from the strong belief of policymakers in that supply-side subsidy would contribute to a regulated market. Simultaneously, upon the completion of Tainan City's policy design, then Mayor of Tainan City, Lai Ching-Te, was soon appointed as the Premier. The political coincidence hence created an unprecedented historical critical conjuncture.

As the policy of Tainan City worked its way into the Executive Yuan, the belief jointly held by both policymakers and legislators was that the new policy enjoyed an imagined support base of parents. Therefore, even the strong opposition launched by interest groups was not able to constitute a veto point against the policy.

As the research shows, the formation of advocacy coalitions is not the necessary condition to formulate the driving force for ideational childcare policy. The state-centered actors can wage tremendous influences on this process. On the other hand, the gradual institutional changes and path dependence at various stages of this policy formulating process led to two divergent facets of quasi-public childcare policy.

An Institutional Ethnography Analysis of Highly Skilled Chinese Immigrant Women's English Acquisition and Career Restoration Experience in Canada

Canada has been active in attracting highly-skilled, foreign-trained workers to overcome its labour shortage, facilitate its economic growth, and enhance its global competency. While promoting gender equality in the workplace and advancing women's labour market participation are ongoing focuses of Canada's attention, the arrival of an increased number of skilled immigrant women and their marginalized experiences in the Canadian labour market reflects a critical problem that the underuse of highly skilled immigrant women's professional skills might be a loss for both Canada and individual immigrants.

This research explores the English acquisition experience of highly skilled Chinese immigrant women in Canada. It reveals how the Language Instruction for Newcomers to Canada (LINC) program fails to meet the specific learning

needs of highly skilled Chinese immigrant women, and therefore constructs barriers to their professional career restoration. Following Seyla Benhabib's weak version of postmodern feminist theory and Dorothy Smith's Institutional Ethnography methodology, this research identifies these Chinese immigrant women's situated standpoint within Canada's immigration system and analyzes the specific gender role that they are expected to fit in. Based on interview data with 46 highly skilled Chinese immigrant women, this research reveals a high dropout rate of young highly skilled Chinese immigrant women who have participated in at least one session of LINC training. This reveals how the federally-funded settlement services for new immigrants in Canada fall short of meeting the employment-driven learning needs of highly skilled immigrants and are sometimes even considered as constructing barriers against their professional career restoration. In the end, this research makes recommendations for improving Canada's existing language training and employment-related settlement services in order to better assist highly skilled immigrants in using their skills to a larger extent.

"Overthrow the Capitalists Again": The Production and Reproduction of the Private Capital De-Legitimization Discourse on Chinese Social Media

Based on Foucault's archaeology of knowledge and culture sociology's insights about legitimization, we systematically captured and analyzed 355,395 speech texts on Weibo (a Chinese social media like Twitter) that contained the term *capitalist*. Combining topic model analysis and critical discourse analysis, our analyses examined the production and reproduction of the private capital de-legitimization discourse on Chinese social media from 2011 to 2021. Focusing on the crucial *discursive events* in it specifically, this study interprets the process of user negotiation and narrative translation.

The term *capitalist* was used by CCP to deny the legitimacy of private entrepreneurs in the Maoist era. Since the 1980s, this concept has been abandoned gradually because the country transformed itself into a market economic regime. Noteworthily, there has been a resurgence in using this concept in Chinese cyberspace recently. To some extent, not only does it indicate the potential direction of Chinese economic reformation, but reveals the changing public opinion toward the market economy regime, private wealth, and social inequality.

According to the data, we find that the evolution of the private capital de-legitimization discourse is constructed collaboratively by Chinese netizens through *culture work* like re-interpretation, analogy, parody, and generalization. Triggered by a series of *discursive events*, both the objects and topics of this exclusivist discourse have gradually expanded. Moreover, the core narrative has shifted from the initial discussion about the meaning of life, to the criticism of labor exploitation, and to the accountability for social problems. Compared with the previous top-down socialism propaganda, this resurgent discourse has a more spontaneous character and intersected with nationalism discourse deeply.

By exploring such a renascent discourse, this study complements the current perspective about the media normalization of exclusivist discourses, especially in post-socialist countries. It also makes methodological advances for researching the meaning-making process through big data.

The Strategic Development of Advanced Indigenous Language Proficiency of Student Teachers Specialized in the Initiative Teacher Program for Indigenous Language and Literacy Domain for Secondary Schools in Taiwan

According to the *National Language Development Law*, Indigenous Languages and Literacy Domain would become MOE-mandated curriculum in secondary education in 2022 in Taiwan. The MOE-approved teacher education program in National Taitung University was established in 2021. In addition to the 68 credits of cultivating courses, Indigenous Peoples' Council (IPC) hosted Advanced Indigenous Proficiency Certification was strongly required for the Indigenous student teachers in their 20s or 30s to apply for Teacher Qualification Exam. However, they can hardly achieve such proficiency in the "severely endangered language" which is spoken only by grandparent generation. Actually, the teacher cultivation was based on the writing systems of indigenous languages formulated by IPC in 2005. IPC has also published textbooks with on-line teaching materials for grades 1-9 and for advanced study since then, accompanied with Indigenous Language Proficiency Certifications of intermediate, higher intermediate, advanced, and excellent levels.

This study aims to develop the strategy of cultivating advanced Indigenous language proficiencies for the indigenous student teachers. The Indigenous languages instructors and the student teachers of 4 Bunun, 3 Paiwan, 2 Amis, 1 Atayal with higher intermediate proficiency certificate participated in this action study. The data was collected through the recording of proficiency strengthening activities and the reflective interviews afterward.

The findings are as follows: Firstly, to concentrate in improving language proficiency for coming certificate exam, a simple teaching practicum model was formulated, integrating the foundamental IPC-published textbooks for grades 7~9, for intermediate certificate learning, and for grammatical structures learning. Secondly, the student teachers practice in group once a week in reading aloud, translating, speaking, and writing on the topics with newly IPC-published 20 readings for grades 10~11 with length and difficulty equivalent to advanced certificate exam questions. Finally, the student teachers improved significantly with the competency of 4-minutes speaking and writing with 150 words on topics.

Global Citizenship Competencies, New Immigrant Youths' Hybrid Identity, and Social Justice- Taiwan Observation Under the Globalization Condition

Those recent reports released by UNESCO and OECD focus on the common future challenges of globalization. They have "cosmopolitan sustainable development citizens" and "neoliberal global citizens" as their educational goals. With such a global impact, Taiwan's "Twelve-Year National Basic Education Curriculum Outline" emphasizes "core competencies" and defines it as "the knowledge, skill, and attitude that a person should possess in order to adapt to current life and face future challenges", "Bilingual (Bilingual) The National) Policy" expects school education to "enhance students' English ability and strengthen the country's competitiveness." These policies are part of the influence of the long arm of liberal globalization. Since marriage immigrants (new residents) from southeastern Asian countries have become one of the important groups in Taiwanese society, the total number of new immigrant students with southeastern Asian ethnic identities has reached more than 300,000. The educational policy has also been changed from a negative perspective of "the disadvantage" to "the advantage" with hybrid identities. This study focuses on the conditions for developing hybrid identities in Taiwan's new immigrant youth. Is it possible to demonstrate the advantages of global citizenship? Are they connecting to Southeast Asia more smoothly than non-new immigrant youth? This research develops the "21st Century Taiwanese Cultural Values Changes and Multi-ethnic Relations Questionnaire", targeting 18-25 Taiwanese youths with ethnic identity in Southeast Asian cultural competencies to understand the actual situation of identity development and possible issues of social justice in Taiwan.

The Associations between Individual Characteristics, Family, School, and Familism and Chinese Adolescent Social Initiative

Adolescent socioemotional health is essential for positive youth development and well-being in later adulthood. Social initiative is a core indicator of socioemotional health. Adolescents with high social initiative proactively build social relationships outside the family. Previous studies focusing on western cultures revealed that multiple individual factors and contexts contributed to adolescent social initiative. However, the associations are understudied among Chinese adolescents. This study aimed to examine the risk and protective factors for Chinese adolescent social initiative through a cultural understanding. The study included 545 Chinese adolescents to investigate associations between multiple individual and contextual factors and desired social initiative. Logistic regression modeling was conducted to compare the odds ratio (OR) of Chinese adolescents' individual characteristics and their family, school, and cultural contexts. Results showed that high maternal autonomy granting (OR = 2.45) at home was the strongest predictor of high adolescent social initiative, followed by recent grade rank (OR = 2.25) in school, conformity to parents (OR = 1.93) at home, high interdependent self-construal (OR = 1.77) of adolescents, positive school adjustment (OR = 1.43), and high independent self-construal (OR = 1.34) of adolescents. Other individual factors, including gender, age, and only-child status, did not predict adolescent social initiative. Nor did parental autonomy granting and conflicts to parents at home, familism in the Chinese cultural context. The findings suggested using a cultural approach to understand the contexts of positive youth development. It also highlighted targeted interventions in family and school contexts to promote positive socioemotional health among Chinese adolescents.

House, the New Workplace? Gendered Experience of Korean Expatriates' Wives in Xi'an, China

Based on traditional gender ideology, women are more likely to withdraw from the workplace for their families. Women defer to family's migration

decision for husbands' career and children's education, propelled by their gender roles, according to existing literature. Their shift from highly educated career women to fulltime housewives facing innumerable constraints abroad unquestionably bring considerable changes in their perception of their gender roles and life, worsened by Covid 19 and inconvenient international mobility, an area insufficient literature has covered. Drawing on qualitative data gained from a 3-month long fieldwork in Xi'an, a northwestern city in China and in-depth face-to-face interviews with 35 well educated Korean expatriate housewives who were full time employees in Korea, this article explores the changes brought by the shift of focus from career to family, factors influencing gender role performance and increased gender inequality because of Covid 19. This research finds that fulltime housewives have shifted their focus from career to family which they attach their sense of achievement to, so they are keen to better their gender role performance. Secondly, housewives have internalized the expectation of what a good mother and wife should be and in turn judge the other housewives with the rules they feel stressful about. Thirdly, due to the cancellation of international flights and strict quarantine policies of the Chinese government, whether breaking the rules and causing troubles to families are regarded as an important standard of gender role performance during the pandemic. The pandemic, causing insurmountable inconvenience to our life, is worsening gender inequality and maximizing pressure in the fulfillment of gender roles for expatriate wives who can only gain secondhand information through their husbands.

"Sorry, I Cannot Understand Your Fear!"-- Engaging Family Violence Workers in Institution Ethnography Study

Institutional ethnography is aimed to give voices to the marginalized groups and promote social change. Following IEers such as George Smith and Ellen Pence, who envisioned institutional ethnography as political activist ethnography, this study shows how institutional ethnography can be used to engage front-line workers to advocate women whose violence experiences are excluded from the institutional scheme. The author worked with a group of front-line worker and started with their work knowledge about 'undesirable cases'. The workers further described features of the undesirable case, which include unable to describe violence in details, and unable to focus on violence during interview. These features were socially imbedded in the judicial process and corresponding to the requirements of testimony as detailed and concrete. The undesirable case represents the type of violence that fails to fit into current institutional scheme which emphasizes on physical safety. The ideological construction on safety is reproduced through the risk assessment tool which is required at the in-take. Cases whose assessment scored over 8 out of 15 items, is considered 'high risk', will be monitored by a special meeting, demanding more attention from workers. The implementation of risk assessment divided cases into the worthy and the unworthy. The construction of 'undesirable case' represents the unworthy ones which mean workers can close cases as soon as possible in order to lower the caseload manageable. To make the undesirable case visible to the public, the group invited workers to share their experiences of undesirable cases and adopted the concept of coercive control from Stark (2007) to name this type of violence. The study demonstrates that by adopting institutional ethnography, front-line workers can produce knowledge that reveals the subjugated voices from their work experiences and promotes changes that respond to clients' needs.

How Has Social Media Made the Distinction between 'Online' and 'Offline' Identity Increasingly Irrelevant?

In sociological theory, a distinction has usually been made between 'online' and 'offline' identities with regard to modern communications technology world. In recent times, the rise of social media platforms have began to calling to question the distinction. This paper is divided into three parts. Firstly, we look at the meaning of 'identity'. Secondly, since the distinction between online and offline identity is getting smaller, we outline similarities and differences between online and offline identities and divide them into three categories: Asylum seekers, actors, and others. Finally, we look at the 'looking-glass of self' theory of Cooley, Althusser's notion of intersectionality, Mead's symbolic interactionism of and an example of the gender binary on Facebook. Using these ideas, we will explore the role of social media in decreasing the distinction between online and offline identities from a more theoretical perspective. We will argue that these theories are helpful in understanding the role social media plays in modern life. The conclusion of this paper is social media made the distinction between 'online' and 'offline' identity increasingly irrelevant, because people's increasing types of identities and functions of social media in modern world.

Effects of Cyberbullying and Traditional Bullying Victimization on Adolescents' Psychological Distress in China: Gender-Based Parent-Child and Teacher-Student Relationships As Moderators

Given the rising concerns about cyberbullying among students in the digital age, there has been growing scholarly interest in understanding the relationship between cyberbullying and adolescents' mental health and its difference from the one related to traditional bullying. However, the knowledge about the factors that might moderate those relationships and relevant gender-based differences is still limited, especially in China. Thus, from the socioecological perspective, this study examines the effects of cyberbullying and traditional bullying victimization on adolescents' psychological distress and tests whether parent-child and teacher-student relationships moderate those effects and whether the moderating effects have gender-based differences.

We used the two-wave (2017 and 2020) cross-sectional data from the multi-wave province-wide school-based Database for Youth Health. The sample in this study consists of 11,207 senior high school students aged 15-18 from 10 cities in Shandong Province. Robust regression results indicate that both cyberbullying and traditional bullying victimizations were associated with a self-rated higher level of psychological distress measured by Symptom Checklist 90. However, adolescents with a better parent-child relationship could experience a stronger effect of cyberbullying victimization, while adolescents with a better teacher-student relationship could experience stronger effects of both cyberbullying and traditional bullying victimization. Moreover, the effects of cyberbullying victimization were stronger among girls with a positive parent-child relationship, while the effects of traditional bullying victimization were more prominent among girls with a positive teacher-student relationship. The results support the reverse stress-buffering model rather than the stress-buffering model.

Findings suggest that the impact of cyberbullying should attract the same social policy and social work practice attention as traditional bullying. Related protection efforts should not only focus on improving parent-child and teacher-student relationships. Contrary to common sense, girls who get along well with their parents and teachers should receive extra social work and other interventions when encountering cyberbullying or traditional bullying.

Gig Workers' Resistance and State-Labour Relations in the Platform Economy—Cases from Platform Food Delivery Workers and Platform Domestic Workers in China

Studies on the Chinese platform economy focus on the tensions between platforms and workers, especially the algorithm management practices and labour process in the industry. The resistance of gig workers and the state-labour relations is inadequately discussed although the state-labour relation is a major scholarly interest in studies on Chinese industrial relations. Drawing on fieldwork starting from 2019 to 2022 in China online and offline using methods of ethnography and interviews, this paper documents two cases of collective actions of gig workers, namely, the male-dominated food delivery workers and female-dominated platform domestic workers, and the responses of the party-state in resolving the conflict.

Attention will be paid to the causes of collective actions, strategies and channels workers taken to fight for their demands, and the responses from the local and central government in pacifying the contentions. This research finds that gig workers, both male food delivery workers and female domestic workers, adopt mix methods in utilizing the legal channels of labour mediation and arbitration and beyond, such as strikes, petition, and *nao*, according to the types of demands they claim and the resources they have; while the government reacts in a dual manner of responses and repression according to the types of demands and the characteristics of workers and actions. Although the existence of collective resistance of gig workers, the precarity and weakness of gig workers in the platform economy remains unchanged.

Gender Violence Against a 'Silent Generation': The Birth and Journey of the 'Black Children' (heihaizi) Under China's One-Child Policy

As a researcher who was born and experienced myself as a 'black child' (heihaizi) in China with the one-child policy, I have studied on the reproductive (in)justice from the perspective of children. The one-child policy was officially introduced to the nationwide in China from 1979 to 2016 (per couple were allowed for one child only in the nationwide, later local modified regulations applied accordingly). A new two/three-child policy replaced the one-child policy whereas little is known about how these children who lived outside the state legitimacy or family recognition, how they experienced their lives, how they conceptualized their self-worthy from day-to-day during and beyond the one-child policy era. The meaning of 'black' roots in the politic of color during the Cultural Revolution (black relates to illegal, outcast or disgraceful. In particular, the female 'black children' who were legally born but decided by their families to be 'black', excluded by the family intimacy and recognition, marginalized by the civil rights and societal solidarity. 20 participants have been semi-structured interviewed (both genders covered) and their narratives circulated around settings of relations from the birth of 'black children', their 'journey' from family separation to reunification, and strongly expressed emotions in their interpretations of family-child bond. Many studies on mother's human cost, yet the daughters' victimhood was largely silenced apart from female infanticide. This research analysis narratives of prenatal and postnatal violence against these daughters with themes of 'trial birth' (meaning the baby was born as a gender test, leave if girl, keep if boy), residential separation, naming disguise, documental denial, commodification of childhood, body confinement, family reunification, sibling abuse, and social alienation. I argue the triple-black-identity (levels of documental, physical, and emotional) of these children was co-produced by the family and state agent and lost their human respect throughout.

WANG, Jingxian* (University of Nottingham, United Kingdom)

How the Human Respect Lost in Producing the 'Black Children' (heihaizi) Under the One-Child Policy in China

This research studies the 'black children' (heihaizi), who experienced their state illegitimacy and family outcasts during and even beyond the one-child policy in China from 1979 to now, explaining how the vulnerable and naïve population was differenced from other 'normal' children from their day-to-day experiences, how the exclusion was structurally constructed throughout when children were referred to the category of 'black', how prenatal and postnatal violence against these children was normalised on levels of individual family, local bureaucratical and state sovereignty, and internalized by individual families as justice in the name of policy. Not only this research explains how the 'black children' experienced their documental denial and reduced citizenships as illegally born babies, but also focuses on those who were legally born yet concealed (from levels of documental, physical, and emotional) at edges of family, community, or society to reserve the family membership for their parents' next birth, normally a boy. I have semi-structured interviewed 20 participants, including both genders from rural and urban China, and analysed their narratives of why and how they were born, what they experienced from concealment to family return, how they responded all happenings and make sense of self-worthy. Themes include childhood of displacement, maltreatment foster care, commodification of childhood, physical confinement, documental denial, problematic family reunification such as sibling abuse, and intimacy collapse in adulthoods, were suggested and shed light on how the population of vulnerability and dependency (such as Holocaust Jewish children, disability, elderly, queer) was differenced and 'othered', regarded as someone 'less', or even reduced to bare life in the name of collective justice. What make sense of children in a family? and what make sense of human respect in a society?

Constructing the Value Chain of the Creator Economy in China

This study aims to explore the labouring process and restructuring of the value chain of the creator economy in China, in particular, the broader context of mass-innovation mass-entrepreneurial campaign. In 2011, Tencent announced its plan to form a creator economy in the digital cultural production industries, assembling different sectors along the supply chain of artistic production, from literature, animation and films, to video games. The supply chain of cultural production is further extended to the consumption side by Alibaba with its networks of communication and dissemination. As such, the value chain of the new cultural industry taps into the massive individual creators, who are distributed in different sectors. Along the value chain, one IP-based story will be produced and re-produced into various forms of products, the value of which is expected to grow due to the accumulated affection of prosumers. This complex creator economy is constituted by a wide variety of heterogeneous forces, from creators, prosumers, MCNs, and platforms, through networking behaviour on multiple scales. I borrow Banet-Weiser's insights on the economy

of visibility and Braton's concept of the interface to explore the labouring process of networking in the embodiment of the value chain. The regime of visibility is associated with the notion of empowerment but also conditioned by the new architectural frameworks for sorting, classifying, and ranking the mediated social field. With the mobility of cultural products from one node to another, what has also been mobilised is a new value system of work and entrepreneurship, emerging in different spaces, with varied manifestations.

Gender Gap in Meritocratic Belief: Examining South Korea's 2022 Presidential Election

Is gender a new axis of the political cleavage in South Korea? This article aimed to explore whether the political cleavage by gender among young Koreans emerges. Recently, the difference in party support among young people by gender between the conservative and the progressive parties has been noticeable. Young men supported the conservative party more, while women were heavily aligned with the progressive party. As this phenomenon became a conventional wisdom, the issues concerning gender conflict and feminism adopted as the main pledge of the candidates. However, while the gender gap in perception of feminism was similar in all generations, that of meritocratic belief and the perception of inequality were large only in the younger generation. This study argues gender gap in meritocratic belief, rather than that of perception on feminism, affected young Koreans' decision in the last presidential election. Using the panel survey data on the 20th South Korean presidential election in 2022, we conducted a logistic regression analysis on factors affecting the vote. Our findings reveal that the difference in presidential candidates supported by gender among young people was due to the influence of meritocratic belief, perception of inequality, discrimination of male, and perspective on national security. The stronger one's belief in meritocracy and the lower perception of inequality one has, the more likely she or he was to support conservative candidates than progressive ones. Consent on the discrimination against men had a positive effect on voting to conservative candidates. When the above variables were introduced together, the significant effect of gender variable disappeared. Strong belief in meritocracy, insensitivity to inequality, and strong consent to male discrimination refer to young men's sense of 'aggrieved entitlement', which has greatly influenced the choice of gender-based presidential candidates among young people.

Comparative Advantage, Industrial Policy, or Developmental State? Developing a Socio-Political Account for China's Technological Statism

China's top-down statist science and technology (S&T) movement in the recent decade has prompted vigorous discussions across academia and policy domains worldwide, but there lacks a convincing theory accounting for the rise of Chinese technological statism. The existing literature offers three comparative perspectives on interpreting China's technological path. The first perspective links China's technological upgrading to its fortuitous niche-building in the global economic system. It views statism as the nation's comparative advantage, which helps the country transform from technological imitation to indigenous innovation. The second perspective views statism as a universal feature evident in a well-established National Innovation System, even in a liberal capitalist economy (e.g., the U.S.). The third perspective emphasizes the authoritarian, growth-driven political cultures that appear similar among China and its East Asian peers and views China's technological statism as a developmental strength. Notwithstanding their insights, all these accounts focus on the (in)effectiveness of China's statism, but none explains why China's S&T statism was configured and how it has evolved. This omission of the origins of Chinese statism-making has considerably circumscribed our knowledge of nation-states' technological development. By analyzing archival data and in-depth interviews, I suggest that China's making of technological statism is a path-dependent instituted process with deep social and political roots. Statism is a political strategy for the party-state to survive its own contradictions, used to cope with not only the challenges from newly arising economic needs domestically and globally but also to tackle the social and political dilemmas rooted in China's political-economic development that overwhelmed the party-state. I emphasize the enabling properties of social forces and political dynamics on institution-buildings and advance the current theories of comparative advantages, industrial policies, and developmental states in explaining nation-state's technological development, state capacity, and economic globalization in comparative contexts.

Social Mobility during the Transition to the Third Industrial Revolution: A Comparison between the United States and China

With the increasing influence of the third industrial revolution since the mid-twentieth century, developed industrial economies have experienced dramatic changes in the industrial and occupational structure. The traditional intergenerational mobility theory, based on the first two industrial revolutions, thus faces challenges against the backdrop of the third industrial revolution. This study aims to systematically discuss the transitions in intergenerational closure during the third industrial revolution, and take the United States and China as examples to compare the differentiated impact of the third industrial revolution on societies at different stages of industrialization.

During the third industrial revolution, with the penetration of new technologies represented by computers, the Internet, and automation, the relationship between technology and skills has shifted from skill-replacing to technology-skill complementarity, resulting in Skill-biased Technological Changes and job polarization. As a result, the changes in industrial and occupational structures did not bring about an increase in opportunities for upward mobility, as in the early stage of industrialization, but instead pointed to a strengthening in the mobility barriers between professionals and other classes. In this context, we propose the "Professional Closure Thesis" about how the third industrial revolution affects intergenerational mobility, which argues that the increase in skill barriers will bring about the rise of the professional class, making the professional-nonprofessional barrier the major driving force for the intergenerational status closure. However, within the non-professional class, the mobility barrier between the intermediate class and the manual class will significantly recede. By pooled data from GSS (1972-2018) for the USA and nine waves of CGSS for China, the study found that the empirical results of American society basically support the "professional closure thesis". Nevertheless, China presents the impacts of overlapping processes of industrial revolutions on social mobility.

Stress Management and Status Disparity in 911 Dispatch

Through the analysis of three-year ethnographic data on 911 dispatchers in an urban police department in New England, this research demonstrates in detail the work process, stress management and occupational status of 911 dispatchers. Incorporating literature on sociology of organizations, cultural sociology and criminology, it shows where 911 dispatchers' stress comes from, how it is produced and reproduced in the cultural and organizational context of emergency response and public safety in America, as well as what role status disparity plays in it. Focusing on the interactions among dispatchers, callers, and front-line responders such as police officers, firefighters and paramedics, it shows how dispatchers' well-being is affected by their daily work making life-and-death decisions in real-time in an entangled network of social and power relations.

Why the Gendered Gap between Entitlement and Usage in Parental Leave?

The female employment rate in Taiwan has increased substantially from 40% three decades ago to 70% in 2020, transforming Taiwan's family structure from a male breadwinner model to a universal breadwinner framework. Behind this remarkable change, the women's movement has played a vital role in raising the awareness of gender equality, and creating and implementing the *Act of Gender Equality in Employment*. This breakthrough is significant for the promotion of women's economic autonomy.

Nevertheless, the second wave of feminism and neo-liberalism has created a political and economic environment that relies significantly on inter-generational support and market mechanisms to ease caregiving responsibilities. Career women—even those who are financially independent—are still trapped in the dilemma of raising children as a second work shift after returning home, creating overwork and exhaustion. The gendered practice of paid and unpaid care responsibilities is highly correlated with gender inequality in the labor market.

After three decades of gender movement's contribution, Taiwan has progressive gender-neutral policy design in parental leave as a mechanism to achieve gender equality in employment. The Legislative Yuan even passed an amendment to the Act of Gender Equality in Employment in year 2021 to expand the generosity and eligibility of leave policy. However, the actual usage of the parental leave still has a huge gender gap.

Therefore, this study aims to analyze the work and childcare arrangement for double-income parents with child under age 3 in Taiwan. Factors contributing the child caring arrangement and usage pattern of maternity, paternity, and parental leaves will be explored by depth interviews. This article will further

analyze the factors contributing to the gap between gender-neutral eligibility and gendered usage for parental-leave policies during past decade (2009-2019).

Effect of the COVID-19 Epidemic on Body Mass Index: A Natural Experiment Result Based on the Wuhan Lockdown

As a natural experiment study of the Wuhan lockdown, a random digit dialing method was used to sample residents aged over 18 years. 11,223 residents in Wuhan City accepted mobile phone interviews during July 2020. Ordinary least squares (OLS) regression and mediation analysis were used to analyze the influence of the Wuhan lockdown on BMI.

Demographic characteristics, lifestyle characteristics, and health status differed statistically significantly between residents living in and those who left Wuhan during the lockdown. The mean BMI among residents living in Wuhan was 0.42 kg/m2 higher than that of residents who left Wuhan during the lockdown, as determined by multivariate OLS regression analysis. The association between living in Wuhan and increased BMI was the strongest among residents with overweight/obesity. The mediation analysis showed an indirect effect path with living in Wuhan (through decreased physical activity and increasing BMI) and the direct effect of living in Wuhan during the lockdown. We conclude that the lockdown in Wuhan city increased residents' BMI, especially among young or overweight/obese people, partly due to decreased physical activity.

'Growing up in the Middle' - Exploring the Interaction between Intergenerational Relationships and Transnational Youth Mobile Transition Among PRC-Born Chinese (PRCC) Youth in Australia and Australia-Born Chinese (ABC) Youth in China

Each year millions of young people of different ages, backgrounds and ethnicities leave their home countries temporarily or permanently in search of better life prospects. China and Australia are both significant hubs for incoming and outgoing mobilities. 'open-door' and the rise of middle-class families with a single child in China have led to a significant wave of young PRC-born Chinese (PRCCs) coming to Australia for a variety of overseas experiences over the last four decades. As China continues to rise as a global powerhouse, young Australian-born Chinese (ABCs) may increasingly begin to consider China as a destination for transnational sojourns. For both PRCC and ABC young people, experiences of childhood, adolescence and adulthood influenced by intergenerational relationships with their parents impact their transnational mobility and transition between Australia and China. Comparing the experiences of PRCC young people who come to Australia and ABC young people who travel to China, this study unpacks the disjunctures and connections around transnational mobility and transition to adulthood under different cultural contexts of intergenerational relationships within the global Chinese diaspora.

This research is based on qualitative data from 34 participants, including PRCC and ABC youth and some of their parents in Australia and China. It adopts multiple methods with in-depth interviews, participant observations, and photovoice. The findings compare six interconnected dimensions related to intergenerational relationships – the youth aspiration, the parents' expectation, the mobility trajectory, the transition to adulthood process, the independent discourse, and the parents-care arrangements with filial piety. This research takes the unique approach of considering Australia and China as sites of both incoming and outgoing flows of young people situated within different forms of intergenerational relationships inside "Chinese transnational families". This research contributes to understanding the intergenerational relationships of youth with their parents across both transnational mobility and transition studies.

Individuals' Experiences during the Cultural Revolution and Their Trajectories of Well-Being in Middle and Later Life

From 1966 to 1976, the Cultural Revolution engulfed the lives of millions of Chinese people, forming a collective memory of turmoil. The personal experiences of the Cultural Revolution, nonetheless, vary across individuals and regions. Previous research has rarely studied the role of the Cultural Revolution in shaping long-term subjective well-being outcomes, particularly the nature of experiences and their occurrences in contexts of time and space. The current study investigates the following types of experiences: the send-down movement, participation in the Production and Construction Corps, reeducation in Cadre Schools, military services, and traumatic experiences

of hunger and denunciation rallies. It focuses on two research questions: 1) Does the Cultural Revolution affect individuals' mid- and later-life trajectories of subjective well-being? 2) How do the relationships between the Revolution and subjective well-being vary by nature, time, and locations of experiences? Growth-curve models are employed to study samples from China Family Panel Studies, 2010-2020. Findings show that people who experienced the Cultural Revolution had lower levels and slopes of subjective well-being. In addition, the send-down movement and traumatic experiences of hunger and denunciation led to the most adverse consequences, particularly when the events occurred during the early years of the Cultural Revolution or in remote regions far from their birthplaces. The study suggests the enduring legacy of major historical events in shaping people's long-term well-being and the importance of a contextualized perspective in researching the variations in experiences and relevant outcomes.

The Difference of Social Capital in Disaster Resilience between China and Japan：Comparative Case Analysis of the 2011 Great East Japan Earthquake and the 2008 Sichuan Earthquakes

Between 1990 and 2000, disaster researchers and policymakers' interests and discourses around the concepts of social capital and resilience proliferated internationally. These concepts have been put forward as valuable tools for understanding the availability of resources in disaster-affected societies in general and in affected local communities in particular. Many studies have documented the significance of social capital for building resilience. However, there are few studies that analyse the social capital structure of different countries. The definitions of social capital show that social capital is not a fixed quantity. On the contrary, it is highly dependent on the immediate political and social context in which it is embedded, as well as on the broader institutional environment (Szreter & Woolcock 2004; Putnam 2000; Cai 2016). Therefore, it is necessary to analyse the structure of social capital in different political and social contexts, which leads to different resilience building strategies. This study reviews the current state of knowledge around social capital as a component of disaster resilience. First, I examine the definition and types of social capital along with the associated mechanisms and applications. Secondly, I compare the differences in social capital in disaster management between China and Japan through a comparative case analysis of the 2011 Great East Japan Earthquake and the 2008 Sichuan Earthquakes in China. The result shows that the role of social capital within different disaster systems varies systematically owing to differences in political and social institutional structures. Lastly, I devise specific policy recommendations for disaster managers, government policymakers, and non-governmental organisations to strengthen community-level resilience to disasters.

Atmosphere of Homemaking: Studying a Digital Platform As a Portable Homeland

With the proliferation of smartphones, social media mobile applications have been playing an important role in our day-to-day communication. For immigrants, social media platforms afford them to 'stay' with their social networks in home countries. WeChat as a Chinese social media has overwhelmingly dominated Mandarin speaking population. It enables immigrants to stay in touch with family and friends back in mainland China wherever and whenever, making their mobile phones a portable homeland. Standing in-between the virtual homeland and physical dwelling, how can we understand Chinese immigrants' sense of their national belongings in everyday life?

This paper aims to look into immigrants' everyday practices on WeChat in order to understand the meaning making processes of national belongings. It argues that such sense of belongings is produced through digital national atmosphere, which is generated through an entanglement of human users, hardware, software, and other nonhuman participants. By unpacking the digital atmosphere, we can understand how Chinese immigrants experience and respond to the fusion of portable homeland and psychical dwelling. Based on posthuman ontology and epistemology, this paper will focus on co-configurations between human and nonhuman actors in terms of digital practices enacted by digital infrastructures instead of simply languages posted on platforms.

RC33-494.2

WANG, Yuhan* (University of Bristol, United Kingdom)

Dissolving the Screens: Understanding Digital Platforms through an Atmosphere Approach

We do not just click, read, talk, or order things on the platforms, such mundane digital engagements underpinned by platform mechanisms have reformulated how we make meanings and sense space, sometimes in a profound way. This paper argues that the dichotomy between studying online/

virtual and studying offline/real has become irrelevant and even misleading. To walk away from the dichotomy of 'real' and 'virtual' is to modify the way we approach our digital experience.

This paper aims to propose an atmosphere approach that unpacks the sociomateriality of digital platforms. It facilitates our understanding of how meanings and space are manufactured and attuned with digital materials in mundane life. That is, by interacting as a situated assemblage, which is subject to destabilise, human and nonhuman actors actively participant in making meaning of situations and simultaneously generating their space. In the meantime, the mediation places a specific attention to the power distribution within a society, which has added layers of complexity and uncertainty to the said reconfigurations. The atmosphere framework enables us to include a diverse collection of entities into our research agenda, which affords a larger scope of understanding digital platforms. Emancipating us from the artificial augmentation between the two sides of a screen empowers us to see how we are living in and through digitally mediated everyday life.

Adolescents' Family Relationship Dynamics and Their Internet Use in China: A National Sample

Internet as part of the information and communications technology (ICT) has brought substantial changes to contemporary society. Even though research has documented the bidirectional relations between depression and problem technology use, little research has examined what factors account for the high amount of youth internet time and excessive technology use. Previous studies have shown the significant relations between family context and negative developmental outcomes of youth including depression, yet the impact of family relationships on youth internet use needs further scrutiny. Informed by Bronfenbrenner's ecological perspective, the present study explored how family relationship dynamics, including family quarrels and parental bonding, contribute to youth internet using time on mobile devices and their importance level of internet use. The study also examined the mediating effect of adolescents' depression between family quarrels (i.e., quarrels with parents and quarrels between parents) and parental bonding (i.e., emotional support, parental engagement, and parental supervision) with youth internet use. Participants were 2,286 Chinese adolescents aged 9-18 years from 28 provinces from China Family Panel Studies (CFPS), a nationally representative dataset. Results from hybrid structural equation modeling revealed that adolescent depression fully mediated the associations of family quarrels and parental bonding with youth reported importance of internet use, but not their daily internet using time. Adolescent-parent bonding was directly and negatively associated with their daily internet using time. The results also showed parental emotional support was the strongest indicator of parental bonding, followed by parental engagement and parental supervision; adolescent-parent quarrel was a stronger indicator than quarrels between parents. Findings contributed to the understanding of the complexity surrounding family context, adolescents' mental health, and their internet use in Chinese adolescents and families. Implications and limitations are discussed for future research, youth development programs, and technology- and family-related policies.

"My Media Mirror and Myself": Chinese People's Social Media Performances and Body Anxiety during COVID-19

This article focuses on the body anxiety which arose by people's increasing social applications due to social inactivity as a result of the pandemic lockdown in the Covid-19 outbreak. The self-images that people present on social media usually accompany with performativity. However, as the pandemic situation changed in China, elements of sharing, catharsis, and edification can be found in Chinese social media users' release of self-images. Apart from the 20 selected representative in-depth interviews, in order to get more accurate feedback on the sentiment of Chinese Internet posts, we choose Weibo, a social media platform with a long history and a growing number of active users in China, and analyze its user posts from January 23, 2020 to July 31, 2022 using Nvivo. The purpose of our search for interview subjects was to compare men's and women's perceptions of body anxiety. In this way, it will promote the development of gender equality by body cognition. In the analyzing process, we mainly use Victor Turner's ritual theories to explain the paths through which people's body anxiety arises. And the result of the final body presentation, whether ideal or realistic, according to Goffman's dramaturgy treats the user's media representation as the front stage and the discourse metaphor of the user's real emotion as the back stage to elaborate the path of the user's body anxiety occurrence.

Development of Undergraduate Student Research Capability in Social Sciences: A Comparative Study between China, UK and the US

One of the social expectations of universities nowadays is the cultivation of inter-disciplinary talents that do not only command specialized knowledge but also are able to navigate through different challenges posed in different areas. Research-integrated education is a key approach to developing such talents.

My research explores different practices of cultivating undergraduates' research capabilities in social science disciplines in China, UK and the US, through conducting qualitative interviews and questionnaires with students and staff. Different cultural contexts present different definitions and interpretations of valuable capabilities, and rationales and practices for developing these, in the lack of studies of which lies the originality of this research. Besides, the focus of social sciences and different forms of social science research education such as dissertation, field research, critical inquiry in class in different contexts is less seen compared to the number of literature on development of natural science students' innovative research ability. Filling this gap, this research addresses the question of how social science research capability is understood and measured in different places, whether as a graduate attribute in terms of problem-solving, information collecting, critical thinking in various aspects of life, or in the subject-specific tangible production of papers and reports, or a combination.

Beside adding to previous research on aspects such as undergraduate attribute, social science research capability, this research also contributes through a comparative lens that highlights the distinct practices of developing student capability and preparing them for future in different cultures and interprets the factors affecting them. While the integrity of each case is respected considering its own social, cultural and political environment, reflections and even improvements at institutional levels are enabled. Further, theoretical implications are made regarding nature, role and social expectation of contemporary higher education, and the complexity and conflicts in institutional praxis responding to these.

HUANG, Yingying* (Baiyunsi school, Shangqiu, Henan province, China)

Investigation on 3-6 YEARS Old Children'S Autonomy of RURAL Area MULTI-Children Families —— Based on an XX Area of Henan Province, P.R.China

Autonomy refers to the expectation and ability of children to choose goals reasonably by relying on their own strength. It includes self-reliance, self-control and self-assertion. The purpose of this research is to investigate 3-6-year old children's autonomy in rural families with multiple children and what demographic factors are associated with children's autonomy and why.

The research used mixed methods. First survey was administered to 205 caregivers, including 81% parents and 19% grandparents, about their children/grandchildren in three villages in Henan Province, China and then followed by interviews with 10 parents and three daycare teachers. We used "Children's Independence Development Characteristics and Influence Factors" Questionnaire for the quantitative data. The results are:

Children's autonomy differs by gender, and girls score higher than boys, especially in self-reliance dimension.

Children's autonomy is correlated with their age. The older the higher is their autonomy, especially in self-reliance and self-control dimensions.

The level of children's autonomy varies by caregivers' type. The children whose caregivers are their parents, their overall level of autonomy are higher.

There is a significant relationship between children's autonomy level and children's birth order. The eldest child has the highest autonomy level, while the fourth child has the lowest autonomy level. Among them, the difference in self-reliance dimension is the most significant.

Father's education attainment affects children's autonomy. The level of children's autonomy is the lowest when fathers' education attainment is middle school or below. When fathers have high school diploma, children's autonomy level is the highest, even higher than that of the children whose fathers have college degree.

Interviews reveal the reasons. Parents with high school diploma spend more time and energy in participating in the daily education of children. Parents' "let go" attitude to girls and "doting" attitude to boys results in girls' high autonomy, etc.

WARDI, Clara* (Graduate Programme in Sociology from University of Brasília (PPGSOL), Brazil)

Reproductive Injustice: An Analysis of Public Data on Women Denounced to the Police for Clandestine Abortion in Brazil

Since the last decade, Brazil has had a prominent role in political discussions on the topic of abortion worldwide, gaining even more prominence with the rise of neoconservatism. The country has one of the world's highest rates of unsafe abortion. Even in the few cases guaranteed by law, there are several barriers to access it. Clandestine abortion continues to be reported to the police in Brazil and is not treated as a public health issue. In this sense, studies within criminal environments are necessary. However, there is almost no sociological research with this focus.

Seeking to contribute to filling this gap, this paper builds an unprecedented panorama of public microdata produced by the police on clandestine self-abortion in the country in the last 20 years (2001-2021). These quantitative and qualitative data are analyzed from a feminist and intersectional perspective based on the reproductive justice framework. The main objectives of this work are 1) quantitatively, to identify who are the women accused of self-abortion at national level, in terms of race, class, age, and other present markers; 2) qualitatively, to investigate how the act is typified as a crime, whether or not it is printed with values attributed to social constructions of gender, race, class, generation, and other intersections. This work points out the sociological problems involved in the production of data and how it impacts the sociodemographic results. The accused's profile highlights the vulnerability of race, class, and age. In addition, registers of institutional violence were found in the filling of qualitative data. In view of the results found, the information produced on women who made clandestine abortions show how this act is linked to negative constructions of social roles of gender, race, and class; which subjugates women and girls differently from what happens with other social actors involved.

WATANABE, Daisuke* (3-3-1 Kichijoji-kitamachi, Japan)

An Analysis of Career and Retirement Pattern in Old Age

This paper aims to analyze the changing patterns from employment to retirement in old age. In Japan, employment in old age is an experience that can bring about significant changes in employment status. Various measures, such as deferred pension benefits and subsidies to firms oriented toward extending employment into old age, have increased the labor force participation rate. This paper aims to describe the pathways of how older people work and retire in old age.

I examine the career pattern after age 60, the general retirement age. Using the Recruit Works Research Institute's "National Panel Survey of Employment Status," I conduct a four-year fixed-effects multinomial logistic regression analysis of employment change around 60 to 65. The dependent variable is employment status, and I analyze the career pattern for four years. In addition, a multinomial logistic regression analysis is conducted using the 2019 data, which has detailed data on activity in old age, with employment status as the dependent variable. In this analysis, economic insecurity, marital status, learning activities, personal development activities, retirement preparation activities, and health are analyzed as independent variables.

The results support the domestic resource allocation hypothesis, as the impact of marital status differs between men and women. The economic insecurity hypothesis is also supported, as economic status is associated with continued employment. Learning activities in the past year do not lead to a retirement, and the third age hypothesis is not supported. Self-development activities related to work and the experience of illness or injury in the past year influenced retention in employment, indicating that supporting these activities and coping with illness and injury is essential for retention in employment. Future work is needed to elucidate how self-development activities about work lead to job retention.

WATARAI, Tomoko* (Yokohama City University, Japan)

Complex, Dynamic, and Sensitive: Street-Level Bureaucracy As a Reflexive Contact Zone

In the past decades, many welfare states that underwent fundamental political changes realized, to some degree, the neo-liberal activation settings of social policies. As they got increasingly interested in mobilization (i.e., activation of human resources), service providers on-site gained a greater significance in political discourses, which inevitably led to the focus on the concept of street-level bureaucracy. The most conspicuous critique of this was that on-site practitioners play an instrumental role and help the execution of coercive social policies.

This paper considers an under-complexity of such theoretical or ideological views of practical activities. Apart from the assumption that local actors merely accept political ideals as they are, this paper inquires how they modify these ideals, and what dynamism emerges in their practical implementations.

Street-level bureaucrats often encounter non-cooperation, disobedience, and resistance from their clients. In this regard, interactional fields are where political ideals meet the autonomous entity of migrant residents.

We have to be very conscious of the perspectivity of the term "inclusion" here. What the host society provides as inclusive measures can be received as inappropriate or undesirable manners of incorporation from the migrants' perspective. In order to consider such cognitive discrepancies, this paper relied on the communication-centered concept of inclusion and exclusion of N. Luhmann.

Referring to the qualitative research that the author conducted in Germany, this paper highlights the ways local actors manage the cognitive discrepancies among various agencies in migrant support areas, and how they develop an intercultural reflexivity which is not reduced to any one of the related actors. In this way, this paper describes local activities as an emerging reflexive contact zone, in which various actors with different backgrounds and interests come together and both inclusion and exclusion are constantly negotiated.

Feeling the Future with Fiction: Storytelling and Sociological Imagination

In the past three years, a remarkable concentration of technologies have emerged that promise to help us get a handle on the future. Recent experiences of COVID-19, floods, bushfires and political volatility, and the many ways such crises also loom large on the horizon, have spurred major investment in novel automation and artificial intelligence applications. These primarily include remote surveillance and monitoring technologies, to provide data and inform decisions for large sites: wildfires in multi-million-hectare regions, the drought and flooding of entire water draining divisions, outbreaks of infection or civil unrest in smart cities. The scale of these reference frames can make anticipated problems – and their solutions – seem abstracted from the realm of everyday life. The future, however, is local, made in the mundane realities of people stuck in traffic on the work commute, watching the news in bed, making an appointment to see their doctor, buying groceries, falling in love. Datafied systems similarly comprise everyday constellations of people and material things: smartphones, wearable monitors, cameras on poles, sensors strapped to bridges, drones flown by someone standing nearby the desired view. What technologies can do in future crises involves the everyday practices of people in their homes, workplaces, communities and local environments. Attending to the both the societal scale and lived realities of digital futures requires imaginative sociological methods. Fiction offers a rich approach. The narrative form and unbounded invention of fictional storytelling allows a shifting panoramic view of social life that, at its best, affects a sensitivity to how other worlds feel. This paper discusses the value of fiction-based methods for sociological research on futures and shares a case study from a project on people's expectations of crises and digital change.

Gender-Based Violence in Mental Health Settings: Manifestations of Gendered Oppression

Mental health inpatient units are settings, typically located in hospitals, that offer both compulsory and voluntary treatment for individuals experiencing an acute period of mental illness. While much has been done in recent years to uphold and maintain the rights of people engaged in mental health services, it remains a longstanding issue that many women who stay in mental health inpatient units are subjected to gender-based violence.

This Australian study investigated women's experiences of gender-based violence that occurred during and due to stays in adult mental health inpatient units. The primary focus of this project was women living with mental illness, thus putting the dual identity signifiers of gender and mental health at the forefront of epistemological concerns. The critical feminist approach applied to this research frames gender-based violence explicitly as a manifestation of gendered power imbalances and inequality, and explores how gendered oppression is sustained in mental health settings.

Through qualitative interviews with women who had experienced gender-based violence in mental health inpatient units, and consultations with key stakeholders, this research revealed that women are experiencing gender-based violence in a range of circumstances and that current approaches to ensuring women's safety are not working. Women are exposed to multiple types of gender-based violence including incidents of sexual assault, physical assault, harassment, and/or threats of sexual and physical violence. Perpetrators of gender-based violence can be male consumers, male service providers, and other men such as partners or ex-partners. Restraint and seclusion are practices undertaken in mental health inpatient units that are especially contentious and can be experienced by women as gender-based violence. Mental health services also contribute to gender-based violence by failing to respond adequately to violence that occurs in mental health inpatient units.

From Outer to Inner: Self-Awareness, Therapeutic Discourse, and Emerging Forms of Cultural Capital Among the Millennial Professional Class in Toronto, Canada

In *Social Class in the 21st Century* Savage contends that the forms of cultural capital observed by Bourdieu in *Distinction* are, owing to generational replacement, gradually being replaced by novel emerging forms. Thus, appreciation of the high arts is ceding ground among younger educated elites to a more ironic and self-reflexive cultural sensibility. This insight dovetails with the scholarship on omnivorousness, cosmopolitanism, and "ordinary" tastes, which show that elite modes of distinction are undergoing significant changes, as a result of the spread of a "democratic" ethos that is hostile to explicit forms of snobbery. Building on these literatures, I identify a particular form of cultural capital that has hitherto flown under the radar. Drawing on 100 interviews with university-educated millennial professionals whose work is based in Toronto, I show that these young urban elites draw comparatively weak symbolic boundaries on the basis of aesthetic taste, while drawing strong symbolic boundaries on the basis of a person's acumen with therapeutic discourse. Specifically, time and again, these professionals spoke of striving to associate with people who are "self-aware," while avoiding those who lack "self-awareness." And among those professionals interviewed who are tasked with hiring, many stressed that they seek employees with a high degree of "self-awareness." For these millennial professionals being *self-aware* is equated with leading an autonomous and self-directed life, whereas lacking self-awareness is conceived as being ignorant, dogmatic, and conformist. Accordingly, the data show that a significant form of emerging cultural capital derives from the ascendence of therapeutic discourse in advanced industrial societies, and the rising symbolic value placed on the ability to perform an autonomous selfhood. Indeed, we might say that the signs of cultural capital are shifting from *outer* (engaging in certain cultural activities) to *inner* (being able to exhibit, through language, a certain kind of subjectivity).

WATTS, Rob* (RMIT University, Australia)

Why Are Liberal Democracies Scared of Dissent? Examples from Australia, Canada, UK and USA

Many liberal-democracies have moved to criminalise dissent and peaceful protest by expanding police powers and court penalties. Those governments say they are responding to heightened protests by climate change groups and COVID anti-lockdown protests. In 2022 the Canadian government eg., invoked the *Emergencies Act* 1988 to suppress protests. In Australia three governments criminalized environmental protest, introducing heavy fines and prison sentences. The British government invented new criminal offences and enabled police to ban people from attending demonstrations. Since 2018, seventeen USA states passed 'critical infrastructure' laws criminalising constitutionally protected rights to free speech and assembly. This criminalization of dissent is hardly new; it builds on long-standing state practices proscribing and punishing political dissent (Bessant 2016, Watts 2020). If liberalism 'structures political, economic and social thought in the English-speaking world' (Geuss 2001: 100), then the long and continuing history of criminalising dissent presents major theoretical and political problems. Liberal-democracies claim eg., to promote and practise democratic rights to free political expression. Yet if liberal-democracies pride themselves on these principles, why don't these states and their decision-makers welcome dissent and recognise it as a hallmark of free society? (Brabazon 2006).

The paper considers some ways of understanding the gaps between the theory and practice of liberal-democracy. We begin by asking how liberal-democratic states attempt to justify the criminalisation of dissent. Are those reasons credible? Is the commitment to the rule of law principle or civic rights fictional? We also consider Neocleous's (2008) argument that liberalism always privileged 'security' over freedoms and rights and assess the claim that liberal-democratic states have to preserve a 'balance' between individual freedoms and order. We also reflect on Schmitt's argument that liberal-democracies rely on naked state power and not the rule of law when declaring a 'state of exception' in response to real -or imagined- threats (1988:1).

Technology for Personalised Enrichment in Aged Care: A Care Ethics Perspective

In the past decade, the use of technology for social enrichment and connection in residential aged care has captured the imagination of researchers and industry alike. Many residential aged care homes have introduced technologies such as virtual reality, robot pets, and videogames, as part of their

social and activity programs. In addition, during visitor restrictions to manage the spread of COVID-19, many homes introduced video calling to ensure family members were able to continue communicating with loved ones in aged care homes. However, using technology successfully in aged care – especially when the purpose is to provide social enrichment and connection – requires considerable input and attention from aged care staff. Aged care homes are complex environments; residents have multiple care needs, and the workforce is under-resourced. Given this complexity, there is a risk that technologies introduced without sufficient understanding of the needs of residents and staff will not be beneficial and could even cause harm or create a burden for staff.

To ensure the future ethical design and deployment of technologies in aged care, it is vital that we gain detailed understandings of people's prior experiences with technology for enrichment in aged care, including the experiences of both residents and aged care staff. Through a series of qualitative interview studies, we have examined the experiences of multiple stakeholders in navigating the use of technology for social enrichment in residential aged care. Our studies have highlighted the core role that care staff play in facilitating technology-based experiences to provide moments of personalised joy and enrichment for residents. Drawing on a care ethics perspective, we highlight the need for facilitators to be attentive to individual interests and needs in order to design and use technology effectively for personalised enrichment in aged care.

WEAKLIEM, David L.* (University of Connecticut, United States)

Education and Opinions on Economic Issues

Education has been associated with more leftist positions on "social issues" including ethnic and religious tolerance, gender roles, and civil liberties, but with more conservative opinions on economic issues such as government ownership of business or egalitarian redistribution (even after controlling for income). Research has shown that the effects of higher education on voting choices have changed in many nations since the mid-20th century: although education was once associated with support for conservative parties, it is now associated with support for parties of the left, and it is often said that this change reflects an increase in the importance of social relative to economic issues. However, in the United States, there is some evidence that the effects of education have shifted—the association with conservative opinions on economic issues has weakened and possibly reversed over the past several decades. Moreover, in an analysis of data from the 1990 World Values Survey, Weakliem (2002) found that the conservative effects of education (particularly higher education) on economic issues were generally weaker in nations with higher per-capita GDP. These points suggest an alternative explanation of the changing relationship between education and party choice.

This paper will extend the analysis in Weakliem (2002) by examining the relationship of education to economic opinions using data from all seven waves of the WVS. The primary research questions are (1) whether there have been changes over time in the relationship between education and economic opinions within nations and (2) whether the relationship between education and economic opinions differs among nations. I will conclude by discussing possible explanations of the changes and their political implications.

WEAVERS, Alice* (King's College London, United Kingdom)

'Pockets of Participation': Exploring the Experiences of Young People and Policymakers Involved in Youth Participation in National Policymaking in England.

Through the voices of young people and policymakers, this paper examines how some young people are involved in national policymaking in England through 'pockets of participation' within government departments. Based on new empirical research, it analyses the extent to which some young people are able to influence policy, and highlights their ideas for how more young people can be meaningfully involved in policymaking.

Young people are positioned at the margins of democracy in England. As policy subjects within a neoliberal system, young people are viewed through a deficit lens with interventions aimed at promoting individual responsibility over providing universal services, particularly since the implementation of austerity measures from 2010. Article 12 of the United Nations Convention on the Rights of the Child (UNCRC) states that young people have the right to have a say on issues which affect them. However, as disenfranchised citizens, the potential for young people to influence policy through formal democratic mechanisms has predominantly been limited to established youth voice projects, such as youth councils.

This paper goes beyond these projects to understand if and how youth participation is happening within government policymaking. Drawing on over 20 interviews and focus groups with young people and policymakers, it finds that there are isolated 'pockets of participation' where both groups work together and discuss policy in roundtable meetings or internal departmental projects. These opportunities are often sporadic and only accessible through chance to young people and organisations who are within government networks, presenting a challenge to the wider engagement of young people in policymaking. Through an analysis of the participants' experiences and their

reflections on themes of power, representation and democracy, this paper presents the challenges and opportunities of these 'pockets of participation' to explore how young people are rethinking youth participation in national policymaking.

Managing Healthcare Professionals As Resources and Patients As a Commodity: A Look at NPM in Action in Aotearoa New Zealand Primary Care

"If I told you that 50% of the requests you get for same day appointments could be resolved on the phone, would you believe me?"

Aotearoa New Zealand, like many countries, is experiencing high demand for primary care services, made worse by practitioner workforce shortages within a sector dominated by for-profit general practice models. Health inequities persist with a model of care that is no longer fit for purpose. The challenges of accessing care, even more so for those patients who have complex health needs and are socio-economically disadvantaged, presents as work for patients. Under the guise of person-centred care, a new work process, clinician triage, purports to address access issues, resolving appointment demands over the phone and rationing face-to-face services so "the right people get seen."

Institutional ethnographers are taught to follow the work processes, to uncover how things happen as they do. Within the new triage system, patients were found to do more work as they navigated access to health care. However, they received less care and less care that was relevant to their needs. Instead of triage placing patients at the centre of care (as claimed), patients were hooked into institutional interests of clinician capacity, restricted appointment allocation and availability of resources. The ideals of new public management, in particular efficiency and value for money, reduced clinicians to a resource and patients to a commodity. Clinician triage intends to improve the flow of patients through a general practice, which appeals to the business interests of the practice. Instituting standardised processes within the ideology of NPM devalues the knowledge of patients and clinicians.

This session considers the complex environment of primary care, the work of patients within the new technologies of NPM, and the power of institutional interests to capture quality improvement attempts.

Personal Disjunctures: Moments of 'Capture' for Researchers Conducting Institutional Ethnography

Institutional ethnographers quickly learn their research will be messy, confronting, disruptive, and overwhelming. For many, the journey as IE researcher can be just as confronting and overwhelming as the research endeavour and the findings it produces. Especially, when the researcher realises they are implicated in the social construction and social relations under investigation.

In this session, two early career IE researchers reflect on their experiences of 'capture' and 'disjuncture' occurring during their doctoral investigations. Feelings of discomfort were associated with challenges to taken for granted assumptions and (supposed) authorised knowledge. These uncomfortable realisations of capture were further compounded by our discovery we were implicated in the relations organising the people at the centre of our research. As well as being organised ourselves by ruling relations, we were activating them for others; perpetuating discourse, 'validating' tools, buying into the priorities of the dominant hegemonies and encouraging others to do the same.

Institutional Ethnography as a method of inquiry is often employed where illumination, explication and emancipation are intended. Our experiences identify for us, and, potentially, for all novice IE researchers, that the process of conducting an IE investigation can *also* be illuminating, explicatory, and emancipatory for the researcher, but that this is often only achieved after a trip and fall into personal disjuncture.

WECKEMANN, Maximilian* (Berlin Social Science Center (WZB), Germany)

Polarising the Future, Mobilising 'the People' - the Temporal Structure of Querdenker Future Horizons

In the proposed paper, I will contribute to the question of which role assumptions about the future play in battles over hegemony. However, I will do this with regards to time itself: while I consider political agents' beliefs about the future, I analyse which temporal aspects run through these imaginaries. Accordingly, the paper asks the question what role assumptions about time (which are encapsulated in imagined futures) play in battles over hegemony.

Theoretically, I draw on the literature on imagined futures burgeoning in recent years and combine it with approaches from sociology of time (e.g. Beckert, 2016; Appadurai, 2013; Beckert & Suckert, 2021; Rosa, 2005). I conceptualise imagined futures as representations of a future state of society that allow agents in the present to place themselves in the future and I follow a praxeological approach to time, which takes it to be an entity that is socially constructed, yet intersubjectively shared and therefore situated in between an objective - or Newtonian - and a subjective - or Kantian - understanding of time (cf. Reckwitz, 2016).

Empirically, I study the discourse of the German Querdenker movement, which successfully mobilised a new protest coalition against the COVID containment measures that consisted not only of actors of the far right, but to a significant extent of participants emanating from milieus akin to esotericism and alternative medicine, conspiracy theories and anti-establishment politics in general (cf. Frei, Schäfer & Nachtwey, 2021). In particular, I analyse the imagined futures articulated in the newspaper outlet Demokratischer Widerstand and which temporal structures are employed therein in order to mobilise for protests that aim at a revolutionary reordering of society.

While understanding and scrutinizing these anti-democratic movements holds merit on its own, the theoretical insights gained may simultaneouly inform the debate on emancipatory politics and social movements.

WEDAM, Elfriede* (Loyola University Chicago, USA)

Can Faith-Based Organizations Change the Culture of Violence in Chicago?

The goal of this research is to establish whether and to what degree faith-based organizations, including religious congregations, that conduct anti-violence programs for adults and youth are successful and by what measures. What solutions to violent behavior do religious actors propose and apply? How effective are their intervention or prevention work against violence and how do they measure this? In this project, I posit that violence at both the personal and community levels is an endemic, but solvable, social problem. However, using the conclusions of the Centers for Disease Control and Prevention, it is a public health rather than policing problem that requires a multi-institutional and multi-sector response. Therefore, I will present preliminary findings explaining how religious resources are brought to bear on solutions with a focus on the city of Chicago and, importantly, how these religious organizations justify their programs and demonstrate their effectiveness. Hence, an important component will be to identify the measures they use to claim successful anti-violence outcomes. I will also examine to what degree explicit and named nonviolent strategies and tactics are used to achieve their results. The principal method is inductive, collecting both qualitative and quantitative data from 15 faith-based organizations that claim anti-violence programs. This project is grounded in a broader theoretical discussion of the role of conflict as a form of sociation in which religion participates negatively and positively. Studies of deviance demonstrate that societies without conflict are dead societies. So also with relationships, families, organizations, and cities. Social conflict is a form of sociation, in Georg Simmel's terms, creating a social order out of attractive and repulsive forms. Therefore, the question is how can religion provide solutions to the problem of violence at the individual and group level?

WEHMANN, Hulda* (Federal University of ABC, Brazil)

The Democratic Co-Production of the City As an Academic Activity: Learning through Experience in Communities in the Southern Region of the City of São Paulo – Brazil

This paper aims to present the role of the experience of the territory as an academic activity, using as case study the partnership between the Laboratory for Spatial Justice - LABJUTA, a research group at the Federal University of ABC, in São Paulo-SP, and the Community Gaivotas, situated on the banks of the water dam that supplies part of the City of São Paulo. The LABJUTA's research actions and partnerships focus on technical support of the political struggle of self-organized movements and social organizations for the right to the city, housing, and spatial justice, in the so-called popular territories located in the metropolitan region of São Paulo and the ABC Region. The partnership with the community Gaivotas started in 2015, and involves partnerships with agents of the 3rd sector, as the Gaspar Garcia Center for Human Rights, international academic partners, and residents of the community, in the southern region of the city of São Paulo, and remains active throughout several academical projects and research. The article initially discusses the concept of urban co-production as part of academic activities, presenting it as it is understood from theoretical discussions based on research carried out in partnership with other institutions in Brazil and abroad. Next, the context of the work will be presented, the Gaivotas Community, from its urban insertion in an area of relevant environmental interest, the main actors involved, and the roles they play in the disputes that took place during LabJuta's partnership with the community. Next, it will be analyzed how the processes of knowledge exchange between the university and the community occur, here called "co-production of knowledge", discussing the concept of co-production of the city as an academic activity; finally, the final considerations, and possible future researches paths.

A Study of the Optimized Path of Leisure Lifestyle in the Post-COVID-19 Era——Based on the Ecological View of Marxism

The COVID-19 epidemic since 2019 has brought threats and challenges to mankind. In this special era, how to deal with our leisure life has become one of the key issues of the world. The constancy and complexity of the epidemic will have a great impact on leisure lifestyle.Although considerable research has been devoted to this epidemic,rather less attention has been paid to the optimized path of human leisure lifestyle in the Post-COVID-19 Era. Therefore, the main aim of this study is to explore the optimized path of leisure lifestylebased on the ecological view of Marxism.Marx advance that the theory of the relationship between human and environment, the thought of practical aesthetics and the thought of community, which are closely related to human leisure life. The long-term existence of the epidemic has changed the leisure psychology of human individuals, the leisure natural environment and the leisure social conditions, which are the key influencing factors of leisure lifestyle. The ecological civilization thought contained in Marx thought provides philosophical guidance for coping with the threat and challenge of epidemic situation, and also provides scientific basis for optimizing the way of human leisure life. The study adopts the methods of integrating history and logic, abstract and concrete, quantitative analysis and qualitative analysis to study the leisure lifestyle of human beings during the COVID-19 epidemic and find out the existing problems. For these problems, the corresponding countermeasures are taken to optimize the leisure life style.such as changing the concept of leisure life through leisure education, and advocating green and healthy leisure consumption,whichsheds lights on optimizing path of leisure lifestyle in the Post-COVID-19 Era and providing some possible avenues for further research.

New Modes and Forms of Civic Education in Time of Populism, Xenophobia, and Racism

The last decade has witnessed a series of crises around the world - from austerity and climate crisis to populism - but also new forms of political participation like Occupy and black-life-matters. These new developments pose a challenge to civic education and the sociology of education: young people are claiming new forms of civic-education that satisfy their need for political activism and efficacy in order to shape their futures and to influence decision-making processes in transnational, global, and postcolonial perspectives.

But what should be the content of such education, and through what forms can it be brought into society? Are state guidelines and programs for the formation of a "suitable" democratic citizen as well as a civil society supporting the political system desirable at all? Or would it be better to strive - as the related sciences such as sociology demand - for a civic-education that is as (state-)free as possible and whose goal is to support (content-)open, critically reflective emancipation processes of the individual and to society?

Interestingly, a determined attempt aiming at an activated democratization, preventing xenophobia, and racism and shaping diversity is currently to be found in Germany. Since the 1990s, special programs of the German government have promoted new contents and forms of civic-education for young people in extracurricular settings. In the last years, these programmes have experienced a massive expansion. A law to promote democracy is even planned for 2023, which is unprecedented within the EU.

This article analyses the tension between the state and citizens/civil society in these new modes and forms of citizenship-education. After an insight into the historical development of the programs, we discuss the implications of different conceptions of society and citizenship, advantages and disadvantages of short-term project funding versus permanent institutionalization, and the potentials and limitations of the programmes

WEILAND, Andreas* (University of Bamberg, Germany)

Gendered Careers and Retirement Incomes of Couples across Europe

This study approaches the persisting gender inequalities in retirement incomes from the perspective that spouses` gendered division of paid labor and unpaid care work reproduces women`s work-family conflict. During the labor market active stage of the life-course defamilizing policies, which aim at reducing the amount of care work within the couple, may shape couples` joint trajectories of pension rights accumulation. Subsequent retirement incomes are contingent the degree of redistribution that Beveridge and Bismarckian pension systems apply in their evaluation of life-courses. Against this background, I explore two interrelated questions: (i) Which couple career patterns emerge across different defamilizing regimes among the birth cohorts 1917-1967 in 14 European countries and (ii) how are they linked to spouses`

individual and combined retirement incomes? Analyses draw on data from the Survey of Health Ageing and Retirement in Europe (SHARE) and retrospective life-courses from SHARELIFE waves 3 and 7 (n=13992). I utilize Multichannel Sequence Analysis to create a typology of eight distinct couples` career clusters from the birth cohorts 1916-1967 and link their prevalence to country and cohort-specific levels of defamilization. Subsequently, I apply multivariate regression analyses to assess the link between couples` career clusters to spouses` individual and combined incomes across different countries. Results, indicate a tangible link between higher degrees of defamilization and more egalitarian couples` careers across countries and cohorts. Income analyses highlight a stark Beveridge-Bismarck contrast, a generally advantageous position of Dual Earners across countries, as well as the ability of female secondary earners to compensate male spouses` income deficits.

Global Democracy Retrenchment and Rise of Autocracy: Challenges to Environmental Politics

Observed global democracy retrenchment and the rise of autocracies call for research on the dynamic processes and causes of these worldwide trends. These changes also call on the danger the global surge of autocracies poses to countries' environmental politics. The proposed study will use a broad multivariate, multi-level analytic framework to develop a comprehensive model of *the dynamic trends of democracy retrenchment and the rise of autocracy* across the world, world regions, and individual countries and assess the impact of these changes on *environmental politics*. Following my previous work on the spread of democracy (Wejnert, 2014), this study assumes that processes of democracy retrenchment are likely multivariate and include both endogenous (country-level) and exogenous (regional, global) factors. However, regardless of several descriptive accounts of global democratic regression and autocracy rise within countries and groups of countries, the processes of the worldwide surge of autocracy remain less explained, and the outcomes of these processes on countries' environmental politics are relatively unknown. Subsequently, scholars and policymakers are left on uncertain grounds regarding targeting their efforts in restraining democratic retrenchment and counterbalancing the global upsurge of autocracy, and guiding global climate change politics. Ultimately, this project will extend existing knowledge in political sociology and environmental studies by its (i) a novel conceptual framework, (ii) an innovative, multi-level methodological approach to study democratic regression and autocracy rises, and the impact of these trends on environmental politics, and (iii) development of a longitudinal database extending the database published by the ICPSR (Wejnert 2007).

WELZ, Frank* (University of Innsbruck, Austria)

Critical Theory As Historical Practice

In dangerous times of an interregnum, when "a great variety of morbid symptoms appear" and the "new cannot [yet] be born" (Gramsci), more than before, Critical Theory is needed again. But which form of critical theory? Which offers both sociological analysis and orientation for our human practices? While the toolbox includes Kantian and Hegelian versions, my plea goes for Horkheimer's Hegelian emphasis on history in his initial sketch of critical theory: Thought and society both are historically constituted. (1) In the Kantian understanding, the synthesizing forms of thinking open up reality, which otherwise, as Weber put it, would be meaningless to us as a "stream of immeasurable events" - on the societal level, the interregnum being ordered by a "charismatic leader". Cognition is subjective. The task of sociology is the thoughtful cultivation of its fundamental concepts and their "measurement" against experiential reality. (2) The alternative path leads from Hegel's historicization of philosophy via Marx and the early Critical Theory to 20th-century developments in the sciences. It does not strive for an "analytics of truth" but for a "historical ontology of ourselves" (Foucault). "Theory" is not a subjective principle of thought that orders reality but a historical practice. Inspired by this path of historical epistemology, I will exemplarily discuss three critical endeavours as particular reactions to societal transformations, connecting both crisis and critique, society and thought. Shaped by the mid-20th century Keynesian capitalism, Adorno indirectly still assumes the possibility of steering the economy. From the 1980s onward, theories suspend political economy analysis. Their interventions strongly differ from earlier approaches. Habermas (promoting the potential of rationality in the public sphere) and, most recently, Rosa's critique (advancing "resonance") no longer target "exchange society", as Adorno did. In sum, what has to be shown, historically anchored, theory construction and normative practice go hand in hand.

WELZ, Frank* (University of Innsbruck, Austria)

European Sociology: Cognitive Promises and Institutional Realities

In the late 19th century, neither philosophy nor history could any longer make sense of the drastic social changes in Europe. A few thinkers successfully created new cognitive tools that only later on were called "sociology" and, far later, "European sociology".

First, three myths about the latter are to be deconstructed: (1) the "myth of the given" of European Sociology, (2) the myth of its coherence, and (3) the myth of its universal applicability. Second, against these three myths and regarding contemporary sociology, I will argue for reevaluating the chances for the open common project of international sociology that are embedded in the historical anchorage of sociological thought initially developed for understanding specifically welfare societies in Europe.

The Twilight of Chinese Aristocracy: How Family Pedigree, Father's Position, and the Imperial Exam Shaped Social Mobility, 618-907 CE

Social scientists have conducted extensive research on intergenerational mobility in modern industrial societies. Due to data limitations, we know relatively little about social mobility in the premodern period. In this study, we construct a dataset containing information from 3,640 excavated tomb epitaphs of male elites in China's Tang Dynasty (618-907 CE). According to historians, the literate population in medieval China generally have tomb epitaphs after death, and the excavations of these epitaphs in modern times are largely random. Consequently, our analytical sample is somewhat representative of the elite class and includes educated men who held government positions and those who did not. As epitaphs written in the period we study tend to be highly detailed descriptions of an individual's life with stylized prose and poems, our dataset contains granular information about the ancestral origins, family background, and complete career history of each deceased elite. This dataset thus mirrors what would have been included in a contemporary social mobility survey. We utilize this dataset to examine a grand transformation in Chinese history---the transition away from an aristocratic society and a rise of meritocracy. We define Chinese aristocracy as coming from a prominent branch, and we measure status as an individual's position in the bureaucratic system. Our statistical analysis reveals that from the 7th to the 9th Century, the effect of family pedigree on career achievement in the bureaucratic system had declined over time, while passing the Imperial Examination (Keju) had become increasingly important. The Tang Dynasty turns out to be a critical period in Chinese history, during which the advantage of ancient great houses gradually vanished and career success became directly determined by father's office rank as well as personal merits. Our findings shed light on the development of political economy in medieval China and social mobility before industrialization.

Why Women Own Less in China? Sibship Structure, Intersibling Transfer, and Gender Inequality in Homeownership

As in most other societies, women in China own less wealth than men, which affects their rights and welfare within and beyond the household. Meanwhile, housing assets have constituted the largest share of family wealth after decades of market reforms. Therefore, this study focuses on the inequality in homeownership between Chinese men and women and examines how the sibship structure explains the gender inequality in homeownership. While most prior literature considers parents' unequal transfers to sons and daughters, we argue that both intergenerational and intersibling transfers may contribute to the gender wealth gap. Due to the strong patrilineal and patrilocal traditions, Chinese parents are more likely to help their sons purchase housing assets. Furthermore, to improve male competitiveness in the marriage market, siblings are more likely to help their brothers' mortgages than their sisters'. Consequently, having siblings may exert opposite effects on Chinese men and women. While more siblings do not worsen and may even improve men's access to homeownership, women's prospect of owning housing assets decreases as their number of younger siblings increases. Using data from two large-scale surveys, *the China Family Panel Studies* and *the China Household Finance Survey*, and covariate balancing propensity score methods to address selection into different sibship sizes, we provide robust evidence for the proposed hypotheses. We find that (1) compared to only-child sons, only-child daughters are significantly less likely to have their names on the property deed; (2) gender inequality in homeownership grows as the number of siblings increases; and finally, (3) while men receive money from siblings

either as loans or gifts for their mortgages, women tend to provide monetary support to their siblings. Under pronatalist policies, these findings suggest that without drastic changes in norms and culture, Chinese women might continue to be disadvantaged in wealth.

Unintended Dilemma: A Sociological Analysis of the Domestic Waste Disposal in Rural China

Domestic waste is a persistent issue in rural China. The existing analyses majorly land on the backwardness of rural environmental governance and inadequate policy implementation due to the urban-rural divide. Some studies emphasize villagers' lack of consciousness of environmental protection. The social interaction and power relations in local communities are under-discussed. Based on qualitative data collected in D county of Northeast China, our study explores the ethnomethods of waste disposal and the strategic actions in the administrative tier of the county, township, and village. Our findings show that the governance-level of the waste issue stands in proportion to the proximity of the administrative powers. With limited financial resources, grassroots cadres can only give priority to dispose rubbish around the government buildings, as well as the main roads, to cope with accountability and inspections from higher-ups. For residential areas that are difficult to cover, villagers have to opt for crude treatment, such as dumping, burning and burying rubbish directly in inconspicuous areas of the village. The differentiated disposal from the administrative tier and the arbitrary treatment of villagers all show egoistic and rational strategies. Though the villagers are disadvantaged in this disposal mode, they further strengthen the existing inequality through rude treatment and abandon their environmental rights. We find that the dominant dilemma in waste disposal is due to the widely accepted rationalization. According to their narrative in the interviews, the involved actors through rational choices based on short-term interests, trigger the unintended disposal dilemma.

Decolonising the Study of Religion in Australia

The study of religion in the land referred to as Australia has thus far focused mainly on so-called Abrahamic traditions of Christianity, Judaism and Islam, and on the southern states of New South Wales and Victoria. This is despite the fact that Australia is a religiously and spiritually diverse nation, and that diverse worldviews in Australia have been and continue to be shaped by First Nations peoples, and South-South flows of migration across the Pacific and Indian oceans, particularly in Australia's far northern regions. This presentation begins by truth telling the historical and contemporary reality of the religious and spiritual composition of Australia, challenging the myth of a White Christian nation, by drawing on relevant literature and census data. It then includes a series of short scholarly and personal reflections, by the presenters, on why and how there is a need to decolonise the study of religion in Australia. Their narratives, recounting lived experiences from their diverse positionalities including their First Nations, Indonesian, Chinese, African, and/or European backgrounds, further reflect Australia's 'multicultural and multifaith Real' (Hage 1998; Halafoff et al. 2021; Weng 2021). The presentation concludes with an analysis of these data and narratives, and posits ways forward to dislocate coloniality in the study of flows of religion across the Indian and Pacific seas and islands.

Reporting from the (Dis)Locating Coloniality Project on Decolonising Studies of Religion in Australia

This paper reports on a small research project funded by the Alfred Deakin Institute for Citizenship and Globalisation that considers the extent and implication of locating and unmooring coloniality in the study of religion in the 'lands now called Australia' (Prentis 2021) and the lands surrounding. To decolonise is to intentionally acknowledge colonial violence past and continuing, and to commit to a future which is different from that past, through every day action (Connell 2014; Paradies 2020). We reviewed key literature on decolonising studies of religion in its application for our context (Hedges 2021; Nye 2019) and, in particular, consider how coloniality meant that the term 'religion' and study of 'religion' have been weaponised in the hands of colonisers and that colonisation, whiteness and Christianity continues to be enmeshed (Hedges 2021; Lake 2018). To dislocate coloniality requires a decentering of Anglo/white perspectives and to centre the witness and the writing of Aboriginal peoples who have been doing this work for a long time (e.g., Deverell 2018; Moreton-Robinson 2020; O'Sullivan 2021; Pattel-Gray

1998). It also requires an attention to current and pre-invasion cultural and religious diversity that exists through movements of religion and culture across oceans (Ganter 2006; Reynolds 2003; Halafoff et al, forthcoming). This paper reflects on previous research findings in its consideration of future research trajectories.

Blurring Civil-Military Boundaries? the Rise of Civil Defence Organizations in Taiwan's Civil Society

This paper extends beyond the traditional defence sector to examine the rise of civilian civil defence organizations in Taiwan and the potential for their integration with the state-run civil defence and regular military. Even before Russia's invasion of Ukraine focused international attention on Taiwan's war preparedness, concern in Taiwanese society about the island's ability to withstand a PRC attack had led to calls for reform of the island's out-dated civil defence system and to the emergence of civil society organizations offering emergency response and self-defence training.

The paper will first review the literature on the relationship between civil society and civil defence and describe the structure of Taiwan's civil defence system under the authority of the Interior Ministry's Policy Agency. The next section will give an overview of the societal conditions that enabled the rise of these organizations, using public opinion research to show how enthusiasm within society to strengthen national defence has combined with aversion to civilian defence mobilization by the government and military establishment to create a demand civil defence organizations in civil society.

The authors will then discuss the findings of their fieldwork at select organizations, which will include interviews with the organizers and participation in their training programs, as well as interviews with Taiwanese officials, politicians and experts involved in civil defence and military issues. This fieldwork will evaluate the culture within Taiwan's civil society civil defence organizations and how they view their role in society and their relationship to the civil defence system and military. The potential for their integration, or at least coordination, with state-run civil defence and military organizations will be assessed, contributing to broader questions of the boundaries between civil society and the military.

Built to Scale? the Canadian Armed Forces' Response to the COVID-19 Pandemic

The Canadian Armed Forces (CAF) have a long heritage of domestic military operations. The colonies that formed the Dominion of Canada in 1867 brought with them the statutory and common law mechanisms by which local authorities could call upon the militia. By the 1920s, the federal government ripped such powers from the hands of such authorities and placed it exclusively in the hands of provincial attorneys general as representatives of governments more able to financially compensate the federal government. Despite this shift, the execution of these operations remained distinctly a local affair and rarely implicated more than a few municipalities at a time. The COVID-19 pandemic changed this, forcing the CAF to integrate domestic operations from coast to coast and operate with agencies like the Public Health Agency of Canada, even as some soldiers delivered firewood door to door. This paper explores the roles performed by the CAF during the pandemic, and while acknowledging that the pandemic was a novel challenge, asks if the CAF's approach to domestic operations is fit for purpose in tackling the challenges of the future, or too heavily rooted in largely unexamined past? This paper employs a legal historical approach and compares the recent emergency to problems of jurisdiction and scale in Canadian history.

Boundaries between Private and Public in the Construction of Limits on Social Housing in Sydney, Australia.

Socio-spatial stigma is a powerful tool, creating boundaries between the so-called 'deserving' and 'undeserving' (Tyler and Slater, 2018). This is a two-way process, by which withdrawal of public funds creates poverty and the stigmatisation of poverty also justifies withdrawal of public funds. However, not only does this process create and re-create poverty, but it is also used to justify capitalist exploitation of specific places (Madden and Marcuse, 2016; Marcuse, 2000), shaping cities in the process (Slater, 2018; Slater, 2021; Paton, 2018). As noted by Madanipour (2019), the relationship between the public and private spheres is shifting, and the change has spatial characteristics. This paper aims to explore the construction of boundaries between private and public housing in Sydney, Australia, including the liminal spaces represented by community housing (Darcy, 1999). Despite having a strong public sector and a functioning social housing program since the Commonwealth Housing Commission was formed in 1944, at 4.7% Sydney has a very low rate of social housing (Family

denotes a presenting author. Abstracts are organized by first presenting author's last name.

and Community Services, 2021). The construction of boundaries between private and public is constantly maintained in the housing sector, despite other sectors such as health and education being overwhelmingly accepted as public responsibilities. The argument is based on 21 semi-structured interviews conducted in 2018 with professionals either working in, or connected to aspects of housing provision, including those working within and outside of social housing provision. It interrogates symbolic and material boundaries (Bourdieu, 1989) and the connections between them to show their spatial effects, which include privatisation of, and densification on, public housing land. An analysis of the interviews shows that boundaries limiting social housing in Sydney are maintained to reinforce individualism in Sydney's housing field and safeguard real estate as a private financialised asset.

Antipodean Travels and National Matters: Meaningful Mobility and Reimagining of the Australia and Turkey through Witnessing Acts

It is commonly theorized that White Australia is shaped by the 'tyranny of distance' it has to its colonial roots. As such, it can be thought to also provide a strategic site for conceptualising the cultural role of international travel in shaping collective identities. Highlighting the analytic limitations of social theories in Mobilities, this paper will draw on Beilharz's antipodean thesis and the strong program of cultural sociology to argue that not only do dominant national narratives become problematized through global travel, but travel practices also commonly allow for a reenchanting of the nation through the development of new postcolonial conceptions of citizenship. Using WWI Centennial commemorative travel rites on the Gallipoli battlefields by both Australians and Turks as my case study, I point to the central role of witnessing acts for meaning-making within travel and how these allow for distinctive emotions of solidarity, dialogical cultural interactions, and the elevation of new carriers and custodians of national social memory. The paper concludes by discussing the ways in which Australia is a useful site for both assessing and developing contemporary social theory.

WEST, Bradley* (University of South Australia, Australia)

Cultural Recognition, Pride in Service, and 'Civilianization' in the Armed Forces: Retention Challenges and the Civilian Employability of Military Personnel

This paper explores how a reimagined professional military identity can be used to simultaneously address the current retention challenges faced by Western militaries, and the employment difficulties contemporary veterans experience as part of military to civilian transition. Empirical insight will be drawn from interviews with participants in an Australian peer workshop program that aims to provide military personnel and veterans with communication skills to translate the relevance of their military roles for civilian employers. The interview data reveals that an unanticipated consequence of participants attaining a greater awareness of the transferability of their military experience is the attainment of a renew pride in their service, something that had become diminished over the course of their military careers and particularly in seeking civilian employment. I argue that this enchanting effect for their military identity comes about as a consequence of cultural recognition dynamics. As a consequence, the Western modernisation and wellbeing reforms that aim to 'civilianize' the military in various ways, may enhance rather than worsen retention rates. The findings are used to expand upon Janowitz' (1960) insights into the power of civil-military convergence to enhance Defence capability.

WETZEL, Dietmar* (MSH Medical School, Hamburg & University of Basel, Switzerland)

Affective Resonance and Conflict in the Context of Bodily Social Interactions

Resonance can be defined as a phenomenon that occurs when a vibration in one system causes a vibration of the same frequency in another system. This definition can be applied to both physical and emotional systems (Rosa 2016). More precisely in philosophy & sociology the "concept of affective resonance makes visible that the interaction dynamic itself creates an affective experience rather than transmitting internal feeling states between pre-existent individuals." (Mühlhoff 2014). I will give some examples and insights provided by empirical qualitative data and taken from the public (political) and the private sphere concerning the following points.

- When it comes to bodies and emotions, affective resonance plays a very important role in social interaction. When two people are in affective resonance with each other, they are able to understand each other on a deeper level than if they were not resonant. This can help to build stronger relationships and can also help to prevent

(political) conflicts from arising. When two people or parties are not in resonance with each other, it can lead to misunderstandings and conflict.

- One of the ways that affective resonance can be used to prevent conflict is by using it to create empathy. Empathy occurs when we are able to feel what someone else is feeling. This can help us to better understand their point of view and can also help us to resolve conflicts more effectively.

- Affective Resonance can also help us to build stronger relationships by making us feel more connected to the other person. When we feel connected to someone, we tend to trust them more and we are also more likely to be cooperative with them. This can help us to form closer relationships with others and can also help us to resolve conflicts more easily.

Dis-Connected Coastal Bluespace Relationships in Aotearoa New Zealand: Ethnic Chinese Communities in the City of Sails

The entangled relationship between the wellbeing of humas and ocean ecologies has become an urgent priority for international decision-makers and organisations (i.e., WHO and UN). Bluespaces have been recognised as having a vital role for promoting human and more-than human wellbeing, and that sport and leisure engagement in coastal bluespace fosters diverse individual, social and environmental wellbeing benefits. Among New Zealanders, coastal recreational activities vary across demographics including cultural/ethnic groups, although research to understand these trends is limited. Chinese is a fast-growing ethnic group, whose involvement in coastal recreation is relatively low.

This paper draws on empirical research exploring Auckland's Chinese communities' relationship with coastal bluespaces (i.e. the ocean/sea, the beach, the harbour) through recreational activities. Interviews were conducted with Auckland's Chinese community members and local stakeholders. We explore the factors that lead to Chinese communities' disconnection from coastal bluespaces and the potential impacts on their experiences of cultural identity, belonging and well-being. Adapting Bourdieu's concepts, 'bluespace-related' habitus and cultural capital are used to understand Chinese communities' relationships to coastal bluespaces. Findings reveal that the Euro-centric view of coastal bluespaces and ethnic and gender stereotypes create social barriers to access bluespaces, with impacts on the wellbeing of people, communities and ecologies. We highlight the need to better understand and meet Aotearoa's changing demographics and foster wider and safer accessibility to coastal bluespaces.

Understanding Coastal Communities and Ecologies: The Surf Zone in Aotearoa New Zealand

The urgent need for advancement in understanding about the co-dependent and mutually implicated human-ocean relationships, and the impacts on people, communities, and ecosystems has been clearly established. Surfer's often express a strong sense of belonging to surf-breaks, with 'locals' seeing themselves as having rights to access, sometimes regulating this through physical violence (Anderson, 2014). Alongside this, surfers can also develop strong ocean identities and literacies, contributing to the care and management of oceans.

Our focus in this paper is surfer's relationships to coastal blue spaces in the settler colonial context of Aotearoa/New Zealand, and how these engagements contribute, or not, to the wellbeing of individuals, communities, and ecologies. Our discussion is based on empirical research in surfing communities in Aotearoa involving interviews with surfers (indigenous Māori, Pakeha and new migrants), duo-ethnography, and participant observation. We argue that to understand surfers relationships, both human and more-than human, requires localised place-based analyses that recognise the socio-political contexts and histories of place, which in Aotearoa, include the impacts of Colonisation and recent demographic change. We show that understanding settler-colonial histories and indigenous ontologies and knowledge systems are vital for understanding relationships to coastal bluespaces and the politics of belonging in Aotearoa New Zealand, including in oceanic surfing spaces. Lastly we advocate for intersectional understanding of surf spaces to show how culture, ethnicity, gender, age, ability, craft, as well as the meaning of the 'local' places in which they are embedded, impact on experiences of belonging.

Social Safety Nets in OECD Countries: Tracing Three Decades of Change

The first comprehensive study of social assistance in OECD countries was Gough, Bradshaw, Ditch, Eardley and Whiteford (1997), which was based on an analysis of the design and characteristics of a range of minimum income protection schemes in 24 OECD countries in 1992. While this study is widely cited, it is arguable that it was almost immediately superseded by significant policy changes including radical retrenchment in countries such as New Zealand, Canada and the United States, and over the longer term by major system redesign (e.g.in the United Kingdom), or policy drift resulting in stagnation. Social safety nets also were introduced in countries outside the OECD, including in the form of conditional cash transfers supported by the World Bank and the Asian Development Bank, and in response to shocks including the Asian Financial Crisis of the 1990s, the Global Financial of 2007-08, and more recently the COVID pandemic since 2020. This keynote presentation aims to provide a panorama of the main features of these trends across three decades. It will discuss the relevance of the original analytical framework, based on indicators of generosity to target groups, coverage of the population and administrative structures, in order to assess institutional variation in social assistance programmes over time.

Outcomes and Consequences for Vulnerable Youth within the Context of Service Provision.

In Australian Commonwealth social policy, young people 16 to 18 years old are recognised as independent for financial support purposes where it is established their parents are unable or unwilling to provide for them (Unreasonable to Live at Home Youth Allowance). This payment approximates 80% of an unemployed adult rate, itself recognised as poverty level income. Other support is provided to young people depending upon conceptualisation of their need; e.g., Homeless, a Job Seeker, having Education difficulties or having Mental Health issues. The inadequacy of this response is indicated by data which shows 40% long term unemployed 20 years old still receive this support.

A Bourdieu informed Sociology of Youth (see e.g., Bessant, Pickard and Watts, 2020) which focusses on a relational perspective of power and context (domains), rather than the binaries of culture vs transitions or structure/agency, includes examination of institutions commissioned by the state to provide services to those construed as "at risk" vulnerable youth. The regulations and service delivery shape the relationship with agents and the resultant practices exhibited by recipients and those delivering service – with each institution being mandated to address particular state goals having Key Performance Indicators to evaluate their performance.

The exercise of state power (control and neglect), on the lives of these young people is illustrated through their stories of difficulties in finding how to get support, the hurdles to ongoing support created by disparate 'support' programmes and the significant gaps created by the siloed ways in which support services are delivered. Young people with complex needs experience mis-recognition and symbolic violence in their practical day to day dealings with services and in their attempts to establish stability.

This qualitative study, mindful of Bourdieu's discussion of 'youth' involve**s** 15 UTLAH recipients.

WIDENER, Patricia* (Florida Atlantic University, United States)

Bodies Under Threat: Resistance and Rapture in the U.S.

The 2016 U.S. presidential election was won by someone who lost by nearly three million individual votes. As a sense of fear and shock swept over many, an equally strong sense of elation and swagger swept over others. Both sides were galvanized by a rabidly popular, unpopular president. This paper contributes a five-year focus on Southeast Florida and the expressed sentiments and visual narratives of civil society, who mobilized against a range of grievances, threats, and injustices – as perceived on both sides. That the nation needed to march for Black lives, climate science, democratic practices, and the rights and securities of women and youth signified how far the nation had shifted toward conservative rightwing beliefs and authoritarian tactics. As a social movement ethnographer, I attended and photographed more than 50 events for and against the 45th president between late-2016 and 2021. This paper contributes to three areas of study: the emotional tensions of demonstrators, the role of allyships, and the significance of location. To the first, citizens were inspired to act based on combinations of contradictory emotions, or what James Jasper calls "moral batteries." Emotional fusions of anger, fear, and hope were shared by members on both sides. The second point is a discussion on the centrality of allyships in the resistance across gender, generation, immigration status, and race and ethnicity. The final focus sheds light on the opportunity and meaning of place. While many demonstrations occurred along high-visibility roadways, others converged at more symbolic places, including federal and school buildings, detention centers, and the president's Florida residence. In short, one sign at the first Women's March captured the sentiments of many, including women's rights advocates, Black Americans, victims of gun and sexual violence, and their allies. The sign read, "I can't believe we're still protesting this shit."

WIDJAJA, Nathan* (Nanyang Technological University, Singapore)

Barriers and Facilitators to Singaporean Minority Older Adults' Participation in Active Ageing Centres

A rapidly ageing population in Singapore has necessitated nation-wide policy shifts to support "ageing-in-place". This directive has seen an increase in social-recreational Active Ageing Centres (AACs) located within residential neighbourhoods, aimed to provide older adults with opportunities to age healthily. Yet, existing observations have pointed to a poor uptake of mainstream community-based senior activities among ethnic minority older adults, who simultaneously suffer disproportionately from health and mental health risks. These trends raise concerns over the inclusivity of current active ageing programmes. This qualitative study utilizes semi-structured interviews with 14 Chinese and 7 non-Chinese eldercare staff and observations from the author's ethnography with one AAC to investigate the barriers and facilitators to ethnic minority older adults' participation in AAC programmes. Four themes were identified: (i) role of multicultural and multilingual programming, (ii) staff ultural competence and commitment towards inclusion, (iii) neighbourhood characteristics and centre culture, and (iv) manpower and resource limitations. While staff noted the value of linguistic diversity in their programmes and ethnic diversity among their staff members, staff also noted that it was more important to develop a culturally competent professional habitus, in order for them to negotiate the everyday interactions of cultural difference within their multi- ethnic neighbourhoods. However, staff also indicated broader attitudinal and resource constraints as obstacles towards further inclusive practices. As ageing-in-place policies continue to expand in Singapore, this study's findings inform the need for policymakers to be conscious of the oft-overlooked linguistic and socio-cultural needs of ethnic minority seniors, and for the promotion of stronger cultural competence among eldercare staff.

Female CEOs As Agents of Change: The Lasting Impact of Early-Career Imprints

The number of women in high-level corporate leadership positions has steadily increased in recent decades, but how much female corporate leaders impact gender differences in wages and promotions is still debated. When theorizing about the impact of female leaders, current research focuses solely on the gender. Leaders' socialization and past leadership experiences has received little attention despite parallel literatures showing that experiences during early career periods have fundamental impact on leaders' preferences and decisions. We contribute to understanding the mechanisms that shape female leaders' capacity to become 'agents of change' by theorizing how female leaders' past experiences shape their influence on organizational gender equality later in their leadership career. Based on career imprinting theory, we argue that exposure to gender-equal organizations as a *norm-setting experience* and a female CEO as a *role model* in junior executive positions increases female leaders' likelihood to foster gender equality when they later become senior leaders. To test our propositions, we use linked employer-leader-employee population data on the 5000 largest companies provided by the Dutch Central Bureau of Statistics (CBS). The data uniquely allow us to reconstruct the career histories and positions of Dutch corporate CEO's from the 1990s onwards and link them to companies they lead later and to employee-level outcomes. As outcomes, we study hourly wages and access to permanent work contracts. We conduct random slope hierarchical regression analysis of the moderating impact of CEO gender and imprinted experiences on the gender gaps in employee wages and permanency in 2018. Our analyses account for organizational factors (CEO age, tenure, gender of past CEO's, board size and current/past gender composition, organizational size and gender composition) and individual factors (e.g., age, tenure, education, marital status and parenthood). Using data from years prior to 2018 we conduct additional organizational panel fixed-effects analyses as robustness test.

WIESBOECK, Laura* (Institute for Advanced Studies, Austria)

Careers of Female Early-Stage Researchers with Childcare Responsibilities in the COVID19-Pandemic

Since the beginning of the pandemic, there has been a decline in women's scientific publications as well as a decline in women's first authorship of publications. These accomplishments are, however, key to a successful university career. The hypothesized explanatory context is that female scientists with children were forced to spend more time caring for them and homeschooling them. A pandemic-induced increase in caregiving may result in significant career harms for female researchers with fixed-term prae doc or post doc contracts, such as reduced opportunities for follow-up employment or the loss of grants due to failure to meet performance agreements.

The central interest of the CAREDEMIA study is to investigate career trajectories and perspectives of female early-stage scientists with children in need of care in Vienna in the context of the increased requirement to perform unpaid care work in the wake of the COVID-19 pandemic. The project is funded by City of Vienna and the Vienna Chamber of Labour. The methodological design consists of 15 problem-centered interviews (PCI) with female researchers with temporary prae doc or post doc contracts at public universities in Vienna.

The results demonstrate tendencies of re-traditionalisation of relationships ("couple fellowships"), the institutional expectation of a consistent level of work performance, a higher workload, e.g. in the form of unpaid work for preparing online classes, a higher demand of caregiving and emotional labor even outside of home, e.g. for students, supervisors, or siblings, feelings of isolation, a turn away from the ambition of building a scientific career, but also more time to spend with the child(ren) and the increase in opportunities to digitally participate in academic meetings, teachings and conferences. Overall, the study provides qualitative evidence that the incompatibility of motherhood and early-stage academic careers has been intensified over the course of the pandemic.

WIESBOECK, Laura* (Institute for Advanced Studies, Austria)

Female Domestic Cleaners in the Gig-Economy: Status Construction on the Informal Labour Market

Previous studies show that gig-economy-supported work opens new ways in which gender inequalities are (re)produced. This is especially the case regarding female cleaning staff in private households, where gender inequalities intersect with migratory experience, ascribed ethnicity or socioeconomic background. The spatially and linguistically fragmented group predominantly works on the informal labour market and poses a challenge for trade union strategies as well as for scientific research, which is reflected in the insufficient data available to date.

The aim of the research project GigClean is to close this gap. The study is funded by the digitalisation fund of the Vienna Chamber of Labour. The methodological design consists of 15 problem-centered interviews (PCI) with female platform-based cleaning workers in private households in Vienna. Interviews are conducted anonymously and, where requested, in the first language of the workers. The study is accompanied by an advisory board consisting of labor law experts and trade unionists to develop information material for household cleaners regarding their own rights.

This paper discusses the symbolic and material violence that cleaners encounter as they perform their jobs in isolated and unprotected environments. The findings reveal that the logic of the platforms, namely the visible oversupply of workers, enhances reserve army mechanisms and therewith wage pressure and underpayment. Overall, interviewees highlight experiences with behavior from clients that intentionally or unintentionally aims to damage their personal autonomy, bodily integrity and dignity. However, the ambition to reclaim agency by setting social boundaries was mentioned as a common approach. Rather than remaining in a submissive role, cleaners construct a sense of independence, pride and power, e.g. by demonstratively appearing as not to be intimidated by threats of being reported as illegal worker or accusations of theft. These strategies for constructing status in partially degrading work environments will be the focus of the paper.

WIETZKE, Frank* (Institut Barcelona d'Estudis Internacionals, Spain)

Dimensions of Social Class in Africa. Results from a Factorial Survey Experiment

Researchers have long debated whether the terminology of socio-economic class can be applied to stratification research in Africa. More recent literature takes a different stance. Starting with an influential publication by the African Development Bank, several studies argued that –following years of economic growth- African societies had developed large 'middle classes' whose members were able to spend growing shares of their income on more than immediate survival. Yet, these studies have been criticized both for their relative 'ahistorical' approach that prioritized income-based measures while ignoring non-monetary dimensions like education, work, or security that dominated in earlier iterations of class-based analysis in Africa, and for the use of very broad definitions of 'middle classness' that effectively included many people who were still close to extreme poverty.

The conference paper takes these debates to empirical data. It innovates by re-introducing the method of factorial (or "conjoint") survey experiments into social stratification research to explore subjective perceptions of class- and status-differences in Africa. Although not much employed recently, they represent a particularly useful method for studying the relative importance of alternative attributes in complex, multi-dimensional phenomena like class (Rossi et al. 1974; Rossi and Nock 1982).

The analysis draws on original data from a nationally-representative survey in Kenya (N=1000). It is supported by several external validity tests to assess whether the results also hold in other African countries. The results suggest that income can serve as a useful proxy for class. However, perceptions of 'middle classness' often still overlap with experiences of heightened socio-economic insecurity (both before and during the Covid Pandemic). Non-monetary attributes that played important roles in earlier debates like government employment and education also still emerge as statistically significant. This underscores the persistence of sociological and political dynamics that long shaped local realities of class in Africa.

WIGHE, Deepali* (Department of Sociology, Goethe University, Frankfurt, Germany, Germany)

Human Rights Issue from a Global Justice Perspective: A Case of of De-Notified, Nomadic and Semi-Nomadic Tribes in India

Article 12 to 35 of the constitution of India defines fundamental rights, which are the basic human rights enshrined in the constitution and guaranteed to all the citizens of the country. Similarly, the Universal Declaration of Human Rights (UDHR), 1948, talks about the protection and promotion of human rights for a better standard of life, recognition of the inherent dignity, and equal and inalienable rights of all members of the human family of the signatory countries. However, even after 75 years of independence in India, this situation doesn't exist for Denotified, Nomadic Tribes & Semi-Nomadic Tribes (DNT/NT) as citizens of the country which consist of 10 per cent of the total country's population (GOI, 2016). The Constitution of India only makes safeguards and provisions for the settled communities, but no budgetary provisions have been made for DNT/NT because of their uncleared citizenship. Under the seventh schedule of the Indian Constitution, the concurrent list, Item: 15 mentions the Nomads as "Vagrancy; nomadic and migratory tribes". This is a matter of contestation and conflict of interest between the state and centre on who will make policy for them and still they have not been recognised at the national level. On the contrary, there are 30-40 (Irannomads Tour, n.d.) million population of nomads in the world, where most countries have recognised their human rights and provided constitutional safeguards & protection. It is in this context, the paper displays the plight of the human rights of DNT/NT in India and problematizes the question of citizenship and human rights by critically analysing the role of the welfare state through the lens of the Constitution of India and UDHR, through a global perspective. It is based on a review of literature and secondary data.

Catholic Environmental Movement in Poland and Its Key Challenges

World religions have in many ways contributed to the numerous issues that are at the heart of today's environmental crisis. They did so in the past and continue to do so through their cosmologies, anthropocentrisms, emphasis on reproduction as well as internal and external conflicts - to name only a few factors. However, religions are also indispensable in addressing the issues of climate change. The proposed presentation will shed light on the key findings of the ongoing research into the "greening of Polish Catholicism" and the response of Catholics in Poland to ecological challenges. The presentation will shed light on the functioning of the Catholic ecological movement in Poland. It will present the activism of various Catholic groups (e.g. the Polish branch of the Global Catholic Movement for the Environment) in the wider context of ecological initiatives in the country. Using the conceptual tools of the social movements theory (from the theory of resources to the latest approaches emphasizing human agency), the presentation will shed light inter alia on the key mobilization structures, dilemmas and mobilization strategies used by its actors. It will also discuss the relations between the Catholic and secular ecological movements in Poland and main barriers for the more dynamic "greening" of Polish Catholicism.

Kurdish Environmental Movements - Dilemmas of Networking, Framing and Strategy

Academic research on social movements and collective actions tends to focus on protests, upheavals, confrontations, political activism or contentious practices (Malone-France 2012; Tarrow, 2011). Collective mobilization aiming at disrupting the status quo and searching for possibilites of social change are regarded as key characteristic of social movements (Della Porta, Diani 2006). As Beinin and Vairel (2011) argue, activism in societies of the Middle East and North Africa, consisting in a large part of less visible, less public forms of struggles, does not easily fit into the categories of resistance or confrontations, which are often applied to the exploration of social movements in the global North. The presentation will highlight some of the key findings of research on environmental and climate movements which have been recently developing in many Kurdish communities. There is a shortage of studies on ecology and social action in the MENA region, which is among the most vulnerable regions to the effects of climate change. The fieldwork in Iraqi Kurdistan, Turkey and Iran between November 2021 – September 2022 confirms that the concept of social movements in the global South should be expanded to inclue a myriad of collective action, such as less publicized informal activism, popular oppositional campaigns which play an important role in mobilizing people to engage in the topic. Political and ethnic divisions, which are often underestimated in social movement theories, clearly have an impact on social mobilization of largely marginalized Kurdish population. Moreover, the mainstream model of developmental states, postcolonialism and authoritarian practices are important for understanding the opportunities and constraints to environmental activism. In such a context, activists have been forced to carefully navigate their existing and potential networks and search for adequate strategies to advance the movements' ideas of environmentally-friendly social change.

Government Guidance and Citizen Responses during the COVID-19 Pandemic: A Cross-Country Analysis

The perception of public health guidance has played an important role in citizen responses to the COVID-19 pandemic. Although the state and associated health institutions should feasibly be sources of epistemic authority, the pandemic has tested their legitimacy as anti-science rhetoric proliferated and 'fake news' spread rapidly.

We present a comparative analysis of interviews with citizens across four different countries and explore how a lack of consistency and clarity in public health guidance from government and other trusted institutions led to the polarisation in public perceptions and mixed understandings of the pandemic.

Using interview data collected across Brazil, Japan, Spain and the United Kingdom, we explored whether there were differences in the extent to which both state governments and scientific institutions were perceived as epistemic authorities through managing the pandemic. Participants grappled with a distrust of government guidelines, finding alternative sources of information, managing perceived infection risk, and decisions around self-medication.

Our analysis suggests several components were key to maintaining trust – and therefore epistemic authority – during the pandemic: reliability of the information delivered by different government bodies, including clarity of information, reliability of the government bodies themselves, including whether officials behaved appropriately, and honesty about claims to expertise, including communicating when something was not known. Our data suggests that honest communication about the limits of their knowledge would assist governments in engendering trust among citizens, and theoretically, compliance with public health guidelines.

Communicating in a Crisis: Digital Solutions for Alerting Culturally and Linguistically Diverse Communities in an Emergency

The COVID-19 pandemic has highlighted the ongoing challenges in multicultural and multilingual societies of providing timely advice, alerts and emergency messages to people who do not speak the dominant language. Without access to accurate, trusted and timely information, the health and survival outcomes of culturally and linguistically diverse (CALD) populations are significantly worse than for people who are literate in the dominant language. In this paper, we report on findings of a systematic literature review that aimed to identify (1) the obstacles to effective crisis communication in diverse languages in multicultural societies; and (2) the reported solutions that have been developed and trialled to respond to this problem. These findings inform our proposed model for developing and implementing technological solutions that support the effective communication of urgent information in diverse languages. This model is underpinned by the principles of co-design, communicative justice, relationality and sustainable solutions that prioritise the interests of marginalised populations.

Virtual Reality in Aged Care: A Relational Analysis of a Technological Innovation

There has been a recent growth in attention to the possibilities presented by introducing Virtual Reality (VR) into aged care settings. Existing studies have demonstrated the potential for VR experiences to provide pleasure, enjoyment and stimulation for older adults, with the potential to address problems of isolation and boredom, as well as create new opportunities for social connection and engagement. To date, most of these studies have been conducted by external researchers who visit aged care facilities introducing and evaluating the VR experiences of staff and residents. In this presentation, we report on a collaborative study conducted by academics and aged care staff that explored the opportunities and challenges encountered when staff within residential aged care facilities independently introduce VR into their lifestyle and care programs. The VR Transformational Toolkit that was provided as a starting point for introducing VR emerged as an important resource, which helped staff to navigate the early set up costs and benefits of introducing VR. However, it became clear that relationships were the key to successful introduction of VR in aged care – including relationships between staff, between staff and residents, but also relationships between staff, residents and their broader family and community networks. These findings further reinforce the need for analyses of technological interventions to pay close attention to the dynamics of intimate relationships and associated identities in framing technology adoption and engagement.

The Declining Importance of the Constructs of Profession/Al/Ism/ Isation for Sociological Analysis?

The nature of work has experienced steady shifts, that have accelerated over the last three years, raising important sociological questions; for instance, what does this mean for individuals and groups; and their relation to society, markets and the political systems that contextualise attempts and opportunities for different forms of livelihood. The concept of profession has been a key construct for sociological analysis to understand, study and theorise the implications of such shifts in different countries, workplaces and indeed particular occupational groups. Studies of professions have contributed to

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

knowledge in many ways, not only highlighting the implications for individuals and groups within work-settings, but also illustrating importantly how this relates or not to wider societal phenomena.

However, at present, there are those that strongly assert that because its function as a mechanism of social structure formation has weakened significantly over time, the construct of profession as a sociological category is no longer relevant. Profession pre-supposes shared identities and value systems constructed around a common knowledge base and set of tasks, practices and rules that characterise and govern the work of a group of individuals. Current socioeconomic circumstances are so different from the past that they alter the current understanding of labour, work and employment that will change the notions of professions and professionalism.

In sharing preliminary results from a systematic review of literature on the application and conceptualisation of the terms, profession/al/ism/isation over the last three decades (1990's-present), this paper interrogates the question of whether these terms have exhausted their sociological relevance across time, countries, and in relation to different fields of practice and occupational groups.

Feminist Intersectional Approaches to Understanding the Experiences of Gender-Based Violence Among Newcomer Women in Canada

Gender-based violence in the immigrant and refugee community constitutes a dilemma for social scientists, policy makers, settlement organizations, and human rights advocates. On one hand, there is a recognition that GBV is often a hidden problem, within some migrant communities specifically, accompanied by their reluctance to seek help because they may face shame or exclusion from their communities. This makes seeking assistance for some newcomer women incredibly difficult due to multiple barriers. Paired with this problem is the lack of funding that provides culturally relevant assistance for women experiencing GBV. On the other hand, discussing and addressing the issue, while important work, must be done with extraordinary care otherwise our efforts will be used to make the case against immigration, a political movement which is gathering considerable momentum in Canada given the growth in ideologies been used to discredit and end immigration in Canada. Our research, part of an internationally funded team consisting of seven countries, examines gender, immigrant status, and other social identities with a feminist intersectional approach to better understand the context, conditions, and experiences of GBV within the newcomer community in Canada. Using evidence gathered from 49 interviews with newcomer women who have experienced violence, in addition to key informant interviews with 43 service providers, this presentation offers an analysis of the intersections of diversity and how these combine to create unique barriers and exacerbate the experiences of GBV among newcomer women in Canada. Policy and programing to support women experiencing GBV are infused with institutional racism and other 'isms' which makes it more difficult for newcomer women to escape and recover from GBV.

Pandemic-Induced Racism Against Indigenous Peoples, Newcomers and Racialized Persons: Canada, USA and Mexico Compared

Prior to the pandemic, the rates of reported hate crimes and racism were increasing in North America (Statistics Canada, 2022; Kros, et al., 2014; Redhorse Bennett, 2022). The speed at which racism and hate increased was enhanced by intersecting with pre-existing economic and social inequalities, that when combined, negatively affected post pandemic outcomes. Given the institutional, structural and systemic foundations of racism which are embedded within the regulatory and organizational structures of Canada, the United States, and Mexico, these unequal outcomes are not surprising. Indigenous peoples and newcomers in all three countries reported higher rates of illness and death as a result of COVID-19 infections (Ibarra-Nava et al, 2021; Islam et al., 2021; Denice et al., 2021) and were much more likely to be working in occupations that placed them at substantial risk of infection and death (Hawkins et al., 2021). Our three-country research team embarked on a research study to quantify the extent to which social, economic and mental health disparities were increased among the Indigenous peoples, newcomers and racialized populations during the pandemic. Our presentation addresses the question: to what extent has the pandemic and the related social and economic inequalities influenced the rise in racism against Indigenous peoples, immigrants, refugees and racialized groups in Canada, USA and Mexico? Using data collected from our longitudinal panel survey of over 7,500 residents from the three countries conducted from March 2020 through October 2022, our team examines the conditions that contributed to the rise racism in the three

countries. Using an intersectional framework, our results reveal that racism and ethnic inequality increased and exacerbated pre-pandemic racism in all three countries. Perhaps somewhat surprisingly, results from Mexico and Canada were more similar in terms of economic and social outcomes for Indigenous peoples and newcomers.

Community Partners in Evaluation and Change: Reflections on a Quarter-Century Evaluation of an Intervention Project Addressing Racial Disparities in Health Outcomes

Over the past quarter-century, The Magnolia Project has served a section of "the Northwest Corridor" of Jacksonville, FL, providing reproductive and well-woman care and intensive case management to reduce infant mortality in the African American community. During this time, the primary focus for Magnolia has been to provide clinic based well woman care, prenatal care, support groups and case management through a store-front site in the heart of the target area. As new opportunities for funding became available, Magnolia moved from its "traditional" focus of women who come to, or are referred to, the clinic site to a broad-based Community-wide focus in order to address the underlying symptoms affecting the community's health and the disparities this community faces. The Director and Staff of the Center for Community Initiatives at the University of North Florida have been involved in the discussion, design, and implementation of Magnolia throughout the past 25 years, literally "sitting around the table" working on the original program proposal. In this paper we reflect on our role as evaluation partner for the Magnolia Project, and discuss how Program Representatives and staff, Evaluation Partners, and Community Partners joined forces over the past 25 years to implement the Magnolia project, and how they made a difference in their community. The lessons learned from this process are informative to other programs seeking to expand their community impact through partnering with.

Understanding Housing Discrimination through African Storytelling: Exploring Experiences of Racism Amongst African Renters in Wellington, New Zealand.

Literature discussing ethnic discrimination in housing has identified racism as an obstacle to housing security and residential mobility for ethnic minorities and immigrants and contributes to residential segregation and inequality. Much of this literature relies on audit studies, surveys, discourse analyses, geographical summaries, or housing outcome assessments. Few directly explore the experiences of immigrants and minorities to understand how racism functions within the housing sector. Drawing on ethnographic research amongst the African community in Wellington, New Zealand, this presentation analyses how systemic racism is experienced by Africans in seeking and maintaining rental housing and in their everyday lives. The research addresses interpersonal, institutional, and internalised racism by focusing on the biographies of Africans renting in Wellington and how they are shaped by encounters with different expressions of racism. The findings point in particular to the role of interpersonal racism in shaping where Africans choose to rent or where they feel limited to. Findings also indicate that participants understand their racist experiences in the housing sector as one expression of a broader racialised system that shapes their lives in New Zealand. In addition to shedding light on the connection between housing and racism, the presentation highlights how systemic racism in this context is shaped by tensions between Indigenous-white settler biculturalism and increasingly prominent multiculturalism. The research draws on African storytelling in particular and in focusing on the context of New Zealand provides insight into an understudied area of relatively recent immigration and settlement of the African diaspora.

A Longitudinal Ethnography over Half a Century

A longitudinal ethnography over half a century
The study of the 'Milltown Boys' is a unique longitudinal ethnography that is now in its 50th year. It started in 1973 through a chance encounter with a small group of school dropouts with differential contact with the criminal justice system, which was the initial focus of research. Participant observation methodology meant, however, being drawn into many other aspects of the Boys' lives, including their families, the labour market, their personal relationships and their leisure time. This informed a wider reflection on their youth transitions and the emergent divergence from their common roots that was already evident as they reached young adulthood. This was published as *Five Years* (1981).

Contact was maintained informally with (some of) the Boys over the next 25 years. By that time, the first generation of youth who had come to be termed

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

'status zer0 youth' or 'NEETs' were entering middle age. A follow-up study of 30 of the Boys, conducted through semi-structured interviews, revealed further significant divergence in their lives, from predictable levels of exclusion and disadvantage to unexpected inclusion and success. *The Milltown Boys Revisited* was published in 2004.

The Covid-19 pandemic provided the opportunity, and catalyst, for a further study of the life course(s) of the Boys. Life had moved on, inevitably, but not always in anticipated directions. Transitions towards pensioner age were navigated in myriad ways, as the Boys wove pathways between the private contexts they inhabited and the public faces they projected. It was also time to reflect and report on the relationship between researcher and researched over half a century. *The Milltown Boys at Sixty* was published in 2021.

The Milltown Boys' trilogy generates a range of theoretical, methodological and policy questions relating to young people and youth studies in the 21st century.

Genealogies of Platform Policing: Time, Economy and Organization

This paper examines the emergence of 'platform policing', the movement of the technical infrastructures of police agencies to cloud-based information architectures that infuse police organizations and are designed to meld together disparate sources of data into modulated flows of maximal utility. The paper considers how contemporary transformations of policing have a considerable historical lineage, whereby policing has been refashioned in terms of notions of efficiency and productivity dominant in the wider economy. The paper adopts a genealogical approach, tracing the lineage of contemporary visions of police digitalization through historically situated socio-technical imaginaries of efficient and cost-effective law enforcement that may be traced to the origins of policing, but emerge most prominently in the US context of the 1960s. The paper proceeds by tracing three historical threads that converge in the present moment of police digitalization: calculation, time and automation. It is argued that current ambitions to achieve 'real-time' policing, emerge from a progressive mathematization of policing activity, and an underlying assumption that technology would facilitate the acceleration of policing to a point of maximal efficiency. Conceptions of technical efficiency in policing were linked to wider conceptions of industrial efficiency. Historically, however, policing agencies struggled with notions of what the 'product' of policing was, and while policing mirrored the industrial structures of the economy, notions of what exactly constituted police 'productivity' remained problematic. It is sometimes claimed that these historical contradictions are resolved via 'platform policing'. Platform policing envisages police agencies that are lithe, flexible and perpetually reconfigured. Importantly, it also envisages policing as key consumer and co-producer within 'platform capitalism'. This paper reflects upon the importance of pursuing a 'history of the present' of police digitalization, and tracing the links between economy, technology and police organization.

Indonesian Digital Laborers' Protest: Strike and Spamming

This paper aims to determine the resilience of digital laborers in carrying out strikes and their effectiveness in Indonesia. Indonesian laborers have a strong history of strikes since the colonial period in the 1900s until now. However, such strikes tend to be carried out by manufacturing workers who work in the same space with similar working time, which making it easier for them to organize. Meanwhile, most digital labor tends to work in different places at different times, which is often considered challenging to organize. Therefore, how did they go on strike? And is the organizing of their strike action capable of getting them to achieve the goal of the strike? The author argues that digital laborers are easier to carry out strikes accompanied by comment spamming because digital platforms rely heavily on the trust of netizens.

WINGE, Vilde* (University of South-Eastern Norway, Norway)

Migration, Technology, and Control: A Critical Discourse Analysis Concerning Data Gathering and Information Sharing of Third-Country Nationals

The use of technology in migration management and border control has grown enormously since 9/11, the so-called "refugee crisis" of 2015/2016 in Europe, and the COVID-19 pandemic (Follis, 2017, 1004: Human Rights Council, 2021, 4: Lemberg-Pedersen and Haioty, 61, 2020). This article focuses on the technologies used by the EU to monitor their external borders and movements within the Union. Data gathering is particularly directed at third-country nationals, and information sharing works to stop irregular migration and facilitate returns. This practice has been criticized as it challenges migrants' human rights as well as the 2030 Agenda for sustainable development, in particular goals 10 and 16. The practice focuses on strengthening border controls rather than facilitating orderly and safe migration (SDG, 10) (United

Nations, n.d.-a), and has a discriminatory nature where non-European refugees are prevented access to their rights (SDG, 16) (Human Rights Council, 2021, 5-6: UNGA, 1971: United Nations, n.d.-b).

Through a critical discourse analysis inspired by Fairclough, this article questions how power relations shape the discourses that legitimate this practice. The EU has the power to bring forth ideological discourses of securitization and criminalization of migrants that allow the exclusion of irregular migrants and the potential violation of their rights to protect EU citizens' trust and security. Structures of social forces, states, world orders (Cox, 1981) and hegemony enable the EU to convince third-countries to cooperate by claiming to save lives, as well as to award and punish them for their cooperation efforts (European Commission, 2016b, 9). The different technologies work to institutionalize an ideology that serves to protect the EU and its citizens from the perceived threat. As data gathering and monitoring of third-country nationals serve to prove the existence of irregular migration, the technologies will work to materialize and legitimize their own perceived necessity.

WINTER, Christopher* (Victoria University, Australia)

Embodied Emotions in a Lone Actor Terrorist Attack: The Lindt Cafe Siege

While sociology has more broadly seen a "turn to the micro-sociological," studies of violent extremism have largely failed to explore the importance of situational and interactional context into how and why terroristic violence takes shape. Instead of exploring meta or meso level sociological factors, micro-sociology explores the situation itself. This could be anything from bonding with fellow extremists in a social setting, participating in street protests, or even a violent attack. Understanding the interactional factors which help form these situations is key to understanding the phenomenon of extremism more broadly.

This presentation explores Randall Collins' concept of the micro-sociology of violence by exploring an act of lone actor terrorism - the 2014 Lindt Café Siege in Sydney, Australia. The analysis centres on the micro interactions between the hostage-taker, the hostages, and the police, and how these interactions helped shape the wider situation, resulting in the execution of one hostage and the death of another in the subsequent police assault. By exploring embodied emotions, and their impact on the performance of intra and interpersonal emotional management, both on behalf of the hostages, and the hostage-taker, the analysis reveals why violence (as opposed to threats of violence) was only used after a dozen tense hours. Ultimately, this case is a good example of the utility of a micro-sociological approach to violent extremism.

TG11-JS-98.3

WINTER, Christopher* (Victoria University, Australia)

Measuring Lone Actor Terrorism: Insights from the Lone Actor Terrorism Micro-Sociological Database

Studies of terrorism have been hampered by significant challenges in definitional challenges (what are we even measuring?) and the availability of data (how can we measure it?). These issues have been compounded by the relative paucity of open-source databases (who else can look at our data?). More so than general terrorism, research on lone actor terrorism has been stymied by these challenges.

This presentation introduces the Lone Actor Terrorist Micro-sociological Database (LATMD). The LATMD represents one of the largest datasets focusing on lone actor terrorism, capturing most lone actor terrorist attacks conducted globally in the last two decades. The LATMD's unique focus on the micro-sociological means that it not only captures biographical and ideological factors of perpetrators but crucially, attack-level and situational factors, something largely missing from lone actor terrorism research.

In discussing the LATMD, this presentation explores both the challenges of creating a dataset focusing on lone actor terrorism and why the maintenance of such a dataset is critical to lone actor terrorism research.

Swagger, Urban Leisure & the Non-Citizen Precariat: Singapore's Migrant Domestic Worker Volleyball Scene

Volleyball is a popular activity among Singapore's migrant domestic workers (MDWs) from the Philippines and Indonesia. Drawing on ethnographic research, this paper explores what drives their passion for the volleyball scene, and the social affordances that emerge at the intersection of convivial leisure, liminal places, immigrant precarity, and urban marginality.

The volleyball scene is a generative ecosystem of informal social and emotional support, social resourcefulness, circumscribed conviviality and embodied belonging. Hundreds of MDWs participate in fortnightly self-organised Sunday 'league' days held on an otherwise unused slice of vacant land in central Singapore. League days involve male, female and non-binary migrant workers, of different religious and cultural backgrounds and sexualities. Mixed gender teams, bespoke team jerseys and creative team names heavily feature. Volleyball players and spectators are both intrinsic to the 'scene'. Spontaneous beauty pageants, music, picnics, group dancing, Tik Tok dances videoed, and performative selfies contribute to the carnivalesque atmosphere. Groups gather and socialise around the makeshift courts, where friendships and romances between domestic workers and male migrant workers from India and Bangladesh are common and unremarkable. Such taboo couplings are highly stigmatised in Singapore and rarely seen in public elsewhere.

The paper will explore how MDWs organise their teams, games, and league days, and how they appropriate this marginal slice of urban space. This generative mode of urban leisure is nonetheless heavily surveilled, and access to the public space tenuously held. We ask, despite this, why 'the scene' generates strong and expressive counter-embodiments to the submissive, mild and asexual habitus expected of 'on duty' live-in domestic helpers, and why the scene has become such a convivial, affirmative and empowering social field.

WITHERS, Matt* (Australian National University, Australia)

Lost in Space (and Time): Precarious Legal Status and Transnational Family Separation in the Pacific Labour Scheme

The Pacific Labour Scheme (PLS) is Australia's first guestworker migration scheme. In recruiting workers from nine Pacific Island countries and Timor-Leste to perform low-wage work for periods of up to four years, it leverages uneven regional development to create racialised 'situations of exception' (Ong 2006) within Australia's national employment framework. Unlike temporary labour migrants on other visa categories, PLS workers are restricted to 'low-skill' occupations in rural and regional Australia, are unable to change employer, and lack rights to family accompaniment. As a result, workers navigate a continuum of precarious legal status trajectories (PLST) (Goldring et al. 2009), shaped by spatiotemporal factors and bound between 'unfree' labour (Yea and Chok 2018; Parreñas 2022) and the alternative of 'absconding' (Bailey 2020; Howes 2022) into irregular status. In both scenarios, PLST entail extended periods of transnational family separation that disrupt and impair personal relationships and care practices that are central to the wellbeing of Pasifika and Timorese migrant workers, as well as their households and communities in countries of origin. Drawing on a combination of in-depth and semi-structured interviews with migrant workers (from Kiribati, Tonga and Vanuatu), their family members (in Vanuatu), and government stakeholders (in Fiji, Samoa, Tonga and Vanuatu), this article explores the personal and developmental consequences of these disruptions. Findings indicate that PLST intersect with spatial and temporal asymmetries within the PLS, resulting in frequent experiences of relationship breakdown that have lasting financial and care implications for migrant families and undermine prospects of sustainable development that the scheme is nominally predicated upon.

WOHLRAB-SAHR, Monika* (Universität Leipzig, Germany)

Post-Secularity or Multiple Secularities – What Is behind New Interpretations of the Religious Situation?

The lecture discusses recent interpretations of the present religious situation that seem to be in competition with each other.

Interpretations of the "post-secular" are diverse. Even if the concept did not only start there, it certainly became prominent with Jürgen Habermas' public intervention after the terror attacks of September 11, 2001. In this intervention, Habermas did not question secularization processes as such, but rather the lack of awareness with regard to the presence of religion in secularized societies. After him, however, postsecularity soon became a keyword for positions which in general found notions of secularity or secularization problematic for capturing present developments. This related especially – but not only – to developments outside the West. Some of these approaches implied a critique of secularism as a hegemonial Western endeavour and concept. This often went along with normative assumptions in favor of the presence of religion in modern societies.

Similar to assumptions of postsecularity, also the thesis of "multiple secularities" (Wohlrab-Sahr/Burchardt, Kleine) started with a critique of the classical secularization thesis. However, it arrives at different findings by using secularity as a heuristic and analytical concept in order to address conceptual distinctions and institutional differentiations between religious and non-religious spheres, symbols, and practice - in past and presence and in different world regions. Secularity in this heuristic sense becomes a tertium comparationis for comparative social research in a global and historical perspective. The outcome of such research, however, cannot be answered from the outset. And the question of the inherent normativity of this approach has to be addressed as well.

The lecture discusses the essential positions with regard to their premises, their approach to research, their social diagnosis, and their inherent normative assumptions.

From Fathers' Rights Movement to Single Parents' Advocacy: The Case of the Platform for European Fathers

The main goal of my paper is to present a European fathers' activism phenomenon, that constitutes a type of men's and single parents' mobilizations. Analysed phenomena play an important role in creating politics and discourses on single parenthood, fatherhood and gender (in)equality. However, despite its size and rather high recognizability in the public discourse, there is a lack of comprehensive, comparative research on the European dimension of the phenomenon and my paper aims to fill this gap. The analysis is based on data collected via mixed methods approach that consist of a) quantitative and b) qualitative social research. The study includes mapping and surveying all identified fathers' (rights) groups in Europe (n> 100) as well as focus group interviews with members of the transnational organizations, its social media analysis and individual interviews with activists from Polish, Swedish, British and German national movements. The study is informed by theories developed within critical studies on men and masculinities, as well as social movements' scholarship. For the purposes of this paper, a case study of *Platform for European Fathers,* the leading transnational European initiative, will be presented.

Would I Do It Again This Way? Experiences of Research on the Bodily Practices of Four Generations of Polish Men

The project I would like to talk about has been implemented since 2020 and is financed by the National Center of Science (Poland). There are three main research aims of the project: (1) identification and analysis of everyday practices pertaining to the body in representatives of four generations of the Polish men (the so-called Baby Boomers generation, generation X, generation Y, and generation Z). (2) Analysis of the dominant cultural content (discourse) pertaining to bodily practices of the Polish men since the 1950's until the 2020's. (3) Identification and analysis of the symptoms of social change generated by male practices concerning the body. The above aims are interlinked by means of the theories of social practices, representing the so-called third sociology, used in the project. During my presentation, I would like to share my experiences on the pros and cons of the theoretical-methodological assumptions (the already mentioned theory of social practicesand the grounded theory) in the context of the field work implementation (which took place in 2022). Primarily I will focus on the process of conducting 60 in-depth interviews with elements of a biographical interview (between January and September 2022), pointing to the encountered limitations and the methods of dealing with them. As a conclusion, I will present reflections on the theoretical and methodological approaches that were used by me and my research team.

Research Involving People with Disabilities

People with disabilities are the largest minority in society. However, difficulties in designing accessible research have led to their exclusion from participation in studies, and consequently insufficient participation in the production of knowledge. This is partly the result of their high heterogeneity (e.g., their diversity in terms of disabilities, functioning characteristics, and needs) and their invisibility to researchers (e.g., because they communicate using alternative methods, they are incapacitated, they live in institutions, or they are in situations of dependency). To align with the slogan of the people with disabilities movement ("nothing about us without us") and the assumptions of the 2006 Convention on the Rights of Persons with Disabilities, social research needs to be designed in such a way that participants with disabilities can express their opinions freely and fully. A new approach—one that addresses methodological assumptions (both practical and ethical) and reflects on ways to maximise the participation of people with disabilities—is required. This presentation aims to encourage thinking about a methodological and analytical framework that re-evaluates traditional assumptions concerning accessibility and realises the principles of equality, non-discrimination, and empowerment. We will consider, amongst other things, how accessible research might be organised; the positioning of the researcher; the asymmetrical nature of the relationship between the researcher and the participant; the role of third parties (e.g., assistants and sign language interpreters); how access is negotiated and how informed consent to participate in research is obtained; and how regimes of ability might be deconstructed.

A Reflection on Teaching Environmental Sociology Using Amsterdam As a Living Lab

Teaching the sociology of socio-environmental relationships, including the social relations that underpin climate change can be an abstract experience for students. The last 50 years has seen a rich development of theories, concepts and empirical studies in the sub-discipline of environmental sociology. Bringing these abstract elements to life in the pedagogical space, however, can be challenging. In this presentation, I reflect on my experience teaching a sociology course, "Environment and Society", using Amsterdam as a living lab. This includes the use of field trips and embedded learning through collaborations with local environmental NGOs. I also discuss the need to include more global perspectives that includes post-colonial critiques of some elements of environmental movements, non-Western concepts, and eco-feminist thought. I conclude with questions around the role of higher education in environmental sociology in preparing students for a climate changed (professional) life after university.

Public Perceptions of Nuclear Energy in Relation to Climate Change in China

Nuclear energy has been increasingly recast as a clean energy technology that is crucial in global efforts to mitigate climate change. This reframing of nuclear energy gained more prominence especially after the 2015 Paris Climate Agreement which nearly every nation in the world signed, marking a significant shift in global efforts to ramp up climate action. This discourse, however, has been led mainly by policy and technical experts. Little is known about the public uptake of this (re)framing of nuclear energy, and even less so in the case of China. Most studies that investigate this also use conventional methods of national surveys and (some) focused group discussions. This paper presents new empirical data based on user-generated content on social media, specifically, Weibo. Using big data analysis, we then derive understandings about public perceptions about nuclear energy in relation to climate change. Unlike the typical landscape of concerns expressed in Anglo-Saxon contexts, we found that climate change, nuclear safety, pollution, and the likes were not major topics associated with nuclear energy. Instead, the dominant themes associated with nuclear energy centre on technological nationalism, energy security, and stock market/finance related topics. We further reflect on how nuclear energy acts as a symbol of post-colonial strength, technological prowess and an important pillar in China's challenge to U.S. status as a global power.

Counter-Movements, Surveillance, and Assaults: Mobilizing Pro-Regime Diasporas As Non-State Agents of Transnational Repression

How do authoritarian regimes mobilize their pro-regime diasporas as global agents to actively repress the exiled dissidents and their activism? The literature on diaspora politics often focuses on a specific subset of anti-homeland regime actors who uphold the cosmopolitan principles of equal rights and democracy. This paper extends the literature by studying the pro-regime diasporas and their efforts to undermine dissident diaspora activism. I specifically ask how autocrats mobilize their pro-regime diasporas as non-state agents beyond the nation-state territory to repress exiled dissidents through countermovement, surveillance, and assaults. This paper draws on both interviewing evidence and ethnographic fieldwork of two sets of cases: (i) counter-movements and surveillance by pro-regime Chinese diasporas against Hongkongers, Uyghurs, and Tibetans in the UK, US, and Canada, and (ii) a mass shooting event that happened in a Taiwanese Presbyterian Church in the US. The findings of this paper demonstrate two national identity mechanisms by which the pro-Chinese Communist Party regime diaspora draws to repress dissident diasporas: (1) Territorializing identity: by invoking "Chinese-ness" as defending territorial completeness and depicting exiled dissidents as "separatists," and (2) Orientalizing identity: by portraying "Chinese people" as "victims of Western imperialism" in the world system and depicting exiled dissidents as "Western imperialist state-sponsored agents." The findings advance our understanding of globalization and authoritarianism by illustrating the intersections of nationalism and transnational repression through identity work that turn pro-regime diaspora into non-state agents of repression.

How Should We Talk about 'We'? Mapping 'Our' Authoritarian Struggles to the Broader World

How can exiled democracy activists fight for their homeland's democratization while supporting democracy movements happening in other places? The literature on diaspora politics often focuses on how migrants channel the homeland and hostland actors in a transnational social field to advance a homeland cause. With the growing presence of trans-diasporic coalition where different diaspora people work together for a broader cause of global democracy, how can diaspora politics move beyond the homeland? To address this question, we need to understand how activists define their identity and their relationships to the broader world through articulations. Seeing diaspora as an ongoing articulation project, instead of a demographic population, I draw on a concept called 'mapping' to reconceptualize how activists discursively set the boundary of the fields of political engagement in different settings to define their relationship to the external actors. Using 24 months of participant observations on the Hongkonger, Taiwanese, Thai, Uyghurs, Tibetan, and Burmese American groups, this paper found three maps of relations: national (based on homeland-hostland relations), cross-national (based on geopolitical relations), and universal (based on human rights and universal norms). Each map has a defined set of relationships between actors, forms of articulation of the homeland political struggles, and a set of opportunities and strategies for mobilizations. The finding suggests that the formation of diaspora and trans-diasporic coalition as a united bloc of people of identity depends on how people draw the map of relations. Examining the 'map' advances our understanding of how diaspora politics works as a sustained global political force against authoritarianism.

Stairway to Purchase: New Customer Journey Mapping on Low-Rise Condo in Thailand

Low-rise condo is very popular in the big cities as consumer behavior has changed. Especially Chiang Mai Province has rapidly expanded the city recently, then Low-rise condo becomes alternative of young people and foreigners to live and invest in this type of property. This research then, tries to focus on customer journey mapping on Low-rise condo purchasing. 10 major customers were collected data through focus group technique of qualitative research. Thematic analysis showed that consumer purchase mapping is an important technique via 7 steps of customer journey mapping: developing a condo unit layout to achieve the consumer purchase journey mapping process; mapping trace and interaction points; classifying the characteristics of effective customer journeys; using maps to recognize and reach specific target markets; measuring the strengths and weaknesses of the customer experience through consumer purchase journey mapping; quantifying the costs and benefits of journey mapping and avoiding pitfalls in planning and implementing customer purchase journey mapping. The results demonstrated that consumer purchase mapping is a significant technique to better understand consumer behavior in the current omnichannel environment. It is common for a consumer to become aware of a Low-rise condo from out of home advertising, to evaluate the condo based on a sales gallery, to read condo reviews online, to see virtual tour online, and to purchase the condo at the nearest area of working. From the result of this study, it is suggested that customer mapping needs to be continually updated to reveal changes in consumer behavior, technology, and competition. Moreover, a good mapping process acknowledges that customers will not always follow the same direction.

Exploring the Use of a Relational Paradigm for Understanding Human-Wildlife Coexistence

A major challenge for contemporary conservation is human population expansion, leading to significant overlap between human and wildlife communities. Accordingly, understanding how humans and wildlife coexist in these shared spaces is becoming increasingly important in achieving effective and sustainable conservation outcomes.

Coexistence studies are trending away from single disciplinary projects towards socio-ecological approaches, which seek to provide a broader understanding of interactions. Yet, conservation researchers have often struggled to understand and combine social and ecological information in ways that balance the experiences and knowledge of both human and non-human participants.

Instead, research typically occurs within positivist human exceptionalism and technocratic paradigms. These paradigms position humans as separate

and dominant over non-humans and privilege the knowledge created by research professionals as reflecting the reality for 'creating' coexistence. These approaches are seen as problematic because they are unable to account for the complexity of interactions, thereby contributing to the ontological exclusion of diverse peoples and non-human organisms. The result is often inappropriate or unwanted 'management interventions'.

This research considers coexistence within a relational paradigm, which regards reality and knowledge as pluralistic and created in the relating space between entities. Reflected within methodologies, a relational paradigm frames coexistence as a multidirectional co-constructive act between human and non-human participants to value agency and knowledge equally.

Interactions between humans and dingoes in a coastal region of Australia provided a case study for revealing the value of a relational paradigm. Data gathering focused on ways humans and dingoes express agency when interacting in shared spaces and included open-ended interviews and secondary ecological and environmental data combined through thematic narrative analysis techniques.

The resulting narratives highlight the relative and relational interactions taking place in shared spaces and identify the unique elements that combine in a contextual understanding of how coexistence is co-constructed in this system.

The Sociology of Youth (and Young Adulthood?)

The sociological approach to youth means that it cannot be defined purely chronologically; youth is relational and shaped by different and changing social contexts. In the context of significant social changes in many countries, youth studies researchers have extended from an original focus primarily on the teenage years well into people's 20s but are yet to properly grapple with the conceptual implications for 'youth studies' when more of the processes and outcomes youth researchers are interested in are extending not only into people's later 20s but even into their 30s. The available research suggests that what might be called young adulthood (≈25-34 years) is in general very different to the experience of the teenage years which are shaped by compulsory schooling and near universal family support, or the now normative experience in many countries of further education and precarious work during people's early 20s. But young adulthood is increasingly important to many of the core questions of the field, such as how educational credentials convert into career outcomes, the building of adult relationships, and the establishment of independent households. Further, support (including financial transfers) from parents to their young adult children appears to be playing a growing and crucial role in these outcomes, challenging frameworks that conceptualise youth studies as tracking the transition to an independent adulthood. Youth studies scholars need to but are yet to properly conceptualise how social change, uncertainty and the reproduction and remaking of inequalities unfolds in linked but different ways across youth and young adulthood. Using examples from the Life Patterns study that has tracked two generations through to their 20s and 30s in Australia, this paper begins to sketch out this conceptualisation and what it means for the relationship between youth studies, childhood studies and life course research.

Tackling Inequality in Construction Trades Training through Gender Transformative Pedagogy

Gender inequality in construction trades is widely acknowledged and reported. Key issues include a heavily masculine culture and an 'outsider' discourse around women, alongside lack of reporting and consequences for inappropriate behaviour. Gendered violence in the construction industry is well documented and research shows that a lack of systems of accountability has created a social context that enables the drivers of violence against women.

Apprenticeships training systems differ around the world, each with their own opportunities and challenges. In Australia, apprenticeships in the construction trades are firmly anchored as one of the key models for training. An apprenticeship includes a combination of practical workplace learning combined with formal learning through a Technical and Further Education (TAFE) college or Registered Training Organisation (RTOs). Recent Australian studies showed that up to 80 per cent of women in construction have experienced inappropriate behaviour in the workplace, and 19 per cent from students or teachers in their educational institutions. Gender inequality is evident in both and the systemic barrier of gendered violence in the construction trades ecosystem is deeply embedded. Negative outcomes include high attrition rates for women apprentices.

Our applied and translational research interrogated the social norms, culture and traditional constructions of masculinity and femininity for women apprentices in construction trades. Our aim was to explore whether primary prevention activities around gender equality can be delivered in TAFE settings and how gender transformative pedagogies can be embedded in

teaching and learning practices. In this presentation we share findings from our engagement with industry, workers, apprentices, local government and organisational stakeholders. By focusing on the educational institutions, the research highlights the impact of gendered violence and inequality on the systemic barriers in the construction industry, and the need for cultural change to attract, recruit and retain women in construction trades.

Class, Social Mobility and Displacement in the Middle East Region – Complex Interrelations from a Biographical and Multi-Generational Perspective

Processes of flight are strongly linked to class positioning and social mobility. This aspect is often neglected in forced migration studies and in the sociology of class. Class positioning has a strong influence on refugees' possible itineraries, networks, the extent of physical strains during the migration process and the possibilities for smoothing arrival, even though their socio-economic position may change during this process and in new geographical contexts. Furthermore, class formation, class positioning and social mobility (across familial generations) can be significantly shaped by displacement, which has been a socio-historically important aspect in the Middle East region in particular.

Reconstructing the life histories and family histories of forced migrants over several generations can help us to understand how decisions to migrate in the context of violent conflict, and the planning of routes and destinations, are closely interrelated with previous trajectories of social mobility, and how class positioning opens up opportunities to move, or makes moving impossible. We argue that these dynamics should be considered in research on displacement, with a detailed reconstruction of the genesis of the familial class positioning in the context of changing social figurations.

We will present case analyses that show the interrelations between processes of forced migration, class positioning and social mobility, based on biographical and family history interviews that were conducted with refugees from Iraq and Syria for various research projects located in the Middle East. In this regional context, the definition of colonial borders and the transformation of (state) institutions in the 20th century led to a societal reshuffle involving complex social mobility processes. These processes shape the power dynamics between different familial generations and within different milieus to this day, and have influenced the intensity of attachment to (authoritarian) state regimes, transregional networks, and imaginations of the future.

Solidarity Networks and Strategies in COVID-19 Lockdowns Experienced By International University Students in Brisbane/ SEQ Australia

Higher education is the third largest Australian export. When the COVID-19 global pandemic resulted in national lockdowns to curtail its spread, the federal government provided little support to international students living in Australia. Some social scientists announced a new age of local interconnectedness and interdependence that might overcome modern economic individualism (Latour, 2020; Springer, 2020), however, our research suggests that such interconnectedness is highly dependent on pre-existing networks, and structural justice.

This paper is the outcome of a study interviewing service providers and over 100 international students living through the COVID lockdowns of 2020 and 2021 in Southeast Queensland. We examine community networks and forms of solidarity forged during COVID lockdowns supporting international students. With limited support, what was available to international students? What forms of solidarity developed? How did networks arise, and how people find connection?

International students who had recently arrived had limited social networks. Many lost their jobs and struggled to survive while in Australia. Preliminary findings show many international students were left with no social connections, no income and sometimes, no shelter. While local support did arise in meaningful ways, its nature was ad hoc. Many did not receive what they needed. Solidarity was thus 'value-based' (US Social Forum 2007, in Smith, 2009) around people supporting similar values. A second form of solidarity promoted by organisations such as faith groups, universities, and political groups (often seen as 'routine organisations' (Small and Gose, 2020), arose as more organised and targeted support in reaction to the lack of government support for international students. This second form promoted new, emerging networks and connections, some continuing when lockdowns were over. These new and established forms of solidarity did not present a spatial dimension, and new relationships with local neighbours did not flourish in the case of international students.

The Role of Cultural Supports for Indigenous Students: Spaces for and Impediments to Decolonizing Education

The Truth and Reconciliation Commission of Canada's final report documents the history of residential schools and attendees' experiences while outlining important responsibilities for schools, along with other agencies, to advance reconciliation. Schools have undertaken several initiatives to affirm Indigenous perspectives and experiences and support Indigenous students, but progress toward decolonization remains limited. Research in Canada and other settler colonial context has revealed the significance of engagement with Indigenous Elders, Knowledge Keepers, and local community members to support such initiatives, including having self-identified Indigenous Peoples working full- or part-time at individual school locations. We present a case study conducted in Alberta, Canada, to examine perspectives and experiences of students, parents, and teachers working with self-identified Indigenous school staff members. Our study draws on data from interviews and focus groups conducted with 201 Indigenous youth and parents and teachers of Indigenous children connected to one Alberta school division. Informed by both critical sociology of education analysis and critical theories of settler colonialism and decolonization, we explore spaces for as well as impediments to decolonization in the context of contemporary school reforms and practices. Our findings reinforce existing research which demonstrate the positive impact that interactions with self-identified Indigenous liaison workers or staff at schools can have, both for students and in supporting teachers and parents, derived from mentorship, emotional and academic support, and access to cultural learning and ceremonies. However, we also observe contradictions produced through pressures imposed by institutional models and practices that stand in the way of progress towards reconciliation and decolonization.

WOZNY, Anna* (University of Michigan, United States)

The Land of Rising Celibacy: Racialized Masculinity, (A)Sexuality, and the Global Gender Order

Recent research in sociology of gender, sexuality, and postcolonial studies demonstrates that global gender hierarchies are often articulated through—and reinforced by—popular representations of male sexuality. Rich literature documents how colonial domination typically involves a symbolic sorting and labeling of local men into racialized "manly" or "effeminate" categories (Connell 2016; Ueno 1997). How are these representations established? Drawing on an in-depth qualitative analysis of English-language media articles that focus on the phenomenon of "sexlessness" in Japan, this paper elucidates the dynamic relationship between the symbolic global order and sex/gender hierarchies. I document how over four decades, as Japan's economy stagnated and its symbolic status as a geopolitical superpower diminished, portrayals of Japanese men shifted from *hypersexual* to *asexual*. At the same time, the positioning Japanese men's racialized sexuality as subordinate to Western masculinity has persistently occupied a central place in these representations. By theorizing the entanglements of sexuality and racialized masculinity with global political economy, this paper contributes a nuanced understanding of how global gender hierarchies are produced and transform over time. I suggest that within the current context of globalization—specifically, with Asian economic ascent and Western decline—these symbolic representations help assuage collective anxieties regarding the West's contested position by simultaneously reaffirming its symbolic dominance and perceptions of Asian inferiority. I conclude by discussing the implications of these findings for the Western and Japanese constructions of collective and individual identities.

WRIGHT, Casey* (Western Michigan University, United States)

An Institutional Ethnography Examining Parental Leave from the Standpoints of Women Pursuing Scientific Doctorates in the United States

Within the U.S. STEM (science, technology, engineering, and mathematics) higher education institution, the establishment of parental leave policies has been lauded as recruitment and retention tools for women faculty in the sciences. Less emphasis has been placed on parental leave for graduate student trainees, despite evidence that many women decide to leave research careers after graduate school, citing concerns about work and family. Through the application of Smith's ontology of institutions to the U.S. STEM higher education institution, I explicated the ruling relations which organize parental leave for parenting women pursuing STEM doctorates. I established doctoral student women's experiences as the standpoints from which to direct inquiry into the ruling relations around parental leave policy. Integrating women's experiences with interviews with university employee informants, ruling relations mapping provided the basis for the ethnographic description of

how texts such as the university parental leave policy and graduate student employee handbook which enacted in the interests of those in ruling positions within the institution. Through the application of the ideal worker discourse to reveal the concealed standpoint around which the institution operated, I describe how the ruling relations constructed parental leave as a favor granted unequally at the intersecting relations of gender, race, international student status, and disability. Smith's expansive definition of work guided a critique of institutional implementation of employee leave that does not afford consideration for the power relations which organize access to these policies. Challenges were most prevalent once the policy implementation was in the hands of faculty advisors and departmental supervisors. I discuss how the everyday embodied realities of how parenting graduate student women's time is used and organized by the institution revealed the devaluation of women's work between their dual roles as researchers and students as they trained to become Ph.D. scientists.

WRIGHT, Claudia* (Utah State University, United States)

Privileged Transmigrant Motherhood and the Reframing of Oppression As Liberation

The discussion on migration as liberation in the gendered migration literature has explored the relationship between structure and agency in relation to how gender is experienced in the context of migration. However, studies have greatly focused on labor migration briefly exploring the role of class, gender, and race ideologies in countries of origin. This paper explores the experiences of migrant privileged women who migrated for various reasons, are raising their children in the Global north in the absence of close family and friends, and who hold strong bonds to their country of origin. For this, I looked at highly educated transnational Colombian women who belong to middle- and upper-class segments of Colombian society. This allows us to further understand how intersectional identities produce specific experiences with the potential to challenge or abide to existing gender structures and expand our knowledge on privileged Latina migrants in the United States.

Using in-depth interviews with 31 mothers, I find that most understand motherhood and migration as a liberating experience. However, they conceptualize "liberation" inside the ideological frames of class and gender in Colombia as well as within their experiences of racialization and the labor of social reproduction in the United States. This results in the reframing of oppression as liberation. At the same time, these mothers question class and childrearing expectations in Colombia and actively defy them in their interactions with close friends and family. I argue that privilege motherhood sits at the intersection of gender, class, and race to produce an experience with the potential to produce social change while remaining in the status quo.

Diversity and Inclusion in Data Activism: Frame Resonance and the Barrier of Problem Recognition

How diverse and inclusive is data activism? The political contention around contemporary issues of digital data and technology (from "net neutrality" to "dataveillance") may sometimes involve highly complex technical aspects that are difficult for average people to understand, especially those from underprivileged social groups. I propose that the *digital divide* and the *technological knowledge gap* create a barrier to *problem recognition* which can impede how well activists can achieve *frame resonance* with different segments of society. How, then, have such activists addressed this problem and sought to be more inclusive of those with less technological knowledge? This study comparatively analyzes two similar, yet independent, social movements engaged in data activism: the Digital Rights movement (DR) and the Anonymous hacktivist movement (ANON). Based on qualitatively analyzed observational and archival data, I identify the framing and organizational strategies of each movement. First, I show how the DR's master frame of "internet freedom" and closed structure appears to indirectly reify socioeconomic inequalities by being only accessible to a large extent by highly privileged social groups. However, I also find that the formally organized DR groups develop specific education and mobilization strategies to directly address the technological knowledge gap and place more emphasis on experts and accreditation. In contrast, ANON's master frame of "freedom of speech" and open, anarchic structure helps it to be more accessible to diverse groups. Yet, this more informal and decentralized collective largely fails to address the technological knowledge gap and relies more heavily on crowd-sourced and unaccredited "citizen science" which leads to inner conflicts and balkanization. This work extends the literature on social movements, the digital divide, and framing by examining cases of highly advanced data activism at the forefront of global social movements.

Public Inquiries and the Societalization of Child Abuse Crises

perpetrated against children in institutional settings. In response to victim-survivor activism, high profile media scandals, and increasing knowledge of the prevalence and effects of child abuse, many countries have established major

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

public inquiries to investigate past wrongs and provide recommendations for legal, institutional and social reform. Drawing on an Australian Research Council funded cultural historical sociology of activism against institutional abuse, this paper employs Jeffrey Alexander's conceptualization of societalization to examine how a series of social crises related to institutional child abuse have been responded to through the public inquiry mechanism in many nations in the Global North. The paper begins by considering the emergence and intensification of societal concern about childhood vulnerability and abuse in institutional settings. Among the many factors that gave rise to changing social attitudes, the paper considers how psychological research and theories of human development, alongside a growing child rights discourse, reshaped how childhood experience, and the long-term effects of violence in childhood, came to be understood. The paper then examines the ways in which victims-survivors of institutional child abuse mobilized to raise public awareness and demand action and justice from governments and key organizations, notably churches. Building on Alexander's theorization of societalization, the paper argues that the establishment of major public inquiries – across Europe, North America and Australia – has been a central plank of crisis management in state responses to revelations of widespread and systemic institutional violence. Public inquiries into institutional child abuse have also been critical to visions and aspirations of violence-free childhoods and to strategies of re-imagining the past and remaking childhood futures.

TG03-809.1

WRIGHT, Katie* (La Trobe University, Australia)

Reclaiming Child Rights: Victim-Survivor Activism Against Institutional Child Abuse

Across the globe, challenges to authoritarianism, inequality and corruption abound, while demands for action on climate change, racial injustice and gender-based violence grow. Against this wider backdrop of mobilisation, participation and collective action against inequality and human rights violations, victim-survivors of institutional child abuse have made their voices heard. This paper explores activism against institutional child abuse and examines the ways in which victim-survivors became leading voices for social change. The paper begins by providing contextual background for the emergence of institutional child abuse as a social issue and the ways in which rights-based framing of justice claims emerged. Findings from an Australian Research Council funded project on activism and child rights are then discussed as the paper explores key strategies and goals that activists and advocates have articulated through social and traditional media. Several different strands of activist strategy and focus are identified, including individual testimony and narratives of abuse, which have been critical. Drawing on theories of activist mobilisation and identity construction, the paper explores how identity influences activist strategies and the extent to which therapy culture and other social shifts over the last two decades have laid the foundation for public disclosures of child rights violations – both in relation to the willingness of people to speak out and the receptiveness of wider communities to hear such difficult stories. The paper identifies how the subject position of the child is mobilised by victim-survivors when making rights-based claims. Yet, these personal narratives of abuse are typically linked to wider societal concerns. Indeed, it is the dual demand of future-oriented social reform for safer childhoods and justice for past wrongs that fuels activists and advocacy efforts and rights-based claims in this domain.

KIM, Ann* (York University, Canada)

Who Believes There Is Anti-Asian Discrimination?

The perception of racial discrimination shapes the degree to which we trust and build healthy relationships with others and support the movement for racial equity. Under Black Lives Matter and Say Their Names, movements and activists against anti-Black racism are organized nationally and internationally and they are highly visible in the public realm to raise awareness and seek justice. Campaigns against anti-Asian racism is, overall, less organized. But the rise in reports of anti-Asian hate since the start of the COVID-19 pandemic may have raised its awareness. In this article, we consider how people from various racial backgrounds perceive anti-Asian racism during the COVID-19 pandemic in the US. Specifically, we examine how personal experiences of discrimination affect perceptions of anti-Asian racism and whether these experiences can explain the racial gaps in perceptions. Our analysis of data from the 2020 American National Election Survey shows that personal experiences of racial discrimination can significantly increase an individual's perception of anti-Asian discrimination regardless of their race. We also find that racial differences in personal experiences of discrimination can largely explain the gaps in perceived anti-Asian discrimination. Black and Asian Americans are much more likely to believe in anti-Asian racism due to prior experiences of discrimination. These findings have important implications for the potential for widespread coalition-building and structural and cultural change given the need for shared agreement on the existence of racial inequity and discrimination across different groups. The denial of discrimination is problematic for achieving such change by perpetuating the othering of groups, victim-blaming, the invalidation of experiences, and discriminatory attitudes.

RC06-109.4

WU, Chia-Ling* (National Taiwan University, Taiwan)

Singlehood, Egg Economy and Stratified Reproduction

Egg economy has been booming in Taiwan. Single women are the major actors in the egg donation and social egg freezing, leading to new family-making through assisted reproductive technologies. I analyze how it is organized and evaluate its consequences. The data include the fieldwork, in-depth interviews and archival data I collect in Taiwan and Japan between 2017 and 2022. For Taiwan's egg donation, I highlight its inter-generational reproductive injustice. The rapid expansion of egg donation in Taiwan since 2012 results from the growing number of infertile couples from Japan, China, and Hong Kong for the infertility treatment in Taiwan, promoted by the state's policy of medical tourism. Young college women are mobilized by the clinics to donate their egg for the women of advanced reproductive age suffering from aged oocytes. The donors face health risk, and their clinical labor has been seldom recognized. For egg freezing, I regard it as hope technology which creates false hope for single women as consumers. Fertility clinics, viewing the trend of delayed marriage and parenthood in Taiwan, create the need of social egg freezing as wise investment for flexible career planning since mid-2010s. However, information such as success rates, the percentage of egg freezing cases resulting in live birth, is never revealed. Taiwan's Assisted Reproduction Act requires single women can only use her own frozen eggs when getting married. It is estimated the usage rate is less than 5%. Single women are also prohibited to use donated sperm in Taiwan. For those who opt for being single mothers by choice, they have to go abroad, facing more social and health risk. Overall, single women in Taiwan have become marginalized clinical laborers, misguided consumers and reproductive exiles in different aspects of egg economy. I propose legal reform and monitoring system-building as policy implication.

WU, Chiaying* (Department of Education, Chinese Culture University, Taiwan)

The Study of Junior High School Students' Reading Literacy: The Cases of Taiwan in PISA 2018

The past decade has been a period of rapid digitalization. The rapid digitalisation of communication is having a profound impact on the kind of information literacy that young adults will need to demonstrate in their future jobs and in their wider social interactions. Some of these changes are already apparent in what 15-year-olds do and read. Reading was the focus of the OECD Programme for International Student Assessment (PISA) in 2018. Readers engage with texts for a purpose; in PISA, the purpose is to respond to questions about these texts in order to provide evidence of their level of reading literacy. The PISA 2018 framework identifies four processes that readers activate when engaging with a piece of text. Three of these processes were also identified, in various guises, in previous PISA frameworks: "locating information", "understanding", and "evaluating and reflecting". The fourth process, "reading fluently", underpins the other three processes. The inclusion of tasks that assess reading fluency independently of other processes is new to the PISA 2018 assessment.

Furthermore, Bourdieu has spoken about cultural capital makes an important part in one's life as it determines the social position in the society, and is an indicator of one's economic position. It is often inherited and passed on from one generation to the other. It is therefore important to maintain the inequalities in the society which are created due to the fact that everyone does not possess the same economic capital.

The datasets were accessed from PISA 2018 national databases for Taiwan. By means of studying the statistical data of learning accomplishment of students, so that to establish the factor model that would cause the impacts. Adopting SEM, this study examines the connection between learning accomplishment and students' socio-economic status, parents' participation, fellow interaction, relationship with teachers, learning attitude, and reading fluently.

The Impact of Social Capital upon Health and Well-Being of Individuals in Taiwan: Changes from 2010 through 2021

Health and well-being are two essential aspects to diagnose social well-being. Health mainly describes the self-growth and self-meaning development of an individual in the external environment; while well-being is a cognitive assessment that reflects subjective well-being and a subjective emotional display of self-state. This study intends to investigate the general situation of Taiwanese people's well-being by measuring and reckoning these two different aspects. Besides, numerous studies have found that social capital is one the most critical features to have significant impact upon individuals' health and well-being; therefore, the current study will investigate the role of social capital in Taiwanese people's well-being.

Using the Taiwan Social Change Survey – 2021, 8th phase, 2nd round, " Health and Medical Care" survey data, this study attempts to explore how social capital have a delicate but continuous impact on the development of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

individual's health and well-being. External influences, such as adequate leisure and entertainment, recurrent contact with people, active participation in organizational activities, etc., will be the main focuses of this study. In addition, in conjunction with the "Taiwan Social Change Survey – 2012, 6th phase, 2nd round, "Health and Medical Care" survey data, this study will also examine the change of 10-year period, from 2012 to 2021, on the health and well-being of individuals in Taiwan and their dynamic association with social capital.

Environmental Politics Under Authoritarian Rule: Policy, Power, and Advocacy

As climate change and other ecological challenges have emerged at the top of states' policy agendas in the 21st century, environmental governance has evolved into a critical sphere for power contestation and the reconfiguration of relationships between states, citizens, and other actors. All types of states – including authoritarian or illiberal ones – need to address increasingly complex sets of environmental challenges. Until now, scholars have primarily explored how democratic institutions provide the basis for advancing environmental governance (e.g. Eckersley 2004, Dryzek 2013), yet knowledge of what this looks like in non-democratic contexts is limited. This paper explores the sociology of environmental politics in authoritarian settings, drawing comparatively from examples in China, Russia, and elsewhere. Despite authoritarian regimes' restrictive policies and structures, environmental advocacy and movements have emerged and grown to fill policy gaps, channel social grievances, challenge environmental injustice, and promote public environmental awareness. Non-governmental organizations and community-based movements have emerged, survived, and played critical roles in such settings, on a wide range of environmental issues including pollution reduction, nature conservation, and natural disaster relief and prevention (e.g., Ku 1996; Plantan 2018; Sofronova & Nagarajan 2014; Steinhardt and Wu 2016; Vu 2019: Wu & Wen 2015; Wu & Martus 2020; Wu 2021a&b). This paper will shed light on core questions in political and environmental sociology: Where and when do environmental and other civic actors emerge under authoritarian rule? How are they able to contribute to the advancement of environmental governance in illiberal settings? Underlying such questions are even broader ones: Are democratic institutions and processes truly requisite to achieve long-term social and ecological sustainability? Under what conditions are all types of states and actors compelled to find ways to work together to address today's ecological challenges?

Discovery, Protection, and Advancement: Utilization of Co-Design Approach to Protect the Rural Intangible Grassroots Place-Making Heritage

The protection of traditional grassroots place-making expertise, that comprise valuable intangible heritage, has not been attracting enough attention in the field of post-disaster reconstruction and recovery. Based on the rural reconstruction that followed the Lushan earthquake (Sichuan, China), this research identifies the benefits of a co-design approach for post-disaster reconstruction and recovery, in order to ascertain various stakeholders' contributions towards discovery, protection, and advancement of community-based intangible heritage. From the perspectives of community planning and architectural design, a qualitative method was employed to assist the professional designers to facilitate the co-design approach by bridging governments with local communities. Focus groups and personal interviews were conducted to discover the government's roles in preserving the communities' intangible heritage. Community-based workshops and family-based design partnerships engaged various community stakeholders to identify the grassroots responsibilities and contributions towards advancing the heritage. This project discovered that as advocates of intangible heritage, all levels of government guaranteed that intangible heritage would be safeguarded in the government strategic plans. At the community level, local residents served as the grassroots protectors. Professional designers utilized cutting edge technologies to improve weaknesses found in the traditional knowledge and skills by staging the protection into practice process. Community-based service agencies promoted the value of heritage to address societal issues. The co-design approach offers a new method of intangible heritage protection in post-disaster reconstruction and recovery by engaging different stakeholders in order to effectively transfer the governmental strategic plans into community-based action plans, and in turn, enable the grassroots voice to inform the government policies.

Reconstruction of Fatherhood in a Strange Land: Exploring Fathering Practices of Chinese Migrants in Spain

Recent studies on Chinese families suggest that, shaped by the strong gender values and regimes, fathers show relatively low involvements in family care. However, how migrant men give meaning to and perform their fathering roles in migrant context has been given scant attention. Based on 25 in-depth interviews, this article seeks to fill the gap in the literature by exploring Chinese migrant families' father involvement, fathering practices, and father-child relationships in Spain. Our findings show an increased paternal childcare involvement among migrant families due to (1) the lack of kinship support; (2) migrant mothers' greater labor force participation; and (3) the enhanced family solidarity norms in migrant context. This study further advances our understanding on how ethnicity, immigration and family commitment impact parenthood in a migratory context and provide important policy implications for immigrant-receiving countries.

Resonance in Digital Leisure in the Post-Covid 19 Era -- a Case of the App Red in China

In his sociological work *Resonanz*, Hartmut Rosa proposed Resonance and Alienation as basic categories of a theory of our relationship to the World. Resonance is formed through af←fect and e→motion, intrinsic interest, and perceived selfefficacy, in which subject and world are mutually affected and transformed. Rosa believes that in an alienated world, the existence of resonance, slows down the acceleration of the world. Specifically, he introduced the concept of axes of resonance and divided them into three categories, the horizontal axes of resonance in terms social relations, the vertical axes of resonance relating with the natural world, and the diagonal axes of resonance about the material world.

The COVID-19 pandemic leads to more restrictions in real space, and it makes leisure further turn to a digital age. Digital leisure presents new and diversified phenomena and experiences about resonance especially on three types of resonance axes introduced by Rosa. By exploring the use of *RED*, a popular APP in China, this paper studies how people resonate and alienate in the process of digital leisure, especially their emotion, affect, expression and experience. Apart from exploring new presence of resonance and alienation in digital leisure, this paper tries to elucidate the critical relationship between people and the world advances in a changeable and uncertain post-epidemic era.

Hukou and Labor Precariousness between the State and Market Sectors in Contemporary China

China's transition to a capitalist economy has been influenced by its integration into the global market and party-state intervention. As a result, the Chinese labor market has been characterized not only by the expanding global trend of flexibilization and casualization of the workforce but also by its post-socialist characteristics with a state-market sector division. The Chinese *hukou,* or household registration system, has long served as an authoritarian state apparatus for population control and migration regulation. Prior research has found that *hukou* plays a crucial role in explaining stratification and determining workers' labor outcomes in socialist and post-socialist China. However, recent *hukou* reforms in the last decade have eased restrictions on labor mobility, indicating that hukou is gradually losing its importance in transitional China. Building upon existing research on precarious work in urban China and around the world, I develop a new analytical framework of precarity by conceptualizing job precariousness in the contemporary Chinese labor market in three key dimensions: low pay, no work-related benefits, and no labor contract. Using data from the 2010–2017 Chinese General Social Survey, this article examines how workers' *hukou* categories affect each of the dimensions of precariousness. The findings show that *hukou,* as the most salient state institution and longstanding stratification system, continues to have a significant and powerful overall effect on all three aspects of precariousness. The findings also shed new light on how the effects of *hukou* on each of the dimensions of precariousness differ by sector.

COVID Prevention As a Chinese Morality: How Chinese International Students Formed Social Resilience amid the COVID-19 Pandemic

While the UK, as one of the first countries, has gradually lifted legal COVID-19 restrictions since 2021, China has been persisting with its zero-COVID policy. Against this background, this study examines how Chinese international students at London universities formed social resilience against COVID anxiety as well as racial stigma. Through interviews, this study demonstrates how Chinese students navigated their conflicting consciousness risen from contradictory policy and cultural environments. Specifically, they actively concealed their worries and actions related to COVID prevention which they only revealed and scrutinised within Chinese communities. On the one hand, they drew the boundary between 'Chinese' and 'foreigners' to counter potential racial stigma and exclusion. On the other hand, predominantly from affluent families, these students attempted to re-establish their dispositions of cosmopolitanism and ease. By negotiating an appropriate and 'necessary™ extent of COVID prevention, they comparatively drew boundaries against 'irresponsibly™ stopping COVID measures and being excessively concerned like those 'unsuitable' for international exposure. Through such meaning-making processes, COVID prevention developed into an indicator of personal morality and values: these students legitimated their feelings and actions related to COVID that might fail to fit into the UK majority around them; meanwhile, they justified their adaptability as cosmopolitan citizens and the authenticity of their international education experience. This study analyses how the intersection of marginalisation and privilege can impact the mobilisation and reconstruction of cultural repertoires to form social resilience. Furthermore, it stresses the importance of studying the local negotiation of an ideal/normative state of well-being under challenge, in which intersecting cultural processes take place; in this case, the group identifies with previous values while adjusting the practice of articulation and the criteria of evaluation

WU, Yuling* (University of Science and Technology Beijing, China)

From "Production Centrality" to "Life Centrality": Research on the Changes of Work-Life Values in the Past 30 Years in China (1990-2018)

Using the repeated cross-sectional survey data from World Values Survey China samples of 1990, 1995, 2001, 2007, 2012 and 2018, we employ an age-period-cohort model to assess period and cohort effects on people's work-life values during the past 30 years in China. It is found that people's work-life values in China have generally undergone a transformation from "production centrality" to "life centrality". This value transformation basically conforms to the general pattern of value changes in the process of modernization, and meanwhile it shows some unique characteristics in China context. Specifically, period effects indicate that work centrality value has been strengthened in the 1990s and gradually weakened after entering the new millennium; on the contrary, family-centrality value has been weakened during 1990s, it has then been reemphasized since early 2000; leisure-centrality value has increased steadily with the development of social economy. Cohort effects did not show significant cohort differences in people's work-life values. Additionally, the disparities of the socioeconomic status were evident in people's work-life values.

Online and Outspoken: Role of Political Conversations in Enhancing Youth Digital Civic Engagement

Political conversations with socialization agents such as teachers and classmates, parents, and friends have been shown to enhance youth civic engagement. Engaging in political conversations is a critical element of participatory democracy. Participating in such activity enhances knowledge about government, public affairs, social problems, and opportunities for civic engagement. With the increasing numbers of youth using social media worldwide, the question of whether political conversations can influence their use of the media for digital civic engagement is worth examining.

Our study analyzed whether political conversations with teachers and classmates, parents/guardians, and friends predict students' digital civic engagement after controlling for socio-demographic characteristics (gender, private vs public schools, urban vs rural locations) and digital literacy. A survey was conducted among a national sample of 1,005 grades 9-10 students (females n=742) from private and public schools located in urban and rural areas in the Philippines. Filipino students from private schools are economically better-off than those from public schools.

The students answered self-reported questionnaires probing their political conversations with teachers and classmates, parents/guardians, and friends; digital civic engagement assessing their online participation in posting/reposting about social issues, volunteering, and donating; and digital literacy assessing their technical skills, information usage, and communication on social media. Our study found that political conversations with the socialization agents uniquely predicted the students' digital civic engagement over and above socio-demographic characteristics and digital literacy. Results also show that political conversations with friends, and teachers and classmates are moderately correlated with digital civic engagement, while political conversation with parents and guardians is weakly correlated with the variable. This suggests that interactions with social groups outside the home play a more significant role in increasing civic participation in online spaces. Implications on how to enhance political conversations with socialization agents to develop youth digital civic engagement are discussed.

Happy ever after in the marketplace? Neoliberalism and Māori in Aotearoa New Zealand.

Neoliberalism can be viewed as a direct attack on Māori and on Indigenous peoples more broadly. Core neoliberal concepts like individualism and competition are uniquely antithetical to the collective and reciprocal bases of Māori society. Indeed, the impact of forty years of relentless neoliberalisation has been felt by Māori in a number of ways including spiraling rates of incarceration, poorer health and mental health outcomes and dramatically increased rates of homelessness, poverty and precarity. Neoliberal deregulation has also contributed to environmental despoliation on an unprecedented scale and lands and waterways that have nurtured Māori for generations are facing existential threat. Yet neoliberalism can also be viewed as continuation, just another chapter in a long and violent history of colonisation and dispossession through which Māori lands and Māori bodies were dragged into the cycle of capital accumulation and Māori ways of being, doing and knowing were systematically attacked through processes of assimilation. The experience of 200 years of structural violence has, however, also furnished Māori with resiliencies of the very kind required to deal with the momentous challenges, like climate change, we now collectively face. This paper concludes by arguing that Māori knowledge and Indigenous knowledge generally might help guide us towards durable and just alternatives to neoliberalism.

The Use of Words As an Expression of Rights. the Institutional Language of Care Services in the Face of Unsupported Immigration, a Case Study in Portugal

The main objective of this communication is to show and analyse how the Portuguese public services, mainly social and healthcare services deal with the needs and realization of the rights that concern precarious immigrant workers and how their language and representation as workers, immigrants or illegals is used in these services and is presented in institutional interactions with these people.

Portugal has witnessed an implementation of intensive agriculture that has triggered the need for cheap labour. Many immigrants, mainly from Nepal, India and Bulgaria, have come to work in seasonal jobs in soft fruit agriculture, living in precarious accommodation and labour conditions. In 2019 the number of Nepalese people residing in Portugal; had risen sixteen-fold comparing to 2011 (SEF, 2020).

Intensive greenhouse production of raspberries and blueberries is concentrated in a specific coastal municipality, Odemira. In April 2021, Odemira's fruit pickers had the highest numbers of *contamination* by SARS-CoV-2 (14 times higher than the country's average) and the poor housing conditions of these workers were exposed. They lived in unhealthy and overcrowded houses and the Portuguese population saw it in the media. The prime minister was outraged by the poor conditions and overcrowding of the immigrants' housing and considered it a huge risk to public health, in addition to a blatant violation of human rights.

How will states protect those most vulnerable to the disease and to social-economic precariousness and how should the language used to refer to these people and situations be congruent with the rights that are recognized?

To study this comprehensively, news and comments are being collect in the main Portuguese media, and in documentation from health and government entities. Interviews will be conducted with social service, health care providers, and others institutional relevant actors. The results will be presented at the congress.

Global ECO Social Policy and Welfare System in the Portuguese Speaking Countries

This paper aims to explore global eco-social policy in the Global South. Discussion about eco social policies and sustainable welfare started recently and focuses on a redefinition of welfare and wellbeing from an ecological perspective, human needs and planetary boundaries. Sustainable welfare is a social policy system that supports the satisfaction of human needs within planetary boundaries. Much of the welfare analysis is concentrated on developed countries, and little has been done to discuss the context of the low-income countries. The Portuguese speaking countries (PSC) are Angola, Brazil, Cabo Verde, Guinea-Bissau, Mozambique, Portugal, São Tomé and Principe, Timor-Leste, and Equatorial Guinea. The main analysis of this paper was performed using data of eco-social indicators from World Bank, IMF, United Nations, and Social Security administration. The paper explores a comparative framework using the five branches of social security: old age, sickness, work injury, unemployment, and family allowances. Despite geographical discontinuity and different levels of development, the PSC shares a strong identity based on a common history, language and social security organization. These countries have a population of 260 million, which, according to the United Nations, will increase to 332 million people by 2050. They occupy an area of 10,7 million *squared kilometers*, across four continents. With very different political, economic and social realities, these countries represent 7.2% of the planet's land and are mostly located in the southern hemisphere (CPLP, 2020). The paper findings show that these countries have increasingly become an important cluster, with increasing relevance for international institutions that influence the development of social policy. The network of these countries has a great potential to promote global eco-social policies.

Nudged My Religion Away? - a Register-Based Study on the Impact of Deregulation Law on Religious Affiliation in Highly Secular Finland and the Sociodemographic Heterogeneity

Religion's persisting salience and the dynamic changes of the religious landscape in the West under growing religious pluralism and deregulation are widely discussed, albeit empirical evidence is lacking, especially in the highly secular and historically religiously homogeneous European context due to data limitation. In the current study, we deploy unique Finnish national register data with religious affiliation information for the entire population from 1970 to 2020 to overcome the obstacle. It is unprecedented data combining population-level scale, long timenospan, panel structure, and full coverage of individual religious affiliation status, including minor religious denominations that can hardly be tracked in surveys. We show that the religious affiliation rate has been constantly declining in Finland during the period. It is mainly attributed to the decline of the National Lutheran Church, while minor denominations have substantially grown. In 2003, new laws on religious freedom and electronic public services are passed in Finland, which in different ways expanded individual autonomy to religious affiliation. It is expected that more people would leave the National Lutheran Church or convert to other denominations after the new laws, according to the religious market theory. However, using difference -in- difference (DiD) and regression discontinuity (RD) methods, there is little causal effect of the 2003 laws on individual religious affiliation. There is no effect for the newborn who no longer has religious affiliation automatically registered according to parental ones after 2003. For teenagers and young adults, the 2003 laws have a marginal impact decreasing the affiliations rates of the National Lutheran Church, but there is no effect on other denominations. Sociodemograpic heterogeneity of the effect is also noted. We conclude that the religious market theory is not supported in the Finnish context, as people are not "nudged" to change religious affiliation when new laws make it more convenient to.

The Returns to Returning – Economic Returns to Remigration to Finland with Sibling Comparison Design

How the experience of migration affects the labor market outcome after remigration is difficult to be causally examined since both migration and remigration processes are driven by various mechanisms of selection. In the current study, we investigate the labor market outcomes of return migration under the context of massive out-migration from Finland (mainly to Sweden) in the late 20th century and the subsequent remigration flow. Deploying Finnish population register data from 1970 to 2019, we use a unique sibling comparison design to causally estimate the labor market return of remigration. By comparing return migrants with their siblings of the same sex who have not migrated, we maximally rule out the confounding of family background and pre-adolescent experience. After controlling for sibling fixed-effect and individual demographic and socioeconomic characteristics, return migrants have substantially higher risks of unemployment or labor market inactivity, and lower income levels compared to their same-sex siblings who have no migration experience. The disadvantage exists across gender and educational level, while it is stronger for women and those without tertiary education. However, the labor market disadvantage also alleviates over time in the long run, and once employed, the income deficiency almost diminishes. Our results strengthen the previous findings in the literature that return migrants have disadvantages in the Finnish labor market, but with a more rigorous sibling comparison design to provide strict control for selections based on family background and pre-adolescent experience, realizing estimattion with stronger causal inference. We argue that the labor market disadvantage of return migrants to Finland is likely due to the disruption of the social network during the years spent abroad. However, the disadvantage can be reduced over time with the individual's reintegration into the Finnish labor market.

Intergenerational Closure of Occupational Status in the USA and China: A Tale of Two Regimes

This paper develops a new framework for modeling comparative social mobility tables in which intergenerational status closure (status IGC for short) is measured as a form of rank dependence (the rank of occupational status in destination depending on the rank of occupational status in origin). We revisit notable recent studies of status IGC in the USA and China to demonstrate that the approach enables new analytic and substantive questions to be addressed. We draw on two similarly designed data series in the two countries, supplemented by the 1996 survey of Life Histories and Social Change in Contemporary China. By pooled data from GSS (1972-2018) for the USA and nine waves of CGSS (2005-2018) for China, we conducted a comparative analysis of status IGC for four decades of birth cohorts (1946-1985).

We obtained three sets of comparative quantitative results. (1) Level of *gross* status IGC: (a) the levels in China are more than double the levels in the USA; (b) farm-sector (farm-nonfarm) barrier is the main source of status IGC for China but trivial for the USA. (2) Trend of *gross* status IGC: (a) the level has been stable in the USA, but steadily declining in China, (b) the reasons for the decline in China are (i) the sizable reduction in the farm-sector barrier (slope-reduction effect) and (ii) the rapid shrinkage in the relative size of the farm sector (compositional shift effect). (3) *Conditional* status IGC: net of the farm-sector barrier effect, the level of *conditional* status IGC is numerically and statistically the same and persistent for both countries. Paradoxically, then, the urban population in Communist China has long shared the same low level of relative mobility as those in capitalist America.

Confucianism, Taoism and Tourism

This article presents a preliminary reflection upon Confucianism and Taoism as philosophical perspectives or methodological approaches to the study of tourism and hospitality. Through review and critiques, the presentation hopes to engage discussions on Asian paradigms in hospitality and tourism.

Over the years, researchers have started to apply or adopt Confucianist and Taoist conceptions in their studies of tourists' motivations and behaviors, decisions and (destination) choices, engagements in tourist activities and experiences, as well as planning, marketing and management of the industry to either manifest traditional Chinese philosophies in their respective businesses, or to better cater to Chinese visitors as consumers who have been innately influenced by their traditional culture (or cultural values). While the foci are largely on the pragmatic/instrumental aspects, few studies have engaged critical reflections on Confucianism and Taoism as philosophical perspectives on future tourism studies.

Drawing from *the Analects* and *Tao Te Ching* (and other Confucianist and Taoist classics), this discussion and subsequently its implications for tourism studies will be developed along the following headings or lines of thoughts:

- *Understanding and practicing relativism/relativity*
- *Knowledge and ways of knowing*
- *The known, the unknown, and the knower*
- *Education – teaching and learning*
- *Travel as learning*
- *Other relevant topics*

"Emo-Slave" ?: A Study on the Affective Labour in the Netease Cloud Music Platform

In this article, we discuss the co-creative process between the platform users and the Internet company. The NetEase cloud music platform provides us a case that the users can become affective labour in an environment of strategic emotional marketing. Through a method of ethnography, we find that emotional advertising builds a trustworthy relationship between the users and

the platform and reduces the environmental pressure for the users to express their emotions. Through a set of different emotions such as fun, enjoyment, honour, and belonging, the users start the route of cultivating their taste and in this process, the platform designs a mechanism for them to socialise as well as pursue those sensations. Meanwhile, the affective labour builds the online community through sharing their daily life, and in this process, the platform has participated in the scene-making by producing relevant offline scenes and online scenes. Therefore, the users' practices are not only digital but also embodied. We also found that the case of NetEase cloud music has demonstrated a new type of online community with more professional management. The voluntary users can also be compared with the music subcultural movement in its passion for music and the accordingly affective practices and capital accumulation.

From Individual Satisfaction to Collective Resonance: The Social Identity Formation in Consuming Tencent Nba Live Streaming Service

Live streaming services provide a platform for viewers to access sports games worldwide. However, scholars have rarely examined sports fans' social identity formation in accessing an imported cultural product on digital media. Users of the live streaming service of the NBA in China are the subjects of this study. NBA's China business is estimated to be worth $7.4 billion annually in a market where 300 million people play basketball. In addition, 490 million Chinese fans live streamed the NBA games on Tencent, a digital media giant in China.

This study indicates that the Tencent NBA live streaming service users build a virtual community in which a novel social identity is formed. The researcher adopted a social identity perspective and investigated Chinese NBA fans' digital practices in accessing globalized cultural media products. Sixteen individual semi-structured interviews are conducted with users of the Tencent NBA live streaming service. Grounded theory analysis is introduced to guide the process of new knowledge generation. Four core themes are derived from the data gathered in the sixteen interviews based on an inductive thematic analysis: Formation of a virtual community, Individuals in the community, Digital practice in the community and Social extensions of the virtual community. Results revealed that the social identity process maintains the digital practices in the virtual community. They invest money, time and emotions when they consume the cultural product imported from the US. Individuals' satisfaction in the consumption process eventually converges into a collective emotional resonance, representing sports fans' resilience. The outcome of this study presents the synthesis of digital media consumption and social group of sports fans in an international context. The finding in this qualitative research extends the understandings from a quantitative study about behaviour intentions of accepting the Tencent NBA live streaming service in China.

The Partner, the Parents, the Nation – the Negotiation of Chineseness in Discourses on "Love" in Contemporary China

When the western concept of "true love" first came to China at the beginning of the twentieth century, China's New Culturalists critiqued its absence in traditional arranged marriage. They argued for the abolishment of traditional family norms as an integral part of modernizing the Chinese nation. Since the marketization of the 1980s, romantic love has resurfaced as a hot topic in popular debates as a sign of newly found personal freedom. In recent years, the state has incorporated 'romanticized true love' into its propaganda for love for the nation. Our paper focuses on the negotiation of different kinds of romantic or non-romantic "love" and Chineseness in public debates in contemporary China. We ask how "love" 爱 is defined, for example as romantic love between partners, as a love between parents and children, or a love towards the nation, how these kinds of "love" are related to each other and defined as Chinese or non-Chinese, e.g. westernized. Drawing from multiple data sets, we aim to show the way in which different groups with different political visions depict the idea of "love" as key element within their political projects, e.g. as element of modernity, or as element of Chineseness, and in course of this envision different practical consequences of love. We ask how the state employs the concept of love in discourses on partnership, on filial piety and on the nation, and how such concepts are negotiated or appropriated in popular discourse. Through this, we interrogate the complex negotiations of the relationship between modernity, Chineseness and Chinese nationalism which have appeared in these debates.

From Fetching to Governing: A Global Survey of Women's Political Empowerment and Water Access

Although access to water is a global problem, water-fetching is a concern that predominantly affects women. In this study, we argue that drinking water access is a gender-related problem that can be improved through women's political empowerment. Using a fixed-effects regression model with data collected from 124 countries between 2000 and 2017, we identified that women's political empowerment has a positive effect on drinking water access. Using a mediation analysis of the model, we then demonstrated that women's political empowerment partially mediates the positive effect of democracy on drinking water access. The explanation of the result may be that when women are politically empowered, they could bring water access problems to the decision-making process and improve the policies and investments on public water services. This study suggests that empowering women in politics, especially in the democratic politics, may be an effective approach to enhance public water supply beyond the traditional model of engaging women in community water management.

The Imbalance between Knowledge in Modern Educational System: Humanities Vs. Natural Sciences

In modern society, the development of knowledge about people, particularly about people's heart and spirit, is extremely unbalanced with the development of knowledge about the external objective world. This is a very important issue in modern education. This article takes a philosophical and sociological approach to examine how the changing perceptions and values of science and the changing social foundations have shaped the development of these two types of educational knowledge in the traditional society, the modern society and the 21st century contemporary society. Today, when the environment of human existence is deteriorating, the process of globalization is being hampered, technology has triggered new educational challenges and identity crises, this article will shed light on the epistemological, axiological, and social foundations of the tension between nature sciences and humanities, and provides philosophical, pedagogical and sociological implications on how to integrate humanistic and scientific knowledge in educational conceptions, curriculum, pedagogy and assessment in today's education system.

Coming Back for Alternative Adulthood Transition: Return Mobility, Waithood, and Bounded Agency of Well-Educated Returnees in Post-Pandemic China

Chinese authority's obsessive stick to Covid-Zero policy not only leads to the rapid decline of its domestic economy but also results in the high unemployment rate of university/college-educated young people. The worsening situation traps well-educated young people in 'Not in Employment, Education or Training' (NEET) status in metropolises, and makes a large group of them return to hometown cities. Drawing on the oral-history interviews with 20 well-educated returnees in hinterland China to specifically explore the tensions and aspirations involved in their migratory decision-making process and current situation, this study reveals that well-educated returnees voluntarily live in waithood in short term and prepare for opportunities of study or employment in metropolises in the future. Through the lens of bounded agency, I argue that Chinese well-educated young people's return to hometown city and live in waithood are their agentic tactics to resist the traditional, linear adulthood transition favored by patriarchal customs and pursue alternative adulthood transition manifested by individualization and upward social mobility. In addition, this study highlights that Chinese well-educated returnees' agentic tactics of adulthood transition are deeply bounded by structural forces, i.e., class and gender. This research concludes with suggestions to develop a Youth Studies to understand the alternative 'way of being' among young people adapt to and hustle in adversity in post-pandemic era.

Beyond 'the Magic of the Mall': The Mall As Social Infrastructure in China

Shopping malls profoundly shape our urban experiences, not only as spaces for consumption but also as spaces for leisure and social life. This paper investigates the potential of malls as social infrastructure. Drawing on ethnographic research conducted in an open-air mall in the Sanlitun district of Beijing, I show how the mall enables and enacts vibrant social life amongst its users. Examining the mall life reveals that while the space is not an unregulated setting with unrestricted diversities, it does attract a variety of people, facilitate spontaneous activities, and create affordances of sociability. Based on the fieldwork, I make a case for treating the mall as a form of social infrastructure across four registers of sociability: (1) pleasurable co-presence of strangers, (2) cross-difference encounters, (3) social care and kindness, and (4) personal relationship work.

These findings have implications for studies on leisure in cities. Although the registers of sociability identified in the mall are not completely dependent on conventional forms of leisure activities, they are, in most cases, expressive rather than instrumental, intrinsically motivated rather than extrinsically forced, associated with enjoyments and satisfactions rather than pressures or depressions, and free from both work-related obligations and the manipulation of consumer ideology, showing their potentialities of constituting and enhancing urban dwellers` leisure experiences. This paper suggests a need to reconsider the nexus between leisure and malls by shifting the analytical focus from shopping activities and recreational facilities toward the sociability afforded by the mall but not directly mediated by consumption.

Educational Assortative Mating and Family Income Inequality Among Internal Migrant Population in China

Based on the data from two National Floating Population Surveys in 2012 (household sample size: 66396) and 2017 (household sample size: 85405), this paper investigates the changing pattern in educational assortative mating among floating population and its impact upon Chinese family income inequality. The analysis presented that the current floating population had an obvious positive educational matching tendency when choosing a spouse. More than 65% of the couples were homogenous marriages in education, and the homogenous marriages at college level and above showed a rapid growth trend. According to the decomposition of Theil index based on the education combination of husband and wife within each household, it was found that the contribution rate of inter-group inequality of family income to the overall inequality increased from 7.41% in 2012 to 14.31% in 2017, indicating that the influence of education matching on family income gap was increasing. Counterfactual analysis of Theil index further confirmed that the changes in the educational matching structure of migrant couples in recent years have widened the family income gap between different educational levels. Finally, RIF quantile regression results showed that there were differences in the effects of education matching factors on different quantiles of family income. On the low quantiles, the traditional matching of "high education in husband and low education in wife" demonstrated income-earning advantages. On the high quantiles, the homogenous higher education marriage and the matching of "low education in husband and high education in wife" tended to be higher in family income. This study proves that the educational assortative mating is an important perspective to understand and explain the income inequality problem in Chinese floating population.

Home Environment and Children's Academic Performance across Time: The Mediator Role of Children's Conscientiousness

Home environment plays an important role in children's academic performance (Deng et al., 2015). Much research investigated the cross-sectional association between children's home environment and academic performance (Manolitsis et al., 2013), but research on the longitudinal effects and the mechanism behind this relationship was limited. Conscientiousness is impacted by the family context (Cox & Oaley, 1997), and can predict children's academic grades (Poropat, 2009). This study aims to explore the longitudinal relationships among home environment in early childhood, children's conscientiousness (ability to interact with people and react to surroundings) and their academic performance, and possible underlying mechanism.

The data were derived from the nationally representative dataset China Family Panel Studies (CFPS). The sample (N = 301, 44.5% girls) we selected covered 26 provinces in China and were 3 years old in 2012. Primary caregivers

reported children's home environment (i.e., telling stories, buying books, going outside, and reading characters) in 2012, conscientiousness (through the Big Five Questionnaire for Children) and academic performance (i.e., Chinese and math grades) in 2018.

The model showed good model fit with child gender as covariate. Findings indicated that the frequencies of telling stories can positively influence children's Chinese grade (β = .17, p = .01) and math grade (β = .18, p = .01). Besides, higher frequencies of going outside in kindergarten can lead to lower conscientiousness six years later (β = −.18, p = .003). Indirect effects were only found for the going outside dimension, indicating that going outside more often would lead to lower Chinese (*indirect effect* = −.03, 95% CI = [−.07, −.01]) and math grades (*indirect effect* = −.03, 95% CI = [−.07, −.01]). Our findings indicate that the mediator role of conscientiousness on the relationship between home environment and academic performance is complex and needs future exploration using mixed method.

How to Build a Community Life Linked By Leisure Activities

Community activities are one of the important ways in the process of human being socialization, among which leisure activities are the most important form of expression to maintain community exchanges, to enhance each other's sense of belonging, life value, and family (friends) relations. and also, it's feature of community activities is often reflected in the process of leisure - not only do we know who we are, where we come from, where we are? This process produces the meaning of socialization, clarifies the mutual responsibilities, obligations and rights, regulates the ethical order, and expands the friendship relationship.

However, with the continuous expansion of urbanization (in the ten years from 2011 to 2021, China's urban population has increased by 223.46 million who are from the rural population), the traditional familial and the " an unethical arrangement " community relations have changed. In this process, the way people connect emotionally has changed. Due to the influence of blood ties, family land and other factors, the traditionally constructed "space order" emotional connection path is replaced by the lonely, closed.

In cities, there is also an antinomy in leisure activities. On the one hand, the pace of urban life is accelerating, and it is difficult for people to have the opportunity to gather and socialize and serve the society; on the other hand, the neighbors in the "cubicle room" in the city have indifferent relationships, "no longer interact", lack of emotional communication and lack of spiritual comforting, most people fall into loneliness, depression, anxiety and other emotions, which is a popular phenomenon.

The paper will focus on how to establish a good community relationship, how to improve community public services and strengthen the construction of community recreation space, and how to improve the socialization process of individuals with high-quality leisure activities.

How Do Women and Men Differ in Their Intergenerational Income Mobility across Cohorts? the Role of Education

In just a few short decades, gender disparities have undergone numerous changes. Among those changes, education plays a crucial role in improving the socioeconomic status of women. In nearly all industrialized nations, women now have a higher college graduation rate than men. With the rise in educational attainment, not only are more women entering the labor force, but highly educated women are also gaining more access to higher positions. Increasing returns to education bring women's earnings closer to parity with men. Moreover, as the process of gender integration continues, men's labor market behavior will also be affected. How would these profound changes affect the trend of intergenerational income mobility differently for women and men? The most recent research indicates a distinct trend in relative mobility between genders. However, the sources of these changes are not well understood.

This study will investigate the role of education-based changes in explaining gender-specific income mobility trends. Using Swedish register datasets for cohorts born between 1958 and 1979, the study finds that intergenerational persistence is increasing for women but remaining stable or even slightly decreasing for men. Reverse changes in between-education association primarily accounts for these gender trends. Despite the fact that college-educated women have been consistently sorted into high-paying occupations, their average income rank among female group has remained stable over time. The increasing returns to college for women are largely attributable to the declining income status of non-college graduates, who work mainly in service and clerk occupations. In contrast, the likelihood of college-educated men working in managerial positions has decreased significantly. More importantly, because of the increasing gender integration in the high-skilled labor market, in professional occupations, the proportion of college-educated men relative to college-educated women has declined. As a result, the average income rank of highly educated men has been gradually declining.

Common Pool Resources, Social Norms and Public Policy

Existing evidence shows the interconnections between collective behavior and social norms. Yet the challenges posed by collective behavior in managing common pool resources (CPR), which are often governed by social norms, remain unexplored. Against this backdrop, our research employs the theory of social norms to investigate the dynamics and complex interplay of tripartite relationships among collective behavior, social norms and public policy. We draw cues from Bronfenbrenner's model of socio-ecological systems to propose a novel framework that integrates behavioral and ecological systems and highlights their impact on social systems.

While highlighting a complex, multifaceted relationship between people and river Ganga governed by strong social norms, it examines the social determinants of water pollution in Ganga. Focusing particularly on non-point pollution sources, it is guided by four objectives. First, it unfolds the social determinants of water pollution in Ganga while focusing on non-point pollution sources to identify the prevalent patterns of collective behavior that pollute it. Second, it extends the application of social norms to the 'sacred' common pool resources and identifies the potential conflict among multiple stakeholders due to varying spiritual, economic and ecological values. Third, it will aid the implementation of bottom-up pollution control while factoring in the community's cultural and religious understanding of water pollution. Forth, aligning public policy subsystems with the behavior-norm paradigm offers the potential for community-based participatory research and integrated knowledge translation, thus, enabling social change through participatory action research promising significant social impacts.

This design-based research applied mixed methods for data collection, data analysis and interpretation of the evidence. Further, it employed instruments such as field experiments, questionnaires, document analysis and statistical modeling to explain to the mechanism behind interrelated problems of collective action and social dilemma, often encountered in the management of CPR.

Pandemic 2020,Returned Migrants and Shifting Social Concerns in India: A Critical Analysis.

The Pandemic 2020 has changed the World. But the shock is not equal to everyone. For some countries it was only a health emergency but for India it was a threat to their livelihood as well as threat to their Citizenship rights. Covid-19 and different phases of Lockdown, India faces a humanitarian disaster of unprecedented proportions. As ninety per cent of Indian workforce is employed in the unorganized sectors. When the Government of India announced the sudden ' Lockdown' in March 2020 to contain the spread of the Pandemic. The migrant workers faced a situation of survival crisis, through income loss, hunger, indigence and persecution from authorities containment and fearful communities maintaining Social Distance. In this context this paper analyses how poverty, informality and inequality are accentuated by the pandemic experiences of lockdown on migrant workers. The present study tries to explore the socio-economic shock of this crisis on inter-state migrant workers. The whole discussion has been divided into three major parts. The first part deals with the pre-pandemic situation of inter-state migration in the country for this Census of India 2011 data has been used. Second part deals with pandemic situation of inter state migration in the country. For this various study reports and news reports has been analyzed. It is revealed that migrants were going towards high developed states during the pre-pandemic situation where it acted as ' Pull Factors'. However the Pandemic shock changed the direction of migration into a reverse migration. Here the developed states acted as 'Push Factors' The third and final part of the paper analyzes The limitations of prevailing public policies in India addressing these migrants who were actually not visible in most of the major programs and also suggests the recommendations for the way ahead.

The COVID-19 Pandemic and Violence Against Women in India: A Sociological Interpretation.

The Violence Against Women is one of the most pernicious gendered ailments of human society. In the background of the public health and economic turmoil of the Covid-19 lurks another crisis that is rising rate of violence against women. The true extent of violence against women amidst Covid-19 deemed the ' Shadow Pandemic' by the United Nations, will likely never be known as incidence of violence go unreported, stifled by lockdowns and centuries old power dynamics around the globe. Amidst the combination of overwhelmed health system, strictly enforced lockdown, fear of the virus, stressful economic uncertainty catalyzed the situations and violence against women has found a sordid opportunity to thrive. This paper addresses the

denotes a presenting author. Abstracts are organized by first presenting author's last name.

shadow pandemics reach in Patriarchal Society of India. Various studies have confirmed the inevitable consequences of gender violence in increased vulnerability to psychopathologies in addition to physical morbidity. Gender Violence cases are vast in India and numbers are further aggravated at an alarming rate during the Pandemic. The first section of the paper provides a preliminary understanding of how the pandemic influences the prevalence of violence against women in India. The second section provides background of violence against women in India. The third section describes the theoretical basis for why the Covid-19 pandemic is expected to increase women's risk of violence. The fourth section describes policy responses to prevent , reduce and support victims of violence against women prior to the pandemic. Finally, policy recommendations to address the 'Shadow Pandemic' are provided. If the Government of India wish to uphold their commitments to advancing gender equality and eliminating Violence Against Women , they must protect Women's safety even during times of crisis.

Global Migration: Sexuality, Law and Class-Based Mobility Capital of Indian Gay Men

The proposed study will try to examine how global migration – becomes a strategy employed by highly educated, Indian self-identified gay men to navigate social stigmatisation, negotiate family pressure, circumvent state oppression and achieve desired life goals. By examining the intersection between sexuality, Law, migration and class, the proposed study will contribute to the sexuality and migration literature. It will explore how relationships between law, sexuality and migration are related and mediated by class-based capital. It will also add to the discussion that migration has increasingly become a multi-directional and open-ended process. Further it will focus on the activities and protests that happened in India to legalise homosexuality. For the class and social inequality literature, it will seek to understand how global migration has become an element of social stratification and generates mobility capital. It would also highlight how law and sexuality influences the value of mobility capital for the pursuit of an authentic self.

Association between School Dropouts, Early Marriages, Childbearing, and Mental Health in Early Adulthood of Women: Evidence from a Cohort Study in Bihar, India

School dropouts, early marriages, and low age at childbearing are issues still prevalent in Indian states like Bihar, which may be responsible for poor mental health among young adults. The present study examined the effect of life-course events such as school dropouts, early marriages, and early childbearing on mental health status at later ages (23–28 years). Using data from the Understanding the Lives of Adolescents and Young Adults consisting of a 2360 adolescent (ages 15 – 19) girl cohort interviewed in 2007 and re-interviewed at ages 23 – 28 in 2016 from the state of Bihar, India, we applied ordinal logistic regression models in analyzing factors associated with mental health status. Women who never attended school, or dropped out from school, and who got married before age 19 showed a poorer mental health status in their young adulthood (22 – 28 years) compared to their respective counterparts who attended a school and who got married at age 19 or older. As compared to women who had a child before age 19, those who did not have any child, or who had children after 20 years of age were more likely to have poor mental health. Working women, high self-efficacy of women, and women who have decision-making power showed better mental health outcomes as compared to their respective counterparts. To enhance psychological well-being of young women, the study recommends continue education and delaying marriage as the programmatic keys with attention to improving young women's autonomy and gender role attitudes and reducing societal pressure for bearing first child soon after marriage.

YADAV, Sarvendra* (Dr. Harisingh Gour Central University Sagar, India)

Intersectionality in Course Choices: A Cross-Sectional Study of Educational Inequalities in India

Educational choices are largely outcome of an individual's socio-economic background apart from his/her interest. Several sociological literatures suggests that an individual's age, gender, caste, class, religion, parental education and rural or urban origin decides what short of course he/ she will attend in the future. Intersectionality of these socio-economic factors reproduces inequalities and several disadvantages in the opportunity structure. One such disadvantage is not able to make proper choice or attend technical or professional course for a neo-liberal job market. This paper tries to understand how intersectionality of different socio-economic factors decides individuals' choice to attend general

course or technical/professional course? Basic line of inquiry will be the role of social origin in educational choices. Using 75th round of the National Sample Survey, 2017-18 data on last course attended, the determinants of course choices will be investigated employing multinomial logit model, specifically the choice of technical/professional over general courses. Broadly, results indicate that inequality exists across socio-religious background and reproduced in terms of course choices. The probability of attending technical courses is higher among urban males and gender polarization is clearly apparent.

Sharing Grief in a Pandemic Era: A Study of Volunteers Working for a Grief Support Agency

The COVID pandemic has changed our lives drastically, including grieving and mourning practices. This study aims to explore the impact of volunteerism and understand experiences of volunteers who work for a grief support agency during a pandemic era. *Peer House for Supporting Children* is a grief support agency located in a Midwestern area in the United States. It provides services for children and their families who have experienced the death of a loved one. Since its launch in 1993, *Peer House* has been successful to develop and maintain its quality of support programs. However, COVID has greatly impacted their service delivery. Holding the restricted number of volunteers, the director of the volunteer program at the agency hopes to maintain the impact of the agency serving for those in need. For this study, three research questions are formulated: 1. How do volunteers perceive their own experiences related to their assigned tasks during pandemic?; 2. How do they perceive volunteer training and preparation tasks provided by the agency?; and 3. To what extent do they feel satisfied with their volunteer work and experience? This study uncovers how the pandemic has affected volunteers' motivations and performances. For data collection, survey and interview were implemented. While they are socially and physically distanced, volunteers at *Peer House* continues to support children in limited but creative ways such as using a virtual method to offer support services and reducing the number of clients per group. Understanding that children are forced to adjust social aspects of grief by considering COVID restrictions, volunteers seemed to receive significant messages and experiences through limited interactions with children.

Where Is "Reciprocity" in Capitalism?: An Approach from the Neo-Polanyian Perspective

Globalization and neoliberalism have led to the excessive expansion of market relations for past decades. If market relations, as Karl Polanyi asserted, cannot be only relations organizing the economy, other relations, reciprocal and redistributive ones, must be prevalent in society.

This paper addresses "reciprocal relations". In the world-system theory of Immanuel Wallerstein, "reciprocity" was thought to be the operative principle of the pre-modern world-system, "mini-system". This can mean that "reciprocity" cannot be originally present in capitalism. If so, how can it exist in capitalist society? What kind of forms can "reciprocal relations" take in capitalism? These questions will be sought in this paper.

First, this paper tries to theorize capitalist development based on the pattern of transition to capitalism, which is focused on the social background of capitalists in the society. This theory differentiated the extent of the persistence of pre-capitalist (premodern) relations. The society where the capitalist class emerged from the ruling class can experience the "longer period" of the persistence of pre-capitalist relations (type 1). This is because the capitalist class can have "*more* closeness" to these relations. On the other hand, the society where the capitalist class emerged from the subordinate class can experience the "shorter period" of such persistence (type 2). This is because the capitalist class can hold "*less* closeness" to pre-capitalist relations. This paper regards Japan as a case of type 1 and the United States as a case of type 2.

Second, this paper clarifies that Japan constructed "reciprocity" *inside* capitalist corporations through the replacement of capitalist industrial relations with pre-capitalist ones while the United States did *outside* them. The former is the establishment of "corporate-ruled society", and the latter holds "reciprocity" through forming immigrant communities.

Third, this paper indicates that the dissolution of "reciprocity" in globalization can show a form of "post-capitalism".

Distancing from the Languages of Victims: From the Life History of Mr. Norio Hayasaka, a Hemophiliac Infected HIV Due to Tainted Blood Products in Japan

When the COVID-19 Pandemic broke out in March 2020, this infectious disease was thought mortal and for fear of possible spread, the infected

denotes a presenting author. Abstracts are organized by first presenting author's last name.

were sometimes abhorred and even blamed for the infection. Mr. Hayasaka who is a survivor of the HIV infected hemophiliacs said that he had deja-vu, i.e. he had seen the same situation once back in 1980's. In the late 1980's, AIDS Panic occurred in Japan, and the HIV infection was regarded as a mortal danger to other people and the presumed infected including hemophiliacs had been abhorred. At that time in Japan, the use of blood product tainted with HIV for hemophiliacs caused HIV infection among about two-fifth of the total 5000 Japanese hemophiliacs and about 500 patients from them were dead because of AIDS. As a result, the Japanese hemophiliacs were stigmatized and as possible victims of discrimination. To avoid the discrimination, hemophiliacs were fearful of disclosing themselves in public, henceforth unable to openly communicate others without anxiety. This experience of social suffering constitutes one of the reasons of "hardness of living" of Japanese hemophiliacs. In 1989, HIV-infected hemophiliacs in Osaka and Tokyo filed lawsuits. In March 1996, the Government accepted the courts' recommendation of an out-of-court settlement in favor of the plaintiff. This settlement, to some extent, alleviated the sufferings of HIV infected hemophiliacs, and set the foundation for the improvement of their QOL including the HIV/AIDS medical care. However, the "hardness of living" caused by the stigma of HIV infection has long been inflicting them until now. We can learn from the Life-History of Mr. Hayasaka the process of first acquiring the language of victims and then gradually distancing himself from it. This might be equivalent to the process of recovery which could be a lesson for the similar discrimination caused by COVID-19.

YAMAKITA, Teruhiro* (Nihon University, Japan)

Suffering from 'Ghosts': A Former Homeless Person and the Supporting Practices of Housing First in Tokyo

The *Tokyo Project* is a support project aiming to provide immediate residence to homeless people with severe mental illness by applying the Housing First approach. While the conventional Staircase model approach requires homeless people to show 'housing readiness', Housing First approach doesn't impose any conditions for their housing access, based on the principle that 'housing is a basic human right'. Housing First approach is being adopted in the most of advanced countries after the 2000s. However, it is not widely practiced in Japan where the conventional approach is still predominant in the governmental policy. Therefore, the *Tokyo Project* needs to advocate implementation without the support of official policy at this stage. For instance, the Housing First projects elsewhere are deployed by utilizing social housings, the *Tokyo Project* needs to depend on private housings. As a result, clients are required to adjust to the conditional rules of private leases, which often become oppressive and create dilemmas in implementing Housing First's principle of unconditionality. Meanwhile, the growing evidence from quantitative research show higher rates of housing retention with Housing First compared to conventional approaches. However, the quantitative approach has been insufficient in understanding the qualitative aspect of the process of interaction between clients, project providers, the welfare office, the real estate agent, and neighbors, and how project providers intervene in clients' lives and handle conflict among actors. In order to clarify and examine the challenges of Housing First in Tokyo, this presentation uses ethnographic approaches and focuses on the experiences of a *Tokyo Project* participant who is now struggling and claims that he is suffering from "ghosts" that haunt him in his apartment. Through the analysis of this episode, this research reveals the critical importance of the role of service providers to accept and understand the seemingly "irrational" realities of participants.

What Limits on Freedom Are Permissible?: A Comparative Analysis of Japan, Korea, and China Under COVID-19

Containing the pandemic was a top priority for every country. However, for this purpose, civil freedom was undermined, including lockdowns and restrictions on mobility, digital tracking of behavior, and so forth. How do citizens view this tradeoff between freedom and state intervention? This leads to a reconsideration of the relationship between the state and society beyond the COVID-19 measures.

Among the East Asian countries, very strict restrictions were imposed in China, including city lockdowns. Japan and South Korea did not have to go as far as a lockdown, but still the public had to be subjected to restrictions. How much support did the citizens of each country have for these state interventions? One possible factor is the political system, which is likely to be more resistant to restrictions in Japan and South Korea, both of which are democracies. However, even in these countries, citizens were basically more willing to follow government policies than in the West. Behind this may be a cultural background common to East Asia. Hence, this study investigates what factors lead citizens to accept state intervention for COVID-19, addressing authoritarian attitudes and state welfare orientation, as well as the infection risk and economic damage.

This study will use survey data conducted in each country from January to March 2022. The analysis found support for state intervention in China and intermediate attitudes in Japan and Korea. In all three countries, authoritarianism and welfare orientation are both strongly associated with

acceptance of state intervention and have little association with direct costs such as infection risk or economic damage. The strong authoritarian attitude in China indicates a high level of acceptance of state intervention.

Creating Legitimacy to "Regenerate" Urban Inner Areas: How Art Under the Creative City Policy Changes the Local Context

When modern art is associated with a regional redevelopment policy, art, especially modern art, effectively serves to conceal previous local history and culture and recreate them under the guise of "community revitalization." This means changing the public's recognition of a certain community to be renewed without respect for the local context. With the case of Yokohama, Japan, this paper discusses critically how art can work to plant a seed for renewing a context that allows and conceals the displacement of vulnerable urban communities. Data are from qualitative social research by the author.

Recently, in Japan, administration policies have often supported the normative idea that arts can solve social problems. Yokohama City began its Creative City policy in 2004 and leveraged modern arts and art projects to regenerate inner-city areas.

Among the inner-city areas in Yokohama, Kogane and Kotobuki are the two main towns in which nonprofit art organizations work with the municipal Creative City policy. Kogane was a former brothel town cleaned up in 2005. Since 2006, an art-related organization has regularly organized large art events and the town is becoming a tourist destination. It recreates the town's image from being characterized by an old, negative history to a "town regenerated by art."

Kotobuki is a former day laborers' town, where recently the majority were on social welfare. In 2008, an art-related organization granted by the Creative City policy started an art project. They received recognition for making artworks even in a town formerly described as a skid row but neither connected to nor respected by a history of community-based culture and those engaged in its long term.

The art projects under the Creative City policy unintentionally serve to change public recognition of inner-city areas to be regenerated, thus concealing the negative effects of redevelopment on vulnerable people.

Post-Disaster Diaspora: Fukushima Evacuees Seeking a Third Way "Home"

This paper discusses the social structure that leads evacuees to remain in a state of limbo, focusing on the case of the town of Tomioka, one of the areas affected by the Fukushima nuclear disaster in 2011.

Areas affected by nuclear disasters require a considerable length of time to return. Previous studies on evacuees focus on two ways—return migration or relocation. However, many of the Fukushima evacuees struggle to seek a third way to postpone the decision to return by maintaining dual lives both in a new place and their original home legally.

After the accident, the Japanese government encouraged the reconstruction of the affected areas with a policy of return migration. However, many evacuees, especially younger people, were concerned about the health risks and hesitated to return. During the evacuation, they seemed to have adapted to new lives, but some felt left behind. Others pretended not to be an evacuee to avoid discrimination. The older age groups were eager to return, so some families were forced to live separately and even face conflict.

One group of Tomioka residents called for a reunion of the diaspora evacuees, and they have held meetings in many parts of Japan since 2012. These meetings made them feel comfortable about expressing their true thoughts. This paper examines what they said at the meetings and points out that 1) the evacuees felt left behind by the ongoing reconstruction of the affected areas in which the government focused on the creation of new industries, 2) they were dissatisfied with the decontamination by the government and indecisive about whether to keep their property, and 3) besides the existing concerns, they hoped to maintain some form of involvement in the town. Despite their intention to maintain a "home," the return migration policy pressured them into giving up.

Sustainable Development Goals and Social Transitions in Terraced Landscapes - a Case Study of Silk Road Area in China-

The purpose of this presentation is to investigate the relationships between sustainable development goals and social transitions in Silk Road area in China.

China has started the global developmental projects which are called "One Belt, One Road" initiative since 2000. The purpose of this project is two points: one is to make a land-based Silk Road Economic Belt linking Central Asia and Europe; the other is to construct a Maritime Silk Road nospanning Southeast

Asia and the Middle East. The main components of the development include infrastructure's development, enticement of foreign investment, increased efforts on environmental conservation, national security, promotion of education, and so on.

This research is based on fieldwork in Gansu province. Gansu province is located at the starting point of Silk Road which is the strategically important in the development. The author did interview survey for local people and collected administrative documents and statistical data of rural development in national and local government.

In the "Constructing Terraced Landscapes" movement in the developmental projects, local community has experienced rural transitions. In the movement, local environment has been changed by overexploit of mountains in Silk Road area. The developmental projects have caused severe environmental problems such as water and soil erosion, desertification, sandstorm, and drought. Terraced landscapes have been drastically changed, as a result, local community has to face the dilemma between development and environmental conservation.

During the development, rural mountains areas in western China have experienced significant changes of local agriculture and communities. Local people have faced severe contradictions between sustainable development and local life. In the process of the development, local communities have struggled for sustainable development. In order to deal with the dilemma between development and environmental conservation, local people have reconstructed sustainable resource management system.

National Health System in Japan and the Experiences of People with Rare Disease

Japanese National health system consists of public health insurance and quasi-private healthcare provisions (meaning not-for-profit hospitals in Japan have various channels for the founders to share the hospitals' profit). Patients are free to choose the clinics and hospitals while the payment is mostly covered by the health insurance which strictly restrict the treatment available to the patients according to the matrix of treatments and diagnosis. In a word, patient is both consumer and patient. Previously the distinction between these two roles is blurred by the wide range of physicians' discretion over treatment choice and its cost. However, due to the current national and local government financial conditions there are constant political pressures to restrict public health insurance coverage and to promote cost-efficient healthcare management through various means. These trends pushed patient into a narrower space of standardized diagnosis and treatment, while opening relatively free space of private treatment for consumers. The dilemma between patient and consumer would not be serious for people with common diseases for which national health insurance covers most of reasonable treatment costs, but for those with rare diseases the situation is sometimes very serious because their status as patient is not fully established in the health insurance system, and they are often critically dependent on irregular use of treatment or on fully private treatment. In addition, as consumers they must find available treatment options among numerous healthcare providers by themselves. Based on our study about the situation of people with rare disease in Japan (2013-2021), we evaluate the changing health care system from the standpoint of people with rare disease. We provisionally argue that the current trends in our national health care system would divide people into patient and consumer positions.

Factors in Upward Mobility of the Socio-Economic Hierarchy in Contemporary France:from the Life Stories of 'non-Reproductive Elites'

This presentation examines the life stories of the 'non-reproductive elites', which refer to individuals who come from disadvantaged backgrounds yet have achieved elite status, in contemporary France, focusing on their encounters with 'key persons,' among various factors that enabled them to move up the socio-economic hierarchy without relying on reproductive mechanisms. I have conducted several qualitative studies on the factors of elite formation in France, examining the significance of 'linguistic capital' in the making of French elites and their surroundings. The result shows that, in line with the findings of previous studies, most of them have formed themselves into elites in France in the twenty-first century based on the capital they inherited from their parents. On the other hand, a small number of the subjects surveyed are aforenamed 'non-reproductive elites'. How did they, who had no capital inherited from their parents, succeed in moving up the hierarchies? In this research, I conducted interviews by asking the question: 'Would you please tell us freely your life story about how you achieved your 'elite' status?' Among the various factors mentioned in the interviews, this presentation particularly focuses on the encounter with a 'key person'. The 'key persons' who create opportunities for them to move up the hierarchies vary from teachers, to friends, older siblings, and acquaintances. Those from disadvantaged backgrounds are often unaware of the existence of the elite courses, such as Grandes Écoles, or they tend to assume that those elite courses are irrelevant to them. Yet, my research shows that the 'key persons' could act as their guidance. Their parents understand the importance of school success but lack the information and knowledge to guide their children to success. In such contexts, the 'key persons' compensate for this lack and lead them to upward mobility in the hierarchies.

Intergenerational Relations in Chinese Families of Former Left-behind Children

Intergenerational family relations are one of the important elements of family structure. Different family structures have different characteristics of intergenerational family relations. The phenomenon of left-behind children in China has always been concerned by scholars. However, few research has been done on this social group as adults - especially on aspect of their intergenerational family relations.

To explore the characteristics of intergenerational family relations among respondents with left-behind experience, the study draws on data from questionnaires (N=643) and in-depth interviews (N=20), that obtained in China in 2021. We compared the opinions of two groups of respondents: parents who were left-behind children in the past, and parents who do not have such experience. We studied the satisfaction of these two groups of parents with intergenerational relationships and analyzed the differences in this satisfaction from two points of view: in "primary" families, when the respondents themselves were children and the parents established relationships with them, and in current families, in which the respondents are parents and establish relationships with their children.

The results of the study showed that respondents with left-behind experience were less satisfied with the intergenerational family relations between their primary and current families than respondents without such experience; a strong correlation between satisfaction with intergenerational family relations in the primary family of respondents with left-behind experiences and satisfaction with intergenerational family relations in their current family; in the primary families of respondents with left-behind experience, the most important variable affecting satisfaction with their intergenerational family relations is parent-child interaction, which may also determine their satisfaction with the current family intergenerational family relations, however, the most important variable for their current family satisfaction with intergenerational family relations is intimacy, and this factor may also determine their satisfaction with their primary family's intergenerational family relations.

English Hegemony from below: How Chinese Scholars Navigate Academic Production in an Anglicized World

While current research on global knowledge production inequalities mostly addresses the power asymmetry between the Anglo-American core and the periphery of other languages and their speakers, this study asks instead whether and why the Anglo-American hegemony in academia may manifest and reproduce itself from *within* periphery nations. This particular question is motivated by an empirical puzzle from the Chinese context, where academics appear to voluntarily attach higher valence to practices and scholarship associated with the Anglo-American core. I use a mix of computational text analysis and qualitative interviews to assess and unravel this puzzle. Exploring texts from two major Chinese-medium sociology journals (*Shehui* and *Shehuixueyanjiu*) published between 1980 and 2018, my statistical analysis finds confirmatory evidence of higher valuation of Western as opposed to local scholarship among Chinese sociologists: After controlling for author affiliation ranking, topical area, publication year and journal title, articles that cite more English-language references are significantly more likely to receive more citations themselves, an effect that one does not observe for Chinese-language references. Yet importantly, as my in-depth interviews with 36 Chinese-origin academics reveal, local scholars by no means blindly praise Anglo-American scholarship due to a willful submission to its hegemony. Rather, various institutional, intellectual, historical, and biographical processes compel them to experientially witness, acknowledge and learn to cope with the gaps between "us" and "the West". Illustratively, philosophy researchers find it hard to trust the quality of Chinese-medium publications when they regularly notice errors in Chinese translations of classical German texts; meanwhile, sociologists emulate what they see as US-type empirical articles, given their view of the US as the global leader in the discipline and more intimately, American intellectuals' essential role in training China's first-generation sociologists. These findings shed important light on the mechanisms that enact and sustain English hegemony in the global academic profession.

The Waning of a Beautiful Rhetoric: Current Protests and Development of the Egg/Surrogacy Market in Japan

In this research, I explain the latest developments of egg donation/selling and surrogacy in Japan. Then, I analyze the social structures used to construct a Japanese market of women's bodies that is mainly rooted in economics instead of "autonomy."

Although there is no law that bans IVF to use third party's eggs and surrogacy, Japan Society of Obstetrics and Gynecology prohibits using them by their guideline. Hence, most Japanese clients and the egg donors chose to be involved in cross-border reproductive services. In 2020 COVID-19 limited human mobility. Agencies developed a new scheme to harvest eggs from Japanese women without cross-border transportation. The new scheme creates a more exploitive situation for egg donors than pre-COVID-19.

The industry's growth is accelerated by the Japanese government. The Diet quickly passed a civil law in 2020, which leads Japan toward legalizing egg donation. In 2022, Japan's major political party plans to legislate a new law that extends Japanese egg market and legalizes surrogacy.

Conversely, the general public sentiment is not as urgent as the major party. Their draft bill is highly criticized as expanding the exploitation industry. This criticism is louder now than the last three decades when Japanese mainly discussed legalizing egg donation and surrogacy. Due to Japan's stagnated economy which deepened women's poverty, people's viewpoints are shifting from being a buyer to being a seller.

This highlights the bio-market is established on poverty instead of popular rhetoric such as "women's autonomy," "helping the others," and "giving life." When surrogacy was imported in the 20th century, Japanese regarded themselves as consumers; therefore, the above perspectives were useful. However, after realizing they could be possible sellers, the rhetoric subsided. This reveals that becoming a provider is not from the women's will, but fundamentally from their economic status.

Bordercrossing Grandparenting and Work-Family Balance in Taiwanese Migrant Families

Childcare has been a central issue in social welfare studies, feminist theories, and family research. Previous research focuses on parenting to explore the division of childcare in the family and market and state influences on work-family balance.

However, grandparenting also plays an essential role in childcare, especially in the specific social contexts that emphasize family members as 'the best childcarers' along with the lack of public childcare provisions in Taiwan. Grandparents not only help to care for their grandchildren in Taiwan, but also go abroad to help their adult children with childcare and postnatal care. These grandparents engage in what I call 'bordercrossing grandparenting.'

Existing work-family discussions seldom consider the specific conditions that migrant families face, having to learn a new language and adapt to and build careers in a new society without the informal support of nearby family members.

To fill this gap in the research, this article focuses on childcare in Taiwanese migrant families in the representative countries of the three welfare regimes defined by Esping-Andersen. I consider the various care services provided in the welfare regimes, the reasons and motivations for bordercrossing grandparenting, and how such informal support helps migrant families with work-family balance. Exploring the complicated practices of grandparenting at micro-level, I analyze the discourses and ideologies related to Taiwanese grandparenting specifically, how these practices are gendered and cultralized, and how grandparents and their adult children negotiate discourses, ideologies, and practices they perceive through differing generational and regional filters. With a deeper understanding of the complexities of childcare in migrant families, this article will contribute to discussions of childcare practices and ideologies, as well as of policies in the three welfare regimes and, using an intersectionality perspective, the influence of those policies on migrant families.

Evading Religious Regulation, Becoming Yiguandao Followers: A Case Study of Chinese Guest-Workers from Mauritius Back to China

The religious regulation in contemporary China has been heavy and severe to date. As an authoritarian communist regime, the PRC government proclaimed its atheist secularism. Although some restrictions were loosened with the Document No.19 issued in 1982, it still reiterated the lists of so-called "Cults" and "Reactionary Sects" every few years. Yiguandao, a Chinese syncretic religion, also known as one of the "redemptive societies" founded in the Early Republic Period (1911-1949) in North China, was initially outlawed by both governments across the Taiwan Strait, though legalized by the Taiwan government in 1987 during the process of democratization. When Cross-Strait Exchanges began in the late 1980s, Yiguandao started to spread back to China with a low-profile strategy because it was still banned as one of the "Reactionary Sects." Nevertheless, an unexpected phenomenon was emerging when the guest-workers from China converted to Yiguandao in some overseas countries, among which Mauritius was the significant one. From the mid-1990s to the early 2010s, the Yiguandao missionary-adepts from Taiwan encountered thousands of Chinese female guest-workers in Mauritius. These three-year contract migrant workers were not provided with a safe and comfortable labor environment in the garment factories run by transnational entrepreneurs from Hong Kong or China; instead, they received family-like warmth in the Yiguandao temple established by the Taiwanese. Afterwards, many of them became sincere followers and went back to their hometown in different provinces of China. They lived a vegetarian life-style, set up Yiguandao's prayer halls in their home, and earnestly proselytized to their relatives and friends. Not surprisingly, some of them were interrogated by the police or even imprisoned. With a focus on the case of Chinese migrant workers becoming Yiguandao followers, this research aims to discuss the changing faces of "religious assemblage" sprouted in Mauritius and then transplanted in contemporary China.

Global Rise in Dual Citizenship

Systematic analysis of the history and trends in dual citizenship remains insufficient. This paper reviews the history of citizenship policies and documents a global rise in dual citizenship in recent decades. Before the 1970s, dual citizenship was considered anomalous and unwelcome, despite the existence of a small number of countries that allowed it. The principle of sole citizenship was explicitly endorsed by the 1930 Hague Convention of the League of Nations (known as "the predecessor of the United Nations," 1920-1946) and implicitly presumed by the 1948 U.N. Universal Declaration of Human Rights and the 1961 U.N. Convention on the Reduction of Statelessness. However, since the 1970s, as a result of globalization dual citizenship has gradually gained growing recognition. Especially, the acceptance of dual citizenship has accelerated since the 1990s and has now become the norm in the majority of the nations. Using the latest data from multiple sources, this paper provides trends and regional variations in dual citizenship policies around the world. The implications of rising dual citizenship (including inequality) are discussed.

YANG, Taoyi* (Freie Universität Berlin, Germany)

Analyzing "Feeling-Better" Videos: Sensuous Scenes and Dramaturgy of Affect

This presentation aims to analyze the dramaturgy of affect in "feeling-better" videos by a "sensuous scene-feeling" formula.

I will first introduce a type of digital audiovisual genre entitled to make people feel better, such as meditative and ambient music, online concerts and virtual hiking videos to name a few, newly emerging from digital health and well-being practices. Based on the theoretical framework of affect as a relational dynamic between human and non-human bodies(e.g. Ahmed, 2004; Clough, 2007; Slaby & Mühlhoff, 2018; von Scheve, 2018), I argue that affect is pivotal to entitling these videos and audio to make someone feel better. I use the term affective treatment to describe these "feeling-better" audiovisualities and the digital health practice of using them for self-treatment.

Then, drawing upon the concept of intersensoriality from sensuous theory (Marks, 2002; Howes, 2013), the eMAEX model (Kappelhoff and Hauke, 2019) from film studies and some research findings from my digital ethnography on affective treatment, I will develop a formula of "sensuous scene-feeling" to analyze the dramaturgy of affect in the "feeling-better" videos and audio *and* in the "feeling-better" experiences of digital health practitioners. This presentation focuses on the dramaturgy of affect in the "feeling-better" videos. To question how affective experiences unfold themselves in audiovisualities(See Part V in Flam and Kleres (Ed.) 2015, Part II in Kahl(Ed.) 2019), I suggest using the formula to investigate the dramaturgical techniques emerging from these videos, for example, conveying positive feelings such as happiness and peace by setting a "slice-of-life" sensuous scene consisting of the certain forms such as colors, light, tonality and rhythm. By discussing these techniques, I will present how these videos affectively respond to digital health practitioners' bad moments caused by work pressure, life changes or severe social events and fulfill the promise of "feeling better".

RC15-225.6

YANG, Taoyi* (Freie Universität Berlin, Germany)

Revisiting Digital Health: "Feeling Better" and Digital Treatment in Public Health Governance

This presentation aims to introduce and examine a new type of digital health practice, digital treatment, emerging from the lay "feeling-better" wellbeing

and health care practices; that is, people watch and listen to varying digital audiovisual forms, such as meditative and ambient music, natural sounds, online concerts, virtual hiking or jogging videos and travelling Vlogs to name a few, to vent negative feelings, alleviate suffering and get through bad moments.

From a "technologies-in-practice" perspective(e.g. Winner, 1980; Bijker and Law, 1992; Latour, 2005; Eubanks, 2018), Marent and Henwood (2021) illustrated how three central aspects of digitalization(quantification, connectivity and instantaneity) are respectively associated with the (re) configuration of health care practices in three dimensions – knowledge about health and illness, health care interactions, and new forms of control enabled through instant feedback and alerts. Following "the continued ambivalences" (ibid.) across a range of situated digital health and well-being practices, I argue that digital treatment provides another pivotal aspect to inspecting well-being and health care practices – affectivity. Drawing upon affect theories(e.g. Ahmed, 2004; Clough, 2007; Slaby & Mühlhoff, 2018; von Scheve, 2018) which consider affect a relational dynamic between human and non-human bodies, I suggest affectivity in digital treatment builds new blocks for the heterogeneity of the notion of digital health through bodily sensations and feelings: shaping digital health practitioners' perceptions on health, well-being and illness and optimizing public health governance.

By sharing some research findings from the digital ethnography I have conducted about affective experiences and digital health and well-being practices, I will discuss how digital treatment contributes to public health governance, for example, during the COVID-19 pandemic in terms of the implementation of preventive measures and the treatment of patients.

Legitimacy through Nationalism: The Evidence for the Retreat of Democracy from China

More than 30 years have passed since the Tiananmen Square protest in 1989, which western analysts believed was the political repression of the civil movement toward a more democratic political system in China. The June Fourth Incident ended with protestors' failure, limiting the possibility of China's becoming a democratic country. After that, through a series of political, economic, and societal reforms, the Chinese Communist Party remains the ruling party in China and maintains its power in every aspect of the state. A number of studies have explored how the CCP maintains its rule from the perspectives of performance legitimacy, anti-corruption campaign, political culture, and other theories. However, less examined is the CCP's exploitation of nationalist ideology in China as a diversionary tactic to restrict democracy. This research examines the consequence of nationalist ideology and the accompanying actions of CCP in undermining support for democracy. Utilizing data from Waves 4-7 of the World Value Survey, covering the period 2001-2018, the present study hypothesizes that the rise of nationalism and its exploitation in China reduced support for democracy over time. Preliminary data analysis shows that those in their 20s to 30s in 2001, who were the main cohorts participating in the 1989 protests, were more likely to support a democratic political system than the older cohorts. However, as time passed, those cohorts lost their distinctiveness and came to hold the same opinions about democracy as other cohorts. Further analysis shows that national pride is associated with support for democracy in both the early and late periods, though it does not explain away the cohort effects in the early period. Thus, there is support for the cohort hypothesis, but not for the nationalism hypothesis. More analysis will be conducted.

Dynamics in Climate Policy Discussion Network on China's Weibo: A Longitudinal Network–Behaviour Co-Evolution Analysis

An effective and equitable climate policy process requires integrating different perspectives of the broader publics, who are not only affected by but also contribute to climate change's ecological, political, and social impacts. Recent research suggests that the role of social media in engaging people in Habermasian communicative action is limited due to fettered information accessibility, political economic interference, self-reinforced or algorithm-driven fragmentation, and other emerging problems. Despite the unfulfilled promise of normative public sphere, social media serve as a "space of encounter" for actors with different interests and perspectives. This is particularly the case in China, where state actor-dominated media environment leaves little space for public deliberation. In this study, we focus on Weibo, China's major social media platform, to analyse the dynamics among officials, stakeholders, and the general publics in climate change-related policy discussion. Specifically, we use longitudinal social network analysis to study the co-evolution between actors' online interaction relationships and their behaviours in generating climate policy-related content on Weibo. We ask whether the development of the online public participation network is associated with a social selection effect (i.e., actors tend to build online interaction ties based on their pre-existing climate policy-related posting behaviours), or a social influence effect (i.e., actors' behaviours in generating climate policy-related content tend to be influenced by those with whom they interact). We study the two effects simultaneously using stochastic actor-oriented models (SAOMs). To do so, we draw on a three-year longitudinal dataset (2018–2020) and use *RSiena* to jointly

model the temporal changes of network ties and individual behaviours. With endogenous network effects and exogenous actor attributes controlled, our preliminary model results show a co-existence of social selection and social influence effects. This empirical finding contributes to a better understanding of Weibo-based public participation in climate politics in China.

Education As Bargaining Power or Egalitarian Gender Ideology? Educational Assortative Mating and the Division of Housework within Married Couples in China

Objective: This study examines how the couple's housework hours and the wife's relative housework ratio vary by different types of educational assortative mating in China.

Background: Given the education expansion and the reversal of the gender gap in education, both gender ideology and educational assortative mating have been in transition in many societies. Prior research has studied how relative resources, time availability and gender ideology shape couples' household labor division. Few have focused on education and disentangled relative resources effect from gender ideology effect both brought by education.

Method: Using data from the 2014-2018 China Family Panel Studies and multilinear regression models, this study examined how the couple's housework division differ by types of educational mating, which was categorized by absolute educational level (junior college degree) and relative educational level (hypergamy/ homogamy/ hypogamy) into 8 groups. To further identify the education effects, predicted housework hours and relative ratio were calculated based on regression models and F test.

Results: Education in terms of both absolute and relative level takes effect in housework. The couple's higher educational attainment contributes to reducing partners' housework hours and wife's relative housework ratio whatever the relative educational level is. Nevertheless, the equalizing effect brought by absolute educational level is partly counteracted by the relative resources effect brought by relative educational level, which only plays a role in hypergamy when both the husband and the wife hold at least junior college degree.

Conclusion: Higher educational attainment acts as a symbol of egalitarian gender ideology and associates with less housework hours and more equal housework division, whereas relative educational level as resource advantage only works in hypergamy when both partners are highly educated.

Implications: This study sheds light on the effect of absolute educational level on equalizing housework division, and on the unequal gender relations even in hypogamy.

Towards Resilient Community Development: Time-Series Findings, Practical Challenges and Reflections on a CCA Action Research Project to Build Disaster Resilience in Rural Cambodian Communities

Understanding and enhancing community disaster resilience is an increasingly urgent priority as climate change increases the frequency and severity of extreme weather events. This paper presents recent findings of, and shares learning from, an ongoing multi-partner academic and practical collaboration surrounding a climate change adaption (CCA) project in three flood-prone, rural communities in Cambodia. This multi-party, participatory action research is focused on understanding and building community flood resilience and disaster risk reduction capacity. The partners are: Habitat for Humanity Cambodia (HfHC), a community development non-profit organization focusing on housing and other development projects, representing the South and working directly with the flood prone communities; and a team of researchers based in the North, affiliated with academic and research institutes, bringing a research framework and methodology, and additional resources to support the research element of an ongoing project.

To measure community flood resilience, we used the Flood Resilience Measurement for Communities (FRMC) approach, developed by Zurich Flood Resilience Alliance. The FRMC measures disaster resilience capacities across five key dimensions of resilience: human, social, financial, physical, and natural capitals. In this paper, we report recent findings from the analysis of time series data from a geographic cluster of three villages on changes in community flood resilience over time in response to different types of interventions (i.e. support in different capital dimensions). We will discuss overall changes in community flood resilience in each village and other specific capital dynamics. This way, we

denotes a presenting author. Abstracts are organized by first presenting author's last name.

hope to provide an evidence-based and context-specific policy suggestions to enhance community resilience and in turn contribute to resilient community development in the region. The methodology and approach will also provide meaningful implications for future research and CCA practices aiming to enhance and disaster resilience, long-term community resilience, and changing climate adaptation.

Understanding Parenting Identity Construction in Chinese Parents: A Narrative Study

Background: Parenting identity forms and evolves through human development and family life course. Research shows that understanding of parent role and values starts from early life experiences (Mowder, 2005) and is shaped by social expectations (Stryker, 1968) and socio-economic conditions (Aycicegi-Din & Kagitcibasi, 2010; Kagitcibasi & Ataca, 2005). How parents' past and current experiences shape parenting identity construction is under-studied. The study aims to explore Chinese parenting identity formation and development through a qualitative approach.

Method: This study is a part of a narrative study on Chinese parents' perception of parenting identity. The researcher conducted three interviews with each of the four Chinese parents of preschoolers, including full-time working and stay-home mothers and fathers. Two steps of story construction and thematic analysis were applied.

Findings: The first phase analysis described four individual stories on formation and development of parenting identity. The second phase revealed three important sources of contribution: early knowledge, social values, and parenting experience. In specific,

- knowledge generated from childhood experience, Chinese social values on parenting, and current experiences in rearing children were primary sources for parenting identity construction;

- the three sources negotiated in an internal meaning-making process and formed a parenting identity in Chinese parents;

- when knowledge from different sources conflicted, parent experienced a struggle in constructing a stable parenting identity;

- and consistent meanings achieved through internal negotiation guided parental behavior in parenting, which consolidates the meaning of the parent role and strengthened their parenting identity.

This relationship indicated a parenting identity construction model by past knowledge, social values and parenting. This study was limited to identity construction in early parenthood, i.e. parenting preschooler children in mainland China. Future studies may test the parenting identity construction model and examine it in other parenting stages and different cultural contexts.

Conceptualizations of Social Justice in Iran, between Religion and Politics

There have been diverse and sometimes contradictory interpretations of the concept of social justice in Iran. This idea, being pivotal to Islamic and Shiite discourses, has been the focus of revolutions and social movements in Iran at least since the early twentieth century. Not surprisingly, the matter has been debated by a variety of religious and secular scholars and continues to be so today. During the recent social movements in Iran that have been becoming more recurrent and persistent, on the one hand we are witnessed to demands for social justice in its various forms called for by various groups and on the other hand to scholarly or normative analyses of the context based on this central concept.

However, given some theories of social justice that understand it at different levels (e.g. Nancy Fraser who develops three levels of social justice: economic, cultural and political), it becomes a requirement to bring in other perspectives to the discussion to better comprehend the existing conflicts in Iranian society from the perspective of social justice. Accordingly, if we acknowledge the existence of different conceptualizations of social justice based on the above three levels, it will be relevant to analyze the tensions between the political system and social groups to indicate the manner in which different conceptualizations of this central idea can raise tensions at the social and political levels.

With this in mind, this paper aims to discuss the different conceptualizations of the notion of social justice in Iran at the religious and political levels, among others, in order to open a discussion on the impacts of these such understandings on different aspects of Iranian social, economic and political life. It also intends to relate this conceptual conflict to recent social movements in Iran demanding social justice in its various forms.

Food Consumption and Social Acitivities : On the Purchase of Ethical Food

The purpose of this paper is to conduct a quantitative analysis of food choice - examining the relationship between ethical food consumption and social activities. Lifestyle studies in social stratification theory have shown that dietary habits are often regulated by the difference between income and social status. However, dietary habits are not only subordinated by the social structure - they may also change society as people make subjective choices. The concept of food citizens, who are involved in policy proposals in large cities, has promoted to change society through their food purchasing.

Japan also has many social problems related to food but not be clarified, therefore I conducted a quantitative analysis of the preferential purchase of domestic food and organic food using data from the Japanese National Survey of Social Stratification and Social Mobility. As a result of ordinal probit regression model analysis, it was found that, in terms of socio-demographic characteristics, women (rather than men), older people, married people (rather than the unmarried), and those with children bought both types of food. In terms of social stratification, however, the higher the household income and level of class-consciousness, the more food was purchased. Service workers bought organic food more often. Domestic food buyers were often active in residents' and neighborhood associations, while organic food purchasers were often active in civic movements and volunteer activities. This result was statistically significant even when socio-demographic characteristics and socio-economic status were controlled.

From this analysis, I found from quantitative data that general consumers who prefer ethical food tend to participate in activities for social change. Based on these results, theoritically I can give grounds for the discourse that food choice is an effective exercise of individual agency over social structure. Practicaly I want to propose a Japanese-style food citizen model to encourage social change.

The Policy Discourse of the Desirable Education System: A Case Study of Post-Revolutionary Iran

The fundamental Reform Document of Education in the Islamic Republic of Iran (FRDE) is currently the most important policy document in Iran's education system approved in 2011. As it is spelled out in its title, FRDE aims to transform the education system radically based on the "philosophy of Islamic-Iranian education". The need for the policy document then is asserted to be a roadmap to solve the problems that are "unfit to the prestige of the Islamic republic and do not meet the requirements of paradigm shift and social requirements". Viewing policy as discourse, this paper investigates the political and ideological project that the FRDE pursues through certain problematization of education policies and practices. As meaning construction is bound to the historical condition and the question of power and authority, this paper explores the discursive production of desirable schools, desirable teachers, and desirable students within this document that jointly produces the discourse of a desirable education system. Drawing on Foucauldian discourse analysis interpreted via the Foucauldian theoretical framework, the paper analyzes the re-introducing of centralism in post-revolutionary Iran's education governance through this policy text and the ways that the state limits the possibilities of the education reform drawing on the religious-nationalistic ideological totalism. The finding indicates that the formal education system that FRDE aims to shape is not as autonomous but as a very dependent organization to the whole body of political society that faithfully serves it by upbringing a certain type of subject who is meant to actively edify, disseminate, and transference "the Islamic revolution values and norm system". As policy discourses should not be considered in isolation, this paper argues the FRDE policy agenda in connection to the broader context of ideological commitment shaping the ethos and strategies of schools in Iran.

The Stories of the Unheard: Border-Crossing, Passports, and Travel Experiences

Airports as borders signify critical thresholds of tourism experiences – arrival and departure. Various levels of mobility rights are bestowed on different passport holders, which create vastly different and controversial encounters (Adey, 2017). Those who rank higher on the hierarchy of passports with the 'right' look, accent, religion, and nationalities receive more favourable treatments (Torabian & Mair, 2022), whilst others submitting to onerous, intimidating and sometimes humiliating border-crossing experiences (Villegas, 2015). In this study, airport border is configured as a liminal, ethically paradoxical space, where gateways and barriers, hospitality and hostility, inclusion and exclusion, and mobility and immobility co-exist (Mezzadra & Nelson, 2015). To safeguard sovereignty, dehumanising practices, such as racial

denotes a presenting author. Abstracts are organized by first presenting author's last name.

stereotyping and risk profiling become normalised at airport border, leaving many negative encounters unnoticed (Stephenson, 2006). Thus, this study aims to unpack the multiplicity of border-crossing experiences and their subsequent effects on travellers' emotions and memories. Grounded within a critical-constructivist paradigm, this study will employ a qualitative in-depth interview as the methodological approach, collecting memories of contested border-crossing encounters. By engaging the authors' own experiences at the border, knowledge can be constructed intersubjectively through interactive dialogues between the researchers and the subjects. Theoretically, the recognition of alternative tourist border-crossing experiences contributes to decolonisation of tourism research, by highlighting the importance of border as key touch points in tourists' journeys. Practically, this study provides timely implications for managing the rapid return of international travel post-pandemic. Tourists undergo emotional, social, physical, and cognitive challenges at borders, necessitating further scholarly attention. Problematising the border space is the first step in surfacing the experiences and challenges of the unheard. Through such understandings, more humane and dignified approaches to border policing could be adapted.

Systemic Racism and Authoritarian Management: Differentiated Experiences According to Social Relationships in Terms of Qualification/Gender/Race

Immigration is causing a demographic shock in Quebec, as in the rest of North America, which is reflected in a striking change in union membership. More and more racialized people are working in unionized jobs. But the jobs that are accessible are still generally confined to a few sectors of activity in the labour market, which are generally devalued and underpaid.

In order to mobilize the different union structures on the issues of systemic racism particularly highlighted during the pandemic, with the disproportionate rates of racialized people, especially black people, affected by Covid 19 or dying, a questionnaire was initiated in a cross-sectional structure of a large central union. The purpose was to understand how racism manifests itself in the workplace. In order not to make it an issue for racialized members only, the questionnaire was addressed to all members. Open-ended questions asked them to indicate whether they had experienced or witnessed injustice or discriminatory treatment. The average response rate was about 2.5%, but it is much more significant in the sense that these responses were obtained from a third of the unions in the structure. Coded by categories constructed from a literature review and then analyzed using SPSS software, the responses show that there is a significant difference in the type and amount of injustice experienced, depending on whether one is racialized or not, or female or male. This result cannot be seen when the questionnaires are only addressed to racialized people. Moreover, the responses describe a general deterioration in working conditions, much more striking, however, among low-wage employees, thus showing the importance of articulating social relations of class and race - an issue that is euphemistically mentioned in studies and discourses, even though it stems from, and relays, the authoritarian drifts of a management in perpetual reorganization

YETKIN, Eren* (Koblenz University of Applied Sciences, Germany)

Youth Co-Research and Memory Work – about the Biographical Data Flourishing in Participatory Research Settings

The reality of plural German society affects various sociopolitical features and institutional frameworks in the country. It can be observed in the discussions about the education system reform plans, civil society funding programmes, and possible policy reforms against discrimination in the workplace and everyday life. In recent years, one of the fiercest debates has occurred concerning cultural remembrance. In this regard, memory of the colonial past has become an essential topic with its transnational ties; the migrant memory – covering a broad spectrum from conditions of migration to the right-wing violence of the 1990s – has been increasingly considered in the new German heterogeneity. Further, the concept of participation, especially of people affected, comes up as a crucial question.

Considering different phases and the data gathered in the project "Participatory Remembrance Education in Koblenz and the Surroundings" at the Koblenz University of Applied Sciences, this paper explores the questions of multimethodology and biographical elements emerging in the process of participatory field research. The project studies the dynamics of remembrance together with young co-researchers who joined the project through youth work and youth organisations. Additionally, it has begun conducting semi-structural interviews with young interlocutors – co-researchers and non-participants – which foster the analysis of participation mechanisms. Due to the identity-related elements of collective memory, a particular biographical turn has taken place in the field research of the project.

This paper discusses the challenges in the implementation of participatory concepts and asks how participatory research does lead to employing a multimethod design. What are the touch-points of biographical turn in this multimethod research context? Driving from the complex intersection of

youth work and remembrance praxis, it also asks when interventions can be consistent with the methodology in such a setting. It examines these questions based on the project's corpus of qualitative data.

Family Ideals/Goals across Cultural and Socioeconomic Groups: A Factorial Survey Experiment in Singapore

Abstract
This paper examines the extent to which the major racial/religious groups and social classes in Singapore have different family goals/ideals. With a novel approach i.e., vignette factorial survey experiment, hypothetical family profiles were constructed to vary along 8-10 characteristics and respondents were randomly assigned to evaluate these family profiles. Overall, we found that the way people view different aspects of family life as successful or desirable is remarkably similar across cultures and social classes despite some gradients in the estimated effects. Specifically, all racial groups think that families that are married, have children, are respected in the community, have an above-average household income, have close family communication, and save to support children as more successful than the same families without these features. While close communication with extended family is a significant predictor for Chinese and Malay Singaporeans, it is not significant for Indian Singaporeans. Also, the Chinese, but not the two other racial groups, perceive families that have highly educated children, have a more egalitarian gender division of labor, and have no work-life conflicts for couples as more successful. There are relatively more differences by religion. Muslims are most likely to perceive fertility and the least likely to perceive egalitarian division of paid work and housework as important factors for successful or desirable families, reflecting their significantly higher fertility rate and more traditional gender division of labor at home than the other groups in Singapore. The results show some differences by socioeconomic statuses such as education and occupation. Compared to those with lower socioeconomic status, those with higher socioeconomic status perceive families that have children, have a higher-than-average household income, have close communication with the extended family, have highly educated children, and have an equal division of labor or no work-life conflicts as significantly more successful or desirable.

Emerging Trends in Social Policy from and for the South: Institutions and Actors

Social policy regimes around the world are undergoing significant change in response to these and other contemporary risks and opportunities. Two seemingly contradictory dynamics are at play. On the one hand, social policy institutions are adjusting to market imperatives and the pressures of fiscal discipline, privatization, austerity and retrenchment. On the other hand, democratization, active citizenship and the growing recognition of the human costs of economic liberalization have given rise to pressures for expanding welfare provisions, and to a "social turn" in the policy orientation of numerous emerging/developing countries. This contradiction is particularly evident when we look at the global South.

We would like to present a new edited collection with the overall objective to contribute evidence and analysis that will improve understanding of alternative policies for social development in low- and middle-income contexts. It introduces new theoretical and conceptual discourses on social policies and examines the emergence, nature and effectiveness of recent developments in social policy in low- and middle income countries including China, India, Indonesia, Russia, South Africa, and Tanzania and selected countries in the Middle East and North Africa. In particular, this volume focuses on the trend away from a "welfare state" towards a "welfare multitude", in which new actors—including civil society organizations and international organizations—play an increasingly important role in social policy, and pursuit of an integrated approach to addressing social, economic and environmental policy goals in a holistic manner.

The analysis presented in this volume suggests that new trends in social policy can be both progressive and regressive, and in most countries, multiple forces push and pull social policies in different directions. The resulting picture is one of new tensions and synergies across social policy sectors, rather than any one cross-cutting direction of change.

Icing on the Cake: How Governance Absorption and Accountability Promote the Durability of Nonprofits

Background: In the New Public Governance (NPG) era, the government has formed a new relationship-governance absorption with nonprofits in the process of allowing nonprofits to govern society in China. Moreover, the evolution of accountability brings controversial impact to nonprofits' durability. Therefore, how governance absorption and accountability affects nonprofits' durability still needs to be explored. This paper draws on NPG perspective and uses network governance theory to develop a conceptual framework among governance absorption, the durability of nonprofits and accountability.

Design/methodology/approach: This paper uses data from the 2019 China Social Work Longitudinal Study, involving 57 cities and 954 social work institutions. Governance absorption is classified into three types while nonprofits' durability is assessed in four dimensions. A multilevel regression model approach that incorporates both institutional- and city-level factors is used to analyze the impact of governance absorption and accountability on the durability of nonprofits.

Findings: First, ideological absorption ($\beta=0.654^{***}$), administrative absorption ($\beta=0.615^{***}$), and strategic resource absorption ($\beta=0.574^{*}$) are generally positively associated with nonprofits' durability. Second, accountability reinforces the contribution of administrative absorption ($\beta=0.808^{*}$) and strategic resource absorption ($\beta=9.440^{+}$) on nonprofits' durability, while mitigating the negative effects of strategic resource absorption ($\beta=0.146^{*}$). Therefore, (1) governance absorption is a core mechanism that influences nonprofits' durability.(2) Accountability can moderate the relationship between governance absorption and nonprofits' durability.

Implications: (1) Governance absorption reflects the interdependence between government and nonprofits and the dominance of government, which helps us to further understand network governance theory. And the moderating role of accountability facilitates us to understand the differences in state-society relations between authoritarian states and Western countries. (2) The impact of governance absorption and accountability on the nonprofits' durability provides guidance for nonprofits in authoritarian countries to handle their relationship with government and formulate development strategies.

Planning While Precarious: The Impact of COVID-19 on Young Temporary Migrants in Australia

The pandemic has brought about unprecedented border control and significant disruption to the high flow of human mobility that characterized globalization. This was especially the case in Australia, which enforced strict border control measures during the pandemic's early stage, including the ban on departure and entry, at times extending the entry ban to its own citizens. This paper focuses on the effect of COVID-19 on the precarious legal status of young temporary migrants in Australia, including those on education, graduate, skilled migration, and working holiday visas. Temporary migration in Australia is characterized by the extensive use of precarious legal status, active involvement of the migration industry, and a high degree of labour exploitation. Despite the prevalence of temporary migrants and their important social contribution, the then-Australian Prime Minister Scott Morrison made headlines by telling them that "it's time to go home" as he excluded them from the emergency support when the novel coronavirus spread in early 2020. This paper argues that the extraordinary situation of the pandemic provided both volatile opportunities and unpredicted pitfalls and focuses on the narratives of migrants that responded with resilience to the erratic turn of events since COVID-19 shook the world by surprise in 2020. The paper draws on the broader study on South Korean education migrants in Australia and in-depth and follow-up interviews with South Korean migrants in 2019 and 2022.

Experts Isomorphism: Institutional Transformation in Turkey, 1950-1960

Experts isomorphism: Institutional Transformation in Turkey, 1950-1960
Following the years of the WWII, foreign experts invited to Turkey played a crucial role in forming economic knowledge and bureaucracy, as Turkey joined into the postwar world order lead by the USA. During the period, Turkey acted on foreign experts' advices on institutional transformation such as adapting economics teaching, establishing administrative sciences, and founding new institutions, through which Turkey was supposed to align with the postwar international order. This study aims at scrutinizing the active role of foreign experts in institutional transformation in Turkey in the years between 1950-1960. In this study, I will analyze foreign experts' active role in the perspective of new institutionalism in organizational analysis by resting on the evaluation that foreign experts worked as agents of institutional isomorphism.

The Rise of Economics As a Profession in Turkey

Professions play a crucial role in economic governance by incubating ideas and structuring state policies. Following the years of World War II, Turkey shifted its policy paradigm from the etatist economic policies aimed at establishing a national industry to the liberal market economy driven by agricultural development programs on the advice of international organizations, such as the IMF and OECD. As the policy transformation bolstered economic performance, economic governance required economics as a profession to conduct institutional transformation. In this paper, I will scrutinize the question of how economics as a profession rose in Turkey in the years between 1935-1960 and the role of foreign experts invited to Turkey in institutionalizing economics as a profession.

YILMAZ, Ayse* (Bahcesehir University, Turkey)

Generational Relations and the Silencing of Children in the Making of School Shows at Public Primary Schools in Istanbul

School shows are widespread activities in Turkey. At primary schools, children have classes where they engage in activities such as modern, and folkloric dances to be staged towards the end of the scholar year. These classes aim to make children engage with activities at school apart from academic life. However, we observe that at schools mostly attended by lower-middle classes, these classes are mandatory. Thus, imbalanced relationships of power between children and adults are generated. The domination of adults over children is facilitated in terms of decision-making and imposition, and children's voices are silenced.

This paper problematizes the active engagement of children in the making of school shows, and it inquires how the children are positioned in this process. Questioning children's position in a widespread school activity, the paper scrutinizes the generational processes which are silencing children. It examines how and in what ways, in the context of Istanbul's public primary schools in the lower-middle-class districts, the school, as a formative institution, doesn't leave space for children for their contributive actions and how the children's capacities of action are neglected. The significance of this research is that it questions the (im)possibilities of children's agency in hierarchical educational contexts by employing a relational and contextual conceptualization of agency from the perspective of generational order in the sociology of childhood.

This research is based on my doctoral research, for which I conducted ethnographic fieldwork, enriched by observations and in-depth interviews. It focuses on the first-grade children's school shows.

The research shows that when it comes to school shows, even though children seem to be the actors on the stage, during the whole process they become the subjects of the educational institutions with the help of these shows.

Understanding Precarious, Migrant Labor Onboard Cruise Ships in the Time of COVID-19

The twenty-first century has seen enormous growth in the popularity of cruise ship tourism. When the COVID-19 pandemic began and cruise ships ceased their operations, tens of thousands of crew members found themselves stuck at sea due to the closure of ports and borders. This study, through 40 semi-structured interviews, explores what this experience was like for crew onboard and back home. For some, being stuck onboard was the best possible place to be during a global pandemic, but others suffered from negative mental health effects due to the isolation onboard and the fear that they felt for their families onshore. Crew members' experiences onboard at the time were largely ship-dependent, determined by the captain of the ship. Seafarers, who mainly work as precarious laborers, lost their jobs and were suddenly back ashore, completely changing the family dynamics in their homes. This research, which is part of a larger PhD project on what characterizes a transnational, mobile community at sea, records how the COVID-19 pandemic affected cruise ship workers, both onboard and in their home countries. The intersection of gender and nationality greatly determines crew members' experiences onboard, and this research shows that these factors also influence how COVID-19 has affected crew. As the tourism industry moves forward from this global pandemic, understanding the experiences of crew onboard cruise ships is essential to ensure that something similar does not occur in the future.

Online Rumors As a Participatory Theatre: The Case of Covid-19 Pandemic in Hong Kong

Have Hong Kong citizens' DNA data been collected by the government during Covid-19 virus tests? Did the Chief Executive of Hong Kong receive the "fake" covid vaccine? Such doubts have pointed to the conspiracy online rumors that have been pervasive in Hong Kong especially during the first four waves of the Covid-19 pandemic (e.g., from January 2020 to April 2021). Traditionally, sociologists have considered rumors as a collective sense-making process that deals with uncertainties such as crises, especially when established channels of information are lacking or challenged by the public. A more general definition is that rumors, whether offline or online, are unverified yet practical information statements that circulate in society. Yet, the conception of online rumor in existing studies are mainly based on that of offline rumors, and a concrete definition of online rumor even appears to be lacking. While both can be similar, they are fundamentally different in terms of the ways in which rumor participation manifests.

By focusing on two conspiracy rumor cases that pertain to Hong Kong's pandemic control, this study proposes to re-conceptualize the meanings of online rumors through using an audience perspective. Based on online document analysis and in-depth interviews, I argue that online rumor can alternatively be understood as a "participatory theatre" that serves as a social stage for people to perform and exchange their sentiments towards certain social and political issues in a creative way. On the one hand, it suggests that online rumor should not be simply seen as a truth claim, but an accumulation of observable discourses (e.g., comments) from the rumor audience that are elicited by the claim. On the other hand, under certain circumstances, online rumor is treated and used by the rumor recipients as a play-form of online participation that generates an inter-subjective sense of playfulness.

YOKOYAMA, Mai* (Rikkyo University, Japan)

Comparing Rape Myths in Western Countries and Japan Using Various Rape Myth Acceptance Scales

Acceptance of Modern Myths about Sexual Aggression (AMMSA) is a reliable and valid new scale that measures people's endorsement of rape myths. A 2017 AMMSA survey among Japanese university students found that approximately 50% of the question items were difficult to answer because over one third of the Japanese student respondents selected "I don't know" from the options. Particularly, the question item stating that women tend to report sexual assault victimization to appear emancipated was the least answered. This may be due to the differences between Japanese and Western social discourses on gender norms. Moreover, the result of a quantitative text analysis of sexual assault topics, such as molestation, sexual coercion, and child sexual consent, on the 2021 Japanese Internet bulletin board indicates the existence of rape myths that were not identified by previous rape myth scales, thus reflecting the current socio-cultural climate in Japan.

Thus, this study investigates Japanese rape myths through a survey administered to Japanese students at a city university to explore the prevalent rape myths in Japan. Several rape myth scales were employed, including the Rape Myth Acceptance (RMA), Illinois Rape Myth Acceptance (IRMA), modified IRMA (gender inclusive version), AMMSA from previous research, and original question items that were developed through a quantitative text analysis of sexual violence-related topics on the Japanese Internet bulletin board. Overall, participants were more likely to endorse specific Japanese rape myths and were less likely to believe other rape myths, such as those mentioned in the AMMSA and RMA. Additionally, as in previous studies, female participants were less likely to accept rape myths. To develop rape myth study, researchers should consider not only the reliability and validity of the scale but also the use of universal wording across the countries.

Essential Workers and Their Movements: Examining Nurses and Platform Delivery Riders' Struggles for Better Working Conditions Under the Pandemic

The health risk unleashed by COVID-19 wrought economic and political shocks across the globe. Governments everywhere began instituting social distancing measures and lockdowns to halt its spread. Economic collapses followed. But while segments of the population complied with stay-at-home orders and navigated the shift at the workplace to the home, there were those required to be physically present for the performance of their essential services such as nurses and platform delivery riders. These workers directly faced the health risks that came with the virus while muddling through new labor relations brought about by their essential status.

This ongoing study investigates two social movements enlivened in the nursing and platform delivery sectors during the pandemic in the Philippines. Through interviews and participant observation, this research examines how

these movements formulated their demands, negotiated with their employers and the state for better working conditions, and how these were responded to. In doing so, it hopes to contribute to the ongoing conversation about how the pandemic changed the balance of power among labor movements, employers, and the state and how these were capitalized on or resisted by workers.

YOON, In-jin* (Korea University, Republic of Korea)

Trends of International Migration and Issues of Migrant Integration in South Korea

In this study, I review the recent trends of international migration and issues of migrant integration in South Korea. Subjects of migrant integration include labor migrants, marriage migrants, and co-ethnic return migrants. A large scale of international migration to South Korea began in the early 1990s and has continued to grow until recently. The population of immigrant backgrounds account for 5% of the total population, transforming South Korean into an immigrant society. The largest group of migrants is migrant workers, followed by marriage migrants, and the majority of the marriage migrants are young women from developing countries in Asia. What makes South Korea different from Western developed countries is that co-ethnic return migrants account for the majority of migrants. They have an advantage over non-Korean migrants in that they share the same ethnicity and culture, but at the same time experience the prejudice and discrimination from native people more strongly. Although migrants different according to their country of origin and status of residence, they do not achieve a high level of social integration overall. In particular, migrant workers have a weak foundation of social integration and experience unfair treatment and exclusion. Marriage migrant women have a more stable foundation of social integration than migrant workers, but have difficulties in maintaining a stable economic life and marriage. In addition, marriage migrant women are forced to assimilate into Korean culture without maintaining their own culture and identity and passing them to their children. Although Korea is changing demographically into a multi-ethnic society, Korean laws and systems are not suitable for accepting them as equal members of society. And many Koreans still insist on an idea of single nation and culture, so they are unwilling to recognize migrants as actual members of society and live together.

Gradationalism Revisited: Intergenerational Occupational Mobility Along Axes of Occupational Characteristics

Studies on occupational mobility typically measure occupation in one of two ways: gradational and class-based. The present study provides a critique of class-based traditions in the study of intergenerational occupational mobility and offers explanations that leverage occupational and individual characteristics like lifestyles, work styles, work-related knowledge, and skills for the transmission of occupations across generations. To do so, we go beyond the traditional gradational approach relying on vertical dimensions of occupation—such as prestige and socioeconomic status—by incorporating multidimensional occupational characteristics and compare the performance of our new gradational approach to that of categorical, class-based approaches. We apply our novel approach to intergenerational mobility as a test case. Our results show that the multidimension-gradational perspective provides more parsimonious explanations of occupational reproduction and occupational movements, and we discuss in detail theoretical improvements of our approach over alternatives. We also find compelling evidence of the preservation of occupational characteristics across generations between both mothers/fathers and daughters/sons, even when occupations themselves are different.

Nationalized and Denationalized Sociologies: The Studying How Borders Were Created between Émigré and American Scholars during the WWII

This presentation examines the relations between nationalized body of social scientists and its others, focusing on American sociologists during WWII.

Everyday organizations, whether they be governmental administrations or scientific associations, took some intelligence roles. But the intelligence activities were much more organized in the war effort actions. Newly formed federal military departments and ever expanding national networks of scholars contributed to intelligence as well as to the nationalization of social sciences. They mobilized many human and social scientists who were born in the U.S. (e.g. Ruth Benedict and Rensis Likert) and those from foreign countries (e.g.Aleš Hrdlička and Frankfurt school), keeping corresponding to other figures (e.g. Kurt Lewin and Erik Erikson). However, most of the foreign born scholars

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

were not taking the everyday post in the big universities. Moreover, most of the emigre scholars were not able to join these wartime actions (e.g. Pitirim Sorokin and Levi-Strauss).

Implications: the comparative national histories of a discipline need to consider why these disciplinary histories became national, focusing on the processes of border making. To this end, the historians of disciplines should take into consideration the following both sides: 1) how a national society, using its administrative, political, and academic experts, manages to study the "national" elements of the society, and 2) how it cope with emergent transnational societies by marginalizing such figures as emigre politicians, grassroots activists, and non-academic scholars.

Pandemic Shock on Manila's Street Vendors: Focusing on Labor Informalization and Stratification

This study investigates the impact of urban planning on people making a living on the streets following city lockdown due to COVID-19. In many countries, capital investment in urban space and restrictions on the use of public space have increased in recent years. The Philippines is no exception; the national government attempts to "reclaim" urban space from "illegal" vendors while promoting exclusive development for "legal" business owners. Owing to the nationwide community lockdowns in early 2020, vendors were not permitted to sell on the streets. There is a greater emphasis on public sanitation and social distance, and the street is regarded as an unsanitary and congested space for pedestrians. These messages create a division between illegal and legal vendors, which has become even more pronounced after the city lockdown. Street vending was often referred to as "informal" in urban planning discussions. It has been explained using the dualist approach of informal/formal framework, but as many scholars have already pointed out, this approach cannot capture the complexities of urban transformation. Therefore, this study seeks to capture the dynamic transformation of urban space and vendor stratification in Manila by presenting the empirical data of 1) vendor types before and after the lockdown, 2) urban planning and national and local policies related to the use of public space, and 3) vendors' tactics to continue their business. As a result, this study clarifies the politics between vendors, the state, and global capital to provide new insight regarding urban informality theory and the challenge of post-pandemic urban development.

Trickle-Down Effect or Vice Versa? Examining the Effect of Female Managers in Japanese Firms, 2008-2016

Occupational gender segregation remains a major problem in many societies. Of particular concern is vertical gender segregation, i.e., the disproportionately low percentage of women in high-level positions, since they are advantageous in many aspects, such as wages, fringe benefits, and prestige in society. To address this issue, some large companies in Japan have recently set targets for the proportion of women in management positions based on the assumption that more women in management positions will increase female employees in subordinate positions, that is, the trickle-down effect. Extant research, mainly conducted in the US, support this effect by analyzing firm-level panel data. However, the previous approach cannot accurately estimate the trickle-down effect when a reverse causal effect is present. Other studies have also shown the reverse effect that women in lower-level positions increase those in higher positions. Therefore, it is necessary to consider this reverse causality to accurately estimate the trickle-down effect. This study uses the cross-lagged panel model with fixed effects (Allison et al. 2017), a recently developed method to overcome this challenge, to accurately estimate the trickle-down effect in the presence of reverse causality. Panel data for large Japanese firms from 2008 to 2016 were used to examine whether the proportion of women in upper management positions increases those in lower-level managerial positions. The results show that even after controlling for reverse causality, the share of women in high-level management positions increases those of women in lower-level management positions in the following year. This implies that mitigating vertical gender segregation from higher positions will increase the female share in subordinate positions, eventually leading to a virtuous cycle that will improve gender equality in the entire organization.

How Digitalization Has Affected the Spectacle of Intimacy in Live Entertainment: A Case Study of Japanese Female Fans of Boy Bands

Fans are people who engage in excessive acceptance, consumption, self-expression, and socializing based on their loyalty to a specific fan community. Loyalty to fan communities is built through participation and collaboration in emotional collectives among fans. The digitized fan community is one of the key reference groups of the current generation. The Japanese female fan community has been formed through face-to-face live entertainment. The spectacle of intimacy, consisting of a convergence of labor of love between the performers on stage and the fans in the audience, has created a sympathetic fandom. They have been carefully managed by the entertainment industry. While face-to-face live entertainment was suspended after the COVID-19 disaster, Japanese female fans also enjoyed the digitized intimacy of live stream concerts and video chat. Today, live entertainment in Japan operates in both face-to-face and online formats. The purpose of this study is to determine the impact of the current spectacle of intimacy in live entertainment on the reference group function of fan communities. A qualitative survey was conducted among female fans who attended face-to-face concerts of J-pop and K-pop boy bands from May to September 2022. The results revealed that the experience of digitized intimacy reinforced the desire to attend in-person live concerts. There was an increase in the number of digital-only fans who were unaware of the norms of in-person live concerts. The diversification of fans was sometimes perceived as a fragmentation of fandom and a decline in intimacy. There were some stage production innovations and fan efforts to bridge this divide. This study suggests directions for community building through media culture and live entertainment, while cautioning against the commercialization of affection and labor.

Transmediating Race and Senses through Subtitling in Translanguaging Classroom

Our paper reflects on a transdisciplinary curricular project in an advanced Japanese language course co-taught by two instructors with different disciplinary expertise in language and media studies. Through a pedagogical practice of translanguaging (Wei, 2018), our course adopts audiovisual media translation, or subtitling in particular, on themes including race and colonialism, and aims to promote students' critical intervention into subtitling to negotiate, question, or subvert ideologies of source and target languages and cultures.

Drawing on critical subtitles studies, our paper explores Nornes's (2015) notion of "sensuous subtitling" wherein subtitled films retain the foreignness of the source culture while potentially "defamiliarizing" the viewer's own culture (Kapsaskis, 2008). Subtitling is not only understood to translate the source language and culture to another, but also to "transmediate" multiple modalities including affect, emotion, and senses (Elleström, 2021; Flynn, 2016). This paper focuses on how students' approach to subtitling manifests itself in transmediating race as multisensory, affective experiences on viewers beyond language and translation.

As Japanese-born, Japanese-speaking women teaching Japanese language and culture at an English-speaking university in Canada, we use our own bodies as racialized and racializing sites of knowing and examine the affective potentials of interlingual subtitles and their pedagogical implications. We reflect on students' subtitling works on Japanese film *Tsuki wa docchi ni deteiru* (1993, dir. Yoichi Sai), which features Korean diaspora and Filipino migrant workers in Japan. Applying Nornes' notion of "sensuous subtitling," students translated and transmediated embodied expressions of race that are communicated in multimodal ways through acting, camerawork, mise-en-scene, and other cinematic techniques. Students' experimental subtitles created a transmedial and "intercorporeal" site in which the cinematic bodies of the characters *touch* our bodies, significantly affecting the way in which race is felt and sensed in the act of film viewing (Brown and Sekimoto, 2020, p.9).

Social Exclusion and Well-Being of Older Persons in Japan: Comparison between 2010 and 2021

Japan has the oldest population with approximately 30% of the population is 65 and over. Social exclusion of older persons is one of the most important social issues as the number of those who are living alone and who are single throughout their lives are increasing. In response to the COVID-19 pandemic, social and economic activities were restricted, which amplified risks for social exclusion. Studies have shown that social exclusion is negatively associated with health and well-being, and the reduced social engagement caused by the COVID-19 is likely to lead to lower levels of well-being.

Using data from the 2010 and the 2021 East Asian Social Survey (EASS) health module, this study investigates social exclusion and well-being of older persons. Walsh, Scharf and Keating (2016) identified six domains of social exclusion in older age. EASS health modules include detailed information about respondents' health status as well as information on various types of social exclusion domains, such as economic condition, social participation, social support and neighborhood cohesion. This study also examines changes in older persons' well-being and social exclusion over 10 years.

The proportion of those who feel downhearted and depressed sometimes or more often increased significantly from 12.9% in 2010 to 27.6% in 2021. Preliminary results of regression analysis are as follows; while subjective health

and social participation have positive association, loneliness is negatively associated with well-being. There are no substantial changes in the predictors of well-being in 2010 and 2021. The results highlight the importance of social connections to maintain well-being in later years. Discussions include implications for programs and policies to engage older persons at the community level.

Trafficking of Child Domestic Workers: A Gender and Human Rights Perspective

On July 12, 2022 media reported a case of 10-year-old child domestic worker tortured to death by his employer in a posh area of Lahore, Pakistan. Upon investigation it was revealed that his other underage siblings were also being exploited (see for example, https://www.thenews.com.pk/print/974314-child-murder-case-takes-new-turn). Unfortunately every other day similar cases are reported in national media. According to the United Nations Protocol to Prevent, Suppress, and Punish Trafficking in Persons, Especially Women and Children, exploitation of minors for the purpose of labor and/or sex is a form of human trafficking which is a heinous crime against humanity. Several international reports unveil that Pakistan remains among those countries with high prevalence rate of trafficking in persons.

Although the recent Trafficking in Persons Report (2022) has upgraded the ranking of Pakistan from Tier 2 Watch List to Tier 2, it specifically mentions that exploitation of minor domestic workers in Pakistan remains largely an unaddressed severe form of trafficking and human rights abuse. The Government of Pakistan promulgated Trafficking in Persons Act (2018), and notified its rules in 2021, but still there is little understanding about the issues surrounding trafficking in persons, especially the exploitation of minor domestic workers. Since most of the times parents or immediate family members are involved in the exploitation of minors, rarely such cases, aggravated by the COVID-19 economic crunch, are reported or addressed as human trafficking—depriving them of their rights as victims of trafficking.

Drawing upon in-depth interviews and archival data on the exploitation (labor and/or sex) of child domestic workers in Pakistan, this study frames the issue as a human rights abuse within the ambit of human trafficking, and highlights the (in)adequacy of the existing interventions to address the long term gendered vulnerabilities of such children making them susceptible to repeated exploitation throughout their lives.

How People Cope With Their Life Under the COVID-19 Pandemic: The Role of Watching YouTube Consumer-Generated Advertising(CGA) Videos as a Leisure Activity

During the COVID-19 pandemic, people's leisure behaviors changed dramatically. The proliferation of online offering and use has been identified as one significant impact of COVID-19 on leisure. Within this trend, the use of social media started serving people's additional needs. While researchers have investigated roles of social media in diverse areas during the pandemic, the focus on social media use in leisure is understudied. It is unexplored how leisure activity on social media evolved as a coping mechanism in helping people to satisfy their social needs in a highly restricted life under COVID-19. Applying the Uses and Gratifications (U&G) approach, this study takes the leisure activity of watching YouTube Consumer-Generated Advertising(CGA) videos during COVID-19 as a window for investigation. Qualitative in-depth interviews were conducted for examining first, how people use YouTube CGA videos watching to satisfy their social needs under the pandemic; second, how this leisure behavior is influenced by the pandemic; third, how CGA videos influence people's brand attitude and purchase intention in the pandemic. Findings reveal that CGA videos watching served as an *offline shopping substitute* during the pandemic, it also satisfied people's needs for *product-related information collecting, social interaction, companionship, entertainment, passing time, learning, escaping,* and *psychological comfort.* Moreover, under COVID-19, this online video watching was influenced by people's moods, lifestyle changes, and the

severity of the pandemic situation. People started to turn to these videos for social interaction after the outbreak of the pandemic, they involved themselves in this watching activity in various ways except for writing comments. Finally, YouTube CGA videos influenced people's brand attitude and purchase intention both positively and negatively during the pandemic. This study contributes to the literature on CGA and U&G theory, while expanding the understanding for the changing nature of social media use as leisure activity during a health crisis.

Couples' Gender Ideology, Work Hours, and Marital Quality

Using data on 796 heterosexual couples from wave 13 of the German Family Panel (Pairfam) data, this study explores the effect of couples' reports of work hours on marital quality. Using couple-level information, this study tests both the actor effects (i.e., the effects of one's work hours) and partner effects (the effects of one's partner's work hours) on one's reports of marital quality. Moreover, this study examines whether this association varies by couples' gender ideology. The preliminary results suggest that one's partner's reports of work hours are equally important as their own work hours in predicting marital quality. Furthermore, testing gender differences, this study concludes that partners' work hours are especially important for men's reports of marital quality. Finally, regarding the moderating effect of couples' gender ideology, the association between work hours and marital quality emerges among couples who do not share the same ideology (and especially among couples where wives have more egalitarian gender ideology compared to their husbands). I further discuss these results, their implications for the couple dynamics, and their relationship quality.

How Can We Write about an Adult Who Says "I'm Really a Small Child"? :Understanding Others' Experiences By Analyzing the Researcher's Emotional Transformation

This paper focuses on a method called the "interactive life story" in Japan to discuss how analyzing and describing the researcher's emotional transformations could lead to sharing an informant's reality beyond an objective understanding.

The "interactive life story" was proposed by a Japanese researcher based on the theory of active interviewing. The method has been widely referenced in Japan, especially among young researchers conducting minority studies, but has also received much criticism. This paper focuses on criticisms of "self-reflection," which is encouraged in the method, as an active description of the researcher's transformations during interviews including an emotional transformation. The main criticisms of such self-reflection are threefold: (1) possible intrusiveness forcing moral self-transformation; (2) use of limited word counts to describe the researcher's own thoughts and emotions rather than the informant's; and (3) most importantly, a lack of clear explanation regarding what aspect of understanding others' experiences cannot be expressed without the researcher's self-reflection.

This paper responds to these criticisms by examining distinctive scenes from my research. For example, an adult male informant told me about his self-image in which he sees himself as "a small child," which caused him distress. He might need a psychiatric diagnosis. In a typical sociological description, the researcher would only provide an objective understanding: "Although he views himself as a child, he is actually a middle-aged man." However, during the interview, I felt uncomfortable and uneasy in dealing with him acting as an "adult," and eventually I realized that I myself had come to see him as a "small child." Such a process of understanding others beyond objective reasoning cannot be explained without mentioning the researcher's own emotions. Based on my fieldnotes, I will elaborate about these moments of "sharing the subjective reality of others," which arise spontaneously during research.

What Should Successful Climate Governance be like?:Implications and Lessons from the 2050 Carbon Neutrality Commission in Republic of Korea

How can governance bodies reach an agreement if extremely opposite positions collide? Can a majority vote be an alternative? Can dialogue and deliberation be an appropriate way to draw desirable conclusions? This study explores a Korean case which has drawn a consensus through the highest climate governance body, called 2050 Carbon Neutrality Commission (2050 CNC) when it established 2050 carbon neutrality scenarios and, especially, enhance 2030 NDC. After declaring 2050 carbon neutrality target in Oct. 2020, the Korean government (Moon Jae-in government) undertook those two tasks through a governance system. The ex-government initiated the 2050 CNC in May 2021, as a main platform to coordinate and deliberate Korea's climate policy toward a net-zero society, based on participation of diverse experts and parties of interest (e.g. industries, civil societies, labor, etc.), in addition

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

to ex officio ministers. In particular, it set up Citizens' Council for Carbon Neutrality in order to collect informed opinions from general citizens as a way of public engagement process. With high growth rates of GHG emissions and high share of energy-intensive manufacturing industries, it was very controversial to strengthen 2030 NDC from 26.3% below 2018 level, especially because of contrasting positions of civil groups and industrial groups. Despite the resignation of four civilian members who advocated higher targets (50% reduction from 2018 level), members of CNC eventually agreed to a 40% reduction compared to 2018 level, but how to evaluate this agreement remains a challenge. Although South Korea's CNC did not meet the level recommended by IPCC, it is highly commendable that it contributed to reaching a consensus on above 35% set by the National Assembly while absorbing strong opposition from the industry, especially under time constraint. Nevertheless, there are still many obstacles to overcome in order to take a more active step towards carbon neutrality.

Ethical Culture and Religion As a Factor of Assertive Identity Formation in Chechnya and the North Caucasus

In the age of modern civilisation, with its migratory movements and increasing multiethnicity, it is essential for its members to develop effective communication and assertive behaviour. It is appropriate to draw on the socio-cultural experience of the past in forming such identities.

The subject: the influence of ethical culture and religion on the formation of assertive identity.

The aim: to reveal the specificity of identity formation under the influence of ethical culture and religion in the past and present.

Materials and method. The study used an interdisciplinary, sociocultural approach, analyzing the data of sociological surveys.

The result: Mountain culture played a significant role in identity formation in Chechnya and the North Caucasus. There was a code of honour that accumulated cultural experience, norms of behaviour and values. Passivity was deplored in society, and everyone aspired to be active. Assertive behaviour was expressed in the orientation towards the cult, the ideal of the "Khonah" man, who is characterised not only by courage, bravery and the ability to resist a superior force, but also by wisdom, diplomacy, the ability to argue for his opinion, individual and collective right. The formation of this identity was facilitated by the tradition of competing in nobleness and doing good deeds for others; it was considered a duty to stand up for the rights of the other, especially the vulnerable and the weak. With the adoption of Islam there was an organic interweaving of ethno-culture and religion, and the "Ustazi", religious teachers, oriented towards moderation, mediocrity in life choices, respect and openness to others. Sociological surveys reveal the adherence of respondents to traditional perceptions of Chechen identity, and the extent to which is expressed in social communication. Contemporary life is characterised by high social mobility, social networks, channels of information, and transformation and adaptation of identities.

The Linguistic and Religious Dominance of Identity in the Context of Regional Conflict

Many countries in the world are multi-ethnic and multi-religious. There are processes of universalisation and preservation of cultural and linguistic specificity. Some states pursue a policy of pluralism of cultures, ensuring unity in diversity, while others pursue a policy of monism, strengthening unity through unification. In conditions of social crisis, the contradictions between the linguistic and cultural interests of different ethnic groups, the basic people of the country and the institutions of power are often exacerbated. This report examines this issue using Chechnya as an example.

The subject of research is the linguistic, religious and cultural features of identity in a regional conflict space.The purpose of research: To reveal the peculiarities of linguistic, ethno-cultural and religious identity in the regional conflict space.Materials and method. The research applied the principle of objectivity, comparison, activity, socio-cultural and conflictological approaches, and used methods of quantitative analysis of sociological data.

Result. The identity is multiple, its components form a hierarchy, and depending on the social situation, a different type of identity may be actualized. In a pre-conflict situation, nationalism, language and religion become a factor in the sociopolitical mobilisation of the protesting part of the population. In the course of the conflict, language takes second place and national consciousness and religion become the dominant markers in collective identification. The report presents sociological indicators that characterise identification, the relationship between the ethno-cultural and the religious, linguistic interests and religious ideas about the structure of the community at different stages in the development of the conflict. The value motivation of the migration of refugees to the East after the Caucasian War (X1X century) and to the West after the two wars (XX-XX1 centuries) is compared with their expected identity perspectives. Conclusion. The theme underlined above calls for further sociological monitoring.

ZABAN, Hila* (Kinneret Academic College on the Sea of Galilee, Israel)

The Appropriation of the Ancestral Homeland: The Case of Privileged Jewish Migration to Israel

This paper looks at (return) migration of Western diaspora Jews to Israel. I suggest a 'lifestyle migration' framing, rather than the ideologically loaded term 'Aliyah' (literally: to ascend), the commonly used term for Jewish migration to Israel. While Aliyah focuses on the particularity of the case of Jewish diasporas returning to Israel, lifestyle migration enables us to view privileged forms of Jewish migration to Israel within global mobility trends. It also enables us to look at the impacts that privileged migration could have on the places where it settles—formation of ethnic enclaves, gentrification, or displacement of other groups. As Israel is an ethnic migration country, people of Jewish ancestry have a legal right to migrate to Israel and naturalise there. The state's agenda, ever since the Israel's establishment in 1948, has always been to encourage and support Jewish migration and its integration in Israel, while privileged migration is particularly desired.

The presentation is based on three projects over a decade and a half: the migration of Jews from USA/France/UK who settled in one Jerusalem neighbourhood (Baka) between the 1960s-2010s, participating in its gentrification; the back-and-forth mobility of British-Jews with second homes in Israel and their impacts on Israeli cities; and the residential choices of recent migrants (2016-2021) from USA/Canada/UK to Israel. The findings I will present will argue for a strong sense of feeling 'at home' in Israel, their ancestral home, even for people whose earlier connections with Israel were limited. This sentiment towards Israel is passed through education, religious practice, and policies of Israel and the leadership of Jewish communities in the sending countries. Looking at the role of place in the 'home-making' of migrants, I will focus on people's motivations to settle/buy second homes in particular places, and the integration routes they take.

RC35-526.2

ZABLUDOVSKY, Gina* (Universidad Nacional Autónoma de México, Mexico)

El Concepto De Carisma

El concepto de carisma- The Concept of Charisma
Por Gina Zabludovsky Kuper
Palabras: Carisma, liderazgo, autoridad, dominación
Words: Charisma, Leadership, Authority, Domination

La ponencia abordará el carácter "elusive" del concepto de carisma. La incorporación de este término dentro de las ciencias sociales se vincula con la teoría de la dominación que Max Weber formuló durante las dos primeras décadas de siglo XX. En contraposición con las "dominaciones estables "como la tradicional y la burocrática, el carisma tiene un carácter efímero ya que la legitimidad se asocia a las características consideradas como innatas de un líder. Por su propia definición y en la medida en que no está sujeto a una normatividad específica, a una estructura jerárquica de funcionarios, ni a un poder acotado por instituciones independientes, el carisma tiene un carácter poco preciso y cambiante pero casi siempre vinculado con la concentración del poder de un individuo que se presenta como un "caudillo" con una misión a cumplir en favor del "pueblo" o a la "masa". En la actualidad, con la importancia de los medios de comunicación masiva, la concepción del carisma ha cambiado mucho y a menudo se considera que éste puede construirse con una buena asesoría política o de mediática. Además, el concepto se ha generalizado demasiado ya que, más allá de la política, en la cultura de las celebridades propias de las sociedades actuales, el término suele utilizarse para hablar del "magnetismo" de otras personalidades como actores de cine, cantantes o deportistas.

ZACARIAS, Abilio* (ISEG-University of Lisbon, Portugal)

The Characteristics of Board Chair for More Effective Recruitment Process in Times of Financial Crisis.

Purpose - Analysing the board of directors of companies is a relevant and timely topic. As a representative of the shareholders, the board is the most senior management body of a company. Therefore, knowing what kind of candidates should be nominated, what characteristics they should have for board leadership in times of financial crisis, those able to contribute towards better company performance, certainly holds great interest.

Methodology – The study applied information collected by surveying the person in charge of the day-to-day management of 1,000 largest non-financial companies and the 100 largest financial companies in Portugal. We processed the data through STATA 17.0, applying multivariate analysis (MANOVA) to the variables.

Findings - The study affirms that the vast majority of boards in the sample run dual leadership structures. Agency theory and stewardship theory postulate different characteristics for the board chair but our results provide proof for either perspective. On the other hand, they did validate the behavioural theory of firms (BToF) in concluding that experience interlinks with levels of organisational performance.

Originality - Analysing companies not listed on financial markets is also relevant not only because of their representativeness in the economy but also because they receive very little research attention with this study thus unprecedented. This article also reaches beyond the scope of Anglo-Saxon countries.

Practical implications – The characteristics that board chairs should hold to ensure more effective organisations.

ZACHOU, Chrysanthi* (The American College, Greece)

Collective Memory and the Ritual Enactment of National Identity: The Centennial Celebration of the Greek Asia Minor Disaster

Following the bicentennial celebration (1821-2021) since the outbreak of the Greek Revolution against the Ottoman Empire, the Greek state, under the pressure of refugee associations, decided to dedicate 2022 to the centenary of the 'Asia Minor Catastrophe'. The defeat of the Greek Army in the Greek-Turkish war (1919-1922), the burning of cosmopolitan city of Smyrna (modern Izmir, Turkey) and the mass killings, brought the expulsion of the Greek population from the millennia old homelands in Asia Minor. About 1,200,000 refugees were forced to flee to mainland Greece under appalling conditions. Perceived as collective trauma, the Asia Minor Disaster constitutes a milestone in modern Greek history and has left an indelible mark on the nation's collective memory and consciousness. Yet, despite their Greek origin, the integration of refugees was not uneventful. Originally faced with discrimination and negative stereotyping by the locals, they were excluded from the national narrative. Focusing on the commemorative activities for the 100 years from the Asia Minor disaster, the paper explores the relation between memory and history and the ways in which the past has been/is (re)negotiated and (re)constructed by the state and state agents and by the refugees and their associations over time. As evident from the innumerable events scheduled as part of the program "All Greece one Culture 2022" of the Ministry of Culture -many of which are organized by refugee associations- the interplay of remembrance and forgetting reshapes the collective trauma as national cultural trauma by selectively reconstructing refugee memory (and the national narrative). Silencing annoying memories and politically inconvenient references, and with the integrative function of rituals, the centennial promotes a national narrative of homogeneity and belonging, which celebrates Asia Minor's distinct cultural traditions as part of the country's cultural heritage and acknowledges the refugee communities' contribution to the making of modern Greece.

ZADEGAN, Shahnaz* (Payame Noor University(PNU), Iran)

Gentrification and the Secret of Iranian Resilience Against Inflation and Covid-19 Pandemic

In 1952, CA Lambton wrote the book "Landlord and Farmer" after years of anthropological research in the villages of Iran. Lambton asserts Iranian poor farmers are unable to control their fate, because they can not cooperate and participate to realize any united organization. Morteza Farhadi in his work "Culture of Cooperation" introduces many cases of cooperation and participation among Iranian villagers by anthropological method. However,

there is less qualitative study on the presence or absence of cooperation among city residents in Iran. In this article, the issue of cooperation and mutual support is studied in the cities as one of the secrets of Iranian resilience against inflation during forty years external boycott and 19-Covid pandemic. The method of research is interview with approximately 200 shopkeepers of urban local supermarkets and mini markets. The interviews continue until theoretical saturation. Population includes local super and mini markets in large, medium and small cities. The interviews uncover and reveal a continuous and enduring social and supportive relationship that many years has been between local shopkeepers and local poor customers in cities. It shows partly the secret of Iranian resilience against external economic and political boycott.

Urban sociologists including Sharon Zukin, David Harvey and John Rennie Short, have discussed gentrification (hypermarkets, tourist attractions, entertainment parks, …) in the cities. It means hypermarkets are replacing supermarkets under the title of Gentrification, which destroys the local support system. Gentrification disrupts stable local social communities. In Iran gentrification is expanding significantly in the cities. With the expansion of hypermarkets in gentrified areas, local supermarkets and mini markets and their diverse social functions will be disappeared. Hoping that with scientific study, a solution will be found to maintain this local support system and improve it.

ZADKOWSKA, Magdalena* (University of Gdansk, Poland)

Family Mission Accomplished? Couple in Empty Nest and Recomposition of Gender Roles.

The purpose of this paper is to tell the story of couples' lives in the empty nest and to show what connects two people ('connectors' Gabb 2015) who are in a long-term relationship. New Family Studies (Levin and Trost 1992; Bernardes 2008; Cheal 2008; Morgan 1996; Gabb 2008) understand kinship: as a set of flexible, time-varying relational practices rather than hierarchical and timeless structures. The moment when children are leaving home is an important moment for a couple. It can be prepared, expected, dreamed about but it can also be sudden, unexpected and a threatening. No matter previous preparation suddenly there is only "just two of us" in the nest. The couples' stories come from research conducted in Poland and in France between 2019 and 2021 in a research project (*Till death do us part... Everyday life practices of 50-64 years old couples with at least 20 years' of common life experience)* that involved in 58 conjoint interviews with respondents aged 44-68 in their homes. Previous studies of the everyday life practices of intimate couples mainly focus on the beginnings of a couple's life (Kaufmann 1992, 1996, 1998, Schmidt 2015), critical moments related to gender roles and the appearance of the first and subsequent children (Schmidt 2018, Żadkowska 2016) on the couple in the context of reconciling work and family life (Gądecki 2016) or the sharing of household responsibilities (Żadkowska 2016). There is still a noticeable gap in the analyses of long-established couples (Smart 2007), even though the impact of the empty nest on marital relationships is one of the main threads of research dedicated to the 'empty nest' issue (Mitchel 2016). The paper will try to answer the question what happens to established gender roles and everyday life practices while "the family mission" is accomplished.

Waves of Anti-Racist Mobilization and Challenges to Racial Capitalism Since the 1980 until Today

In the social sciences, we have recently seen a renewed engagement with the relationship and connections between racism and capitalism which are often framed through concepts of racial or racialized capitalism. In so doing, these discussions can build upon a long legacy of critical perspectives: From dependency and world-systems theory to post-colonial approaches, from critical theory to Black Marxism and Cultural Studies. Simultaneously, however the newly emerging theories seem strangely disconnected from knowledges produced in the context of social movements trying to change structures of (racialized) inequalities. In this paper, we want to put such knowledges center stage by investigating the interrelations of capitalism, racism, and anti-racist mobilization through the lens of specific social movement contexts in Germany: namely, earlier attempts of antiracist mobilization in Refugee protests of the 1980s and early 1990s on the one hand, and the contemporary wave of Black

Lives Matter protests on the other. By bringing these two contexts into dialogue with each other, we illuminate some of the specifics of anti-racist struggles in the German context but also draw attention to the ways in which ideas and concepts central to these movements with regards to racialised capitalism 'travelled' both temporally and geographically.

RC05-94.1

ZAKHAROV, Nikolay* (Södertörn University, Sweden)

Futures of Anti-Racism: Comparative Perspectives

This presentation discusses the nature and extent of the project of deracialization required to counter the contemporary dynamics of racialization across four varieties of modernity—Sweden, South Africa, Brazil, and the United Kingdom — based on the original research on each of the four country's contexts. Since it began to be recognized or identified as a problem, an assemblage of supra-national initiatives has been devised in the name of combatting, dismantling, or reducing racism. So, in this study I present the results of the investigation of the effectiveness of the roles played by the South African Human Rights Commission South African Human Rights Commission (SAHRC), the UK's Equality and Human Rights Commission Equality and Human Rights Commission (EHRC) and the Race Disparity Unit Race Disparity Unit (RDU), the Special Secretariat for Racial Equality Special Secretariat for Racial Equality in Brazil, and in Sweden, the National Plan to Combat Racism and the Equality Ombudsman National Plan to Combat Racism. Deracialization as a possible future in national anti-racism projects is politically contested because of the seemingly impossible task of 'decolonizing global imaginaries' and reimagining the world differently through anti-racist and decolonization commitment, and anti-racism and decolonization efforts nationally and transnationally. These efforts must go beyond legislative intent. The shape of those efforts would vary in terms of unpicking and unsuturing from the white rule embedded in systemic and institutionalized racism. However, deracialization is embattled in all contexts. This presentation looks first at old and new approaches to deracialization, before moving to a south-north comparison of racial inequality and anti-racism and cross-national implications for/of deracialization projects, segueing into a conclusion on decolonizing deracialization and anti-racism.

Religion in Authoritarian Belarus: Protest Mobilisations Against Election Fraud and Against War in Ukraine

In post-communist Europe, the Church still retains its role of a support of the state's project of national identity, or otherwise it contributes to the preservation of ethnic identity of minorities, but it rarely works as a locus of civil resistance. However, the religious factor unexpectedly became central to both the mobilizations and to government repressions in Belarus, where the initiatives of religious groups have fostered collective action in the state system that is punitive of any dissent. Moreover, the forms of protest that Church could suggest neatly fit into the non-democratic settings of Belarus, providing with a necessary opportunity structure for otherwise forbidden mobilizations.

Based on interviews with clergy and active believers as well as on the analysis of media sources and official documents this paper analyses the position of the Churches on the recent events in Belarus and discusses why their contract with the authoritarian regime was broken. The article identifies Churches as an ambivalent space: one where the state can exercise social control, but where potential resistance to the repressive state might also occur since they enjoy a greater degree of freedom than other organisations in authoritarian Belarus. This study argues that religion can be seen as a privileged arena of protest within existing legal frameworks of the "contract" between the state and the Church. Moreover, religion-based movements have the option of pursuing the path of strategic accommodation by emphasising values, aims, and even patterns of resistance that are not incongruent with normative standards within the authoritarian state. Amidst the post-Soviet distrust both of the rulers and of those who actively protest against them, as well as generally weak interest or disillusionment in politics, religious denominations provided an institutional frame for supposedly depoliticized forms of protest, featuring non-violence and non-ideological slogans.

Recipes for Crafting Authenticity and Coloniality

This paper sheds light on the dark side of craft by examining how local elites project images of craft and coloniality through claims of authenticity in postcolonial contexts. We focus on the contemporary Peruvian culinary field where elite chefs are spearheading a new cuisine based on the appropriation of cultural elements of native indigenous communities. Drawing on an ethnography of the new Peruvian cuisine, we find that elite chefs project images of craft through three authenticity claim-making practices: the rediscovery, reinterpretation, and revaluation of marginalized cultural elements. However, these overtly celebrated practices disguise practices of extraction, elevation, and exploitation of marginalized cultures whereby the logic of coloniality operates. From this, we make two contributions to the literature on craft authenticity: we put forth a process model of domestic cultural appropriation where images of craft and coloniality are two sides of the same coin and we uncover the enchanting role of craft-based authenticity claims in concealing the reproduction of coloniality.

Inequalities in Pay and Occupation Among STEM Graduates: What Do Administrative Data from the Brazilian Government Reveal?

This paper follows the inter- and intragenerational mobility of a cohort of 2011 graduates in science, technology, engineering, and mathematics (STEM) programs in Brazil for a period of seven years after graduation. It analyzes how the effects of the social origins on inequalities in the labor market are mediated by the characteristics of higher education programs and institutions. For doing so, we joined several individual-level administrative records from the Brazilian government, with emphasis on the educational and employment datasets. We built novel indicators related to the prestige and quality of higher education programs and institutions, as well as for the occupational position of workers. In addition to a rich set of descriptive statistics, which portrays graduates' trajectories and their intragenerational mobility, we use multilevel regression models to estimate the effect of higher education on their intergenerational mobility. The results show that: (i) the influence of higher education on intergenerational inequality is substantial but decreases over time; (ii) the effect of social origins is partially mediated by higher education trajectory; (iii) this mediation is higher for parents' education and lower for gender. The former reveals the importance of education to reduce intergenerational inequalities, while the latter shows that the labor market has its own inequality mechanisms; (iv) quality of the initial occupation of graduates is essential for their medium-term intragenerational mobility.

The Socio-Economic Characteristics of the Productivity Strata of the Economic Sectors of Mexico in 2005 and 2020.

In this research we identified the factors associated with the evolution of productive employment in Mexico and its regions in 2005 and 2020. The main economic and socio-labor characteristics of those employed in the sectors of economic activity. Likewise, the analytical framework of structural heterogeneity is rescued and operationalized through a conditional Latent Class Analysis (LCA). With this we studied the productivity level of 61 economic subsectors of Mexico and the change in their socio-economics characteristics in 2005 and 2020. We used data from the National Occupation and Employment Survey (ENOE) and the Economic Census to generate four indicators to approximate the three strata of economic activity.

We studied the Mexican labor market's macro-, meso-, and micro-relationships at the national and regional levels. We returned to the concept of Structural Heterogeneity originally planted by Anibal Pinto and the Economic Commission for Latin America and the Caribbean in the sixties that describe three sectors of productivity: the modern sector, which is highly integrated into the foreign trade; the intermediate sector, dedicated to supplying the national demand; and the low sector, that produces nearly at the subsistence level.

Additionally, we use the model's types of occupation, years of education, and income as conditional variables. We found a robust classification using LCA approach that supports structural heterogeneity, according to what is expected by the theory.

About half of those employed in the low productivity sector and profound differences in education and income between the productive sectors are explanatory factors of the country's economic inequality. We found that the factors affecting the Mexican labor market are complex and are conditioned by the degree of structural heterogeneity and how the country was inserted into the international division of labor after the change in the development model that prioritized trade liberalization.

Class Differences in Digital Capital Accumulation: How Social Background Dictates Digital Socialisation of Young Adults in Poland

Academic discourse on digital divide focuses on how unequal distribution of ICTs access and digital skills causes some social groups to miss out on online and offline benefits (van Deursen et al., 2021), similarly to the process of capital conversion in Pierre Bourdieu's theory (1986). Because of that, the notion of digital capital gains recognition, as scholars discuss how the use of ICT translates to outcomes in other spheres of life (Ragnedda & Ruiu, 2020; Calderon Gomez, 2021). Previous research on the digital skills of young adults (Helsper, 2017; Eynon, 2021) showed how young, technologically savvy people accumulate access and competence needed to boost their, already high, chances of social success. I argue that to understand the effects digital capital has on the lives of young people, we need to research an overview of technologically domesticated people that use technology in a specific context, including people that are usually less visible in studies. In this paper, I aim to show class differences in digital capital accumulation throughout the process of technological socialization of young adults in Poland. The results, based on 15 In-depth Interviews using Biographic Narrative Interpretive Method, show that young people having high or medium level SES and living in bigger cities tended to not only use the internet more critically but had a lot more opportunities to engage with digital technologies throughout their lives than people from lower classes. Additionally, young people with higher education were the most conscious about how their digital skills translated into their current employment, whereas people that had secondary education did not see the connection between digital skills and their employment. The results highlight the general tendency where inequality over digital capital distribution fossilizes other inequalities in economic, social, and cultural capital distribution.

ZAMPIERI, Giovanni* (Università degli Studi di Padova, Italy)

Judge, Physician, Teacher, and Father. Metaphorizations of the Habitus in Early Modern Manuals for Confessors (1563–1750).

As an outcome of the Tridentine Council (1545-1563), the Roman Catholic Church established the centrality of Sacramental Penance as a tool for the salvation and discipline of believers, especially in the Italian peninsula, where the circulation of Protestant and heretical ideas undermined the already precarious legitimacy of the organization. Paralleling the mobilization of a disciplinary infrastructure aimed at improving the training of secular priests (e.g., seminaries and monitoring practices), Bishops and members of the Company of Jesus authored and distributed a particular type of cultural object: manuals for confessors. These books provided their readers with all was needed to perform the role of confessor in line with the liturgical standards established by the institution they represented—that is, the Counter-Reformation Church. In this paper, I examine how the authors of twenty manuals for confessors analogized the role of the confessor to the roles of judge, physician, teacher, and father. By mobilizing these metaphors, the producers of these cultural artifacts aimed at explaining to parish priests how to behave inside and outside confessional boxes; the confessor had to be—and appear—competent, to preserve the symbolic capital of the Catholic Church, and to reproduce the existing power asymmetries between himself and his parishioners. In sociological terms, these texts exemplify a form of objectified cultural capital that the members of the Church high in cultural and symbolic capital used to standardize the habitus, and thus the behavior, of those who occupied the lower ranks of the organization within a newly-defined and still unstable religious field.

RC56-758.1

ZAMPIERI, Giovanni* (Università degli Studi di Padova, Italy)

The Salvation of the Soul, the Salvation of the Face. Strategy and Tactics within the Catholic Disciplinary Revolution (16th–18th centuries).

Threatened by the Protestant Reformation, the Roman Catholic Church strengthened the tenets of its religious message and strived to discipline its members and believers. The decrees emanated by the bishops at the Tridentine Council (1545-1563) established the creation of training institutions for priests (e.g. diocesan seminaries), the mobilization of control mechanisms (e.g., pastoral visitations performed by Bishops), and the circulation of expertise through missions managed by knowledgeable members of the Company of Jesus. As a tool to control the circulation of ideas and instruct penitents on the tenets of the renewed religious message, auricular confession occupied a central place in the sacramental economy of the Counter-Reformation Church, as ordinary priests had to obtain a license to perform the sacrament and were asked to keep registers of those parishioners who eschew confession. Penitents, however, did not undergo this disciplinary turn passively. In this paper, I examine the resistance strategies acted out by believers as they are represented in twenty early modern manuals for confession targeted at parish

priests. By using Michel De Certeau's concepts of "strategy" and "tactics," I argue that while the Counter-Reformation Church produced and enforced strategies aimed at governing the conduct of believers, the latter were creatively able to exploit the loopholes in this infrastructure. The tactics mobilized by penitents show that they believed in the sacramental nature of auricular confession, but also wished to save their face with their fellow parishioners taking advantage of Sacramental Penance as a powerful tool to shape their local reputation.

Ruling the Skin: Body and Legislative Proposals in Brazil

This communication aims to examine the statute of the human body through the bills on the "skin" proposed and discussed in the Brazilian Parliament. It seeks to present how the "skin" is constructed as a symbol and which social meanings are disputed in the process of creating laws. In order to circumscribe the social intelligibility of the "skin", the contents of legislative proposals available on the website of the Chamber of Deputies of Brazil are examined. Social studies on the "skin" are part of the recent field of research of the sociology of the body, constituting a subfield formed by several areas of knowledge, including anthropology, sociology and history. As an object of investigation, the "skin" presents itself as a limit, that is, the border between the body and the world that surrounds it, but it is also, simultaneously, part of that body. ; by marking the skin, the body is marked; by modifying, attacking or preserving the skin, one is doing the same to the body. The skin is also a marker of differences, equally marked by differences. In this multidisciplinary field invoked by "skin", issues related to gender, race, age, health and illness, identity, violence and body modifications (piercings, tattoos and surgeries, for example) are faced. About 150 bills were identified between the years 1968 to 2021. From this analytical corpus, it is highlighted that the Brazilian Parliament constitutes itself as a stage in which different social aspirations are concretized to configure an uncertain, diversified and, sometimes, incoherent public order of the body, confronting the medical-scientific discourse with conceptions of the common sense.

Youth and Their Future Aspirations: Reflections on the Relationship between School and Inner Entrepreneurship

This communication analyzes the relationship between school, youth and inner entrepreneurship of students at the Instituto Estadual de Educação, Ciência e Tecnologia do Maranhão (IEMA), Matões, state of Maranhão, in the Northeast of Brazil. The focus is the discipline called "Inner Entrepreneurship" (in portuguese, "Projeto de Vida"), which was inserted in the school curriculum from the reform of High School, enacted by Law n. 13.415/2017. This discipline aims to encourage the exercise of youth leadership, focusing on the development of skills and abilities that promote self-knowledge, perspectives on the future, values and socio-emotional skills. The research, in the development phase, is built by a qualitative approach, with bibliographic and documentary analysis and field research, through interviews with focus groups. It is intended to expand the academic discussions on the theme School, Youth and inner entrepreneurship, in addition to reflecting on the sociological relevance of these categories in the Brazilian educational context.

Bourgeois-Aristocratic Alliance As an Overlooked Source of Peripheral Nationalism

The sources of peripheral nationalism, particularly in Central and Eastern Europe, are usually seen in the actions of the intelligentsia or the cultural elite of the region. By its very definition, it is opposed to landed and financial elites. One can't deny that it was intelligentsia who was behind creation of key mythical images of nations striving for political emancipation since at least the end part of the 19th century. However, as Keith Hart has argued, in major powers of the time, including the US, Russia, Britain, France, and Germany, political revolutions took place in the 1860s and early 70s, each aiming to synthesize industrial capitalism and the nation-state. It was then that the modern idea of a *nation* emerged. As Hart points out, it was, in fact, a largely anti-modern concept. In my paper, I will argue that the same kind of crucial alliance that Hart mentions stood behind the emergence of part of what can be called peripheral nationalisms. Polish nationalism seems to be a good case in point. Interestingly the role of these alliances for minor nationalisms of Central and Eastern Europe is overlooked in global history and, in particular, in national historiographies, which tend to privilege the role of the national intelligentsias. However, it was not until around 1918 that the intelligentsias became dominant forces in the national fields of power. Before, they played a rather subordinate role and largely responded to the needs of the aristocratic-bourgeois alliance. This paper will analyze the forms and motives for which the

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

political revolution of the second part of the 19th century in the Polish territories led the new alliances to often support the peripheral Polish and not always dominant imperial nationalisms. I will also reflect on the reasons why these roots of Polish nationalism are currently largely forgotten.

The Strategies of Pretense and Disguise As Norm-Destabilizing Factors

Our research concerns the perception of complying, omitting, ignoring, contesting and, violating a variety of social norms. In order to describe this phenomenon, we apply the language of a number of well-known game theories (E. Berne, P. Bourdieu, V. Turner) as well as formal game-theoretic models. We distinguish an array of social behaviors that contribute to the destabilization of the norms regulating a given social game. We observe that in some cases individuals are more encouraged to abuse the existing norms and benefit from it. We are particularly interested in analyzing these strategies, which include broadly understood "pretense" and "disguise" (regarding: facts, attitudes, values, actions, capitals). The mechanics of these actions impacts the evolution of the norms of a given game, which have to adapt to these behavioral changes. The digitization of interpersonal relations and contemporary shift towards cyber-environments seem to amplify these processes and attitudes even further, contributing to the growing significance of pretense/disguise strategies.

Moreover, identification of concrete mechanisms of explaining/rationalizing the very adoption of these different approaches/attitudes provides us with many interesting observations. Our research has an empirical component embedded in the study of a few particular social games which we distinguish, reconstruct and analyze ("green responsibility" game; "being a professional" game; "beautiful life" game). In all of these games individuals play to win social recognition and respect. We use classic analytical categories (field, habitus, capitals) to create, describe and operationalize the model. In particular we analyze: (a) awareness and motivation to pretense/disguise (parameters characterizing the individual); (b) circumstances encouraging the individual to adopt a given pretense/disguise strategy (parameters characterizing the context); (c) reaction patterns, types and effectiveness of sanctions (parameters characterizing game-stabilizing factors); (d) the effectiveness of pretense/ disguise (parameters describing the overall pragmatic assessment of a given strategy).

RC45-635.2

ZARZYCKI, Roland* (Collegium Civitas, Poland)

Transformations of Capital, Justification and Rationalization Structures

The processes of blurring the concept of truth, crises of attitudes and values, as well as the elusiveness of the difference between declarations and actual actions liquefy everyday social life. This in turn may imply a number of negative consequences for the lives of societies and individuals (e.g. disinformation, populisms, identity disorders) (Z. Bauman; U. Beck; A. Giddens; and others). Well-known game theories (E. Berne; P. Bourdieu; V. Turner) provide us with good tools and models, which can be applied to describe the universe of strategies adopted by individuals within the social games they play. However, typically "pretense" and "disguise" strategies are not taken into account by these classical approaches. This area of research is less popular due to the obstacles related to the necessity of including highly speculative factors such as the intentionality of actors. On the other hand, the recent intense spread of pretense/disguise strategies seems to be closely related to the neoliberal organization of social life, including galloping commodification of all spheres of life resulting in mono-capitalism.

Understanding the emerging rationalities underlying pretense/disguise strategies as well as the metamorphoses imposed on the old rationalities by new circumstances is a research object of key importance on our way to reveal the big picture. The analysis of narratives used by individuals to justify their behavior and/or evaluate other people's actions is our primary empirical source of information. In this context we observe that the very structures of argumentation and rationality explaining pretense/disguise are class-related and deeply rooted in social inequalities. Various strategies require various types of capital and/or semblances of different capitals, which is an intriguing aspect of the analysis.

ZAVALETA, Jose Alfredo* (Universidad de Veracruz, Mexico)

Las Arenas Públicas En Torno Del Corredor Del Istmo De Tehuantepec, México

El diseño técnico del CIIT ha sido producto de una política gubernamental basada en alianzas con empresarios e investigadores articulados en torno a la CONCAMIN y otras organizaciones empresariales, consultoras y universidades regionales que participan de este proceso. En esta lógica, el gobierno federal, comenzó la construcción del CIIT mediante la integración logística de puertos, nuevas carreteras y la renovación de vías para un tren transístmico, sin debate público acerca de las implicaciones socioculturales de éste y sólo, una vez iniciada la implementación, ha realizado foros de consulta a pueblos implicados en la construcción de infraestructura y el esquema de inversiones privadas, los cuales son considerados limitados por las comunidades (PNUD, 2020).

En contraparte, organizaciones indígenas, campesinas y urbanas, organizadas en redes de movimientos, recuperan el repertorio de protestas utilizadas por diferentes luchas sociales y políticas de décadas pasadas en defensa del territorio, la lucha por los gobiernos locales, la oposición a los parques eólicos y la inseguridad, con el propósito de resistencia, negociación y obtención de beneficios. Los pobladores de la región argumentan que desconocen los elementos financieros y técnicos del proyecto, denuncian la simulación de consulta a pueblos indígenas y campesinos, porque argumentan que son utilizadas para la legitimación de un proyecto en curso, sin la autorización efectiva de las comunidades. Las organizaciones y redes de movimientos en las cuales participan los pobladores, reivindican saberes populares, servicios públicos (carreteras, escuelas, pagos de tierra, pago de rentas) e inclusión en las decisiones acerca de la reparación de daños a recursos naturales y respeto del multiculturalismo.

How Covid-19 Pandemic Has Tempered Ukrainians to Effectively Conduct Sociological Health Research in the Context of War and Any Future Crises

Background:
Researching how older people with HIV (OPWH, defined as ≥50 years) in Ukraine cope with crises, we developed new instruments, adapting to a "new reality".

Methods:
During Covid-19 (April-May 2021), we conducted 22 qualitative phone interviews with 11 pairs of OPWH and their caregivers. During the war (March-April 2022), we conducted 10 qualitative phone interviews with 5 OPWH and 5 HIV clinicians in Kyiv. Our team critically reflected on fieldwork experiences to identify key lessons learned that may apply to researching future crises.

Results:

1. Remote data collection (by phone, Zoom, Vyber) and remote payment of participant compensation developed for Covid-19, became applicable and important during the war when many Ukrainians are forced to move to other regions of Ukraine or overseas.

2. Resilience to stress of the total population has increased in the last 2 years - the pandemic tempered! Like at the beginning of the pandemic, when the war began and "normal life" stopped, people's readiness to work was remarkable. Our research team quickly responded to crisis realities, rethinking the mechanisms and research tools, which did not stop the workflow.

3. During the data collection - interviewing remotely, there was an exchange of psychological support between the interviewer and the respondent, each party stated this.

4. It was important from the beginning of the pandemic to date to continue research, as the consistent workflow provided financial support for both researchers and research participants.

Conclusions:
Continuing research during crises produces essential knowledge for managing future crises and provides timely support buffering staff from great personal cost becoming an indefinite 'new normal'. OPWH could be hired as peer navigators, tapping into their desire to help others. Medical staff can be trained in coping with fear, stress, to primarily stabilize own condition, and then provide assistance to another.

The Willingness of Older People with HIV to Live and Clinicians to Work When a "Normal Life" Is Stopped.

Background:
To understand how older people with HIV (OPWH, defined as ≥50 years) cope during the war with daily life challenges and HIV and non-HIV care, we explored experiences of both OPWH and clinicians living in Kyiv, Ukraine.
Methods:
Qualitative phone interviews conducted in March-April 2022 with five OPWH and five HIV clinicians in Kyiv were audio-recorded, transcribed verbatim, and analyzed for themes.
Results:
Four key themes captured how participants viewed the immediate response to crisis:

1) Unlike many younger patients, most OPWH from Kyiv did not evacuate. Reasons included impaired mobility, fear of the unknown, lack of financial and other resources needed for evacuation, emotional attachment to home, caregiving responsibilities, and/or wishing to stay close to their trusted HIV and other healthcare providers.

2) Reluctant HIV status disclosure to receive help with accessing ART during the war (to relatives and/or clinician "strangers" when OPWH evacuated).

3) The war disrupted "normalcy" but produced overwhelming solidarity and mutual support. HIV care continued through ingenuity and sacrifice by clinicians. While clinics lost half of frontline personnel who evacuated, remaining clinicians worked intensively to accommodate all patients, and performed additional tasks, including custodial, to assist internally displaced patients, and provide psychosocial post-trauma counseling.

4) Clinical directors' decisions since war began despite imperfect information and unknown outcomes saved continuity of workflow through financial support and psychological help to personnel survive war risks. Work was therapeutic for staff, helping them manage uncertainty and high stress.
Conclusions:
OPWH and clinicians in KYIV need urgent social support lest coping at the expense of greater personal sacrifice becomes "new normal". As Ukrainian society rebuilds after the war, one option may include introducing training for medical staff on how to personally cope with fear, stress, and anger, to initially stabilize own mental health condition, before providing assistance to another.

Feminist and Queer Activisms and the Transformation of Gender Studies in Greece: Encounters on Gender Related Violence.

Our paper discusses the role of feminist and queer politics in the construction and transformation of gender studies in Greece, focusing specifically on understandings and interventions regarding the issue of gender related violence, and drawing on biographical and archival research in Athens and Crete.

We approach gender studies and gender activism as a complex and articulated field shaped by theoretical, institutional/academic and social dynamics, in the context of which competing accounts of gender and/ or violence are at stake. In this sense, following a long tradition of feminist research, we wish to interrogate the politics involved in the production of power/knowledge about gender and gender related violence.

Growing out of the post-dictatorship autonomous women's movement of the late '70s and '80s, academic feminism in Greece engaged in public interventions on key social problems facing women, including rape and domestic violence, demanding legal protection and social support and assuming a woman-centered approach. More recently, however, especially since the 2010 crisis, a multiplicity of novel gender activisms, subjectivities and politics has emerged, including younger feminist and queer collectivities, civil society initiatives, and NGOs, which are often in dialogue with, but also challenge and confront academic feminism. They draw attention to the silences and erasures of the field, highlighting the intersections between gender, sexuality, ethnicity and class which render certain kinds of violence less visible, legitimised or normalised. Thus, critical new understandings of gender related violence are elaborated and new voices of epistemic authority are claimed.

Drawing on biographical research with older and younger feminist and queer activists and scholars, in this paper we revisit the relationship between institutionalised and grassroots gender discourses, practices and identities in order to trace the different trajectories- social and conceptual- that have shaped and are transforming the field.

ZAYED, Hany* (University of Illinois - Urbana Champaign, USA)

'We Are Not Cheating. We Are Helping Each Other out': Cheating, Deviance and Resistance in Egyptian Secondary Education

Cheating has long been an obstinate feature of Egyptian secondary assessment. Jeopardizing ideals of meritocracy and equality of opportunity, it has consistently been vilified, pathologized and criminalized by the state, which sought to combat it recently using digital technologies. Yet, while promising a tighter grip on assessment, those technologies afforded a new modality of cheating with a scale and speed unprecedented in Egyptian educational history. This research examines the social phenomenon of digital cheating at a time of assessment fetishization, post-revolutionary fervor, state-led educational digitalization, and pandemic exceptionalism. Using in-depth interviews with educational communities, oral history interviews with government officials, and novel qualitative social media research using WhatsApp, Facebook, Telegram and YouTube to observe cheating in situ, this research asks to what extent digital cheating can be conceptualized not as deviance but as an act of resistance.

Morphing from an individual practice into a social process, digital cheating embodies an emerging collaborative ethic both in assessment and learning. It exemplifies a collective articulation of agency and a creative act of resistance to state-led educational change and unfair structural conditions exacerbated by Covid-19. Within a subversive counterculture, students are contesting the meanings, normativity and morality of cheating, forging solidarity and camaraderie, and constructing a shared social identity with an anonymous community of peers. Bringing together the sociology and criminology of digital cheating, social movements and digital activism, and the cultural politics of educational change, this research informs contemporary cheating in more global contexts and helps reimagine assessment.

The Politics of Swap Lines and the Hierarchy of the International Financial System

The Covid-19 pandemic was a massive shock to the global community. It has claimed near 6 million lives and induced a rapid recession of unseen severity since the World War II. As investors flew to 'safe-haven' currencies and assets–– in particular, the U.S. dollar and Treasuries––global dollar funding became scarce and expensive. In particular, emerging economies were badly hit. Emerging economies faced portfolio capital outflows and currency depreciation at a speed and scale that was unmatched even by the 2008 financial crisis. In those economies with a heavy dependence on external financing, central bankers often had to scramble to find adequate amounts of U.S. dollars to pass onto their governments, domestic banks, and businesses to pay for imports and meet foreign debt obligations. In more fragile economies, access to U.S. liquidity impacted much needed access to medical equipment and supplies. The global distribution of dollar liquidity has had very tangible consequences, not just for international inequality but for livelihoods around the world.

In this context, the US Federal Reserve (Fed) has emerged as the world's *de facto* lender of last resort. The Fed governs the dominant international currency––the U.S. dollar––and is the only central bank capable of providing an unlimited supply of dollars to the rest of the world. During the pandemic, the Fed provided dollar liquidity to 14 central banks using currency swaps. Other central banks were excluded from the Fed's swap network. Although the Fed has framed swaps merely as an economic policy, who gets them is ultimately a political question. Moreover, the discriminatory and selective provision of liquidity has had significant political and economic implications for countries. Using public texts and data, this paper examines the politics of swap agreements and the effects of the Fed's actions on inequalities in the international financial system.

Post-Socialist Urban-Periphery Development Towards Construction of Alternative City Center: Combining Deliberative and Design Intervention in the Rural County in the Western Poland

The paper traces a collaboration of Polish scholars and local government formed to overcome the socialist and postsocialist legacies in social relations and spatial planning by creating an urbanscape and socialscape in the periphery of the Poznan metropolitan area. To forestall a spread of the "generic landscapes of consumption" and social fragmentation, the initiative, undertaken in 2014, utilized the local heritage to create an alternative centrality

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

to the metropolitan center and to design a civic center as the new centrality's nucleus. Through its architectural form and social functions, the civic center, as a socialscape, is intended to catalyze social cohesion and civic participation. The research was informed by an ethnographic study conducted in the county in the middle 1990s on the results of postsocialist reforms. The collaborative and interdisciplinary initiative was constructed by merging sociological-ethnographic and architectural methods and literature and document review, and conducted jointly with local officials and residents. The initiative serves as a model for deliberative spatial planning and civic engagement in the construction of sustainable social, economic, and ecological solutions in the postsocialist context, congruent with the EU 2030 Agenda of SDGs.

Constructing Insemination Fraud As a Social Problem: A Qualitative Study

Developed at the end of the 19th century, artificial insemination is now the most commonly performed assisted reproductive technology (ART) practice (Golombok, 2016). In Canada, it is estimated that approximately 8,000 people of all family structures undergo this procedure each year (O'Reilly et al., 2017). However, although most countries have implemented a number of measures to regulate artificial insemination, it remains the least regulated ART practice. This state of affairs has led to a number of abuses, including insemination fraud, which occurs when the physician performing an insemination knowingly substitutes a different sperm sample (from another donor, another patient in the clinic, or the physician himself) for the sperm sample chosen by the parents without the parents' knowledge or consent. For more than 40 years, dozens of physicians have performed insemination fraud without being questioned, taking advantage of a legal void in this area. In response to this void, and in the wake of advocacy efforts to advance the rights of donor conceived people and their families, a number of social demands are beginning to emerge, primarily in North America, to acknowledge the psychological and social impacts of insemination fraud and implement preventive and punitive measures. This oral communication will present the results of an exploratory qualitative study conducted on 17 Canadian and American people who discovered they were conceived through insemination fraud. The goal of this communication is to examine the process through which insemination fraud is constructed as a social problem that requires a regulatory response (Spector and Kitsuse, 2017).

ZEGHICHE, Sabrina* (Université du Québec en Outaouais, Canada)

'My Eyes, My Smile... They Belong to Someone I Don't Know' – the Impact of Insemination Fraud on Family Ties

For several years, concerns about third-party reproduction have been evident in many countries. However, despite these growing concerns, several loopholes remain in the legislation governing sperm donation. For example, the lack of consistency across clinics in donation tracking and record-keeping procedures has led to cases of accidental or intentional sperm mix-ups. Such mix-ups imply that the sperm chosen by the parents is not the sperm used for conception. With the advent of DNA kits, more and more cases of sperm mix-ups are being uncovered and several doctors have found themselves in the media spotlight, namely in Canada, where a situation involving a doctor who was a pioneer in assisted reproduction made the headlines in recent years. Surprisingly, this phenomenon has received very little attention in the scientific community, as shown by the recency and scarcity of the literature on this topic. This presentation aims to fill this gap by presenting the results of an exploratory qualitative study carried out with 15 Canadian participants (7 parents and 8 donor-conceived persons) who were victims of insemination fraud perpetrated by the Canadian doctor mentioned above. The goal of this study is to document the consequences of this fraud on the lives of the people affected by it. A thematic analysis of the data revealed three main themes: 1. Renunciation of the original parental project and a feeling of having been robbed of one's agency; 2. Concerns about the unknown medical history of the donor and its potential health implications; 3. A reshuffling of family ties, with a narrowing of some ties and a widening of others, all entailing a redefinition of the family entity. This study shows that the experience of the people affected is inconsistent with the social representations around this type of malpractice.

The School Normative System a Key Element in Determining the Quality of the School Environment

According to the findings of Emil Durkheim, the normative system determines the condition of society, including any institution, organization, group, individual. This statement also applies to the school and the individuals involved in carrying out its tasks. In the case of a school, this system consists

of, among other things: recognized values by the main actors of the school environment, norms that regulate the behavior of students, measures to guard the respect of these norms, consolidation of the educational activities of teachers. A well-functioning normative system allows educational institutions to function smoothly and effectively achieve the goals that these institutions set for themselves. In my presentation, I will focus on school educational measures and point out their importance for the quality of the school: students' evaluation of the school, school achievement, teacher effectiveness, teachers' satisfaction with their profession. The presentation will be based on the results of empirical research conducted among elementary and secondary school students in Poland.

Food Movements in Germany: An Explorative Mapping

All around the world, social movements protest against the corporate food regime (Friedman & McMichael, 1989) and claim for a socio-ecological transformation in relations of food production, exchange and consumption. The aggravating food crisis due to the entanglements of the war in Ukraine, Covid-19 pandemic, climate emergency, and loss of biodiversity, have also been addressed by food movements. In their heterogeneity, they provide an analytical lenses to explore the multiple and intersectional dimensions of food inequalities (Motta, 2021); they resist the dominant deregulated structures of capitalist, postcolonial, epistemic and anthropocentric exploitation and violence (Holt Giménez & Shattuck, 2011).

In addition to protesting injustices and inequalities in hegemonic food relations, food movements present alternative practices and concepts for dealing with structural and multi-scalar challenges, combining demands for food democracy, food sovereignty, and food justice (Fladvad, 2018). Drawing on concrete and local practices, they advocate for a just and resilient food regime in the here and now and future (Jarosz, 2014).

Who are these actors that mobilize for a socio-ecological transformation? What are the main dimensions and intersections of inequalities addressed by these movements? Based on an explorative mapping, this work identifies relevant food movements in Germany and gives an overview of the heterogeneous actors in this field of social mobilization. The unit of analysis is food movements with significant actions and participation in social mobilization during the last 5 years (2015-2021). The methodology follows a qualitative approach (Mayring, 2000; Saldana, 2015) to create a data set that categorizes food movements in types, juridical form of organization, main dimension and intersection of inequalities, territorial focus (urban-rural), and targeted sphere of social change (state-economy-civil society). Based on such mapping and description, the paper aims to assess the actors in this emerging field of social mobilization in Germany and their emancipatory potentials and limits.

Teaching Global Aging and Social Policies in a Global Virtual Classroom

Global virtual exchange is a new mode of teaching reaching classrooms beyond national borders and across disciplines. With advanced virtual technology, sharing the same virtual classroom with students across the pacific or at any location of the global has become possible and exciting.

This presentation demonstrates two virtual classroom experiences teaching a sociology class titled, "global aging and social policies." Students at Georgia State University (GSU) in the U.S. and students at Zhejiang University of Finance and Economics in China are sharing the virtual classroom in the fall of 2022; Students at GSU and students in Catholic university of Costa Rica are sharing a virtual classroom in the spring of 2023. All students in the 3 countries use the same textbook, they learn together and from each other. The presentation will demonstrate the 3 collaborative learning projects among international students who learn from each other about healthcare, long-term care, and retirement systems. These learning projects are comparative and, thought-provoking. They provide students a chance to apply critical and global lens into the understanding of different social contexts and social policies. Weekly online interactions between international students provide students opportunities to understand how healthcare, long-term care, and retirement pensions are utilized and experienced at personal, familial, and societal levels.

Global virtual exchange may be a byproduct of Covid-19 distant learning. It surely has opened new channels for breaking geographic boundaries of learning and teaching sociology in global and critical perspectives.

Socioeconomic Status and Access to Urban Eldercare Resources: Interrelated Predictors for Elderly's Mental Well-Being

This study investigates the interplay between household socioeconomic status (SES) and the geographic accessibility to eldercare resources and how they collectively influence the mental well-being of urban elderly. We extract the geo-information of officially registered eldercare resources in Shanghai from the Eldercare (Yanglao) Map created by the Shanghai Bureau of Civil Administration and combine it with geocoded survey data of the Shanghai Urban Neighborhood Survey. Eldercare resources, such as elderly daycare, elderly canteen, geriatric activity center, and elderly activity center, are considered and the accessibilities to which are measured using both the two-step floating catchment area method and the counts within elderly residents' 5-/15-/30-minute circle. We employed multivariable regression analysis with elderly's self-care ability controlled to examine how household SES is interrelated with the accessibility to eldercare resources and how the interrelated predictors influence elderly's mental well-being (depression, loneliness, subjective well-being). The empirical evidence provides implications for allocating eldercare resources to meet the diversified needs of elderly of different SES.

The Intergenerational Legacy of Early-Life Malnutrition during the Great Leap Forward Famine in China

The "turning point" of parents' early-age experiences may influence their life-course trajectories. Their offspring's development may also be influenced. In this study, I choose China's Great Leap Forward Famine as a natural experiment to examine whether and to what extent the effects of the exposure to famine is associated with economic and health outcomes for parents and their children. This study also explores whether parental exposure to famine at different stages of their life-course has heterogeneous impacts on their children's economic and health outcomes. Based on data from the 2010 China Family Panel Study, my results show that mothers exposed to famine *in utero* are more likely to have lower socioeconomic outcomes, and this poor condition is transmitted to their children in terms of annual income and monthly salary. However, the adverse effects of famine as a result of fathers themselves are insignificant. It seems that the intergenerational effects of famine on children's economic outcomes are not transmitted through the paternal line. Moreover, children's health condition only transmit through fathers who exposed to famine during childhood, but not through maternal line. Findings from this study extend the literature on Baker's fetal origins by providing the long-term intergenerational effects of famine. Further, this study highlight the theoretical and empirical relevance of the "linked lives" principle of life course approach in mobility research by exploring the intergenerational effect of famine experienced by parents at different stages of their lives. Finally, the method used in the study could also be expanded to the further studies of the ongoing COVID-19 pandemic.

Resilient Communities Evaluation

Resilient Communities Evaluation Indicators System Practice from the Perspective of Disaster Prevention and Mitigation--Field Research from Chengdu, China
Located in southwest China, Chengdu is the capital of Sichuan Province. Because of its unique geology and climate conditions, Chengdu and its surrounding areas face frequent earthquakes, floods, mudslides and other natural disasters. According to interviews with officials, its planned resilience transformation projects have been completed by Chengdu government departments in the past three years. Therefore, our research team tries to investigate the evaluation indicators system for resilient communities and Chengdu is taken as a typical study object.
Resilient Communities Evaluation Indicators System
Our team obtained a large amount of first-hand data through key person interviews, questionnaires, and file retrieval. Evaluated mainly in terms of resident satisfaction, infrastructure integrity and management adequacy.
The proposed indicators system consists of 3 first level evaluation indicators, 10 secondary evaluation indicators and 39 tertiary evaluation indicators that make up the overall indicators. Indicators are sourced from comprehensive standards such as the Safe and Resilient Cities Evaluation Guide (GB/T 40947-2021), Security and resilience-Urban resilience-Framework and principles (ISO 37123).

Questionnaire survey on urban residents' satisfaction with resilient communities
The researchers collected a total of 533 samples of urban policy makers, community workers and urban residents through a questionnaire survey. These samples are from 5 communities in different districts (counties) of Chengdu. The sample communities included residential, commercial and industrial, four communities with different emergencies (fire, gas leak, epidemic spread) within five years and one community without any emergencies within five years.
Through this fieldwork, we have attempted to quantitatively evaluate the effectiveness of resilient communities in Chengdu along three dimensions: people, facilities and management. These samples provide valuable experience for other cities in China and around the world to develop resilience in the future.

Paradoxes of Intention: A Conceptual Exploration on How Nature Guides Mediate and Interrupt

While the topic of nature guides in tourism settings has been widely explored, it is often from a pragmatic and instrumental perspective, discussing relationships between motivations, skills and competences of the guides and the eventual experiences the guided receive. Working as a researcher at the Swedish Center of Nature Interpretation has allowed me to gain some insights in the practices and phenomenon of guiding from both practical, educational and theoretical perspectives. Although I was always drawn to the nature guides group, what I find extremely interesting in this current position is the in-between space of practice and theory. In this paper I wish to reflect on one aspect that emerge from this space, through looking at the practices and affects in guiding and guided situations through a phenomenological approach. This is to do with 'intention', both in the sense of the general motivation behind guiding, but also the ad hoc practices and affects in which guiding happens, involving the guide and the guided, but also the other non-human elements. What kind of constructive paradoxes can we learn about from the intentions of a guide during a guiding session (for instance, what the guide intends to curate or convey, may disrupt what they intended originally, yet whatever co-created results may not happen had the intention not be at the first place)? My intention, at least, is to have discussions and dialogues from this presentation and later translate back to the course materials or other research projects carried out at the Center.

Unlost in Translation: Issues of Languages in Re-Centering Critical Debates within Tourism Studies

One of the main concerns of including critical thinking from scholars with non-Western background is the issue of language. While scholars have criticized that English as the *lingua franca* in academia standardizes and safeguards the Anglo-centric values and attitudes, few provide possible alternatives. Within tourism studies, similar discussions on language issues exist on how to recognize the contributions from Asian-pacific scholars in order to pluralize research ontologies and epistemologies. Here I aim to contribute to the re-directing and re-centering of critical tourism studies through reopening the questions of language. Drawing on philosophical inquiries and cultural theories of language, I address the often-overlooked ambiguities of language in relation to the binary of the original/the represented. I discuss the non-English scholars' usage of English in academic settings and how the ambiguities and ambivalence in that usage is often reductively understood as a lack of skill, fluency or confidence. Rather than examining the linguistic aspects in detail, I suggest we take the multilingual background of Asian-pacific scholars as sociological, cultural and emotional contexts to understand the ambiguities of language. This also provides a symbolic entry to revisit the concept of 'cultural translation', and the multidimensional meanings of 'translator', which have been influential in postcolonial studies. Base on these conceptualizations, I suggest that we reconsider the view that English is a barrier for Asian-pacific scholars to engage in critical debates in tourism studies. Instead, I propose we may explore the possible roles of cultural translation residing within Asian-pacific scholars and how it can be a source of criticality and creativity. This includes not only the literary translation of non-Western ideas into English words, but also broader practices of living and working with multiple languages. Instead of being 'lost in translation', we can therefore be 'unlost' which also means to re-gain through re-searching and re-defining.

The Oppressed in Indian Society and the Eros Turn of the Community: On Arundhati Roy's the Ministry of Utmost Happiness

This essay focuses on the Eros turn of the Community in The Ministry of Utmost Happiness written by Indian author Arundhati Roy. By exploring the value of reality of The Ministry of Utmost Happiness, Roy's position in Indian literature, and the thoughts as well as ideas conveyed in her work regarding the contemporary social situation of India, we can find that Roy is concerned with the oppressed in Indian civilization and history and that she regards the community of the oppressed constructed on the basis of love and friendship rather than geography and kinship. Roy's emphasis on the Eros turn in community synchronizes with the current trend of rediscovering Eros in philosophy and sociology. Calling for Eros allows us to rethink the construction of community in the context of the spread of terrorism and violence, digital technology becoming an accomplice of discipline to individuals, and it can also awaken the potential of human beings as actors and reshape their social identity, and then question the unjust part of the society.

The Weak Public Cultural Space: Power and Interaction in Bookstores

This study is to investigate how bookstores become public spaces and the transformation of bookstores in China to reflect the dawn and decline of Chinese public space. The boom and decline of semi-public spaces like bookstores can present political changes and urban modernization. So, the bookstore is an appropriate field to see how intellectuals and the public interact with authority. This study uses the space theory of Foucault and Lefebvre to examine the development of public space. This research addresses the following problems: (1) how bookstores in China were constructed as a public space under the influence of social trends and intellectuals since the early 20th century; (2) how socialist governmentality affects the function of bookstores; (3) how daily life practices rebel against authority in bookstores in the age of consumer culture, digital technology and COVID-19. I would like to conclude that to maintain physical public space, it is necessary to refocus on practice and get rid of control imposed on the human body by authority.

Anti-Productivism: A Rural-Initiated Alternative to Productivist Agriculture

This paper studies one of the most successful comprehensive rural cooperatives in China and uses this case study to explore the alternatives to productivist agriculture. Based on this case study, I argue that there are two types of post-productivism emerging in rural China today, each driven by a distinctive dynamic. The first is a consumption-oriented transformation of rural space and agriculture, driven by outside urban demands; the second is a rural-based countermovement against the dominant productivist agricultural regime, initiated from within. The empirical part of the paper, which draws on ethnographic data collected between 2015 and 2018, documents the experiences of a rural community in Shanxi Province, led by a group of women activists, in searching for a sustainable, alternative food regime. Over the past two decades and after repeated setbacks, the community have gradually developed a coherent "anti-productivist" strategy to agricultural production and food consumption that was motivated by the economic precarity and social decay they had experienced under productivist agriculture. They intentionally rejected the core tenets of the productivist agriculture, including state financial support, reliance on industrial inputs, monoculture, commodification of production and existence, and output maximization, and instead prioritized ecological sustainability, self-sufficiency, reciprocity, social solidarity, and cultural heritage. They not only transformed the agricultural regime in the villages, but also reversed the urban colonization and devaluation of the rural culture and agriculture by bringing urban consumers into the community and assimilating them into the anti-productivist value system. In conclusion, I argue that this type of rural-initiated anti-productivist alternative food regime is both more sustainable and more beneficial to rural communities.

Queer(ing) Lives and Spaces on Japanese Campuses

U.S. scholarships have been the predominant focus of research on LGBTQ+ issues in higher education. Recently, Japanese campuses have seen an increase in conferences, events, workshops, and publications related to SOGIE issues. However, most of them stem from the perspectives of educators and practitioners. Although these studies highlight the ongoing changes and administrative directions on supporting queer-identified students and faculty members, little attention is paid to how queer students and faculty members experience their campuses, how they perceive university policies, and how they cope with institutionalized heterosexism and cisgenderism.

This qualitative study aims to bridge the gap and further understand queer students' and faculty members' experiences within higher-educational institutions in Japan and to find possible factors that can improve the current campus environment. By exploring concepts such as cisgenderism, heteronormative oppression, coming out, and passing, this study examines how queer individuals devise their identities in the face of social and sexual stigma. The study also visualizes assemblages of the factors responsible for creating queer spaces on campus by investigating how different actors interact with each other. Moreover, this study demonstrates how queer spaces on campuses play a constructive role in creating an inclusive campus environment that promotes the well-being of queer individuals.

Uncovering the Motivations and Decisions of Immigrant Entrepreneurs in Tourism

Since the 1970s, patterns of Australia's immigration have changed dramatically. One such change includes the introduction of skilled migration, whereby immigrants are allowed to enter the country to alleviate nationwide labour shortages. The scheme has evolved since its introduction, and in the 1990s, as means to address regional development, special consideration was given to those who choose to study and work in regional areas. For example, in 2012-13, Tasmania introduced additional criteria that gave extra consideration to graduates and also temporary residents who own and operate a business. This has resulted in many immigrants applying to stay as entrepreneurs.

It is generally accepted that entrepreneurs want their business to be profitable and grow. However, the skilled migration policy has introduced an extra element - social membership - in this case it is an unconditional stay in their new country. In Tasmania, the tourism and hospitality industry plays a vital role in economy. Many immigrants view this industry as having a relatively low entry-barrier, leading to the purchase and creation of ventures in order to create a convincing immigration application. Overall, a dearth of research has focused on their business choices and the related motivations, especially under the restrictions of immigration policies.

Anecdotal observations suggest that some immigrants become 'temporary entrepreneurs' in tourism and hospitality industry, who abandon their enterprise and the island after receiving Australian residency. There are also many who stay in business and remain in Tasmania. Previous research has not considered these situations. This research will respond to the call of a renewed understanding the motivations of immigrant entrepreneurs, as well as the relationships between the policy, their social environment, and entrepreneurial activities (Barberis & Solano 2018). This presentation will highlight a distinct immigrant entrepreneurial motivation and how it affects their entrepreneurial and social decision making.

(Re)Interpretations of Harbin's Russian-Era Heritage: Heritage Tourism in the Changing China

Under the terms of the 1896 Li–Lobanov Treaty and the 1898 Pavlov Agreement, tsarist Russia was allowed to build the Chinese Eastern Railway (CER) and its southern extension in the north-eastern area of Qing China. A 'CER Zone' was in turn created around the junction of the two railways. It accommodated the Russian administration of the railways and was under extraterritorial jurisdiction, thus effectively acting as a Russian colony. This zone soon developed into the metropolis of Harbin. The Russian colonial rule ceased in the 1920s, but many Russian-era structures, buildings, and landscapes still exist in Harbin today—most of them are significantly different from the Chinese ones in terms of architectural/art style. In the 1990s, Harbin, the then national industrial hub of China, experienced radical deindustrialisation and impoverishment due to the nationwide economic reform. To sustain the city's economy and society, the local government started to re-value the city's exotic and aesthetic Russian colonial remains as heritage, and use and promote them to attract tourists and profit from the emerging tourism industry. Relevant heritage sites are frequently described as 'European-style' and 'Western' rather than 'colonial'. From the 2010s, the Russian-era heritage in Harbin is increasingly referred to as 'CER heritage' and highlighted as a type of industrial heritage. Most recently, 'CER heritage' is reinterpreted by some as a revolutionary heritage, which links the CER to the initial imports of Marxism and the early communist movements in China. Using archival analysis, observation, and in-depth interviews, this paper investigates how and why Harbin's Russian-era heritage is interpreted and reinterpreted as such. It is argued that these (re)interpretations reflect the changing thoughts and needs in and beyond the tourism industry of Harbin and, more broadly, China. The Chinese perceptions of and attitudes towards the West are crucial in this dynamic process.

Never Forget the War Crimes of Unit 731: The Autocatalytic Evolution of Chinese Nationalism in Harbin

Harbin is the northernmost metropolis in China. It became a part of the puppet state Manchukuo in 1932, soon after the Japanese troops entered the city. Harbin had, since then, been under Japanese colonial rule for thirteen years. During that period, Unit 731 of the Imperial Japanese Army, a covert biological and chemical warfare research and development unit that undertook lethal human experimentation, was founded and operated in Harbin to serve the then ongoing Second Sino–Japanese War and the broader Second World War. After the establishment of the People's Republic of China, the former sites of Unit 731 were listed and conserved as heritage. Using archival analysis, observation, interviews, and user-generated content (UGC) analysis, this paper investigates how the Unit 731 heritage sites, especially the former camp of Unit 731 in Pingfang District, are perceived and approached by authorities and ordinary people in post-colonial and post-war Harbin. It is found that the Unit 731 heritage is used politically to facilitate the construction of China's national identity. Harbin's official heritage making and interpretation based on the past relating to Unit 731 have been constantly evolving, but the underlying idea is always that people should 'never forget' the Japanese atrocities, the Chinese collective suffering, and China's national humiliation. The increasingly tactical heritage presentation and interpretation strategies adopted by the Unit 731 heritage management have made such political communication more and more effective, both domestically and internationally. Victimisation is not only a statement made by the authorities but also a reality remembered and shared among the populace, as the serious consequences and repercussions of Unit 731's research are still in living memory. These official and popular perceptions/attitudes have been reinforcing each other throughout the decades, and together they contribute to the Chinese nationalism in the Harbin of today.

Going Back to West: The Rise of Chinese Television Format (1998 - 2022)

For almost two decades in the history of Chinese television, the development of Chinese television programmes has relied on import overseas television formats to enrich the choice of television programmes available to Chinese audiences. From the first French TV format imported by CCTV in 1998, the process of importing TV formats has developed alongside the changes in China's political landscape, the development of Chinese society and the innovation of Chinese TV technology. At the same time, the purpose of import television format was for Chinese television practitioners to be able to produce their own television format, telling Chinese stories and selling them overseas. 2022 saw the introduction to Europe of the first Chinese television programme to be officially landed in Europe, which was sold at the Cannes Television Festival. This paper will discuss how Chinese TV industry create successful TV format through the progress of import as a pathway as a basis for innovation by sorting out the flow of TV format as a material to the Chinese market in the midst of globalisation.

Low-Tech Immigration Living in Modernity: The Ongoing of East-Asian Bubble Tea Entrepreneur in Finland

Opening bubble tea shops is one of the latest ways East Asian immigrants' survival strategy in Finland. Bubble tea, starting in Taiwan in the 1980s, combining tea and multiple other ingredients, such as milk, tapioca, and various sweet materials, is today expanding all over the world (Anon, 2020, Từ, 2020). In Finland, open a bubble tea store is becoming the most popular choice of business because it requires relatively few educational qualifications and small amounts of financial capital and can be learned recipe from internet. Studying this group can prompt policy makers to consider long-term strategies to deal with the current and future challenges of immigration and integration policies and creating inclusive cities in Finland.

This paper explores the transformation of survival strategies in contemporary East Asian immigration in greater Helsinki, through the lens of the bubble tea business, an emerging new survival strategy for East Asian immigration in post-pandemic time. It is an ethnographic study, through the interviews and fieldwork, that facilitates a dialogue between current debates in the sociology of migration and globalization of food and drink grounds them in the everyday practices of East Asian immigrants in Finland (Miller, 1997; Ram, 2004; Inglis, 2009, 2010; Sigley 2015; Drash, 2015). This paper argues that although lack of local language skill makes migrants hard to establish their root in Finland, Finland's *Future Migration Strategy 2020* and bubble tea's flexible employment benefits East Asian migrants living in Finland. Immigration is a huge "intellectual gain" for Finland, and therefore a deeper study of different immigrant groups is essential to fully exploit their potential for a paradigm shift at the social and policy levels (Kilinc, 2020).

In between Senses of Belonging and Strangeness: Return Migrants' Practices of Homing at Rural Ancestral Home in the Context of Urbanization

Since the 1980s, China has experienced rapid urbanization. The first group of rural migrants moved to the city between the 1980s and 2000s, and many of them have managed to settle in small cities by obtaining homeownership there. In recent years, some of these migrants went back to their ancestral homes in villages after retirement. In doing so, these aging migrants search for meanings of aging life from place affiliation, rural way of life, and agricultural work, since the urban become meaningless for them after retirement.

However, the experience of home in the villages is diversified among these return migrants. In contrast to some migrants who gain a stable sense of belonging, others have experienced a fluid and dynamic place identification process as their initial sense of belonging at the ancestral home is soon replaced by a sense of strangeness after dwelling in the village. Situating migrants in the urbanization processes, this study emphasizes urbanization influences not only the city but also the villages, always making which not a social world in migrants' memory. To negotiate with the spatial and social transformation of the ancestral village, return migrants constantly engage in the practice of homing such as developing more relationships with the rural, especially land, to invest the ancestral home with more meanings.

This study examines how the ways of experiencing home are shaped by the interplay between the transformation of place, migrants' practices of homing, and their imagined and desired relationships with villages. It also asks how they negotiate with their fluid place identity through practices of homing.

This study draws on multi-sited ethnography in small but rapidly urbanizing Chinese city, Jiaonan, and return migrants' villages. Research methods include in-depth interviews with return migrants and their family members, visits migrants to their villages, and archival research.

Pride and Prejudice: Professional Work, Occupational Identity, and Technology Framing

Technologies play a crucial role in professional work. While recent scholarship often examines a single information technology for white-collar workers, this study conducts a comparative analysis of three key technologies for blue-collar American firefighters: the thermal imaging camera (TIC), the fire helmet, and the self-contained breathing apparatus (SCBA). We develop a conceptual framework that highlights firefighter's dual interpretations of these technologies in terms of their technical functionality related to work performance and their symbolic meanings associated with occupational identity. Such dual interpretations can generate tensions and create different foci in technology framing, ultimately leading to different technology adoption patterns. We draw empirical evidence from 46 semi-structured interviews of American firefighters in two states with different environments (North Carolina and California) and 279 firefighters' posts on Reddit forums.

Our comparative analysis illustrates different technology framings through the lens of professional work and occupational identity. Specifically, firefighters' narratives praise TIC's technical functionality, yet portray it as just one new tool in their "toolbox." In contrast, firefighters' accounts of the fire helmets focus on the symbolic meanings of appearance of the traditional helmet, while downplaying the functional utility of the new European-style helmet. Finally, firefighters' framing of the SCBA has shifted over time, initially focusing on its symbolic meaning as an identity threat and now highlighting functionality as a "necessity" for modern firefighters. Because of these different framings, American firefighters have adopted the TIC quickly and widely, cherished their traditional helmet while rejected the advanced European-style helmet, and changed their attitude toward the SCBA from resisting it to embracing it. These findings reveal the critical role of professional work and occupational identity in shaping technology framings, which in turn affect technology adoption and work performance. Our framework and findings advance the literature on technology and professional work and have broad implications.

Synthesis of Two Field Theories: The Dual Institutional Process and Differential Organizational Status

The neoinstitutional theory represented by Meyer and Rowan (1977) and MiDaggio and Powell (1983) has been a prominent theoretical approach in organizational sociology over last few decades. But it has focused on isomorphic structures and practices along a horizontal dimension in an organizational field, while paying little attention to differential organizational

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

status along the vertical dimension. To address this research gap, we incorporate Bourdieu's field theory into organizational sociology and integrate it with the neoinstitutional theory and recent research of organizational status. Synthesizing the two field theories of noeinstitutionlism and Bourdieu, we develop a framework on the dual institutional process of integration and differentiation in a field. While the neoinstitutional theory has focused on similar organizational structures based on the integration process, we offer an institutional explanation of differential organizational status. Drawing insights from Bourdieu's theory and key concepts, we pursue a dialogue with MiDaggio and Powell's (1983) classical piece. We highlight that the very institutional mechanisms causing isomorphism—regulative forces, normative pressures, and cognitive processes—also generate systematic status differentiation among organizations via their different levels of capital, homologous structures, and various habitus in a field. We further develop a series of testable propositions on how these institutional mechanisms and related key factors affect status attainment at the organizational level and status differentiation patterns at the field level. Our expanded framework extends the neoinstitutional theory to explain both similarities and differences in an organizational field. It also helps integrate Bourdieu's work with the Anglo-Saxon sociology with a long tradition of status research. Finally, while earlier institutional analyses in sociology have highlighted status differentiation at the individual, group, occupational, or societal level, our institutional framework adds a crucial missing piece at the organizational level and thus helps depict a more complete picture on multilevel status differentiation and social stratification.

Exploring the Intergenerational Relationship through the Going-Abroad Stories of the Chinese Migrant Elderly Parents

Based on semi-structured interviews with 24 Chinese elderly parents who live or have lived abroad (9 in Canada, 9 in Australia and 6 in the Scandinavian countries) with their migrated adult children, this paper explores how the intergenerational relationship changes in the context of transnational migration. Adopting Arthur Frank's perspective of socio-narratology (2010), it analyses how these elderly parents construct the meaning of migration in telling their stories of going abroad to live with their children, either permanently, periodically or temporarily. Earlier studies on Chinese migrant elderly parents in the context of internal migration shows that the migration of the elderly parents is a form of what Yan Yunxiang (2016) calls 'descending familism'. It was directly by the care need within the family, and was mainly perceived as an act of a functional intergenerational solidarity to help the younger generation with child care, which also reflects a change of norm in regulating intergenerational relationship (Zhao & Huang, 2018, 2021). In comparison, the migrating stories of the elderly parents abroad deploy multiple narratives that both include and go beyond the discourse on family obligations around care, and thus shed light on multiple aspects of aging and well-being. In particular, the intergenerational company as an important aspect of well-being in the aging life and navigating different welfare systems for better medical and care services as to future elder care needs are narrated as meaningful in accounting for why they chose to live abroad with their adult children.

Interpretation of Foucault's Micro Power Thought: Take the Documentary "Ermao" As an Example

Foucault's idea of micro-power breaks through the traditional perspective of power studies and reveals a set of hidden power operation mechanisms and power relationship networks that regulate the human body and the mental sphere. Li Ermao's status as a sexual minority, an addict and an AIDS patient makes him a typical marginal figure in China's period of rapid development. Therefore, this paper aims to analyse how Li Ermao became a marginalized person through the mechanism of transformation from punishment to discipline in Foucault's micro-power, and to reveal how the abnormal people, behaviors and phenomena in China's transition period were disciplined and tamed.

Chinese Queer Female Students' Queer and Adult Identity Making in Australia

My PhD project explores queer international students' queer and adult identity making in Australia. Specifically, I focus on a critical yet underrepresented population in academic, media and political discourse—the mobile Chinese queer young women studying and living in Western societies. Young women working on adult and queer identity making while transnationally mobile amidst a global health crisis, yet their struggles are often overlooked and underrepresented in extant scholarship due to their limited visibility, intersectional vulnerabilities, and continuous marginalisation. To address this lacuna, I collect and share untold stories of Chinese queer female international

students in this project. My research captures the complexities and tensions in these young queer women's narratives about their transnational and cross-cultural experiences, the 'in-betweenness' throughout the (im)mobile journey, and navigation of sexuality, identity and intimacy. To this end, I deploy innovative and inclusive approaches to examining how Chinese queer female international students craft their queer and adult identities while exploring a new culture.

Queer International Students' Self-Expression and Civic Engagement on Social Network Sites

This study examines queer international students' use of social network sites in the presence of heteropatriarchal surveillance and censorship of their queer identity. Prior research suggests that queer young people use social network sites to share and connect with others online and in the moment. This study argues that queer international students' use of social network sites can be driven by their need to seek belonging and autonomy and serves as a mechanism to counter the pressure from heteronormativity and marginalisation in their transnational transitions. Forty interviews were conducted in 2021 with 20 PRC-born queer female students aged from 20 to 34 who are currently located in Australia. The interviewees are found to use Weibo, one of the biggest social network sites in China, to cultivate spaces for self-expression and civic engagement in a Chinese context. While Weibo facilitates their queer representation, the interviewees have expressed critical concerns with how their voices have been suppressed and their private ownership of online spaces has been invaded by the censorship of feminist and queer discourse. These findings show the detrimental effects of heteropatriarchal surveillance and censorship of queer identity on Chinese queer female students' endeavours in finding a safe place for expressing their queer identity online. This research unveils the tension and complexity brought by queer identity onto queer international students' digital practices arising from surveillance and censorship of queer identity. Collectively, the findings contribute to a more nuanced understanding of queer young people's use of digital media.

Learning to Become Neoliberal Subjects: Discursive Tensions between Australian Higher Education Policies and Research Student Experiences

Australian universities have been granted too much power. As domineering institutions where thinking is performed in delicate yet rigorous forms, contemporary university governs what holds true as 'knowledge' - discursively and empirically (Caretta et al., 2018). Additionally, with successful transition into profitable enterprises, Australian universities excel at the neoliberal game of investment-return, pleasing emerging political and economic expectations. However, such 'excellence' is achieved through exploitative practices under entrepreneurial ideologies (e.g., casualisation) – at cost of university worker and students' wellbeing. Embodying academic norms in professional and private lives, Research Higher Degree (RHD) students are especially vulnerable as they face emerging expectations from research training to become self-driven and highly competitive individuals who are 'ideal candidates' who 'can play this game' (Thwaites and Pressland, 2017, p.24).

This paper focuses on the precarious experiences of RHD students and problematises the existing model of research training in Australian universities. Informed by a post-structuralist tradition of critical discourse and policy analysis (Bacchi and Goodwins, 2016), I interrogate key Australian higher education texts (e.g., Go8 documents, university policies) to expose their prevailing discourses. Drawing on my fellow RHD colleagues and my own experience as an RHD representative at an Australian university, I then operationalise an autoethnographic approach to map how these discourses permeate and govern research students' everyday learning and working experiences and how RHD students strategically resist. By doing so, this work demonstrates the discursive tension between support and expectation in RHD research training and the power-full interplay between student agency and structural constraints. This paper highlights the harm of the existing research training model that prioritises investment-outcome and rushed completion. We argue it produces the identity struggle of RHD students being simultaneously a higher education consumer, a precarious worker, an alienated labourer: a neoliberal subject with minimal room for learning and creativity.

The Impacts of Income Inequality Perception on Inclinations to Nationalism in China: Evidence from CGSS2008

Utilising data from CGSS 2008, this paper examines the impacts of income inequality perception on inclinations to nationalism in China. I constructed indicators to measure the dependent and independent variables in my research and divided the inclinations to nationalism into two subtypes, namely

　　** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

economic nationalism and cultural nationalism. Adopting an ordered logistic model and controlling for income, subjective social class identity and other covariates, I found that 1) income inequality perception had a positive impact on inclinations to economic nationalism. I also did the heterogeneity analysis by dividing the sample into different groups according to their different income levels and different social class identities. Results showed that the lower the income level, the greater the positive impact; 2) income inequality perception had a negative impact on inclinations to cultural nationalism. And heterogeneity analysis showed that the lower the social class identities, the greater the negative impacts. This paper adds the empirical evidence to the need to segment and disaggregate nationalism in empirical studies and supplements the previous literature exploring factors influencing inclinations to nationalism in the Chinese context.

To Devote the Body for Harmony: A Comparison Study on Beijing Elite Universities' Dynamic Zero-COVID Policy during the 20th National Congress of the Communist Party of China

Under the new era of technological advancement, governmentality has reached new triumph on this communitarianist land under the state of exception. With facial recognition systems and health code, the body has been classified into legal or illegal ones, governed under arbitrary range of time. Through these new gained technology, the campus living space, already been colonized as a representation of the sovereign's will, has been segregated off for even months and years. However, it has been exposed after several student movement, that the lock-down policy were little more than a political theatre. With professors, administrators and their family members being granted access freely while the rest of the students are being forced to bear almost daily Covid tests and almost no right to leave the campus, this policy had proven itself to be little more than a performance, a plead to loyalty to the bureaucrats under a pressure-type administrative system. The once open Universities had become another gated community we see so frequently in China, with a big data system closely examining the lives of all students, giving or taking away individual freedom at the whims of the bureaucrats. Under a sensitive political tempest around The 20th National Congress of the Communist Party of China, these governing landscape is becoming more and more intense, with Wuhan University using students' degree of compliance to Covid tests to evaluate their political loyalty, and even determining their futures. This report will conduct field work in three most prominent Universities in Beijing: Peking University, Tsinghua University and Renmin University, to study and compare the nuanced differences and general similarities of their covid lock-down policies, and draw conclusions of campus life in China under "the new normal" of surveillance capitalism with Chinese characteristics and how the students cope with the pressure by actively adopting self-control.

Populist Cultural Nationalism on Chinese Social Media - an Emotion Discourse Analysis

In China's digital space, discussions and controversies on the attribution of specific traditional cultural resources to China and South Korea are increasingly visible. From traditional costumes and food to festivals, all of them have become hot topics of discussion among netizens, reflecting the prevalence of nationalist sentiments in online culture. By collecting Chinese netizens' discussions on social media and analysing their emotional discourse, this paper examines how these discourses and emotions: 1) reflect a perception of self/other; 2) are connected to the official discourse of national and cultural rejuvenation in China today; 3) reflect the imagination of the state and nation. This paper selected Zhihu, a Chinese knowledge-sharing community, as the data collection platform. It is a Quora-like social media and China's most significant Question and Answer platform, with more than 200 million registered users and rich, high-quality answers. I borrow Koschut's (2017) Emotion Discourse Analysis method to interpret Chinese netizens' discourses and emotional expressions. He argues that discourse can provide an entry point and pathway into the study of emotions, through which the meanings contained in emotions can be deciphered. The analysis reveals that the discourse and sentiments of the netizens, to a certain extent, exclude the characteristics of integration and transmutation, creation and renewal of traditional culture, and integrate it into the framework of the state and the nation by emphasising the inherent nature of specific cultural resources. However, it is believed that the relationship between the export and the reception of culture is one of mutual influence and equality, rather than one of master and subordinate, sovereign and subject.

ZHOU, Mujun* (Zhejiang University, China)

The Interstitial Emergence of Labor NGO Activism in China and Its Contradicting Institutionalization, 1996–2020

This article seeks to extend the theoretical discussion of interstitial emergence to authoritarian context. It is argued that an interstitial space in an authoritarian regime is the space that is interstitial to the power of the state; to understand how interstitially emergent actors could promote social change, it is necessary to examine the interaction between interstitial space and the state as an institutionalizing force and recognize that 1) institutionalization is an ongoing process that nospans over a period and 2) state's intervention may induce unintended consequence. The rise and fall of labor NGO activism in China between 1996 and 2020 are used as a case to illustrate the theoretical discussion. Labor NGOs emerged out of the interstices of state control since the 1990s. Although the state started to regulate these organizations since the late 2000s, its intervention lacked consistency. Before the state finally gained the capacity to enforce rules, which was around 2015, labor NGOs had already launched a series of advocacy activism and cultivated a group of activists who identified with the value of social movement. Hence, although the activism was eventually incorporated, it had successfully thematized labor issues and produced enduring impact on the culture of public discussion.

ZHOU, Rachel* (McMaster University, Canada)

Make America Great Again (MAGA), Global Britain, and the Chinese Dream: Nostalgia in Times of Uncertainty

The rise of nostalgia as a public sentiment, an articulation relating to time (not necessarily linear), and as a tool of political manipulation in an era of uncertainties (e.g., economic, political, public health, and environmental) raises questions about the relationships among geo-temporality, affect, politics, culture, and history. Taking the UK, the US, and China as cases, this paper aims to understand the transnational connections of the rhetoric of nostalgia – or, more precisely, what Robertson (1990) calls "willful nostalgia" – in the current phase of globalization. Despite the differences in their articulations, the willful nostalgias of the cases discussed have features in common. First, nostalgia – with its hybrid, multidirectional, affective orientation of time – allows the political leaders in the respective countries to move back and forth in time to bring back the "glorious" past; not even, necessarily, for the sake of the present, but rather for the promise of an imagined future. Second, identity politics – defining the Self against the Other – has become an important tool with which to create a dichotomous or oppositional trajectory of national belonging and to narrate the nation at the respective turning points of globalization. Third, while trade is integral to the rhetoric of nostalgia in all three cases, the politics of culture is also apparent. I contend that the divergent rhetoric of nostalgia reflects these countries' different empirical stages and experiences of globalization and (re)articulations of the places to which they aspire in the future world. While the willful nostalgia under discussion has revealed the continuing tensions among nation-states, citizens, international relations, and humanity in the context of accelerated global capitalism, the conflictual and mutually constitutive relationship between globalization and nostalgia are also important to consider.

Moving Toward a Generational Conversation on Transplanetary Connectivity: A Case of Collective Reading By Global Youth on Reddit

Examples of youth withdrawing from economic activities – such as *Hikikomori* in Japan, NEET (young people Not in Education, Employment, or Training) in Europe, Latin America, and Africa, and the recent "lying flat movement" in China – have been widely observed in the context of contemporary globalization. Such phenomena have been studied either through a deficit lens or as separate, geography-based issues; we know little about the perspectives of affected youth across places, however. Using data (consisting of over a thousand comments) collected from Reddit, an online platform used by young people worldwide for exchange of ideas, this paper explores how a news report on China's "lying flat movement" was discussed in that supraterritorial space, and how this collective reading event has enabled the emergence of a global consciousness among global youth. From broader perspectives transcending territorial borders, these Redditors re-spatialized the local phenomenon under discussion as a generational issue of common concern and, hence, a conversation of transplanetary connectivity. This case manifests the ongoing construction, extension, and intensification of social links among youth who feel stuck, or "out of place and pace", at the current stage of contemporary globalization (Overell, 2018, p.212). I argue that consciousness of connectivity can function as an innovative and productive entry point to understanding the contestations and possibilities of "planetary youth". Exploration of such subjective aspects of contemporary globalization, especially from the perspectives of youth who are habitually peripheralized and neglected, also reveals some progressive potentials that merit future consideration.

Not Spending ≠ Not Willing to Spend ——an Empirical Analysis of the Impact of Macro Provision on Consumption

Expanding consumption and achieving high-quality consumption is the focus of the academia, the government and also the whole society in China. Traditional paradigm of economics and sociology emphasize budget constraints and institutional constraints, and thus advocate increasing income and income mobility and improving the social security system to expand consumption. However, these theoretical models overemphasize the agency or the situational factors of consumers, and fail to embed consumers in the complicate provision-consumption system, or relate consumption practices to provision practices. This paper proposes a "dual structure" theoretical model to more comprehensively and systematically examine how the micro and the macro structure shape consumption patterns. Based on the China Social Survey in 2021 and statistical data at district and county levels, the empirical analysis examines the impact of socio-economic status (SES) and macro material provision on people's consumption. The analysis shows that both SES at individual level and the material provision at the macro level significantly influence people's consumption, and the impact of provision is largely constrained by people's SES. Specifically speaking, both the occupational class at the individual level and the number of restaurants, express delivery outlets and whether there is a high-speed rail at district level have significant positive impact on household consumption expenditure, while the improvement of material provision at the district level have stronger positive impact on the consumption of households with higher SES. This study provides empirical support for the "dual structure" consumption theoretical model – understand consumption from both micro level of individual circumstances and macro level of provision system, and also provides new policy paths on how to expand consumption: emphasizing both improving income distribution and social security, and improving management and innovation of provision, can we achieve increased and high quality consumption in the context of transitioned China.

The Production of Authenticity in Leisure Spaces: Infrastructuralized Heritage, Internet Celebrity and State-Led Redevelopment

In inner-city redevelopment projects in Chinese and other Southern cities, urban governments usually manipulate cultural resources like historical heritage to facilitate new opportunities for consumption and economic growth. This paper uses the case of a state-led redevelopment project in Qingdao, China to illustrate the authentication and commodification process of architectural heritages for producing new leisure spaces. The vernacular architectural heritage of "Liyuan" is infrastructuralized in both material and immaterial ways. On the one hand, the architectural style of Liyuan is wrapped up into a certain discourse on the value of heritage and historical folk cultures, which is in turn employed in authenticating and advertising the redevelopment project. And on the other hand, the historical buildings are also renovated with new materials and improved facilities to accommodate cultural and leisure activities, after the displacement of original residents and other users. This infrastructuralization process is in line with the emerging Chinese "wanghong" (internet celebrity) culture, where various placemaking and marketing practices are adopted to create a "wanghong neighborhood." In so doing, this project is turned into a trendy destination for social media photographing to get more "authentic" experiences, catering to the need of middle-class consumers. By authenticating the leisure space with architectural heritage and "wanghong" culture, the local state attempts to revitalize and gentrify the inner city both economically and socially. This case examines the interconnections between material infrastructures and discursive manipulations in the production of leisure spaces, and may shed light on interrogating the materiality-discourse links in culture-led urban (re)development.

Has It Become Easier or Harder to be Homeowners in Contemporary Urban China? Evidence from an Age-Period-Cohort Analysis

Urban housing has always been a focal issue in understanding socioeconomic inequality in transitional economies. Since the massive housing privatization, there has been a significant improvement in various aspects of urban housing in China. Official data and research articles report substantial increase in urban homeownership rates. Accompanying this spectacular achievement, however, are prevailing studies and media reports about the growing difficulty for young people to attain homeownership in urban China. Hence, it is puzzling whether it has become easier or harder for Chinese urban residents to be homeowners, and why. Regarding this puzzle, we propose to differentiate two types of homeownership – a more encompassing one that indicates the ownership of an urban housing unit (broadly-defined homeownership) and a more restrictive one that indicates the ownership of the housing unit that one currently lives in (narrowly-defined homeownership). While it may become easier for Chinese urban residents to achieve the former one due to the increasing provision from the supply side, it becomes harder for new entrants of the housing market to achieve the latter one. We draw on a national representative survey, the Chinese General Social Survey (CGSS), waves between 2003 and 2017, for the empirical investigation. Analytically, we employ the hierarchical-age-period-cohort model (HAPC) to estimate the cohort variations of the two types of homeownership. The findings substantiate our propositions. They also reveal that young people's disadvantage of living in self-owned housing units is greater for migrant workers in more developed regions. This study not only contributes to the emerging literature about the housing inequality in urban China, but also reveals the problems resulted from the uneven development across regions and the induced massive rural-urban migration.

India through Chinese Generation Z's Eyes: The Link between News Media Consumption and Youth's Perceptions of India

Despite the similarities (most populous countries, emerging economic power and the oldest civilization), China and India have long been suspicious and unfamiliar with each other due to the striking difference in political system, social structure, and cultural traditions (Ji, Hu & Muhammad, 2016). A plethora of studies have been conducted on the China-India bilateral relations at the high level, but much less is understood about how ordinary Chinese people, particularly Chinese Generation Z, the generation of digital natives born from the mid-1990s to the late 2000s (Gentina, 2020) and the tower of strength in China, perceive the largest neighbour and their contemporary Indian counterparts. The youth's perception is of strategic significance because it promotes a better understanding of the partnership via a civic dimension (Shen, 2011).

As neighbouring competitor, both China and India have been heavily stereotyping each other, deploying mainstream and social media to engage in "strategic narrative" to attack the other (Caterina, 2015). Since few Chinese young people have visited India in person, media become the main forces shaping their perceptions of India and Indian people. This study aims to answer the question: how Chinese Generation Z's media consumption is associated with their perceptions and attitudes towards India. Building on cultivation and framing theories, the research investigates how the types of news media consumption (De Coninck, Ogan, & d'Haenens, 2021) and the amount of news media consumption (Shrum, 2017) by Generation Z influence their perceptions of India. An online questionnaire survey is adopted on the professional survey platform "Wenjuanxing" (www.wjx.cn), the Chinese equivalent of Amazon Mechanical Turk (Choi et al., 2020; Hua et al., 2020). Data are going to be collected between October 24 and November 24, 2022, one month immediately after the Communist Party of China's 20th National Congress, a highly important meeting in China.

Taming the Strange Animal - How the European Parliament and the European Commission Representatives Use the Arope Composite Poverty Index in Their Power Games

Comparative performance metrics are increasingly used as tools of transnational governance by international and regional organisations – including the European Union. The literature has so far focused on how and to what extent such metrics serve as instruments of exerting influence on countries to comply with standards defined by those organisations(Cooley and Snyder 2015; Fougner 2008). Scholars have also emphasised that such metrics contribute to supporting and disseminating 'normative agendas', that define what different actors 'should look like, what they should value, and how they should behave.' (Broome and Quirk 2015: 826). Yet, much less is known about the role the comparative metrics play for the organisations themselves, including how they shape their internal power games.

Our paper addresses this gap by problematizing how key EU actors – the EP and EC representatives – use comparative performance metrics to further their agendas in the area of anti-poverty policy. Based on the in-depth interviews and document analysis centred around the AROPE composite poverty indicator, we shed light on how 1) metrics are applied to support argumentation and legitimize claims; and to 2) communicate positions to actors form the outside of the EP and EC. Furthermore, we also link those arguments, claims and

communications to fundamental lines of division in the EU, namely the tension between particular interests of the Member States and of the supranational bodies, as well as between economic and social policy objectives.

Prosumption As a Mode of Acting on Web 2.0: Typology

The second generation of Web, or the so-called participatory, social Internet is creating new opportunities for mass communication and collaboration. The opportunity to participate may be seen as the essential difference between the first and second generation of Web. The principles of Web 2.0 activities not only define the new scale and nature of relationship in the process of production or creation, but also capture the changing relations between the producers and consumers of a material or intellectual product. The operating principles brought about by Web 2.0 enable the user to participate in the development of products or other artifacts. The consumer becomes the so-called prosumer – producer and consumer combined.

The aim of this presentation is to formulate a more systematically defined conceptualization of prosumption and to propose a new and more efficient typology of prosumptive activities. Furthermore, I will discuss the main field of application of the concept and identify the possible broadening of it, with the aim of applying this concept to the analysis of the organization of the dissemination of scientific knowledge.

Existing classifications of prosumption either lack completeness, are limited to a certain area, or do not provide a clear consistent classification criteria. Therefore, I propose a more systematic typology of prosumptive activities. It is based on three dimensions: 1) the nature of prosumptive activity in terms of cooperation (individual / collaborative); 2) the primary reason for engaging in a particular prosumptive activity (prosumption in order to create / prosumption in order to use); 3) required level of preparation, meaning whether a specific technical or professional knowledge facilitates the involvement in a particular prosumptive activity ("specialists" / "amateurs"; this designation is conditional and metaphorical, as all prosumers are in principle amateurs in the sense that they do not receive a formal salary).

RC23-342.5

ZILINSKAITE, Rima* (Vilnius University, Lithuania)

Science and Web 2.0: Prosumption in the Creation and Dissemination of Scientific Knowledge

Digitalization and related processes have an enormous impact on professions that are tightly related to the creation and dissemination of information and knowledge. Some of the main characteristics of current internet and digital technologies are the features of participation and collaboration, that are encompassed by the concept of prosumption (production+consumption).

When thinking about how the logic of Web 2.0 is generally reflected in the creation, dissemination, and application of scientific knowledge, at least four forms of expression can be distinguished:

- massive cooperation between scientists and scientific institutions;
- cooperation between businesses and individual scientists;
- involvement of "lay people" in science projects by giving them tasks to perform;
- creation and dissemination of scientific or science popularization content by Internet users themselves (Wikipedia, various blogs dedicated to science topics etc.).

The last form should be considered as the most distinctive. In the first three cases, the role and status of a scientist is more or less the same as in the traditional forms of scientific cooperation, except that the digital technologies create conditions for a new scale of cooperation and communication. And in the fourth case, a new reality and environment for the dissemination of scientific knowledge is being created, in which the so-called prosumers become the new players.

The aim of this presentation is to answer the following questions: What forms do prosumptive scientific projects take? What is their content? Who are the creators and participators of such projects? What might be their motivations to engage in such activity and do these motivations reflect any new values brought about by Web 2.0 (or are they already known forms of activity, adapted to the new circumstances)? To answer these questions, I will use empirical data, as well as my proposed new typology of prosumptive activities.

ZILINSKIENE, Laima* (Vilnius University, Lithuania)

Impact of the Covid-19 Pandemic on the Life Scenarios of 1990-2000 Cohorts: Lithuanian Case

The Covid-19 pandemic created "impossible" changes, which became a social experiment worldwide and had different consequences for the adaptive behavior of different birth cohorts and in Lithuania. Those changes are related to work, family relationships, and prospects. This presentation analyzes the 1990-2000 cohorts whose early socialization took place during the period of transformation after the end of the Soviet regime when Lithuania regained its independence in 1990. The life scenarios of these cohorts have been affected not only by changes in political, economic, and social life but also by the adaptive behavior of their parents, which varies from successful adaptation to very complicated ones. In cases where, for various reasons, parents cannot adapt during the period of transformation, children must assume their parents' responsibilities and obligations in the family. Such experiences influence their subsequent life scenarios related to profession, job change, and family. And during the Covid-19 pandemic, initiatives are taken that would not even be considered in "normal" times.

The behavioral patterns of these cohorts are analyzed in terms of the effects of internal and external adapters, as suggested by Riesman, Glazer, and Denney (1989). The presentation is based on 40 life story interviews collected within the framework of the ongoing project "Growing up in Independent Lithuania: Life Courses of 1980-2000 Cohorts, Behavioral Strategies and their Contexts" (2021-2024).

When Bad News Became Good News - Factors Predicting Gen Z's Decline in Purchase Intentions after Receiving Negative Environmental Information - Fashion Brand Shein As a Case Study

The e-commerce fast fashion industry, encouraging over consumption of ever-changing cheap fashion items is one of the most growing e-commerce sectors in the world. Alongside the growth of the fashion industry, a major critical debate regarding its societal and environmental damages is affecting the industry.

The starting point of the current study is that pro-environmental behavior may be manifested not only by enhancing purchase intention of sustainable fashion brands, but also by *reducing* purchase intention of *unsustainable* fast fashion brands such as SHEIN. The current research focuses on generation Z consumers, who were born between 1995 and 2010 and have grown up amid climate change concerns, are considered to be the most environmentally conscious generation from one side and one of the main target audiences of SHEIN from the other side. As the knowledge of consumers plays a direct role in their attitudes as well as behavior intentions, the study's purpose is to understand whether providing SHEIN's consumers with negative information about the social and environmental impact of the brand affects their purchase intention and which consumers' values are related to the decrease in it.

The results of the online survey among 607 Gen Z SHEIN consumers indicate that negative environmental information reduces purchase intention and brand attitudes significantly. Multivariate analysis indicates that the gap in purchase intention before and after providing negative environmental information is only explained by a decrease in positive attitudes toward SHEIN and by feelings of deception after exposure to negative information. The association between other independent variables derived from the generational identity of Generation Z: objective knowledge of online fashion, ascription of responsibility, materialistic motivations and the gap in purchase intention were insignificant. Thus, promoting sustainable behaviors is possible by providing environmental information which changes attitudes that reduce the purchase of unsustainable brands.

The Relationship between Educational Aspirations and School Achievement

Background and research question

Previous empirical findings have raised doubts about whether students' aspirations have positive effects on their school achievement. We, therefore, examine the direction of the relationship between students' ideal and real aspirations and their school achievement in German and mathematics from grades five to nine. In our analysis we draw on four different explanations to describe the association between aspirations and achievement (aspiration-driven, achievement-driven, aspiration- and achievement-driven, and neither aspiration- nor achievement-driven) thus building upon previous work from the United States by Goldenberg et al. (2001) and Guo et al. (2015).

Methods

Our data source is the National Education Panel Study (NEPS) (Blossfeld, Roßbach and Maurice, 2011). We drew our data from the starting cohort 3, grade 5, collected annually as a two-stage random sample, starting with the school year 2010 / 2011. The final sample size for the analyses consisted of a total of 3,465 students. We examined the direction of the association between students' ideal and real aspirations and their school achievement in German and mathematics longitudinally using five measurement points employing a dynamic cross-lagged panel model based on maximum likelihood with fixed effects (ML-SEM) (Allison, Williams and Moral-Benito, 2017) to yield possible aspiration-driven and achievement-driven explanations. In order to avoid a

misspecification of the temporal lags (Vaisey and Miles, 2017), we employed two ML-SEM model specification recommended by Leszczensky and Wolbring (2019).

Results

Contrary to the findings of Goldenberg et al. (2001) and Guo et al. (2015), who both found performance-driven associations, our results point to a bidirectional relationship between school grades and real aspirations. This bidirectionality only exists between real aspirations and both the German and the mathematics grade. The association between ideal aspirations and the grades in German and math turned out to be unidirectional, i.e., aspiration-driven.

Navigating Risk and Uncertainty – a New Perspective?

The sociology of risk and uncertainty has always acknowledged that risk and uncertainty are related concepts, but it has failed to systematise the relationship between them and whether risk as well as uncertainty have an independent meaning and role to play in risky decision-making situations, conflicts, or deliberative and other social situations. This presentation explores the different ways how risk and uncertainty occur and whether there are other forms how risk and uncertainty are navigated for different purposes, which are crucial for understanding phenomena of risk and uncertainty in crisis situations of present-day societies.

A lot of theorizing on risk follows the control paradigm that focuses on mastering (e.g. science), transforming (e.g. insurance), shifting (e.g. from politics to science or state to individuals) and externalising (e.g. to inner or outer nature) risk and uncertainty. But there are also many cases when risk and uncertainty are navigated in other ways, when for example, uncertainty is welcomed for different reasons and purposes. That goes beyond the entrepreneur who is trapped in the tension of risk taking and risk minimisation. Instead, risk and uncertainty in knowledge, regulations or norms are welcomed for being exploited (e.g. by social media companies), invisibilised (e.g. through dichotomous thinking), disguised through ambiguous formulations and metaphors, contained in formalised risk assessment procedures or created for exercising power (e.g. threatening others or spreading false information).

The recent communicative dynamics in the public sphere during the Coronavirus crisis and the Russian war on Ukraine has made visible ways of navigating risk and uncertainty which have been neglected in large parts of the work within the sociology of risk and uncertainty. Is a new perspective needed for risk studies?

TG04-819.4

ZINN, Jens* (University of Melbourne, Australia)

Risk Taking and Social Recognition

Risk-taking is an underdeveloped area in risk studies. It is addressed in the cultural approach (Douglas) as part of the culture of individualism. It can also be seen as a key element of neo-liberalism in the governmentality perspective (Foucault). The edgework approach focusses on the alluring character of voluntary risk taking (Lyng). All these approaches are conceptually too narrow to capture the different dimensions of risk taking this includes the role of risk taking in the reproduction of social inequalities. Outside of the socio-cultural approaches, risk-taking is addressed in youth studies and criminology where mainly quantitative studies have shown systematic connections between age, gender, ethnicity and others and risk behaviour but are weak in addressing the various motivations to take risks. The presentation presents builds on earlier work (Zinn 2020) to develop directions for a conceptual framework that considers both, systematic social inequalities and risk-taking as a more or less voluntary activity people refer to for different reasons, such as vulnerability, joy or search for social recognition. With this broader conceptual rooting the presentation tries to combine both the motivational side of risk taking as well as the socio-structural conditions. For this purpose, it complements risk studies approaches with critical theory and in particular theorizing on social recognition (e.g. Honneth, Hegel, Althusser) with empirical studies with explore the phenomenology of risk taking.

Mobilizing Enduring Stability: Chinese Officials' Toolkit for Social Stability Maintenance

Xi Jinping's self-elevation to "core leader," the enshrinement of Xi Jinping Thought into the constitution, and a revamping of Maoist-style campaigns has been part of the resurgent and increased infrastructural and despotic power of the central state over and through the public in China. New monitoring and surveillance practices have proliferated, intensifying the power of the state to sanction and punish dissent and maintain control. In addition to increased surveillance, the central state has initiated a new round of crackdowns on civil society organizations, especially labor organizations, to further their efforts of authoritarian control and social stability maintenance. However, meso-level

officials in inland China, far away from Beijing politically, have been encouraging specific types of civil society and labor mobilizations, using these "manipulated mobilizations" as tools to further their own power over and through society.

Meso-level officials, those who are between the central elites and the street-level bureaucrats and who do most of authoritarian statecraft, use the law and on-going mobilizations as a tool of social stability maintenance, while increasing their power vis-à-vis other state officials and civil society actors whose voices are amplified and brought into the state. In this way, meso-level officials are able to create another tool in the authoritarian toolkit. These manipulated mobilizations, though, are not without their drawbacks: when mobilizations are amplified and supported by officials, workers and civil society actors become emboldened, often pushing beyond the acceptable boundaries of protest delimited by meso-level officials, leading to crackdowns.

Based on 149 interviews with meso-level officials, mobilized workers, and civil society organizations in Shanxi and Henan Provinces in North-Central China between 2018 and 2019, I show the increased repressive power of the quotidian authoritarian state and the ways in which those who are in charge of authoritarian statecraft wield their power over and through society.

Role Division in Same-Sex Couples

The purpose of the present study was to investigate the role division among same-sex couples compared with heterosexual couples. One hundred and twenty-four participants (54 heterosexuals, 30 gay men and 40 lesbians) were tested. Significant differences were found between the spouses in their responses regarding role division in housekeeping in each group. The responses of heterosexual spouses correlate more closely with each other regarding the role of each of the spouses than was the case for same-sex couples. However, the role division among lesbian couples was more egalitarian than that of heterosexual couples. In addition, heterosexual women consider their married life less equitable than heterosexual men do. Similarly, one of the gay spouses considers the relationship less equitable than the other spouse does. The results are discussed in terms of their relevance to theories of social perception and cultural backgrounds.

Growing up in Military Families: Coping with Prolonged and Repeated Parental Absence

Family life in late modern societies is subject to numerous challenges. In the context of the work-family interface, military families face particular challenges arising from repeated military deployments of one or both parents. This means that military families in general, and the parent-child relationship in particular, face particular risks and difficult periods of absence. We were interested in how parental employment in military families affects the life course and well-being of children. Specifically, we were interested in how children experience prolonged and usually recurrent absences of a parent due to the demands of military service as they grow up; how a parent's absence affects their everyday life, life course, and transitions; and what coping strategies they develop and use in their daily lives to deal with absence and other features of growing up in military families.

We conducted 14 retrospective semi-structured interviews with adult children who grew up in military families where at least one parent was employed in the Slovenian Armed Forces and was deployed militarily at least once for an extended period of time.

Research shows that multiple and prolonged absences of a parent during the child's growing up and adolescence are stressful and challenging for children and have a significant impact on their growing up, with the severity of the impact highly dependent on the number or frequency of absences. While one-time or infrequent absences tend to focus families on the shock of a sudden change and mobilising the family's strength to get through the time, repeated, multiple absences simply become a daily habit and the norm. In some families, absences are so frequent that the presence of the normally absent parent becomes unusual.

Do You Think You Stand Where You Actually Stand? the Interplay of Subjective and Objective Social Status in Nine Industrialized Countries (2002-2018)

The relationship between subjective and objective social status remains understudied in sociology. We interpret subjective social status as an individual adjustment mechanism to material inequalities across space and time to offer a novel way to examine this relationship. This context frames two research questions: 1.) How are subjective and objective measures of social status associated? 2.) Upon what factors — individual characteristics, country, and time — do subjective social status and its (dis)alignment with objective status depend?

We mobilize 215,000 observations in ISSP data from 2002 to 2018 in ten industrialized countries (Denmark, France, Germany, Japan, Norway, Spain, Sweden, Switzerland, Taiwan, and the US) to analyze the interplay between a 10-step subjective social status scale and ISEI scores. We find that first, absolute differences in subjective status tend to reflect objective socioeconomic status. Second, underestimating one's social status is more likely to occur in symbolically weaker or stigmatized social groups (the unemployed, the disabled, divorcees, retirees, and women). Third, subjective status across countries broadly correlates with the economic development level, with those in the US, Germany, and the Scandinavian countries scoring highest. People in the US greatly overestimate their status and those in late industrialized countries (Japan, Taiwan, and Spain) report the lowest absolute levels and underestimate their statuses the most. Fourth, subjective social status and its association with objective status are volatile and declining over time. The point of lowest absolute subjective social status and greatest underestimation of status converge in 2009, in the aftermath of the Global Financial Crisis. Overall, subjective social status appears particularly susceptible to country-level and temporal influences, possibly revealing configurations of social welfare regimes and industrialization histories that affect perceptions of the social stratification system.

ZOU, Guannan* (The Chinese University of Hong Kong, China)

Beyond "Insider" and "Outsider" in the Field: Reflections on the Roles of Human Geographers in Shifting Contexts

Previous scholarship in human geography commonly classifies field researchers as insiders or outsiders. However, the prevalence of participant observation in numerous social science disciplines has blurred the insider-outsider distinction and highlighted that the levels of researchers' involvement in the field are becoming context-specific and far more complex than just insider or outsider. Inspired by this tendency in fieldwork methodology, this paper seeks insights from a theory in communication studies, role theory, to understand researchers' identities regarding the roles they adopt in their contacts with interviewees. Through reference to relevant sociological and psychological schools of thought, this paper highlights discourse as a crucial instrument for researchers' role-making in fieldwork. This study draws on the author's experience conducting fieldwork in Changsha, China, to explain how a researcher engages with shifting contexts in the field by intentionally assuming numerous roles. In order to explore state-firm relations in local development, the author recruited two groups of interviewees: government officials and business managers. The author actively learnt and employed comparable discursive techniques in interactions with each set of respondents, thereby assuming various roles in different contexts. These findings underscore the significance of analyzing how the purposeful self-presentation of researchers influences their interactions with interviewees and suggest a means for human geographers to build identities for more efficient data collection in the field.

EL Comienzo De UN Intento De Comprensión a La Crisis De Satisfacción De La Democracia Española Desde La Comunicación Responsable.

Estudios recientes sobre el estado de la democracia en España abordan diversos enfoques que nos permiten obtener una visión global de los factores que la determinan. Podemos señalar aspectos como su funcionamiento, su relación con los medios de comunicación en el escenario digital actual, la búsqueda de soluciones, la necesidad de un nuevo impulso y, por supuesto, la desafección política predominante.

Este estudio cuestiona si sería posible establecer las bases para la construcción de una Comunicación Responsable como eje fundamental en la socialización política entre instituciones, representantes y ciudadanos, la cual busque afrontar la crisis de satisfacción de los sistemas democráticos representativos.

En pos de alcanzar el objetivo planteado, se toma como punto de partida el estado actual de la democracia española y el estudio del concepto de la comunicación en el marco de la responsabilidad socio-política. Se lleva a cabo un análisis cuantitativo y de carácter exploratorio sobre el comportamiento de la variable del grado de satisfacción con la democracia española durante el período comprendido entre los años 2000 - 2018. Se pretende ofrecer algunas consideraciones útiles para el fortalecimiento del sistema democrático español, estimulando una cultura de comunicación responsable desde los partidos políticos, las instituciones y los representantes.

El análisis que se presenta muestra la necesidad de elevar los índices de satisfacción con la democracia española, señala sus posibles deficiencias y propone, en términos generales, vías para superar esos retos actuales frente a la democracia y la Comunicación Responsable.

Reflecting on Some Methodolological Challenges in Investigating Data Governance and "Digital Entrapments"

One of the crucial contemporary challenges for social sciences is the emergence of Big Data practices and infrastructures (Couldry 2020). Scholars have addressed the phenomenon of big data (Borgman 2016, Boyd&Crawford 2012), underlining the spatial nature of data manufacturing and emerging data divides (Andrejevic2014, Dalton et al. 2016). Recent studies have emphasized "data justice" (Sourbati&Behrendt 2020) as a significant issue to be addressed in data-driven government and policy-making, suggesting that we need studies that demystify the transnational process of data manufacturing as secretive, non-transparent and intimidating. Data is the newest and most coveted raw material, and is extracted by transnational companies that are not transparent to the host or local authorities. Thus, this key question is how can we make these companies more accountable and improve fairness in data governance? In order to answer this question, study aims to investigate the processes of data extraction and data governance accompanying urban smartification (creation of smart cities and ports) using the example of Digital Silk Road (DSR) – digital infrastructure package within the Chinese Belt and Road Initiative (BRI). The modest goal of the presentation is to reflect on some methodological challenges in conducting research on emerging relations in data governance between transnational corporate entities and local authorities, customers and citizens. Drawing on the critical data studies (Kushner 2013, Pasquale 2015, Seaver 2013), media theory (Couldry&Mejias 2019, Kitchin 2018) and borrowing from studies of organizations in digital economy (Bialski2020, Takhteev 2016) the presentation aims at presenting power asymmetries emerging in a new regime of data extraction. The introduced concept of "digital entrapment" helps to examine mechanisms through which local governance becomes technologically locked-in and dependent on the supply of tech solutions by Chinese companies. Digital entrapments are legal and technological assemblages/practices contributing to frictions between data capturing companies and host-countries.

Ageing Migrants and Social Well-Being: The Case of Filipino Women in Rural Japan

Japan is one of the fastest ageing societies in the world. In this regard, the Japanese government has implemented various institutional measures to address this social phenomenon. Along with the ageing of Japan's population is the ageing of its long-term foreign residents, many of which have lived most of their adult lives in the country, have families of their own, and see themselves staying longer in their adopted country.

This study examines the experiences of migrants in Japan as they reach their older years. In particular, this research focuses on women from the Philippines who arrived in Japan the late 1980s and early 1990s, and are currently living in Japan's rural areas. Many of these women came to Japan as so-called "rural brides." Based on qualitative data gathered through interviews and fieldwork in rural areas of Northeastern Japan from 2021 to 2022, this study analyzes ageing, migration, and social well-being from feminist and transnational perspectives. Specifically, this study explores these migrants' perceptions of their ageing process outside their countries of birth, as it relates to their own perceptions on social well-being – particularly its social and cultural aspects – as long-term migrants in Japan. It is argued here that the ageing experience of migration is gendered and intertwined with one's own cultural and social capital. In addition, language and communication, one's status of residence, spirituality and religion, and the presence or absence of family are also deemed significant. This study aims to shed light on the challenges that older female migrants in Japan are facing as they navigate ageing with their realities as migrants.

The Emotional Journey of Doing Life Stories in Chilean Prisons

Qualitative social research entails emotional work, both from the researcher and the interviewee, which must be considered together. There is no pattern or interview guide that can anticipate the emotions that will surface during interviews. With a captive population, it is expected that sensitive issues will arise and even more so when delving into their life stories, where memories and episodes, that most of the time have been bitter, are intentionally stirred up by the interviewer. The intense emotional work that prison requires is an element that must be considered both in the design and in the process of data collection and analysis. However, it should always be considered as an open space, since it is not possible to anticipate the emotions that will arise in both parties involved in the interaction. Based on the experience of a year of doing 50 life stories of inmates, both men and women, it is showed how the different emotional journeys emerged and were interspersed over time: each person and each interview involves an emotional journey that influences the next encounter. It is argued that the capacity for emotional agency of the people involved generates different interview situations that, when described and classified, can generate more comprehensive methodologies for working with people imprisoned.

Aspects of Volunteerism in Time of Covid 19

Public trust is an essential component in democracy and characterizes volunteers' activity. As it is often found among volunteers, the levels of social trust and of trust in the institution in which they volunteer in are generally high. The Covid-19 has undermined public confidence in government officials. Considering this, the current study hypothesizes that volunteers during this period will believe more in state institutions compared to non-volunteers. Additionally, the Covid-19 situation also obliges volunteers to face high-risk situations regarding their health. Previous studies show that volunteers in acute crisis situations experience higher psychological distress compared to the non-volunteers, the current study hypothesizes that volunteers during the pandemic will feel more psychological distress as compared to non-volunteers. Finally, another research hypothesis, based on the Logotherapy theory, is that volunteers will have more meaning in life than the non-volunteers.

The study took place after the second wave of the Covid-19 in Israel and was based on a convenience sample gathered through digital networks. It included 996 participants, 49.8% of them were volunteers (50.6% men, 49.4% women), and 50.2% non-volunteers (44% men, 56% women). The average age of the volunteers was 39 (Sd=17) and of the non-volunteers was 36 (Sd=16). T-tests for independent samples revealed that the volunteers felt that the government organizations had more competence in dealing with the Covid 19 compared to the non-volunteers. They felt more meaning in life while reporting higher levels of psychological distress compared to non-volunteers

The hypotheses were confirmed. The experience of volunteering can give volunteers in times of crisis an opportunity for personal development and growth, while appropriate guidance is required, so that the volunteers can cope with the psychological distress. As volunteers believe more in the competence of state institutions, they can carry out assistance roles in cooperation with government organizations.

Social Justice Perceptions Among Recipients of the Lowest Pensions in Poland

The paper presents a qualitative study of social justice perceptions by Poles who received the lowest pensions in the context of a recent fundamental reform of the public pension system.

Poland's public pension system was reformed in 1999, affecting those who retired in 2009 or later. One fundamental change was switching from the defined benefit system to the defined contribution system, in which the amount depends on the total sum of contributions paid to the system. The reform has eliminated the requirement to have an adequately long contribution period to be eligible for a pension, and now anyone who has ever paid any contribution is entitled to receive a benefit proportional to their input. For people who have paid contributions for at least 20 years (women) or 25 years (men), and whose contributions would translate to very low pensions, the state increases pensions to the so-called "minimum pension" level. However, more than 330,000 Poles receive pensions that are below this "minimum" level. This is a new phenomenon – before the reform these people would not have received any pension due to their insufficient contribution period.

In 2022–2023, we conducted qualitative interviews with people receiving pension benefits below the minimum pension. In this presentation, we focus on how the interviewees perceive their situation in terms of justice and what arguments they use to support their opinions. Preliminary conclusions suggest that our participants apply different discursive strategies to justify their situation, many of them aligned with the liberal notion of homo economicus. In the paper, we also juxtapose the views of the interviewees with four order-related justice attitudes described in the literature: equality, equity, need, and entitlement (Liebig and Sauer 2016) and with the discourse of Polish social policy experts.
